Monitoring quality costs is an essential prerequisite for the introduction of an efficient quality management system. They represent an important instrument for the improvement of the quality and efficiency of the organization because they are the fundament of the strategic decision-and have a direct influence on the profit size. For the evaluation of the performance of the quality management systems, a system of quantitative indicators based on quality costs and on the economic and financial results of the company should be developed. A comparative analysis of the main models of evaluating the performance of quality management systems is presented in table 1.

Table no. 1
Comparative analysis of the models of evaluating the performance of quality management systems

It. No.	Aspects	Deming Model	M. Baldrige Model	EFQA Model	Juran Model
	Purpose of development	Japanese industrial reorientation towards quality	Recognition of the American organizations with outstanding quality management achievements	The orientation of European organizations towards *excellence* sustainable by the systematic identification and promotion of the best practices	Promoting the Romanian organization competitiveness through quality
	Common objective	Continuous organization performance improvement			
	Accessibility degree	Limited	High	High	High
	Conformance with a certain model	It does not require that candidates should conform to a certain model	It requires that candidates should conform to a certain model	It requires that candidates should conform to a certain model	It requires that candidates should conform to a certain model
	Model type	Two-dimensional: TQM bases ; TQM purposes	Three-dimensional: strategy and action plans; system; information and analysis	Two-dimensional: determining factors; results	Two-dimensional: determining factors; results
	Number of criteria	10	7	9	9
	Criteria quantification	It is not standardized but depends on the importance, extent and role of each criterion	Definite	Definite	Definite
	Orientation towards clients	A very important objective. (undefined percentage)	A relatively high orientation towards clients as compared to the orientation towards the other business results (210 points)	Strong emphasis (200 points out of 1000 possible points)	Strong emphasis (200 points out of 1000 possible points)
	Orientation towards the business results		Very strong emphasis (325 points out of 1000 possible points)	A lower emphasis than the one of client satisfaction (150 points out of 1000	A lower emphasis than the one of client satisfaction (150 points out of 1000 possible

				possible points)	points)
	Dependence on Benchmarking	Less dependent	Dependent	Relatively strong emphasis	Compulsory
	Feedback	The evaluation report is only given to qualified candidates	The evaluation report is given to all the organizations taking part into the competition	The evaluation report is given to all the organizations taking part into the competition	The evaluation report is given to all the organizations taking part into the competition

Table no. 2.

Performance indicators structured with the help of quality costs in Romanian companies

It. No.	Designation
1	*Customer returns, expressed in physical terms (units/100 sold products).*
2	Customer returns, expressed in financial terms, (lei / turnover of 1000 lei).
3	Repairs performed on in-warranty products, expressed in physical terms (no. of units / 100 sold products)
4	*Downtime expressed in financial terms (lei/ production costs of 1000 lei)*
5	*Cost due to unusable supply expressed in financial terms (lei/ production costs of 1000 lei)*
6	Product downgrading costs (products the price of which was reduced as a result of their non-conformance with the customers' requirements or due to an excessive quantity of manufactured products (cost of the downgraded product in lei / production costs of 1000 lei)
7	Repairs performed on in-warranty products, expressed in financial terms (lei / a turnover of 1000)
8	Inspection activities expressed in physical terms (min / shift).
9	Client losses expressed in financial terms (loss in lei / a turnover of 1000 lei)
10	*Inspection activities expressed in financial terms (inspection costs in lei / production costs of 1000 lei).*
11	*Scrap expressed in physical terms (units/100 manufactured products)*
12	Marketing and research related costs (marketing and research related costs in lei / total costs of 1000 lei)
13	Scrap expressed in financial terms (lei / production costs of 1000 lei)
14	Costs related to audits to suppliers (costs related to audits to suppliers in lei. / total costs of 1000 lei)
15	Rework of defective products expressed in physical terms (units/100 manufactured products)
16	Employee training costs (employee training costs in lei / total costs of 1000 lei)
17	Rework of defective products expressed in financial terms (lei / production costs of 1000 lei)
18	Insurance premium related costs (insurance premium related costs in lei / total costs of 1000 lei)
19	Downtime expressed in physical terms (ex.: min/shift).

One can notice that the vast majority of indicators are constituted on the basis of the internal failure related costs (scrap, unusable supply costs). This fact proves once again that Romanian companies are focused on eliminating the found failures, which is characteristic of quality control systems, and are less focused on their prevention through the identification and elimination of their root causes (which is characteristic of modern quality management systems).

Abstract: The operative success of a company results from the use of success potentials. If a company intends not only to react, but also to structure its evolution consciously, then the entire company has to be oriented to the success potentials. Thus the company plans strategically a vision of its superior objectives for the following years. In addition, the strategic planning includes the ways through which these objectives have to be attained.

1. Conceptual delimitations on budgets, budgetary systems and related principles

Designing budgets is a management technique which allows the management board to set objectives and to define strategies. The budgetary process is used in the European organizations (especially in the French ones) since the 30s and has reached a large use and diversification based on the fact that the budget is a way of rationalizing expenses. In the US, the budget has a contractual reasoning as base and it represents an important control management tool.

The function of forecasting the management process could not provide enough orientation capability to the managers without the creation of budgets and programmes. The budgets draw the directions to achieve the objectives, in terms of financial and efficiency terms, and they also set clear competences and responsibilities regarding resource allocation and use. Budgets ensure a management style which creates coherence, decentralization, and subsystems control. Along the forecast function, budgets also have a function in control and financial balance. Budgetary control compares results of budgetary forecasting to identify the causes of differences and to implement various corrective measures for various hierarchy levels. The budgetary system ensures a change from strategic planning (long term) to short term management. For some organizations, the budget is only a management control tool, as for others serves as management control. The budgetary process is intended to define the objectives and action plans to achieve these objectives with the existing means whereas the budgets quantify in an accountable and financial manner the way an organization will obtain and use its resources in a given period. The budget as an instrument of financial planning has a series of advantages, such as:

Coordinates the efforts of functional departments involved in the budgetary process to obtain the most advantages in the overall activity;

Favours an efficient control system by comparing the achievements against the forecast and by taking corrective measures at the right moment;

As a control and work tool, it guides the organization to achieve economic management;

To take advantage of all its attributes of economic-financial management tool, the budget must evolve into a network of budgets, to take into account every responsibility centre to determine the points with negative influence over the results of the organization.

The budget is a figure forecast of resource allocation and of responsibility setting to achieve the organizational objectives in an efficient way. The budget is a fundamental component of control management but also an important short-term planning instrument.

Traditionally, budgets are linked to the establishment of responsibility centres and of functions, therefore being called functional budgets. Some budgets (administration budget, investment budget) have an imperative character as they prevent financial responsible and organizational management team from going over the budgeted limits. The operating budget and the treasury budget are orientational budgets.

The organizational budgetary system reunites two main components: a system of budgets and a budget control procedure. In theory and practice, the general principles of budgetary management correspond to their objectives.

The coherence of the budgetary system is achieved by ensuring the following principles are respected:

- The principle of overlapping the budgetary system with the organizational authority system: the budget is always under the authority of an operation responsible who has a role in the overall context (forecast, organization, command, control). For example, the commercial manager is responsible for the sales budget; the chief engineer is responsible for the operating budget.
- The principle of totality which states that the coordination of the overall activity of the organization must ensure the balance between various functional and operational services. The totality of budgets represents the engagements of budget responsible to the management of the organization, according to the operating objectives of the organization.
- The principle of flexibility states that a budget must adapt to changes, to new information regarding the evolution of hexogen economic variables.
- The principle of maintaing solidarity among departments and the principle of correspondence with general organizational policies. The budgetary system must eliminate the tendency of over evaluating the importance of certain departments compared to other departments and to contribute to achieving the strategic objectives of the organization.

2. Defining the information flows between the multi-annual planning and the annual planning

The multi-annual planning, also named the medium-term planning has to make a connection between the strategic planning and the operative planning. This transposes the strategic planning that often operates with qualitative sizes with operative standard values. Therefore it represents the framework of a detailed annual planning.

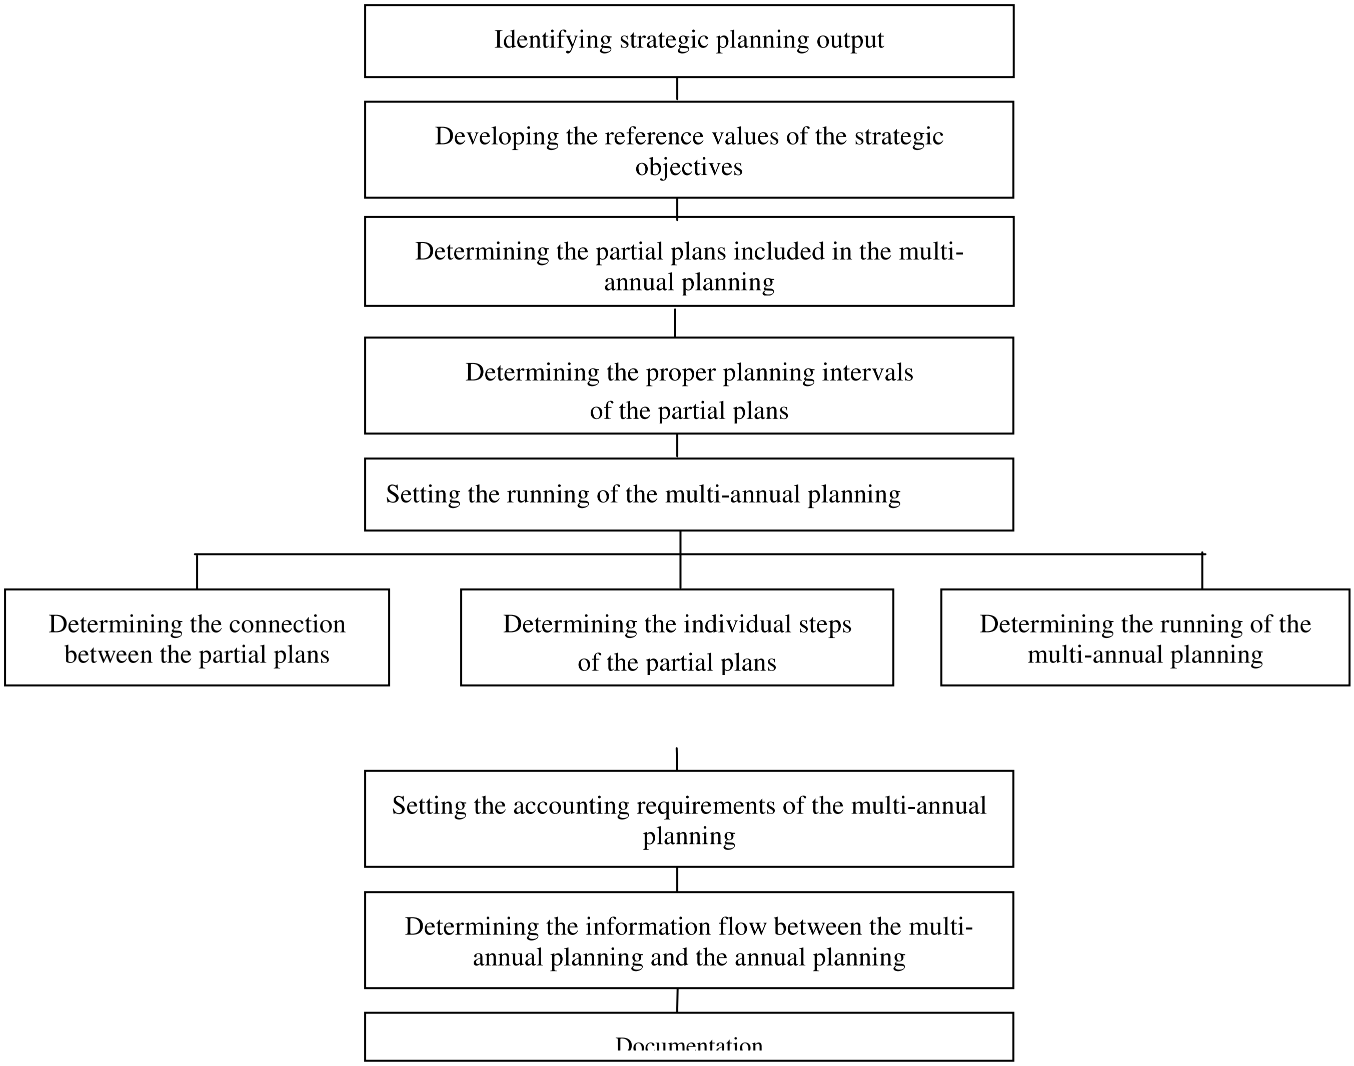

Figure 1. The stages of the multi-annual planning

The type of *output* provided by the strategic planning has to be established during the first stage. It does not refer to the so-called content, but to the form of the strategic plan, to be exact: if the strategic planning provides *hard facts*, as the standards of business records for five years, or limits to sensitive objectives, as to improve *Corporate Identity*. The first offers better approaches for the multi-annual planning.

The strategic planning *output* has a rather qualitative nature, so that the quantification process of the strategic objectives should be considered even since the multi-annual planning system is structured.

The third stage refers to choosing the respective partial plans and not all the responsibilities have to planned on many years. The multi-annual planning is necessary mainly for investment planning, turnover, research and development, staff. Purchase and stock planning is usually made for one year.

The planning intervals do not have to be similar for all partial plans, though the three year multi-annual planning is often used in practice. The proper planning intervals vary from company to company. For example, a pharmaceutical company with long-term research and development processes should use a five year plan of research-development.

The precise running of the multi-annual planning is determined during the fifth stage. This is about the data flows between the partial plans and the multi-annual plans, and the individual processing stages for each partial plan. The terms, references, the decisional bodies and information transfer have to be settled. Moreover, the adequacy period has to be determined, that is the period between plan processing and its transmission.

To define accounting requirements and the information flows between the annual and multi-annual planning means to assign responsibilities. The controlling function should consider them permanently due to their major importance within the structure of the multi-annual planning system and its application.

When concluding the procedure plan, the documentation of the multi-annual planning system results and integrates usually in the annual planning manual.

The result: the annual planning has been extended to a multi-annual planning on medium-term.

A comprehensive planning system may be achieved only when the strategic procedures mentioned in the procedure plan for the multi-annual planning have a structured order, also known as the strategic planning process.

3. The connection between strategic planning, multi-annual planning and annual planning

The operative success of a company results from the use of success potentials. If a company intends not only to react, but also to structure its evolution consciously, then the entire company has to be oriented to the success potentials. Thus the company plans strategically a vision of its superior objectives for the following years. In addition, the strategic planning includes the ways through which these objectives have to be attained.

An integrant part of the strategic planning is to define the company model. It shows how to understand the company and represents a guiding line for the company's members and their behaviours. For example, if a company's model is to offer trade mark products of high quality, than the operative planning almost excludes the sale of mass products. The strategic objectives determine the elements the company intends to insist on in his operative activity. If the objective is to reach a 10% market share in the USA for the next five years, the strategy may result in establishing a branch in the USA. Strategies are ways to achieve objectives. They settle the development direction which should be structured in the multi-annual and annual planning with precise individual stages.

The strategic planning means also to establish the premises to start planning. They are very important because the entire planning structure and the company's activities are based on them. Therefore the strategic controlling should supervise them.

The main objective of the strategic planning is to establish the company's future framework of development. Secondly, the strategic planning has to identify the new success potentials, in order to develop and secure the existing potentials. This may influence the future success and liquidity at the time the company still has numerous possibilities to action .Thus it provides the company's main objectives of development which are structured and materialized in the following planning steps:

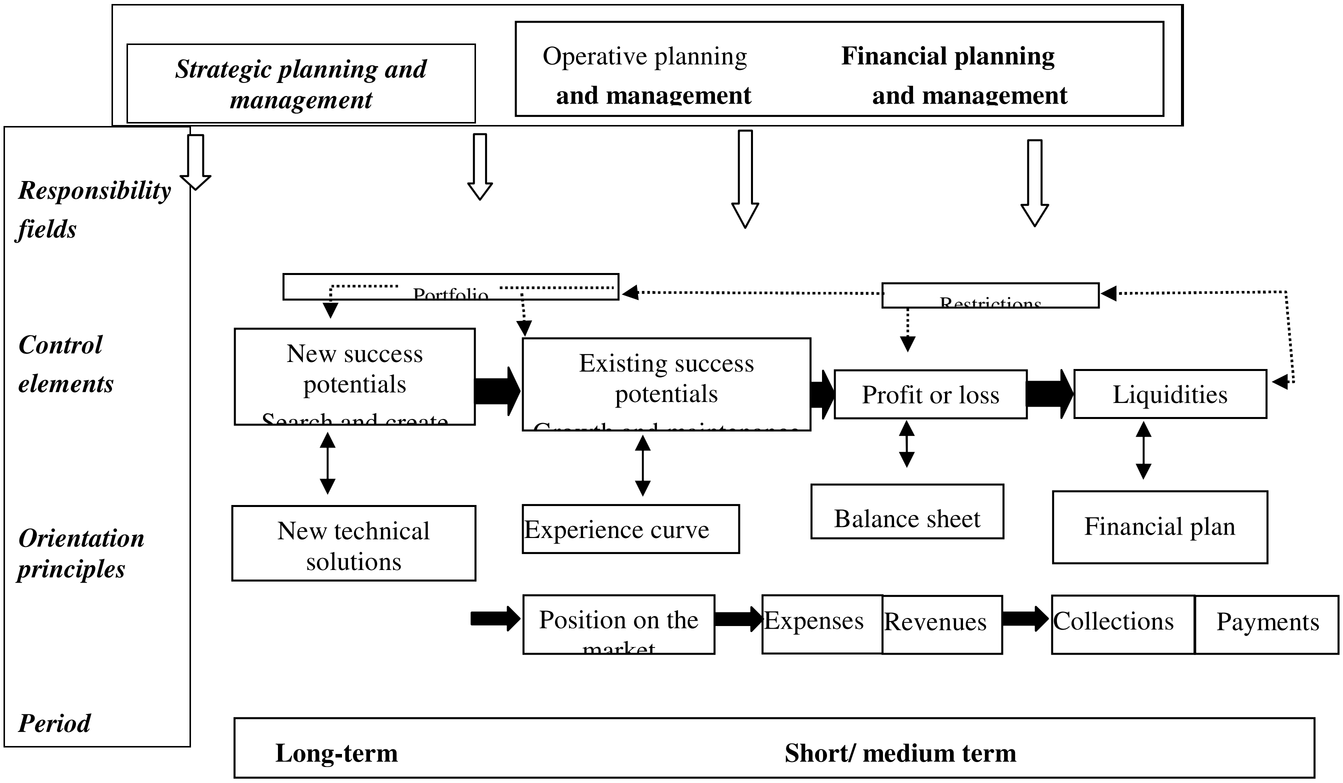

Figure 2. The strategic planning of the company (Galweiler, 1990)

The strategic planning turns into achievement stages through the multi-annual planning. The multi-annual planning turns the strategic objectives into operative key values, whose achievement leads gradually to strategic objective achievement. Therefore it is obvious that the strategic objective development and the consequently the multi-annual planning are useful in controlling the strategic planning.

A multi-annual planning is usually structured as a rotation planning. This means that the planning is processed yearly and the planning period leads to updating yearly the planning values and ensures that the planning corresponds to the latest information.

1The multi-annual planning shows the strategic objectives in precise programs and responsibilities as key sizes. For example, one of the objectives of the multi-annual planning would be to introduce a new special line of products in the USA by the year N+3. Therefore the development process must be completed by the year N+1 and the performing resources must be available by the year N+1.

A detailed annual planning should be derived during the nest stage, since the first year of the multi-annual planning. Thus the multi-annual planning becomes the liaison between the strategic planning and the annual planning. Its objective is to turn the strategic objectives and the key sizes into precise sizes on medium-term for the next financial period. By deriving the annual and the long-term planning for strategic reasons, the strategic objective achievement comes to be included in the operative activity of a financial year.

The annual planning assigns precise objectives for each person in charge precise for the following financial period. The annual planning is an estimate that corresponds to the superior levels that will turn into precise values. The expected results for the financial period are also precisely stated.

There is a *feedback* process between the different planning stages. The strategic planning shows whether the annual planning is approved by the management. In addition, the annual planning shows whether the strategies are achievable and are not mere visions. An important component of the annual planning is the financial planning. Differences may occur here because the precise values show clearly that the strategic objectives cannot be achieved or they will not be achieved so soon as planned. The annual planning may also show a necessary revision of the strategic planning. The objectives should be watched retroactively or covered with the new strategies.

4. The multi-annual planning based on investment planning

The multi-annual planning for investments represents the connection between their strategic planning and the annual plan of investments. The entire process is described below. The framework of available means is the strategic planning of investments. As part of the strategic planning, it shows where the company's resources should be implemented. The objective is to reach a competitive advantage as high as possible. Beside the investment framework, the strategic plan of investments establishes important investment projects. The multi-annual planning records the strategic plan of investments in individual objectives. They are planned from the point of view of the individual stages and the necessary means to achieve them. Planning the achievement stages and the payment moments after the financial periods are very important here. The larger investment objectives usually run as projects. Therefore they are fundamental in planning the project, from its beginning to its end.

The annual planning specifies the partial investment projects that have to be made within the planning period. The investment needs are presented in the annual budget. In addition to the annual budget for the investment individual projects, one may provide partial budgets for certain stages of the project.

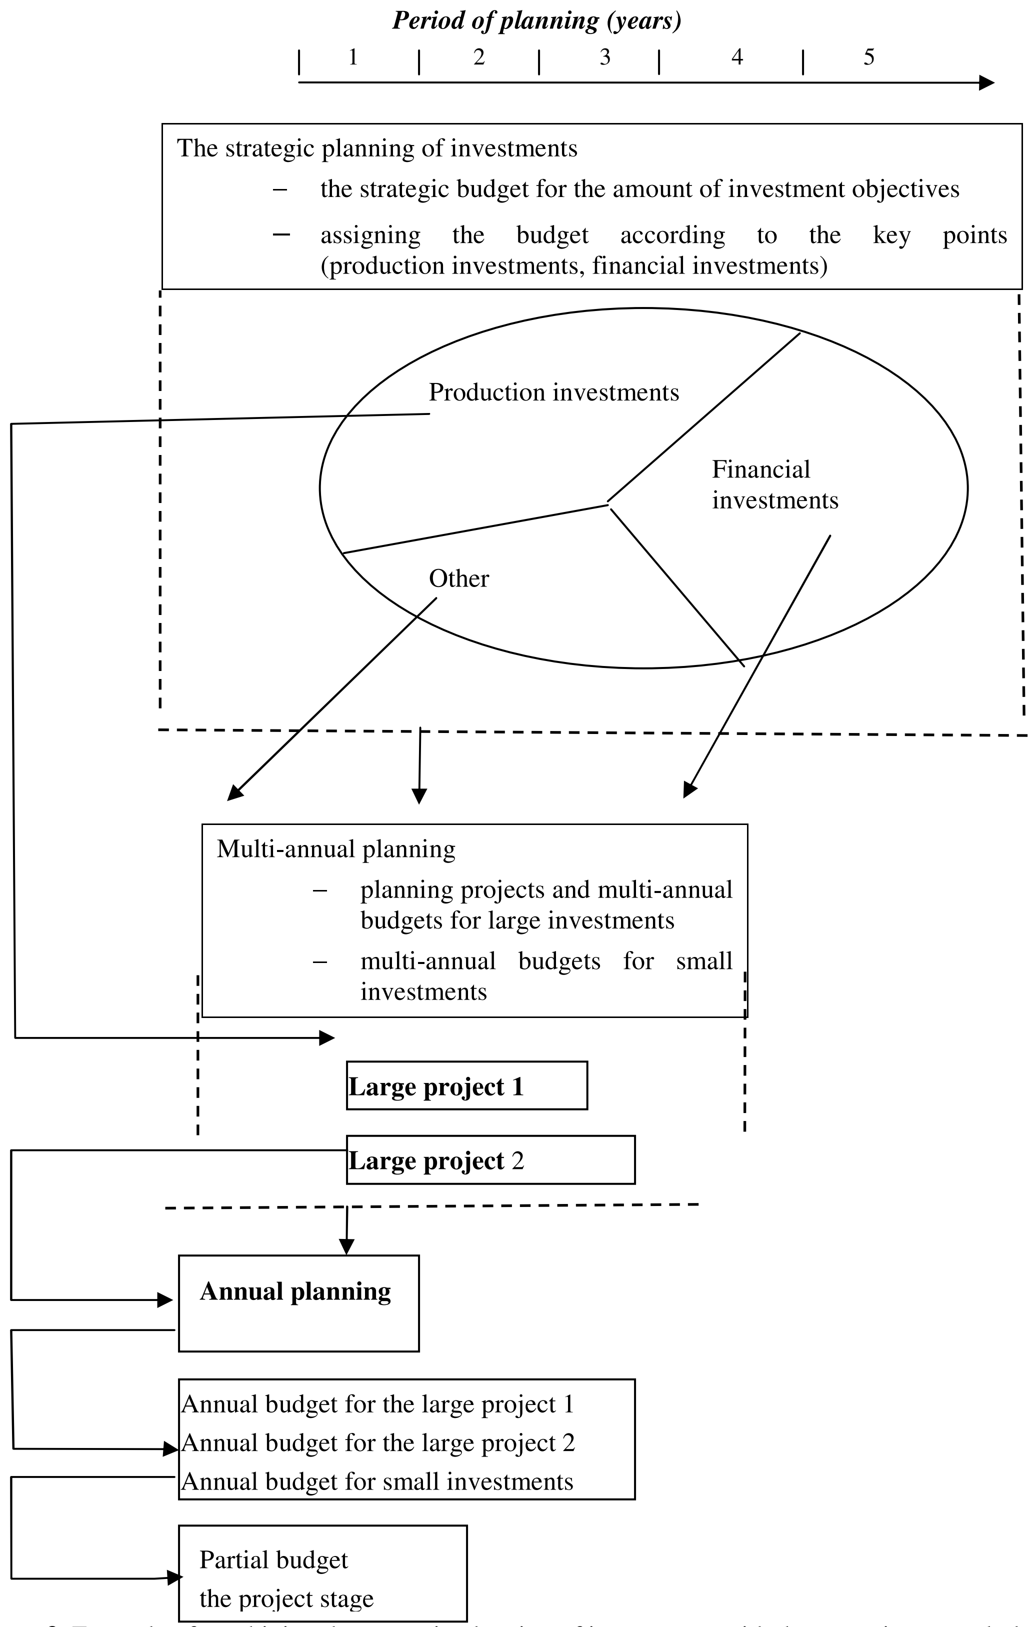

Figure 3. Example of combining the strategic planning of investments with the operative annual planning

Conclusions

Combining the approach of the leadership strategy with regards to costs and the differentiation strategy makes the organization aware of the importance that is has to grant to product innovation, to creating product features which are appreciated by clients, to constantly reduce costs by investing in production equipment, to rigorous control of fixed and total costs, to sale costs reduction.

Achieving all these objectives is imperative as a series of factors operate on the competition: increase in competition among organizations, new emerging organizations, new replacement products, buyers and sellers' business power.

An organization which learns, has the following traits:

- quality improvement processes as a result of gaining new knowledge and new insight;
- transforming the lessons learned during the organizational evolution into routines which guide behaviours;
- it is an organization able to create, achieve and transfer knowledge, and to adapt its behaviour depending on the new knowledge it has gained;
- doubting the past and transforming result into knowledge which is accessible to the entire organization and adapted to its objectives;
- ability to gain new knowledge based on own and others' experience and ability to transform the way it acts according the new perception;
- the organization is a place where people continuously improve their ability to get results, where new and stronger learning patterns continuously develop, where common inspiration is stimulated and were people continuously learn.

Abstract. The information regarding the production costs has a central role, determined by their implications on the actual status and on the future evolution of the company. The value of the information regarding the production cost justify its use on the decision taking process for the current activity, as well as for the company's strategy.

The use and the superior exploit of the resources in order to increase the competitive capacity of the organisation impose the wide-scale use of the advanced cost management methods, which sustain the performance, the significance and accuracy. The efficiency of the selected method depends on the speed it provides the information to the board, in order to allow the fast-taking decision process.

The standard-cost method guides the future activity of the company through acquiring long term standards, which will guarantee a efficient technological process and the implementation of a modern management.

Key words: method standard cost, cost of production, direct and indirect costs, decision

In order to operatively supply the information on manufacturing costs on the one hand, and to develop the estimated side of the managerial accounting on the other hand, there is a need to promote various methods of cost calculation based on estimated expenses. In this regard we can take into account the standard – cost method.

The history of standard cost calculation is marked by numerous evolution stages; a direct impact on plan cost calculation had *„Estimated Cost System")* and *„Standard Cost Accounting"*.

The standard-cost method (also known in literature as the standard cost method) underwent throughout time a permanent improvement, which allowed its use in many countries.

If the used methods were based on the concept according to which cost is being calculated after the completion of the manufacturing process, the standard-cost method aims at anticipatedly establishing direct production expenses (raw materials and direct materials) and indirect production expenses (common expensens of the section and general expenses of the unit), which we hereby call standard costs or standards.

These estimated costs are deemeed normal, typical and in the same time real and they stand as standards of measure and comparison of the level of effective production costs. Any difference between the effective costs and the standard ones is deemed as an exemption from the normal (estimated, anticipated, schedules) situation, which influences the financial results of the organization.

The forecalculated cost system mainly refers to the annual antecalculation of production costs on product unity, separately for the cost of materials and separately for the processing cost, that is the production in quantitative units is monthly multiplied by the forecalculated costs on unit product, and the result should be compared to the effective costs. To simplify, the effective costs are globally calculated for the whole production and not analytically for each cost bearer. The only analytical calculation is that of forecaculated costs.

The anticipated determination of resources needed to realize the product allows the management to fastly evaluate the production, the identification of exemptions and of the corrective measures of the differences between effective and standard costs.

The typical structure of a standard-cost contains the following main calculation articles:

- Raw and direct materials;
- Direct wages (labour cost);
- Common expenses of the section (or common direction of the section) and
- General expenses of the unit (or general direction of the unit).

The first two calculation articles make up the direct standard costs, while the last article in the presented structure stands as indirect standard costs, also known as cost budgets.

Standard cost calculation stimulated the concern of European authors as to develop and to improve the calculation procedures. Such a concern resulted, in Germany, in the transfmoring of *rigid calculation of normal costs* in *rigid calculation of plan costs..*

As part of this transformation, two problems effectively contributed to the passage from normal costs to plan cost. The first is the elaboration of standard measures, respectively plan measures, for common costs. The adopted solution referred to the determination of common costs planned on proportional reference measures, determined analogically with those used, for a long time ago, as standard for the dimensioning of wages planned direct costs. It has been remarked that, in most cases, common costs are in a direct proportionnally relation with manufacturing time. Therefore, through the calculation of quotas of common costs on time unit (hours-production, hours-equipment) ponderated, in their turn, by the planned manufacturing time, the determination of common planned costs on each cost place could be achieved.

The second problem, the approach of cost calculation through the analytical methods of the science of enterprise organization and management, respectively, the admission of the fact that production cost is a function of numeruos influence factors, led to the conclusion that standard-costs calculation implies:

The specification of dependence relations of costs against the influence factors:

- the determination of standard-measures or of reference measures which to indicate the degree of influence of each factor;
- the transcription of the dependence relations of costs as liniar equations, by taking into account the degree of influence of each factor.

Also, the acceptance of the thruth according to which cost is depending on many factors has transformed cost calculation in the decisive pivot to realize the central objective of enterprise efficacy planning; under these terms, the only variant able to supply a solution proved to be plan cost calculation.

The standard cost method refers to the anticipated determination against the entry in production of products both of direct expenses and indirect ones as well, included in the production costs as forecalculation. Exemptions from standard costs should be registered as distinct costs. Through their addition or their deduction, as the case may be, the effective costs of the production obtained will be calculated upon the standard costs.

The restructuring process undergone by the enterprises in the furniture industry entails a diagnostic analysis and an objective evaluation of the a performances of the methods of cost scheduling, record and follow-up of the quality of information supplied to the decision-making factor, but also of the manner in which the decision-making factor uses the information supplied by the accounting department in general, and in the managerial accountiling specifically.

The need of the enterprises to operate with scientifically established and controllable production costs stands as a fact admitted in practice, while the calculation methods based on fore-established standards in order to calculate the costs meet the needs of the technological processes and organization structures in the enterprises from the furniture industry.

The concern to find calculation methods which to ensure the operative determination of a production cost and the establishment of ratios with enhanced information power as required by the fundamentation of decisions for the efficient management of the activity of enterprises in the furniture industry and in order to oppose the more powerful competition environment have influenced the multinational companies in this field so to evoluate throughout time towards the standard-cost method.

The standard-cost method has the advantage to allow the enterprises from the furniture industry to determinate some previsible costs, deemed as normal, which are used for the fast evaluation of the production obtained in relation to which one can operatively determinate the variations of the expenses during the production process and, therefore, the leadership by exception, the management control through the analysis of exemptions from the pre-established costs, inclusively through the determination of sub-activity costs, the separation of expenses according to their dependence in volume of production, in variable expenses, fixed expenses and mixed expenses, which allow the determination of each enterprise's rigidity degree.

The problems had in view within the method proposed to the enterprises from the furniture industry should be:

- standard cost calcultion, record and analysis of exemptions and effective cost calculation. The standard cost calculation involves the determination of maximal limits for the expenses required by the achievement of the scheduled production. Standards for direct expenses, indirect production expenses, general administrative expenses and delivery expenses should be set upon. Based on the calculated standards, budgets for indirect production expenses, administrative expenses, auxiliary activity expenses and delivery expenses should be set upon;
- the calculation of the standard cost on product will include the summing up of standard direct unitary expenses with the standard indirect expenses of the respective product. The calculation of standard costs on product should be made before the start of the management year, whereas important changes in the standard expenses should occur, the calculation made at the beginning of the year should be updated ongoingly.

The use of the standard cost submits, at an enterprise level, the following advantages:

- it ensures an operative and efficient control on costs, by offering the decision-makers, at brief intervals of time, information on exemptions from standard costs;
- it supplies the decision-makers with operative, pertinent and efficient information on the evolutions in cheapconditions of the production process;
- it stands as an efficient means to exercise preventive control on production costs;
- it enriches the material needed for cost analysis, the determination of causes that have generated the possible overfulfilment;
- it offers the possibility to take measures in order to achieve previsions and to determine and signal exemptions ongoingly;
- it considerably cuts the time for cost calculation, the activity taking place almost all the time in relation to exemptions;
- the projection and standardization of the production costs entails some changes in the work og the financial-accounting and administrative department, that is efforts concentrate during the stage before the management period.

This information help managers to evaluate if a workshop or a production process is efficient; it also shows if prices can be adjusted to face competition. During the periods of trade regress, the information shows the price on which work can be done to ensure an activity enough to cover fixed expenses.

When standard costs are settled, it is necessary to determine the performace level targeted by the said enterprise. Therefore, there are three levels to take into account, namely:

- that suggested by previous achievements. This level can be deemed satisfactory, as is easily reachible, but the management could indulge in it;
- the level to imply the highest possible efficacy. This level is not a realistic one and will invarriably lead to negative exemptions, due to the too high standards required. Exemptions can stimulate the management, but they can have frequently a discouraging effect on the personnel;

- the level made possible by leadership and efficient work. This level is satisfactory, since it's a realistic one. Any negative exemptions will provide possible ways to save. The management will realize that, through a optimal effort, standards could be met.

However, in order to achieve the purpose had in view for the superior valorification of the information used in the standard - cost method, a peculiar attention should be given to the objectives set out in the budget. The standardization of the production costs should be based on scientifically fundamented quantitative and valorical standards with technical-economical motivation. This is necessary, since exemptions of effective expenses from the standard ones, concomitently determined with the development of the production process, have a larger significance than in case of the exemptions calculated at the end of the management period, which in many cases lead to tardive decisions or as compared to the effective data considered isolately, which only shows what was achieved, but not the way of its achievement. The said exemptions necesarily involve the operative determination causes, since these are elements required by decision-adoption and future actions to revise exemptions in the achievement of the objectives set out for the improvement of activity.

The indicated weight of raw materials consumption and direct materials expenses in the total of production expenses necessarily requires the permanent follow-up of their efficient use in order to cut the cost of the products achieved and the increase on this ground of the enterprise rentability.

In this regard, the improvement of the management accounting appears necessary in terms of operative identification of the exemptions of the effective expenses from the standard ones with raw materials and direct materials comsumption, the analysis of the respective exemptions on cost centres where causes were also located and their discount in order to calculate the effective cost of the al production achieved.

These exemptions falls upon two types: exemptions from standard consumption, also known as quantity exemption or consumption and exemptions from price difference.

As regards the operative identification of quantity exemptions, these can be determined within the enterprise on cost centres, and within their limits one can divide on types of raw materials and direct materials, by using the following ways, namely:

1. During the delivery of the preventive control visa, after the drawing up of the respective documents by the organs of the scheduling during the start of production. The control visa is delivered by the preventive control department, only on those consumption documents to observe the necessary referred to in the production internal program. The respective necessary must be in keeping with standard expenses, also taking into view the necessity of the material required by the cost centre, should there be no similar materials supplied for the said production, and also if materials similar to the requested ones cannot be found in the section or cost centre where the respective product is being manufactured
2. Be it through the non-supply of already launched consumption documents. These can be used only in case that consumption tickets may be used as primary documents for the delivery of materials from the warehouse.

   According to this modality, consumption tickets are launched for all the materials necessary for the execution of the production prescribed in the internal monthly manufacturing programme. When taking over the materials from the warehouse, the head of section and the responsible of the cost center submit the delivery visa, according to necessities, for each delivery in turn, until the achievement of the planned production. Therefore, a series of consumption tickets stay unpaid, since the materials prescribed there are no more necessary to manufacture the planned production. These materials stand as economies, there favorable exemptions, and the respective tickets will be applied on a distinctive sign to signal economies. In case of consumption exceed, there will be issued additional consumption tickets, to stand as unfavorable exemptions.
3. Be it through the inventary of the pending raw materials and direct materials at the work places in the section. This modality refers to the inventory (daily or on brief intervals) of the materials at the work places within each cost centre, to be then substracted from the total of the materials issued by the respective centre, while the difference should stand as the effective consumption of materials from the same centre. This one should be compared to the standard consumption of materials for the said centre and the difference on plus should stand as surplus, then unfavorable exemptions, and on minus, economies, then favorable exemptions.

This procedure can be successfully applied on these sections and cost centres where the production process is not deprived of the inventory operation. The control is also recommended if until the end of the month the pending materials in that section were recorded on the documents of restitution.

The causes to enable such exemptions from the standard consumptions of raw materials are multiple: for example, the use of non-standardized materials or of those with different output during the manufacturing process, the use of other equipment or machinery than the standard ones, the defeciency of the equipment or tools, the failure to update standards in the same time with the change of the constructive solution of the products etc.

In the case of the second category of exemptions, therefore at raw materials, price exemptions can be calculated either according to the materials received, when the material accounting is organized at the delivery standard, or according to consummed materials when material accounting is organized at the proper said supply price.

Exemptions from the price difference at raw materials include: change of purchase prices, change of the transport fees, change of suppliers from those taken into view when elaborating the budgs etc.

The calculation and analysis of exemptions can be effectuated both concomitently with the development of the production process, according to irts evolution, and at the end of the management period, when the manner of observance of the production cost budget can be controlled post-factum.

In the first case, the analysis aims at discovering the causes that have led to the respective exemptions, so as to enable the direction to take, in keeping with these, a series of correction decisions to those previously taken.

As far as the second case is concerned, this aims at grounding and taking over certain perspective decisions based on the previsions made on production cost.

The calculation of exemptions from standard costs for raw materials is being made on cost centres and on types of materials, totally (globally) and on causes, by comparing the effective costs to the standard ones.

The application of the standard cost method in the enterprises fromthe furniture industry requires the improvement of primary documents and of their circuit, of the operating record, as well as of the automated processing data systems.

The improvement of the primary document system in order to monitor exemptions will be achieved starting with the drawing up of sheets of standard costs for each product. Standard cost sheet should contain both quantitative standards and standard prices for raw materials and the cost of labour, as well as standard direction expenses.

At the line of calculation of raw materials, the comparison of data in the consumption data referring to the materials delivered from the warehouse with the situation of the manufactured production will define the observance of the limits of the standard consumption.

Exemptions from standard costs will be covered in the reports dealing with from standard costs for materials, labour cost and direction expenses. For am easier follow-up of these exemptions the use of automated data processing appears necessary.

The follow-up of production costs through accounting in the case of standard-cost method can be organized in one of the following variants: partial standard-cost, unique standard-cost and double standard-cost. The differences between these variants mainly refer to the manner of cost reflection in the calculation costs and in the manner of calculation and record of exemptions from standard costs.

Taking into account the benefits and minuses of each of the three variants of organization of standard cost accounting, it is certain that the variant to mostly meet the needs of the enterprise's management is the unique standard cost variant.

This variant allows for the definition of exemptions from effective costs from the standard ones during the development of the production process oth on cost and order centres, as well as on calculation and cause articles, which ease the budgetary control of costs and the adoption of efficient conclusions on a management level at all the hierarchy positions.

Exemptions from standard costs for raw materials, as well as for labour cost, will be established based on primary documents as for material and labour consumption; these should be followed-up and operatively raported.

Exemptions for materials resulting from a price difference will be established during the supply or when consumpted during production. These will be recorded in the accounts opened with each calculation article and analytically described on expenses sectors (sections).

The use of primary documents to establish the exemptions of materials and cost of labours provides the possibility to inform the management about the troubles occured during the manufacturing process.

The operatively reported sums will be confronted with those periodically written in accounting. Even an additional effort is required to establish and operatively report exemptions, these effort will be balanced with the fact that the unique cost-standard method should not require a mandatory inventary of the unfinished production.

In order to obtain better results, the management of the enterprise must make decisions based on a complex, operative and accurate information. In this respect the production cost must be known as complete, precise and timely as possible.

The use of automated data processing systems as part of the concept of the standard method will result in: the ease of the circuit of primary documents, work speed acceleration, information circulation speed acceleration, reduction of the information cycle, of the time to obtain situations, all these necessary to the management; the operative, precise and complete grounding of the decision-making process at all the hierarchy levels; increase of the decision-making process and not in the least a better operativity and precision when achieving internal control.

Taking into account that a management due for an enterprise be conceived without a cost conceived as a complete system of operative internal management based on standardized costs, a few directions of cost calculation improvement in the furniture industry can be mentioned: The anticipated establishment, before the start of the management period, as a rule at the beginning of the year, of some standard costs, to stand as all the maximum admitted expenses for the obtainance of a certain production, separated on homogenous types of expenses (calculation articles and their inventory); expense places (cost centres); finished or half-finished products (the standard unitary cost).

In times of economical stability, unitary standard cost can be percieved as the only calculation of the unitary cost of finished (half-finished) products, therefore eliminating all the post-calculation works typical to absorbing methods.

Under this conception, the very center of the current work moves from the sphere of the most detailed follow-up of expenses on calculation articles and on places generating expenses, by ignoring the finished (half-finished) product that generated it. If during certain periods the effective calculation is had in view for finalization also on the units of finished (half-finished) product, this should be made starting with the calculation on expenses places that do not eliminate cost calculation on product. As a result the standard – cost method gives a new orientation to the record of the expenses of production and work analysis of production costs, therefore: post-calculation works as well as the analysis retrospective become secondary.

The follow-up and quantification of exemptions from standard costs, by delimitation

of the place of production, of the type of expense, as well as of the cause of exemption as part of the expense to which it refers. If using electronic technique, exemptions can be followed-up, at least on the level of direct expenses established starting with specific consumption for each finished or half-finished product. Under the conception of the standard-cost method, the calculation, follow-up, analysis and report of exemptions stand as the centre of cost calculation activity. This means that the identification and revision of all that ignores the pre-established program will be had in view, by taking into account that the rest of the phenomena and processes always falls within the desired limits to ensure the purpose had in view, or otherwise said, the idea of a management through excellence as a material form to apply the basic concepts of the modern management of an enterprise.

As stated by many specialists in this field, that we approve without the slightest reserve, the information supplied by the record of exemptions must be organized according to the selection (pyramid) system, therefore the causes of exemptions must be detailed accurately from the level of sections and installations, in order for their management to take operative measure, while the management of the enterprise should be supplied with synthetic information as regards the volume, structure, frequency, tendencies, the manner of behaviour of the exemptions during larger periods of time, places which generate expenses locuri etc.

The structure of expenses and the adaptation of calculation so as to meet the current demands of increase of the information potential of costs, through the elaboration of calculations based on the grouping of production expenses in direct and indirect expenses, but also their grouping according to the relation with the volume of production, fixed expenses, variabile expenses and mixed expenses. As regarda the first grouping, the structure of expenses on articles of calculation specific to enterprise in the furniture industry should be considered.

Within this second grouping, the estimation of indirect expenses should be made only after a previous comparison of their level to the volume of production, which supposes the previous update or “flexibilization” of the indirect expenses budgets, in order to bring them in the perfect comparison state in relation with the real volume of the activity. According to the recognized accounting rules, the charge of fixed production expenses on cost is based upon the need to use the normal production capacity. In order to observe the principle of non-inclusion of costs in the sub-activity cost, these expenses must directly reflect themselves in the result of the exercise.

In this context, there must be had in view the improvement of the allocation criteria of indirect expenses through the development of pluri-criteria proceeding, which should take into account the causal relation between these and the places generating expenses and cost bearers as well.

Due to the significant volume of works entailed, the effective application of the standard-cost method in the practical activity of the enterprises from the furniture industry can be made only when calling on the facilities only provided by the IT technique.

The new conception that underlines it and the advantages it has offered to the scientifical management of production has resulted in a fast dissemination and evolution of this method which has succesively took the forms of flexible calculation of standard cost (Standard cost Accounting) and flexible calculation of standard costs based on full costs etc.

The managerial decision-making oriented "Standard-cost" system is perceived as a control instrument and provides the possibility to obtain a number of basic advantages:

1. Standard consumption has a special meaning when drawing up budgets, since they stand as a means of evaluation of the activity efficacy and of ensurance of control on the cost level. In the case of existence of the respective control system, which aims at identifyng the operations that are not in keeping with the plan, managers are warned in due time in terms of the creation of unpleasant situations, which may require rectifying measures.
2. Norms (standards) contribute not only to the accumulation of information referring to effective consumption on a unit of finished product, but also to the elaboration of forecast as for future consumption, which may be used upon decision-making.
3. The application of standard consumption simplifies the accounting of the good and material stocks and of the costs of sales. All the entries in the current accounting are based on standard consumption, which may be obtained by multiplying the quantity of each type of materials, components or products from the warehouse at the respective unitary standard price of the product or material. Such a system significantly decreases the time of data collection and processing. All the more stable works the enterprise and all the highest is the level of production process standardization, the cost of labour for the record and calculation works consequently decreases.

As part of the "Standard-cost" system, practically all the management services of the enterprise need standards to be calculated not only to establish the production cost, but the cost of other expenses as well: trade, general and administrative etc. Therefore, the administration requires such standards in order to establish the predictible budgetary consumption and of the resources neede by the enterprise on the whole; the marketing service – to establish product prices, decision-making on the acceptance or refusal to fulfill a specific order; the production section – to control consumption by means of the analysis of exemptions in order to submit the report on the results of the activity and charge of responsability; accounting – in order to calculate production cost and the evaluation of stocks of goods and materials.

Generalizing those mentioned ahead, we remark the existence of two modalities of approach that can be applied to calculate standard consumption. In the first place, the record of the foregoing years are being used to evaluate the need of consumption. In the second place, standards are set out through calculation, based on a technical analysis, but it is necessary to mention that, when using the first modality, there is a danger to reflect by means of standards the previous inefficacy of production. The use of the second modality based on engineering investigations provides a much consistent follow-up of the evolution of each operation, and this allows for the clearer record of exemptions (variations), the analysis and the exercise of influence upon these.

The objective of the method is the alert of responsibilities when an anomaly occurs, which supposes the comparison of pre-established costs to the effective ones and the definition of exemptions, allowing therefore for the evaluation of internal performances of trade agents during a given period. When applying the standard-cost calculation method, accounting becomes integral part of calculation, during all its stages, with a highly active role.

Summary. The information about cost provided by the ABC method can be used for various purposes in the enterprise by the administration of the activities or ABM (Activity Based Management). The most interesting contribution of the ABC/ABM model is the horizontal dimension of the administration of the activities and, beyond that, the administration of prices. The model supplies a representation of the activities which allows an identification of the cause-effect relationships that connects the activities. The analysis of these relationships of causality allows an operational and strategic administration of the costs. The ABC accountant information provides the manager with the information he/she needs to administrate the activities and to practice the programs of leading and reducing the costs. In practice there can be multiple applications of the administration of the activities to the enterprises that develop an ABC system. In this article the most important of them were shown, which constitute contributions of the ABC method to the management of the firm.

Key-words: ABM, administration through activities, portfolio of products, the map of the activities.

The information about the cost provided by the ABC method can be used for different purposes in the enterprise by the administration of the activities or ABM (Activity Based Management). The administration of the activities aims at the assembly of actions that can be practiced by the enterprise by improving the efficiency and the efficacy of the activities and the processes by using the information related to the prices of the activities, processes, products, clients and other calculation objects, provided by the ABC calculation method. Figure 1 schematically presents the articulation of the ABC/ABM model on the one hand with a vertical model of the allocation of the cost of resources on activities and the cost of activities on calculation models and, on the other hand, with a horizontal level of administration of the activities based on the knowledge of the inductors of cost of the activities and on the dimensions of the performances in their fulfillment.

CALCULATION OBJECTS

Fig. 1 ABC/ABM Model

The most interesting contribution of the ABM/ABC model is the horizontal dimension of the administration of activities and beyond, the administration of costs. The model provides a representation of the activities, allowing an identification of the cause-effect relationships that connects the activities between them, and the analysis of these relationships of causality allows an operational and strategic administration of the costs. The ABC accountant information gives the manager the information he/she needs to administrate the activities and to practice programs of leading and reducing costs. In practice there can be multiple applications of the administration of activities in the enterprises that develop the ABC method. Further, a few of them will be presented without the details of the analysis that would exceed the object of this article.

The analysis of the profitability of the portfolio of products.

The first enterprises that acted to the calculation of the costs after the principles of the ABC method acquired a very different profitability of their product. To emphasize this, we consider the following example: The ALFA society presents the situation from table 1 regarding the production manufactured and has a classical system of cost calculation, where the assembly of the indirect expenses of the products is gathered in a single analysis center and is assigned on the products by a single work unit, respectively hour-worker (system I).

Explanation	Product A	Product B	Product C	Total
Production volume	80.000	11.000	65.000	156.000
Unitary sale price	91	95	65	-
Raw material/ unit of product	35	28	16	4.148.000
Direct labour/unit of product	16	8	12	2.148.000
Hours worker/ unit of product	2	1	1,5	265.500
Hours/unit of product	2	3	1	258.000
Total indirect expenses	-	-	-	5.253.100

Table no.1

The progressive automatization of the production process reduced the pertinence of the accountant information regarding the complete costs of the products. To consider this in the calculation of the costs, the unit of work hour-worker was replaced with the unit of work hour-machine (system II). However, the conditions of homogeneity of the costs are no longer respected in the classical calculation system of the costs from the ALFA society, where the human resources and the equipment are not consumed in the same proportion by all the products that use the services of the only analysis center. That is why, the society decided to introduce an accounting system based on activities, respectively the ABC method.

The full costs calculated by the ABC method are very different from the costs calculated in the classical accounting system, resulting from table no.2, especially as far as the B product is concerned.

Explanations	**Product A**	**Product B**	**Product C**
1.Sale price	91,00	95,00	65,00
2.Cost I (hour worker basis)	90,12	55,56	57,34
3.Net I (1-2)	0,88	39,44	7,66
4.Cost II (hour-machine basis)	91,72	97,08	48,36
5.Net II (1-4)	-0,72	-2,08	16,64
6. ABC full cost	87,84	107,61	51,35
7.Net ABC (1-6)	3,16	-12,62	13,65

Table no.2 The comparison of the full costs acquired through different accounting systems

Analyzing the data from table no. 2 we notice that at product B, the full cost and the profitableness are very different in the three ways of cost calculation. The B product seemed very profitable after the first calculation system, but it becomes inefficient if the hour-worker is replaced with the hour-machine as a single work unit, or if the ABC method is put into practice. The difference between the costs of the B product is explained by the fact that the product is not a consumer of activities to a greater extent than the working hours lapse or machine working hours, that are work units appropriate for working level activities units. The exclusive use of the single working units for assigning the indirect costs of the B product triggers the underestimation of the costs of the B product because wasting the resources in activities of a higher level than that of the unit is proportionally more important than the consumption of activities of level unit, measured by single working units. As far as the A product is concerned, the change from the classical accounting system to the ABC method modifies equally the image profitableness of the A product that, from the position of the outsider (system I) or lean (system II), becomes profitable with a differential measure of profit of 4%. Regarding the C product, the three accounting systems point that it is profitable, but the net differential measure is doubled when we pass from system I to system II or ABC system. Table no. 3 shows the variation percentage of the full cost for the three products when we gradually pass from a system to another taking as a reference point the full costs of system I, that has at its base as a working unit, the hour per worker.

Products	The hour per working system	The machine working hour	The ABC system
A Product	90,12	+1,7%	-2,5%
B Product	55,56	+74,7%	+93,7%
C Product	57,35	-15,6%	-10,4%

Table no. 3 The compared evolution of the cost of the products

The results from table no. 3 can be placed on the same line with the majority of the results published in the accounting administration literature, relatively to the impact of the introduction of the ABC method on the full costs. They can be synthesized in the following way:

- the full costs of the products manufactured in large quantities, like the A and C products, regarding the ALFA society, are easily overevaluated in the administrative accounting classical systems, but in an increasing order, that rarely exceeds 10%. So, the profitableness is easily underevaluated. After the ABC analysis, we can notice the fact that the products which do not get too much credit from the management, insufficiently profitable, have a normal profitableness percentage for the large products on the strongly competing markets;
- the full costs of the manufactured in small quantity products as the B product, for the ALFA society, are strongly underevaluated in the classical accounting system and often in an increasing order, going up to 100%, even more in some extreme cases. Their excellent seeming profitableness most often conceals a failure of the sale prices, practiced to cover the assembly of costs of batch activities and of the sustaining of the product, that are done for the production of these small quantities. The example shown emphasizes the fact that the introduction of the accounting through activities generates a different image of the contribution of the products to the profitableness of the enterprise. Regarding the ALFA society, the products can be classified based on their contribution to the profitableness, resulting from table no. 4

Products	**Unitary differential measure**	**Sold quantity**	**Total profit**	**% of the total profit**
C Product	13,65	65.000	887.250	88,6%
A Product	3,16	80.000	252.800	25,3%
B Product	-12,62	11.000	-138.820	-13,9%
TOTAL			1.001.230	

Table no. 4 The relative contribution of the products to profitableness

Table no. 4 indicates the fact that a single C product contributes with almost 90% of the total profit of the enterprise, that two products, A and C, contribute with more than 100% of the total profit (almost 115%)

and B, the third product, involves a damage of the profitableness of the enterprise. Different studies made on the profitableness criteria of the products had similar results, even striking ones. Many times, 20% of the products of the enterprise generate profit and 80% of the products, which represent only 20% of the total amount business, hardly reach the balance or are easily lean- this is the case of the B product in the given example.

The administration of the activities based on the assembly of cause-effect relationships that connects the assembly of activities will allow the evaluation of different alternative solutions that aims at improving the profitableness of the products that are not profitable for the moment. Different solutions are considered , such as: the increase of the sale price, the analysis of the product concerning the reduction of its consumption of activities that have a high cost of production, the improvement of the production process etc.

The analysis of the clients` portfolio and the marketing politics

In the last 15 years the weight of the commercialization, distribution and marketing expenses in the structure of the costs has continuously increased at many enterprises, often succeeding in representing 15% up to 20% of the total costs. These expenses cannot be taken into account in the calculation of costs to evaluate the stocks. However, it is possible for them to be ascribed to the objects of calculation, the clients or the products that consume these activities.

The commercialization, distribution and marketing activities can be the object of the same type of analysis, like the support activities of the production. There is, at the same time, a hierarchy of the costs of these activities:

- the unit level activities;
- command level activities, similar with the production lot: all the activities connected by the taking and the treatment of the order, independently of the commanded products;
- activities of level of sustaining the client: assembly of one time realized administrative activities for every client;
- activities of level of sustaining the sign: an enrolling or publicity company.

Different clients can consume these activities differently. The scheduled politics, based on the application of a different measure equable to all clients to cover the commercialization, distribution and marketing expenses, can create great distortions in the clients` contribution to the profits of the enterprise. The ABC analysis will allow the establishment of a map of the assembly of the marketing activities, of the costs, of the inductors and of the dimensions of the performance. Based on this accountant information, it will be possible to establish a classification of the enterprise's clients, based on their contribution to the profitableness of the enterprise. The first enterprises that made this analysis acquired very surprising results, where 20 % of the clients had 300% profit, 75% of the clients were in a dead point and easily in loss and 5% of the clients had significant loses.

The administration of the activities will allow the analysis of different options to try to make the profitable clients that generate important loses. The map of the activities, combined with the ABC accounting information, will allow the imaging of alternative commercialization and distributions of the products scripts, to improve the profitableness of some clients that consume more activities without paying their price.

The analysis of the relationships with the suppliers

Another application of the approach of the administration of activities is to make a detailed analysis of the assembly of activities that are involved in the supplying policy of the enterprise and in the administration of the relationships with the suppliers. The objective is no longer to reduce the acquisition price of the suppliers, but to decrease the total cost of the suppliers and of the assembly of interfacing activities, regardless of their position in the organization of the enterprise. The map of the activities allows the identification of the assembly of the activities that occur in the supplying policy and the accountings through activities indicate the cost of the resources involved in these activities. An important part of the activities of the supplying process, like the commands, the reception, the control of the quality at the entrance, the payment of the suppliers, are activities of lot level. Their taking into consideration in a classical accounting administration system, based on the percentage of the increase of the suppliers, risks to trigger important distortions in the cost of the products, as there are important differences of production volume between products.

The disposal of ABC information on the supplying activities and of the consumption for different products of the enterprise allows the management to reconsider the assembly of the supplying system, to modify and negotiate the commitments with the suppliers that would reduce the cost for the two partners, through the electronic transfer of the funds for the deliveries on time and/or the suppressing of the quality controls at the reception. The approach is to optimize the assembly of the process, by using the available accounting information about the cost of different activities that make up the supplying process.

The outlook of the new products

It presents importance the solution chosen in the moment of the conception and the developing product for the future cost of the production. The technical conception choices, the choice of the components of the product conditions more than 80% of the total production costs on the assembly of the cycle of life of the product.

Two accounting innovations, the ABC method and the "Target costing" one, made possible the control of the costs in the moment of the conception stage of the new product. The accounting information supplied by the ABC system can be used to give the engineers of conception and of the developing the new products information on the consequences of their choices, about the future production cost of the product they are just making.

The map of the activities and the suitable cost for every activity allow the engineers to compare the cost of different technical solutions that are possible in the moment of the conception of the product. The ABC analysis allows seeing that the multiplication of the different components increases the cost with the supporting activities of the production and that the referring to common marks would allow the drastic reduction of the costs of the supporting activities. A strategy of differentiation will be less expensive for the enterprise when the solution of the conception of the product aims more at the using of standard marks and the postponement, as much as possible of the personalization of the product.

Conclusions

The ABC method has two complementary orientations: one which concerns the calculation and the analysis of the costs and another one which aims it as an instrument of measuring the performances of the enterprise. The superior quality of the accounting information about the costs, acquired through the ABC method, allows making the best decisions concerning the conception and the manufacturing of the products, the externalization of some products or components, the orientation towards the client, the relationships with the suppliers, as shown above. The map of the activities supplied by the ABC method allows the redressing of the managers` attention towards the elimination of non-productive valueless activities, which leads to the diminishing of the costs of the enterprise, without a reduction of the value of the product offered to the clients. The suppressing of these activities assumes solving the problem upstream and downstream.

Also, the ABC method allows the comparison of the performance level reached by different organizational structures to accomplish an activity with an internal or external reference level of the enterprise.

Besides the shown advantages, the ABC/ABM can be the object of criticism. The main disadvantage of the ABC/ABM model is that the administration through activities doesn`t help to the increase of the competitiveness but has to be filled with the orientation to the final consumer. On the other hand, the orientation of the enterprise towards the satisfaction of the client no matter what leads to the privilege of a more external orientation of the accounting administrative system. However, this external orientation doesn`t remove the necessity of disposing the accounting information about the development of the processes and the phenomena inside the enterprise, to compare with the competition. The accounting through activities does not have as objective the supplying of an accounting information in time to sustain the current administration of the operations, but the supplying of a pertinent information in making the medium and long term strategic decision.

Another problem that the representation of the enterprise assigns as an assembly of activities and processes is that of its articulation with the structure of responsibilities that correspond most often to an organization through functions rather than through processes. In some cases, the structure of the accounting re-grouping centers through activities that ensure a relative precision of the costs does not correspond to the structure of the accounting re-grouping centers through responsibility centers. The replacement of the traditional system, based on responsibility centers, through an ABC system would risk paralyzing the administration of the enterprise because the ones to blame would not have an information on the responsibility they have.

In practice, the ABC systems, in the majority of cases, were developed simultaneously and remained independent of the traditional accounting system, even if it inspired them for part of the information that they needed. The traditional accounting system was not modified and continued to work as before. This fact maintained the articulation of the system of accounting information with the authority system and allowed the comparison with past data and assured the continuity in the analysis of the accounting information. The ABC system that works independently is used for the analysis of the costs of the cost objects, once or twice a year, and for the analysis of the strategic decision concerning the policy of the product, the decisions of externalization, etc.

In conclusion, a stage of the cost of the cost objects, calculated after the ABC principles, updated once or twice a year, can generate pertinent information to guide the making of a strategic decision.

This paper explores the idea of globalization in economy in general and its role in that process in order to develop new directions for the accounting concepts. Globalization is a reality in today's world. As globalization intensifies the need for complex financial information becomes obvious. Expanding capital markets require analysis of financial statement prepared under diverging accounting standards. Investors believe that the lack of common financial statement increases the risk of an investment and affects the free flow of world capital. A single set of accounting standards would bring great benefits to the investors and would reduce the cost of accessing capital markets around the world. The convergence of accounting standards would assure enhanced comparability, greater reporting transparency, more efficient capital markets.

Keywords: *globalization, convergence, fair value, international accounting*

The accounting evolution has always been triggered by the phenomena occurring at the level of the real economy. The economical progress has led to the evolution of the technique and the development of civilization in general. Therefore, the big scientific and technical discoveries have had an impact on the economic evolution, and all this reflected in the evolution of accounting, as subject within the information system of the economics. Even from the oldest times, a lot of initiatives have been identified relating to organizing the accounting, in countries which have managed to establish solid and stable organizations. Thus, accounting has taken shape once with the need to organize a certain evidence in Economics, evidences in Economics, and the economic evolution has always imposed and asked for a higher level information on the economic status.

The present is governed by globalization, a phenomenon that defines the global economy. The globalization effect consists in implementing international financial reporting standards across the world. By contrast more and more countries try to benefit from using cultural values and tradition of accounting.

1. The globalization phenomenon and the implications on the economical – political and accounting level

In the last part of the 20th century and in the beginning of the 21st century, a popularized and equally controversial phenomenon has marked and has had a great impact on the economies existing on the global level: namely the globalization.

The term of globalization was proposed for the first time in 1983 by Theodor Eleviu, meaning the convergence of the markets all around the world, which would operate as a sole entity. Starting from this definition, in practice and the special literature there have been issued a number of opinions on globalization.Wikipedia, the free online encyclopedia defines globalization as „a series of economic, social, technological, cultural and political changes seen as increasing interdependence, integration and interaction between people and companies in disparate locations". The International Monetary Fund defines globalization as the "growing economic interdependence of countries worldwide through increasing volume and variety of cross-border transactions in goods and services, free international capital flows, and more rapid and widespread diffusion of technology".

From an economic point o view, globalization is identified with a series of trends:

- Increase in international trade at a much faster rate than the growth in the world economy
- Increase in international flow of capital including foreign direct investment
- Development of global financial systems
- Increased role of international organizations that deal with international transactions

Supporters of globalization pretend that this process offers great benefits to the economies of the world such as raising living standards in developing countries, development of new markets and new jobs creation, removing obstacles to international flow of good and capital. Although there are also a lot of opponents, the effects of globalization on the world economy cannot be denied (Gorgan & Gorgan, 2006).

On the international level, the present phenomenon is controversial, and there a various for and against opinions. An interesting overview of the reasons in favor and against as related to globalization, is accomplished by Barna in 2003, (as quoted by Ristea et al., 2006). Presented below, for the purpose of creating a picture of the said phenomenon, we shall present a synthesis of the said arguments. The arguments in favor of globalization are:

- Globalization is a stable support of the economic growth;
- Globalization is a stable support of the global trade;
- Globalization and competitiveness are complementary;
- Globalization enables the getting of all scale advantages, the capitalization of the synergic advantages, the turning into account of the geographical advantages and of those corresponding to its own market power.

The arguments against globalization are:

- The existence of a tendency to increase the inequality of incomes, at the global level, but also inside the countries;
- Globalization causes asymmetric shocks, of the type: social break between the rich and the poor, the duality of work - unemployment, the duality: lack of power in interdependency;
- Globalization is a potential process of disappearance of the state - notion;
- Globalization, through the transnational companies has suppressed and even eliminated some of the national markets.

The strong and weak points as previously present are capable to enhance the significance of this phenomenon in the contemporary period and the implication exercised by the latter within the most different areas: the environment, technologies, culture and communications, economy etc. Globalization in the economical field has also implications on the accounting level, a fact which triggers the following questions: which is the trend to be followed by the accounting in the future? (Calu, 2005).

The international accounting standards (financial reporting) and the European accounting directives, are results of the efforts made by the representatives of various countries for the purpose of attenuating those differences caused by the specific character of the application of the several national accounting regulations. Yet, the common view on the drawing up of the financial standings is a desideratum of all those involved in the process of the supply and demand of accounting information. From a linear perspective, an approach of accounting from the point of view of the globalization phenomenon generates a reply which seems to be unequivocal: the implications on the accounting level of the phenomenon of the economic globalization are represented by the process of implementation of the international standards for the financial reporting on the global level.

2. The analysis of accounting concepts evolution

Identifying and analyzing the relationships between economical and political mutation across history and the accounting evolution have been a permanent concern for researchers in the last decades. Most of them conclude that the economic development was the factor that propelled the accounting evolution (Collase, 1995, Richard, 1996, Dobroțeanu, 2005). The specific of every historical age (the Antiquity, the Middle Ages and Modern Times) has determined the appearance of accounting mutation, the appearance or disappearance of some concepts.

The historiographic researches reveal the fact that in Antiquity there were a lot of accounting notes, which were present in a primitive form, especially at old peoples having an ancient civilization and economy. From this particular period, there is information from the field of public accounting (the state role), agricultural accounting and bank accounting. In the period of Middle Eve there begins the systematization of notes, an accounting technique is shaped and even a theory elaboration is tried by some. Thus, „In may Italian cities there has been used, even from the 13th century, the single – entry bookkeeping, and in the other cities, the double – entry bookkeeping" (C. G. Demetrescu, 1972, as quoted by Calu, 2005). The first published work presenting the „Venetian art" of the double – entry bookkeeping is the Accounting Treaty of Luca Paciolo (Pacioli), as included in Summa de arithmetica, geometria, proportioni et proportionalità. The latter has appeared in 1494. But the double – entry bookkeeping system shall be generalized, in West European Countries, as of the second half of the 19th century, due to various causes such as: the increase of competition, the increase of the administrators' information needs, as well as of the new model capacity to calculate the outcomes of the activities and not just the monetary overplus. As related to the evolution in this particular period, Stevelinck (as quoted by Dobroțeanu, 2005) believes that „the phase of the commercial capitalism has inserted in the accounting the patrimony – related concepts and that of the protection of wealth with the help of the accounting books, be the latter either public or secret, the agent accounting, but also the concept of an artificial person, a concept which has imposed itself within the subsequent stage, that of the industrial capitalism, each of the aforementioned phases requiring more and more complex accounting techniques". The analysis of accounting in the period of the corporatist capitalism (after the years 20-30 of the 20th century) should be done within the existing economic, social and political context. From the accounting point of view, this period is mainly marked by: all the initiatives existing on the global level, for the purpose of creating a plan of accounts (in the West Countries), respectively all the initiatives relating to the improvement of the financial communication, given the fact that, „the 1929 crisis has made the public aware of the lack of any accounting information" (A. Naciri,1986, as quoted by N. Feleagă, 1995). At the same time, the concept of „true and fair view" has been introduced; more precisely this concept has replaced the previously existing one, namely, „true and correct view".

Although from a historical point of view, *cash accounting* preceded the *accrual accounting*, nowadays only a few small economic entities from developing countries use the cash accounting. On the other hand the accrual accounting is used by most world businesses. Even if some speclialists support the confidence offered by cash accounting (they know exactly when pays occurred), developing financial statements useful in making decision canot be done without accrual accounting. The IASB conceptual framework states that "in order to reach their objectives, the financial statements must be prepared on an accrual basis".

Within the context of the remarkable development of economy, accounting specialists face a dilema as related to assessment in accounting: is the classic model of the historical cost still adequate for the display of the reality within the financial standings or does the model of the fair value have to be enforced?

It is indeed true that accounting based on *historical costs* is one oriented towards the past, which it describes through the distinction between flow and stock (profit and loss account – balance sheet). The historical cost presents, as compared to other bases of assessment, a series of advantages but a large number of limits as well. The main advantage as related to the other bases of assessment is given by its fiability (credibility). Using this basis of assessment enables the offering of objective and checkable information. But during the periods of inflation and deflation, the use of the historical cost is harsly criticized, leading to a series of deformations in the financial standings. The limits of the historical cost are also represented by the its approximate and subjective estimations, especially when it is about the assets depreciation, which estimates are strongly influenced by the interests of those drawing up the financial standings.

For a couple of years, certain courts for accounting normalization (FASB, IASB etc) have consecrated the practice of the fair value in an extensive way, which tends to cover all the balance sheet assets, starting with the financial instruments, investments in real estate assets and ending with the agricultural products (Ionaşcu, 2003). The American standard no. 157 Fair Value Measurements, issued by the Financial Accounting Standards Board (FASB) on September 15, 2006 provides enhanced guidance for estimating the fair values of assets and liabilities reported in financial statements. The supporters of *the fair value* bring arguments to the fact that the latter represents a highly superior basis for assessment from the economic point of view than the historical cost. Most of the times, the fair value is not checkable, is not exact, is not faithful and moreover, there is the risk to be misrepresented through subjectivity" (Ristea & Dumitru, as quoted by Lapteş).

The conclusion is that the economical and political evolution influenced the accounting and concepts development. If at the beginning of the Middle Agea cahs accounting was appropriate, the development of commerce and banking, the industrial revolution, the transition towards an economy based on services have lead to the need of using accrual accounting. Having analyzed the relation between advantages - inconveniencies we may clearly find the supremacy of advantages. It is obvious and without any doubt that the investors represent the users, if not the main ones, at least the ones appointed as those who need to be privileged, as related to the requirements and the offer of financial information. In this respect, they wish to get informed based on the fair value. Nevertheless, the near future won't bring the abandon of historical cost. In other words, we are heading towards *a mixed model* of balance sheet assessment: the fair value for the negotiable assets and liabilities, respectively the historical cost for the rest of the elements. The future of the fair value needs to be mainly searched in the construction of the consolidated financial standings and not as a singular model for assessment, that replaces the historical cost, but more as a solution for the adjustment of the historical cost, considered by the European Accounting Directives as being the fundamental basis for assessment (Lapteş, 2007).

3. The globalization effects over accounting environment

It is clear that nowadays the entire world is affected by *globalization.* Under these circumstances, attention has been paid to the need for the *international harmonization* of the accounting practices. Harmonization stands for the agreement between the national, the European and the International in accounting, by limiting the variations between the accounting systems. This term is especially used as related to the agreement upon the accounting regulations from the European Union member states, through the European Accounting Directives. Harmonization is a process for the increase of the compatibility of accounting practices through delimiting a degree of variations. On the European level, for the purpose of harmonization of the accounting, the European Directives have been gradually adopted by the European Union member states (Ristea et al., 2006). Moreover, the European Commission with the hope to improve transparency, comparability and quality of the financial standings, has approved the international accounting standards, which are applied for the financial years as of January the 1st 2005, this way compelling all the companies quoted on the European markets, to present their consolidated financial standings in accordance with the said standards. Such an action determines the parallel use in the European Union countries of two sets of accounting standards: both the international and the national ones. The accounting directives shall remain the basic accounting legislation for those companies which are not quoted and shall continue to regulate those fields which are not covered by the IFRS standards.

Through the decision taken by the European Union, which decision has been followed by various similar methods in Russia, Australia and the New Zeeland, the trust in the international accounting standards has increased, just as their role as standards for the global economy also increased. The tendency to create a common language in which the financial standings of the companies from many countries of the world should be presented, has also manifested through the signing of an agreement regarding *the convergence* between IAS/IFRS and US GAAP in 2002 between The council for the international accounting standards-IASB and The council for the financial reporting standards-FASB. Within the said agreement, both signatories have undertaken to make best use of their efforts in order to: make it possible for the already existing financial reporting standards to be fully compatible as soon as possible and to coordinate their future working schedules, so that once obtained, the compatibility shall be maintained.

Not all the countries walk at the same pace and with the same speed on the road of the convergence with the international accounting reference. The national accounting standards of the countries with a slower pace usually cover less problems that the international accounting standards (Ding, Jeanjean, Stolowy, 2005).

CONCLUSIONS

The globalization, the harmonization and the international accounting convergence stand for the phenomena which tend to be more and more present at the level of the entire world. The application of the international accounting standards has become a necessity in order to ensure the quality of the accounting information. However, many of the world’s countries are at present trying to maintain thei domestic identity, through the capitalization of the latter’s cultural values and of the tradition as related to accounting. This thing can especially be noticed at the level of the individual accounts of the national companies, which apply their own national standards, the latter being the result of the legal, economic, social and cultural particularities.The international harmonization, followed by the international convergence are significant factors for the development of various new directors regarding the accounting concepts.

For as long as the globalization phenomenon shall remain a reality, the tendency in accounting shall be represented by the implementation of the international standards for financial reporting (IFRS), doubled by the reconciliation, through the accounting convergence, between the opinion as expressed within the American standards for financial reporting as issued by FASB and the IFRS’s. Just the implementation of the international accounting standards does not automatically stand for the amelioration of the national accounting system, if at the same time there are no deep changes occurring as related to the policies of economic development, the mechanisms of corporative governance and the operation of the financial market (Ding, Hope, Jeanjean and Stolowy, 2007).

Abstract: IFRS 3 describes and defines the accounting treatment for the Business Combination, so- called method "purchase method" that imposes the purchase price allocation to the assets and the liabilities identifiable by the society that makes the acquisitions object and the accounting of the operations that take place. Business combination means a fusion of distinct societies that are in one economic unity or derived from the fusion of one company with another one, either by obtaining the control over the net assets and over the administration of a company. This standard defines "business" as a whole system of tangible, intangible and financial assets involved in the development of an economic activity; if a company acquires a set of assets or even another entity, but it does not respect the definition of "business", the transaction cannot be accounted as a Business Combination.

Keywords: International Financial Reporting Standard 3(IFRS 3), business combination," purchase method", fair value

According to the international conceptual frame, a reporting entity is represented by „companies for which there are certain users defined that rely on the financial statements as an important source of financial information for them." Practically, a group of companies consists of bringing together separate units or businesses, in one reporting unit. The objective of the IFRS 3 standard is to obtain a superior quality and unification on an international level of the accounting of the groups companies' trying to focus in the same time on the analysis of the following main issues:

- the accounting method used by the groups of companies;
- the initial assessment of the identifiable assets.

Within the contemporary economy we can notice a phenomenon of development and flowering of many groups of societies that have sometimes one fixed purpose or other times, multiple and diverse objectives. The consequence of this phenomenon is that in the modern society, there is no activity sector of activity where there are not present multinational groups with a world or even globalization attempt. In order to accomplish the development strategies, these societies create a real network of multilateral relationships, that vary from the most simple to the more complex ones, from the most profound to the most superficial, their organizational chart being, most of the times, not intelligible or even to difficult to read by a beginner.The groups of societies omnipresent in all the sectors of activity have imposed themselves as an economic reality hard to neglect, although from a juridical point of view they are not considered to be a juridical reality. The entity groups manifest as an economic entity formed by a group of societies, each having its own juridical personality, brought together by different connections, in virtue of which one of them holds the unity of the decision and has an influence or a control over the others, determining them; so to say the decision unity of the determination society can manifest only if there is a relation of dependency of the other societies towards this one. So this difference can be: a financial difference- as a consequence of the majority of the voting rights in the General Assembly, the majority obtained directly by owning more than 50% of the voting rights, or indirectly through one or more societies having the right to control over another one; the directorial dependency of having the majority of the persons in the management level; the contractual dependency- as a consequence, either of renting together with a society an exclusivity contract or the designation of the administrators, or as a consequence of some statutory clauses; the economic dependency – resulted from the detaining of a group of the monopole of the activity.

The specific forms of the group of companies are:

- *the holding* – society that either has as jointures the majority of the assets or of the social parts of some or more societies; either is controlling the composition of the administration council of other societies;
- *the trust*- is a legislative creation of the English and American Law and designates an independent patrimony affected to one interest. The number of founders and of the beneficiaries of the trust is unlimited. According to the existing regulations, the trust can be used in various domains, but especially for the organization of the interests and of the groups in already made collectivities. As far as the connection between the trust and the group of societies if concerned, on one hand, the group of societies is not formed always for a monopoly interest, and on the other hand the idea of monopoly is opposed to the free and loyal competition encouraged and protected by the legislation and the contemporary doctrine;
- *the industry group* – is a concept introduced by the European economists and legal advisers, which, unlike the trust, which is founded on the idea of monopoly, if based on the idea of productivity. The industrial groups have been created for the purpose of reaching the maximum productivity, with the purpose of stimulating the competitors, opposed to the trust;
- *the concern*- is a variant of the industrial group, being regulated since 1973, being also completed with a part that regulates the subordinated societies and define the concern as being one of the group of societies quoted grouped under the unique direction of a dominant society. The society subordinated is the society that is juridical independent, found in subordination to another dominant company that can exert a direct or indirect influence. The difference from the group of societies lies in the nature of the domination relation that can appear and from a contract existing between the two companies, that has clauses in this sense, by which the dominant society is authorized to give directives to the dominant society and to make the group interest manifest;
- *the group of economic interests*- is a notion of French origin, but which has been adopted by all the community countries. The idea on which the constitution of these groups lies is that to allow the members to develop common actions and to face competition, respecting the independence of each of them;
- *the joint ventures group* – is one of the oldest forms of groups and it is based on a contract of association of the societies. It has no juridical personality; but it is a reality in fact. This type of group is made on the free consent expressed voluntarily, in a written interest, the purpose of the group being to obtain and share benefits. In order to reflect the nature of the control, it is necessary to calculate the percentage of control held by the dominant society, taking into account the dependency connection between the dominant society and the rest of the societies; that is the voting rights detained. This connection of power must not be mistaken for the financial dependency power, which results from the detaining of a part of the equity ownership of the 12511251society, dependency which is measured with the help of another instrument named interest percentage.

The control percentage - is calculated by summing up all the voting rights held directly or indirectly through a society placed under the exclusive control of the dominant society.

The interest percentage - taking into account the practical existence of different types of actions, we can found out that between owning a fraction of the capital and the rights that are attached there might exist a gap. While obtaining a right to vote reflects the exertion of a power, holding a share as a part of an equity ownership reflects the financial implication of a society in the high society. The financial implication is measured with the help of the interest percentage, calculated by multiplying the parties held directly with those detained indirectly in the equity of one society, gathered on each branch. The utility of the interest percentage results from the fact that it allows the calculation of the rights of the society that belong to the whole to assemble, for the distribution of the equity ownership and of the result between the interests of the group and the interests of those outside the group.

A lot of economic operations take place within the context of a group structure that includes companies and entities that interrelate one with the other. The general frame IFRS for the approach of the equity ownership and of other investments in custody accounts are presented as follows:

Accounting approach of various acquisitions of custody account

Joint percentages according to IFRS 3 are as follows:

Under 20% - they are evaluated at their just value according to IAS 39;

- between 20-50% they are evaluated by the method of putting in equivalence according to IAS 28;
- over 50% - consolidation and business combination according to IAS 27;
- Others – joint association's business combinations evaluated according to IFRS 3.

The aspects taken into account in the IFRS 3 standard refer to:

- accounting treatment at the date of the acquisition;
- for all the business combination, it is accounted by applying the method of the acquisition;
- the initial assessment of the acquired assets and of the liabilities, including the contingent ones, assumed, identifiable in a company at the just value;
- recognition of the liabilities for the closure or reduction of activities;
- the accounting for the goodwill and of the intangible assets acquired in a business combination;

In the same time, this standard does not apply in the following cases:

- the business combination that imply entities that are under common control;
- business combination that imply two or more mutual entities;
- business combination that have been gathered in order to build an entity that reports just in one contract without obtaining an interest in jointure;

The accounting treatment applied by the IFRS 3 standard stipulates the identification of the acquiring part in any business combination that is under its incidence; the acquiring part is that part that obtains the control over the other entities within the business combination. The acquisition must be accounted using the acquisition method. Since the date of the acquisition the acquiring part must integrate into the profit and loss account the results of the acquired entity's activities and to recognize the assets in the balance sheet, the liabilities and the contingent identifiable liabilities of the acquired entity as well as the goodwill generated by the acquisitions. Applying this method involves taking the following steps: identification of the acquiring part; evaluation of the cost of acquisition; allocation at the date of acquisition of the combination cost on acquired assets and liabilities, including assumed contingents.The acquisition cost supported by the acquiring part represents the sum of the just value of the transferred assets, of the liabilities taken and of the instruments of shareholders' equity issued by the acquiring part, in exchange of the control over the entity acquired, at the date of the transaction. This includes the costs that can be direct, but not the professional fees or the emission costs of the shareholders' equity investments or liabilities used for the payment of the obligations.

The assets, the liabilities and the identifiable contingent liabilities that have been acquired must be the ones belonging to the acquired entity and that existed at the date of the acquisition. The intangible assets must be recognized as acquired assets in the case which they correspond to the definition of the intangible asset according to the IAS 38. In the case which, for the accounting of a business combination, the values can be determined only provisory, the acquiring part must account the combination using the respective provisory values. The acquiring part must recognize the adjustments of the provisory values as a result of finalization of the initial accounting in term of one year from the date of the acquisition. The assets, the liabilities and the identifiable contingent liabilities that have been acquired must be evaluated at the just value of the assets and identifiable liabilities are described as goodwill and are recognized as asset. The goodwill is annually tested through depreciation and it is not amortized.

The positive difference between the interest of the acquiring part from the just value of the assets and the acquired identifiable liabilities and the cost of acquisition represents an earning and it is recognized in the profit and loss account. This difference is not recognized in the balance sheet as negative goodwill. However, before recognizing any earning, the acquiring part must reassess the cost of the acquisition and the just values allocated to the assets, the identifiable contingent liabilities belonging to the acquired entity. By acquiring significant package of shares we can notice the fact that a society can acquire control over the other societies by forming groups of societies, but also between independent entities there could be developed operations of gathering for the formation of groups of societies.

Within the contemporary economy we can notice a phenomenon of development and flowering of many groups of societies that have sometimes one fixed purpose or other times, multiple and diverse objectives. The consequence of this phenomenon is that in the modern society, there is no activity sector of activity where there are not present multinational groups with a world or even globalization attempt. In order to accomplish the development strategies, these societies create a real network of multilateral relationships, that vary from the most simple to the more complex ones, from the most profound to the most superficial, their organizational chart being, most of the times, not intelligible or even to difficult to read by a beginner. The groups of societies omnipresent in all the sectors of activity have imposed themselves as an economic reality hard to neglect, although from a juridical point of view they are not considered to be a juridical reality. The entity groups manifest as an economic entity formed by a group of societies, each having its own juridical personality, brought together by different connections, in virtue of which one of them holds the unity of the decision and has an influence or a control over the others, determining them; so to say the decision unity of the determination society can manifest only if there is a relation of dependency of the other societies towards this one.

So this difference can be: a financial difference- as a consequence of the majority of the voting rights in the General Assembly, the majority obtained directly by owning more than 50% of the voting rights, or indirectly through one or more societies having the right to control over another one; the directorial dependency of having the majority of the persons in the management level; the contractual dependency- as a consequence, either of renting together with a society an exclusivity contract or the designation of the administrators, or as a consequence of some statutory clauses; the economic dependency – resulted from the detaining of a group of the monopole of the activity.

Conclusions:

If an entity wants to obtain the control over a net asset (Net asset = Total assets - liabilities) belonging to another entity, there are a series of modalities through which we can accomplish this control from the juridical point of view, fusion, consolidation, offer. Through an acquisition of net assets, part of the assets and liabilities of an entity are directly acquisitioned by another entity or through the acquisition of participation to the equity ownership, an entity mother acquires the control over 50 % of the ordinary shares with right to vote of another entity. Both entities can continue exist as separate juridical entities, each one producing an independent set of financial statements, or they can fusion in a certain way. The interest percentage is different from the control percentage – the first represents the part that goes to the society mother, directly and indirectly from the equity ownership of the controlled society, obtaining them through the multiplication of the interest percentages held directly or indirectly on each branch that finally are gathered. The interest percentage lowers as there are more societies in the chain of participation. The just value of the long term debt taken from a combination of companies is the value up dated of the equity ownership and the interest on the period left until the settling day, the updating being made at the current rate of interest existing on the market. The acquisition cost of the long term acquisition is compared to the just value of the assets, the liabilities, the contingent liabilities of the entity acquired, and the positive difference is recognized as goodwill. If the just value of market of the assets, of the liabilities and contingent liabilities of the entity acquired is bigger than the cost of acquisition, IFRS 3 foresees that the positive difference should be reported as earning.

Abstract: The idea of providing financial balance that would lead to long-term, sustainable development of the companies gathers more and more ground in economy. A state of financial balance means a company is capable of conducting its business effectively and in normal conditions. „Normal conditions" mean the company conducts its activities according to its productive potential without employing any uncontrolled and unplanned for capital infusions. In our opinion "effectiveness" means establishing a relationship with the external and internal sphere (internal conditions of practice) of the company through the products and services it offers, a relationship which could lead to the possibility of reproduction on an enlarged scale, while shareholders, staff, managers and all the other factors participating to the production process can be adequately remunerated. We claim there is a close relationship between financial balance, costs and results which managed properly will provide investors the benefits they planned for.

Key words: company, costs, cost calculation, effectiveness

1. Introduction

Within a market economy economic units have to fulfill consumers' needs as effectively as possible. However the latter cannot decide by themselves what goods and services are needed on the market, because there are two great restraining factors at work: economic resources and existing technology. Thus economic units and consumers are at the center of the market economy system and once there is a balance between demand and supply they solve the three great economic problems: what is being produced, how it is being produced and for whom is being produced.

Since economic resources are limited and an economic unit needs to consume some resources in order to produce goods and supply services to its clients these expenditures generate expenses which as a whole make up **costs**. First the economic unit has to have some resources in money or in some other assets, then it has to ensure these resources are used as effectively as possible so that the finite products and services can be sold on the market at a higher price than the cost of their production. Therefore **production costs** are one of the main issues the management of economic units should be concerned with. In our opinion it is a mistake to take into consideration only the level of expenses and to say that the amount of expenses is adequate and therefore the activity of the company is effective, since costs and cost analysis has to be related to the gains the company has, i.e. to the profit.

In the theory of economics there have been two main principles regarding the objective of the financial function of an economic unit: *maximization of profit* and respectively, *maximization of the economic unit's value*. The former objective has been formulated by the neoclassical school. They considered the objective to be fulfilled when the volume of production in an economic unit reached a level where the enterprise's marginal income and marginal cost was equal. However this objective is impossible to reach in a competitive economy and the objective also fails to take into account market requirements and the uncertainties and risks present in the economic and social life. Considering all these today it is an accepted fact that *maximization of the economic unit's value* should be the fundamental objective of the financial function of an economic unit. Obviously reaching this objective is closely linked to making a profit, an indicator of the dimensions of the economic effectiveness of the company which adds to the value of the company. *"Setting the maximization of the economic unit's value as an objective has as a consequence the fact that the company is evaluated according to its ability to make a profit in the long-term, according to* *the perspectives for progress in its activity and according to its ability to diminish incorporated financial risks." (Mironiuc M., 1999).*

In market economy costs are dealt with inverse to the way they are treated in centralized economy. In a centralized economy costs define and justify the selling price. In market economy the price is the one defining the costs (Ghiță M., 2000). The selling price is set by the correlation between demand and supply and no economic unit will produce a certain type of good unless production costs for that good are less than its price in order to make a profit. Moreover, in our opinion the difference between costs and the selling price has to be such as to provide the minimum return expected by the investors who invested capital in the company. Indeed, it is important what the market the company tries to sell its goods on is like. Price for a good is formed in a different way on a market with many producers and buyers and on a monopoly market. Still in a functional market economy there is a great competition between producers, the market is very active and thus price becomes a variable which can be little controlled by the companies. Therefore follow up and control of production costs becomes a major concern of the management of any economic unit, since cost is the only factor the company can influence so that it would be diminished and thus the economic effectiveness of the company increased.

Having a proper knowledge of the production costs and expenses, including the relationship of these two is therefore a vital information for the management of the companies in their attempts to increase their economic effectiveness.

2. Definition and classification criteria of costs

Production cost is the main indicator of a company reflecting the activity of a productive economic unit and its economic effectiveness. Etymologically the concept of **cost** comes from Latin, from the verb *constare* meaning to determine, to define. From this verb the term *costa* was derived, which was used to name the expenditure rendered necessary by the production of an object. Later this term was derived into the term *cost*, used with the same meaning ever since in the literature and practice of economy.

The Romanian Thesaurus defines costs as „a sum of money spent to produce or purchase a good, to carry out of a work or to have a service supplied". Another work defines costs as „a sum generally expressed in money of the expenses needed to acquire or produce a good or to supply a service” (Bernard Y, Colli J.C., 1994).

According to other specialists „costs are the expression in money of the effort a company has to make in order to reach its objectives (Glautier M., Underdown B., 2001). The main features of the concept of „costs” are (Ristea M., Possler L., Ebbeken K., 2000):

- Resource consumption – costs are created as a result of the consuming of the factors of production;
- Links to achievement – these are the cost-bearing goods obtained or services supplied intended for sale or internal consumption;
- Evaluation expressed in money – both resources consumed and achievements are expressed in monetary units.

In our opinion costs means all the production expenses a company has by consuming limited resources in order to produce goods and services usually intended for sale on the market. Consuming of unlimited resources (e.g. air) is not included in the production costs, since despite of the fact that they have a great inherent value, they do not have any economic value.

Information regarding „costs” is indispensable to the management of the company in order to ground well their decisions. As all the other pieces of information regarding accounting information regarding „costs” has to have the following features in order to be useful; it has to be:

- *relevant* – a piece of information is relevant when it influences the economic decisions of those who use the piece of information helping them to evaluate past, present and future events and to confirm and correct their former evaluations. A piece of information has both a retrospective and a predictive value. It is retrospective by the analysis of the differences between real and predicted costs and the actions taken by following up on that information. It is also predictive, since production can be obtained using many variants in combining the factors of production to be consumed. Thus any avoidable cost is relevant. Any costs included in one variant of the manager's decision and missing (completely or in part) from another is considered an avoidable cost. Costs already had, which cannot be altered no matter what decision variant the manager decides to follow are not avoidable costs. As far as future events are concerned these costs are irrelevant, which means these costs have to be eliminated from the process of decision making leaving us only with avoidable costs also called *differential costs*;

- *credible* – it means pieces of information on costs should not contain major errors and the person who uses them should trust them;
- *intelligible* – this can be excluded, since it is assumed the pieces of information regarding costs are addressed to managers who have sufficient knowledge to understand them;
- *comparable* – this feature is valid mainly in the case of the analysis of the difference between real and predicted costs.

As in the case of production expenses we are going to present a few classification criteria of costs in order to make the reader understand better the importance and the place of information regarding costs within the process of decision making (Ionaşcu I., 2003):

According to the time and goal of their calculation:

- Real or actual costs – defined on the basis of real production expenses;
- Pre-established or pre-calculated costs – defined on the basis of estimated expenses.

According to the content and economic features of the calculated cost type:

- Complete (integral) costs – defined on the basis of capital expenses registered in the financial accounting; sometimes a distinction is made between traditional complete costs and economic complete costs;
- Partial (proportional) complete costs – formed out of expenses that can be directly attached to the produced goods or the supplied services; these partial costs have two forms of manifestation: variable costs and direct costs.

According to their influence in the process of decision making:

- Pertinent costs – meaning future costs which can still be decided upon and which are used as alternatives in the decision making process, i.e. avoidable costs;
- Indifferent costs – costs already had which can no longer be decided upon and which can no longer be used in the decision making process.

According to the level of the analysis:

- Unit cost – reflecting all the production expenses for a product unit;
- Global costs – containing all production costs for the entire quantity of manufactured products.

According to the extent the management can influence costs (Epuran M., Băbăiță V., Grosu C., 1999):

- Reversible costs and irreversible costs – the costs become irreversible when the manager can no longer withdraw his decision to have that cost;
- Controllable and imposed costs – in case of the controllable costs the manager can fully decide whether to have it or not, imposed costs are imposed by external factors;
- Fixed costs and variable costs – a cost is considered fixed if the cost and the production are interdependent with each other and variable if not;
- Visible costs and hidden costs – hidden costs are expenses of the company which are usually accounted, but cannot be singled out and identified as costs (e.g.: employees failing to come to work, work accidents, quality defects, etc.);
- Internal costs and external costs – external costs are costs the company transfers to third parties (depolution costs paid for by the community, but produced by the company), while internal costs are made up of production expenses necessary to the company activity.

So decision making capacity is limited in the case of internal costs and controllable costs, and is less restricted in the case of visible, reversible and fixed costs. Since competition is getting ever harsher the companies have to pay more attention to the quality of the products they manufacture in order to increase their economic effectiveness. Thus every productive company has to follow closely the relationship between *quality and economic effectiveness*, which means manufacturing increasingly competitive products at prices accepted by the market, while expenses are kept lower and lower in order that the targeted economic effectiveness can be reached. The quality level of the product determines its costs and price, thus there is a close relationship between costs and price which helps define the extent to which increase in value produced by the increase in quality justifies higher costs. In this respect the relationship between the effort invested in obtaining quality (costs of quality) and the results achieved (economic influence of quality) has to be closely watched in order to find an optimal ratio both for producers and consumers. In principle economic literature divides quality related costs into four categories:

- Costs of prevention – costs of studying, preventing and reducing defects;
- Costs of evaluation – costs of attempts, inspections and examinations intended to establish if specified requirements are being met;
- Costs of internal damages – costs for correction of unconformities detected before the product is shipped to the beneficiary;
- Costs of external damages - costs for correction of unconformities detected after the product is shipped to the beneficiary.

In our opinion the accounting system has to provide information also regarding quality costs, since excepting the case of discarded goods most of the economic units do not care about the costs implied by repairs, by customer complaints, by visits made in order to investigate the complaints etc. The ISO 8402 standard defines total quality management as "a management system of an organization focused on quality, based on the participation of all its members and a tool in providing long-term progress by satisfying the customer and obtaining advantages for all the members of the organization and society."

3. Opinions and conclusions regarding cost calculation considered from both the point of view of the provisions of accounting regulations and of the need for information of the companies

The financial management of an economic unit paid close attention to production costs in order to establish a starting point in negotiations for the selling price and in revealing the effectiveness of the economic unit. It can be said that the company gains a profit if production costs are lower than the negotiated transaction price. However this does not naturally mean it is profitable, too, since there are certain expenses that, according to standards of accounting, are not part of the production costs.

In principle, production costs contain all the expenses necessary for the company to manufacture a product, carry out a work or supply a service. At first sight everything seems simple, but still within a company there are certain expenses that are not at all connected to the manufacturing of a product (e.g. fines and penalties). Put it in another way we could say production costs have to contain all expenses necessary for manufacturing a product and being directly or indirectly connected to the manufactured product.

According to the international accounting standards (IAS 2 „Reserves") adopted also by Romania, „reserve costs contain all costs necessary for the acquisition and processing and other costs had in order to bring reserves in the form and place they are at present".

Acquisition costs of reserves contain purchase price, transportation and handling fees, taxes and other non-recoverable costs. Processing costs contain the following:

a) Direct costs;
b) Indirect production costs detailed as:

- Fixed expenses: indirect expenses which stay relatively the same regardless of the volume of the production. These kind of expenses can be as follows:

1. Assigned expenses, which contain the part of fixed expenses proportional with the production capacity actually used by the company; Assigned fixed expenses are included in production costs;
2. Unassigned expenses, which contain the part of fixed expenses brought forward by not using the production capacity at hand of the company at the usual parameters. Assigned fixed

expenses are not included in production costs and they are considered as an expense within the financial year and are offset directly from the income statement.

- Variable expenses: production expenses altering proportionally or nearly proportionally with the volume of the production.

Within the production costs the following items are included: acquisition costs of raw materials and resources used in obtaining the products, direct expenses of processing, assigned fixed expenses and variable expenses. Therefore, in principle, production costs do not contain: unassigned fixed expenses, general management expense and sale expenses. This means expenses which are offset directly from the income statement have to be covered first from the margin resulting from the difference between selling price and production costs and only then can the amount remaining be considered the profit of the company.

In order to meet the provisions of accounting regulations (as a consequence of the standardization of the accounting information produced by financial accountancy) and also to the internal needs of the company management we believe it is necessary to build up a cost calculation and result establishment system based on the following principles:

- Production cost calculation according to existing accounting standards;
- According to accounting standards general management expenses and sales expenses are offset directly from the income statement, but in case the management needs the pieces of information for internal purposes these can be allocated to goods produced by the company (general management expenses and sales expenses are offset directly from the income statement, but the income statement is formed when the company goes out on the market, when its products are being sold and not when the products are manufactured, which means general management expenses will be offset from the income statement only after the products which have attached some general management expenses have been sold);
- A proportionate sum of the general management expenses and sales expenses will be subtracted from the “margin” resulting from the difference between the selling price and the production cost and thus we obtain the result for each product. Then we eliminate from the calculation unproductive expenses (unassigned fixed expenses, fines, penalties, etc.), since these need to be analyzed separately.

In this context, we started out from the following hypotheses in order to demonstrate the algorithm presented above:

- Let us suppose a company produces products A and B and they are registered within financial accounting at the delivery price, distinctly highlighting the differences of price compared to the actual production cost calculated according to the IFRS;
- Sales expenses and general management expenses will not be included in the production costs, but for internal need of information two levels of defining the income statement will be established:

1. *At the first level* a „gross margin” as a difference between the delivery price and the production costs, calculated according to the IFRS is calculated;
2. *At the second level* a result for one product unit taking into consideration general management expenses and sales expenses for each product unit is established;

The basic rule is to connect expenses with income thus an actual result per product unit being established. Thus delivery expenses made in month "X" will be referring to products sold in that month (delivery expenses usually come up at the same time products are delivered and this fact justifies such an approach; however if delivery expenses are created after selling, they will no longer be registered as referring to the respective products). General management expenses made in month “X” will be considered for the month the respective products have been sold in. Thus two accounts are created:

- **The account of products made in month „X”**, by which the production costs are calculated, according to the IFRS;

The account of products sold in month „X”, by which the gross result for a product unit is obtained by deducing production costs (production costs referring to the sold products are taken over from the first category that has already been drawn up), general management expenses and sales expenses referring to the sold products from the selling price.

Accounts drawn up based on our example are as follows:

1. Account of products made in month X:

Serial number	Product	Produced quantity (kg)	Production cost per product unit (lei/kg)	Production costs (lei)	General management expenses (lei)	Total costs (lei)
0	**1**	**2**	**3**	**4 = 2 *x* 3**	**5**	**6 = 4+ 5**
1.	Product A	100	14	1.400	28	1.428
2.	Product B	100	26	2.600	52	2.652
3.	**Total**	**200**	**x**	**4.000**	**80**	**4.080**

Serial number	Product	Quantity	Costs per product unit*)	Production costs	General management expenses	Delivery expenses	Integral costs	Selling price per product unit	Incomes from sales	Gross result
0	1	2	3	4 = 2 *x* 3	5	6	7 = 4 +5+6	8	9 = 2 *x* 8	10 = 9 - 7
1.	A	60	14	840	16.8	120	976.8	18	1,080	103.2
2.	B	40	26	1.040	20.8	140	1200.8	35	1,400	199.2
3.	**Total**	**100**	**x**	**1.880**	**37,6**	**260**	**2.177,6**	**x**	**2.480**	**302,4**

2. Account of product sold in month X:

It can be noticed that in management accounting the pieces of information obtained are far more complete as far as costs, including product profitability are concerned. As a conclusion it is to be declared that the above presented method of dealing with production costs satisfies both the requirements imposed by provisions of accounting regulations and the need for information of the companies in order to make economically well-based decisions.

Abstract: Starting with 01.01.2006 the working entities of Romania apply accountant regulations according with the European directives, starting with the 4th Directive of the CEE and it's afterwards changes. The authority for accountant regulation had emitted more normative papers applicable to different entities, depending on their activity field and specific economic agents, credit institutions, insurance societies. Adopting the information within the European directives is not consequent in all the normative papers released. In this paper we will refer at the other perspective of the value adjustments and at the provisions within the credit institutions.

Keys words: credit institutions, value adjustment, provisions, depreciation.

Introduction

The accountancy rules are elaborated for all the entities which unfold their activity in the national economy must have a common base for all the notions within a general frame.

At this time, in Romania, all the entities apply accountancy rules conforming to the European directives. In this paper we will refer at the confronting between the regulation modules of the European directives of the economics agents and the credit institutions.

A framework for the analysis of the value adjustment and provisions

Appling the European directives are incumbent both for the commercial societies (legal entities article 1. line 1, accountancy law) and credit institutions.

The elaboration order of the normative papers was O.M.F.P. no. 1752/2005 for the approval of the accountancy regulations conforming to the European directives applicable to the commercial societies after the B.N.R. Order no. 5/2005 was published, regarding the accountancy regulations in conformity with the European directives applicable to the credit institutions.

In the normative papers up-mentioned the value adjustments are identically defined, so "**The value adjustments** contain all the corrections designated to view the reduction of the individual actives value, established at the balance date, regardless if that reduction is or not final. The value adjustments may be: permanent adjustments, also named amortizations, and/or extemporary adjustments, also named adjustments for depreciation or value loss, viewing the permanent or not character of the active adjustment.

In the 5th/2005 Order is mentioned that the value adjustments are "registered in the provisions accounts within the 1-4 classes of the Chart of Accounts for the credit institutions which diminish the main value of these actives."

If we analyze the 24th/2006 Order which modify and supplement B.N.R. Order no. 5/2005, in which the 5th.1 chapter is introduced "The operations accountancy" where is used the notion of "provisions for the depreciation of the main actives", but in the 2nd chapter Rules regarding the annual financial situations is used “adjustments for the value loss”. We can see that in the normative paper the notions are not correlated, these was taking over from the old papers.

In the 19 article of the 4th Directive no 78/660/CEE is clearly mentioned the following: „Value adjustments shall comprise all adjustments intended to take account of reductions in the values of individual assets established at the balance sheet date whether that reduction is final or not.”

The Romanian translation is consequent and uses the term of “value adjustments”. So, the actual version of the Order no. 1752/2005 and no. 5/2005 expose the correct idea within the directive, just that in the normative paper applicable to the credit institutions the name of the utilized accounts for the accountancy registration of the credit institutions is “provisions for depreciation”.

We consider that both papers must contain coherent stipulations for the notions within general a frame, without misunderstandings. An aspect that must be enlightened is that regarding the adjustments for the active depreciation. In the O.M.F.P. 1752/2005 is explained what active depreciation represent, the fact that they displace the expression “provisions for depreciation” an undertaking which was maintained in the Chart of accounts also. In the B.N.R. Order no. 5/2005, the depreciation adjustments notes are maintained without changing the name of the accounts and that may induce into error the ones who utilize the accountancy regulations or the debs in this domain.

In the regulations elaborated by B.N.R. and C.N.V.M. (Romanian National Securities Commission), regulation no. 23/28/2006 regarding the technical criteria of the organization and the treatment of the risks, and also the technical criteria used by the specific authorities for their checking and evaluation and the regulation no. 25/30/2006 regarding the publishing requests for the credit institutions and investments companies is used the notion of “value adjustments” and “building up adequate provisions within the transaction portfolio”. We can observe that these regulations are made up according to the 4th Directive, but we can also understand that that a depreciation of the value of an active is a “value adjustment”, and it’s registration in accountancy is made by “building up some adequate provisions”.

If we also refer to the normative paper which prescribes the reporting of the financial situations of the credit institutions at individual level, and the financial Reporting FINREP situations, necessary for keeping up with the rules of the Committee of European Banking Supervisors CEBS according to Basel II, and the B.N.R. Order no. 13/2007, in this is mentioned that the reporting at an individual level have as a regulation basis the European directives. Analyzing the financial situation model FIN2 – the profit and loss account, line 150 is named Provisions, line 160 Provisions for financial actives depreciation and line 170 Provisions for non-financial actives depreciation. Again, we have a situation in which for the value adjustments is used the notion of provisions for actives depreciation.

We also want to show that in the Order no. 3129/2005 for approval of the accountant regulations according with the specific European directives in the insurance domain the utilized accounts for the adjustments registration is named “adjustments for depreciation/ value loss”. So in the insurance sector the regulation is according with the European directives.

Regarding the notion of “provisions” their definition is identically in both regulations, but in the regulations applied in the credit institutions is mentioned that “they are registered in the accounts open within the 5th class from that Chart of accounts, applicable within the credit institutions and presented in the balance of the credit institution”.

At the credit institutions the provisions structure is different due to the activity object of those. Knowing that the credit institutions have to report the financial situations according to the IFRS, we can say that the notion of “provisions” which must be utilized is just the one contained by the IAS 37 Provisions, contingent liabilities and contingent assets. If we compare the provisions definition from IAS 37 with the ones in the European directives we can clearly see that the notions are harmonized.

Coming back to the notion of “value adjustments” mentioned in the European directives in the International Standards of Financial Reporting we notice the notion “impairment losses” in IAS 36 Impairment of assets, IAS 32 Financial instruments: presentation, IAS 39 Financial instruments: recognition and measurement.

If we refer only to the topic we observe that the name of the accounts adopted for the credit institutions is a combination of all the notions presented, “provisions for depreciation”.

We consider that is necessary to replace the word “provisions” with “adjustments for depreciation” and changing the name of the accounts accordantly with the below table:

ACTUAL ACCOUNTS	PROPOSAL ACCOUNTS
191 Provisions for the receivables inter-banking operations	191 Adjustments for the depreciation of the inter-banking receivables operations.
291 Provisions for receivables through the clients operations	291 Adjustments for the clients receivables depreciation
391 Provisions for the title depreciation	391 Adjustments for the title depreciation
393 Provisions for the stock depreciation	393 Adjustments for the stocks depreciation
399 Provisions for residual and ambiguous receivables.	399 Adjustments for the residual and ambiguous receivables depreciation
491 Provisions for depreciation of the shareholders hold within the commercial societies, participation titles and portfolio titles owned.	491 Adjustments for depreciation of the shareholders hold within the commercial societies, participation titles and portfolio titles owned.
492 Provisions for immobile depreciation	492 Adjustments for the immobile depreciation
493 Provisions for leasing operations	493 Adjustments for leasing operations
494 Provisions for simple local operations	494 Adjustments for simple local depreciation operations
499 Provisions for residual and ambiguous receivables.	499 Adjustments for the residual and ambiguous depreciation receivables.

Of course that the modified name of the up-mentioned accounts leads to the changing of the expenses accounts within the group 66 Expenses with provisions and losses from lost receivables and of the Finance accounts within group 76 – Finances from provisions and recovery of amortized receivables.

According to the coherence principle, for the 191 Provisions for the receivables inter-banking operations, and 291 Provisions for receivables through the clients operations accounts the notions from the B.N.R. regulations no.5/2002 regarding the classification and investments of the credits, are not respected, as well as constituting and the usage of the specific credit risk provisions. The power of decision lies within the competent organisms to proceed or not at the unification of the notions, or at least to explain them and to mention the links between different normative statements.

Conclusions

Our research prime objective was to highlight that, the risk of confusion of the value adjustments with the provisions is imminent for the users that do not have sufficient knowledge about the credit institutions particularities. We think that it would be indicated to be created an Accountant code or a Unique General Frame for all the entities within the economy, and for those who have a specific object of activity to be elaborated supplementary normative papers to help them impress with the specific operations. We sustain this point of view because the general elements go along with the immobile, stocks, debts to personnel, insurances companies and social protection, government budget, local budgets which does not present major differences from an entity to another. The normal or special frame for each type of entity would go along only with supplementary information specific to the activity object without repeating the general elements.

Abstract: Insurance system are actively involved in a vast array of "social" insurance services, prominently through provision of public pensions, health insurance schemes and medical services, regulation of health insurance markets, unemployment and work injuries insurance. Recent economic literature emphasizes a tension between Insurance system, and competitiveness and growth. In particular, a trade-off is envisaged between redistribution and growth, as the high fiscal burden needed to finance the Insurance system has perverse incentive effects on wages, lab our supply, capital accumulation, and the adoption of new technologies. In this paper we focus on the Insurance system as a "public insurer", rather than as a mechanism for redistribution of income. The authorized insurance companies have the obligation to have at all times an available solvency rate, in concordance with the activity developed, at least equal to the minimum solvency rate calculated in conformity with the valid regulations.

Key words: Insurance system, IFRS 4, insurance contract, insurance market.

In most deve1loped countries Insurance system systems are undergoing substantial re-organization. Growing costs of welfare systems, stringent public budget constraints, and the intense development of financial markets allowing for significant innovation in the design of insurance contracts, are amongst the main reasons behind this fact. In many European countries, re-organization of Insurance system systems is also strongly stimulated under the Lisbon agenda.

Within this perspective, the fundamental question underlying the present paper can be framed as follows: In what circumstances, to what extent, and under what conditions can the provision of "social" insurance services, nowadays typically offered in Europe by Insurance system institutions, be delegated to the market? The answer to this question will be sought by linking together, and providing advances on, several strands of analysis. First, a detailed analysis of the several instances of market failures in insurance markets will be performed, with specific emphasis on market failures connected with insurance typically provided by Insurance system institutions. Second, competitive equilibrium, and the conditions for Pareto optimality and "fairness", under both adverse selection and moral hazard, will be characterized.

Third, the literature on mechanism design will be applied to a number of social security programs, in order to obtain deeper comprehension on issues such as: public provision or financing of "private goods"; the bundling of different social insurance programs; the optimal design of pension schemes under both private and public provision; the optimal management of retirement wealth in the face of life risks; the optimal provision of old age health risks insurance; the design of prevention policies aimed at reducing health risks associated to transmissible diseases.

The "Lisbon strategy for growth and employment" (the "Lisbon agenda") commits the European Union to become by 2010 "the most dynamic and competitive knowledge-based economy in the world capable of sustainable economic growth with more and better jobs and greater social cohesion, and respect for the environment" (italics added).Under the objective of "greater social cohesion" the agenda includes the ambitious paper to a tighter compatibility between sustained competitiveness (as the development in world trade demands) and social protection that nowadays, in many countries belonging to the European Union, rests on a diffuse public Insurance system. Insurance system systems usually serve two, often intertwined, tasks: they implement income redistribution and they provide public insurance against a class of "social" risks largely connected with health, work injuries, unemployment, and retirement.

Recent economic literature emphasizes a tension between Insurance system, and competitiveness and growth. In particular, a trade-off is envisaged between redistribution and growth, as the high fiscal burden needed to finance the Insurance system has perverse incentive effects on wages, labor supply, capital accumulation, and the adoption of new technologies.

In this paper we look at the Insurance system as a "public" insurer, rather than as a mechanism for redistribution of income. We intend to focus on the reasons behind public provision of "social" insurance, and to examine the efficiency conditions under which the State as a "social insurer" can act. In many European countries Insurance system are undergoing substantial re-organization, induced by the fast growth of their costs.

In addition to the cost effects of the ageing process of the population and of scientific innovation in the provision of retirement and health insurance services, the "cost" of the Insurance system is also linked to the pervasiveness of perverse incentives it can exert on the economy's supply conditions, thus on growth and competitiveness. In fact, the institutions of Insurance system have often shown themselves to be permeable both to individuals' strategic exploitation of private information and to the inefficiencies of collective, i.e. political, decisions. These facts can have perverse effects on social cohesion, thus weakening the political consensus towards the institutions of Insurance system.

As a matter of fact in recent times we have been observing a growing demand for "decentralization", i.e., for "market" and "competition", in many "social" insurance services traditionally provided by the State. The "modernization" of the insurance system, i.e. the reshaping of social protection mainly provided nowadays in Europe by "the State as an insurer", is accordingly a major challenge for the EU countries within the framework of the Lisbon Agenda. A central issue - and the one we intend to tackle in this paper - is whether there can be efficient scope for market delegation of "social" insurance services, and the conditions for it.

The definition of an insurance contract refers to an insurance risk that IFRS 4 defines, other than the financial risk, transferred from the owner of the contract to the eminent. A contract that exposes the eminent to a financial risk, without a significant insurance risk, is not an insurance risk.(Barry j. Epstain & Abbas Ali Mirza, 2005).The definition of the financial risk includes a list of financial and non financial risks, the list includes non-financial variables that are not specific to to a contractual party like an index of the damage provoked by earthquakes in a certain region or an index of the temperatures in a certain town, the list excludes the non-financial variables that are specific to a certain contractual party like the fact that a fire takes or does not take place which affects or destroys an active of that part. Besides that, the risk of changing the right value of an non-financial active is not a financial risk if the right value does not reflect only the modifications of the prices on the market for such actives (a financial variable) but only the stage of a non-financial specific active owed by a contractual party (a non financial variable)For example a guarantee for the residual value of an automobile exposes the warrant at the risk of change of the physical state of the auto, that risk of insurance and not a financial risk. (Constantinescu Dan Anghel, 2004)

The definition of the insurance risk refers to the risk that the insurance company accepts from the insured person, in other words, the insurance risk is a preexisting risk, transferred from the insured person to the insurance company. Consequently, a new created risk by the contract is not an insurance risk.(Dobrin Marin & Ionescu Luminita, 2003).A contract that exposes the eminent to a negligence risk, to a persistence risk or to an expense risk, is not an insurance contract, except when it exposes the eminent also to the insurance risk. However, if the eminent of that contract lowers that risk by using a second contract to transfer a part of that risk to a third party, the second contract exposes the contract to an insurance risk.

Insurance system are actively involved in a vast array of "social" insurance services, prominently through provision of public pensions, health insurance schemes and medical services, regulation of health insurance markets, unemployment and work injuries insurance. In most developed countries Insurance system systems are undergoing substantial re-organization. Several reasons lie behind this fact. First, the costs of welfare systems are growing fast, also due to the ageing process of the populations and the effects of scientific innovation on the costs of health services. Second, stringent public budget constraints increase the awareness of the incentives problems generated by public interventions. Third, the intense development of financial markets allows for significant innovation in the design of insurance contracts.

Within this framework, a major issue in many European countries is whether there can be scope for market delegation of social insurance services - and the conditions for it. Policy proposals to reform the Insurance system systems, also through recourse to "market delegation", have to be subject to an articulated set of evaluation criteria. Firstly, stringent accountability and cost-benefit analysis are to be adopted to evaluate the scope for market provision of social insurance services vis a vis public intervention.

Secondly, the optimal design of public policies becomes a crucial issue where public intervention continues to play a significant role. Third, in many an instance in which welfare systems continue to provide insurance, there can often be scope for public and private insurance systems to coexist. Fourth, under both regimes, when market results may involve incomplete risk-covering, regulation can be needed to ensure acceptable levels of both efficiency and fairness. A common answer to incomplete risk-covering is recourse to straightforward coercive powers, namely compulsory insurance.

To summarize, the basic paper question can be framed as follows: In what circumstances, to what extent, and under what conditions can the provision of "social" insurance services, nowadays typically offered in Europe by Insurance system institutions, be delegated to the "market"? To tackle the question, the background literature relating to several strands of analysis has to be taken into account.

A first strand of literature focuses on the several instances of market failures in insurance markets (emphasis will be specifically put on market failures connected with insurance typically provided by Insurance system institutions): Competitive conduct of firms can lead to excessive price discrimination (Rea, 1992; Crocker e Snow, 2000), to the inability to credibly commit to long period contracts (Cooper and Hayes, 1987), to insufficient incentive to control costs (Cummins and Tennyson, 1992, Scalera e Zazzaro, 2003). Contractual design allows to reach second best solutions under moral hazard (Cooper and Hayes, 1987; Winter, 2000; Chiappori et al., 2004). However, neither the insured nor the insurer have incentives to propose adequate contractual devices when the effects are "external" to their relationship, and directly fall on society as a whole (Vickrey, 1968, Edlin, 2003, Buzzacchi e Valletti, 2005; Emons, 2001).

The possibility of incomplete coverage is known in the literature of competitive insurance markets at least since Rothschild e Stiglitz (1976) and is particularly severe in long-term contracts. Incomplete coverage can result from cream skimming strategies (Crocker and Snow, 1986); or because risk factors undergo relevant exogenous changes; or because a strong correlation among risks makes the assessment of the risks themselves extremely difficult (Gollier, 2005). Difficulty in risk assessment calls for the need, and the tough task, of aggregating the opinion of experts (Morris, 1977; Bayarri e DeGroot, 1991). Administrative costs can rise very high. In health insurance a common explanation for this result is the competitive search for separating equilibria (Diamond, 1992). In the literature relating to pension funds, the same result is expected to arise from contract incompleteness and renegotiation (Acemoglu et al. 2003; Besley and Prat 2003) that limit the capacity of future pensioners to (ex ante) identify and legally verify good indicators of fund managers' performance.

Conclusions

To ensure fairness, compulsory insurance goes frequently together with forced pooling equilibrium, when separating equilibrium, particularly burdensome to the riskiest subjects, are expected to arise. Another regulatory arrangement intended to combine efficiency and fairness policy objectives is the bundling of social programs under a comprehensive scheme whereby insurance against a number of different social risks is provided together with redistribution. Still, in a policy perspective, the search may also be open for alternative routes. For example, more indirect regulation may serve the purpose of favoring product innovation, that is, the design of more sophisticated insurance contracts, also as a result of competition.

A final theme deserves attention. Provided social insurance is delegated to the market, insurance firms are subject to antitrust law. Particular aspects of antitrust law that come into play would typically involve: prohibition of agreements among firms, strict regulation of information exchanges; severe restrictions, under several circumstances, of the possibility for firms to refuse to deal with customers. Antitrust constraints, especially when coupled with other regulatory constraints, can significantly affect the way in which insurance firms compete in the market.

ASPECTS REGARDING THE HOMOGENEITY OF ACCOUNTS AT GROUP COMPANIES

Huminiuc Cristian

Universitatea „George Bacovia"Bacău, Facultatea de Contabilitate şi Informatică de Gestiune, Str. Pictor Aman nr.96, e-mail: cristian_huminiuc@yahoo.com, tel. 0732401577.

Summary: The accounts consolidation has as an objective to illustrate a fair image of the equity, of the financial situation and of the result of an assembly of companies all together forming a group. The companies entering within the frame of consolidation can be very different in their juridical form, activity sector, or country in which they act. All these elements can have a direct or indirect influence upon the regulations about evaluation and presentation used to settle the annual accounts. In order to satisfy the fair image principle when the consolidation is realized it is compulsory to achieve the homogeneity of the annual accounts of the consolidated companies, this means to harmonize the evaluation and presentation methods, before starting the accounts consolidation.

Key words: consolidated accounts, group, consolidation, homogeneity.

Les opérations de consolidation s'inscrivent souvent dans un cadre juridique et comptable inconstant et/ou international. La situation est fréquente où le groupe est composé à l'aide des sociétés qui ont chacune ses activités économiques et/ou des implantations géographique diverses. En vue de l'obtention d'une image standardisée et pertinente de cet ensemble économique, les sources d'informations comptables doivent faire l'objet d'un véritable filtre, par une suite d'opérations qui, d'une manière générale ont été appelées „d'homogénéisation".

D'ailleurs, les comptes consolidés ne peuvent être obtenus à l'aide d'une adjonction directe des comptes individuels des entreprises qui forment le périmètre de consolidation, parce que les comptes individuels peuvent être créés selon des normes différentes en fonction de l'aire géographique des sociétés qui seraient consolidées. Ainsi, les comptes individuels sont élaborés avec le respect des réglementations juridiques et fiscales, différentes de celles applicables dans le processus de consolidation.

Par ces raisons, les normes concernant la consolidation des comptes fixent un principe fondamental de la consolidation, c'est-à-dire l'homogénéisation.

Ce principe ne se limite pas seulement à l'assurance d'un langage comptable commun pour les comptes individuels, mais on suppose aussi la création des opérations de retraitement ou reclassement de la matière comptable.

L'homogénéisation vise les éléments de l'Actif et du Passif du bilan, les postes de revenus et dépenses, les informations contenues dans les annexes, en d'autres mots, toutes les situations financières spécifiques d'une société.

Ce processus n'a pas lieu au hasard, mais sur un plan comptable de consolidation, où pour le groupe visé sont retenues les règles et les méthodes plus adéquates, pour qu'en fonction d'elles on obtienne l'image parfaite, claire et complète du patrimoine, de la situation financière et ces résultats.

Si une entreprise membre du groupe utilise dans le traitement des opérations des méthodes comptables différentes de celles retenues par le plan comptable de consolidation, il faut apporter les ajustements nécessaires pour l'obtention de l'homogénéisation en cause. Toutefois, si les éléments respectifs sont insignifiants en rapport avec la grandeur du groupe, ou si le coût d'obtention des informations homogénéisantes est plus grande en comparaison avec des effets obtenus, on peut renoncer aux ajustements survenus dans le passé. Ainsi, observe-t-on une mise en pratique du principe de l'importance objective.

Le processus d'homogénéisation peut impliquer des aspects suivants :

- l'homogénéisation temporelle
- l'homogénéisation des évaluations
- l'homogénéisation en vue d'éliminations
- l'homogénéisation en vue intégration.

L'homogénéisation temporelle

Les comptes consolidés s'établissent et se publient annuellement. Comme règle générale, les comptes annuels du groupe s'établissent à la même date de fermeture et pour la même période ainsi que les comptes annuels de la société-mère.

En vue des dérogations et sous la réserve de la justification en annexes, les comptes consolidés peuvent être créés à une date différente de création:

- la société-mère ferme ses registres après ses filiales de production, pour pouvoir tenir compte à la création des comptes consolidés et de résultats des filiales respectives;
- les entreprises du périmètre du groupe ont une activité saisonnière et très diverse;
- les règlementations nationales imposent, à une société située à l'étranger, une autre date de fermeture des comptes.

La législation européenne et internationale prévoit que si la date de fermeture de l'exercice d'une entreprise participante dans la consolidation est antérieure à plus de trois mois de la date de fermeture des comptes consolidés, ceux-ci sont élaborés sur la base des comptes provisoires. Ces comptes sont établis dans les mêmes conditions que les comptes annuels des sociétés participantes dans la consolidation. Ils sont établis sur la base de l'inventaire et ils comprennent d'une manière obligatoire des informations concernant la variété des stocks (et si la somme afférente est ou non significative), les amortissements et les provisions, des ajustements des comptes réciproques entre les sociétés consolidées, le calcul de l'impôt sur le profit.

La société-mère peut consolider directement les comptes annuels établis à une date antérieure à celle concernant les comptes consolidés, à condition obligatoire d'application de la procédure de retraitements nécessaires, de l'élimination des comptes réciproques intra-groupe et de l'assurance que ce décalage de date n'est pas de nature à détruire l'image fidèle des comptes du groupe.

Il faut aussi souligner la situation inverse, celle d'admettre que la date de fermeture des comptes individuels d'une entreprise participante dans la consolidation est postérieure à postérieure de la date de fermeture des comptes consolidés. Une telle possibilité serait contraire aux principes qui gouvernent l'établissement des comptes consolidés et spécialement au principe que à la fermeture des comptes consolidés, on reconnaît et on enregistre seulement les résultats enregistrés et présentés à cette date.

L'homogénéisation des évaluations

Les comptes consolidés s'établissent en fonctions des principes et des règles d'évaluation spécifiques à la comptabilité générale, donc ils sont les mêmes comme dans le cas des comptes individuels.

Il y a encore des ajustements indispensables provenus des caractéristiques propres des comptes consolidés, en rapport avec ceux annuels. Sous la réserve de la mention et d'une justification en annexe, la société consolidée peut utiliser d'autres règles d'évaluation, fixées et destinées à l'élaboration correcte des comptes consolidés.

Si entre les règles d'évaluation, applicables aux comptes individuels et ceux appliqués pour les comptes consolidés apparaissent des divergences, il y aura des retraitements sur les comptes individuels.

Les méthodes et règles d'évaluation complémentaires, optionnelles, spécifiques à la consolidation sont suivantes:

La méthode du coût historique indexé: les comptes consolidés peuvent être établis sur la base de sa monnaie nationale, avec sa force d'achat, à la fermeture de l'exercice. Tous les éléments initialement reflétés, soit dans une autre monnaie, soit celle nationale, mais avec une unité monétaire commune. Cette méthode a été développée particulièrement aux Etats-Unis et en Grande Bretagne.

La méthode de la valeur de remplacement: les immobilisations corporelles amortissables et les stocks peuvent être inscrits à leur valeur de remplacement à la fermeture de l'exercice. Cette méthode, sous la réserve des difficultés pratiques d'application, présente l'intérêt dans certains compartiments d'activité. Il y a le cas des entreprises d'une période très longue d'investissement (qui ont été soumises à l'inflation dans les années antérieures) et des entreprises soumises aux variations de prix importants concernant des achats de marchandises.

La méthode LIFO: contraire aux deux premières méthodes mentionnées, l'option pour cette méthode ne peut pas être appliquée à l'ensemble des stocks concernant le groupe, mais peut être limitée aux certaines catégories de celles-ci, sur la base de la localisation géographique ou la branche d'activité spécifique.

L'inclusion des achats financiers dans le coût des stocks : les intérêts des capitaux empruntés, pour le financement de la production d'un élément de l'actif circulant, peuvent être inclus dans son coût seulement dans la période de la fabrication afférente.

Vu les biens que la société dispose par un contrat de location (ou en leasing) :

- est permise l'enregistrement dans l'actif du bilan ayant la valeur stipulée dans l'absence de l'indication de la valeur en contrat;
- est permise la comptabilisation de ces biens de contrepartie (en Passif) avec l'obligation financière correspondante;
- est permise l'affectation du compte de profit et de perte avec le pourcentage d'amortissement du bien respectif, celle-ci étant considérée une dépense financière courante.

Les différences de conversion : peuvent être inscrites dans le compte de profit et perte consolidés. Les profits (en ajoutant les valeurs latentes) peuvent être retenues, contre les dispositions comptables générales pour les comptes individuels, qui prévoient que seulement les pertes latentes doivent retenues (en se constituant provisions dans ce sens).

L'homogénéisations en vue des éliminations

Le principe fondamental de la consolidation vise la prémisse qu'un groupe est une entité unique. Ainsi, résulte-il la nécessité de l'élimination des enregistrements dans les comptes des sociétés qui font partie dans un groupe et qui visent des échanges réciproques, générateurs ou non de résultats financiers, ainsi que les dividendes distribués à l'intérieur du groupe.

Quand des opérations ont lieu entre des unités du groupe, premièrement, il faut y assurer une homogénéisation qui consiste, dans ce cas, dans le débat et la mise d'accord aux grandeurs inscrites dans les comptes des partenaires.

Cette démarche apparaît nécessairement parce que les échanges apparaissent parfois dans la comptabilité d'une société sans être reflétées d'une manière correspondante et dans la comptabilité de l'autre côté. D'ailleurs, l'inscription dans les comptes des parties pourrait être présentée aux niveaux différents.

En principe, au moment où l'opération interne du groupe apparaît seulement inscrite dans les comptes d'une des sociétés, ou quand les sommes sont différentes, l'homogénéisation signifie la force, d'un commun accord des grandeurs et l'inscription dans la comptabilité de la partie ou l'échange a été opéré.

Après ce premier groupe d'homogénéisations, des éliminations peuvent effectivement être réalisées. D'après leur origine, les éliminations peuvent être:

- éliminations patrimoniales,
- éliminations financières,
- éliminations économiques.

Les éliminations d'origine patrimoniale visent les éliminations concernant les titres de participation dans le bilan de la société dominante, en contrepartie avec des capitaux propres des sociétés dépendantes.

Les éliminations d'origine financière visent les comptes réciproques qui apparaissent dans les documents annuels des sociétés du groupe, sous la forme des créances à une société et aux dettes à l'autre, des revenus à une société et aux dépenses à l'autre, sans avoir une influence sur le résultat au niveau du groupe.

Les éliminations d'origine économiques visent par contre les opérations qui génèrent les résultats à une ou à l'autre société du groupe, comme suite à des échanges internes d'entre elles. Certains échanges peuvent viser:

- Les cession d'immobilisations: une telle élimination apparaît lorsque le prix de vente est plus grand ou plus petit que la valeur nette comptable, les cas où les profits sont enregistrés, respectivement des pertes exceptionnelles.
- Les ventes de produits entre les unités du groupe: le problème de l'élimination apparaît ou cas où les produits ou les marchandises vendus par une unité dans ce groupe à l'autre ont

obtenu pour la première fois un résultat. Celui-ci doit être éliminé vu le fait que les produits ont circulé entre ces deux unités, à l'intérieur du groupe, l'élimination s'imposant indifféremment s'ils sont stocks ou consommés ou vendus.

– Les provisions internes: les provisions enregistrés à l'intérieur du groupe et qui visent les dépréciations réversibles des quelques créances générales générées par des opérations réciproques à l'intérieur du groupe doivent être éliminées.

L'homogénéisation en vue l'agrégation

Elle suppose l'effectuation de reclassements nécessaires, du moment où les structures des comptes annuels d'une société du groupe ne coïncident pas aux structures des comptes annuels de la société dominatrice, donc leur transport à un point commun du point de vue du contenu.

Par l'agrégation on comprend le cumul des postes, inscrits dans les comptes annuels individuels, après la réalisation d'autre homogénéisation présentée antérieurement. Ce cumul peut être intégré ou divisé selon la manière des relations d'être la société prédominante et des filiales s'encadrent au contrôle exclusivement ou le contrôle conjugué.

ORIENTATION AND PLANNING THE FINANCIAL AUDIT

Huminiuc Cristian

Universitatea „George Bacovia"Bacău, Facultatea de Contabilitate şi Informatică de Gestiune, Str. Pictor Aman nr.96, e-mail: cristian_huminiuc@yahoo.com, tel. 0732401577.

Summary: The period of orientation and planning of the audit mission supposes from the part of the auditor the proceeding of the following important works: the general knowledge of the enterprise, the identification of the significant fields and systems and planning the mission.

The general knowledge of the enterprise has as main objective the obtaining from the part of the auditor of a sufficient understanding of its specific particularities and of their influences upon planning and mission organizing

The identification of the significant fields and systems aims a better orientation and planning of the efforts in order to avoid useless things and to finally fundament the decision regarding the stated opinion.

The planning of the mission means to make a synthesis of the obtained information and to give an orientation and a coordination to the entire audit activity.

Key words: auditor, fraud, error, significant.

Le rôle de cette étape est de déterminer l'origine et la grandeur des interventions qui vont être créées par l'auditeur en cours de sa mission et d'établir les mesures d'organisation nécessaires pour les exécutions des travaux de l'audit au maximum d'efficacité dans le cadre des termes établis.

Des travaux importants ont lieu dans l'étape d'orientation et de planification du métier de l'audit:

La connaissance générale de l'entreprise a comme objectif l'obtention d'une compréhension suffisante des particularités de l'entreprise et du domaine où elle fonctionne, pour déterminer les buts généraux de l'audit et de l'identification des domaines et des systèmes significatifs.

Pour la compréhension et la connaissance des particularités de l'entreprise, les auditeurs peuvent utiliser une suite de processus et de techniques, par exemple: des discussions avec des managers et des salariés de l'entreprise; le contrôle des documents internes et externes; la visites des restaurants des entreprises; le contrôle analytique des indicateurs économiques-financiers les plus importants (chiffre d'affaires, profit, liquidation, etc.). Après l'utilisation de ces processus et techniques, l'auditeur a la possibilité d'avoir une opinion en ce qui concerne: l'origine de l'activité; les particularités du secteur; les structures de l'entreprise; l'organisation générale; les politiques commerciales, financières et sociales; l'organisation administrative et comptable; les pratiques comptables utilisées; les contrôles internes appliqués; les retards dans la présentation des informations à l'extérieur de l'unité.

En conformité avec les Normes Nationales de l'Audit, le but d'une mission d'audit des situations financières est de permettre à l'auditeur d'exprimer une opinion conformément à laquelle les situations financières ont été fondées sous tous leurs aspects significatifs conformément au cadre général de rapport comptable identifié.

Le concept d'assurance raisonnable est dans une liaison étroite avec le rassemblement des épreuves d'audit, en vertu desquelles l'auditeur peut décider l'existence ou l'absence dans les comptes annuels des anomalies significatives. Grâce aux sondages utilisés et aux limites de quelque système comptable et de contrôle interne, ainsi l'auditeur découvre les anomalies significatives. Cette situation est connue sous le nom *risque d'audit* qui correspond à la possibilité qu'un auditeur exprime une opinion incorrecte quand il y a des erreurs significatives dans les comptes annuels qui n'ont pas été découvertes à l'occasion de la planification et de l'exécution de sa mission.

Ainsi, l'auditeur doit prévoir, à l'occasion de l'appréciation du risque d'audit, ces anomalies significatives dans des situations financières provoquées par des fraudes ou erreurs.

La notion de fraude désigne un acte volontaire entrepris par une ou plusieurs personnes, faisant partie dans la direction, salariés ou tiers qui ont le but de falsifier les dates de la comptabilité et d'une manière implicite, celles des comptes annuels. Ces faits sont considérés des fraudes: manipulation, falsification ou altération de la comptabilité ou des documents; allocation fausse des actifs; enregistrement des opérations sans fondement; application incorrecte des politiques de fermetures des comptes; omission des effectifs des transactions ou des opérations en ce qui concerne la comptabilité ou les documents.

En comparaison avec la fraude, **l'erreur** représente une inexactitude involontaire continue des situations financières par exemple: une erreur de mathématique ou d'enregistrement dans les documents et dates de la comptabilité; l'application non correspondante des politiques, vu la fermeture des comptes: l'omission ou la fausse interprétation des faits et des événements.

La responsabilité pour la prévention et la détection des fraudes et des erreurs revient à la direction de l'entité qui a l'obligation de mettre en pratique et en exploitation des systèmes de comptabilité et contrôle correspondants. Même si tous ces systèmes de contrôle réduisent évidemment le risque de fraude ou erreur, ils ne l'éliminent pas totalement.

L'auditeur n'est pas et il ne peut pas être responsable de prévention et détection des fraudes et erreurs, mais il peut constituer un facteur décourageant pour les personnes intéressées.

En ce qui concerne l'évaluation des risques, l'auditeur doit définir les processus de l'audit qui permettent l'obtention d'une assurance raisonnable que les anomalies significatives dans les situations financières causées par les fraudes et les erreurs seraient découvertes. Au cas où l'impacte d'une fraude ou d'une erreur dans les situations financières est considéré comme normal, l'utilisation de ces processus offre la possibilité de l'auditeur, soit de confirmer, soit d'infirmer cette présupposition. L'auditeur doit demander des explications de la direction en ce qui concerne le problème et évaluer si la fraude ou l'erreur ont été corrigées ou reflétées d'une manière correspondante dans les situations financières.

L'auditeur est obligé de communiquer à la direction les fraudes et les erreurs constatées (s'il suspecte l'existence d'une fraude même si l'effet potentiel dans les situations financières est négligeable, ou si une fraude ou une erreur significative a été effectivement découverte) à l'organe hiérarchique supérieur (si la direction a été impliquée) ou il consultera un avocat pour établir la procédure à suivre.

L'identification des domaines et des systèmes significatifs suit une meilleure orientation et planification des efforts ayant comme but l'évitement des épreuves inutiles et pour l'adoption, finalement, de la décision, vu l'opinion émise. La connaissance générale de l'entreprise offre la possibilité à l'auditeur d'orienter sa mission, en fonctions des domaines et des systèmes significatifs.

Le Comité International de Standards Comptables, par le Cadre général pour la création et la présentation des situations financières pct. 30 a donné la définition suivante du caractère significatif: on considère que les informations sont significatives si l'omission ou leur fausse déclaration influencerait les décisions économiques des utilisateurs, prises à la base des situations financières.

Pour un auditeur, un système significatif est représenté par quelque cycle comptable manuel ou informatisé qui traite des informations qui peuvent avoir une incidence significative dans les comptes annuels. L'évaluation du caractère significatif constitue le résultat d'une appréciation professionnelle de l'auditeur.

A l'élaboration du plan d'une mission d'audit, l'auditeur sera en mesure de définir un plan de signification globale et des seuils de signification par domaines d'activité.

Le seuil de signification est donné à l'aide de la grandeur des sommes sur laquelle l'auditeur considère qu'une erreur, une inexactitude ou une omission peut affecter la régularité et la sincérité des comptes, l'image fidèle du patrimoine, du compte de résultat et de la situation financière. Pour la détermination du seuil de signification on peut utiliser plusieurs éléments de référence, parmi lesquels les plus utilisés sont: les capitaux propres, le résultat net, le résultat courrant, le chiffre d'affaire, la variation de la situation nette, etc.

Habituellement, les domaines significatifs sont différents d'une entreprise à l'autre, toute fois, on peut constituer dans des domaines significatifs les éléments suivants: achats (fournisseurs, stocks, disponibilités); ventes (clients, stocks, revenus, disponibilités); salaries (paiements, achats, disponibilités), production (stocks, achats, revenus); trésorerie (encaissements, paiements, revenus, charges); immobilisation, etc. Ces domaines doivent être analysés d'une manière plus efficace par l'auditeur, en fonction des caractéristiques propres de l'entreprise, à cette occasion, établissant où on peut produire des erreurs ou inexactitudes et qui peuvent avoir une influence significative dans les comptes annuels.

La planification de la mission (la création du plan général de travail)

Les objectifs du programme général de travail consistent dans une synthèse des informations obtenues et, en fonction d'elle, orienter et planifier toute activité d'audit.

La réalisation du plan de mission suppose:

1. la sélection des membres de l'équipe en tenant compte de l'expérience et leur spécialisation dans le domaine d'activité de l'entreprise auditée, vu le degré de chargement et la nécessité de respecter des règles d'étique professionnelle, vu l'intégrité, l'objectivité et l'indépendance;
2. la répartition des travaux par gens en temps et en espace (sous-classes);
3. la précision de la manière où l'auditeur peut avoir confiance sur le contrôle interne comme la manière les travaux réalisés par d'autres auditeurs internes ou externes seront utilisés;
4. la collaboration avec des censeurs et avec d'autres auditeurs externes des autres unités à l'intérieur du groupe;
5. la sollicitation ou la collaboration avec des spécialistes dans le domaine de l'informatique, juridique, fiscal, technique, etc.;
6. la précision de la manière d'utilisation des registres de séance A.G.A. et du Conseil d'Administration;
7. l'établissement des termes du dépôt du rapport.

Par l'intermédiaire du plan général de travail on peut obtenir des réponses aux questions suivantes:

- Quels sont les travaux qui doivent être effectués par l'auditeur, la date et l'ordre de leur réalisation;
- Quels sont les rapports et les relations que l'auditeur établit avec des censeurs, avec des auditeurs précédents, avec des spécialistes dans les autres domaines d'activité, avec la direction etc.
- Quels sont les moyens disposés par l'auditeur et quels sont les heures et les coûts engagés.
- Le plan général de travail contient une suite d'informations concernant:
- La présentation générale de l'entreprise: nom, coordonnées, la structure organisatrice, petit historique, l'objet d'activité, les lieux de déroulement de leur activité, les personnes proposées à être contactées au cours de la mission;
- L'organisation de la comptabilité: politiques comptables retenues et appliquées, comptes prévisionnels, la comparaison prolongée du bilan et du compte du profit et de perte, etc.;
- Les systèmes et les domaines significatifs: l'établissement du seuil de signification, les fonctions et les comptes significatifs, la spécificité des zones de risque, la présentation des points forts et faibles du système, l'attitude de la direction face au contrôle interne;
- La nature de la mission: la certification des comptes annuels, l'attestation des situations financières particulières;
- Les conditions nécessaires pour la réalisation de la mission: documents à obtenir (les moyens nécessaires), confirmations à recevoir, fonctions à évaluer, intervention des autres spécialistes, inventaires auxquels on participera, etc.;
- L'organisation de la mission: la structure et la composition de l'équipe, le soutien en ce qui concerne le contrôle interne, le calendrier des interventions sur le terrain;
- Le budget: l'établissement des heures nécessaires de chaque catégorie de travaux en partie, la détermination des coûts estimatifs en tenant compte de l'expérience des membres qui forment l'équipe, la comparaison du nombre d'heures ainsi établi avec les limites précisées par normes professionnelles de travail et la justification de possibles différences.

CONSEQUENCES OF THE INFLATION OVER THE CONTINUITY OF ENTERPRISES` ACTIVITY

Ighian Diana

Universitatea de Nord, Facultatea de Ştiinţe Economica, str. Victor Babeş, nr. 62/A , Baia Mare, judeţul Maramureş Telefon: 0262-218922Fax: 0262-276153

ABSTRACT: In conditions of inflation, the historical costs accounting, related to a basic principle of accountancy, that is the caution principle, lead to the enterprises decapitalization, with serious consequences over the continuity of the activity in conditions of economic efficiency. Therefore, finding new alternatives which could lead to the removal of this deficiency in the traditional accounting model, in conditions of inflation, is an imperative. In this context, the major objective of the firms that carry on their activity in an inflationist environment is to maintain their capital, as well as to secure a profit which can ensure the maintenance of the capital, the continuity of the activity depending mainly of its fulfillment.

Key words: inflation, financial capital, physical capital

The inflation is a self sustained phenomenon of an overall price increase, which affects the economy of a state, having important implications not only at an economical level, but also to the social one. The inflation has as effect the corrosion in time of money value, as well as the sustained price growth in economy.

In most countries, the financial statements are produced on the basis of the historical costs, without taking into account the changes of the overall price level or the individual change of the owned assets prices, except for the fixed assets, that were reassessed. Thus, the assets elements, the capital accounts, the debts, the incomes and the expenses are expressed in accordance with the value existing at the date when these elements appeared. The impact of the inflation is consequently ignored.

The inflationist phenomenon distorts the accounting information presented through the financial statements in two ways:

- it diminishes the accounting information's capital accounts;
- it over valuates the results of the accounting period;

In conditions of inflation, the historical costs accounting, related to a basic principle of accountancy, that is the caution principle, lead to the enterprises decapitalization, with serious consequences over the continuity of the activity in conditions of economic efficiency. Therefore, finding new alternatives which could lead to the removal of this deficiency in the traditional accounting model, in conditions of inflation, is an imperative. In this context, the major objective of the firms that carry on their activity in an inflationist environment is to maintain their capital, as well as to secure a profit which can ensure the maintenance of the capital, the continuity of the activity depending mainly of its fulfillment.

The distinction between profit and capital is extremely important in inflationist conditions. As long as the source of obtaining the profit is the capital, this one can not be consumed without affecting the future profits. So, the capital must remain intact in order to be able to produce the same profit level.

"In general terms, an enterprise maintained its capital if at the end of the period, it has a capital that is equal tot the one from the beginning of the period. Any other supplementary value besides the needed one in order to maintain the level from the beginning of the period is considered to be profit."[355]

"The concept of capital preservation decides the extent to which an enterprise can allot the accruals obtained during the year without prejudicing its future[356]".

Consequently, the profit is the maximum value that an enterprise can allot during the year, so that it can preserve intact the capital owned at the beginning of the period.

---

[355] General Framework for the Preparation and Presentation of Financial Statements issued by the International Accounting Standards Board, pct. 107, overtaken in OPFM no. 94/2001 (O.G. no. 85/20.02.2001)

[356] Lavinia Olimid, Măsurarea rezultatului contabil, Economic Publishing House, Bucharest, 1998, page 60

Within an economy which is not affected by inflation, the profit obtained at the end of the period represents the real profit, and it can be consumed entirely, without the fear of impoverishing the capital. The capital is expressed in the same monetary units as at the beginning of the period and remains intact during all this time.

But in an inflationist environment, taking into account the fact that the incomes are expressed in real monetary units (in terms of the value of money from the moment of their recognition), and the expenses which are to be connected to these incomes are expressed in nominal monetary units (in terms of the value of money from the moment of achieving the assets which generated the expense), in order to find the real profit and to compute an unitary result of the activity, the expenses must be expressed in real monetary units.

The overall expenses adjusted to inflation will represent the sum of the value of expenses expressed in nominal monetary unit, and the price variations between the real monetary unit the nominal one due to the assets which generated the respective expenses.

Therefore:

$Cr = Cn + v$ where:

Cr – expenses expressed in real monetary units,

Cn – expenses expressed in nominal monetary units;

v – price variations due to the assets.

The real profit will be:

$Pr = V – Cn - v$

The historical costs profit (Pci) will represent the sum of the real profit and this price variations, which is in fact the gain resulting from the owning of the assets that generated the expense.

$Pci = Pr + v$

This owning gain represents the sum that needs to be invested in the enterprise, so that the capital level stays the same. In other words, the existence of the owning gain determines the issue of the capital preservation concept.

The question is: this owning gain must be regarded as a constitutive part of the profit which is to be distributed later on, or as an element of the capital account under the form of a resource?

The answer to this question can be found depending on the means of capital measurement. From the point of view of the desired objective of the enterprise, there are two perspectives regarding the capital measurement:

- the owner's (shareholders)
- the enterprise's

The owner's capital (financial) and its maintain

The owner's capital is found in the specialty literature under the name of financial capital. The paragraph 102 from the Conceptual Framework IASB defines the financial capital: "the financial capital is synonym with the net assets or with the entity's capital account".

The concept of financial capital maintain is defined in the paragraph 104 from the Conceptual Framework IASC[357], where it is specified that "*according to this concept, the profit is secured only if the financial value of the net assets at the end of the period is higher then the financial value of the net assets from the beginning of the period, after the exclusion of all distribution towards the owners and of any contributions of the owners during the analyzed period*."

In other words, the increase of the assets value, which exceeds the overall price increase, is to be recognized as profit.

The preservation of the financial capital can be measured in nominal monetary units, by using the concept of nominal financial capital or stable value of money, through the real financial capital.

[357] General Framework for the Preparation and Presentation of Financial Statements issued by the IASC Board and adopted IASB, International Financial Reporting Standards, page 54, CECCAR Publishing House, Bucharest, 2005

When the prices are stable, we can talk about the preservation of the nominal financial capital. The sharable profit represents the difference between the capital accounts existing at the end of the period and those from the beginning of the period, taking into account the possible capital increases or decreases which appeared during the year due to the owners` contributions or withdrawals.

When the prices are variable, the term of real financial capital becomes operational. As the preservation of the nominal capital becomes insufficient, the capital accounts from the beginning of the accounting period are adjusted according to the variation of the overall price index in order to preserve the real capital.

The financial concept of the capital must be adopted if the users of the financial statements are concerned mainly with maintaining the invested nominal capital or maintaining the value of the invested capital.

According to this concept, the profit is recognized only after the value of the capital accounts is maintained. All the adjustments that need to be done to the financial statements, so that the enterprise's financial capital (capital account or the net assets) stay stable, are the objectives of the conversion based methods (methods based upon the current value of money). This methods aim to adjust the financial statements expressed in nominal unitary methods, with the purpose of expressing them in stable monetary units , and also the quantification of the result owned to the national currency depreciation.

In order to exemplify the above mentioned, let's take the following hypothetical example:

At the beginning of the N accounting period, an enterprise has a share capital of 300 m.u., representing a building with the value of 200 m.u., stocks in value of 80 m.u. (40 pieces * 2 m.u./piece) and money supply in value of 20 m.u. The building is subjected to a straight-line amortization for a remaining period of 20 years. At the end of the N accounting period, the enterprise sells 20 pieces of stock at the price of 3m.u./piece.

During the N period, the overall price increase was of 20%.

(Historical costs) Balance sheet at the 1st of January N

Table no. 1

Fixed assets Stocks (40 pieces*2 m.u./piece) Money supply	200 m.u. 80 m.u. 20 m.u.	Share capital	300 m.u.
Total assets	300 m.u.	Total liabilities	300 m.u.

Loss and gain account at the 31st of December N

Table no. 2

Elements	In historical costs	In historical costs modified depending on the evolution of the overall value of money
Sales incomes - the cost of the sold stocks - the building amortization Losses from owning monetary elements (money supply)	60 m.u. (20*3 m.u.) -40 m.u. (20*2 m.u.) -10m.u. (200*5%/year)	60 m.u. (20*3 m.u.) -48 m.u. (40*1,2) -12 m.u. (10*1,2) -4 m.u. (20*0,2)
Profit	10 m.u.	-4 m.u.

The balance sheet from the end of the N accounting period expressed in current value of money will be:

Balance sheet at the 31st of December N

Table no. 3

Gross fixed assets (200*1,2) - amortization Net fixed assets Stocks (40*1,2) Money supply (20 + 20*3 m.u)	240 m.u. -12 m.u 228 m.u. 48 m.u. 80 m.u.	Share capital (300*1,2) Profit/Loss	360 m.u. - 4 m.u.
Total assets	356 m.u.	Total liabilities	356 m.u.

The real profit computed as a difference between the capital accounts from the end of the accounting period and the capital accounts from the beginning of the accounting period adjusted with the overall price index is:

Pr = 356 m.u. – 300 m.u.*1,2

Pr = -4 m.u.

The monetary elements (cash assets and debts) stay recorded at their nominal value in the financial statements from the end of the accounting period. The difference between them will determine the gain/loss from owning monetary elements, which will appear as a different position in the loss and gain account.

In what concerns the non monetary elements, these will be recorded in the financial statement at their new value adjusted in counter trade with an element of expenses or incomes, from case to case, for the adjustments of the current year, and a resources account for the adjustments of the previous years.

In conclusion, the adjustment of the financial capital, with the purpose of its maintenance, will be done through the overall prices index. This perspective admits the effect of the inflation over the patrimonial monetary and non monetary elements as a component of the enterprise's result.

The enterprise's capital (physical) and its maintain

The general framework IASB defines in the paragraph 102 the concept of physical capital or "the exploitation capacity" as it follows: "*the capital represents the production capacity of the enterprise expressed, for instance, in production units per day"*.

The concept of maintaining the physical capital is defined in the paragraph 104 as it follows: "according to this concept, the profit is secured only when the productive physical capacity (exploitation capacity) of the enterprise at the end of the period surpasses the productive physical capacity from the beginning of the period, after the exclusion of all distribution towards the owners and of any contributions of the owners during the analyzed period."

The profit determined on the basis of the historical cost does not make the distinction between the profit resulting from exploitation and the profit resulting from owning goods whose current cost is higher than the cost to which they were achieved. These owning gains are not gains obtained during the maintenance of the goods in enterprise's possession, and when they are to be sold, they will be entirely recognized in the gains and losses account, even if they are due to more accounting periods.

The concept of maintaining the physical capital decides the extent to which these gains are included in the sharable profit. With the purpose of maintaining the productive capacity of the enterprise, the increase of the assets value, and the latent additional value, will be recorded in the resources category, in a distinct account "adjustment reserves". The maintenance of the enterprise's physical capital is possible only if these reserves are not sharable.

With the purpose of establishing the production capacity which needs to be maintained, the goods that are used within the production process (fixed assets and stocks) must be expressed in current values, and also in values into which they can exchange at a certain point using real basis.

Among the assessment bases which can be used in the assessment of the financial statements (historical cost, current cost, realizable value and present value), the current cost, the realizable value and the present value can be considered as forms of the current value.

As it is determined based on some objective values (book value, specific price index), the current cost is the assessment base used the most often in order to express the present value of the goods. *The current cost* is the delivered cost of an equivalent new good, to which a rectification for depreciation is applied. The current cost can also be determined by multiplying the book value of the good with a price index specific to that category of goods.

Starting from the previous numerical example and knowing that, at the end of the accounting period, the stocks replacing cost is of 2, 5 m.u./piece (it grew with 25% from the beginning of the period), and the replacing cost of the fixed assets is of 240 m.u. (it grew with 20% from the beginning of the period), the financial statements will be retreated with the purpose of maintaining the physical capital as it follows:

Loss and gain account at the 31st of December N

Table no. 4

Elements	**In historical costs**	**In current costs**
Sales incomes - the cost of the sold stocks - the building amortization	60 m.u. (20*3 u.m.) -40 m.u. (20*2 m.u.) -10 m.u. (200*5%/year)	60 m.u. (20*3 m.u.) -50 m.u. (20*2,5 m.u.) -12 m.u. (240*5%/year)
Profit	10 m.u	-2 m.u

Determining the capital gains

Table no. 5

Realized yield from the sold stocks owning (20*(2,5-2))	10 m.u.
Realized yield from the building owning – interest from yearly amortisation ((240-200)*5%/year)	2 m.u.
Unrealized yield from the unsold stocks owning (20*(2,5-2))	10 m.u.
Unrealized yield from building owning ((240-200)-2)	38 m.u.
Total owning income	60 m.u.

The balance sheet of the N period, expressed in current costs is:

Balance sheet at the 31st of December N

Table no. 6

Gross fixed assets	240m.u.		
-amortization (240*5%/year)	-12 m.u.	Share capital	300 m.u.
Net fixed assets	228 m.u.	Profit/Loss	
Stocks (20*2,5 m.u)	50 m.u.	Reserves of capital maintaining	-2 m.u.
Money supply (20+20*3m.u.)	80 m.u.		
			60 m.u.
Total assets	358 m.u.	Total liabilities	358 m.u.

The real profit, computed as the difference between the capital account from the end of the accounting period and the capital accounts from the beginning of the accounting period, adjusted with specific price index of the non monetary assets, is:

Pr = 358 m.u. – (200 m.u. * 1, 2 + 80 m.u. *1, 25 + 20)

Pr = -2 m.u.

The non monetary assets are presented in the balance sheet at present value, and the profit will be recognized by the enterprise only after its operational capacity was maintained.

The adjustments made to the financial statements with the purpose of maintaining the enterprise's production capacity, represent the objectives of the assessment based methods (current costs based methods). These methods are oriented towards the usage of the specific index for the value correction of different categories of goods, of the amortisements and of the sales cost.

In conclusion, the maintenance of the enterprise's physical capital is done through the specific price index of the non monetary assets, recognizing the profit only after the capital was maintained.

The maintenance of the owners' and enterprise's capital

As resulting from those mentioned above, the adjustments made in order to maintain the financial capital do not take into account the fact that most prices of certain goods can surpass the overall price changes, and this prejudices the maintenance of the physical capital.

Moreover, with the purpose of maintaining the physical capital the inflation impact is quantified only in the case of non monetary assets, without taking into consideration the influence that the inflation has over the monetary elements of the enterprise, and this way, the complete maintenance of the financial capital is not ensured.

In order to maintain the financial capital, as well as the physical capital, the profit must be corrected with the gain or with the loss from monetary elements owning and diminished with the gain owed to the value increase of the non monetary assets over an overall price increase.

In the balance sheet, the non monetary assets are to be presented to an adjusted value, adjustment made through the overall price index or through the specific price index, depending on which one id higher, and the non monetary liabilities are to be adjusted through the overall price index. The monetary elements will stay recorded in the balance sheet at their nominal value.

The gains resulting from the non monetary assets owning, whose specific price index surpasses the overall price index, will be recorded under the form of non sharable reserves, which will rise the enterprise's capital accounts.

With the purpose of preserving the financial and the physical capital, the capital accounts from the beginning of the accounting period are to be adjusted with the overall price index, except for the non monetary assets whose prices are higher than the overall prices increase, which are to be adjusted through the specific price index to the respective assets.

Starting from the same numerical example, the financial statements adjusted with the purpose of maintaining the financial capital, as well as the physical capital, are as it follows:

Loss and gain account at the 31st of December

Table no. 7

Elements	In historical costs	In historical costs adjusted with the purpose of maintaining the physical capital and the financial capital
Sales incomes	60 m.u. (20*3 m.u.)	60 m.u. (20*3 m.u.)
- the cost of the sold stocks	-40 m.u. (20*2 m.u.)	-50 m.u. (20*2,5m.u.)
- the building amortization	-10m.u. (200*5%/year)	-12 m.u. (10*1,2)
Losses from owning monetary elements (money supply)		-4 m.u. (20*0,2)
Profit	10 m.u.	-6 m.u.

Determining the capital gains

Table no.8

Realized yield from the sold stocks owning (20*2,5-40*1,2)	2 m.u.
Unrealized yield from the unsold stocks owning (20*2,5-20*2*1,2)	2 m.u.
Total owning income	4 m.u.

Balance sheet at the 31st of December N

Table no. 9

Gross fixed assets -amortization (240*5%/year) Net fixed assets Stocks (20*2,5 m.u) Money supply (20+20*3m.u.)	240m.u. -12 m.u. 228 m.u. 50 m.u. 80 m.u.	Share capital(300*1,2) Profit/Loss Reserves of capital maintaining	360 m.u. - 6 m.u. 4 m.u.
Total assets	358 m.u.	Total liabilities	358 m.u.

Pr = 358 – (200*1,2+80*1,25+20*1,2)

Pr = -6 m.u.

The capital accounts from the end of the accounting period expressed in real monetary units are of 358 m.u, and those from the beginning of the accounting period, adjusted with the purpose of expressing them in real monetary units are of 364 m.u., the difference between them representing the real loss, of 6 m.u.

If we compare the historical costs accounting system with the three accounting systems which have as purpose the maintenance of the capital in inflation conditions, we can see that historical costs profit is of 10 m.u., which is equal to a 4 m.u. loss if the financial capital is maintained, a 2 m.u. loss if the objective was the maintenance of the enterprise's production capacity and a 6 m.u. loss if the objective was the maintenance of the owners` capital, as well as of the enterprise's capital.

The choice of one of the capital preservation concepts is motivated by the requirements of the accounting information users, as well as their interest in maintaining the financial power of the invested capital or the operational capacity of the enterprise.

The maintenance of the financial capital is mainly preferred by owners, as it leads to the attainment of a maximum profit and to the maintenance of the capital value.

The physical concept of capital preservation is more attractive for an enterprise' managers and employees, which can consider that the objective of an enterprise is to perpetuate its existence, by providing future goods and services similar to those in the present.

Even if the enterprise's main objective is to maintain the physical capital, as the prices increase, the physical capital needs a higher financial capital, and this capital can be achieved by reinvesting the profit from the previous years or it can be brought by shareholders.

We can conclude that the objective which should be followed is to maintain the owners` possession in an inflationist environment and to maximize it, and this objective is also in compliance with the employees` requirements (jobs availability, safe wages, etc). This thing is to be achieved by the implementation of the inflation adjustment procedures of the enterprise's financial statements items.

The principle of continuous activity starts from the presumption that a company will continue its activity into the previewed future. Therefore, we presume that the company does not intend and does not need to terminate or to reduce in a significant way its activity; if there is such an intention or a need the financial situations might be imposed based on a different valuation base and in this situation the used based must be indicated.

If the continuity is insured the traditional accounting principles will continue to be applied, and the accounting works and the financial situations will be elaborated in a usual way, as during the previous periods.

If the company enters a discontinuity state the continuity principle is to be infringed because complying with it should take to distorted financial situations.

Keywords: principle of continuos activity,discontinuity activity, intangible assets and tangible assets

The companies from around the world elaborate based on the accounting data the financial situations (the balance sheet, the profit and loss account, the situation of the treasury flows, accounting policies and explanatory notes) in order to be presented to the external users.

The basic concepts stipulated by the General frame of elaborating and presenting the financial situations, elaborated by the Committee for International Accounting Standards (IAS) are the engagement accounting and the principle of continuous activity.

The principle of continuous activity starts from the presumption that a company will continue its activity into the previewed future. Therefore, we presume that the company does not intend and does not need to terminate or to reduce in a significant way its activity; if there is such an intention or a need the financial situations might be imposed based on a different valuation base and in this situation the used based must be indicated.[358]

The Romanians mainly respect the definition given by IASB: „The company normally continues its activity in a previewed future without entering the impossibility of continuing its activity or without significantly reduce it. If the company's administrators found out about some un-secure elements related to some events that may lead to its incapacity to continue its activity, these elements must be presented in the explanatory notes as well as the reasons that were at the base of the company's decision not to continue its activity anymore".[359]

It is obvious that this principle (postulate) has appeared together with the development of commerce, credit and business. Initially the companies have been created to be related to the life duration of their owners. The concept has been consolidated together with the appearance of shares companies.

[359] *Order of the public Financing Ministry no 94/2001 regarding accounting regulations harmonised with the Directive 4th of the European Economic Community (C.E.E)and the International Accounting Standards, O.M.F.P. no. 306/2002 for approving the Simplified accounting regulations harmonised with the european directives.*

Mainly, continuing the exploitation does not mean that the company has an unlimited life or permanence but it supposes that it will exist a long enough period so that the targets, previewed activities to be accomplished, the agreement to be respected, the companies existence being longer that the use period of its assets. It is an expression of what A. Marschall called "a longer period" as a subdivision of the economic time, where all the production factors are variable. This determines that the goods' valuation to be done based on their utility, presuming that the company's activity will maintain without any significant reduction in a previewed future.

Applying the principle of continuous activity needs the performance of the following requests in the accounting-financial field:

- separating the companies' activity during the financial exercises depending on which the following will be established: the patrimony's situation, the financial situation, the obtained results and the elaboration of the financial situations.
- limitation in time of the expenses and income;
- using the historic cost and the actual value in valuating the assets and passive, the expenses and the income;
- separating the assets in intangible assets and tangible assets and the passive in long term and short term passive;
- adapting the accounting to the inflation.

Jacques Richard identifies the origins of the continuity principle in the practice of the American companies between 1920-1930 and he wrote that „ companies can have longer life duration than the individuals that make them, they can transfer capital and their target is to insure an operational continuous cycle."[360]

From a juridical point of view,[361] the continuity postulate was mentioned for the first time in the Anglo-Saxon texts in 1971 (the English text SSAP no 2 and the American APB Statement no.4), and in 1974 in the IASC norm no.1, the Communitarian Europe mentioned the continuity principle in the UEE recommendation no 4 (1978) and the 4th Directive (1978).

Even if the French accounting plans from 1947 and 1957 did not mention this principle rules related to the continuous exploitation have been published, such as: immobilisation liquidation, valuation at historical costs etc., and the one in 1982 does not mention the continuity among the general principles, but it refers to it when considering the goods valuation and rules of presenting synthesis documents. Nevertheless the accounting law from 1983 and the Commercial Code mention this postulate in a distinctive article.

In the Anglo-Saxon world we talk about „going concern", like a fundamental working hypothesis, mentioned by the commercial code: „To elaborate the annual accounts either for an individual or a moral person, the trader continues his activities"[362].

The pregnancy of the continuity in exploitation, mentions Professor Robert Teller, from the Institute of Administrating Companies, Sophia Antipolis University, Nice, France, justifies by:[363] the hypothesis of continuity in exploitation is an implicit support, but an essential one of the accounting-financial information. The financial situations are used for obtaining a company diagnosis, by starting from the exploitation continuity presumption. IAS 1 „Presentation of the financial situations" sees the exploitation continuity presumption as a fundamental base in establishing financial situations. So in IAS 1 it is mentioned „the financial situations must be elaborated based on the activity's continuity, except the case when the management either intends to liquidate the company or to terminate its activity, or has other alternative"[364] .

The exploitation's continuity is rooted in practice and accounting doctrine, it is an implicit hypothesis of the traditional accounting model. This refers to the neo-classical model of a company that develops its

activity under the conditions of a pure and perfect competition of waiting conditions. An increase is possible, but it is regulated, balanced, without interruption, and the price variation is regulated by the market.

We consider that the logical consequences of these hypotheses formulated by R. Teller for the classical accounting model can be resumed as following:

- The model is universal and does not depend on time;
- It describes the economic agents' balance conditions correctly;
- It perfectly resumes the company's reality (balance sheet);
- The administration control can be resumed to a checking of the correct data (applying the principle of transparent information);
- The environment is stable; the risk related to exploitation is covered by previsions.

Appreciating the continuity criteria in this way is difficult, because in evaluating the company's activity, there are some subjective and objective factors. Therefore the European Federation of the Accounting Experts - the European Union of the Accounting Experts (F.E.E. – U.E.C.), referring to the continuity principle recommends: „This principle cannot be used in a valid way when it is not probable in a previewed future that the company may dispose of sufficient funds to regulate the debts in their payment terms or when a company that would be solvable there are doubtable external factors to determine it to stop its activity or to significantly reduce its volume. Normally, this situation will be valuated on the period after terminating the exercise and for which a previewed prevision is probable to be realized, a prevision to bring again into discussion the perspective of continuous activity"[365].

Usually, the exploitation's continuity is appreciated while elaborating the financial situations. The management analyses the effects that the technical, financial, commercial, social, external difficulties have on its activity in the future. They have sufficient data for such a valuation, that is: the financial situations from the last years, the previsions for the future activity, the market study for supplying and sale, due of some important debts, attracting supplementary financial resources, etc. While analysing the annual financial situations or other sources the auditor may see some clues to suggest the infringement of the activity continuity principle:[366]

Financial clues

- The net debt or the situation of the current net debt;
- Appreciating the expiration of the debts with fix deadline without realistic perspectives of renewing or reimbursement or relying too much on short term credits for financing long term activities;
- Financial unfavourable key clues;
- Substantial exploitation losses;
- Non-payments or interruptions in paying the dividends;
- Incapacity to pay creditors on the due date;
- changing the transactions on credit for transaction suppliers with payment on delivery;
- Incapacity to obtain financing for developing new essential products or for other essential investments.

Clues from exploitation

- The loss of key management members without the possibility to replace them;
- the loss of an important market, the licence or the main supplier;
- Difficulties with the labour force or the lack of important suppliers.

---

[365] Robert Obert, Eric Delesalle, Barthelemy Mercadal, Patrick Dalion, Gilles Nodel „*Law and accounting*". (traducere) Editura Economică Bucureşti 2002 p.96.

[366] Audit 2000 Standarde. *The code of the ethic and professional condition,* Editura Economică, Bucureşti, p.181 – 187. *Audit Standard No.570 The Principle of continuous activity*.

Other clues

- the non-conformance with the requests related to capital or with other statutory requests;
- Legal actions in progress against the entity that if successful may take to judicial decision that could not be respected;
- Legislation change or governmental political change.

The significance of such clues may be attenuated by a serial of factors. Such as the incapacity to reimburse debts on time can be counterbalanced by the management's plans to keep the cash flow obtained by assets transfer, rephrasing the reimbursement of debts or obtaining supplementary capital or losing a main supplier can be diminished by corresponding supplying alternative sources.

After analysing the criteria based on exploitation, financial situation and other criteria the administrators and the auditors of the financial situations can reach one of the following conclusions:

- the continuity state is obvious;
- continuity is uncertain;
- the company will enter a discontinuity state.

If the continuity is ensured, the traditional accounting principles such as: valuation of the transactions and events at historical costs, the permanence of the methods, continuity of exploitation, independence of exercises, the prudence principle etc. will continue to apply and the accounting works and financial situations will be elaborated as during the previous periods. In case of uncertainty, the situation changes, the principles of the traditional accounting cannot be applied anymore. It is obvious that the appearance of some uncertainties regarding the exploitation continuity does not justify the abandonment of the exploitation continuity, and in the explanatory notes their causes must be presented as well as the conditions that justify the maintenance of the continuity principle.

If the company enters a discontinuity state the infringement of the continuity principle is imposed, because complying with it will take to the distortion of the financial situations. Such an attitude may have the following consequences:the valuation of the patrimonial elements is done at the liquidation values (realized on the market) and not at the historical costs, by infringement of the methods permanence principle;the activity being terminated, there is no need to register the liquidation and to create previsions, the prudence principle being infringed;the stocks and debts will be devalued; expenses registrations and advance income are not justified; this will affect the principle of exercise independence;there is n o distinction between assets and circulant assets, debts on short and long term;involves expenses related to liquidations, indemnities for annulling contracts in progress, for firings, etc.

In a crisis period of the world's economy mentions Professor R. Teller, a period characterised by rupture situations, uncertain events, bankruptcies, activity decrease levels or week activity of the companies, the question is asked if it is correct to consider and implicit hypothesis of exploitation continuity? Must this hypothesis be rethought; is there no discontinuity of the company's activity?

The answer to such legitimate questions must start from the need to put an early diagnosis for each company depending on analysing the criteria based on exploitation, financial and other criteria (social, legislation, political etc.) regarding its difficulties, survival, restructure, merge, its development or liquidation. The principle of exploitation continuity is valid only when the continuity state is obvious or uncertain, difficulty repair measures can be taken. If the company enters a discontinuity state its reorganisation or liquidation is necessary.

Summary. The accounting systems of traditional administration have lost their credibility, in the sense in which the accounting information that they produce is lesser and lesser adequate to the action and the control of the modern enterprise, based on the diversity of the production and the multiplication of the combinations of goods and services for the satisfaction of the demand of a more and more differentiated custom. As a reaction to the limits of the classical methods of administration accounting, in the 1980s there was developed and implemented the ABC method, which is based on two complementary orientations: one concerning the calculation and the analysis of the costs and another that aims for it as an instrument of measuring the performances of the enterprise. It represents more of an evolution than a real revolution in the field of the administration accounting.

Key words: ABC method, cost inductor, pertinent cost, activity.

1. The premises of the organization of the calculation of costs through the ABC method

The economical environment most enterprises are part of knew important mutations in the last decades. They can be synthesized in three major evolutions:

- the development of globalisation phenomena and the increase of competition'
- disfunctionalities that can appear in industry and services;
- the acceleration of the technological innovation.

In this context the administration accountancy must answer to the following problems:

a) the variation of the production and the multiplication of the combinations of goods and services for the satisfaction of the demand of a more and more differentiated custom. On the hand, the enterprise must administrate from now on, at the same time, the two components of the profit: the value, which is fixed by the client, and the conversion value and, on the other hand, the production of an enterprise can be represented through a continuous good-service, in a diversity of combinations products-services, going from the pure physical good to the pure service (the informational sector constitutes an excellent example of this evolution).

b) the development of the support activities. The production function loses from its importance in the economy of the last decades in favour of the activities downstream and upstream. Beside the sold product, there also generates value for client the complex of services associated to it, offered through these support activities (delivery, installation, formation, service, etc.), and in this context the classical systems of administration accountancy must answer to the following question: how is determined the cost of the resources consumed by the customers if the administration accountancy system is organized on the fundamental principle that the resources are consumed by products?

c) The structure of the costs of the enterprise has radically changed in numerous industrial sectors. The automation of the industrial production processes led to the modification of the structure of costs. Thus, it arrived, from a structure of costs in which the raw materials represented 40-50% from the total cost of production, while the materials, which represent 29% to 70% from costs, constitute indirect expenses (for example, the electronic industry).

In this new structure of costs, in which there increased the weight of the indirect expenses of production, the adequate distribution of indirect expenses between products becomes preponderant and the use of the division key hour-worker or our-machine, used in the classical accounting systems, is no longer adequate.

On the other hand, in the last 20 years, in many enterprises, the part represented by the conversion values have constantly diminished in the global cost of the enterprise (approximately 40% from total cost of the enterprise) and has increased the weight of the activities of marketing and/or research (approximately the same weight).

In such a context the performance of the enterprise doesn't depend on a single factor of production, direct labour, which, in these cases doesn't represent but a minimum part of the total cost. So, the performance of the enterprise results from a combination of factors as: the minimum price, the maximum quality, the respect of the delivery terms, etc.

d) the functional control of the resources.

The instability and the uncertainty that characterize more and more the environment in numerous enterprises put in difficulty the possibility of the assurance of the coordination of different activities of the enterprise through the budget and, also, lets the different responsibility centre take decisions of local optimization without taking into consideration the impact that they have (their decisions) on the other structural units of the enterprise.

The informational accounting systems must be built in such manner that they generate pertinent information for the processes in the enterprise.

e) the pertinence of the production volume as unique inductor of the cost.

The passage from an economy of offer to one of demand and the multiplication of products that result have modified the causality structure of the costs of the enterprise. Beside the production volume that constitutes, undoubtedly, the predominant cost inductor of the enterprise and other cost indicators like: the diversity of the production and the complexity of the processes of production, get a certain importance to explain the causality of the structure of costs. The increase of the number of cost inductors makes that the adequate representation of the consumption of resources of the enterprise be complex.

In conclusion, it is asked the question: how much pertinent can be accounting systems based on a taylorian representation of the enterprise for the orientation of the administration and the assurance of the control of the enterprise, permanently confronted with the change and the complexity? The answer is that the administration accountancy systems, which inspire from the taylorian vision of the organization of the production, have lost their credibility, in the sense in which the accounting information that they produce is less and less adequate to the action and the control of the enterprise.

2. The general presentation of the ABC method

To remove the limits of the classical administration accountancy systems, which have at their basis the taylorian organization of the enterprise, some American enterprises began to develop, in 1980s, administration accountancy system based on the representation of the enterprise going from its activities. A close analysis of this accounting systems show that, in fact, it's rather about more of an evolution of the classical systems than a real revolution in the conception of the administration accountancy systems.

Synthetically, two major changes distinguish the accountancy systems on the basis of classical systems activities:

- - an other modality of division the indirect expenses on the bearers of costs, through centres of accounting regrouping based on activities and not through functional centres of responsibility;
- - it is resorted to a bigger diversity of the basis of division for the allocation of the cost of the analysis centres at the bearers of costs.

Through the brought innovations, the ABC method produces a more pertinent cost, because there is a relation cause-effect between the activity and the product that consumes the activity. From the point of view of the construction of a system of administration accountancy, the activity becomes the centres of representation and modelling of the enterprise. The activity serves as an interface between the consumed resources and the bearers of costs the cost of which we want to measure. It allows a new vision in the cutting up of enterprise, the transversal vision, which replace the vertical one, respectively the cutting up on functions. In this way there is obtained a more real cost, on the basis of which there can be taken strategically decisions, through the non-creative activities of value and the division of expenses, using as basis the activity that generates them.

The ABC method has at basis two fundamental principles, and namely:

- the activities consume the resources of the enterprise;
- the products consume the activities.

Within the ABC method, the treatment of the direct expenses is alike the one in the classical systems, respectively direct allocation on the bearers of costs. The indirect expenses make the object of a different treatment, the procedure of their allocation on the bearers of costs, supposing two stages:

- the division of the indirect expenses between the centre of accounting regrouping established on the basis of the activities;
- the allocation of the cost of the activities on the bearers of costs according to the consummation of the activities.

The ABC method has at basis two complementary orientations: one concerning the calculation and the analysis of costs and other that aims it as a measurement instrument of the performances of the enterprise, which will be followingly presented;

3. The calculation of costs through the ABC method

The organization of the calculation of costs through the ABC method supposes the going over of the next stages:

- the identification of the activities and of the due costs;
- the establishment of the cost inductors of the activity;
- the regrouping of the activities in homogenous centres;
- the allocation of the costs of the activities at the calculation objects.

a) The identification of the activities and of the due costs. The analysis of the activities in the first stage in the construction of an ABC systems and presents a big importance, because according to this initial stage is determined the nature of the administration information produced in future by the ABC system, on long term. The knowledge of the finalities of the accountancy system on the basis of activities will direct the labour of the identification of the activities and the degree of detailation of the analysis. The calculation of cost needs, in most cases, the identification of 30 up to 40 big activities; following, a measure of the profound analysis and of the reconfiguration of the processes demands a much more detailed analysis which allow the identification of various activities in an enterprise. In this essential to be determined for each activity the responsibility centre of which it is attached to identify the person that can take the administration decisions relative to the activity. Without this connection with the structure of responsibilities it is not possible the control of the cost of the activities. The regrouping of the activities in administration processes allows to be determined, through the aggregation of the cost of activities, the cost of the process. Some authors have introduced a distinction between the activities creating of value and those that don't create value, with the purpose to concentrate the efforts of reducing the costs on the non-creative activities of tax-added, without diminishing the offered value to the final client. After the activities were identified, it is proceeded to the determination of the costs of the resources consumed by the activities. Although certain consumptions of resources are indirect in comparison with the products, they are still direct towards the activities, which makes that the resources consumed by the support activities not be divided in the cost of the products in comparison to the arbitrary division bases. Actually, one of the basis principles of the ABC method relies precisely in the more realistic division of the indirect expenses on the products, in comparison with the classical methods of calculation of costs.

b) The establishment of the cost inductors of the activities. The cost inductors represent the innovating part of the ABC method, but are, at the same time, the more expensive aspect.

The cost inductor constitutes a causality factor of the cost of the object of calculation and, particularly, of the activity. The knowledge of the inductors of cost of the activities is essential for an administration of the activities in view of the reduction of their cost.

The cost inductors allow the allocation of the cost of the activities on the calculation objects, they serving as measurement instrument of the volume of the provided prestations.

In the context of the administration of the activities, the choice of a cost inductor can be oriented in view of the attaining of two different objectives:

- the representation of the consumption of resources in activities by the objects of calculation;
- the orientation of the employees' behaviour, choosing as cost inductors those that determine the members of the enterprise to take decisions referring to the consumption of the activities allow the realization of the strategically objectives of the enterprise.

c) The regrouping of activities in homogenous centres. The activities that have the same cost inductors will be grouped in a single centre of accounting regrouping on the basis of activities, without being affected the quality of the allocation of activities on the objects of calculation. Generally, in a enterprise there can be identified 200 up to 300 different activities. The making of 200 up to 300 centres of accounting regrouping of indirect expenses can lead to an accounting system that is extremely voluminous and that is why the management must realize a compromise between the simplicity of the model of accounting representation of the enterprise (reduced number of activities and cost inductors) and the precision of the provided accounting information (the detailed ensemble of the activities and of the cost inductors). That's why it is imposed the regrouping of the activities, it must be done in comparison with the factors of causality (the cost inductors) so that the distortion risks, in the calculation of the cost of the objects of calculation be minimum.

d) The allocation of the cost of the activities on the objects of calculation. For the determination of the complete cost of the objects of calculation, the next stage relies in the division of the indirect expenses on the objects of calculation, between the analysis centres on the basis of activities. This primary division of the indirect expenses between the analysis centres on the basis of activities, can be done after two ways that correspond to two types of indirect expenses:

- the indirect expenses that are directly attachable to a centre of activities. In this case, the indirect expenses are directly affected, as also in the case of the direct expenses of the products;
- the indirect expenses both towards the objects of calculation, and towards the analysis centres on the basis activities. They can not be directly imputed and must make the object of a division between the different analysis centres on the basis of activities, using a division key, more or less arbitrary, which can lead to distortions in the calculation of the cost. In the conception of the ABC method, the cost of the objects of calculation (products, technological installations, customers, etc.) is formed by the direct expenses at which it is added the cost of the consumed activities, the latter being obtained through the weight of the unitary cost of every inductor with the volume of the inductors used for the obtaining of every calculation object.

The adoption of the ABC system for the calculation of the complete costs of the products has a bigger impact on the effective level of cost and, so, of the profit margins, when there are accomplished two conditions:

- the part of indirect expenses due to the support activities for the production increases in the structure of the total costs of the enterprise;
- the diversity of the products or the services offered to clients is increasing.

Conclusions

We appreciate that the introduction of the ABC method, as a reaction to the limits of the classical methods of administration accountancy, generates a series of mutations in the administration of the enterprise, and namely:

- **the administration through activities** allows continuous improvement of the performance through the identification of the ensemble of activities, cost and relations of cause-effect between the activities. **On other hand, the map of the activities allows the heading of the managers' attention towards:**
- **the activities that represent the most important cost for the enterprise and, so, the most important potential of the reduction of costs;**
- **the non-creative activities of value the elimination of which would allow the diminishing of the costs of the enterprise, without a reduction of the value of the product offered to the customers;**
- **the comparison between various entities of the enterprise (factories, sections, workshops, etc) in what concerns the performance level attained in the realization of an activity. The most performing entity, in the putting into practice of the activity, becomes thus the reference for the realization of this activity in the ensemble of the group and indicates ways of continuous improvement of the performance. The comparison can also be made through the comparison to a reference point external to the enterprise, as it is, for example, the enterprise considered the most performing in the sector.**
- **it shows the impact of a decision taken concerning an activity on other activities structurally comprised in another function of the enterprise.** A concrete example is represented by the choice of the solution in view of the conception of the product because 80% up to 90% from the value of the product is definitely fixed in the moment of the conception phase. All the actions of reduction of the value, which is limited to the production operations, won't lead but to minimum results.
- identifies the causes of costs better than the classical methods, which leads to the increase of accuracy and pertinence of the obtained costs, and also to the use of the information about the cost in different purposes within the enterprise.

This thing is realized through ABM (Activity-Based Management), as it will be presented in a separate article. The improvement of the quality of the accounting information about costs allows the taking of the best decisions in what concerns the politics of the product, the externalisation or the fabrication by the enterprise of some products or components, the orientation to the client.

With all these advantages, the ABC method represents more of an evolution than a real revolution in the field of the administration accountancy. The ensemble of the concepts and the fundamental principles that stay at the basis of the classical administration accountancy systems are found put into practice by accountancy through activities.

The two mains changes brought by the ABC systems refer, actually, to the application of the fundamental principles. On the one hand, the criterion of the regrouping of the indirect expenses in analysis centres is done on the basis of the attachment of resources to the activities that consume them, and not on the basis of the belonging to a responsibility centre. The regrouping way doesn't put into discussion the principle of treatment of the indirect expenses in the calculation of the complete cost. On the other hand, the introduction of the cost inductors for the division of the expenses in the analysis centres on the objects of calculation is an application of another calculation principle of the complete cost, respectively the division of the indirect expenses on the basis of some division keys. From a strictly accounting point of view, the contribution of accountancy through activities is limitation itself, through, to a **reactualization of the classical model of the administration accountancy, to adapt it to an economical and technological environment that has evolved in terms of complexity of the processes of production and of diversity of products, to satisfy a demand of a more and more exacting custom, whose satisfaction determines the performance of the enterprise.**

The vision of the enterprise as an ensemble of activities and processes before becoming an ensemble of responsibility and functions centres imposes it self more and more in different science domains of the administration. **The most interesting contribution of the ABC system is, undoubtedly, that it articulate the existent administration system with the representation through activities and provides information to those with decisional power to letter administrate the activities.** The analysis through activities has the big merit to place in the centre of the accounting preoccupations the care to generate information that is pertinent for the taking of the decisions in the enterprise. It undoubtedly allows to be better redefined the role that the administration accountancy can have in the taking of the operational and strategically decision in the enterprise.

Abstract. Since 1 January 2005 European listed companies have to start using new International Accounting Standards (IAS /IFRS). It is an important chance for studying the relationship between accounting information's and financial markets. Since quality, transparency and comparability of financial information's reported by companies affect the informational and a locative efficiency of capital market, European Union has carried out a global accounting harmonization process that has been achieved by setting common accounting standards (IAS/IFRS). The basic idea of this harmonization process is to improve the relevant characteristics of information's made available by the firms. Although we think this accounting harmonization process is important and it can be the right way to improve informational efficiency of financial markets, we think it is necessary to further investigate some crucial topics.

Keywords: international accounting standards, financial statements, earning quality, fair value.

During the transition process to the market economy, Romania looked for a special way in the accounting implementation and regulation. The International Financial Reporting Standards (IFRS) represent generally approved accountancy rules, accepted by all the world countries, able to harmonize to a larger extent the accountancy standards and procedures used in different countries.

Starting with 1st January 2005, our country, as all the other countries of the European Union started to apply a certain system based on International Financial Reporting Standards (IFRS) for the rated companies and especially groups, which will allow the implementation of the best practices at the world level. Therefore, at the national level, the normalizes have to give up their old accountancy techniques and practices in order to facilitate the continuation of the reform in accountancy and of its evolution. The accountancy system in Romania proves nowadays to be broader regarding the national and international accountancy field in order to elaborate certain economic and accounting models and balances at a macro-economic level.

In the transitional process to market economy, Romania searched for at own road in the accountancy regulation and implementation. Until 1990, Romania adopted a monist bookkeeping system, based on excessive standards. From 1994, this system was dropped, and adopted a new one, the dudist one – which is a Latino European origin, based on the French General Accountancy Plan.

New international accounting standards are very close to the experience of market oriented countries (U.S. and Great Britain) where accounting information's addresses investors. Vice versa in the other European Countries accounting information's address many other groups, as creditors and state treasury. We wonder how financial information reporting will change.

Which will be the degree of compliance with new accounting rules? Will the companies adopt just the compulsory disclosure or will they choose a voluntary disclosure too? The discussion on many accounting standards is still open and some more changes and amendments are likely to come. By studying the United State previous experience is it possible to identify some critical points for European countries? Finally, will international accounting rules be able to truly improve the quality of public financial information? Will they be useful for market? As many observers argue, will there be a trade-off between information relevance and reliability?

The accountancy reform in Roumania commenced in 1991, by adopting the accountancy law - continued through HG (Government Decision) no.704/1993, was consolidated by adopting OMFP 403/1999, replaced with OMFP 94/2001 and OMFP 306/2002 (OMFP=Public Finances Ministry's Order), through those being harmonized with European Directives and the International Accountancy Standards. Public interests entities (such as credit institutions, assurance companies etc), in consequence with OMFP 907/2005, can draw up financial situations, according with International Financial Reporting Standards, for informing the users, other than state's institutions, in accordance with their opinion, and only if they have a proper implementation capacity. In order to apply these regulations, the Public Finances Ministry issued OMFP 1752/2005, abrogating OMFP 94/2001 and OMFP 306/2002. Beginning with 2006, most of the entities from Romania are applying the bookkeeping regulations according to European Directives – the 6^{th} directive concerning the annual accounts, and the 7^{th} directive, concerning the consolidated accounts. Carried out bookkeeping reforms after 1990, determined a connection of some specific concepts, such as: normalization, harmonization, conformability etc.

Accountancy normalization = defined as a process which presents general concepts and principles and bookkeeping norms based on a précised terminology, identical for all the users and producers of accountancy information, fully or partially applicable in a assemble of countries, enterprises or accountants. The purpose of accountancy normalization consists in bookkeeping norm elaboration, as a reference system for the production of accountancy information, and the social validation of financial situations. Accountancy harmonization = represents the process that harmonizes the rules or norms different from a country to other, in order to be concluded, and to be interpreted all the same.

In our country, the harmonizing process is carried out in 2 levels:

- the European level – by implementing the directives 4^{th}, 7^{th} and 8^{th}.
- the international level, for big and very big entities, by implementation of International Standards of Financial Reporting (IAS/IFRS).
- These 2 harmonizing landings have as a basis 2 levels:
- the European level – by implementing the CEE directives 6^{th}, 7^{th} and 8^{th}
- the international level, for big and very big entities, by implementation of International Financial Reporting Standard.

The accountancy convergence presumes the focalization of all the bookkeeping activities in the same direction, but most of all the drawing of the annual financial activities, at the end of the exercise, these being targets depending on the databases adoption for the financial year. The accountancy convergence consists in orientating the whole activity into producing those information that are useful in elaborating financial situations, and which includes parameters, variables and unitary indicators for all the economical entities. Accountancy conformity pictures the adaptability that national standards, concerning the bookkeeping domain, can take it to other similar (ex: European Directives), which are highly generalized, representative and acceptable.

The Romanian regulations concerning accountancy, firstly pictures the CEE directives conformation, (4^{th}, 7^{th}, 8^{th}), and then The International Standards of Financial Reporting.The 4^{th} directive, adopted in 1998, refers, through its articles, to evaluation rules, published financial situation formats, and the demands concerning the financial communication, aspects that cover the problematical of un-comprised companies to financial groups, but analyzed individually.

Following the adoption of the 4^{th} directive, and knowing the financial globalization phenomenon, and the international standards evolution, the European device included in the 7^{th} section new rules that are relying on the evaluation system, based on the true value. The 7^{th} directive, adopted in 1983, aims the consolidated accounts, namely the drawn financial studies, presented and published in order to offer information about the financial position, performances and evolutions of companies and groups – which are a weight in the world-wide economy.The European regulations foresees that accountancy directives will continue to apply to quoted companies, which will publish financial situations in accordance to The International Standards of Financial Reporting (IFRS). As consequence, there was necessary a revision of accountancy directives, in order to modernize them and to be compatible with the present and future International Standards of Financial Reporting.

So, the European Parliament and the European Union's Council, adopted, in 2003, 2003/51/CE Directive which refers to European accountancy texts modernization and actualization, supplementing the European regulation IFRS 2005, being transposed into the national rights of all the EU members, starting with January 2005. Many Italian authors have written books and articles regarding consolidated financial statements and the main problems connected to them. For this reason, national references are consistent and numerous, as shown in the references (some citations: Andrei, 1994; Brunetti, 1987; Caramel, 1995; Lai, 1994; Mella, 1985; Provasoli, 1988 e 1997). This paper unit will start from the national contributions on these themes, which will be analysed in detail, and with a study of international publications regarding group accounts and related topics.

The main emphasis will be given to the impact of the adoption of international accounting standards (IAS/IFRS) on consolidated financial statements in terms of representation, valuation and financial communication to the shareholders and, above all, to the stakeholders.Each argument will be critically reviewed in order to consider its impact on "earnings quality" production and representation in public consolidated Annual Reports. The objective of International Accounting Standards Board (IASB) is actually to produce a single set of high-quality global standards (IASB, December 2003).According to this declared objective and also to the activity of the Italian Accounting Standards Organism ("Organismo Italiano di Contabilità", OIC), the paper team has committed itself to study critically the transition from national to international Accounting standards in Italy. In doing so, the paper intend to look at national standards throughout the world (with particular reference to the USA and the UK) and select a sort of "best practice" global accounting standards.The study will be conducted on the basis of Italian groups of companies listed on the Milan Stock Exchange. As a matter of fact, these companies will have to adopt IAS/IFRS starting from 2005 (Pierce, Brennan, 2003). Moving towards IAS/IFRS seems to be a very strong effort, both in relation to the phases of the consolidation procedure, and as to the more relevant (than today's) problems that will emerge during and at the end of the same transition process. It is also remarkable that - as a consequence of some world known financial scandals - true and fair financial statements and the need to apply generally accepted international accounting standards are clearly pressing problems for standard setters worldwide. For major companies, the group accounts are the statements to which most attention is paid. Worldwide, however, there are disputes about the way in which such accounts are compiled.

Consolidation involves theories about the composition of the group itself; moreover, arguments abound internationally over whether control of the operating and financial policies of the Board should take precedence over the ownership of 50%+1 of the voting equity; issues are raised about accounting for joint ventures which are not subsidiaries but operations involving joint control; problems relates even accounting for goodwill and consolidation differences, so as their evaluation; also the introduction of mandatory cash flow statements will be of strong impact and evidence for Italian groups of companies; even more difficult questions arise over special purpose entities and ‘quasi subsidiaries'; and many other themes.

Every topic will be dealt with critically and in a view of comparison between Italy and the international arena. The aim is to analyse existing interpretations and comments and to produce new ones which could be useful for Italian groups starting to manage this challenging process following to the EU Regulation n. 1606/2002 (and subsequent Directives and implementation documents). Above mentioned studies refer to one specific branch of literature that examines the value relevance of accounting information and the relation between capital markets and accounting information’s. The purpose of these studies is to measure the value relevance of information by using the association between earnings and stock prices or returns and by observing the adjustment of prices to specific new informations.

Through this kind of tests it is possible to infer the market efficiency from the observed independence of successive price changes. In an efficient market, stock prices adjust rapidly to new informations. The basic idea which such kind of analysis underlies is that persistent and systematic abnormal earnings are inconsistent with the so-called efficient market hypothesis, which in turn suggests that financial markets handle information efficiently, and drive managers' and shareholders' behaviours. The amount of paper on event studies is large, both on theoretical and empirical perspectives. On the one hand, theoretical studies look so advanced that it is thought that "much is known about how to do – and how not to do – an event study" (Khotari e Warner, 2005). On this side, other important papers are due to Peterson (1989), Armitage (1995) e McWilliams e Siegel (1997). On the other hand, the empirical line of paper focuses mainly on both cross-sectional and time series approaches. The aim of paperers applying cross-sectional studies has often been testing whether the expected value of a distribution of abnormal earnings (earnings which are not in line with the ones which should result from market forces) is inconsistent with the one implied by some theoretical models; some of these studies, moreover, also verify whether and to what extent empirical and theoretical distributions differ in high order moments. Instead, the strand of literature using time series frameworks aims to study earnings persistence in the time span immediately following the event that is being studied.

In our paper the most important branch of event study literature is the one focusing on the consequences of accounting standards changes. In this sense, several former studies focus on the reasons driving accounting rules' changes instead of examining ex ante and ex post consequences of these changes. On the other hand, financial markets development and the growing complexity of organizational structure of firms make further paperes indispensable in order to evaluate the impact of accounting rules' changes. According to this perspective, new accounting rules, compulsory for all European listed companies, are an important chance for realising an event study; the relevance of this coming accounting changes is demonstrated if we consider that so far it was impossible to test market reaction to accounting changes just because there was never been a similar revolution in accounting rules. Actually former literature (for example Ball, 1972; Dharan and Lev, 1993) juts investigated the effects of changes in specific accounting standards or criteria but not the effects of changes in all the accounting system. Another branch of the literature examined the investors reaction whether firms using national or international accounting standards – Bartov et al. (2000) analysed Deutsche firms, Auer (1996), Caramanolis and Cotelli (1999) analysed Swiss firms. These studies show that information is more relevant when it is presented under IAS. These results are consistent with European Union premises that focus the attention on the investors needs accordingly to US and UK accounting models. Nevertheless the discussion regarding some IAS critical points is still open both in Europe and US. Several authors doubt whether firms from Continental Europe will be in a position to adapt to new accounting standards and some authors expect that introduction of IAS should even bring short-term confusion and a reduction in transparency and results comparability until initial stage will be overtook (Stittle, 2004).

Conclusions

As conclusion, the adoption of international standards has as priorities:

- setting up conditions for a integrated and efficacious capital market, returning balance sheets (most of those comparable on the unique market), allowing concurrence rising, and promoting capital circulation
- necessity for adopting a regulation that can manage if the quoted companies from the EU applied correctly the IAS until 2005 (credibility, concurrence, evaluation)
- applying these standards has to lead to an authentically vision of the financial position of an economical entity, and contributes to European public interest, and has to respect all the criteria concerning the quality of expected information.

The objective of International Accounting Standards Board (IASB) is actually to produce a single set of high-quality global standards (IASB, December 2003).

According to this declared objective and also to the activity of the Italian Accounting Standards Organism ("Organismo Italiano di Contabilità", OIC), the paper team has committed itself to study critically the transition from national to international Accounting standards in Italy. The Romanian enterprises make out their own balances, in accordance to a system of laws and regulations differentiated on economic activity sectors, on juridical nature of the economic entity, on its dimension, on quoted and unquoted companies.

As it is known, OMFP no.1752/2005, actually replaced with OMFP no. 2374 of 12/12/2007 (MO no. 25 of 14th January 2008), inserts Directive IV (no. 78/660) and Directive VII (83/349) of EEC, foresaw specific diagrams of yearly financial situations and enlarged the accountancy evaluation criteria, which the economical entities have to use towards those used until then. CECAR, AGER, etc and other professional organizations, upon basis of required regulations have as main aim the integration and interpretation, of the standards content, if necessary. The compulsory introducing of IAS/IFRS issued by IASB for the groups of quoted companies, on elaborating the reinforced balance and extending the obligation for all entities impose a significant changing; it won't deal just by problems of technical character, by formal changes within emphasizing and presenting process of information on financial situations, by applying IAS/IFRS in Romania and Europe, but assuming first after all understanding the cultural vision, of background philosophy, which underlain all standards. In accordance to international opinion, the balance principles represent a tool that aims towards making efficient the markets functioning, on rationalizing the financial resources, on efficient protecting of investors and tracking the public and collective interest. It is obviously that the assimilation process of accountancy standards culture will have repercussions on medium and short term over the management controlling system, and over the informational system, in forthwith time

Babeş-Bolyai University, Cluj-Napoca, Faculty of Economical Science and Business Administration, St. Teodor Mihali, No. 58-60, 400591, Romania, botaavramflorin@yahoo.com***, Tel: 0740-886491***

Abstract: The concept of "true and fair view" is a very subjective one , which didn't find yet the definition general accepted and in this way we can't say that there are relevant instruments for measuring the level of the fidelity reflected in the financial statements. The financial audit plays an important role for delimitating the true and fair view supplied by the financial statements and despite the fact that the financial auditors are consciences that there isn't a mathematical formula or other kind of formula through which could be possible to measure the level of the fidelity and the true and fair view of the financial statement, they consider that they have the possibility to identify the situations in which the financial statements didn't present the reality true and fair, using the professional though to determine the level of the financial statements to give a true and fair view We have made an empirical survey which permits us to analyze the quality of the true and fair view supplied by the financial statements from the point of view of the financial auditor, without having the pretentious of using all the significant aspects.

Key words: true and fair view, financial audit, survey, financial auditor, financial statements

1. Introduction – motivation and importance of the research

The fidelity represents that characteristic, quality of the accounting information through "which are reproduced or which follow précised, exactly a model, a norm, an object"[367]. The image represents the reflection of an object in the conscience as a sensation, perception or representation or in the same time the image represents the reproduction of an object by the optical system; plastically, representation through drawing, painting, sculpture etc. is the artistic reflection of the reality, also through words[368].

In this way, the accuracy of the accounting information is the representation in the financial statements of the economic reality as accurate as possible, reproducing the company's activity in the documents of the accounting synthesis. In other words, there must be a very well defined two-way connection (through norms, rules and principles) between the activity of transposing the financial and economic activity of the company (the domain of definition of the accounting functions) in the financial statements (the co-domain of definition of the accounting functions, where represents abstract the financial position, financial performances, treasury flows and the other information referring to the developed activity) and the real situation of the company. If we start from the idea: "The true and fair view could not be confounded with the exactly copy of the economical reality, but is represented by the image in which we could have trust, to whom we can give credit."[369] we can say that an very important role in the assurance of the true and fair view of the accounting information has the auditor, the person called to assure, to guarantee the trust of the users of the supplied information.

2. Research methodology

For realizing the proposed objectives, we have made an empirical study, based on the survey where the subjects to whom the questions were addressed had been the financial auditors from Romania, which activate in different organizations, and their selection was made from the active members of the Chamber of Financial Auditors from Romania. The conception of this survey is based in an objective mode on the research from the domain till present, using the aspects find in the studied works, the scope was that of adding to this theoretical aspects the practical conclusions regarding **the analyze of the quality of the true and fair image supplied by the financial statements, from the financial auditors point of view**. Corroborated with the survey techniques, we use the sampling, which use the sample as a researching tool. The sample represents a subpopulation of the statistical population studied, and this subpopulation is selected in the mode of keeping the characteristics of the whole population. The method used for the sample realization was **multistage sampling**[370], which suppose to group the population on subgroups, selecting from this a sample of groups, and from every group we select using a statistical step a number of subjects. After the sample was made we sent through the email the survey, and after feed back from subjects we process the data and analyze it for getting the answers to the objective initially settled to be touched at the final of the survey.

3. The techniques used in collecting the data, respective to accomplish the sample

In this study we use the technique of the sample survey the questionnaire. The questionnaire represents the technique of collection of information, which includes a list of questions, composed in that way of generating the possibilities of the results which permits to get the objectives previous settled. For the distribution of this questionnaire we chose the email, because direct survey is a little difficult for the accomplishing the condition of distributed subject's on the whole geographical territory of Romania, and to approaching the financial auditors from all the countries of Romania, giving in this way a higher relevance for the study. We paid attention for the conception of the questionnaire regarding the format, the content and the way of expression, for assuring for the subjects a large freedom of expression. Also we try to find the best formula of questionnaire for avoiding the boring of the respondent, the subject to spend few time for answering (optimal time for keeping the interest for subjects is 5 minutes in completion of the questionnaire), but in the same time we need the answers which gives us the finality in the objectives previous settled at the staring of the research.

We compose the sample by using few alternatives:

- We use the database from www.cafr.ro, The Chamber of Financial Auditors from Romania, where we find all the financial auditors from Romania. Respecting the initial grouping of the financial auditors, settled at the start of the research, we get 21 countries from 42 of all, and from every country we chose a number of financial auditors respecting the rate of auditors from that country relative to whole number of auditors from Romania.
- Second alternative was the approaching the group of Big Four: Price Waterhouse Coopers, Ernest&Young, KPMG, Deloitte & Touche, by contacting some senior managers which we pleased them to help us in contacting experienced financial auditors, who activate in this institutions.
- The last alternative which we used was building of a data base with the same rules: grouping on the countries the companies of audit and consultancy, other those from Big Four, randomizing a number of these companies of consultancy and financial audit.

From every group we select a number of 10 till 35 subjects, considering the level of every group (country). We use systematical sampling, using Ms Excel tool, and we carry in excel all the selected subjects alphabetically sorted and the auditors which should be the subjects of the research was extracted conform to the sampling step[371]. If the **N** is the selected population, for choosing of the sample with **n** subjects, the sampling step is resulted from the rate **k= N/n,** this rate mean that the **k**-th element will be member of the

[370] Rotariu, T.& Iluț, P.(2006), *Ancheta sociologică şi sondajul de opinie: teorie şi practică,* Ed. a 2-a, Editura Polirom, Iaşi

[371] Rotariu, T.& Iluț, P.(2006), *Ancheta sociologică şi sondajul de opinie: teorie şi practică,* Ed. a 2-a, Editura Polirom, Iaşi

sample. From the K subjects from the selected list we extract a random one, the **m**-th, the next subjects are extracted through a order number at which we add the step **k.** Result a component of the sample:

$$\mathbf{E = \{m, m+k, m+2k, ...\}}$$

So in the firs phase of the sampling we select a number of 1027 of the financial auditors, after this on the systematical sampling we select 673 subjects, which also was included in the sample. For collecting the data we use the site www.cafr.ro , where we find contacts for selected subjects. After this, every selected auditor was contacted through email, presenting the research developed, we underline the scope of the research, and also the objectives settled, with specification of the institution who gives me support in this research. We consider important the reaction of the subjects regarding the first action (deleted email, reading email – options of the outlook). We ask through Outlook the responses. In every email we attach the questionnaire in Word documents, completion of this being very facile, by marking with X in the box corresponding to the answer selected by the subject, and returning the attached document through email. In this stage we create the necessary framework for picking the data, after this step we wait for feedback, and after this we continue with the stage of synthesizing and processing the information for the final conclusions.

3. Presenting the picked data and analyzing the results of the research

The answers received after sending on email the questionnaire, was centralized in an Excel file, and this facilitate the management of the data easer for an analyzing and for conclusion. We respect all the conditions for assuring the maximizing the number of answers received. The rate of answers in our research is 12.9% (87 valid questionnaires from 673 subjects). From the total of subjects who give feed back to this research, 43 was auditors from group of Big Four; and 29 financial auditors who activate in audit and consultancy companies, others than group Big Four; and 15 auditors were independents.

For assuring the relevance of the conclusions, a question for subjects was regarding the professional experience as financial auditor, looking for number of missions at which participate till the date of the research (period of the research was 04.01.2008-04.02.2008). This question was settled considering that a higher experience of the subjects from the sample assure a higher relevance of the conclusion extracted, diminishing the disadvantages of the small number of answers, not very high from the total of sample selected (but relevant).

2. How many financial audit missions in the last 5 years have you done?	
	1-5 financial audit missions
	5-15 financial audit missions
	15-25 financial audit missions
	over 25 financial audit missions

Answers structure:

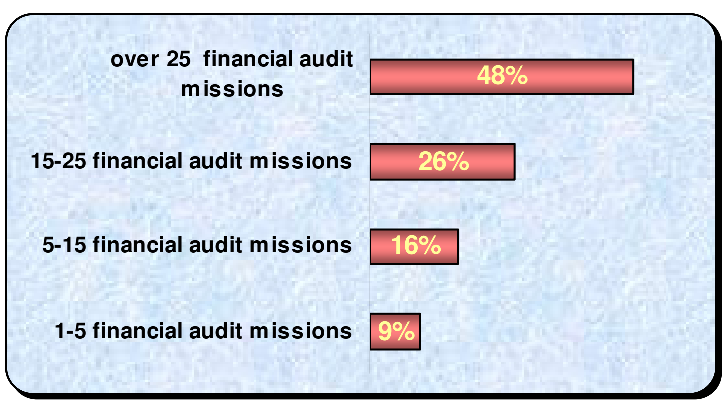

Chart no. 1 "Financial audit mission participation"

We consider favorable the facts that from the total of subjects 48% participate to over 25 missions, 26% participation at 15-25 missions. We appreciate that in this conditions we accomplished the essential condition in sample representatively, and this condition is the higher professional experience of the respondent.

Next element tested in our research is the words which express the best the role of the financial auditor.

3. Which of the following affirmation express the best the role of the financial auditor?	
	To supply a reasonable assurance, through the expressing of an opinion regarding the level in which the financial statements present a true and fair view
	Assure a higher credibility of the financial statements of the entities
	Supply an independently control of the accounting information accordingly with a list of pre-established conditions, which suppose a reflection of the whishes and needs of the users
	Others please specify..

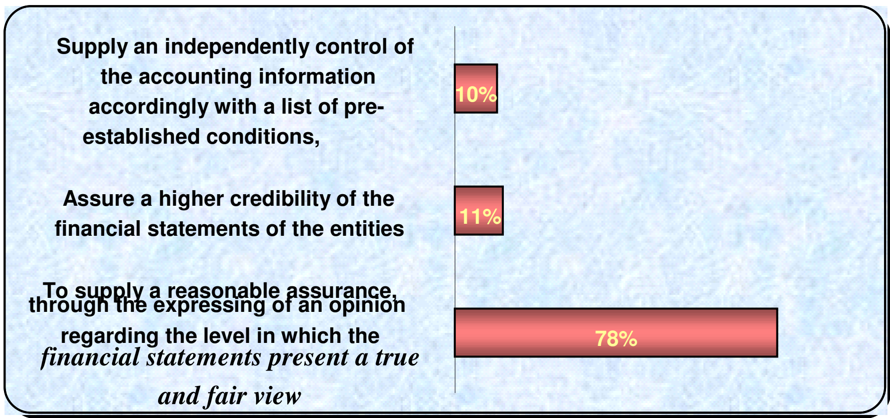

Chart no. 2 "Financial auditor role"

From the total number of the subjects 78% agreeing that the role of financial audit is that of supplying a reasonable assurance, through expressing an opinion regarding the level of the financial statements in reflecting a true and fair view.

The efficiency of the financial audit work is directly related to the level of the assurance which the auditor can give regarding to the true and far view of the financial statements audited. From this reason, we wish to see the most important factors which determine this efficiency, through the next question:

4. Which are the factors which you consider that narrows the efficiency of the financial audit works, and in which measure? (Please use the next specifications: (5) - very high measure, (4) - high measure, (3) - medium measure, (2) - low measure, (1) - very low measure.)					
	(5)	**(4)**	**(3)**	**(2)**	**(1)**
Existing ambiguous concepts in accounting					
Estimations used in accounting can't be higher precisely than the allowing of the methods used for their dimensioning					
Existing for the same transaction more than one reflection through accounting treatments settled by the accounting standards, and this implies different results					
Unrealistic expectations of the users regarding the performances which should be realized by the financial audit services, relative to the real and normal performances.					

Incorrect informing of the users regarding the role and the inherent limits of the financial audit.					

Factors which ceiling the efficiency of the financial audit (% from total answers)	(5)	(4)	(3)	(2)	(1)	Total
Existing ambiguous concepts in accounting	**6%**	**21%**	**41%**	**23%**	**9%**	**100%**
Estimations used in accounting can't be higher precisely than the allowing of the methods used for their dimensioning	**2%**	**39%**	**29%**	**23%**	**7%**	**100%**
Existing for the same transaction more than one reflection through accounting treatments settled by the accounting standards, and this implies different results	**47%**	**22%**	**18%**	**10%**	**2%**	**100%**
Unrealistic expectations of the users regarding the performances which should be realized by the financial audit services, relative to the real and normal performances.	**3%**	**22%**	**13%**	**47%**	**15%**	**100%**
Incorrect informing of the users regarding the role and the inherent limits of the financial audit.	**11%**	**25%**	**32%**	**23%**	**8%**	**100%**

Table no. 1"Factors which ceiling the efficiency of the financial audit"

Analyzing the answers we can underline that the factor which has a very high important influence to the financial audit work is the existence of alternative treatments for the same recording transaction, in the opinion of 47% from subjects. The estimations used in accounting have a high influence for the financial audit work (39%). We can't ignore the significant percentage of subjects which affirms the influence of other factors regarding the audit efficiency, which even if it is in a medium measures it is important. So 41% from the total of subjects appreciate that still find ambiguous concepts in accounting, which affects in a medium measure and 32% of subjects consider that a factor which affects the efficiency and indirect the quality of the true and fair view reflected by the audited financial statements is wrong information of the users regarding the role and limits of the financial audit.

The independence of the auditor is an significant element whit direct influence to the finality of the financial audit, at the end of which the auditor issue an opinion regarding the true and fair view of the audited financial statements. If the condition of independence is affected the opinion of the auditor isn't valid and trusted, so it can't be considered a "health certificate" for the financial statements of the company. We test in this way the principal factors which could affect this independence.

5. Which factors do you consider that can affect the independence of the financial auditors, and in what measure? ((5) - very high measure, (4) - high measure, (3) - some measure, (2) - small measure, (1) - very small measure.)					
	(5)	**(4)**	**(3)**	**(2)**	**(1)**
Dimension of the audit company					
Period of time when are delivered services for the same client					
The competition between financial auditors					
The fear of the auditor to lose his client or a bad reputation					
Responsibilities of the auditor regarding the third parties					
The professional sanctions settled and the strictness of their applying					

Factors which affects the independence of the financial auditors	(5)	(4)	(3)	(2)	(1)	Total
Dimension of the audit company	**0%**	**45%**	**32%**	**14%**	**9%**	**100%**
Period of time when are delivered services for the same client	**3%**	**31%**	**39%**	**22%**	**5%**	**100%**
The competition between financial auditors	**30%**	**25%**	**16%**	**18%**	**10%**	**100%**
The fear of the auditor to lose his client or a bad reputation	**15%**	**46%**	**23%**	**10%**	**6%**	**100%**
Responsibilities of the auditor regarding the third parties	**7%**	**0%**	**33%**	**28%**	**32%**	**100%**
The professional sanctions settled and the strictness of their applying	**9%**	**0%**	**26%**	**28%**	**37%**	**100%**

Table no. 2 „Factors which affects the independence of the financial auditors"

Analyzing the answers regarding the factors who affect the independence of the financial auditor in the opinion of 30% of the subjects, the factor with the highest influence is the competition between financial auditors. We see a high percent of answers who consider that the independence of the auditor is affected in a high measure by the dimension of the audit company (45%) and the fear of the auditor to loose his client or a bad reputation (46%). These results are justified by the structured of the subjects, half of them activate in audit companies other than Big Four or independents financial auditors. Despite of the evident necessity of the financial audit, being compulsory by the accounting laws, there is few factors which have the effects to the binding condition of independence for the auditor. The fear of the auditor to loose his clients or getting a bad reputation could be analyzed from two point of view: from a point of view the auditor is avoiding to issue an opinion unflavored for the client, specially in the case when the auditor activate in a small company of audit (the dimensions of the company and the competition between the auditors intervene here); or from another point of view the financial auditor has a responsibility for issuing an opinion regarding the quality of the true and fair view of the financial statements, with direct influence for the decisions made by the users of these information who analyze the opinion of the auditor issued in the report and as an reasonable assurance regarding the reality of the information. The issued of an opinion without insufficient argumentation can generate in the future consequences very important for the companies and of course for the auditor, who has the responsibility of the opinion issued in the financial audit report.

From the structure of the financial statements we want to see the importance for every component of the financial statements from the point of view of the subjects:

6. Which is in your opinion the importance of every component of the financial statements for the quality of the true and fair view supplied by this? ((5) - very high, (4) - high, (3) - medium, (2) - small, (1) - very small.)					
	(5)	**(4)**	**(3)**	**(2)**	**(1)**
Balance sheet					
Profit and loss account					
Cash flows statement					
Own capitals movement statement					
Explicative Notes and Accounting Politics					

The importance of every component of the financial statement	(5)	(4)	(3)	(2)	(1)	Total
Balance sheet	**90%**	**10%**	**0%**	**0%**	**0%**	**100%**

Profit and loss account	**68%**	**21%**	**11%**	**0%**	**0%**	**100%**
Cash flows statement	**67%**	**14%**	**16%**	**3%**	**0%**	**100%**
Own capitals movement statement	**32%**	**44%**	**17%**	**5%**	**2%**	**100%**
Explicative notes and accounting politics	**76%**	**20%**	**3%**	**1%**	**0%**	**100%**

Table no.3 *„The importance of every component of the financial statement"*

Every component of the financial statement is appreciated being with a very high importance and high importance in reflecting the whole image of the reality supplied by the financial statements. Interesting is the fact that a significant percent (76%) of the subject consider very important the explicative notes and the accounting policies more than the importance of the profit and loss account (68%) or cash flows statement (67%). We can appreciate that the possible argue for this answers from the financial auditors who analyze the financial statements for issue an opinion regarding the quality of these:

- Through the details from the explicative notes the auditor understand much better the professional judgment of the accountant who made and presents the financial statement, having a high utility;
- In the explicative notes we have to find the reasonable explications of argues the choosing some or another accounting treatment permitted by the accounting standards;
- In the explicative notes could find details which could give a large vision of the performances of the company.

The financial auditor's opinion regarding the true and fair view reflected by the financial statements are in a very close relation with the signification level or materiality. We wish to see the principal criterion used in selecting the level of signification.

7. The level of significance, which represent the dimension of the accepted error rate in the context of every audit mission, has an essential influence in the process of appreciating the true and fair view of the financial statements. Specify please, which is the frequency of the criterion used for settling this level of significance? (5- always, 4 - very often, 3 - some times, 2 - very rare, 1 - never.)

	(5)	(4)	(3)	(2)	(1)
The gross profit					
The net profit					
Total turnover					
Total assets					
Net assets					
Others..					

The criterions for settling the significance level	(5)	(4)	(3)	(2)	(1)	Total
The gross profit	**16%**	**36%**	**31%**	**7%**	**10%**	**100%**
The net profit	**15%**	**17%**	**45%**	**10%**	**13%**	**100%**
Total turnover	**36%**	**54%**	**9%**	**1%**	**0%**	**100%**
Total assets	**17%**	**28%**	**47%**	**7%**	**1%**	**100%**
Net assets	**6%**	**7%**	**13%**	**29%**	**46%**	**100%**
Others..	**3%**	**26%**	**11%**	**0%**	**0%**	**41%**

Table no.4 *„The criteria for settling the significance level"*

Analyzing this table no. 4 ***„The criteria for settling the significance level"*** we can see that very often criterion used for settling the significance level are the gross profit (36%) the total turnover (54%), and sometimes are used the net profit (45%) and the total of assets (47%). We have to underline the fact that 41% of subjects chose last option "others" giving details such: the selection of the significance level are different from company to company being important to give importance to more aspects for example the domain of activity, the level of the company, the activity of the company, the environment of the company, and the most important fact is the professional judgment of every financial auditor and his own experience and professional preparation.

To argue and to give a fundament for his opinion, regarding the audited financial statements, the auditor has to find evidences necessary and enough for sustaining his point of view. These evidences have to respect some conditions or quantitative criterion, in that manner that they could not be disavowed. We consider necessary at this stage of the survey to test the most important criterion in appreciating the truthfully of the audit evidences, asking the next question:

9. The audit evidences are necessary for proving the fidelity of the image supplied by the financial statements. Which criterion do you consider most important regarding which you appreciate the quality of audit evidence? ((5) - very important, (4) - important, (3) - some kind important, (2) - little important, (1) - not important).					
	(5)	**(4)**	**(3)**	**(2)**	**(1)**
The evidence have to be enough quantitative for having the level of the needed trust level					
The pertinence of the audit evidence: in the sense of possibility of influencing the professional judgment in accepting or rejecting of a declaration presented in the financial statement.					
The independence of the source					
The objectivity of the audit evidence					
The form of the audit evidence (the evidence in the form of the written documents are more credible than a verbal one)					

The criteria in appreciating the audit evidence	**(5)**	**(4)**	**(3)**	**(2)**	**(1)**	**Total**
The evidence have to be enough quantitative for having the level of the needed trust level	**8%**	**29%**	**56%**	**7%**	**0%**	**100%**
The pertinence of the audit evidence: in the sense of possibility of influencing the professional judgment in accepting or rejecting of a declaration presented in the financial statement.	**61%**	**30%**	**8%**	**1%**	**0%**	**100%**
The independence of the source	**45%**	**43%**	**13%**	**0%**	**0%**	**100%**
The objectivity of the audit evidence	**39%**	**51%**	**10%**	**0%**	**0%**	**100%**
The form of the audit evidence (the evidence in the form of the written documents are more credible than a verbal one)	**38%**	**52%**	**9%**	**1%**	**0%**	**100%**

Table no.5 *„The criteria in appreciating the audit evidence"*

In the opinion of the subjects the most important criterion used in validating the audit evidences are: the pertinence of the audit evidence (61%) and the independence of the source (45%). Important in appreciating the evidence is: the objectivity of the audit evidence (51%) and the form of the audit evidence (52%). ***Having a whole picture of the results we can see that the subjects underline the importance of the***

qualitative characteristics than the quantitative characteristics for the audit evidence. Being enough from the point of view of the quantity is appreciated with some importance from the point of view of 56% of the subjects. The professional judgment has a very important role in appreciating the audit evidence. We consider that the professional experience of the subjects selected for the survey plays a very important role and we appreciate that this determinates the respondents to choose this option of qualitative audit evidence. We conclude underling that both criterions are important, being sufficient on a side and on the other side the adequacy of the audit evidence.

Another important element for evidence is the disposability of the material used as the evidence in the financial audit activity.

10. Which are the factors, in your opinion, which could have an influence for the disposability for the audit evidence?	
	The moment of the disposability of the evidence
	The access less or more difficult to the audit evidence
	The cost of getting some audit evidence
	Others...

The answers to this question are laid down:

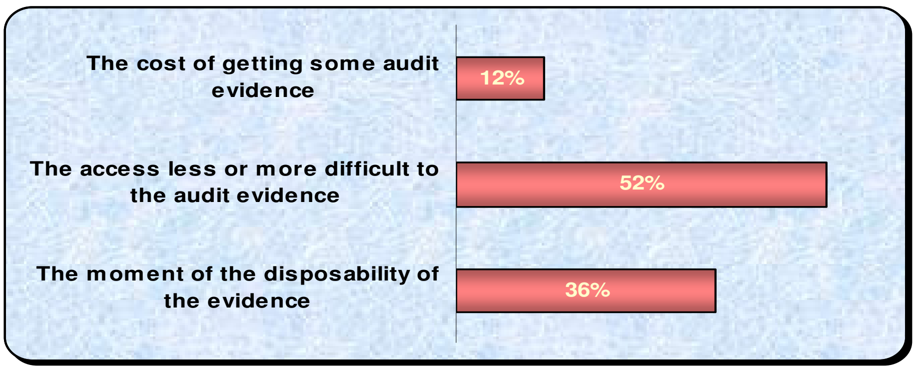

Chart no.3 „Factors for disposability of the audit evidence"

The most important factor for the subjects regarding the disposal of the audit evidences is the access of the auditor to the audit evidence (52%). There are enough situations in which the auditor hasn't access to some information or audit evidences. The problem appears when is considered legal or illegal the access of the auditor to the data, those situation where the company pretends that some information are secret, and they are not accessible for the auditor, but the real reason of the company is this of stopping the auditor to change his opinion in case of getting the information considered secret.

The finality of the financial audit is the audit report, which reflects the opinion of the auditor regarding the fidelity of the image supplied by the audited financial statements and the conformity with a referential accounting system very well settled. At this moment of the survey we are interested by the information regarding the frequency of the opinion used in the audit report.

11. Which is the frequency of the opinion issued by you in the financial audit mission? [(5)- always, (4)- very often, (3)- some times, (2)- very rare, (1)- never.)]					
	(5)	**(4)**	**(3)**	**(2)**	**(1)**
The opinion without reserves					
The opinion with reserves					
Impossibility to issue an opinion					

Adverse opinion					

Types of opinion issued by the financial auditor	**(5)**	**(4)**	**(3)**	**(2)**	**(1)**	**Total**
The opinion without reserves	**0%**	**38%**	**48%**	**10%**	**3%**	**100%**
The opinion with reserves	**1%**	**61%**	**33%**	**3%**	**1%**	**100%**
Impossibility to issue an opinion	**0%**	**0%**	**0%**	**56%**	**44%**	**100%**
Adverse opinion	**0%**	**0%**	**0%**	**21%**	**79%**	**100%**

Table no.6 „Types of opinion issued by the financial auditor"

Analyzing these results we can see some aspects very interesting. We would like to conclude that the *opinion without reserves* should be the most used opinion but we can see that very often is expressed *the opinion with reserves* (61%) and *the opinion without reserves* is expressed some times (48%). Of course, *the opinion with reserves* isn't unfavorable for the client, and a user of the audit report will analyze the information reflected by the financial statements with some reticence, the true and fair view of the financial statements is in a some measure affected and this opinion let to fall down the fidelity of the financial statements in a semi shadow. A good point in this question is the answer of 79% of the subjects where they said that never issued an adverse opinion, unfavorable of client this opinion. We have to underline that 21% of the subjects meet situation in which the image reflected by the financial statements is very different by the reality and user should be informed by the auditor through an adverse opinion.

Looking forward for the objectives of the survey we would like to find the reasons which determine the auditor to choose an opinion or another. For the first time we need to see the arguments of the subjects for issued the opinion wit reserves. The relevance of this question appears thinking to the percent of the subjects who expresses very often an opinion with reserves (61% of subjects). We put the laid down question:

12. Which are reasons which determine you to issue an opinion with reserves after the mission of financial audit?	
	Some reasons which implies impossibility to apply all the audit procedures needed
	There are some significant errors in the financial statements, but not so bad in the measure to issue an adverse opinion.
	There are some elements in the financial statements which could not be considered a base for the decision of the potential user of this financial statement.
	Others..

The answers structure:

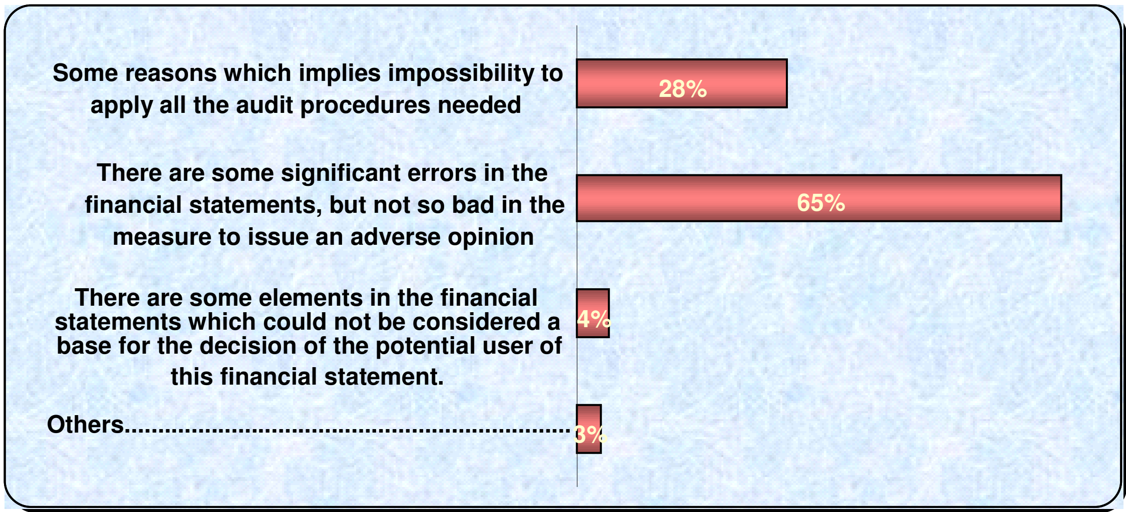

Chart no. 4 ***„Reasons in choosing the opinion with reserves"***

We can see that the reason for the 65% of the subjects for issuing *the opinion with reserves* is the existence of some significant errors in the financial statements, but not so bad in the measure to issue an adverse opinion, and for 28% from subjects the issue of the opinion with reserves is determined by existence of some reasons which implies impossibility to apply all the audit procedures needed.

Despite the small percent of the subjects who express an adverse opinion (according to the question 11. only 21%) we consider that an opportune question at this phase of the survey is to ask the reasons which determine the subjects to give an adverse opinion.

13. Which are the reasons which determine you to issue an adverse opinion after the financial audit mission?	
	The difference from the principal criteria related initially settled is very high
	The difference from the true and fair view is to high for expressing an opinion with reserves
	Using the financial statements in taking some decision will determine wrong decision due to errors from financial statements
	Others..

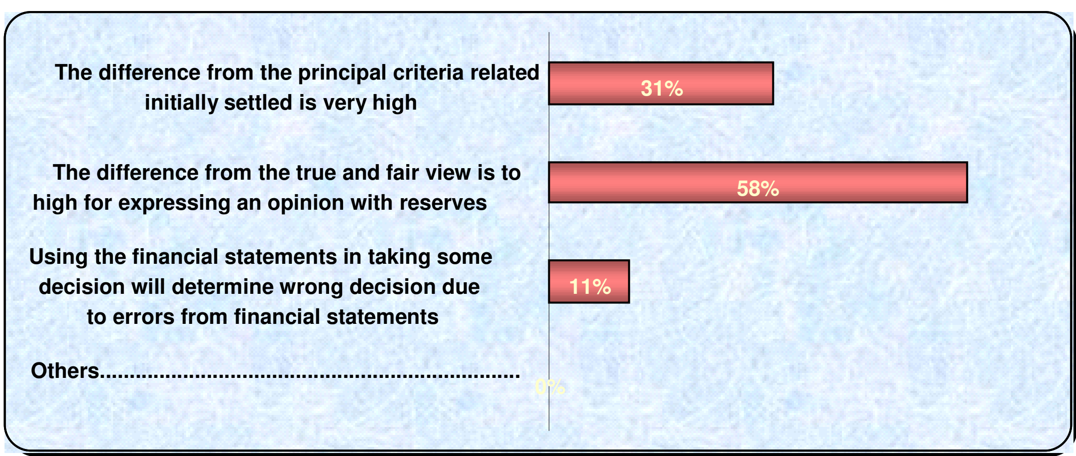

Chart no. 5 „ Reasons in choosing the adverse opinion"

The reason which determine to issue an adverse opinion is the differ from the true and fair view is to high for expressing an opinion with reserves (58%) and for 31% of subjects determinant in issuing an adverse opinion would be the difference from the principal criteria related initially settled is very high. The issue of an adverse opinion has a consequence stronger than the impossibility to issue of an opinion or an opinion with reserves. The auditor transmits through this opinion a message to the users of the financial statements, and this is that the financial statements are completely wrong, there is no fidelity in reflection of the position and financial performances of the company, implying in this way errors for those who want to use this wrong information. We consider fairly the fact that 58% of subjects would issue an adverse opinion only in the situation of the differing from the true and fair view is too high for expressing an opinion with reserves.

5. General conclusions

As a general conclusion after this survey we can say that despite definition of the true and fair view is a controversial one (in the present we don't have a definition general accepted in the accounting literature) the financial auditors, who have to validate and to issue an opinion regarding the quality of the fidelity of the image supplied by the financial statements, facing this challenge, having a continuously searching for improving the methods for an higher objectivity and assurance in expressing an opinion regarding the true and fair view. The auditor advantages is that one that they have the knowledge and qualities needed to identify at least those situations in which the true and fair view is not respected, the professional judgment being very important in appreciating the true and fair view, the fidelity of the financial statements with the reality.

The percentage of achieved answers in this research is 12.9% (87 valid answers from total of 673). The specialty literature regarding the theory and practical of surveys appreciate that a satisfying feed back for assuring the relevance is between 10-20%. In this condition the percentage of 12.9% from the total of subjects targeted, and the fact that from all the subjects at least 48% participate to over 25 audit mission in the last 5 years and 26% between 15 and 25 audit missions (this implies a relevant experience in financial audit activity) we have assured an important characteristic of the statistical population researched, and we appreciate that the conclusion are sufficient relevant for generating to the whole population targeted.

Obviously, like any scientific research, there is some limits which we identified in our survey, but these limits didn't affect significant the well progress of the empirical study and without affecting the relevance of the conclusions obtained from the analyses of the results. These limits we can classify in two categories: formal limits and administrative limits.

Regarding the formal limits we can lay down:

- Because the short time allocated for the answers (for not taking to much time of the subjects), in the questionnaire structure we didn't cover all the significant aspects regarding the researched theme;
- Detailing some questions or including some open questions could result in a better refinement of the conclusions and from this to observe other interesting aspects;

Regarding the administrative limits we consider that extending this research for a long period and retransmitting the survey, insisting for a feedback would implies a high number of answers.

EVOLUTIONS ON THE ROMANIAN CAPITAL MARKET, FROM THE VIEW OF THE ACCESSION TO THE EUROPEAN UNION

In the last few years financial experts demonstrated the very close relationship between the evolution of the capital market and the economic growth level in different countries.

In the present context of Romania's EU accession, we expect a continuous trend of economic growth as a consequence of EU funds absorption for rehabilitating the economic and business infrastructure.

The aim of our study is to examine the main events on the Romanian capital market and to present an accurate picture of its evolution before and after the EU accession, in order to prove the strong relationship between economic growth and capital market evolution.

Keywords: capital market, EU accession, IFRS

1. Capital markets – a possibility for investing cash surplus or for financing treasury deficits

The market economy, marked by the existence of a powerful competition environment, generates the need for companies' development and coping with environmental pressures. Where the internal financing sources are not sufficient in comparison to the company's needs, it becomes necessary to attract foreign sources.

In the present context of EU accession, private companies can use various ways for attracting financing sources: share issue, bondholders, bank loans, European non-reimbursable structural funds, etc.

In a stronger competitive environment and under the pressure of the globalization of the financial markets, companies perceive becoming an open company as a way to survive, but also for improving the company's competitiveness. This process presumes a punctual preparation and the quantification of risks and advantages resulted from listing the company on capital markets.

From the company's point of view, the most important benefit of being listed on capital markets consists in the access to foreign alternative financing sources, absolutely necessary at a certain development level, provided that capital costs are acceptable in comparison to bank financing costs.

The possibility of being financed through the issue of securities attracts efficient companies on capital markets, resulting automatically in continuous transactions with the issuers' securities. In order to materialize the two most important advantages of companies' listing, capital markets should achieve their two functions: permanent valorisation of securities at a stock market price based on the issuers' actual performances and financing the listed companies' most profitable investment projects.

Although seeming very simple, the relationships between listed companies and capital markets are complex from the view of achieving the markets' two functions and fulfilling certain performance criteria by the issuers.

On the other hand, capital markets also offer the opportunity to invest cash surplus in different investments with a superior profitability than those offered by bank deposits.

As a conclusion, economies have two attracting, propagating and stimulating channels: the bank system and the capital markets system. At the beginning of the competition, capital markets have been very unstable.

The bank system continues to be attractive for investors even if interests are lower than the winning possibilities on capital markets. The bank system and the Treasury attracted most of the available savings, re-allocating them by means of consumer loans or imports of goods for resale. Under these circumstances, most of the money did not return into the actual economy by means of loans, but indirectly, by means of each company's added value. Another share of the money attracted into the bank system was used for covering the companies' current cash needs by means of short-term loans. In a developed economy, long and medium-term available funds actually insure the general economic development. Companies can access these available funds both through the bank system and through the primary capital markets.

The main difficulties in developing the Romanian capital markets were the following: reduced liquidity and lack of a complex range of financial instruments, financial indiscipline on the capital markets, prevailing position of certain financial mediators, voidance of large companies and corporations, withdrawal of some companies due to their takeover.

2. History of capital markets

The Romanian securities market has been structured from the beginning into two different elements: Bucharest Stock Exchange (BSE) and RASDAQ (Electronic Stock Exchange RASDAQ). Subsequently, these two units merged into a single market, BSE absorbing RASDAQ.

Presently, BSE functions as a joint-stock company. It was set up based on Decision no. 20/1995 of the National Commission for Marketable Securities (CNVM). Its set up was requested by 24 financial investment companies (marketable securities companies at that time), founders of the Stock Exchange Association. The National Market for Marketable Securities RASDAQ was launched on 26 October 1996, as a result of the need for an institutional and technical frame for the transaction of all securities distributed within the Privatisation Programme. RASDAQ is the direct result of the Romanian-American co-operation, enacted through the Memorandum concluded in 1994 between the Romanian and American Governments.

As noticed, the two markets had a similar evolution, being strongly influenced by the period's domestic economic and political events. After an excellent start, overlapped by a high level political change (1996), it reached the top in the summer of 1997, with a maximum of transacted securities and value quotations. Afterwards, the Romanian securities market experienced a major decline, both in value and duration. The descendant evolution had many reasons, the most important being the following: "overheating" of the market (1997) due to massive securities acquisitions based on speculative funds, not achieving the political objectives set during the elections (which became obvious at the end of 1997), non-implication of capital markets in the privatisation process, mistrust of state owned financial institutions in the Romanian capital market, the monetary policy dictated by NBR and the Finance Ministry, which cancelled any chance of the Romanian financial market (highest interests for the most secure financial instruments – titles issued by the state), the slow general evolution of the Romanian economy.

The end of 2000 could be considered a milestone, which marked the inversion of the evolution on the securities market. The main cause, which stopped the decline could be considered the reaching of certain incredible minimum transaction levels for a normal stock exchange market (for example, SIF shares were transacted at prices, which determined the capitalisation of issuers exceeding 50% out of their liquidities – bank deposits and government stock). Also, the end of the financial crisis from 1999, as well as the political changes in 2000, quickened the general evolution of stock markets.

In the summer of 2001, the stock markets entered an ascending trend. Meanwhile, bank interests decreased especially due to the future predictability of this phenomenon (confirmed in the next years). The fiscal policy for sustaining the Romanian exports (by applying a decreased profit tax rate for these operations) had also an important role in improving the evolution of listed companies and by default, their attractiveness for investors.

The enactment of a better legislative frame during 2000 consecrated the stock exchange market as a viable alternative for investing funds, and meanwhile there was the hope that the Romanian capital market will be able to play its ultimately role in economy: facilitate the meeting between long and medium-term capital demand and offer. In this context, 2002 was a top year for the Romanian stock exchange market, both related to the level of transacted values and stock exchange marks, but especially to the level of the public's perception of the stock exchange phenomenon.

A boom period followed. During 2003, 2004, 2005 and 2006, the stock exchange market overcame record after record and a scenario began to be respected every year: accelerated increases in the first months, spectacular adjustments in spring, a relaxation period followed by new increases with new historical maximums in the last part of the year. From the beginning of 2003 and until the end of last year, BET and BET-C indices increased up to 5 times. More and more foreign funds turned their eyes to Romania, encouraged by its EU accession, by the economic development of many large companies (increasing financial results), privatisations, development of certain PAS associations, etc. Meanwhile there was an increase in domestic investments, number of transactions, number of opened bank accounts, stock exchange turnover, and market capitalization. Developing fast during a couple of years, the capital market became again attractive and visible in the same time, as the inhibition generated by past events decreased and bank interests became less and less satisfactory.

A common element for the period 2003-2004 consisted in the repeated withdrawal of companies from the stock exchange. The legislation in force at that time committed the shareholders, who overran the level of 90%, to launch the public takeover bid in order to withdraw the company, so that many shareholders initiated such bids. Companies like Arctic Găeşti, Dacia Piteşti and, subsequently, Terapia Cluj Napoca, are only the largest withdrawn companies, which at that time had a significant weight in market capitalization. There were significant losses for the market, especially because after the withdrawal the three companies experienced spectacular evolutions in respect to their financial results.

An interesting event, which could significantly influence the development of the stock exchange market, is the set up of the "Proprietatea Fund", whose aim is to compensate the owners dispossessed by the communist regime and whose confiscated properties can no longer be given back. The fund functions as a legal person since the end of 2005 and holds a portfolio of shares in 114 state owned companies. Its equity amounts to approximately EUR 3.9 billion. However, currently there are some problems related to the fund's stock exchange listing (without this the compensation process would be practically impossible). Probably the main problem consists in the compulsoriness that all companies within the fund's portfolio are to be listed.

In the last years, another series of events influenced the capital markets. We briefly mention some of them: Petrom's privatisation (the largest company in Romania) through the acquisition of the controlling interests by OMV Austria, the merger of the two stock exchanges, the Electronic Stock Exchange Rasdaq being absorbed by the Bucharest Stock Exchange, the Romanian Commercial Bank's privatisation (not listed, but SIFs own 6% each, thus with impact on the SIF segment) and last but not least, Romania's accession to the European Union (although the market reacted long before the actual accession on 1 January 2007).

In comparison to the withdrawals from 2001-2003, last year Transelectrica has been listed on the stock exchange. The company represents the state monopoly in electric energy transport. The Romanian State announced few years ago its intention to list large companies in its portfolio, like Romgaz, Transgaz, Electrica, the Constanța Harbour, Romtelecom, the Henri Coandă Airport, but so far only Transelectrica was listed. It was a great success. In a few months the shares doubled their value compared to the initial takeover bid, and in the first transaction day the value increased with over 35%. The Romanian State did not sell any shares and instead it doubled the value of the Transelectrica interests. At the end of the last year there was another IPO. This time a private company chose to get listed on the stock exchange - Alumil Rom Industry, part of the Greek industrial group Alumil. Under these circumstances, it is highly likely that there will be a new stage on the Romanian capital market, with a new wave of very necessary stock exchange listings.

3. Current situation

Presently capital markets have a new regulatory frame ("Law no. 297 regarding capital markets"), which includes provisions regarding: new market opportunities; highly transparent standards for issuers; ascertaining a high protection level for investors; implementation of the regulatory context necessary for the new transacting instruments and techniques.

Although the transacted values or the stock exchange capitalization are higher than in the previous years, they are still at low levels compared to the markets in the neighbouring countries. Generally speaking, emerging markets in Central and Eastern Europe were marked by similar elements, common to all shaping markets. However, a detailed analysis shows that a series of particular features significantly difference their evolution compared to the Romanian stock exchange market from the perspective of the general context of stock exchange markets (national specific, rhythm of economic reforms, etc.). The main elements, which brought countries like Hungary, Poland or the Czech Republic at a higher level than ours, with regard to the development of stock exchange markets are the following: economic start advantages (superior economic performances and a certain level of opening of the respective economies); time advantages (these stock exchanges reopened before the Romanian one); a sustained privatisation rhythm, which ascertained the background for an efficient market economy and for a functional stock exchange market; earlier accession to the European Union.

The synthetic situation compared to the countries mentioned above (to which we currently compare ourselves) is presented in the table below:

Tara	Capitalizare (mil. USD)	Indice (nov.2006)	Variatie 2006	P/E	Capit. / PIB	Capit. / Activ bancar
Bulgaria	9439	SOFIX (1160,26)	+40,55%		~21%	32,2%
Polonia	210043	WIG20 (3217,41)	+21,14%	17,4	~34%	82,6%
Ungaria	38559	BUX (22880,67)	+10,08%	12	~32%	38%
Rep. Ceha	71381	PX (1570,6)	+6,63%	21,2	~46%	47,5%
Slovacia	5711	SAX (412,89)	-0,1%	10,4	~13%	10,8%
Romania	28456	BET (8047,98)	+22,2%		~17%	52,4%

4. Connecting the Romanian accountancy to the latest evolutions on the capital markets

The decision to make a certain investment is very difficult and it should consider the analysis of a number of agents like conjuncture, market features, financial benchmarks and last but not least, the investor’s personality.

Nowadays, the existence and development of capital markets are inconceivable without the use and propagation of accounting information. An article of the prestigious British daily newspaper „The Economist” underlined that international capital markets have a very important role in improving the preparation and communication of accounting information at global level.

Considering these general trends, accountancy obtained the same valences like the capital markets, thus resulting the need for „governing” accountancy at global level.

The globalization of capital markets led to the imperative necessity for unitary information, for understanding and comparing the financial-accounting information in different corporations. A person active on the international capital market or another person involved in reporting financial information, working in a multinational or in a large company, which intends to get listed on foreign financial markets, have a very difficult mission in accomplishing their tasks. Only an employee with direct involvement in achieving these tasks realizes the benefits of an international unique accounting language, given this „Babel Tower” in which accountants live all over the world. However, they only apply the provisions of the various national accounting systems, which give different interpretations to the same events or transactions.

Besides these aspects, the extension of the financial relationships between companies, for instance the set up of subsidiaries or participations, brought the necessity of adjusting the accounting consolidation methods, in order to measure the global weight of the group made up of the subsidiaries, the participations and the mother company, and to facilitate comparisons between the financial situations obtained in different countries for getting listed on various stock exchange markets.

Under these circumstances we can highlight the increase of the accountancy's contribution on the international capital markets, especially related to the information of participants for preparing the decision taking process.

The company's listing on the stock exchange also significantly influences its accounting system (its financial reporting procedures). Generally, listed companies have hundreds or thousands of shareholders. Under these circumstances, the yearly financial statements become the main communication means between the company and its shareholders. Thus, the companies will disclose the balance sheet and income statement in the easiest way to be understood by the shareholders. The balance sheet and income statement will be accompanied by additional information presented in the statement of cash-flows, in the statement of changes in equity or in the notes to the financial statements, which aim to help the reader to understand as well as possible the company's results and performances.

In the context of a fantastic development of capital markets, the lack of a unitary accounting system represents a hold back for investments, because investors are not sure of the different accounting models used, being suspicious about them. The Asian crisis underlined the lack of transparency and the deficiencies of accounting systems in different countries, asserting once again the need for an international unitary accounting system.

In the context of Romania's accession to the European Union and its integration in the European Common Market, our country understood the necessity of complying with the accounting regulations applied in the Union and made efforts for adapting to these requirements. The Programme for development of the Romanian accounting system started in 1997.

In our opinion, the penultimate step started on 1 January 2006, with a new change in the Romanian accounting system: the adoption of the European Directives in the Romanian accountancy.

The adoption of the European accounting legislation will ease the information offer to the most favoured information users: the investors on the capital markets. The direct result of this change will consist in the development of the Romanian capital market and its integration in the European Common Market.

The next step at global level would consist in the adoption of a unique set of international accounting regulations in order to provide unitary information on the financial markets in whatever place of the world and regarding any company, regardless of the country in which it develops its activity. Significant efforts in this respect were made by issuing the International Financial Reporting Standards (IFRS), as a result of the convergence programme developed by the competent institutions in this field: IASB and FASB respectively.

In conclusion, we can say that Romania's accession offers great possibilities for the development of both the Romanian capital market and the Romanian companies, which due to their stock exchange listing could attract funds for financing future development investments.

Abstract. Since 2005 the societies quoted have started to apply the international financial reporting standards IAS/IFRS for the drawing up and the publishing of the balance sheet. The objective of the IFRS, except for the fact that they aim at the harmonization of the ways of drawing up the financial statements, is that of drawing near the patrimony value close to its current value. Applying the standards IAS 32 and IAS 39, which introduce, in particular a new classification of the financial instruments has new significations within the accounting administration of the security operations made by the use of the derived financial instruments. Particularly, the IAS 39 focuses on the assessment of the financial instruments specifying the application and utility area of the just value, as well as of the evaluation criterion.

Keywords: financial instruments, jute value, IAS 32, IAS 39, IFRS, financial risk

The necessity and importance of the introduction of the international financial reporting standards IAS/IFRS

The world economic frame has suffered in the past few years an inevitable and irreversible process of transformation. The main directions of these changes are directed to the globalization of the markets, the technological process, the informational and communication system, the extension of the borders of the EU and to a series of reforms from the social and fiscal area that have given this context of reference more complex and more unstable. These new modifications have transformed the borders of the markets, canceling the physical and geographical distances as well as the commercial and financial barriers, allowing the free circulation of goods services, capitals and information.

In the process of internationalizing the economic interests of the entities, determined by the growth factors, the competitively and the competition, the operative horizons of the economic entities have extended, that have been put in the situation of facing the capital circulation and the commercial operations with connotations on the international market. The application at the international level of a series of accounting standards for the drawing up and the presentation of the annual financial statements represents an important and unquestionable step, that comports various difficulties, at the practical level and not only. The users need information that would allow them to have a better understanding of the signification of the financial instruments balance and extra balance related regarding the financial position of the enterprise, the performances and the cash flows, as well as of the assessment of the amounts, the moment of the appearance and the certainty of the future cash flows associated with these instruments.

IAS 32 – Financial instruments: - presentation – treats all the types of the financial instruments, recognized and not recognized and it must applied for the contracts for the sale and the purchase of a non-financiers element that can be discounted in cash through another financial instrument or through a change of financial instruments, as the contracts would be financial instruments. According to the IAS 32, the financial instrument is any contract that leads to a financial asset of an entity, as well as to a financial instrument of equity ownership or of debts of another society.

The financial asset is any active under the form of :

- Money in cash available;
- The contractul right to be cashed, to cash money or othe financial asset;
- The contractual right to change financial instruments in potentially favorable conditions;

- A contract that will or can be discounted in instruments of equity ownership of an entity.

The financial debt is the contractual obligation to:

- Deliver a financial asset ;
- Change financial instruments in potentially unfavorable conditions;
- To be discounted in instruments of equity ownership of the entity.

The instruments of equity ownership represents any contract that proves the existence of a residuary interest in the assets of an entity after the deduction of all its debts. The obligation to issue a equity ownership instrument is not a financial debt, because it has as result an increase of the equity ownership and cannot generate a loss for the company.

The just value – represents the amount with whichan asset can be changed or liquidated a debt in a closed transaction in objective conditions, between the parties who know and by the expression of the free will of this one.

The desciption of the just value of the financial instruments can be found in the IAS 39 „Financial Instruments – recognition and evaluation" which treats issues of recognition and the assessment of the financial instruments. This standard sets the recognition principles, evaluation and presentation of the information on the financial instruments from the financial statements, standard that increases significantly the use of the just value in the accounting of the financial instruments, especially in the asset part of the balance. IAS 39 distinguishes four classes of financial assets, more specific the assets owned at their just value in the profit and loss account, the available assets for the sale of the assets held until the due time and the loans and debts. Moreover, it identifies two classes of financial debts, those for the just value and the debts presented at the normalised cost. The specific accounting approach for each case classifies and establishes the accounting treatment for three types of security against risks: just value, cash flow and the investments.

The incorporated instruments derived – represent a component of a hybrid instrument that includes also a host contract non derived- having as effect the fact that the variation model of the cash flows generated by the combined instrument is similar to that of a derived instrument.A derived instrument that is attached to a financial instrument, but that is based on a contract, can be transferred irrespective of the fact that that instrument is not an incorporate derived instrument.but a separate financial instrument.

The evaluation of the financial instruments and of the incorporate derivates is made to the:

- just value, its definition has been described above;
- liquidated cost, that represents that value at which the financial asset of the financial debt is evaluated at the moment of the initial recognition, minus the reimbursements of principal, plus or minus the cumulated depreciation of the bonuses or discounts, minus any associated reduction or the impossibility to cash. The calculation of the depreciation must use the effective rate of the interest and not the nominal rate of the interest.

Covering against the risk (hedging)

Any covering against the associated risk to the just value of an asset or recognized debt, such as modifications of the just value of some fixed rate debenture, as a consequence of the modifications of the market rates of the inetrests. At the accounting level, to proceed to an operation of security means that the company designates one or more financial assets, so that the variation of the just value would compensate partially or totally, the variation of the just value of the treasury flows afferent to the covered element.

The covered elements can be an asset, a liability, an engagement or a future forecasted transaction, that exposes the enterprise to a certain risk regarding the just value or the variation of the future treasury flows and that is designated, in the accounting of covering, as being covered.

The covering instrument representd a designated derivate or another financial asset or libility (in cases well specified) from which it is expected that the just value or the treasury flows would compensate the variation of the just value or the treasury flows referring to a an elemnt designated covered. According to the IAS 39, an asset or a liability cannot be designated as a covering instrument, in a covering accounting, only if it covers the risks of fluctuation of the foreign exchange. So, it is recognized as a covery instrument, either a financial asset or a derived financial liability, either an asset or a non-derived financial liability, but this aims, exclusively, at the risk exchange administration.

Example

At the end of the financial year 200x, an economic entity receives from a commercial partner, an order of goos of a value of 10 000lei. The operation must be made on the 28.02.200x +1, for the protection of the foreign exchange, the entity has sold 10 000 lei at the exchange rate of 3.65 lei/ euro. The rate exchange of the euro on the 31.12.200x is of 3.65euro. On the 12.02.200x, the leu exchange rate is 3.70/ euro. At the closure of the financial year 200x, the benefit generated by the covering instrument is of 10 000 x (3.75-3.65) = 1000lei.

It is compensated by a loss of the same value generated by the covered element. The accounting registrations made by the economic entity are:

– - on the 31.12.200X the covering operation is made

Covery instruments = Benefits from the coveries *10.000 x 3,7=3700 lei*
against the rate exchange variations
(equity ownership.)

– on the 12.02.200X+1 the transaction is made and the lei are sold:

% = Covering instruments
1500

Current accounts in the banks *500*
10 000 x (3,75-3,70)
Expenses with the exchange differences *1000*
10 000 E x (3,70-3,65)

Benefits from the covering against = expenses with the exchange differences 1000
(equity ownership) the exchange variations

We can see that the financial year 200x will be colsed with a net benefit of 500 (1500-1000)u.m, which corresponds to a foreign exchange difference between the exchange rate on the term and the exchange rate at the date of the sale (10 000E x (3,75-3,70)=500).

The notion of the just value is based on the presumption that the enterprise continues its activity, without the intention or the necessity to liquidate or to limit significantly its activities and without the need to make a transaction in unfavorable conditions. In this manner, the just value is not the size that an enterprise would receive or would pay with the cases of forced transactions or involuntary liquidation.Although the just value reflects the the credit risk of the instrument. On an active market, the just value is determined when there are quoted prices on this market, such prices represent the best estimation of the just value and they are used in order to measure the financial asset and liability. A financial instrument is considered to be quoted, on an active market if the prices that reflect normal market transactions can be obtained rapidly and regularly, within the context of a money market, of an intermidiary, of an evaluation service or of a regulation agency. The quoted price in the case of the assets held and of the liabilities to issue, is generally, the price offered for sale. The quoted price adequate in the case of the assets to buy or for the held liabilities is generally the price offered when buying.When the prices at sale or at purchase are not available, the just value correponds to the price of the most recent transaction, if there have not been significant changes in the economic conditions, between the date of this transaction and the date of the assesment. If it is proved that the price of the most recent transaction is not the just value, it will proceed to the adjustment of the price respectively. In case there is no active market, the just value is determined by a special technique.

The validation objectives of the evaluation models: the objective of the assesment techniques is to esatblish which would have been the price of an accomplished transaction, at the date of the closure of the accountsthat agree motivated by normal considerations. Thus, the evaluation includes all the factors that the ones that are active on the market would consider in the price determination, the hypothesis and the estimations detained must be coherent with the estimations and the hypothesis that others participants on the market will make for the determination of the price of the instrument.

The models of evaluation susceptible to be used are: the assesment techniques set on the market, including the reference value existing on the market, of a similar instrument, the analysis of the future analysed flows and the models of evaluation and options.

Sequel – Cost of the depreciation and the method of the effective rate of the interest

Calculation relation of the liquidated cost is presented as follows:

Liquidated cost =	*initially registered value*	*- Reimbursements made in the name of the principal*	*± Amortisation of any difference between the iniitial and the due date value*	*-Provisions for the depreciation*

The method of the effective rate of the interest id the calculation manner of the liquidated cost and of the revenue and income regarding the interests, based on an effective rate of interest of a financial asset or liability. The effective rate of the interest is the rate at which, updating the future flows of treasury estimated, to receive or to pay, on the expected life duration of the financial instrument or when it is on a shorter period of time, it is obtained a value equal with the value written in the balance sheet. For the determination of the effective rate of the interest, the future flows estimated on the base of the contract terms referring to the financial instrument without taking into account the future expected losses.

Conclusions

We can ascertain that the international accounting practice and especially the international standards of accountzing IAS/IFRS are oriented in certain cases, towards the elimination of the method of the cost in favor of the just value, that the IAS 32 and the IAS 39 define and present as we did previoulsy. In essence, it is about....the evaluation to the value that can define „ the market value", considered by the european accounting values as just value. In order to better understand the reasons that have determined the introduction of the evaluation criterion, of the just value, it is important to underline the different balance structures, in accordance with the IAS/ IFRS in relation with the valid accounting practices in our country or from other countries, that derive from the communitary directives. We can state that the just value constitutes an estimation corresponding to the evaluations from the balance sheet, estimation that should respect the general principle that states that the drawing up of the balance sheet or the faithful and correct representation; as a consequence this estimation must be credible.

The IAS/IFRS favors in ceratin situations the criterion of the just value, so that we could undertand the reasons for which this evaluation criterion, in certain cases is chosen in favor of the cost, being preferred to this one.There is no doubt that, at first impression it could negative or at least regarded with a certain amount of scepticism, but understanding the reasons that are at the basis of this choice, the initial impression could be reviewed integrating this matter in a different function, that the international practice integrates to the balance sheet, knowing the implementation difficulties and the critical points of the new method of assesment.

Summary: The presented theme is approached from the perspective of the accentuated extension of the operations concerning the dissolution and liquidation activities, which care allow some accounting and fiscal treatments and some specific insurance measures. We have considered that it is useful to debate the following significant problems: the competences to adopt the decisions concerning the operations of this nature; their realization flow; the managerial implications; the specificity for the inventory and for the evaluation of the tangible and intangible elements. A special attention has also been given to the presentation of the accountancy methodology for the economic and financial operations that the dissolution and the liquidation generate, by realizing the accounting registrations under the form of a case study.

Key words: accounting information, own capitals, dissolution liquidation.

Concerning the theme in debate we consider as being justified a short **introduction** within which we retain as a first aspect the fact that the operations which are realized in connection with the cessation of the activity by dissolution and liquidation need some accounting, fiscal and treatment and some specific insurance measures. So, within the dissolution operation we should take into consideration, first of all, the structure and the form of property for the capital. The dissolution and the liquidation, in the case of the private capital, is an act of decision of the own shareholders, based on a decision of the majority taken in the general meeting. The situation changes in the case of the companies with a mainly or integrally state capital where the dissolution and the liquidation are decided by the state structures with competences in the capitalization of its assets.

Without taking into consideration the decisional competence, the dissolution and the liquidation of the entities suppose the realization of many **specific operations** and more exactly:

- The inventory and the evaluation of the tangible and intangible elements of the entities that will cease their existence by dissolution and by liquidation, followed by the registration of the results;
- The elaboration of the financial situations according to the applicable accountancy norms;
- The settlement in the general meeting of the shareholders of the operations that will be realized by the liquidator in the name of the entities;
- The capitalization of the asset elements, the cashing of the debits, of the financial investments on a short term, etc.;
- The payment of the debts towards the state budget, the budget of the state social insurances, as well as the payment of the other social obligations towards other funds, employees and other third parties;
- The settlement of the result for the liquidation (profit or loss);
- The calculation, the retention and the payment of the tax for the profit and of the tax for the dividends corresponding to the action of dissolution/liquidation;
- The elaboration of the partition balance, according to the accounting norms in force;

- The realization of the partition concerning the own capital (net asset), resulted from liquidation, depending on the provisions of the statute, the decision taken by the general meeting of the shareholders, as well as depending on the participation quota in the social capital.

There are some situations when the entities, as a consequence of some unpleasant events or of some decisions of the jurisdiction organs, for the cessation of the activity are introduced in a juridical reorganization procedure, which supposes, besides the operations described above, some the obligatory measures such as:

- The sealing and the conservation of the goods which make part of the entities' fortune;
- The sale of the perishable goods or of the goods subjected to an imminent depreciation;
- The sale of the important goods from the debtor's fortune (lands, factories, installations) in then most advantageous and rapid conditions, by the previous agreement from the part of the creditors;
- The bank deposition, in the debtor's account, of the sums realised from the sale of the goods;
- The settlement, according to the law, of the intangible elements of the mass;
- The distribution of the sums realised from liquidation, according to the distribution plan between the creditors, in the order mentioned by the legal norms;
- The elaboration and the approval of the final report;
- The elaboration of the final financial situation, in the case when the liquidation ends in the current exercise. If the liquidation is prolonged over the duration of a financial exercise, the liquidators are obliged to elaborate the annual financial situations.

The realization of the operations of dissolution and liquidation, as well the ones from the juridical reorganization and bankruptcy presents some contexts and situations with a certain difficulty degree generated, as a rule, by the commercial relations, by the legal obligations of the entities towards their partners and also by the own shareholders.

The management of such an operation supposes that the general meeting should also settle the realization way of the activities that are obligatorily and which will comprise the organisational structures, the functional processes and the allocated human resources and the responsibility.

Depending on the fact if the management elements have been settled, that we consider essential in the realization of the operations of cessation of the entity's activity, at the date settled by the general meeting, there will be started **the inventory and the evaluation of the tangible and intangible elements of the company**. Within this framework, both the inventory, and also the evaluation have to be structured on categories of assets, as far as possible, as they are presented in the financial situations. The inventory is realized by observing the procedures which correspond to the accounting norms, and the evaluation is done by observing the standards and the use of the adequate values.

The resulted of the inventory are registered in the accountancy, and depending on their nature, they will be recognized in the profit and loss account, and the ones with fiscal implications (the perishable ones) will follow the fiscal procedure. The results of the evaluation are registered in the accountancy based on the recognition principle and they are taken into consideration for the settlement of the entity's global value and they will finally affect, the result of the dissolution and liquidation process.

Further on, we consider that there is a justification to exemplify the **accounting methodology for the main operations** appeared with the occasion of the dissolution and of the liquidation, inclusively concerning the elements of own capitals, related to which we appreciate that it is not suggestive to treat them separately.

The financial situation presented by the entity that has entered in the dissolution and liquidation process, decided by the general meeting of the shareholders, contains the following essential elements concerning the determination of the final result:

Item	Indicators	Details and determinations	Balance (thousand lei)
1.	Immobilized assets		800,00
	Corporal immobilizations (ct. 212 - 2812)	2.000.000 – 1.200.000	800,00
2.	Circulating assets		500,00
	Stocks (ct. 301-391)	200.000 – 40.000	160,00
	Debits (ct. 4111 + 4118 - 491)	The sums will be cashed after a period bigger than one year and they are separately presented 250.000+50.000-20.000	280,00
	Cash register and the accounts in the banks (ct. 5121)		60,00
3.	Debts (ct.404)	which should be paid in a period of up to one year	600,00
4.	Assets – Debts	Rd. (1+2-3)	700,00
5.	Provisions (ct 151)		100,00
6.	Own capital		600,00
	Subscribed and paid capital (ct. 1012)	500.000 shares x 1,0 lei/share	500,00
	Reserves from revaluation (ct.105)		
	Legal reserves (ct. 1061)	The legal reserve has been deduced with the occasion of the constitution	100,00

Situation concerning the tangible and intangible elements belonging to an entity that is dissolved and that will be liquidated

The general meeting of the shareholders has mandated the liquidator to capitalize the immobilizations and the stocks by sale, as far as possible, by the auction procedure, which has been considered to be advantageous for the entity.

In the same time, it has offered details concerning the clients and especially concerning the uncertain clients, as well as concerning the suppliers.

Base on this, the liquidator has sold the buildings over their net value presented in the balance sheet, with the sum of 100.000 lei, and in the case of the raw materials under the value from the balance sheet, with the sum of 16.000 lei. The sum corresponding to the sure clients has been received with a value of 250.000 lei with a discount in sum of 5.000 lei, and from the uncertain clients there has been received the sum of 24.000 lei from the sum of 50.000 and an adjustment of 20.000 lei has been constituted in this sense. The suppliers have been paid before the fixed term with the sum of 600.000 lei, and in this case the liquidator has gotten a discount of 20.000 lei. For the realization of the activity, the liquidator has registered expenses in sum of 52.000 lei.

All the operations are registered in the accountancy as they are presented below:

1. The capitalization of the corporal immobilizations:

a) Sale of the buildings by an auction:

461	=	%	1.071.000 lei
		7583	900.000 lei

4427 171.000 lei

b) Cashing of the value for the buildings:

5121 = 461 1.071.000 lei

c) Subtraction from the evidence of the sold buildings:

%	=	456	2.000.000 lei
281			1.200.000 lei
6583			800.000 lei

d) Closing of the account for incomes:

7583 = 121 900.000 lei

e) Closing of the account for expenses:

121 = 6583 800.000 lei

2. Sale of the stocks of raw materials:

a) Sale of the raw materials:

411	=	%	171.360 lei
		707	144.000 lei
		4427	27.360 lei

b) The registration of the goods as raw materials and their subtraction from the administration:

371 = 301 200.000 lei

607 = 371 200.000 lei

c) Annulment of adjustments:

391 = 7814 40.000 lei

d) Closing of the account for expenses:

121 = 607 200.000 lei

e) Closing of the account for incomes:

%	=	121	184.000 lei
707			144.000 lei
7814			40.000 lei

f) Cashing of the value for the sold goods:

5121 = 411 171.360 lei

3. Cashing of the debits:

a) Partial cashing from the uncertain clients:

5121 = 4118 24.000 lei

b) Passage on expenses of the uncertain clients:

6588 = 4118 26.000 lei

c) Annulment of adjustments:

491 = 7814 20.000 lei

d) Closing of the sure clients:

5121	=	411	245.000 lei

e) Allowance of the discounts:

667	=	411	5.000 lei

f) Closing of the account for expenses:

121	=	%	31.000 lei
		667	5.000 lei
		6588	26.000 lei

g) Closing of the account for incomes:

7814	=	121	20.000 lei

4. Payment of the debts:

a) Payment of the suppliers of immobilizations:

404	=	5121	580.000 lei

b) Discount received as a consequence of the payment before the due date:

404	=	767	20.000 lei

c) Closing of the account for incomes:

767	=	121	20.000 lei

5. Registration of the expenses from liquidation:

a) Expenses realized by the liquidator:

628	=	5121	52.000 lei

b) Closing of the account for expenses:

121	=	628	52.000 lei

6. Annulment of the provisions for the clients:

a) Annulment of the provisions for the risks and for the expenses:

151	=	7812	100.000 lei

b) Closing of the account for incomes:

7812	=	121	100.000 lei

7. Adjustment of the value added tax:

a) Registration of the tax which should be paid:

4427	=	4423	198.360 lei

b) Payment of the VAT:

4423	=	5121	198.360 lei

8. Settlement and payment of the tax for the profit resulted from the liquidation

a) From the registrations in the account 121 „Profit and loss" we observe that we have a credit footing of 1.224.000 and a debit footing of 1.083.000, resulting that the profit before the tax of 141.000 lei, which means that the tax for the profit is of 23.040 lei (1.224.000 x 16%) fact which also implies the realization of the registration:

691	=	441	23.040 lei

b) Closing of the account for the profit tax:

121	=	691	23.040 lei

c) Payment of the profit tax:

441	=	5121	23.040 lei

After the validation of the registrations in the accountancy we realize the works for the elaboration of the financial situations, that, in the previous example are represented by a balance sheet known under the name of **partition balance**. The partition consists in the division of the own capital (net asset), resulted from the liquidation, between the shareholders of the dissolved and liquidated trade company, which allow the usual accounting registrations. Mainly, they refer to the taxation of the legal reserves and the registration of the gotten net value, together with the realized profit, as dividends to be paid, the taxation of the dividends resulted from the profit, the disconnection of the sums due towards the budget and towards the shareholders and the closing of the account for the subscribed and paid capital.

As a conclusion, we appreciate that the present work brings a modest contribution concerning the clarification and the profound study of some essential aspects related to the accounting information corresponding to the dissolution and liquidation operations of the economic entities, which brings a benefit to the quality of the generated accounting information.

Profit margin is a performance indicator of a commercial company that represents the main source for covering the circulation expenses, being in the same time a weight balance in the intermediate administration balance-sheet of commercial companies.

This indicator shows the earning obtained as margin from goods selling, that has a balance in the operating activity of a commercial company. The analysis of gross margin’s influence to the economic-financial equilibrium of commercial company is done through the “direct-costing” method.

Margin, profit margin, intermediate administration balance sheet

La marge commerciale est un indicateur de la performance de l’entreprise en commerce, qui constitue la principale source de couvrir les dépenses de la circulation et elle mit en évidence l’efficacité de l’activité de l’exploitation. L’influence de la marge commerciale sur l’équilibre économique-financier est réalisée par l’usage dans l’analyse économico - financière de la méthode ’’direct-costing’’.

Caractéristique de la méthode ’’direct-costing’’ c’est la poursuite sur la formation du résultat de l’exploitation de l’entreprise en commerce par la corrélation qu’il y a entre les dépenses de la circulation mises en évidence par les dépenses variables et fixes et bien sûr le chiffre d’affaires. La séparation des dépenses variables de celles fixes permet l’analyse approfondie des dépenses variables, qui met en évidence l’usage des actifs circulants à court terme et des dépenses fixes qui mettent en évidence la stratégie du développement ou la diminution, à long terme du patrimoine des entreprises commerciales.

Par l’usage de la méthode ’’direct-costing’’, dans le processus d’analyse économique on peut déterminer le point d’équilibre entre les encaissements résultés par la vente des marchandises et la prestation, les dépenses pour la fonctionnement efficace des entreprises commerciales et le résultat par l’activité d’exploitation.

La connaissance du point d’équilibre par les hommes des entreprises en commerce peut influencer positivement la prise des décisions optimale en ce qui concerne les programmes prochains d’assurance sur la rentabilité de l’activité d’exploitation et implicitement sur l’équilibre économico - financier.

L’application de la méthode ’’direct-costing’’ dans l’analyse des dépenses dans les entreprises commerciales présente les éléments suivants:

- on simplifie l’évidence de l’évolution des dépenses de circulation par rapport au chiffre d’affaires.
- on assure la connaissance de l’influence des dépenses variables et fixes sur le résultat de l’activité d’exploitation et implicitement de l’activité générale.
- on permet pour les manages un contrôle rigoureux, sur les dépenses et la prise des décisions efficaces dans l’administration du patrimoine, la maintenance de l’équilibre économico - financier et l’optimisation de l’activité économique. Les informations nécessaires pour prendre des décisions efficaces sont fournies par la dynamique des indicateurs:le chiffre d’affaires, les dépenses en ce qui concerne les marchandises, les dépenses variables, la marge des dépenses variables, les dépenses fixes.

Pour l’analyse de la dynamique des dépenses de la circulation par rapport au chiffre d’affaires on utilise la méthode ’’direct-costing global’’ qui se base sur la séparation des dépenses de l’exercice par les dépenses variables et les dépenses fixes et sa poursuite par rapport au chiffre d’affaires.

L’analyse de la structure des dépenses est réalisée tenir compte de l’implication des indicateurs: le chiffre d’affaires, les dépenses de marchandises, la marge commerciale, les dépenses variables, la marge des dépenses variables, les dépenses fixes et le résultat brut de l'activité d'exploitation par rapport au chiffre d'affaires déterminé selon le schéma numéro 1:

Le chiffre d'affaires
- les dépenses de marchandises
= la marge commerciale
- les dépenses de la circulation variables
= la marge des circulations variables
- les dépenses des circulations fixes
= le résultat brut de l'activité d'exploitation selon le chiffre d'affaires

L'illustration numéro 1. La détermination du résultat brut de l'activité d'exploitation.

Par le schéma présenté, il en résulte les relations suivantes:

CA - Mf = Mc – Cv = Mcv; Mcv – Cf = Rbex, où:

CA - le chiffre d'affaires résulté par la vente de marchandises;

Mf - les dépenses en ce qui concerne les marchandises;

Mc - la marge commerciale;

Cv - les dépenses variables de la circulation;

Mcv - la marge des dépenses variables;

Cf - les dépenses fixes de la circulation;

Rbex - le résultat brut de l'activité d'exploitation.

La détermination du résultat par l'exploitation pour la société commerciale ''ALFA'' S.A. :

Les indicateurs	***L'exercice financier***						
	N	***N+1***	***N+2***	***N+3***	***N+4***	***N+5***	***N+6***
1. *le chiffre d'affaires (CA)*	*3813*	*3995*	*3827*	*2791*	*3033*	*2358*	*1782*
2. *les dépenses de marchandises (mf)*	*3101*	*3169*	*2834*	*2095*	*2266*	*1754*	*1311*
3. *la marge commerciale (Mc) (rd.3=rd.1-rd.2)*	*712*	*826*	*993*	*696*	*767*	*604*	*471*
4. *les dépenses variables de la circulation (Cv)*	*424*	*612*	*566*	*491*	*559*	*502*	*338*
5. *la marge des dépenses variables (Mcv) (rd.5=rd.3-rd.4)*	*288*	*214*	*427*	*205*	*208*	*102*	*133*
6. *les dépenses fixes de la circulation (Cf)*	*279*	*397*	*552*	*419*	*421*	*527*	*294*

***7.** le résultat brut de l'activité d'exploitation selon le chiffre d'affaires (Rbex)* *(rd.7=rd.5-rd.6)*	*9*	*-183*	*-125*	*-214*	*-213*	*-425*	*-161*
***8.** la production immobilisée*	-	-	-	-	-	-	-
***9.** la variation des stocks*	-	-	-	-	-	-	-
***10.** les autres rapports de l'exploitation (Ave)*	*81*	*383*	*36*	*260*	*312*	*663*	*382*
***11.** le résultat de l'exploitation (Re)* *(rd.11=rd.7+rd.8+rd.9+rd.10)*	*90*	*200*	*-89*	*46*	*99*	*238*	*221*

Par l'analyse il en résulte :

- le résultat d'exploitation est concrétisé en bénéfice, à cause des autres bénéfices d'exploitation.
- la marge commerciale ne couvre pas les coûts de la circulation et la réalisation du profit.

Pour préciser le résultat d'exploitation, on retient comme un désavantage le fait que les facteurs de décisions n'ont pas poursuit la réalisation du chiffre d'affaires avec un surplus commercial selon les marchandises vendues qui pourraient couvrir les coûts de la circulation.

L'équilibre économico - financier des entreprises commerciales est exprimé par les relations suivantes:

1. Cmf + rmc = Cmf + rmcv + Cv = 1, oỳ :

Cmf - le coût moyen des marchandises par 1 leu chiffre d'affaires

rmc - la mensualité commerciale;

rmcv - la mensualité de la marge des coûts variables;

Cv - le coût moyen variable par 1 leu chiffre d'affaires.

2. rmcv = mcv / CA / Mc / CA – Cv /CA = rmc – Cv ; Cv = rmc - rmcv

Si l'on considère:

E = Cmv / Cv, il en résulte Cv = Cmv / E,

Et rmcv = rmc – Cmv / E = rmc. E – Cmv / E;

Rmcv. E = rmc. E - Cmv;

Cmv = E(rmc - rmcv);

Et E = Cmv / rmc - rmcv, oỳ :

Cmv - la dépense variable marginale;

Rmcv - la mensualité de la marge des dépenses variables;

Mcv - la marge des dépenses variables;

CA- le chiffre d'affaires;

Mc - la marge commerciale;

Cv - les dépenses variables;

Rmc - la mensualité de la marge commerciale;

Cv - la dépense moyenne variable;

E - le coefficient d'élasticité.

Le rendement de l'activité d'exploitation de l'entreprise commerciale est rendu par la valeur du coefficient d'élasticité.

- le rendement augmenté: E < 1; Cmv < Cv; rmc – rmcv > Cmv;

– le rendement constant: E = 1; Cmv = Cv; rmc – rmcv = Cmv;

– le rendement diminué: E > 1; Cmv > Cv; rmc – rmcv < Cmv.

3. rmc = Cv + Cf + b, oừ:

Rmc - la mensualité de la marge commerciale;

Cv - la dépense moyenne variable;

Cf - la dépense moyenne fixe;

b- le bénéfice par 1 leu chiffre d'affaires.

L'activité de l'exploitation devient efficace si:

Rmc > Cv + Cf, et Cf a un niveau constant.

4. rmcv = Cf + b, oừ:

Rmc - la mensualité de la marge commerciale;

Cv - la dépense moyenne fixe;

b - le bénéfice par 1 leu chiffre d'affaires.

L'efficacité de l'activité de l'exploitation augmente l'équilibre économico - financier, si la mensualité des dépenses variables (rmcv) évolue positivement, et la dépense moyenne fixe (Cf) se maintient constante. Aussi, la mensualité de la marge commerciale croît dans un rythme supérieur comparatif à la mensualité des dépenses variables.

14. la dépense marginale variables (Cvm)	-	*1,03*	*0,26*	*0,07*	*0,27*	*0,08*	*0,28*
15. la valeur du coefficient d'élasticité	-	*6,86*	*1,85*	*0,38*	*1,50*	*0,38*	*3,50*

L'analyse des indicateurs et des resultants obtenus par SC ALFA SA

Par l'analyse on peut comprendre les conclusions suivantes:

- les coûts de marchandises et la marge commerciale ont été un niveau constat.
- l'activité d'exploitation a enregistré un rendement augmenté, quand la dépense marginale variable a été plus petite que la dépense moyenne variable.

Pour l'assurance de l'équilibre économico - financier il est nécessaire:

- l'augmentation de la marge commerciale dans un rythme supérieur aux dépenses de la circulation.
- que les dépenses variables soient effectuées en concordance avec la modification du chiffre d'affaires, et des autres indicateurs économiques.
- que les dépenses fixes soient constantes ou diminuées par rapport au chiffre d'affaires et la marge commerciale.

Abstract Corporate Governance ensures that long-term strategic objectives and plans are established and that the proper management structure (organization, systems, and people) is in place to achieve those objectives, while at the same time making sure that the structure functions to maintain the corporation's integrity, reputation, and responsibility to its various constituencies. Audit committees have a big job to do in an organization, tough when the members have other responsibilities and the audit committee role is a part-time job with huge accountability.

Key words: Audit Committee, Organisation, Corporate Governanc,Audit Committee Charter

1.Einleitung

Im Zentrum der Corporate Governance-Debatte steht die Frage, durch welche Instrumente oder Mechanismen potentielle Interessenkonflikte zwischen Kapitalgeber und Management gemindert werden können. Diese Interessenkonflikte, in der wissenschaftlichen Literatur auch bekannt unter der Principal-Agent Problematik, lassen sich auf die in der Natur der modernen Aktiengesellschaft liegenden Trennung von Eigentum und Kontrolle zurückführen. Die Aktionäre als Eigentümer der Aktiengesellschaft überlassen deren Führung üblicherweise einer Unternehmensleitung respektive einem Management , da ihnen die Zeit oder der Anreiz fehlt, das Unternehmen selber zu führen oder sie nicht über die dazu erforderlichen Kompetenzen verfügen (Beiner, 2005, S. 1). Die Interessen der Agents müssen in der Folge nicht zwangsläufig mit denen der Principals übereinstimmen.

Forschungsgegenstand der vorliegenden Arbeit ist es, den spezifischen Beitrag eines Audit Committees zur Corporate Governance einer Gesellschaft und die speziellen Anforderungen an die Zusammensetzung eines solchen Ausschusses herauszuarbeiten.

2.Organisation des Audit Committees

2.1.Innere Organisation

Den organisatorischen Aspekten des Audit Committees kommt hierbei eine grosse Bedeutung zu. „Aufbau und Prozess sind für den Erfolg des Prüfungsausschusses genauso wichtig wie für den Erfolg eines beliebigen Unternehmens“ (Lussu, 2004, S. 8). Zu einer zweckmäßigen Organisation gehören unter anderem Festlegungen hinsichtlich der Zusammensetzung, der Vorgehensweise, aber auch der regelmässigen Selbstbeurteilung. Nach der Untersuchung der Hauptdokumenten, des deutschen Best Practice- Empfehlungen, haben wir 242 Geschäftsberichte des Jahres 2006 von deutschen kotierten Unternehmen analysierst.

2.1.1. Audit Committee Charter

Gemäss der Empfehlung 4 des Blue Ribbon Reports und den Listing Requirements der New York Stock Exchange (sec. 303A.07) soll das Audit Committee über ein schriftliches Organisationsreglement respektive eine Audit Committee Charter verfügen. Allerdings ist das Organisationsreglement nicht nur ein wirksames *Instrument* für eine klare und unmissverständliche Zuteilung der Aufgaben, sondern auch ein *formelles Commitment* des Audit Committees „to ensure the integrity of financial statements and to supervise the internal and external audit functions“ (Moeller, 2004, S. 61). Nicht zuletzt ist zudem auf der Ebene des Gesamtverwaltungsrates von Gesetzes wegen des Organisationsreglements vorgeschrieben, wenn der Verwaltungsrat die Geschäftsführung an einzelne Mitglieder oder Dritte überträgt. Deshalb sollten die Corporate Governance-Richtlinien im Bereich der organisatorischen Aspekte des Prüfungsausschuss wohl im Minimum eine Audit Committee Charter empfehlen.

2.1.2. Anzahl Mitglieder

Ein Audit Committee sollte einerseits gross genug sein, um den umfangreichen Aufgaben nachkommen zu können und ein ausgewogenenes Spektrum von Ansichten und Erfahrungen zu gewährleisten. Andererseits sollte es aber auch klein genug sein, um effizient arbeiten zu können (PWC, 2003, S. 20). In den USA und Grossbritannien wird eine Minimalgrösse von drei Mitgliedern gefordert. Generell wird bei drei bis sechs Mitgliedern von einer optimalen Grösse gesprochen (PWC, 2003, S. 20). Grundsätzlich gilt auch hier, dass die Grösse jedes Prüfungsausschusses den spezifischen Eigenschaften (wie der Grösse des Unternehmens oder dem konkreten Arbeitsumfang des Ausschusses) des Unternehmens anzupassen ist. Der Blue Ribbon Report und der Combined Code tragen der Berücksichtigung der Grösse des Unternehmens Rechnung, indem sie die Mindestgrösse erst ab einer Marktkapitalisierung von USD 200 Mio. respektive der Zugehörigkeit zum FTSE 350 Index fordern.

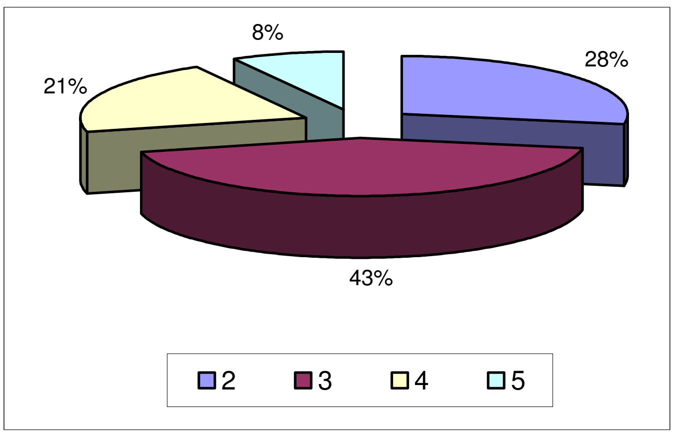

Abbildung 1 Anzahl Mitglieder der Audit Committees (eigene Darstellung)

Die Auswertung, der deutscher Unternehmen zeigt, dass 72 % der Unternehmen die Forderung nach mindestens drei Mitgliedern erfüllen . Gemäss einer Studie von PWC (zit. in PWC, 2003, S. 20) haben 70 % der wichtigsten europäischen Unternehmen ein Audit Committee mit drei bis vier Mitgliedern. Nach unseres Analyse können wir bemerken dass der Anteil der deutschen Unternehmen fast deckungsgleich ist mit dem Europäischen Niveau. Es stellt sich jedoch die Frage, ob zur Sicherstellung einer ausgewogenen Mitgliederstruktur, einer gewissen Altersschichtung, aufgrund von Verhinderungen und der Zuteilung von geeigneten Mitgliedern zu weiteren Ausschüssen nicht generell ein grösseres Gremium nötig ist (Böckli, 2004, S. 1440). So sieht Böckli (2004, S. 1440) das Optimum für einen Verwaltungsrat denn auch bei sieben bis zehn Mitgliedern. Auf der anderen Seite sind grosse Verwaltungsräte mit sehr vielen Mitgliedern aus Effizienzgründen anerkanntermassen problematisch. Von den neun Audit Committees mit fünf Mitgliedern gehören fünf einem Gesamtverwaltungsrat mit über zehn Mitgliedern an. Hier besteht die Gefahr der Konzentration aller wichtigen Funktionen im Ausschuss und der Informationshemmung zwischen den Ausschüssen (Böckli, 2004, S. 1440), weshalb eine Verkleinerung des Gesamtverwaltungsrates und des Audit Committees in Erwägung gezogen werden sollte.

2.1.3. Anzahl Sitzungen

Damit man zu einen guten erfolg kommt ist neben einer nutzenmaximierenden Grösse der Prüfungsausschuss für eine effektive Durchführung seiner Aufgaben angewiesen. Wenn man das in einem Wort zusammen fast kann spricht man von der Zeit „Audit committee members must make the time, and take the time, to achieve an adequate understanding of what the company´s financials represent, to have enough time to consult with outside counsel and experts if necessary, to ask the tough and incisive questions, and to obtain answers that make sense" (Herdman, 2002, S. 7). Für diese Arbeit sind *regelmässige Sitzungen* des Audit Committees unerlässlich. Der 1992 publizierte Cadbury Report ging noch davon aus, dass zwei Sitzungen pro Jahr genügen würden. Zur Erfüllung der heutigen Anforderungen genügt dies allerdings kaum mehr. Die Häufigkeit der Sitzungen hängt zwar vom genauen Umfang der Überwachungstätigkeit und –verantwortung des Audit Committees ab. Man spricht von einer optimalen Anzahl von Sitzungen wie es Bertschinger und Schaad (2003, S. 27) sowie PWC (2003, S. 21) nennen jedoch von drei bis vier Sitzungen. Eindeutiger äussern sich dagegen Wallace und Zinkin (2005, S. 216), sowie Böckli (2005, S. 39), indem sie vier ordentliche Sitzungen pro Jahr als Untergrenze ansetzen.

Ausser der internen und externen Revision sollte man auch die Probleme der Follow-up, der Stand der Arbeiter und vieles anderes Diskutieren. Diese Probleme, die in den Sitzungen zu Besprechen sind, kann man kaum in einer Sitzung bewältigen. Um einen guten Verlauf der Sitzungen zu gewährleisten, sollte man eine gute Vorbereitung vornehmen und die dazugehörige Agenda erstellen. Das Management des Unternehmens sollte für diese Veranstaltungen die nötigen Ausrüstungen zur Verfügung stellen.

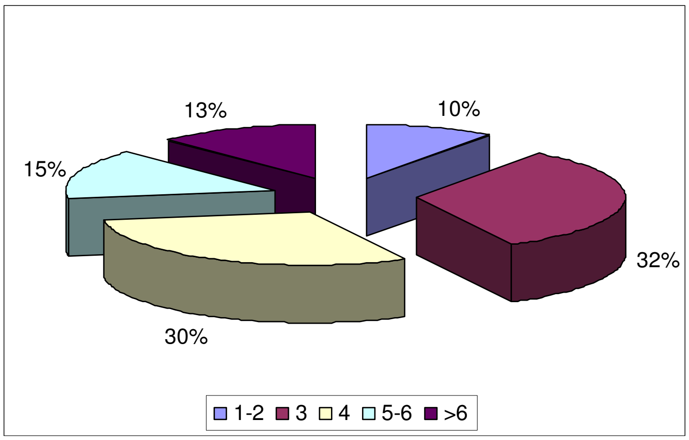

Abbildung 2 Anzahl Sitzungen der Audit Committees (eigene Darstellung)

Von den untersuchten Unternehmen haben nur 80 respektive 52% Angaben bezüglich ihrer Sitzungen angegeben. Wie man es in der oberen Grafik feststellen kann, 72% der Unternehmen erfüllen die Minimalerfordernis von vier Sitzungen pro Jahr. Es sind sogar 28% der Unternehmen, die mehr als vier Sitzungen pro Jahr haben.

2.1.4. Selbstbeurteilung

Gemäß des Combindet Cod sollen die Ausschüsse jährlich ihre Effektivität überprüfen und gegebenenfalls den Gesamtverwaltungsrat nötige Änderungsmaßnahmen vorschlagen. Die jährliche Selbstbeurteilung wird von der Corporate Governance gefordert. Durch diese Selbstverteidigung kann man beweisen das man die Arbeit gewissenhaft durchgeführt hat. Man stellt sich die Frage nach welchen Kriterien sollte man die Selbstbeurteilung vornehmen und nach welchen Prozessen soll man das durchführen.

Nach der Beurteilung der einzelnen Mitglieder und des Audit Committees als Gesamtgremium, kann man auf der Ebene der Ausschussmitglieder folgende Faktoren in betracht ziehen:Fachkunde, Kritische Grundhaltung, Objektivität und Integrität, Urteilssicherheit, Verständnis der Geschäftstätigkeit der Unternehmen, Verständnis und Verpflichtung für die Aufgaben des Audit Committees und Bereitschaft, genügend Zeit für die Vorbereitung der Sitzungen aufzuwenden.Auf der Eebene des Gesamtgremiums dient als Grundlage die Audit Committees Charter.Auf der Ebene des Gesamtgremiums dient als Grundlage zur Beurteilung idealerweise die Audit Committee Charter, wobei beispielsweise die Zusammensetzung des Ausschusses, der Ablauf der Sitzungen, die Aktivitäten, die Beziehungen zum

Management und den Revisoren und die Nutzung der Ressourcen als Kriterien für die Beurteilung der wirksamen Überwachungstätigkeit herangezogen werden können (PWC, 2003, S. 48).

Schweizer und Hofstetter empfehlen eine Zweistufiges verfahren der Durchführung des praktischen Teiles. In der ersten Phase sollte man eine individuelle Bewertung vornehmen und eine Bewertung des Ausschusses.In der zweiten Phase sollte ein kostruktives Dialog im Rahmen einer Diskussion der Resultate durchgeführt.

2.2. Anforderungen an die Mitglieder

Damit man über effektives Audit Committees sprechen kann, benötigt man eine Besetzung mit geeigneten Mitglieder.Um eine glaubwürdige Position zu gewährleisten, sollen Mitglieder über die nötige Zeit, Sorgfalt, Unabhängigkeit, Integrität und Fachkunde verfügen.Mittels ihrer Kenntnisse sollten sie „die Geschäftsleitung herauszufordern und genügend Aufmerksamkeit auf zweifelhafte Praktiken zu richten, selbst in scheinbar erfolgreichen Unternehmen"(Bertschinger, Schaad, 2003,S.16).

2.2.1. Unabhängigkeit

Zu den Kernpunkten der Corporat Governance - Anliegen gehört seit Mitte der neunziger Jahre die Vorstellung dass der Prüfungsausschuss mit vollkommen unabhängigen Mitgliedern zu besetzten sein. Die konkreten Anforderungen der verschiedenen Kodizes und Gesetze unterscheiden sich jedoch in ihrer strengen und Reihweite.

Die internationalen Regelungen zur Unabhängigkeit sind merklich strenger als die nationalen Regelungen. So siecht der Combined Code auch schon in der Verwandtschaft eine Gefährdung der Unabhängigkeit und erfasst mit der so genannte „catch-all-clause"(Böckli, 2004, S.1823) alle denkbaren Umstände, welche die unabhängige Ausübung des eigenen Urteils in Frage stellen.

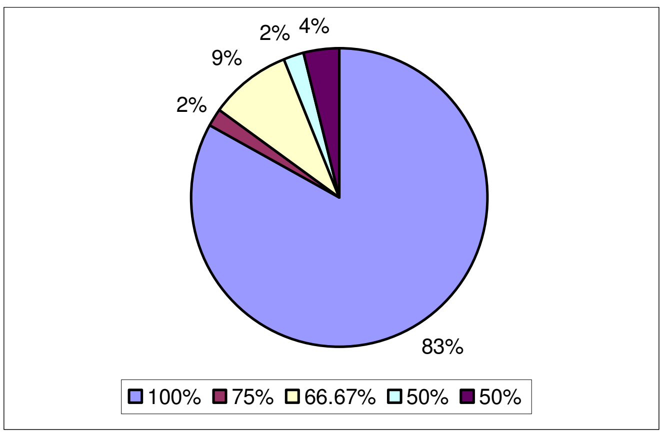

Abbildung 3 Unabhängigkeit der Audit Committee Mitglieder (eigene Darstellung)

Die Unabhängigkeit der Audit Committees der untersuchten Unternehmen kann als positiv eingestuft werden. 83 % der untersuchten Audit Committees setzen sich vollständig aus unabhängigen Mitgliedern zusammen.

2.2.2. „Financial Literacy" und „Financial Expertise"

Heut zutage sollte jeder Audit Committee Mitglied gute Erfahrung im Finanz- und Rechnungswesen haben, d.h. „in der Lage, Zusammenhänge der Rechnungslegung rasch zu erfassen, zielgerichtete Fragen zu stellen und die Antworten inhaltlich rasch zu analysieren" (Böckli, 2004, S. 1561). Bereits der Blue Ribbon Report stellte diese Anforderung auf, die vom

Sarbanes-Oxley Act drei Jahre später übernommen wurde (sec. 407). Der Combined Code (princ.

C.3.1) fordert analog: „The board should satisfy itself that at least one member of the audit committee has recent and relevant financial experience.

Während die „Financial Literacy" international als Vorbedingung für die Wahl in einen Prüfungsausschuss gilt, gehen die amerikanischen Vorstellungen noch einen Schritt weiter, indem sie darüber hinaus fordern, dass mindestens eines der Mitglieder ein so genannter „Financial Expert" ist, d.h. faktisch ein diplomierter Wirtschaftsprüfer.(Böckli, 2004, S. 1765). Der Smith Report von 2003 erachtet in seinem Kommentar (Ziff. 32) diese besondere fachliche Qualifikation zwar als wünschenswert und „virtually essential for some complex businesses", wendet sich aber explizit gegen eine entsprechende Formulierung in seinen Empfehlungen.

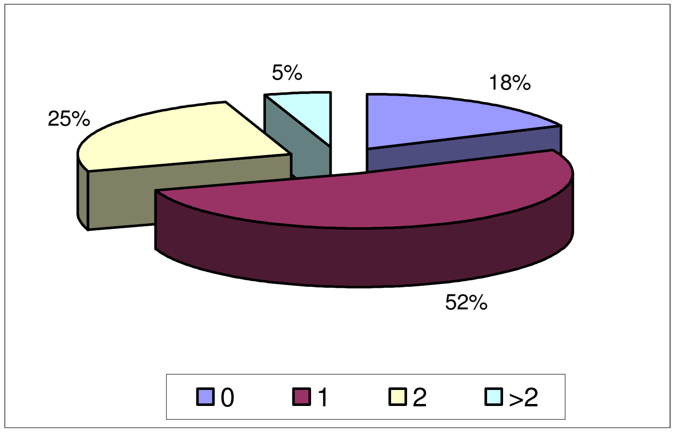

Abbildung 4 Financial Experts in den Audit Committees (eigene Darstellung)

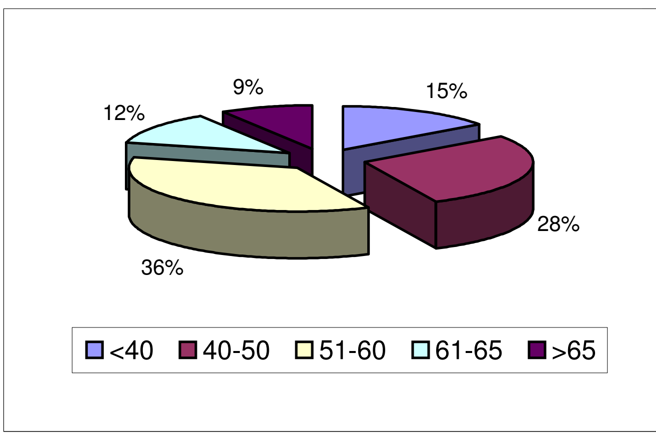
Trotz des Fehlens einer entsprechenden Empfehlung setzen 70 % der untersuchten Audit Committees mindestens einen „Financial Expert" ein, ein Drittel von ihnen sogar zwei oder mehr. Als Erfüllungskriterien für den Status eines „Financial Experts" wurden die oben erwähnten Ausführungen von Böckli (2004, S. 1765) herangezogen.

2.2.3. Weiterbildung

Gerade auf dem Gebiet der von dynamischen Veränderungen geprägten Finanzberichterstattung ist eine innere Bereitschaft des Audit Committee-Mitglieds, dazuzulernen, von entscheidender Bedeutung. Eine Einführung für neu eintretende Mitglieder ist dabei ebenso unerlässlich wie eine *regelmässige Weiterbildung, um das Wissen auf dem neuesten Stand zu halten.*



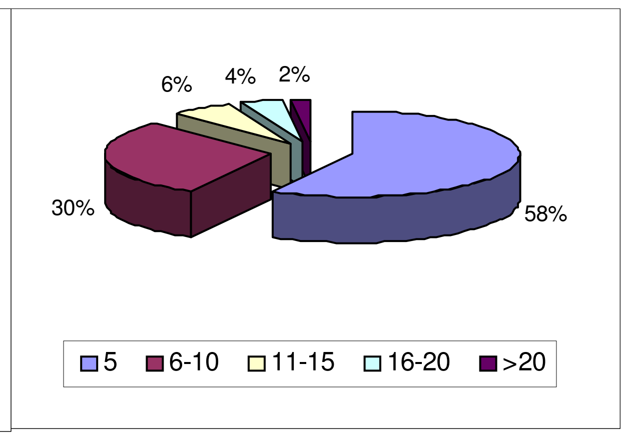


Abbildung 5 Alter der Audit Committee Mitglieder (eigene Darstellung)

Abbildung 6 Amtszeit der Audit Committee Mitglieder im Verwaltungsrat (eigene Darstellung)

Wie in den Grafiken zu sehn ist, sind 57 % der Audit Committee-Mitglieder über 50 Jahre alt und beinahe die Hälfte von ihnen bereits mindestens sechs Jahre im Verwaltungsrat tätig. Die Vermutung liegt nahe, dass dabei einige von ihnen als erfolgreiche und selbstbewusste Unternehmer für diese Belange wenig übrig haben könnten. Tatsächlich sind aber die fachlichen Anforderungen an ein Audit Committee-

Mitglied heute eindeutig grösser als das, was noch bis in die neunziger Jahre von ihm erwartet wurde (Böckli, 2005, S. 37). Deshalb handelt es sich bei Weiterbildung (und auch Einführung) um Erfordernisse, von denen, so Böckli (2004, S. 1813) zu Recht, praktisch unter keinen Umständen in einer börsenkotierten Gesellschaft abgewichen werden darf.

3.Zusammenfassung und Ausblick

Zielsetzung der vorliegenden Arbeit war, den Beitrag eines Audit Committees zur Stärkung der Corporate Governance herauszuarbeiten. Überdies sollten die spezifischen Anforderungen an die Zusammensetzung eines Audit Committees aufgezeigt werden, die diesem eine effektive und effiziente Wahrnehmung seiner Aufgaben ermöglichen.Um den umfangreichen Aufgaben mit der gebotenen Sorgfalt nachkommen zu können, sollte ein Audit Committee aus mindestens drei, aus Effizienzgründen maximal vier Mitgliedern bestehen. Überdies sind regelmässige Sitzungen des Audit Committees unerlässlich. Vier ordentliche Sitzungen pro Geschäftsjahr sind dabei als Untergrenze anzusetzen.

Für eine zielgerichtete Wahrnehmung ihrer Aufgaben müssen die Ausschussmitglieder zudem persönlichen Anforderungen an ihre fachliche Qualifikation und ihre Unabhängigkeit gerecht werden. Um die Fülle an Berichten wie Konzernabschlüsse, Prüftestate und Zwischenberichte sachgerecht verarbeiten und in einen fundierten und konstruktiven Dialog mit der internen und externen Revision treten zu können, müssen die Mitglieder im Finanz- und Rechnungswesen erfahren sein. Die Schaffung eines obligatorischen Financial Experts, wie im Sarbanes-Oxley Act gefordert, stellt eine Möglichkeit dar, dieses Qualifikationsniveau sicherzustellen.Als weiter Studie haben wir uns Vorgenohmen eine Analyse bezüglich der rumänischen Unternehmen vorzunehmen. Wie möchte sehn, wie weit in Rumänien das Corporate Governance angewendet wird und ob wir über Audit Committees verfügen.

Through this paper we intend to disclose our actual research project focused on evaluation of the actual stage of Romanian academic accounting education in order to support the national university reform which has began in 2005. The research is meeting the international trends oriented to improve the academic process of accounting graduates. In this way, by determine a correlation degree between international trends: globalization, regionalization and the evolution of Romanian accounting system and by evaluation of the actual stage of Romanian accounting academic system from the point of view of actors involved (graduates, teachers and employers) we intend to determine the connection between the appliance of public requirements with the actual level of graduates' professional knowledge. Then we will offer constructive solutions, empiric validated, which will help the accounting graduates in their way to accounting profession. The research is interdisciplinary and its originality is give by the pioneering work performed at national level by the research team who is developing such a theoretical and practically complex approach.

Keywords: accounting education, professional development, academic education, accounting profession

An overview of the project

In recent years, at least three major factors had a significant impact on the business environment for which teachers prepare graduates: technology, globalization and the increased concentration of power among certain markets investors. In this circumstance, the future of the accounting education depends on how proactive teachers are and on the way universities can meet the necessities of the economic world's ongoing change. High trade literature (Albrecht and Sack in 2000 and 2002, Dusch and Wambsganss in 2006, Hurt in 2007, etc) reflects concerns regarding the perilous academic accounting education is. Moreover, the accounting profession's organisms (IFAC, IAAER, UNCTAD, GAE, AAA, ACCA, etc.) are demanding changes in accounting education to be made before the image of the profession will be affected.

The proposed research's topic is based both on a fundamental and applicative research. The fundamental research focuses on analyzing information by description, offering the useful instruments in order to perform analyze, launching ideas and believes. It allows, based on existing theories and concepts, to draw essential guidelines in the accounting education domain which assure the pre-requisite of the research.

The applicative research is meant to identify the actual stage of the Romanian academic accounting education concerning the accounting graduates' level of knowledge. Its results will have a great impact on verifying the hypothesis developed by fundamental research and also on identifying new problems, stages or particular cases for Romania. Using both of the research methods will contribute to establishing the connection ratio between the application of public requests and the actual level of accounting graduates' knowledge.

The transdisciplinary feature of this project is proved by involving within the research project both Romanian's professional organisms and top management of the most important audit and accounting companies. Their implication will add value to our research by bringing a practical and different vision and ideas. In this way, the hypothesis developed throughout this research will be larger. Since the subject of the research affects the public interest, the participative approach is a must.

The structure of the research underlines its' interdisciplinary feature: firstly, we are going to investigate the actual stage of the accounting curricula in relation to the requests of the professional organisms on the necessary knowledge an accounting graduate must have: accounting, finance and related knowledge, organizational and business knowledge and IT knowledge [IES 2, p.3]. Being indispensable to assure a minimum base in gaining knowledge process of the accounting graduate, these areas of knowledge will be analyzed in order to identify the degree of correlation in between at curricula level. Moreover, we will analyze other significant aspects like teaching methods, educational models, technology and the development stage of Romanian university.

Research's objectives are:

- O1: To identify the accounting education public requests made by the professional organisms and professional organizations at international, European and national level and the factors that affect them.
- O2: To determine the degree of correlation between the nowadays trend: globalization and the evolution of the Romanian academic accounting education system.
- O3: To evaluate the national academic accounting education by deeply analyzing the accounting graduate's level of knowledge.
- O4: To determine the extent to which the professional organisms' public requests are connected with the accounting graduate's level of knowledge.
- O5: To issue new pragmatic approaches and to offer constructive solutions for achieving a higher accounting graduates' level of knowledge.

The research methodology and methods used

The research methodology is based on scientific epistemology. A critical and mostly inductive research will generate the obtaining of verifiable knowledge which contributes through their value to the development of the scientific knowledge in this area. Our vision is to build new hypothesis and opinions supported by the preliminary analyze of the present knowledge and specific phenomena and to test further the validity of the hypothesis and issued opinions. The testing process for the obtained data validity will consider only scientific methods. Besides inductive research, deductive research will also play an important role in the consolidation process of the research's results.

The research methodology implies gathering all possible existing theory, concepts, ideas and opinions of high rated specialists and a comparative approach of different visions on two levels: conceptual (literature and existing regulations) and de facto (the actual stage of academic accounting education in Romania).

The first important step is represented by identifying the knowledge area in this field, which will be achieved through a harshly documentation over the most recent publications: articles in journals, governmental acts, reports, standards, recommendations issued by international and national professional organisms. The documentation process followed by observation will help us to use a comparative approach on three different levels (International, European and National) in order to identify the requests of the most active professional organisms. By offering explanations on similarities and differences observed in our effort to establish a causality relation, based only on valid theories, we can build a necessity's perimeter of academic accounting education in Romania.

The Academic accounting system (AAS) is influenced by external and internal aspects. One of the external aspects which play an important role is the globalization/regionalization process (Mathews, 2001, Hilton, 2005, Needles, 2005, Pekdemir, 2007). We will look closely at this factor in order to identify its impact on national AAS. On the other hand, AAS is influenced by the evolution of social, economic, cultural and not at least political factors. We will identify and investigate their influence using the holistic analyze because the effect of each factor's evolution is representative only if it is analyzed on the whole. The issued hypothesis will be empirically tested to reach trustable conclusions from scientific point of view.

Having the goal of evaluating the actual stage of national AAS we will apply four questionnaires in order to assess the accounting graduate's knowledge in Romania. The questionnaires which will be applied are based on those used by Steve Albrecht S and Bob Sack in 2000 and published in their remarkable study: „Charting the Course through a Perilous Future". The reasons for using their questionnaires are as follows: they were drawn by a team of specialists whose professional probity can't be questioned; the trade literature didn't identify any doubts regarding their quality, although their study was analyzed and commented by many specialists; the questionnaire's scope is the same: to evaluate the academic accounting graduates' knowledge; the questionnaires are available at http://aaahq.org/pubs/AESv16/index.html with no restriction to be used. Even so, we will not use the same questionnaires' working methodology: few amendments will be considered regarding the nature and number of analyzed subjects. Moreover, some additional questions will be added in order to clarify some specific aspects. The results will be processed with SPSS 16.0 using descriptive statistics. The practical approach of the research is essential by permitting us to assess both the actual stage of the academic accounting education system and its results which will guideline our research to reach and offer practical solutions of the studied phenomena. By doing so, we can connect the theoretical research's results with those resulted from the applicative study in order to establish a correlation ratio between public requests and the actual stage of accounting graduate's knowledge. All these new results will be managed using the instruments of the inductive research. This stage of the project contributes to the reality's deep knowledge of the studied topic and permits us to identify and explain different problems or specific identified situations and phenomena. The tools used in this phase will permit us to draw scientific conclusions which will be empirically validated. Based on the achieved results and using observation and direct analyze we can identify new approaches and offer constructive solutions with the purpose of raising the performance of the Romanian academic accounting education. In order to reach the proposed objectives, the documentation process will be focused on ongoing bases and oriented to the recent journals' publications.

The originality and the novelty of the proposed research topic

It is for the first time that such a deep analyze of the actual stage of the Romanian accounting academic education is taken into consideration, with the specific purpose of bringing a contribution to its development. By proving preoccupation in improving the academic education system, this project will confer Romania a special status among the UE countries. In addition, we have to underline that none of the European country has performed a similar research. The international echo of the project will be sound, Romania becoming one of the few countries who had tried to move on to be competitive in this domain, and this way showing its preoccupation regarding the faith of accounting profession. Such complex research, approached both theoretical and practical are extremely valuable because it tests the identified subject as a whole. Since now, partial researches which focus on accounting curricula ((Malciu, 1998, Tiron si Mutiu, 2007) and accounting regulations (Diaconu, 2006) have been done, but they are not so detailed and can't offer a global picture of the Romanian academic accounting education; moreover, they can't offer a constructive solution regarding the entire system. These are the motivations that show the originality and the novelty of the proposed research topic.

The functioning chart of the consortium

The consortium comprises research teams from the most well-known Romanian universities with a long tradition in accounting education. Each research team is run by a coordinator whose election was made based on a mix of several reasons: the level of expertise, professional and scientific achievements. The coordinator is in charge to select the research team's members except one amendment: team members have to be young researchers (masters and PhD students) which can assure by their background and knowledge the research will be carried through its final stage at the highest possible standards. The teams' structure has to be revised every time it is considered to be necessary, so that therefore, the professional knowledge of the researchers which are involved can successfully assure the achieving of the research's goal.

The project will be run by teams' coordinators and by the director of the project. The administration process of the project will be done by a person who is not involved in research.

Every team is involved actively in achieving every objective, as it is shown in the table from below. Their role is a major one, the work they perform being indispensable for the proposed research project. Based on the written procedure issued by the project's director, every team has specific tasks regarding the documentation process, obtaining and analyzing data, in order to build hypothesis and to test them. Advancing hypothesis, results interpretation and designing the conclusions will be done by the coordinators, assisted by the representatives of the Romanian professional organisms and business environment. The representatives' participation in this project will be voluntarily and no claims for any financial reward will be possible. The team's contribution is presented below according to the project's objectives:

Scientific objectives of the project	***Team's contribution (%)***				***% from total***
	UBB	*ASE Bucuresti*	*AI Cuza Iasi*	*UV Timisoara*	
O1: *To identify the accounting education public requests made by the professional organisms and professional organizations at international, European and national level*	*42,5*	*19,5*	*19*	*19*	*100*
O2: *To identify the accounting education public requests made by the professional organisms and professional organizations at international, European and national level and the factors that affect them*	*31*	*23*	*23*	*23*	*100*
O3: *To determine the extent to which the professional organisms' public requests are connected with the accounting graduate's level of knowledge*	*31*	*23*	*23*	*23*	*100*

% on objectives	*33,9*	*22,1*	*22,0*	*22,0*	*100*

Table 1. The team's contribution according to the project's objectives

The research's results

The research's results will have a great positive impact and will represent an important milestone for the national academic education system because the result will identify new approach directions characterized by a high level of pragmatism, offer new development's solutions of the national academic educational system and allow designing new strategies whose main role will increase the performance of the accounting graduates and the prestige of Romanian accounting academic system at international level. The results of the research will constitute a reference point for future similar research both at national, regional and international level. Moreover, they will permit an ongoing analyze of the national education system's performance.

The utility of the project is claimed by the international trend that emphasize the power of academic accounting education has to increase in order to help its bigger sister: the accounting profession. The results of the research will follow this trend by proving to be a part of the effort made by international professional organizations: (IAAER, IFAC, ACCA, etc.), well known accounting and audit companies (KPMG, PricewaterhouseCoopers, etc.) and researchers (Albrecht and Sacks, 2002, Bennet 2005, Hurt, 2007, Cheng, 2007, etc.) in their way to improve the accounting educational system. Going further, our belief is that the results will be applied into practice since their existence will be circumscribed with the direct interest of the university in increasing the quality of the education process.

Our research will most definitely add value in this field because it both identifies the actual stage of national academic accounting education and offers ways to improve it, this way contributing to the development of the accounting educational strategy. We consider that a strong connection exists between the high quality of accounting profession and the high quality of the accounting education system. Because of that, the future imagine of the accounting profession depends on the improvements made in the quality of the education system.

ROMANIAN ACCOUNTING REFORM BETWEEN ILLUSIONS, DISILLUSIONS, TRENDS AND REALITIES

Neag Ramona

University Petru Maior, Tg. Mures, Faculty of Economics, Legal and Administrative Sciences, ramonaneag@yahoo.com, tel 0744/285345

The Romanian accounting reform is a process which has a starting date. This is a true which cannot raise debates. But, can we say the same thing about the finish line of this process? The evolution of the Romanian accounting regulation is full of ingeries from the beginning to present. The advisers used in the process were very different from time to time. Each of them left a strong mark on the accounting norms and regulations. In Europe and in the world the period from 2000 to present had many interesting events. IASB got an important influence in Europe. His goals are realized step by step, with lot of patience. IASB – FASB agreements and work gives confidence about the future shape of accounting regulation worldwide. In this context, the trends and realities of the Romanian accounting reform are analyzed. We try to understand why we had such a strange evolution regarding the accounting reform and why so many questions are without answer. And one of the most important questions is: where was and where is the accounting profession in this process? We try to present some personal ideas regarding the future evolution of accounting reform in Romania taking into account the most important events in Europe and worldwide.

KEY WORDS: reform, convergence, IFRS, national accounting norms, trends, evolutions

BODY OF PAPER

„Beginning with year 2000, within the Romanian accounting environment, it took place an infusion of Anglo-Saxon concepts and practices which must be analyzed and decanted ... Which it is sure is that we are engaged on an evolution line subjected to the future century accounting”[372].

With these words I was finished my book published in 2000. The young spirit, emulated by the environment in which I was training, convinced me to have an optimism that today still not feel it anymore. Though, let’s start analyzing the period has elapsed since than.

In 2000, the Romanian accounting environment was still under the great influence of the regulations foreseen by the Order of Minister of Public Finances (OMPF) no. 403/1999. These regulations were audacious and foreseen; inter alia, the publication in the 3rd volume of the international accounting norms and the national accounting norms. The idea regarding the drawing up of some national accounting norms did not have a longevity, as the OMPF 403 was totally abrogated once with the emerge of the OMPF 94/2001. Regarding the “national accounting norm”, it has not been spoken since than in any other accounting regulation issued after 2000.

The regulations development in the Romanian accounting field after 2000 cannot be analyzed without knowing the international context in the field of accounting regulations. Any evolution or “involution”, if any, must be watched and analyzed relating to the dinamic changes’ in the accounting field on the European and international level.

Regarding the regulations in the accounting field, in Romania, the period after 2000 could be divided into two stages: period 2000 – 2005 and period 2006 – present.

For the first stage the essential aspects could be synthesized as follows:

- drawing up by the Minister of Economy and Finances the regulations in the accounting field: the two known regulations have led to drafting some annual distinguish financial statements for the Romanians entities, starting from the 3 sized criteria foreseen in the mentioned regulations;

---

[372] Neag Ramona – “*Reforma contabilitatii romanesti intre modele francez si anglo-saxon*” (Editura Economica, Bucuresti 2000, pag. 224)

- the mentioned regulations have represented the inspiration source for drawing up some specific accounting regulations, for insurance and reinsurance entities, entities regulated through norms drafted by the National Commission of Securities Exchange etc.;
- alteration of the accounting law etc.

The above mentioned two regulations have brought with them “the breath” of changes which the Order 403/1999 has been announcing. Of course these changes were not so “though” for the accounting profession in Romania. The university environment, in cooperation with the accounting profession have engaged in an ample process of continuous professional training, process that aimed the knowledge and thoroughly study of the international accounting standards and the international financial reporting standards. Period 2000 – 2005 was announced, by the accounting normalization entities in Romania (named Ministry of Economy and Finances) as being a first stage of new reform, reform that was anticipated to be finished by taking over the international accounting standards in the accounting regulations in Romania. On that time no one knew exactly what was going to mean this. Also, the achievement method has not been known. However, there was an assurance, namely: regulations foreseen by the OMPF 94/2001 and OMPF 306/2002 should be abrogated in 2005, these being considered only a “rehearsal” of the reform to follow.

On European and international level, the anxieties and changes that took place in the same period were many and diverse. The changes evolution was increased, thus you had to be always careful of their evolution.

As a simple viewer of these changes I was tortured of one thought, namely: the evolution of Romanian accounting normalization could not take place without taking into account the evolutions in that field on the European and international level. The modification of IASC structure, the agreement from Norwalk, the meetings between UE representatives with the chairman of SEC, the speeches of IASB representatives before the committee for accounting regulation of the European Commission are only several references that give to those interested the starting points in analyzing the future evolution of the accounting regulations on European and international level. For this period I remembered an idea which would like to mention. The European Commission, putting on the first place the desire to create a unique European market, specified that a way to achieve this goal would be the applying of IFRSs in the accounting of member states: „It is definitely regrettably that anything was happened in this sense until now: Europe would have been at least on the USA level in this field if it has been developed European accounting norms starting with the ‘70s. Now it is obviously clear that IFRS enacting and convergence encouraging is the right way to follow in order to stay in touch with the larger capital markets in the world, even that it would not be an easy experience”[373]. It thus result, that even on the European level have been and maybe still exist voices regretting that in the ’70s (so, at the beginning of the European Union) were not created some European accounting norms. But, even with these regrets the future evolution of the accounting regulations on the European level is considered to be in strong relation with the IFRS evolution.

In his speech, IASB chairman, Sir David Tweedie, before the Committee for accounting regulation of the European Commission, from July 8, 2005, remarked the European Commission support before the European Parliament, of the UE Member States, in developing a unique assembly of some international accounting norms, rigorous, coherent, applicable, and usable on the worldwide capital markets. „Your choice in the direction of an international approach for the European accounting norms is considered a pattern for the others”[374]. Sir David Tweedie used to speak about the need of achieving the elaboration of some really global rules with all the advantages they would bring, but he also pointed out the fact that an accountancy convergence would necessarily involve the USA, which means almost half of the capitalization of the international financial markets. He also was confident about reaching IASB purpose regarding the convergence and the reconcilability, with the support of the European Commission and SEC.

Stage 2006 – until present, represents a period full of worries for the normalization of Romanian accounting. The regulations appearance drawn up by the MOF, respectively the Order 1752/2005 have unbalance a large part of the accounting profession, and why not the University staff. The efforts achieved on the understanding and assimilation IAS/IFRS were, for the members of accounting professions,

---

[373] Peter Walton – “La convergence IASB –FASB et ses implications”, *Revue francaise de Comptabilite, Numero special IAS/IFRS*, Septembrie 2005

[374] David Tweedie – “Le programme de IASB” – *Revue francaise de Comptabilite, Numero special IAS/IFRS*, Septembrie 2005

uncommonly huge, with significant costs. The university environment has represented an engine of promotion and assimilation IAS/IFRS both among the students and within the accounting profession. The publication of the Minister of Public Finances Order 1752 discouraged those who put their soul into promoting the international accounting standards on the national level. A regulation through which it is not recognized, not easily, the enthusiasm started in the new reform stage of the Romanian accounting system.

On the international level, the accounting normalization body IASB, has continued the efforts on the line of its program or convergence and of acquiring the recognition and acceptance by SEC of the financial standings drawn up in compliance with IFRS. The IASB work was focused on creating of one set of highly appreciated financial reporting standards to be used on whole capital market in the world. Mr. Bertrand Collomb, vice chairman of IASC Foundation estimated:

„In the context of this goal, the IASC Foundation and the IASB have made much progress, and the European Union has been a leader in this effort. More than 100 countries throughout the world, including the 27 European Union Member States, require or permit the use of International Financial Reporting Standards (IFRSs), developed by the IASB. This number is expected to rise substantially within a relatively short time frame"[375].

"The transition to IFRSs has gone relatively smoothly and without any shocks to the financial system. We have sought to provide additional stability by announcing that we would require no new standards to be applicable before 2009 and to give at least one year between the time a standard is completed and is required for application"[376].

On June 20, 2007 the SEC agreed to propose a rule to eliminate the reconciliation requirement for those companies applying IFRSs for financial statements for the calendar year 2008. This would eliminate a major cost to European and other companies listed in European market place and should increase the supply of capital to European economies. The change would permit non - US companies to access US capital markets without reconciliation with US generally accepted accounting principles (GAPP) by 2009.

Sir David Tweedie, IASB chairman:

„The SEC proposal shows its recognition of the tangible benefits of a single set of financial reporting standards used in the world's integrating capital markets and the relevance of the continuing IASB-FASB convergence process to the economies of the US and the rest of the world. If approved, the rule will eventually reduce significantly the barriers to capital flows between countries using full IFRSs and the United States. We appreciate the SEC's continued support of our work. Our ultimate aim at the IASB is to have a single set of accounting standards used worldwide. The SEC's proposal is an important step in achieving that goal, but much work remains to be done"[377].

We believe that the result of convergence will not be the internationalization of US GAAP, but improved accounting based upon an understanding of international business and accounting practices.

Bertrand Collomb sad: „It is my hope that European Union and, in particular, the European Parliament will remain the standard-bearer in promoting consistent applications of IFRSs"[378].

For this period, we must not skip over the publication in February 2007 of the exposure-draft regarding the IFRSs for Small and Medium sized Entities – (IFRSs for SMEs). The aim of the proposed standard is to provide a simplified, self-contained set of accounting principles that are appropriate for smaller, non-listed companies and are based on full International Financial Reporting Standards (IFRSs), developed primarily for listed companies. In developing the proposal that is published for comment now, the IASB has sought to make modifications based on users' needs and cost-benefit considerations, using the expertise of a broadly representative working group and external consultation. "The proposal organizes the requirements by topic to enhance readability, eliminates topics from the full IFRSs that are not relevant for most SMEs,

[375] Bertrand Collomb – prepared statement of vice chairman of the International Accounting Standards Committee Foundation, before the Open Coordinators Meeting of the Economic and Monetary Affairs Committee of the European Parliament, 10 July 2007

[376] Sir David Tweedie – IASB Chairman Addresses European Parliament, April 10, 2007

[377] David Tweedie, press release 21 June 2007

[378] Bertrand Collomb – prepared statement of vice chairman of the International Accounting Standards Committee Foundation, before the Open Coordinators Meeting of the Economic and Monetary Affairs Committee of the European Parliament, 10 July 2007

simplifies accounting recognition and measurement, and removes choices for accounting treatment”[379]. The year 2009 is taking into consideration for having a workable and broadly accepted standard for SMEs.

The European and international context after 2006 and the last events induce us to give some appreciations of the accounting evolution in Romania and the future reform of accounting system in Romania:

- We believe the idea of a set of financial reporting standards for small and medium sized entities has not been skipped by the Romanian accounting normalization entity. Or this make us to consider, for the next future, the need for drawing up some new regulations which to be distinguished between entities, relating some seize criteria. IASB consider that it is inappropriate for him to prescribe what companies should or should not be able to use the IFRS for SMEs. So the national body must decide whether they can find inspiration in the IFRS for SMEs standard ;
- Including into the field of using the IFRSs of a larger number of entities;
- Transferring the powers of “full and omnipotent” normalization entity of the MOF to an independent body, even the CCRF (College of Accounting and Financial Reporting) in the first stage. Maybe I am too much optimistic, but this optimism is also based on the fact that MOF shall give up to its prerogatives in the field of accounting regulations on the pressures to be made by some bodies outside the country limit borders;
- The idea of drawing up some national accounting norms, as much as tempting should be, it really seems to be out of perspective. We notice during this work the nostalgic reaction of some individuals, concerning the drawing up of some accounting norms of European level. But, in the same time, it should be noticed their fairness, when they have appreciated that the recognition and unitary applying of IFRS is the policy to be supported and promoted taking into consideration the actual realities. Drawing up some national accounting norms it is not impossible to achieve, but the costs of such a process would be huge, and the effects, in the present conditions, would not be so profitable;
- Even if it wishes or not, EU has to recognize the achieved efforts on the line of convergence in the accounting field, process guided by the two accounting bodies IASB and FASB. Beneficiaries of this process’s results are also the European entities. Starting from the IASB achievements it is possible that once the IFRSs are elaborated for the small and medium seized entities to find within EU a great recognition. For EU, these IFRS could be compulsory for several categories of entities and thus Romania, member of EU, should take over the IFRS for SMEs in the Romanian accounting regulations.

CONCLUSIONS

It could be said that on the international level and European one there are many events that make us to appreciate the dynamic changes, to which we assist, in the accounting field. We are contemporaneous with some changes which shall mark the accounting evolution on the national and international level. What it could be obviously noticed is the continuous increasing importance of IASB in the evolution of accounting regulations. If at its beginnings, this body was seen with skepticism, even with much reticence by the accounting environment these things are changed today. Through a slow but sure process, IASB achieves its proposed goals, becoming an important factor in the evolution of accounting regulations, both on international level and the European level.

Romania, through its regulatory body, must be connected to all these changes. From our point of view it is sure that we shall try to acquire “red points” for what the MOF shall achieve in the field of accounting regulations. It seemed that also the Minister of Public Finances Order 1752/2005 has represented a “red point” to which MOF presented before the Romanian accounting representatives. But is this really enough? Now really, is it not important to be recognized by those to which these regulations are intended to? As it can be noticed, the illusions that accounting profession has been made in the period 2000 – 2005 have dissipated very fast. However, the current trends are clearly outlined, and thus, Romania should circumscribes to these realities.

[379] Sir David Tweedie – IASB Chairman Addresses European Parliament, April 10, 2007

But how to do this? Elaborating by your self accounting regulations which are not discuss with those who must apply them or with those which are the beneficiary of the accounting information drawn up with these norms? Now, when accounting is not so linked to fiscal matters why is so difficult to say from the MOF part: “it’s enough, the accounting rules, regulations or norms are not any more subject for my activity. I have other thinks on my mind!”

When we analize the accounting changes in Europe and worldwide we so that the engine for all the progress are independent bodies. We know that every where the independence of these accounting bodies has a high price. But with tenacity and perseverance this goal can by achieved, even in Romania. The question is: Who is the most important “actor” of this process or who will take charge of it?

The accounting profession could be the most important “actor”. In actual context, the accounting profession is divided and we notice a lot of pressure from the MOF, so who is able to take charge? A body led by MOF or an independent body?

In Romania, we cannot find representatives from the accounting field which could be able to decide the path to be followed?

It is strange for me that the biggest entities from Romania do not make an efficient lobby in this direction. Are they satisfied about the accounting norms and regulations prepared by MOF? Or maybe, the questions must be put to the investors, banks, financial institutions, others users of the financial information’s.

If we are right or not, the future shall demonstrate it.

Regarding the accounting in international context, in 2006[380] I stated that we are just simple “viewers” of these anxieties, opinions, works, viewers who shall applause once as the “performance” is ending. But we could be some careful viewers, eager to acquire and take benefit of the participants’ achievements, participants who keep us in suspense until the end of the “show”. It is important to be connected with all this evolutions to keep the rhythm with the evolutions of accounting regulations on the European and international level. Who shall be the beneficiaries of these? The entities to which these regulations would be addressed and the users of information provided by financial statements.

For my point of view it is now the time to do more for the accounting regulation. We must learn from others. We must be consequent in what we do. Regarding behind, we see a lot of inconsistency in our actions. Now I think that we are able to provide a path to be followed in the future and to be willing to realize the proposed actions. But, again I would say, MOEF cannot realize all this thinks by himself. Maybe it the time for a change, a “wind of change” is waiting!

ISSUES REGARDING VALUATION IN ACCOUNTING. FROM HISTORICAL COST TOWARDS FAIR VALUE

Nichita Mirela Elena

Academy of Economic Studies – Bucharest

ABSTRACT: A primary goal of financial reporting is aiding investors in making economic decisions. A primary economic decision investors make is assessing the value of firms in which they are invested or consider investing.

The role of accounting numbers in valuation has been of fundamental interest to analysts, investors and researchers alike. Much of the empirical research in accounting based valuation has revolved around analyzing historical and forecasted accounting numbers.

In my paper I will present few accounting model used in evaluation and the implications of choosing one of those models: historical cost model, fair value model.

KEYWORDS: Accounting models, conservatism, earnings, valuation

INTRODUCTION

The IASB focus on assets and liabilities as the primary elements of financial statements contrasts starkly with "traditional" accounting practice. Until recently, accounting practice was generally based on historical cost and focused on accounting for transactions, underpinned by the concepts of "realization", under which profits were not recognized until they were realized, "matching", under which revenues were matched with costs, and "prudence", which implied an element of conservatism, but was seen by some as a means by which companies could inappropriately smooth their profits through the creation of hidden reserves or excessive provisions. The inadequacy of the historical cost, transaction-based approach for dealing, in particular, with derivatives (which have little or no initial cost but can expose companies to very substantial financial risk) and diminutions in the value – impairments – of assets, encouraged standard-setters to espouse an asset/liability approach to recognition and a "fair value" basis of measurement of assets and liabilities.

EVALUATION IN ACCOUNTING – THE CONCEPTUAL FRAMEWORK FORESIGHTS

It is generally considered that accounting is a measurement as well as a communication discipline. By measurement is meant "the assignment of numerals to object or events according to rules". The first step in accounting is to identify and select these objects, activities or events and their attributes that are deemed relevant to users before actual measurement takes place. Naturally, limitation of availability of data as well as specific characteristics of the environment, like uncertainty, lack of objectivity and verifiability, may create constraints to measurement. Where measurement is inadequate or infeasible, non quantifiable or non-monetary information may be provided in the footnotes.

Types of measurement

Various types of measurements are possible in accounting:

Accounting measurement can be direct or indirect. Direct or primary measures are actual measures of an object or its attributes. Indirect or secondary measures are derived indirectly by an algebraic transformation of a set of numbers that themselves represent direct measures of some objects or attributes.

With respect to decision time dimension, accounting measures can be classified as past measure, present measure or future measure to refer respectively to a measure of a past, present or future events.

To refer to accounting object or its attributes measures belong to a past, present or future event relative to the time at which measurement is made, the accounting measures can be classified as a retrospective measure, a contemporary measure or a prospective measure.

Measures can be:

- Fundamental measurement where the numbers can be assigned to the property by references to natural law and not to rely on the measurement of any other variables.
- Derived measurement which rely on the measurement of two or more quantities and depend on the existence of a verified empirical theory linking the given property to other properties.

Measurement can be made when confirmed empirical theories may be used to support their existence or made by fiat, based on arbitrary definition.

Types of scales

Every measurement is based on a scale. Scales can be described in generally terms as nominal, ordinal, interval or ratio.

- A nominal scale assist in the determination of equality; it is a simple classification system like the case of a chart of account. The numbers reflect the objects themselves rather than their properties.
- An ordinal scale assists in determination of greater or lesser; it is an order of preference system. One problem with ordinal scale is that the differences or intervals between the numbers are not necessary equal.
- An interval scale assists in the determination of the equality of intervals or difference. It assigns equal values to intervals between assigned numbers.
- A ratio scale assists in the determination of the equality of ratios, with the additional feature of the existence of a unique origin, a natural point zero, where the distance from it for at least one object is known.

According to Conceptual Framework, measurement is the process of determining the monetary amounts at which the elements of the financial statements are to be recognized and carried in the balance sheet and income statement. This involves the selection of the particular basis of measurement.

A number of different measurement bases are employed to different degrees and in varying combinations in financial statements. They include the following:

Historical cost. Assets are recorded at the amount of cash or cash equivalents paid or the fair value of the consideration given to acquire them at the time of their acquisition. Liabilities are recorded at the amount of proceeds received in exchange for the obligation, or in some circumstances (for example, income taxes), at the amounts of cash or cash equivalents expected to be paid to satisfy the liability in the normal course of business.

Current cost. Assets are carried at the amount of cash or cash equivalents that would have to be paid if the same or an equivalent asset was acquired currently. Liabilities are carried at the undiscounted amount of cash or cash equivalents that would be required to settle the obligation currently.

Realizable (settlement) value. Assets are carried at the amount of cash or cash equivalents that could currently be obtained by selling the asset in an orderly disposal. Liabilities are carried at their settlement values; that is, the undiscounted amounts of cash or cash equivalents expected to be paid to satisfy the liabilities in the normal course of business.

Present value. Assets are carried at the present discounted value of the future net cash inflows that the item is expected to generate in the normal course of business. Liabilities are carried at the present discounted value of the future net cash outflows that are expected to be required to settle the liabilities in the normal course of business.

The measurement basis most commonly adopted by enterprises in preparing their financial statements is **historical cost.** This is usually combined with other measurement bases. For example, inventories are usually carried at the lower of cost and net realizable value, marketable securities may be carried at market value and pension liabilities are carried at their present value. Furthermore, some enterprises use the current cost basis as a response to the inability of the historical cost accounting model to deal with the effects of changing prices of non-monetary assets.

The historical cost accounting is characterized primary by:

- ☑ The use of historical cost as the attribute of the elements of financial statements;
- ☑ The assumption of a stable monetary unit;

- ☑ The matching principle;
- ☑ The realization principle.

FAIR VALUE VALUATION

As if the shift to IFRS in itself were not enough for the financial reporting system to digest, there are further, even more fundamental matters that the adoption of IFRS will bring to prominence. These centre arounds the valuation basis for assets and liabilities that the IASB has adopted in many of its new standards. The valuation approach that the IASB has embraced is rapidly introducing "fair value" as the primary basis of asset/liability measurement. As a result, a substantial portion of a reporting entity's assets and liabilities will be stated in the balance sheet at "fair value" – including pension assets and liabilities, derivative financial instruments, certain other financial assets, financial liabilities held for trading, tangible and intangible fixed assets that have been acquired in a business combination, impaired or revalued, assets held for disposal, share-based payment liabilities, investment properties, provisions and biological assets. The IASB has adopted what is essentially a market value definition of fair value, and expresses it in most of its standards as follows: 'the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction'.

Valuations required for many asset types in financial statements, and for different purposes, including:

- Establishing the carrying amount on balance sheet
- Treatment of surplus assets
- Establishing lease liabilities
- Calculation of depreciation charges
- Establishing value of assets acquired in takeover

The objective of a fair value measurement is to estimate an exchange price for the asset or liability being measured in the absence of an actual transaction for that asset or liability. Thus, the estimate is determined by reference to a current hypothetical transaction between willing parties. Willing parties are presumed to be marketplace participants representing unrelated buyers and sellers that are (a) knowledgeable, having a common level of understanding about factors relevant to the asset or liability and the transaction, and (b) willing and able to transact in the same market(s), having the legal and financial ability to do so. Fair value presumes the absence of compulsion (duress). Accordingly, the amount that forms the basis for the estimate is the price that would be observed in a transaction other than a forced liquidation transaction or distress sale. In all cases, that price shall be estimated without regard to an entity's intent to currently enter into such a transaction.

Like other estimates, a fair value estimate, using present value, is made under conditions of uncertainty because the cash flows used are estimates rather than known amounts. In many cases, the amount and timing of the cash flows will be uncertain. Even contractual amounts, like the payments on a loan, will be uncertain if there is risk of default.

Marketplace participants generally seek compensation for bearing the uncertainty inherent in cash flows (risk premium). For example, marketplace participants will place a higher value on an asset with promised (contractual) cash flows and no uncertainty than on an asset with expected cash flows of the same amount that are uncertain. The lower value reflects compensation for bearing risk. Similarly, marketplace participants will demand more to assume a liability with cash flows that are uncertain than a liability with cash flows of the same amount and no uncertainty. The higher value reflects compensation for bearing risk. An estimate that excludes compensation for bearing risk would not faithfully represent fair value if it is apparent that marketplace participants would seek compensation for bearing that risk.

The objective of including risk in the estimate of fair value is to replicate the market's behavior toward assets and liabilities with uncertain cash flows, using as a benchmark the rate on monetary assets that are essentially risk free and that have maturity dates or durations that coincide with the period covered by the cash flows (risk-free interest rate).

Fair Value is used in the following cases:

- Expensing share options (IFRS 2)
- Assets acquired in takeover (IFRS 3)

- Surplus assets (IFRS 5)
- Carrying amount on balance sheet (IAS 16 and 40)
- Measurement of lease assets and liabilities (IAS 17)
- Impairment Reviews (IAS 36)
- Measurement of embedded derivatives (IAS 39; IFRS 7)
- Agricultural Assets (IAS 41)
- Important to note that in many cases Fair Value is optional as an alternative to cost:
- IAS 16 – Property plant and equipment may be put on balance sheet at historic cost or fair value
- IAS 40 – Investment property – cost or value, although if cost adopted fv must be shown in notes to accounts

CONCLUSIONS

The need to finance high growth and manage the interests and needs of investors make value creation a critical concern for businesses. Almost any financial endeavor, such as attracting new investors or making investment decisions, necessitates the consideration of the equity value created by the endeavor. The perceived value creation has a direct effect on the percentage of the firm outside investors will require if they are to invest in the business.

In today's business environment, companies face tremendous pressure to create value.

This pressure comes not only from shareholders but also from a wide array of market observers such as the financial press, financial institutions, and shareholder activists**.** Business owners must understand that maximizing value creation is possible only when their company maintains a well-planned and well-controlled operation that efficiently integrates the company's resources. Planning and controlling for value creation requires an ability to measure and relate the creation of value to current and prospective owners.

Of course, value is a relative term that can be viewed differently by the various stakeholders that have an interest in the company. Job creation, personal fulfillment and community pride adds to the general level of energy and optimism in society.

ETHICS IN ACCOUNTING

Nicolaescu Cristina

„Aurel Vlaicu" University of Arad, Economic Sciences, Arad, Bv. Revolutiei nr. 77, Email: cristina_nc2@yahoo.com, Tel.: 0722597987

Pantea Mioara Florina

„Aurel Vlaicu" University of Arad, Economic Sciences, Arad, Bv. Revolutiei nr. 77, Email: miofp75@yahoo.com, Tel.: 0730585908

Ethics is an important element of social life, which influences the relationships between peoples. The professional accountants are not just members of a specialized organization; they are members of a society. It means that their behavior influences not just the business environment, but the entire society from they belongs. IFAC has developed a Code of Ethics, which establishes ethical requirements for the professional accountants from all over the world.

Key words: ethics, code of ethics, professional accountants

The Explicative Dictionary of Romanian Language gives ethics the follows definitions:

- Science which purpose is the theoretical and practice study of human worthiness and values from the morals principles perspective and their role in social life;
- Entire norms of moral behavior of a domain, of an activity or a collectivity;
- Collection of moral principles or values.

From those definitions results that ethics is an important element of social life, which influences the relationships between peoples. The professional accountants are not just members of a specialized organization; they are members of a society. It means that their behavior influences not just the business environment, but the entire society from they belongs. This is just one reason that proves the necessity of ethical requirements for the professional accountants. So that, like it is mentioned in The Economic Dictionary, ethics is importance to professional accountants because provides them the principles and values which allow orienting their professional practice in varying of the specific context.

Therefore, we can say that the necessity of an Ethic code consist in:

1. Necessity guarantee of an optimal quality of the services;
2. Trust maintenance of people, in the accounting profession;
3. Protection insurance of professional accountants and of the consumers of their services;
4. Confirming the authority of working made by of the professional accountants;
5. The necessity of defending the dignity and the independence of professional accountants and the organism from he belong.

In Romania the organism who has the attributions to assure all those aspects are The Body of Expert and Licensed Accountants of Romania (CECCAR). The Body of Expert and Licensed Accountants of Romania was found in 1931 like an independent professional organism and in the '30-s it was one of the most powerful specialize institution from Europe. His most important attributions were the standardization of accounting activity and the performing the audit activity. In 1950 the communist regime from Romania forbid the activity of the CECCAR. In 1989, after the change of the communist regime, was found The Professional Agency of Accountants Experts and in 1991 was re-establish The Body of Expert and Licensed Accountants of Romania. In 1996 The Body of Expert and Licensed Accountants of Romania became a member of the International Federation of Accountants (IFAC) and of the European Federation of Accountants.

Today, CECCAR advanced in the reform process of accounting, necessary for the integration of Romania in European Union. The reform process consist in the convergence of the accounting and audit to the international standards, the increasing of the quality of Financial Statements, the counteract the economic criminalities, the improvement of business environment and, for the acquire the trust in the professional accountants activities, based on science, law, honor and morality.

The mean purpose of the IFAC is "the worldwide development and enhancement of an accountancy profession with harmonized standards, able to provide services of consistently high quality in the public interest", and for this reason has develop a Code of Ethics which establishes ethical requirements for the professional accountants from all over the world. IFAC has in present 133 members and 24 associates. Members and associates are required to participate in the Member Body Compliance Program to demonstrate that they are maintaining their good standing and addressing the requirements of IFAC membership.

The IFAC's members have the following obligations:

- Should support the work of the IASB by notifying their members of every IFRS;
- Must notify their members of all exposure drafts issued by the IASB and to encourage them to comment on behalf of those members that have an interest in accounting standards;
- Should use their best effort:
    - To incorporate the requirements of IFRSs in their national accounting requirements, or where the responsibility for the development of national accounting standards lies with third parties, to persuade those responsible for developing those requirements that general purpose financial statements should comply with IFRSs, or with local accounting standards that are converged with IFRS, and disclose the fact of such compliance;
    - To assist with the implementation of IFRSs, or national accounting standards that incorporate IFRSs.

The Code of Ethics develops by IFAC contains three parts: part A, part B and part C.

Part A establishes the fundamental principles of professional ethics for professional accountants and provides a conceptual framework for applying those principles. The fundamental principles of professional ethics for professional accountants are: integrity, objectivity, professional competence and due services, confidentiality and professional behavior.

The integrity means that a professional accountant should be straightforward and honest in all professional and business relationships. He should not be associated with reports, returns, communications or other information when they believe that the information: contains false or misleading statement materially, contains statements or information furnished recklessly, omits or obscures information required being included where such omission or obscurity would be misleading.

A professional accountant must be objectively, he should not allow bias, conflict of interest or undue influence of others to override professional or business judgments. A professional accountant may be exposed to situations that may impair objectivity. It is impracticable to define and prescribe all such situations. Relationships that bias or unduly influence the professional judgment of the professional accountant should be avoided.

A professional accountant has a continuing duty to maintain professional knowledge and skill at the level required to ensure that a client or employer receives competent professional service based on current developments in practice, legislation and techniques and should act diligently and in accordance with applicable technical and professional standards when providing professional services.

A professional accountant should respect the confidentiality of information acquired as a result of professional and business relationships and should not disclose any such information to third parties without proper and specific authority unless there is a legal or professional right or duty to disclose. Confidential information acquired as a result of professional and business relationships should not be used for the personal advantage of the professional accountant or third parties.

A professional accountant must have a professional behavior which means that should comply with relevant laws and regulations and should avoid any action that discredits the profession.

Part B explain how the independent professional accountants must applied the conceptual framework presented in part A in specific situations such us: professional appointment, conflicts of interest, second opinions, fees and other types of remuneration, marketing professional services, gifts and hospitality, custody of clients assets, objectivity in all services and independence-assurance engagements. It provides examples of safeguards that may be appropriate to address threats to compliance with the fundamental principles and also provides examples of situations where safeguards are not available to address the threats and consequently the activity or relationship creating the threats should be avoided.

Part C of the Code illustrates how professional accountants must apply the conceptual framework contained in part A in business. It is presented an exhaustive list of some circumstances experienced by a professional accountant in business that may create threats to compliance with the principles but is mentioned that rather, the framework should be applied to the particular circumstances faced. It also explain: how a professional accountants in business should act when appears the possibility on a conflict; what are his responsibilities and duties for the preparation and reporting of informations; a professional accountant in business must always act with sufficient expertise and which are the threats who can affect his professional training; a professional accountant in business must avoid the situations when his financial interests or receiving inductions are threatening the fundamental principles.

In Romania's social and business environment some would affirm that ethical principles are a theory that can't be applied in practice. There are many managers, entrepreneurs and businessman who believe in a fast way of enrichment and for these reason they don't believe in the ethical principles. They say that to promote honesty is old fashioned and that just an aggressive way of business can bring profits. Fortunately, we can say that the number of those who think in that way is decreasing, but for being realists, the ethical principles never will be respected completely by all the society members. But, a business environment without ethical principles is like a state without laws, in which exists just anarchy and disorder. Therefore, we can affirm that just like a state cannot exist without lows, the business environment cannot exist without ethics principles.

Professionals Accountants need to demonstrate a practical commitment of being ethical and in this way they will contribute not just to the healthy of the business environment, but also to the healthy and welfare of the entire society which they belong.

MONISM OR DUALISM IN ACCOUNTING?

Nicolaescu Cristina

„Aurel Vlaicu" University of Arad, Economic Sciences, Arad, Bv. Revolutiei nr. 77, Email: cristina_nc2@yahoo.com, Tel.: 0722597987

Pantea Mioara Florina

„Aurel Vlaicu" University of Arad, Economic Sciences, Arad, Bv. Revolutiei nr. 77, Email: miofp75@yahoo.com, Tel.: 0730585908

Abstract: We are trying to answer in this paper at the question: "Monism or dualism in accounting?" thru analyze of the dimensions and characteristics of the two systems, and also, thru, which the advantage of each system individually offer to different type of users. Also, we simultaneously analyze the both levels at the dualist concept, the managerial accounting and the financial accounting. The meaning of these analyze is to identify the possibility and the opportunity to process thru just one circuit the information's offered by the two accountings, therefore to pass to a monist system of organizational accounting.

Key words: monism, accounting dualism, globalization

The idea that made this article come to life was the request of the german company where we keep accounting records, which asked us to keep a "daily" accounting that will offer the possibility of daily patrimony check and company results. Since an accounting company keeps accounting records, we stated that the request was impossible to be fulfilled and offered as solution operative recordings of the structures that needed daily update of the balance and activities.

Out of this example we conclude that in nowadays Romania there are two accounting levels: financial or general accounting and administrative or managerial accounting. Such an accounting organization is typical for a dualist concept. The question that arises is whether or not this type of organization is in the best interest of the user? If it is, for what kind of users, internal or external? We ask these questions because accounting is not a purpose in itself, as it has to serve the interests of accounting data users. What follows next is the question that sets the name of this article, monism or dualism in accounting?

The question creates controversies as professor Feleagã stated in his book "Accounting treaty", the monism – dualism controversy being one that conveys "good taste to accounting".

The analysis of contemporary accounting, especially under the aspect of destination and of the way of treating and representing accounting data, revealed the fact that accounting doctrine established two concepts of organizing accounting: monism and dualism concept.

Although the meaning of the two concepts has historical roots, their presence in Romanian accounting literature is rather new. The introduction of accounting monism and dualism, with their extended meaning, belongs to Feleagã Niculae and Ionaşcu Ion in the book "Financial accounting", printed in 1993.

As proof of the importance specialist give to the two concepts is the controversy between them, which fundamented numerous studies, professor Jacques Richard, quoted by Feleagã Niculae in the book "Accounting controversies", introduces three dimensions of monism and dualism, defining a formal monism and dualism, a material monism and dualism and an informational monism and dualism.

Formal monism is characterized by simultaneous processing, in a single circuit, of changes determined by external economic fluxes and by internal economic fluxes. The formal monism has two practical forms: complete formal monism and reduced formal monism. In complete formal monism (the most radical form of monism) accounts play the main part. This type of monism characterized Romanian accounting until 1989, with branch accountings, without external users and applicable in a strict centralized economy. Reduced formal monism is characterized by the fact that certain accounting parts are treated "outside accounting" through tables.

Formal dualism separates accounting on two levels: financial or general accounting and administrative accounting. This form of organization characterizes present Romanian accounting.

Material monism represents accounting system organization through which only a type of evaluation is used, usually the economic one. Unlike material monism, material dualism uses additional economic evaluation and other types of evaluations: fiscal, financial evaluation etc.

Informational monism is characterized by directing accounting data to a single user, usually part of the organization's management. The characteristic was also present in Romanian accounting until 1989; in it the unique user of accounting data was the state.

Informational dualism or pluralism is that communication expression through which accounting data is oriented towards two or more types of users.

Professor Feleagã Niculae and his contributors in the book „Financial accounting – an European and international approach", identify four categories of data produced by a company:

- Operational data;
- Financial accounting data;
- Administrative accounting data;
- Data to fulfill fiscal needs.

In this case we can talk about informational pluralism in accounting, not about accounting dualism.

Financial accounting deals especially with recording the changes in the company patrimony and results determined by external fluxes. This type of accounting is characterized by: obligativity, normalization, precision and permanence. Administrative accounting is addressed exclusively to inside users of the company and analyses especially internal fluxes. It is a type of accounting, restriction free, in simple or double party, permanent or temporary, rather operative than precise and its main characteristic is the fact that it can be set up at management's wish, the only objective being to offer useful data.

As a consequence there are similarities and differences between financial accounting and administrative accounting. Although the differences are numerous, certain profound similarities can be identified. Not by chance, in other accounting systems, the data of the two types of accounting form a single functional, integrated circuit (accounting monism in the USA or compromise accounting systems between accounting monism and dualism).

The similarities between the two accounting branches refer to the fact they: are mandatory by law, use the same data from the same documents and periods of time, have as common research object the patrimony and as main objectives its efficient administration and profit increase, use accounts from the same General Account Plan (GAP), etc.

At manager's request, according to data needs and specific company conditions, administrative accounting can be organized in one of the following variants:

- Analytically developing accounts of the financial accounting (classes 1 – 8 of the GAP);
- Using specific accounts (class 9 of accounts in GAP);
- Keeping a personal technical-operative record.

In order to be useful, the accounting data must have the same quality characteristics, even if it is about administrative or financial accounting, namely clarity, relevance, credibility and comparability.

Next we will try to establish if these quality characteristics have the same valence for the two accounting categories.

Clarity is a feature all accounting data must have, indifferently of the level. Debates regarding this characteristic could be toned according to the knowledge level of users, as certain data could be clear to some users while in other cases users may need more details. For instance, in the case of internal users, the main beneficiaries of administrative accounting, who are supposed to have complete data about the company, in many cases less data, are enough for understanding, impossible in the case of a person from outside the company.

Relevance or pertinence represent confirmation and prevision capacity, namely judicially choosing the right meaning level for accounting data, choosing what is really important and what is not. Opportunity and under unitary cost – profit report play an important part in ensuring relevancy. Here, too, the meaning level is different for administrative accounting, where, although details are important, the operativity comes before accuracy and financial accounting, which generally offers less detailed data as it addresses external users. Also the report concerning the cost paid for obtaining the data and the profit brought by using it is addressed to internal users only and the company that pays for it. For an external user that makes a request for certain information, the effort the company makes in order to obtain that information is irrelevant. From this point of view, the situation of the state asking companies through its fiscal institutions, numerous situations, statements and reports that, in most cases, are irrelevant for the company but entail effort, is representative. We shall not mention the cases in which different public institutions request the same data but in a different format. Obviously in this case the relevance of the accounting data remains only a concept.

Credibility is given by the merged influence of faithful representation characteristics, prudence and integrity (complete presentation of economic reality), by propitious balance between quality and quantity features of accounting data. The main role of the accountant, as accounting data producer, is to make it credible, believable for those who use it. This characteristic is very important on both accounting levels set upon the dualist concept.

Comparability is necessary in order to compare data from one period to another and from one company to another. It is the consequence of constantly measuring and presenting the financial effect of the same operations and events within a company and along the time for that company as well as for other companies. The main way to ensure data comparability in accounting, in the case of financial and administrative accounting, is to apply the principle of method permanency.

Another similarity between the two accountings is that explicitly or implicitly, they change what needs to be changed, and are guided by the same accounting principles.

So, explicitly, legal reglementations stipulate the following general principles of administrative accounting: the principle of expense separation, the principle of expense limitation in time, the principle of expense limitation in space, the principle of delimiting productive expenses of those non-productive, delimiting expenses of finished production from those not finished yet, etc.

The principle of expense separation in administrative accounting supposes the separation of expenses that involve obtaining the goods, works, services from the expenses that do not involve the acquisition, production or processing, etc. them.

The principle of expense limitation in time in administrative accounting is found in financial accounting as well as the principle of exercise independency.

In order to apply these principles, OMFP 1.826/2003 suggests using rational methods, consistently applied, which can be wholly assimilated to the principle of method permanency in financial accounting.

Also in administrative accounting, other financial accounting principles can be applied: the principle of prudence, the principle of activity ongoing, the principle of non-compensation, the principle of historic cost, the principles of recording and book-keeping, the principles of quantification (measuring and evaluating), the principles of observation, the principles that establish what and how to organize that part of the accounting that fulfils the need of information of internal users?

Going back to the beginning of the paper, what the german manager requested were in fact operational data as well as administrative accounting data. Accounting data producer must organize his administrative accounting so as to be able to produce data when, how and as many as the manager asks for. What if the manager has no requests? This situation is commonly met in small Romanian companies, where the manager believes that accounting data are unnecessary for a good management. Unlike Romanian companies, the American ones believe in the importance of analyzing administrative accounting data in order to improve the functionality and rentability of different company activities. In this case the manager's exigency regarding the rhythm of data reporting, the monthly, weekly or even daily rhythm, is enhanced when the activity characteristics impose it.

The passage from accounting monism to accounting dualism is nowadays followed by an opposite dynamic: the reverse to an accounting monism, under the effect of globalization, on one hand, and because of IT system perfecting at the level of companies and societies, on the other hand. It has to be mentioned that it is a formal monism (reduced type) because at a material and informational level accounting remains dualist (even pluralist).

A single obstacle obstructs Formal monism: fiscality. In this case quoting the following idea printed in a recent fiscality paper is appropriate: "…financial accounting will become more and more transparent and capable, through standardized financial situations, being able to notify involuntarily cases of fiscal evasion, while at the level of administrative accounting there is still place for the so-called creative accounting…” We should remark the expressions “involuntarily” and “the so-called creative accounting”.

As a conclusion we may say that even if the tendency is to pass to accounting monism (at least at a formal level), it will not happen until accounting will be discharged of fiscality and over-reglementation.

Abstract: SMEs are outnumbering other types of firms in the Romanian economy. For this reason, the importance given to this type of enterprises must increase. One possible way of achieving this goal is stimulating their activity using means for raising the financial and legal support.

Throughout this paper we intend to identify and propose specific procedures for achieving the above mentioned objective, out of which we mention: evaluating the economic impact of the existing regulations concerning the SMEs; simplifying the procedures for obtaining the authorizations and special licenses needed for starting up the business and the ones which are issued after the firm is registered; simplifying the declaration and registration procedures for SMEs; improving the legal environment for SMEs by removing the administrative barriers. The object of our study is providing assistance for SMEs in identifying new ways of increasing and developing their business, and, last but not least, the accounting harmonization with international regulations.

Keywords: small and medium-sized enterprises, structural funds, stimulating methods, accounting implication

1. Introduction

After 1990, the Romanian economic environment has enriched itself with new actors—small and medium-sized enterprises. Today, these small and medium-sized enterprises (SMEs) are active contributors to the Romanian economic development as a whole. In the EU economy, who we are part of since the 1st of January 2007, SMEs are underlying pawns where innovative ideas and especially new jobs are being fostered. According to statistical data there are roughly 23 million SMEs in the EU that ensure about 75 million jobs and represent 99 % of the total number of enterprises functioning within the EU [1].

In this context, *the objectives of the present paper* are mainly directed towards: the place occupied by SMEs in the EU and Romanian economic sphere; the impact of SMEs on the economy's evolution as a whole; the identification of the ways in which economic growth can be stimulated through SMEs, taking advantage of economic and fiscal opportunities offered by the state, and by accessing European funds provided for that purpose; the financial and accounting implications of the presented methods for SMEs' activity stimulation.

The paper uses a deductive approach, moving from theory to practice, sometimes focusing on inductive research that consists in practical case studies aimed at verifying the extent to which certain theoretical aspects that were previously mentioned are validated from a practical point of view.

1.1 Literature review

In "Encouraging Tourism Development through the EU Structural Funds-the implementation of EU programs on Bornholm and the tourism sector's use of them" [2] Benedicte Bull designed a case study and involved 57 interviews with tourism organizations. , funding recipients and regional governments responsible for the implementation of the funds on Bornholm. In "Regional growth, national membership and European structural funds: an empirical appraisal"[3], Jackz Fazyolle and Anne Lecuyer tried to debate groth growth performances of European region over the period 1986 - 1996. John Bachtler and Ivan Turok brings together in "The Coherence of EU Regional Policy: Contrasting Perspectives on the Structural Funds" [4] a rich selection of up-to-date practical experience of EU regional policy from across Europe. In "Structural fund programs as instruments for sustainable regional development - a review of Nordic effectiveness" [5], Clement K. presented the achievements of Denmark, Finland and Sweden through 6 project examples with an associated diversity of approaches. Nicole Koenig and Eberhard E.Bischof f analyzed in "Analyzing seasonality in Welsh room occupancy data" [6] the general relationship between occupancy performance and hotels activities. Adriana Corfu, Zélia Breda and Carlos Costa, in "EU Integration and tourism destination management: The case of Portugal" [7] attempted to provide some theoretical and empirical findings on Portuguese tourism evolution during the two-decade period of EU membership. Leonas Simanauskas and Skirmantas Šidlauskas, in "Efficiency of the EU structural support and its effects on the country's progress" [8] showed the main method used by the European Union to reduce the discrepancies.

2. In fact, what do these SMEs stand for?

One definition that took the form of a recommendation was given by the European Commission in 1996. It was implemented all over the EU territory until 2003 when the said Commission, taking into account the economic development between 1996 and 2003, adopted a new recommendation by which the SMEs were redefined, recommendation that is taken into account in the elaboration of the politics, programmes and measures initiated by the European Commission for SMEs. The new definition entered into force on the 1st of January 2005. Both EU countries and also the accession countries as well as the European Investment Bank and the European Investment Fund—the two institutions acting as indispensable providers of funds for the EU states—are recommended to use the latest definition.

The main advantages offered by these economic entities can be summed up in the following way: they offer products and provide services at lower costs than the big enterprises do; they are flexible and adapt themselves easier to the market requirements, thus enhancing the economic development of the country; they represent the incubator for the future big enterprises; they encourage competition; they offer new jobs.

Moreover, the financial resources of these enterprises are scanty, the financing being, more often than not, self-financing from the owner's pocket. In this way, the SMEs are up against real difficulties in obtaining capital or loans, especially at the beginning of their activity. The limited resources narrow down the possibilities to access new technologies or innovations. This is where one has to step in to redress the unfavorable situation of the SMEs, by raising them from the status of being mere "debutant" in the economic life to that of influential participant. This shall be done through the improvement of the production capacity, the increase of competitiveness in the human resources field and the increase of investments, all of these bearing on the subsequent evolution of SMEs but directly influenced by the financial capacity of the entity.

Consequently, in this paper we focus on the following possible ways of financial stimulation, indispensable on an active EU market: economic and fiscal advantages offered by the state; financing through structural funds (post-accession).

2.1 Economic and fiscal advantages offered to SMEs by the state

Under the state budget law, funds amounting to 0.2 % of GNP are granted each year, both at local and national level, for setting up and funding of SMEs. Also, with a view to improving the access of SMEs to funding, the National Fund of Credit Guarantee for SMEs was set up and the government annually approves stimulation programmes for setting up and developing SMEs, based on programmes compiled by the National Agency for SMEs and Cooperation.

Other advantages offered to SMEs by the state are: for criteria pertaining to turnover, 50 % discounts from the performance guarantee required in public procurement of products, services and works; free technical assistance with a view to facilitating access to specialist services in the public procurement field; first hand access to hiring and leasing available assets of independent operators, national companies and state capital companies; reduction or removal of the required guarantees and early payments for the consumption of utilities and public services provided for SMEs. Some of the fiscal advantages offered to SMEs are: duty-free imported raw materials, needed in the manufacture of products which, in turn, are duty-free on importation; duty-free and tax-exempt importations meant to work up the activity (machinery and equipment); income tax exemption for reinvested profit; other facilities: allocation of budgetary funds to finance development programmes and the set-up and development of SMEs; simplifying the administrative procedures for registration and procurement of opinions, authorizations and licenses; availability of information, assistance, consultancy, research and technologic innovation services; management professional training.

2.2 EU post-accession funds or cohesion and structural funds

A. Generalities

After accession to the EU, the Romanian SMEs shall be eligible for an array of activities co-financed through EU structural funds. Using structural instruments, the funding will help SMEs align with the quality requirements in order to cope with competition from member states and the environment requirements mapped out by the EU. Therefore, the first sector considered is the producing sector comprising investments into equipment, machinery, apparatus, procurement of technology, patents, licenses, qualified services, access to certification of international standards, implementation of environment and quality management systems.

The same instruments will be used in order to grant funds for consultancy services, preparation of business plans, and development of products and strategies for the company and to foster the set-up of new business centers and incubator units.

The structural funds for the creation of economic and social cohesion are the structural instruments used to distribute the European funds during the period 2007-2013. There are three financial instruments, known as structural funds:

- **European Regional Development Fund—**designed to reduce the imbalance between different EU regions. It will fund projects pertaining to all the three objectives of the cohesion politics, covering the following areas: research and technological development, computerization of society, transport, energy, the environment, tourism and culture, urban and rural redevelopment, support for companies and contractors, investments in social, educational and health infrastructure.
- **European Social Fund**—designed to fund priorities from two cohesion politics. The projects concerned will belong to four main areas: increase of enterprise and labour adaptability, improving access to labour market, strengthening social inclusion, promotion of partnerships for reform in employment and social inclusion.
- **Cohesion Fund**—designed to fund major projects on environment and transport infrastructure, being a continuation of ISPA fund for candidate countries.

From the point of view of financing opportunities for SMEs, the three most outstanding operational programmes are: the Sectoral Operational Programme “Increase of Economic Competitiveness”, the Regional Operational Programme and the Sectoral Operational Programme “Human Resources Development”.Summing up the priority axes specific to each operational program above-mentioned, table 1, presents the correlation between the priority axes.

Table1: Correlation Operational Program—Priority axes peculiar to SMEs

OPERATIONAL PROGRAMME	PRIORIT AXES	ACTIONS
OP “Increase of Economic Competitiveness”	1. Innovative production system	- productive investments - support in obtaining qualified services for the implementation of European standards; - support for enterprise internationalization and access to new markets; -consultancy for SMEs; - integration in the chain of suppliers
	2. research, technological development, innovation for competitiveness	-research-development partnerships; - investments in infrastructure;

	3.information and communication technology	-fostering the usage of information technology; - development of e-economy;
	4. increase of energetic efficiency and sustainable development of the energetic system	- improving the energetic efficiency; - turning to profit the renewable energy sources
OP Regional	1. strengthening local and regional business environment	- creating and/or improving local and regional business supporting structures; - renewal of abandoned industrial sites;
	2. local and regional tourism development	- increase the quality of tourism services and the services for the recovery of historical and cultural heritage
OP "Human Resources Development"	1. education and vocational training supporting economic growth and the development of a knowledge-based society	-ensuring quality in the continuing of vocational training;
	2. connection of life long learning	- improve access and participation to continuing vocational training
	3. increase of labour adaptability	- training and support for enterprises and employees for the facilitation of adaptability

B. The financial mechanism

Besides the EU contribution from its own budget, the financial mechanism for the use of Structural and Cohesion Funds imposes strict rules regarding the intervention of the beneficiary state in supporting, through its share of the project's value, the expected and actual achievement of the operational programmers' objectives. The maximum amount of EU contribution is established by the Council Regulation No. 1083/2006, in compliance with EU financial perspective for 2007-2013. At the level of an operational program, Romania is eligible for a maximum Community financing ratio of 85 % for all the three funds: ERDF, ESF and CF [4].

To this effect, the amount of money that Romania will receive as aid from the EU budget through Cohesion and Structural Funds is 19.668 billion euros. 12.661 billion thereof are to be allotted through structural funds within the "Convergence" objective, 6.552 billion euros will be allotted through the Cohesion Fund and 455 million euros will be allotted to the "European Regional Cooperation" Objective.

According to the proper financial mechanism the beneficiary of the project is supposed, firstly, to incur costs for the carrying on of the activities approved in the financing contract. The beneficiary will require that the costs be settled after they are verified for legal, eligible and effective conformity. This might be a disadvantage because SMEs first incur costs from their own sources after which they require the settlement.

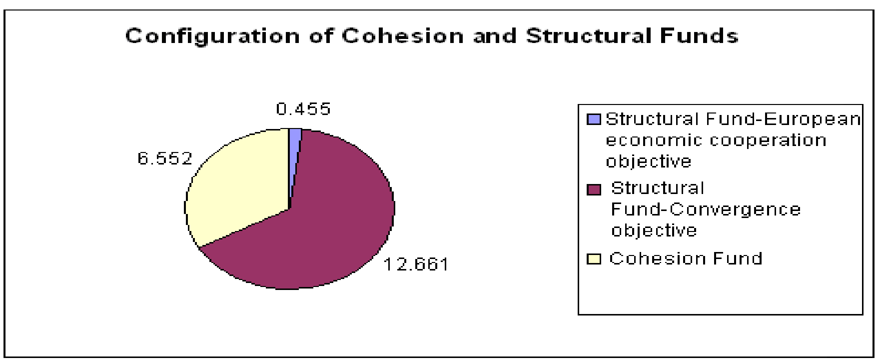

Fig.1 Configuration of Cohesion and Structural Funds

For the reimbursement of costs incurred within a project, a payment application is submitted to the relevant authority. The costs are evaluated by taking into account the eligibility rules and the content of the application. Therefore, in order to be eligible, such cost must meet the following cumulative conditions:

- It must be incurred by the beneficiary between the 1st of January 2007 and the 31st of December 2013, unless otherwise decided by the management authority in the financing contract;
- It must be accompanied by invoices, in compliance with the national legal dispositions, or other accounting supporting documents equivalent to invoices, under which costs are identified and audited;
- It must comply with the dispositions of the financing contract, concluded by the management authority or the intermediate body, for and on behalf thereof, for the approval of the operation;
- It must comply with the national and Community law.

The in-kind contribution can be considered an eligible cost if it consists of lands, buildings, equipment, materials. In this case, it is considered as the beneficiary's own expenditure and must not exceed the total contribution of the beneficiary by more than 20 %, as was settled in the financing contract. In the case of lands, buildings and equipment, their value is certified by an independent authorized auditor. In the case of buildings and equipment, these must be part and parcel of the operation's outcome. The lands and buildings must be free of charge and should not constitute the subject-matter of unsettled disputes.

There is, also, a range of expenditures that are not eligible, such as: the value added tax, interest and other credit commissions, collateral costs supervening in a leasing contract, procurement of second hand equipment, fines and costs. After the afore-mentioned conditions will have been met, the payments owed to the beneficiary can be incurred in two ways, namely: direct payment—the Paying Authority transfers money directly in the beneficiary's account; indirect payment—the Paying Authority transfers money in the account of the Paying Unit attached to the Management Authority and the Paying Unit pays the beneficiary.

The funding of the payment application does not take place where incongruity with national and Community law can be proven. Consequently, precise knowledge by each applicant of the rules concerning Structural Funds allotment is compulsory.

C. The accounting treatment applicable to structural funds

In order for the theoretical presentations regarding the financial and accounting mechanism of the structural funds to be relevant, we will use a numerical example that will bring forward the necessary steps that must be taken from the concluding of the financing contract until the settlement proper.

Stage 1: Submitting the documents which must contain the following: financial and economic analysis; risk analysis; feasibility study; technical project (where applicable); building authorization; environment authorization; environment strategic evaluation; documents confirming the co-funding; details regarding in-kind contribution; property certificate/concession act; accounting documents of the company; fiscal records of the person authorized to submit the financing application and the person responsible with the project; certificate proving that the applicant does not incur debts to the state budget (obtained from the Financial Administration).

Stage 2: The eligible beneficiaries fill in the financing application and the annexes required by the Management Authority.

Stage 3: The financing application is submitted to the Intermediate Body/the Management Authority.

Stage 4: The administrative conformity of the financing application with the internal procedures of each Management Authority is checked.

Stage 5: Then follows the check of the project eligibility and the technical and financial evaluation of the project.

Stage 6: The project is approved and the financing contract is signed.

Stage 7: The investment is carried out through the procurement of equipment approved in the financing contract.

Numerical example: An enterprise procures a piece of equipment necessary for the implementation of the alternative energy system approved through the Operational Program "Increase of Economic Competitiveness", priority axe 4—improvement of energy efficiency and sustainable development of the energy sector.

%	=	404 „Suppliers of non-current assets"	11.900
2131 „Plant and machinery"			10.000
4426 „Input VAT "			1.900

Stage 8: Payment of the debt for the equipment procured:

404 „ Suppliers of non-current assets"	=	5121 „Cash at bank in lei"	11.900

Stage 9: For the reimbursement of the money allotted in the investment carried out within the project, a payment application is submitted to the relevant authority.

Stage 10: The eligibility rules and the content of the application are checked;

Stage 11: Settlement of the investment carried out;

5121 „ Cash at bank in lei"	=	132 „Irredeemable loans representing investment subsidies"	8.000

Stage 12 (only for accounting): The depreciation of the investment over a period of 10 years (for example):

6811 „Expenses with depreciation of non-current assets"	=	2813 "Depreciation of plant and machinery"	1.000

Simultaneously, acknowledging the share of the non-reimbursable loan as current income:

132 „ Irredeemable loans representing investment subsidies"	=	7584 „Incomes from investment subsidies"	800

Conclusion

In conclusion, although the Structural Funds represent for Romania a new field, they should be an impetus to knowledge and to permanent involvement of all possible beneficiaries because, after all, it is in the interest of the beneficiary to get involved. The progress of each EU country depends not only on the funds proposed to be allotted from the EU budget, but mainly on each one's capacity to access these funds, thus proving it is difficult to obtain money and even more difficult to spend it.

Through the present paper we have presented a few ways in which SMEs can be stimulated, taking into account the fact that these represent the backbone of every economy. As this paper shows, the state is not and must not be the only responsible body for the boom of an entity. In the context of the integration into the European Union, the active involvement of each SME in obtaining the funds necessary to subsequent evolution is absolutely imperative. Asking is not enough; it is interest and exactingness that must be shown towards one's own business since financing possibilities are not short.

Abstract: The liquidity characterise the financial situation of the company, its ability to convert assets into cash or to obtain cash to meet short-term obligations. Lack of liquidity may affect seriously the continuity of the company activities. Computation and analysis of the liquidity are made by a system of ratios based on the data within the financial statements. An absolute value of a liquidity ratio is not relevant. For a correct analysis of the company's financial situation more liquidity ratios have to be considered and their trend also.

Key-words: liquidity, ratio, analysis, financial statements

Introduction

The fundamental source of the bankruptcy risk consists in the insolvency of the company. Solvency is represented by the capacity of the company to cover all its obligations that result either from previous contracts or from current operations. Solvency must be analysed on short-term (liquidity), as well as on long-term. Thus, liquidity expresses the capacity of the company to meet its short term obligations, that is, to cover its cash outflows with adequate cash inflows and, moreover, to ensure a security reserve for unpredicted events such as the decrease of the cash inflows or increase of payments. Consequently, liquidity may be defined as the capacity of the company to rapidly transform the current assets in cash or to obtain cash to meet its short term obligations. By „short term" we usually understand a period of at most 12 months but, in fact, it is identified with the duration of the normal operating cycle of the company (the period of time that starts with the acquisition of the raw materials and ends with the change of the end-products into cash or equivalent).

According to their gravity, the liquidity problems may determine:

- to lose some opportunities or some lower purchase prices;
- deteriorating of the relationships with business partners, due to the non-observance of the contracts involved;
- delays in the payments of the falling due rates and interests related to the loans;
- difficulties in obtaining of new credits;
- necessity to sell at a loss a part of the assets in order to be able to pay the current obligations.

If a company fails to meet its current obligations, its continued existence is doubtful. That is why measures of liquidity are very important in financial analysis. In our material, we present the liquidity measures based on data from financial statements. We have in view to raise the advantages of using of these measures in a company's liquidity analysis, also their limits and the potential adjustments to these analysis tools.

Liquidity measures

Computation and analysis of the liquidity are made by a system of ratios. These liquidity ratios characterise the financial situation of the company, its capacity to generate adequate cash for payments. The data on which the liquidity ratios are computed can be found within the components of financial statements: balance-sheet, profit and loss account, cash flow statement and notes.

Usually, the company's liquidity is measured by comparing the value of the current assets with the value of the current liabilities (on short-term). The current assets is represented by the cash and other assets that are expected to be realised in cash or sold or consumed within one year (or the normal operating cycle of the company if greater than one year). Current assets category includes: inventories, accounts receivable, short-term investments, cash and cash equivalents, as well as prepaid expenses. If current assets include items that have a life cycle that is longer than twelve months, the sums that are assigned to the next financial year must be disclosed into the notes. Short-term investments must be presented as current assets only if they are expected to be sold in less than twelve months (even these titles have a higher liquidity, the intention of the management is prior to their liquidity potential). Current liabilities are obligations expected to be satisfied within a relatively short period of time, usually one year. Typically, these include: accounts payable, short-term loans (includes bank overdrafts and all other interest-bearing short-term debts), accrued payments, interest, current tax and dividends due.

Liquidity ratios, as any other ratios that are use in financial analysis, are not relevant as absolute values. They must be computed and interpreted for a longer period of time (that must allow to observe the trend over time for the analysed entity) or by comparisons through different entities. Analyzing the trend over time for a certain company or the comparison among different companies is often enlightening.

a) Current ratio

The most often used liquidity measure is the current ratio, that is computed by:

Current ratio = Current assets / Current liabilities

This allows to measure [1]:

- current liability coverage. The higher the amount of current assets to current liabilities, the greater assurance we have that current liabilities will be paid;
- buffer against losses. The larger the buffer, the lower the risk. The current ratio shows the margin of safety available to cover shrinkage in noncash current asset values when ultimately disposing of or liquidating them.
- reserve of liquid funds. The current ratio is relevant as a measure of the margin of safety against uncertainties and random shocks to a company's cash flows. Uncertainties and shocks, such as strikes and extraordinary losses, can temporarily and unexpectedly impair cash flows.

The current ratio is appreciated as favourable if it has a value over the unit, lying between 2 and 2.5 [2]. The higher the ratio, the greater protection against lack of liquidity that could be generated by dues repayments. But a current ratio much higher than 2 can signal an inefficient use of the resources.

The advantages of the current ratio are: simplicity of its computation, availability of its data, its understandability. But current ratio also has some important disadvantages that are going to be presented in what follows. Even these disadvantages have not restricted the application area of this ratio, it is useful to be known and used when interpreting the value of the current ratio. These disadvantages are:

- it has a static character, measuring the resources available at a point in time to meet the current obligations;
- its data also contain non-monetary items or items that do not suppose input or output cash flows;
- does not distinguishes between various types of current assets, some of them being less liquid than others;
- does not measure the adequacy of the input cash flows (determined by the liquidity of the current assets and by the credit politics of the company) to the necessary output cash flows (determined by the liabilities exigibility). As a consequence, the ratio can have a "good" value and the company can have a lack of liquidity.

Moreover, when estimating the value of the current ratio we have to take into consideration the field of activity of the firm, as well as the evolution of the value of the ratio. Cash needs depend, in a significant manner, on the specific of the activity. Some business may function very well with a very low liquidity ratio. Others – especially those with a long manufacturing cycle – usually store up a lot of cash in stocks and, as a consequence, present high values of the current ratio. The ratio has to be analysed in its evolution, from a period to another. It is not enough the current ratio to be over unit, but it is necessary for its sense to be growing. A decreasing evolution of the liquidity points out a falling-off activity.

In what follows, we shall present some aspects that are not taken into consideration when setting the current ratio, but influence the cash inflows and outflows. As we already shown, the current ratio compares the current assets, as available cash resources, with current liabilities. But these resources do not necessarily suppose future cash inflows and liabilities do not necessarily suppose cash outflows.

The input cash flows depend on factors that are not included in the current ratio, such as: sales, cash expenditures, profits, changes in business conditions. For example, in the case of inventories, the determinant factor is represented by the sales. Sale is the one who initiates the conversion of inventories to cash. The future cash inflows depends on the profit margin that can be realised. Neither the sales level, nor the profit margin do not appear in the formula of the current ratio. In the case of the accounts receivable, the main factor is also represented by the sales. Modifications in the level of receivables depend on modifications in sales. Receivables are not necessarily a measure of the future cash inflows. These last ones are influenced by the credit policies and by the collection methods. At the same time, not all accounts receivable suppose future cash flows. It is the case of postponed or overpaid taxes, that do not generate cash inputs. Short term investments are appropriated for cover of current obligations. If are evaluated at their fair values, they allow the estimation of the future cash inflows (net realizable value). Presentation at the historical cost does not allow this. The cash disclosured in the balance-sheet does not really have connections with the level of the activity and, as a consequence, it is not recommended to make previsions on this basis. For example, the value of the cash at the end of a financial exercise can be very high if the company intends to acquire, within the next period, a long-term asset. Moreover, many firms rely on cash equivalents such as open lines of credit, that do not appear in the formula of the current ratio (as long as they are not used) neither as assets, nor as liabilities.

Current liabilities, that is the denominator in the computing formula of the current ratio, depend on sales in a great proportion, too. Purchases increase together with the increase of the sales, so current liabilities to the suppliers increase, too. The exigibility of these attracted funds, the moments of the cash outflows respectively, depend on the trade credit periods stipulated in contracts. But current liabilities do not include some important elements that affect future cash outflows. It is the case of future payments, associated to some certain obligations that do not appear in the balance-sheet, such as: construction contracts (that imply substantial payments that are done along with the execution of the work), lease contracts (rental expenses in case of operating lease, respectively interest in case of financial lease), post-retirement benefits, etc. These payments are mentioned only in notes, without being recognised as liabilities in the balance-sheet. On another side, current liabilities include elements that will not necessarily generate cash outflows. Here we talk about collected advances, current deferred tax liabilities or temporary differences of a recurring nature (such as depreciation).

We also have to remark that the computing algorithm of the current ratio supposes the liquidation of the company. But this is contradicting the usual going-concern of the activity that assumes the current assets as well as the current liabilities are in a continuous movement: new receivables replacing collected receivables, new payables covering payables due.

Current ratio can be influenced through management techniques (such as window dressing). Thus, when the financial exercise comes to end, inventories can be reduced (by postponing new stocks acquisition) as well as receivables (by forcing their collection). Cash obtained like this is used to pay, in advance, current liabilities. By means of example no.1 we show how an anticipated payment can influence the value of the current ratio [1]:

Example no.1. The current assets and liabilities of the company are the following:

	Before Payoff	**After Payoff**
Current assets	200,000	150,000
Current liabilities	100,000	50,000
Current ratio	2	3

The current ratio increases from 2 to 3 by making an earlier-than-normal payoff of 50,000 u.m. of current liabilities.

b) Quick ratio

A more restrictive method to compute the liquidity is represented by the quick ratio. The difference from the current ratio consists in excluding inventories from the numerator of the computing formula. We obtain:

Quick Ratio = (Current assets – Inventories) / Current liabilities

The main reason for excluding the inventory figure is that its liquidity is less secure, as temporal moment and as value, as well. Another reason is represented by the lack of uniformity in inventory valuation. Evaluation methods can be used in a discretionary way by the management of the company.

So, quick ratio (also called acid-test ratio) includes those assets that are most rapidly convertible in cash: cash and cash equivalents, short-term investments, accounts receivable. A value of the ratio between 0,8 and 1 is considered to be optimal [3]. Over unit values indicate that inventories are not financed from short-term liabilities. The informational value of this ratio reveals through comparative analysis in time and through comparison with the current ratio.

c) Immediate liquidity ratio

Immediate liquidity ratio (also called effective liquidity) is the most restrictive method to compute liquidity. It takes into consideration, at the numerator, only cash, cash equivalents and short-term investments. The ratio ensures the comparison of the most liquid current active elements with the liabilities that are immediately exigible:

Immediate ratio = (Cash + Cash equivalents + Short-term investments) / Immediate exigible liabilities

The recommended value of this ratio is at least 0,5. If at the denominator we take into consideration all current liabilities:

Immediate ratio = (Cash + Cash equivalents + Short-term investments) / Current liabilities

then the value of the ratio shouldn't be smaller than 0,2 – 0,3. Too high values of the ratio indicate, in most cases, an inefficient use of the available resources (excepting the situation presented above, when the company preserves cash over the normal value, in order to acquire an non-current asset). A small value of the immediate liquidity ratio does not necessarily represent an alarm signal, if the company owns other current assets, with a high degree of liquidity.

In the specific literature we can also find another liquidity ratio, that compares the very liquid assets with current assets:

Immediate ratio = (Cash + Cash equivalents + Short-term investments) / Current assets

This ratio expresses the liquidity degree of the current assets. The higher this ratio is, the assets are more liquid.

d) Working capital – measure of the liquidity

Working capital, computed on the basis of short-term elements in the balance-sheet, is the difference between current assets and current liabilities, which makes it a measure of the liquidity. The actual format of the balance allows the immediate observation of the working capital at the beginning and at the end of the financial exercise, respectively. But the computing relation above does not confer enough relevance to the working capital, as an expression of the liquidity (example no.2).

Example no.2: We consider two companies, A and B. The sum of the current assets and liabilities reported by the two companies are the following:

	Company A	**Company B**
Current assets	20,000	110,000
Current liabilities	10,000	100,000
Working capital	10,000	10,000
Current ratio	2	1,1

Even the working capital is the same, 10,000 eur, the situation is not the same for the two companies. This is indicated by the values of the current ratio, 2 for company A and 1,1 for company B.

But a relevant indicator we obtain by relate the working capital to other financial variables, such as the sum of the sales or the total assets.

e) Working capital to sales ratio

Whereas the previous liquidity ratios use balance sheets figures only, here we take into account the ongoing operations by including a value from the profit and loss account. It will often highlight a trend the other ratios miss. It is possible to have a stable current or quick ratios while this ratio is falling. This usually happens when sales grow a lot and the working capital maintains constant. It is considered that an abnormal growth of the sales, when comparing to the resources disclosured in the balance-sheet, may constitute a danger signal of bankruptcy. The term „overtrading" is used to describe such a situation [4].

If we consider that sales figure reflects, to some extent, the operating cash inflows, then we can say that the ratio relates the short-term surplus liquidity to the annual operating cash flow.

The liquidity of the working capital can also be analysed by means of the percentage hold, in the total of current assets, by every component (example no.3).

Example no.3: The structure of the current assets of a company, for years N and N+1:

Current assets	Year N (eur)	%	Year N+1 (eur)	%
Inventory	30,000	30	50,000	50
Accounts receivable	40,000	40	30,000	30
Cash	30,000	30	20,000	20
Total	100,000	100	100,000	100

Even the value of the current assets maintained at 100,000 eur, their liquidity considerably depreciated. We notice a decrease with 10% of the weight, both of cash and liabilities. In return, the weight of least liquid current assets (that is, inventories) has grown. If current assets are presented in the balance-sheet at their total value, information concerning their structure should be presented in notes.

f) f) Cash flow ratio

Cash flow statement is a very important component of the financial statements, due to the information that it contains. The analysis of the liquidity of an entity cannot avoid considering this information source. Considering the fact that liabilities pay in cash, a comparison between current liabilities and cash flow generated by the operating activity becomes very important. Cash flow ratio makes such a comparison:

Cash flow ratio = Operating cash flow / Current liabilities

The disadvantage represented by the static character of the current ratio of liquidity is eliminated by this computing algorithm. In the numerator of the relation, current assets are replaced by a dynamic variable, namely the operating cash flow. This cash flow expresses the measure in which the basic activity of the company generated enough liquidity to meet the liabilities, without considering external financial sources.

Conclusions

When analysing the liquidity of a company, it is recommendable to take into account all available information. If the analysis is made by an external user of the financial statements, that cannot access the internal information of the company, he must use all relevant data and not only those in the balance-sheet. As has been proven, the ratios computed only on the basis of the balance-sheet are not enough. Even if they are important, the information offered by these ratios must be completed with information offered by other ratios mentioned in our article. A great disadvantage of the classical ratios, based only on the balance-sheet figures, is that they do not grasp temporal correlation between cash inflows and cash outflows caused by the falling due of the debts. This disadvantage can be avoided, in a significant manner, by using relevant data from:

- cash flow statement (especially when this are prepared through the direct method)
- notes on the financial statements (for example, day's sales in receivables, day's purchases in accounts payable, inventory turnover).

If this is possible, interim reports must be also analysed. These reports offer information that are available at certain moments along the year (in Romania, halfyearly reports are compulsory only for the information needs of the government institutions). They allow a better approximation of trend of a certain ratio, as well as the tracing out of the window-dress situations (that are more difficult to be realised during the year).

THE BOOK-KEEPING OF INSIDE -COMMUNITY TRANSACTIONS

Paliu-Popa Lucia

University „Constantin Brâncuşi", Faculty of Economical Science, Târgu Jiu, Victory Street, Block. 9, Staircase.1, Flat.8, univers_cont@yahoo.com, 0721840684

Starting from the reason that since the first Janury 2007 in the frame of foreign/abroad trade are not included the commercial operations or economical participation operations or technical-science operations in relations with stataes members of European Union, in the work presented below I intended to approach the way to evidence the inside-community transactions book-keepimg, taking into account the aquisitions and inside-community goods deliveries, illustrating the way the fiscality influences the book-keeping.

Key words: transactions, acquisition, delivery, inside-community

Introduction

The active participation to international work split/division represents an essential component of development process from every country. Illustrating relations established inside the world's countries in development process of production and international trade, the international work split is a worldwide phenomenom, which actions in the frame of one worldwide/aggregate inter-related economy.

In present times, a lot of enterprises adopt affairs strategies which focus the entirely global market, strategies which inside frame are made various international economic forms of transactions, such as: international trade operations, alliances/unions and international co-operations/participations, foreign implement or combinations between these elements.

The foreign trade as different branch of one national econoy includes commercial operations or economic, tehnical-science participations in abroad relations related to sell-buy process of wares, works, services, licenses, consignment or deposit, representation or allowances, the financial operations, ensurrances and, generally, any document or fact of trading.

Accordingly to this definition, the foreign/abroad trade includes *two basic elements,* such as:

- international commercial operations;
- participations and international economic co-operation.

The international commercial operations represents a form of inter-relations between entities and national economies in the sphere of commercial trade, including :

- the international trade with wares/goods (export of wares, import of wares);
- the international trade with commercial services (the invisible commerce);
- the combined commercial operations.

The participations and international economic co-operation represent a developed form of economical connections between states in order to achieve a common strategy, for a long period, in various activity areas, including:

- participation on contract bases;
- strategy co-operations as participations, holdings etc.;
- co-operation between institutions.

Taking into account the fact that starting from the first January 2007 the foreign/abroad trade does not include the commercial operations or economic co-operation or tehnical-science operations in relations with the member states of Europen Union, in the following presentation I have proposed to illustrate the way of accounting representation of inside-community commercial transactions, respectively:

- the inside-community acquisition of goods;
- the inside-community deliveries of goods.

The book-keeping of inside-community commercial transactions

The inside-community commercial transactions are related to acquisitions and deliveries of goods which are made between the member states from the community space.

Are considered *inside-community acquisition of goods* to obtain the right to dipose, as an owner, by the tangibles goods send or transport to the indicated address of the supplier, the buyer, or any other person, inside the account belonging to the supplier or the buyer, to a member state, different from the exit point of transport or send the goods.(Article no. 130 from Law no. 571/2003 regarding the Taxes Code).

The delivery inside-community represents a delivery of goods which are send or transport from a member state into an other member state by the supplier or the person to whom are made the delivery or by other person in the account of those. (Article no. 128, paragraph. (9) from Law no. 571/2003 regarding the Taxes Code).

Related to manner to illustrate into book-keeping the acquisitions and inter-community deliveries of goods, all these issues are proceeded after, first, was made an analysis regarding the tax treatment of value added tax for the respectively operation.

a) The book-keeping of inside-community acquisitions of goods

We appreciate that is necessary that before registration into book-keeping of inside-community acquisitions of goods to make some specifications from tax point of view, respectively :

- the place of inside-community acquisitions of goods is considered to be the place where are situated the goods in moment to which are settled their sending or transport;
- value added tax payment for an inside-community acquistion will be always the obligation of person which are proceeding the acquisition;
- the romanian persons registred from value added tax considerations, will apply the inverted taxation procedure by registering value added tax from Romania in the invoice received from the supplier belonging to an other member state.
- the value added tax are registering both as deduct value added tax also as collect/gather tax into the same account;
- in situation when the supplier don't make the invoice until the 15 th of the next month for th efact which produced the tax, the buyer writes down an self-invoice and in the moment when receive the invoice from the supplier are make references on both invoices regarding that issue.

a1) We assume that a romanian taxed person registred from value added tax point of view acquires wares in total value of 5.000 euro (to the index of 3,7 ron/euro) from a taxed person belonging to France, to which supplies it's valid code from value added tax point of view, extant same time the transport proof.

This situation generates/engenders in accountacy/book-keeping the following registerings:

- acquisition of wares from community space:

371 „Goods purchased for resale”	=	401 „Suppliers”	18.500 ron

- same time are illustrating the deduct value added tax which is gathered:

4426 „ Deduct VAT”	=	4427 „Gather/Collect VAT ”	3.515 ron

a2) We assume that a taxed free person which has not surpassed the maximum of 10.000 euro acquires wares in total value of 1.000 euro (to index 3,7 ron/euro) from a taxed person from Italy registred from value added tax point of view.

The place of inside-community delivery is Italy , and the italian supplier writes down the invoice with value added tax in percentage of 20%, due the fact that is not fulfilled the condition that both taxed persons to be registred in value added tax goals and operates the general rule. In order to don't overcome the ceiling, the romanian unit is free from value added tax payment in Romania, but pays the value added tax in Italy, the tax which will be not recover due the fact that is not registred from value added tax goals.

This situation engenders in book-keeping the following registering:

- acquisition of wares from Italy:

371 „Goods purchased for resale”	=	401 „Suppliers”	4.440 ron

a21) We assume that a legal romanian person surpassed the maximum of 10.000 euro and ask for registering from value added tax goals obtaining a valid registering code which could be used only in relations with partners from European Union and which don't give the right to deduce the value added tax in Romania.

In this situation, the italian partner will write down the invoice without value added tax, but the legal romanian entity will calculate and pay the value added tax in Romania, writing down the Rehersal/Recapitulative Declaration and the Specially Claim.

In book-keeping are generate the following registerings:

- acquisition of wares from the italian partner :

371 „Goods purchased for resale”	=	401 „Suppliers”	3.700 ron

- illustrating the value added tax payd to romanian state:

371 „Goods purchased for resale ”	=	446 „Other imposits, taxes and assimilated amounts payable” - distinctly analytic -	703 ron

- duty payment to the state budget :

446 „Other imposits, taxes and assimilated amounts payable” - distinctly analytic -	=	5121 „Cash at banks in ron”	703 ron

a22) We consider that a romanian legal person surpassed the ceiling of 10.000 euro, but are not registered from value added tax goals. In this situation the italian partner writes down the invoice with value added tax, and the romanian legal entity will pay both the tax calculated by the legal entity from Italy also the value added tax from Romania, writing down in this situation the Rehersal/Recapitulative Declaration and the Specially Claim.

In book-keeping are generate the following registerings:

- acquisition of wares from Italy:

371 „Goods purchased for resale”	=	401 „Suppliers”	4.400 ron

- illustrating the value added tax payd to romanian state:

371 „Goods purchased for resale”	=	446 „Other imposits, taxes and assimilated amounts payable” - distinctly analytic -	703 ron

- duty payment to the state budget :

446 „Other imposits, taxes and assimilated amounts payable” - distinctly analytic	=	5121 „Cash at banks in ron’’	703 ron

b) The book-keeping of inside-community deliveries

Even in the case of inside-community deliveries of goods is necessary to make some specifications regarding the exempt, which is given in the following conditions i:

- the supplier must to issue an invoice which must to contain the elements mentioned in article no. 155 from Law no. 571/2003 regarding the Taxes Code;
- the invoice will contain also a valid code for value added tax, communicated by the beneficiary from other member state;
- the supplier has to obtain justificatory documents for the transport made in other member state, which must to present to control officilities at their demands: command, offer or contract, documents of transport and ensurrance, payment documents etc..

b1) We assume that a romanian taxed person registred from value added tax point of view deliveries to a Greece legal entity a bunch of wares in total value of 3.000 euro (to index of 3,7 ron/euro). Is known the fact that the beneficiary communicates to the romanian supplier it's code of value added tax from Greece. In This situation the invoice is writing down in foreign currency, without value added tax, with mention: „ inverted taxa-exempt with right to deduce”.

In book-keeping is make the registration :

- delivery of wares to the greek partner :

4111 „Customers”	=	707 „Revenues from wares sell ”	11.100 ron

The inside-community delivery of goods, value added tax free are registred to the inside-community deliveries sentence/position Value Added Tax Claims and in Recapitulative Declaration which are transmit to teritory tax officiality for each year quarter during which takes place the inside-community deliveries (including transfers).

b2) In the case that thes three conditions mentioned before are not fulfiled, the delivery is not exempt from value added tax(the romanian legal entity is registred in value added tax goals).

This situation engenders in book-keeping the following registering:

4111 „Customers”	=	%	13.209 ron
		707 „Revenues from wares sell ”	11.100 ron
		4427 „Collect VAT ”	2.109 ron

Conclusions

From the previous examples it results the fact that before registering into accountancy/book-keeping, an operation which takes place between the member states of community space, has to be analysed from tax treatment regarding value added tax point of view, responding in this sense to the following answers :

- Is the operation made by a taxed person ?
- Is the operation located in value added tax area?
- Where is the place of operation prooved with documents? In Romania? (the place where is finalised the transport for inside-community acquisitions of goods, the place where starts the transport in the situation of inside-community deliveries of goods).
- There is exemptions?
- Is the romanian legal entity oblige to value added tax payment ?
- Is it some specific obligations regarding operations registering in Value Added Tax Claim, the Rehersa/Recapitulative Declaration, the Specially Claim etc.?

Abstract: All over the time, the accounting theorists and practitioners focused their attention on the synthesis accounting documents because, by means these documents, the financial position and the corresponding results are periodically rendered. Thus it is essential that the way this presentation is made should allow both some accurate comprehension of any company's economic reality and carrying on comparative analyses and forecasts regarding its subsequent evolution. This is the very reason for having been looked for an adequate model to help these purposes to be accomplished. Hence, a series of balance-sheet theories issued. The aim our paper hints at was to point out some theoretical aspects, specific to the classic theories on the balance-sheet, aspects that still prove to be of present interest.

Key-words: balance-sheet, static, dynamic, organic, multiple, theories

Introduction

It has become common knowledge that the very first two components of the annual financial statements, i.e. the balance-sheet and the loss and profit account, are the ones to focus most of their users' interest. Nothing unexpected as long as this is to be considered the very aim the financial statements hint at, namely the bringing up of the financial position and the profitableness the company reports. The financial position, as well as its change, is rendered in the balance-sheet, while the results, both current and previous, are disclosured in the loss and profit account. The presentation of the values of the two subsequent financial exercises allows an instant view on the annual changes recorded.

The balance-sheet displays the synoptic and systematic value of the business accounting data, concerning the economic means of the company, their resources and the final results. To some degree, they could reflect the level of both quality and quantity indicators, describing the company's activity. By means of the analysis based on the data within the balance-sheet, there could be considered some correlations between resources and means, between their structures and components, in order to reach conclusions regarding the ratio between the means the company possesses and the objectives it is to attain. The analysis might interest the profit and loss account which focuses on the financial database of the management over a given period of time. The analysis function of the financial accounting – through the comparative calculus – acquires consistency which allows it a survey of the present related to the past. It is to be examined and compared the present situation in relation with the initial one, the recent outcomes with the results recorded previously, in the hope of making capital out of past experiences, or of taking decisions about future actions.

The classic balance-sheet theories

The importance and the advantage the balance-sheet has for the management of the company have been stirring both the theorists' and the practitioners' concern in this field of activity. They elaborated and founded a series of theories on the balance-sheet, theories differing from each other in their perspective on the content, the purpose and the evaluation bases [1]. The most significant theories on the balance sheet are:

1. The static theory on the balance sheet, elaborated by Walter le Coutre, that supposes drawing up the balance-sheet in a way to show the situation of the assets and the financial result at a particular moment, that is to say the company's wealth. The balance relation defining this model is:

$$\textit{Assets - Liabilities = Net worth} \pm \textit{Financial Result}$$

The financial result is rendered as a financial source, if it is positive, and as a circulating capital in reimbursement, if it is negative. Consequently, the income-expenses difference that constitutes the financial result means – within the balance sheet – a result characteristic of the period of time that encourages an increase or a decrease in the company's wealth [2] the same way the assets–liabilities difference suggests the situation of the owners' funds. In this particular instance, the balance sheet does not reflect the way the financial result emerges. The supporters of this theory, Herman Veit Simon, H. Nicklisch, define it as an organic theory, due to the organic relationship the company entertains with the market it depends on, while the theory's opponents (E. Schmalenbach, mainly) called it a static one, just to enhance its opposition to the dynamic theory, by underlining the priority the balance sheet (at a given moment) has over the loss and profit account (over the period of time) [3].

According to the static theory, the assets must include the inventories, accounts receivable, fixed assets as well the intangibles on condition that, for the last ones, there had been made expenses liable to be directly allocated. As for the liabilities there should be recorded: the share capital and the reserve funds (the revenue reserves and the capital reserves) along with the debts (if the last ones suppose legal obligations). Such a perspective allows an analysis of the assets' structure, mainly the relation between the fixed assets and the circulating ones, of the liabilities, that is the relation between proper sources and debts, as well as the balance between assets and liabilities.

The evaluation of the assets within the static balance-sheet counts on the individual evaluation, supposing the going-concern activity, taking as a base for the assessment the historical cost (the purchasing cost or production cost, accordingly). The use of the purchase cost or the production cost as a high-value limit encourages substance preservation.

Herman Veit Simon remarked some shortcomings of the static balance-sheet, and suggests that it should be given a dynamic pace, by means of the introduction of some regularization posts and he also found it appropriate to the valuation done at the selling price of the goods to be sold (price that is confined to the price used on the market). The regularization asset-posts hint at the rights to future services on payments in advance, while the regularization liability-posts hint at future obligations to do some services in return for the amounts the commercial partners pay in advance.

2. The dynamic theory, originated by E. Schmalenbach, states the determining of the annual economic results as the main objective of the balance-sheet. In keeping with this theory, less attention should be paid to the amount and the structure of the company's worth and more attention should be paid to the changes it is subjected to at a specific moment. The valuation of the elements of the balance-sheet is done in such a way that the profit resulted from the economic activity could be compared with the previous results or with those specific to different other periods and the efficiency of the activity performed could be measured. The assets posts are thus considered elements foreseeing expenses and products to turn into results. For this reason, they have a temporary status within the balance-sheet [4]. E. Schmalenbach does not show much interest to the result got through a temporary business management but to the way this result was achieved: “The profit of a company is the latter's dynamic manifestation, the former being the additional income compared to the expenses of a company, and representing the measure of profitableness.”

The promoter of the dynamic theory divides all the company's activity in periods, or in sub periods (i.e. the financial year). For this purpose he introduces the concepts *revenues* and *expenses* which he distinguishes from the notions: *receipts* and *payments*. The balance-sheet is acknowledged the role of taking over “the suspended posts” (the assets and the liabilities) which, excepting for the clear payments (expenses included), are based on the fact that the economic events do not influence the result the same period when the inflows and the outflows are registered. The balance-sheet functions as some regularization account whom Schmalenbach suggestively calls: “the power deposit of the company” [3].

In order to permit the results to be compared, the valuation based on the market value is not desirable (as it could undergo changes), but the cost valuation. It is yet accepted some assessment in keeping with the price of the day for the fixed assets, as they are protected by the market fluctuations. This dynamic theory on the balance-sheet is also influenced by a prudence principle that is the profit is stressed on as soon as the goods are realized and not when the market value of the unsold products rises. Schmalenbach recommends that the result should be handled carefully, finding an overestimated profit more unsafe than the underestimated one.

The author of the dynamic theory has the merit of contributing much to the theory and the practice of the financial reporting, establishing some theoretical concepts concerning the drawing both of the balance-sheet and of the profit and loss account. He also insisted on the fact that the main purpose the dynamic balance-sheet looks for is giving the external users accounts and, just for this reason, it must be as objective as possible.

3. The organic theory, stated by Fritz Schmidt, represents a dual concept that supplies the balance-sheet with two functions, namely finding the results at a certain moment and getting knowledge of the means and the resources at work [5]. So, the balance-sheet displays both the company's wealth at a particular moment and some results' calculus. Every single company is considered "a cell in the economy's body" so one could appreciate the result of the company as being positive only if it keeps its relative position within the entire economy, managing to maintain its economic substance [3]. Thus, the profit as the result of the inflation must be distinguished from the real profit of the time period.

The important element of the theory is considering a valuation model based on the possibility the expenses are covered, calculated at their repurchasing cost, under a going concern assumption. In this instance, the financial result represents the difference between the selling cost and the reproduction cost, and not between the selling cost and the purchasing cost (for goods), or production cost (for products).

Apart from its being able to monetarily express the value and the inner progressive process, the theory of the organic balance-sheet makes use of quantitative expression, stating that, this way, it could assure a steady productive rhythm of the assets.

Other balance-sheet theories

In the specialized literature, there are mentioned some other theories such as: the integrated theory, the financial theory, the forecast balance-sheet theory, etc. Many of these particular ones are developed approaches to the above-mentioned theories.

We can't finish without dealing with a recent theory, i.e. the theory of the multiple balance-sheet professor M. Ristea develops in his "The balance-sheet in the patrimony administration" (we are to employ further on the "patrimony" term even if, nowadays, it is considered outdated). According to the author's opinion, the balance sheet is allotted a series of double-functions, based on the double representation of the patrimony [2]. So:

- the balance-sheet represents a *global* and a *structural* model. It synthetically renders the patrimony, but it also reflects the motions involving the patrimony's elements (assets and liabilities);
- the balance-sheet represents a *state* and a *motion* model. It shows the patrimony's condition at a certain moment, by means of balances of assets and liabilities accounts. It also reflects the patrimony's changes. This particular one could be described in the form of a matrix of the motion relations (i.e. inflows, outflows, and processes), between the patrimony's elements. This way defined, the balance-sheet should present an accounts system (and an implicit financial-economic indexes system) to characterize the financial position, the financial result as well as the financial position's changes;
- the balance-sheet represents a *static* and a *dynamic* model. The static characteristic is determined by the fact that the balance-sheet is drawn for a period of management. But delimiting these periods of management means analyzing the changes from one period to another. This continuous-flow spreading of the balance-sheet supplies the model with a dynamic character;
- the balance-sheet represents a *reflection* and a *control* model. The balance-sheet assures a subsequent representation of the relations between assets and liabilities but it must offer anticipatory data regarding the relations about the preservation and the rising of the company's wealth. Such an informative perspective on the balance-sheet is based on the fact that the equilibrium relations characteristic of the double representation (*Assets=Liabilities±Financial results* and *Expenses±Financial results=Revenues*) are, at same time, efficiency relations.

Taking into account the complex role the balance-sheet should perform, it should be drawn in the form of a set of documents to contain:

- the account balance-sheet, as a basic model, to describe the patrimony as a whole and to focus on its structure;
- some other models in relation with and converging to the account balance-sheet that are meant to show: the financial result and the profit's allocation, the revenues and the expenses, the state and the motion of the assets, the state and the motion of the liabilities;
- the explanatory report, as an analysis model, to encourage the results-interpretation process.

Conclusions

Even if developed at the beginning of the 20^{th} century, most of the concepts specific to the three classical theories are also to be found today in the rules concerning the elaboration and drawing of the balance sheet and the profit and loss account. As far as an assessment is concerned, are there to be maintained both the assessment at the historical cost – characteristic of the static and the dynamic theories – and the assessment at the current value at the moment when the financial statements are drawn – characteristic of the organic theory. The matter of advantages or disadvantages of the employing of the two valuation's bases is still debated and analysed among the accountant theorists and practitioners. The going-concern principle that stays for the basis of the three classical theories on the balance sheet is still one of the main concepts looked for at the elaboration of the financial statements. The concepts of both the financial and physical capital maintenance – belonging to the organic theory – are still available. It is also to be noticed the availability of the relation concerning the company's wealth – from the static theory of the balance sheet – which is used to discern the financial position revealed by the present balance sheet (assets – liabilities = owners' funds).

The actual pattern of the financial situations, a mixture of models specific to various previous theories on the balance sheet, appeared as a natural consequence of the users' needs for more and diverse information. Apart from the revealing the instant value of the assets and the liabilities, the financial statements must as well show the way the results are made up, and the cash flows so as to make it possible the study of the degree to which the revenues and the expenses that influenced the financial result were collected and paid. It also must disclose the changes the company's capital underwent. The importance paid to the financial statements' notes is greater and greater nowadays. By means of these notes, it is asked that all the additional data to be disclosured, data liable to contribute to a more accurate report addressed to the users of these financial statements. This set of synthesis accounting documents must permit both a retrospective analysis and a prediction of the company's evolution.

The strategy of domination through costs is the most popular from all the strategies at the microeconomic level. This opinion is sustained by the fact that the competition fight is the most often held by means of price. This paper refers to the comparative advantage who has the power to determine the consumer to buy the product or service which has the highest quality standards compared to the same product produced by another firm. The paper is focused on a series of advantages and disadvantages of the strategy of domination through costs, taking into consideration the importance of the sources of the cost advantage, and synthesize the fields of reducing costs.

Cuvinte cheie: strategy, advantage, costs

The strategies elaborated by the managerial bodies have an essential role in conceiving and funding the firm's activity. Presented under the form of forecasts, these strategies direct the development of every enterprise, bringing quite often efficiency to the entity with for which they act enlarging the market share and profitability.

Strategy comes from the Greek word "strategio" which means general and which resulted from the unification of two words "stratos" meaning army and "agein" meaning to lead. The complete Market Economy Dictionary defines strategy as follows: "term from the military field, extended in a managerial direction, through which one understands the assembly of the major objectives of the enterprise for a long term period, the main ways of achieving it, together with the allotted resources".

The firm strategy comprises a set of medium and long term objectives referring to the assembly of activities, or to their major components, the volume and the structure of the disposable resources, main actions, the main responsible person and executers, the financing sources, the final and intermediate terms, the global and partially efficiency indicators. It serves as a base for the elaboration of the short-term and long-term development strategy at the level of each unit.

It results that a strategy will concentrate in defining the field of activity: setting the major objectives of the enterprise, the setting of the policies and plans for attaining the objectives, determining the managerial board responsibilities and at the same of those who are shareholders, employees, clients, suppliers, setting of the disposable resources necessary to achieve the strategy.

The strategy represents a product of the strategic managerial process and comprises some defining characteristics: possesses a large number of aggregate information, it subordinates itself to the settled objectives, is interchangeable with the objectives, defines the major directions of the firm future activity and do not mark the beginning of its transposing into being, is the base for the elaboration of the strategic planning.

In order that a strategy presents utility for the organization it is essential to aim an assure the obtaining of the comparative advantage referring to the product cost or quality. Those strategies that permit the firm to the obtaining of a competitive advantage are called competitive strategies.

Referring to one or many component elements having an essential importance for consumers, the comparative advantage has the power to determine the consumer to buy the product or service which has the highest quality standards compared to the same product produced by another firm.

In M.Porter's [1] opinion, the competitive advantage reduces itself to ensuring a reduced cost or a product and service which differs itself through quality from other offers with similar products already existing on the market. As the competitive advantage is concerned the source can be innovation which means a newly conceived product, technology and equipment, management, trading, financing, or staff.

The basic condition under which the competitive advantage is lively is represented by its durability, respectively the possibility of its maintenance for a longer period of time. Under the circumstances in which this condition is not fulfilled one cannot talk about a competitive advantage of the strategic type, but of an occasional one or about the valorization of an opportunity. M.Porter [2] has delimitated a number of five generic strategies such as:

1. general leader as concerns the manufacturing cost;
2. a differentiation at the level of the whole activity sector;
3. a focalized differentiation (at the level of a segment);
4. the focalized strategy of the minimum manufacturing cost;
5. the strategy of the most competitive manufacturing cost.

The strategy of domination through costs is the most popular from all the strategies at the microeconomic level. This opinion is sustained by the fact that the competition fight is the most often held by means of price. Choosing this strategy, a firm having classical manufacturing systems proposes itself to become the producer with the lower cost of that kind of industry. The firm will have a competitive goal large, serving many market shares, being able to operate even within industries having a linking between them.

The supremacy through cost supposes the identification and the exploitation of all the sources of advantage in cost. The producers having the lowest cost sell a product or place their cost advantages on harvesting the absolute costs from all the possible sources. In the situation in which the enterprise succeeds to achieve and sustain the general cost of leader, it will get performances above the average in its industry and it will be able to impose prices at the industrial level.

For equivalent prices or even smaller than those of the competition, the leader position with minimum costs may have results in bigger profits. In the specialty literature it is mentioned that in order to greater diminish the cost of the finished products, the firm acts frequently for the maximization of the production in order to get its own economies for the mass production and for the large series production, too.

Successfully using the costs strategy asks from the part of the organization an activity and a concentration of accounting information directed upon costs. In this situation the aim is:

- determining activities and zones generating costs, respectively those zones where there exist resources consume;
- determining responsibilities for each type of activity;
- a more efficient organization and administration of the general activity of the firm;
- to fundament the internal decisional process.

The option of a firm directed towards the choosing the costs strategy is determined by the perspective to get some advantages such as:

- realizing some superior incomes reported to the average registered in the same kind of industry, because those producers obtaining goods and services at lower costs than those of the competition have the possibility to use this advantage linked to cost in order to determine a larger limit of profit;
- getting a front position in relation with its competitors and which results from the possibilities to offensively compete based upon prices in order to extend the activity on the covered market share and in order to protect in case of a “prices war”;
- getting a secured limit of profit in front of powerful clients, as their pressure to diminish prices can be exercised only up to the surviving level of the next competitor on the market;
- adopting an offensive attitude even in relation to powerful suppliers. The greater efficiency which is obtained it will offer the firm a larger interval for negotiating prices in case of raw materials and necessary energy;
- obtaining a powerful position in relation to the potentials entered on the market, because reduced costs constitute a barrier but also a weapon to fight the disturbances created on the market by a new comer;

- the possibility to use reduced prices as a competition weapon having its efficacy in order to defend the substitution product or services offered by the competing firms at competitive prices.

Applying the strategy of domination through costs oblige firms to find those zones which can be potential sources of economy, respectively of reducing costs. M Porter considers that the cost relative position of a firm depends on the “important motion forces of cost” and they are the determining structural factors of the cost of an activity and they differentiate themselves through their control degree exercised by the firm upon them The motion forces determine the behavior of costs inside of an activity, reflecting any link or interdependence relation which may influence it.

The cost performance of a firm for each separate activity cumulates itself in order to determine the relative cost position of the firm. Besides these factors, P.F. Drucker gives a major attention to the quality of information. “The biggest problem confronting us in future is the obtaining of some correct external information in order to be able to take correct decisions. This fact depends upon the internal market, the changes in clients and distribution channels.” [3].

The factors that M.Porter considers to be decisive in winning the cost advantage are: scale economy, learning, the capacity used pattern, links, interdependence relations, integration, coordination in time, discretionary policies, location and institutional factors. In other words, we can consider that the main factors contributing to costs reduction are:

- the results obtained as a consequence of the experience and to the knowledge transfer;
- reduced production costs due to a severe control of the used materials;
- the integration degree that influences differently from one industry to another;
- the degree of use of the production capacities;
- the moment of entering the industry. Experience may bring advantages such as notoriety, formation effect etc; but it can also be followed by disadvantages such as necessity to find suppliers, to form distributors, clients etc;
- privileged access to some sources that are offered at competitive prices;
- relations with institutional partners (government, labor unions, public power etc) that are inaccessible to the other competitors and which permit to realize an important economy such as: financial exonerations, the absence of social conflicts, good prices etc;
- scale economy in different elementary activities.

The competitive cost advantage can be created and sustained in two ways:

- a rough control of using the cost instruments comparing it to the achievements of the competing companies and adopting the adequate measures in this direction;
- through re-analyzing the structure of the activities-cost chain in order to determine the background corrections necessary to a significant reducing of cumulative costs.

When doing the strategic analysis of costs it is necessary to run through several stages which suppose: the identification of the activities and sub-activities generating expenses, settling factors which act upon costs, determining competition costs, identification of the elements that differentiate the own costs from those of other producers, shaping the strategic directions in order to reduce costs, applying and checking the strategy.

The most common ways of achieving the economies in the field of costs aim the material and salaries expenditures. If we refer to the factor capital production, a prime package of measures to reduce costs aims the materialized labor expenditures. In this case, one can act in the following directions:

- using some larger spread and cheaper raw materials, other materials, fuel, energy etc;
- the promotion of some new and modern manufacturing technologies;
- the reorganization of the technological processes;
- re-projection of the already manufactured products applying a reduced consume of materials;
- re-evaluation of the consuming norms and/or the elaboration of some new ones;
- finding some ways to reduce the number of failures or their re-valorization;

- improving the organization of the supplying , dispatch and production activity;
- the growth of the rotation speed of the working capital;
- the acquisition of machines and equipments, performing installations in order to reduce the reparation expenses;
- intensive use of the production capacities in order to reduce the writing off level for each product;
- acquisition of some machineries at a competitive price, corresponding from a technological point of view;
- avoid uploading or under loading of the machineries.

Acting, in the direction of reducing costs, upon the factor production and labor, we refer especially to the ways of enhancing the work productivity:

- the increasing of the technical level of production through the introduction of automation, robotizing and cybernetics in the manufacturing processes. In this situation one can get a greater production having the same quantity of work and having implications in the diminishing the other expenditures;
- the improving of the professional training of the human resources by employing a high caliber staff; the permanent assessment of the personnel, the organization of qualification training etc;
- the promotion of a competent management for the entire economic activity by adopting some measures aiming to reduce the work volume, the planning of the production and an operational control of it, launching into manufacturing process of some new products and the development of the existing ones, increasing the efficacy of those activities having an auxiliary and service character, the improving of the basic activity of the firm etc;
- providing the material incentive of the employees by creating a prizes system for special results and the realization of high level products, the allotting of some extra payments for extra-working hours and other motivating procedures;
- increasing the quality of labor conditions and of the socio climate of the firm.

Improving the activity of the technical-material supply represents a way to reduce cost, and it can be materialized through:

- raw materials and materials stocks redirection;
- rationalizing the warehouses activity;
- simplifying the supply program;
- shortening the distribution channels;
- settling solid contracts with suppliers respecting products quality;
- reducing dispatch expenses has its contribution in minimizing costs through:
- organizing its own net for goods dispatch;
- developing the service activity during the guarantee, and post-guarantee period
- employing trained staff in the field;
- setting a solid market policy.

The administrative-operational expenditures, being considered constant conventional expenses, they can be reduced, mainly through the increase of the production volume. Their contribution at reducing production cost can be determined through:

- re-projection of the administrative apparatus;
- reducing the office supply.

Taking into consideration the importance of the sources of the cost advantage, we can synthesize the fields of reducing costs as follows:

ACTION AREA	USED INSTRUMENTS	EFFECTS
Used materials resources	- decreasing the consume of raw materials, fuel, energy , water etc; - using some new non-conventional cheaper resources.	- the modification of the proportions between the material resources and the salary ones; - reducing the total costs and prices; - occupying new market shares.
Work productivity	- qualification, re-qualification and self improvement of the labor force; - assuring a certain rhythm in the employment supply, increasing the degree of organizing the work and its discipline.	- improve the physical productivity per each working people; - reducing costs and implicitly the profit increase; - increasing the net profit.
Achieved production	- introduction in the production process of some new products; - re-projection and modernization of the existing production.	- improving the products quality; - reducing expenses resulted from non-quality.
Production capacity	- enlargement of the production capacity; - the increase of the degree of using the production capacities.	- increasing the physical production; - the increase of total costs; - reducing the costs per unit; - the decrease of the costs of some sub-activities .
Production quality	- re-organizing and improving the management of the material and human resources, of the organizing processes and leading the scientific research activities	- increasing the costs of prevention and faults identifying; - reducing the costs generated by non-quality; -the increase of products quality.
Introducing the technical progress	- improving the ways of valorizing the firm resources.	- the increase of the physical activity; - decreasing of the specific consumes; - increase profit.
Management activity	- operative monitoring of the expenses for each employee and determining some deviations of the effective expenses from the provisioned level using all the information linked to costs and taking decisions in this sense and through the analysis of the opportunity and investment costs.	- identifying the causes determining the increase of costs; - an absolute economies in the structure of the relative costs; - eliminating or maintaining in the manufacturing process of some products.

Table 1: The fields of reducing costs

The strategy of domination through costs, besides a series of advantages, it also has some evident disadvantages:

- exercising a pressure upon the financial resources of the firm which fulfills an essential role in the introducing of the technological news in order to significantly reduce production costs;
- performing massive investments in technologies, in the circumstance in which buyers preferences are oriented towards products or services having new characteristics offered by competitors, a fact that implies the risk of the strategic inflexibility;

- the loss of advantages and efficiency bonus generated by the previous investments, in the moment of the producing of the technological changes made in order to reduce costs;
- the exclusive focalizing upon the ways to reduce production costs and neglected the changes of products in the consumers' preferences regarding the quality of the products and services, ways to use, reduce the demand elasticity in its ratio with price etc;
- the exclusivity of applying the strategy under the conditions in which on the entire market there are acting many firms. From this reason the respective competition is very intense.

The profit perspectives opened by the appliance of this strategy become materialized not only for the firm which succeeds to win the competition and shape itself in a leader position on the market as long as prices are concerned, fact that is capable to determine the other competing firms to abandon the respective strategy.

Abstract: Green or environmental accounting describes an effort to incorporate environmental benefits and costs into economic decision-making. Corporate environmental accounting is concerned with a business's environmental impact, national environmental accounting tries to accomplish the same at a national level.

Key words: green accounting, sustainable development, environmental protection

We all wish to live better and better. But we ask ourselves if the planet is it still viable, if it can still satisfy our wishes without affecting it?

The emergence of some important problems concerning the environment has altered the indifference in some of us and stimulated the initiative of others regarding the necessity of doing something to remediate those problems.

This way, the specialists have come to the conclusion that the liaison between a safer environment and the hope of an increasing quality of the people's lives involves taking some decisions.

In conclusion, at The United Nations Conference for the Environment, taking place in Rio de Janeiro, in 1972, the term *sustainable development* was for the first time used. The message of this conference was to find those strategies which offer the possibility to protect the resources of the natural environment in the process of social and economic development, in other words, to achieve a sustainable development.

From that moment onwards, this concept has signaled people's doubts about the future of the planet. This way, in 1983, The World Committee for Environment and Development was founded. In 1987, in the Brundtland Report, published by this committee, the main problems of the environment were underlined.

In this report, sustainable development was defined as a strategy of economic development intended to harmonise the economic and social progress, without affecting the natural equilibrium of the planet for a development which must respond to the actual necessities without affecting the capacity of next generations to satisfy their own necessities.

Some time later, in 1992, at The United Nations Conference for Environment and Development, taking place in Rio de Janeiro, concrete directions of action for environmental protection were established, from among which we can mention: the elaboration of a guiding document for the administration of the environment in almost all the world (21st Agenda), the cooperation between the poor countries and the rich one, the harmonization of the concept of economic increase with sustainable development, the rights and the obligations of the states concerning the environment.

In 2002, at The World Summit for Sustainable Development, which took place in Johannesburg, it was stressed the fact that the main actor on the world market which must take action for the realization of sustainable development is still the enterprise, which is interested more in itself than in the others, even ignoring the environment.

Being conscious of that, more and more enterprises have started to take into consideration the environment in their programs and action plans, especially when they observed the improvement of their own image, a better satisfaction of the clients and, through this, a competitive advantage.

This fact led to the elaboration of some norms ‘to facilitate the enterprise managers’ understanding of the necessity of integrating the environment in their administration, and to facilitate the development and improvement of the environmental administration system’[381].

In Romania, this objective of major public interest, namely the environmental protection, is regulated by The Governmental Urgency Ordinance no. 195 in 2005 approved and modified by Law no. 265 in 2006.

The Ordinance mentioned above refers to the economic and social activities with impact over the environment (dangerous substances and different waste; chemical fertilizers and pesticides, radiations), natural resources protection and the biodiversity preservation (the waters and the aquatic ecosystems; the atmosphere; the soil, the subsoil and the terrestrial ecosystems; protected areas and natural monuments; human establishments).

According to the ordinance mentioned above, for the realization of the European integration process, the principles which govern the entire activity of environmental protection are settled, and they marked out the directions of economic activity rules to accomplish the sustainable development objectives, elements which take into account the public interest and which constitute extraordinary emergency situations. This way, the system of environmental management was defined as ‘a component of the general management system which includes the organizational structure, the planning activities, the responsibilities, the practices, the procedures, the process and the resources for the elaboration, the application, the realization, the analysis and the maintenance of the environmental policy’[382].

The realization of sustainable development by the enterprises determines the appearance of ‘green accounting’ or ‘ecological environmental accounting’. This was also determined, on the one hand, by the necessity of resolving the increasing problems of the natural environment and by the necessity of taking pertinent decisions concerning the environmental policy of the enterprise, and, on the other hand, by the growing concern of the different users of the financial statements regarding the impact of the enterprise over the environment.

Green accounting represents ‘a process of identification, calculation, control, analysis and reporting of the costs generated by the enterprise-environment relation, resulting from the prevention, the limitation and the elimination of the effects of ecological disasters with a favorable impact over the company and the environment’[383].

The idea of identifying, calculating, controlling, analyzing and reporting the costs generated by the company-environment relationship also has at its basis the fact that this cost sometimes has an order of magnitude which is closely related to that of the company’s benefit. Thus, the environmental costs represent the potential sum of maximizing the profit by taking environmental measures. Practically, these expenses regarding the company-environment relationship could be avoided by adopting an efficient policy of environmental protection, and, therefore, the company will be exempted from possible recoveries of environmental damages, fees or penalties owed to organizations which protect the environment, etc.

The methodology of administering the costs generated by the company-environment relationship which is facilitated by green accounting comprises two stages:

1. the former stage consists of identifying, collecting, and controlling the costs generated by the company-environment relationship and of elaborating the environmental financial statements (reporting);
2. the latter stage consists of analyzing and interpreting the data in the environmental financial statements and, on their basis, decisions are taken regarding the correcting measures to be introduced so that, in the future, it could become possible to reduce at least those costs paid in order to remove the environmental damage, according to the principle saying that ‘it is better to prevent rather than to combat’.

The costs generated by the company-environment relationship are collected from among the following:

---

[381] Tabără, N., Nuță, F. M., *Normalizare şi globalizare în gestiunea şi contabilitatea mediului*, in <*Finanțe Publice şi Contabilitate*>, no. 5/2007, published by The Ministry of Economy and Finaces.

[382] * * * *The Governmental Urgency Ordinance no. 195 on December 22, 2005*, approved by The Environmental Protection Law no. 265/2006

[383] Caraiani, C., Jianu, I., *Contabilitatea verde – o perspectivă a schimbării în contabilitate*, in <*Contabilitatea, expertiza şi auditul afacerilor*>, no. 5/2007,Published by C.E.C.C.A.R., București 2007.

- the acquisition prices (or production costs) for machinery, equipment, means of transport,
- or the acquisition prices of ecological raw materials which, being higher than the ordinary ones, ensure an increased level of environmental protection and, consequently, they ensure the prevention, decrease and even elimination of costs generated by environmental pollution;
- fees or penalties resulting from polluting the environment.
- The structure of the costs deriving from the company-environment relationship could be
- the following:
- the costs of preventing the noxious effects over the environment resulting from the company's activity;
- the costs of limiting or abolishing these effects;
- the costs of regenerating the affected environment.

The documents used in the determination and analysis of the evolution of environmental costs are represented by:

- the environmental report, defined in G. U. O. no 195/ 2005 as being part of the
- documentation of plans and programs, and which identifies, describes and assesses the potential significant effects over the environment, their application and their rational alternatives, taking into account the objectives and the corresponding geographical area, in compliance with the enforced legislation;
- the environmental balance sheet, defined by the same regulation as a document
- elaborated by individual or corporate bodies attested by the law, aiming to obtain the notification for establishing environmental obligations, or to acquire the environmental licence which contains the elements of technical analysis, by means of which one could get information about the activity's causes and consequences of cumulated, anterior, current or prospective negative effects, so as to measure the real impact on a certain location;
- the risk evaluation study, which completes the environmental balance sheet, in case there
- is a significant impact over the environment;
- the primary documents, functioning as informational support, in which the costs generated
- by the environmental protection are recorded; these documents are similar to those employed for recording the other company costs;
- the general chart of accounts, including subsidiary accounts specific for the company-
- environment relationship;
- compulsory accounting books, which present, in corresponding subsidiary accounts, the
- costs involved in the company-environment relationship;
- synthesis documents and environmental accounting records (a distinct set from the
- compulsory ones) which reflect the company-environment relationship.

The work force involved includes:

- the agents issuing the primary documents;
- the environmental protection department which verifies the way in which the company-
- environment relationship develops;
- the accountancy and financial department which registers the transactions and the events
- related to the company-environment relationship;
- the economic analysis and diagnosis department, which analyses the ratio between the
- costs and the benefits generated by environmental protection, the extent corresponding to the various categories of environmental costs within the total environmental costs and within the total costs of the company, also making proposals about measures to be taken so as to improve the company-environment relationship, etc.;

– the company’s management taking environment-related decisions.

Ecological accounting can be used in different contexts and with different meanings[384]:

– in the context of the national accounting, the green accounting is named the accounting of natural resources and it has a macroeconomic dimension, it offers information about the consumption, the quantity and the quality of natural resources, which can be regenerated or not;
– in the context of the financial accounting, green accounting refers to the financial estimation and reporting of environment costs and debts related to them, according to the accounting standards;
– in the context of the managerial accounting, the green accounting is orientated to offer the necessary information in taking economic decisions concerning the investment, the level and the structure of the production and other things, starting from the environmental costs of an organization / a department / a line of production / a system.

The system of national accounting can offer an image of the relation existing between environment and economy, unifying the information offered by the entities concerning the environment. The first "satellite-accounts" of the environment were published in 1986. Those accounts were covering the next areas: the continental waters administration, the elimination and recovering of waste products, the protected natural spaces (national parks, regional parks), the protection of maritime spaces, or hunting.

In the actual stage regarding the reflection of national accounts at the international level, a planetary evaluation of the natural patrimony and an evaluation of the deterioration suffered by the environment are still very difficult to do. The preference is to elaborate physical accounts able to describe the whole natural patrimony of a country with its different components, presenting, on the one hand, the uses of natural resources, and, on the other hand, presenting the degradation of natural environment caused by the economic activities.

Still, the specialty literature offers some examples of accounts, also presenting the account shown bellow, which tries to cover the entire natural patrimony.

The environment account[385]

Resources	**Uses**
Initial Inventory	
- High estimation adjustment of the known reserves	- Low estimation adjustment of the known reserves
- Natural increase	- Natural decrease
- Increase of man-made elements	- Artificial decrease
- Imports	+ Samplings
+ Pollutions	- Exports
= Final Inventory	

Just as with financial accounting where the double effect is at the basis of transactions’ logic, in the case of ecological accounting the same principle operates: affecting an element corresponds to replacing and counteracting the deficiency or the evil done. The synthesis of this information can be reflected in the annual financial statements by introducing some green headings. An example of an ecological balance sheet, adapted by Professor Neculai Tabără, after reading the example presented by Raffegeanu in the work *Memento Practique Francis Lefebvre Comptable*, presents the next headings:

384 Caraiani, C., Jianu, I., *Contabilitatea verde – o perspectivă a schimbării în contabilitate,* in <*Contabilitatea, expertiza şi auditul afacerilor*>*,* no. 4/2007, published by C.E.C.C.A.R., Bucureşti 2007.

385 Tabără, N., *Contabilitatea naţională a României*, published by Sedcom Libris, Iaşi, 2005.

1. inventories for the environment protection (equipments used for the environment protection, equipments for the recycling or the economy of energy, equipment which reduces the pollution and other negative effects);
2. flow associated to the usage of equipments destined to protect the environment (the amortization of equipments; works, supplies and exterior services; staff expenses attributable to the environment protection activities; the purchasing cost of the energy destined to the maintenance and to the functionality of the equipments; pollution royalties paid; depollution bonus received; subsidies and loans with special interest rates acquired for the financed equipment; provisions for risks);
3. flow associated to the production activity (the purchasing cost of the energy and raw material on the physical unit of sold product; purchasing and sale of lands);
4. natural patrimony of the enterprise (built and non-built land areas);
5. flows (the volume of spent energies on the physical unit of sold product; the volume of net emissions of pollutants and residue inventories; sold and bought land areas).

The fair view of the financial position and the fair view of the enterprise performance will be completed if we add the information about the implementation of the environmental policies concerning the impact of the company's activities over the environment and over the population (here we also include the financial statements' users).

In our country this information is presented now in the environmental report, defined by The Governmental Urgency Ordinance no. 195 in 2005 as a part of the plans or programs documentation, elaborated by the companies, which identifies, describes and evaluates the possible effects which could have a major impact over the environment, and which also analyses the rational alternatives of those plans and programs, taking into consideration the objectives and the geographical area involved. The companies which respect themselves include some indicators in this environmental report, as: the land area allocated for the wastes administration, the number of the elucidated or investigated incidents in a determined period, gas emissions with specific greenhouse effects, recycling rates for different wastes.

Moreover, ecological environment accounting is also a managerial tool, with many goals: the control of environment costs; the realization of investments in less polluting or even in ecological technologies; the promotion of some production process and the promotion of some less polluting products, improving environment-related performance.

The traditional accounting methods do not take into consideration the environment costs and the performance concerning the environment, whereas environmental accounting includes the calculation of environmental costs structured as follows[386]:

1. conventional calculation of the environment costs, having as objectives the detailed reporting of environmental protection costs and noxious factors costs which affect the environment;
2. calculation of costs related to losses, which includes: the prevention costs, the protection costs, the material loss costs, the costs of the loss generator flow;
3. cash flow accounting, which identifies and analyses the totals costs concerning both the used materials and the flow generated by them, the loss generated, the efficiency of the usage of materials and energy aiming at generating a minimum level of loss.

As far as the investments in depollution or antipollution technologies are concerned, including the quality of raw materials and materials used, they contribute essentially to the prevention, diminution or even elimination of the noxious effects over the environment.

Lastly, we present some advantages that companies could have by implementing ecological environmental accounting:

- informing the enterprise about the effects of the activity over the natural environment and over the population;
- sustaining the decisional process concerning the action plans for the environmental protection;

[386] Dumitrană, M., Caraiani, C., Dascălu, C., *Contabilitatea şi mediul ecologic – viziune conceptuală şi informaţională*, în C*ongresul al XVI – lea al profesiei contabile din România,* Ed. C.E.C.C.A.R., Bucureşti, 2006.

- the increase of the financial statements users' trust and also the attraction of new investors;
- the realization of sustainable development.

In conclusion, ecological environment accounting attempts to measure the performance of an organization and of a national economy in relation to the environment and, in economic terms, by means of the monetary evaluation of environment costs associated to the development and functionality activities, and the evaluation of economic benefits brought by an advantageous environmental management and other measures.

Corporate governance has for some years been one of the most intensively discussed topics in business. Until now, accounting and compliance issues have primarily been at the centre of the debate. However, some authors have started to point out that it might be time to let these discussions move backstage and to focus on alternative aspects of corporate governance such as the question of how a board of directors may and should exert influence on the corporation's strategy. Corporate governance is concerned with the resolution of collective action problems among dispersed investors and the reconciliation of conflicts of interest between various corporate claimholders. The objective of this article is to determine which role strategy committees play and have played within the corporate governance concept and to establish which tasks these committees routinely perform.

Key Words: Startegy Committee, Corporate Governance, Development, Board

Introduction and Literature review

Research findings on the processes and conduct of boards of directors are generally very scarce (Charkham, 2005). And especially the topic of boards' involvement in strategic processes has received very little attention to date. Yet, while accounting and compliance issues have taken centre stage in most of the discussions, the ongoing corporate governance debate starts to direct researchers' interests to the board's role in strategic planning as well. In this context, the installation of strategy committees is sometimes recommended (Welge, 2005).

In order to understand and assess the role and tasks of strategy committees in corporate governance and in German and Swiss corporations in particular, a substantial knowledge base had to be built, drawing from secondary as well as primary sources.

Secondary sources such as textbooks and publications in journals and on the internet were first of all used to establish an insight into the theory of corporate governance and to provide an overview of how directors' involvement in strategy integrates into the corporate governance framework. Moreover, an overview over the academic debate on strategy committees of the 1970s and 80s is provided, including a discussion of the benefits and drawbacks of board participation as suggested by proponents and opponents of the idea. Finally, the historical development as well as advantages and disadvantages of specifically strategy committees are depicted.

The Strategy Committee

Committees represent a means available to the board of directors to develop an organisational structure in order to support the internal allocation of tasks (Müller- Stewens and Lechner, 2006; von Werder, 2005). They do not constitute permanent units, but traditionally only become active at certain intervals in order to either prepare or make decisions (von Werder, 2005). Among the topics which a committee may be asked to explore in detail are investments, financing, the nomination and compensation of management as well as explicitly the strategy of the corporation (Government Commission German Corporate Governance Code, 2005).

Concerning strategy committees, first of all it has to be noted that the precise nature of the committee may again vary depending on its function, that is whether there is a mandate for the formation or simply for the oversight on the strategic planning process, on its composition, chair and integration with the remaining board committees (Beekun, Stedham & Young, 1998; Harrison, 1987). Consequently, various authors pointed out a series of options concerning the design of a strategy committee.

Most notably and persistently, Andrews (1981a,b, 1987) has called for the introduction of a strategy committee composed exclusively of outside directors. This committee would not necessarily have to become familiar with detailed discussions shaping specific strategic alternatives, but rather be concerned with the management of the strategic process within the company as well as the evaluation of strategic choices and the CEO's performance.

Wommack (1985), envisions a strategy committee which could function as a vehicle for the establishment of formal procedures and routines to facilitate board involvement in strategic matters. Once a routine has developed, the committee could after a few years then be enlarged to include all outside directors. Wommack (1985) emphasizes that it should be the committee's role to discuss, debate, modify and ultimately approve strategy, while the responsibility for developing proposals should remain with management.

According to Harrison (1987), committees may become involved in the strategy process in various manners. They may for instance perform a strategy formulation role or simply have an oversight function. He continues in suggesting that it would be the most reasonable approach to allocate the task of strategy formulation to a strategy committee and leave the full board in charge of strategic oversight. The appropriateness of the introduction of a strategy committee will depend on a set of conditions, Harrison (1987) further claims. He outlines that strategy committees are most valuable to companies, which have recently appointed a new CEO, face rapid change, or where management has not been actively concerned with planning. On the other hand, a committee may not be as effective in situations where the full board is already considering strategic issues, where other committees perform a strategic function, or where the firm's business is very narrowly defined or stable. Regarding the composition of strategy committees, Harrison (1987) found that on average four outside and two inside directors built the committee and presented data on the most common types of directors to form part of a strategy committee (see Figure 1). Finally, he draws attention to the importance that should be given to the coordination of the various board committees' activities as well as to the securing of CEO support.

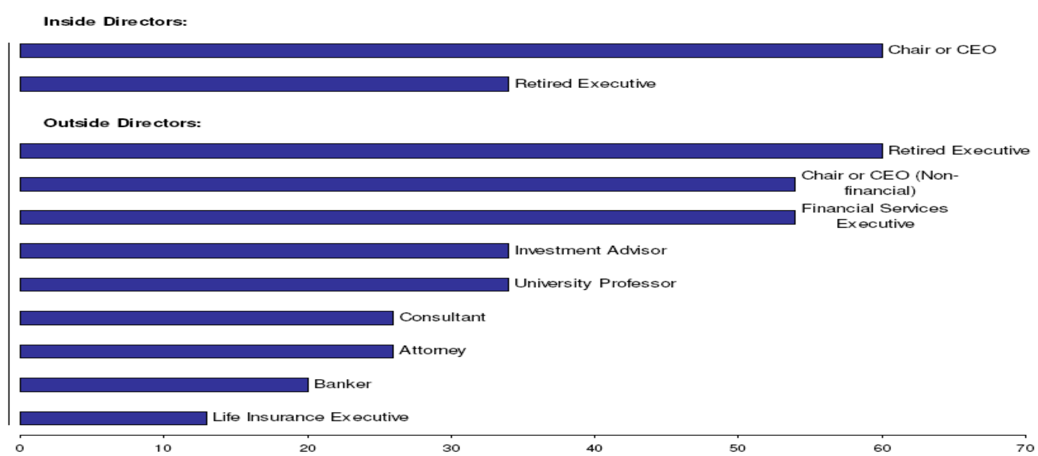

Figure 1 Composition of Strategy Committees Adapted from Harrison (1987), p.121

In line with Harrison's (1987) illustrations, Zahra (1990) reports that strategy committees are found to perform a wide range of tasks such as the review of corporate missions and strategies, the evaluation of competitive positions as well as the definition of diversification targets and of criteria to evaluate these targets. Texas Instruments' corporate objectives committee is mentioned as an example of a strategy committee, which establishes organisational missions and guidelines for managerial actions to be taken.

In contrast to Andrews' (1987) beliefs, Henke (1983) feels that the strategy committee should not be reserved to outside directors only. Instead, he thinks that the committee should consist of a balanced number of inside and outside board members. Depending on the complexity of the business and the time requirements associated with it, a group of four or six people is considered to be an appropriate number. It is recommended that meetings take place regularly or at least once a quarter throughout the year.

A rather different model than those mentioned above is presented by Donaldson (2000), who advocates the installation of a "strategic audit committee" (p.54). This committee would be composed of ideally three outside directors and endowed with the authority to establish criteria for and methods of strategic review. The committee's duties would include not only the selection of the review criteria, but also the oversight over the required data collection processes, the identification of topics for discussion with management, and the ongoing update of the remaining board members on strategy issues. In contrast to other proposals, Donaldson (2000) however suggests that the committee should meet only about once in three years, for he claims that it may otherwise run the risk of drifting from a strategic into a rather operational review and of mistaking insignificant changes in specific indicators for important trends. Yet, he admits, that the frequency of meetings will also be determined by the degree of turbulence in the company's environment and the nature of the industry the corporation operates in.

In order to get an impression of the reception of the strategy committee idea in practice, an overview of the historical development of these committees shall be helpful.

Historical Development of Strategy Committees

As reported e.g. by Rosenstein (1987) and Harrison (1987) the 1970s saw a sharp rise in the introduction of audit, compensation and nomination committees. In the early 1980s, a number of studies however concluded that despite an increasing emphasis on board involvement in strategy, only very few corporations had actually installed a strategy committee (Brown, 1981 as cited in Harrison, 1987, p.117; Ballout, n.d. as cited by Harrison, 1987, p.117; Harrison, 1987; Henke, 1983). Henke (1983), e.g. analysed data from 227 predominantly manufacturing companies and found that only 13.2% of the corporations used a committee to address strategic planning (see Figure 2).

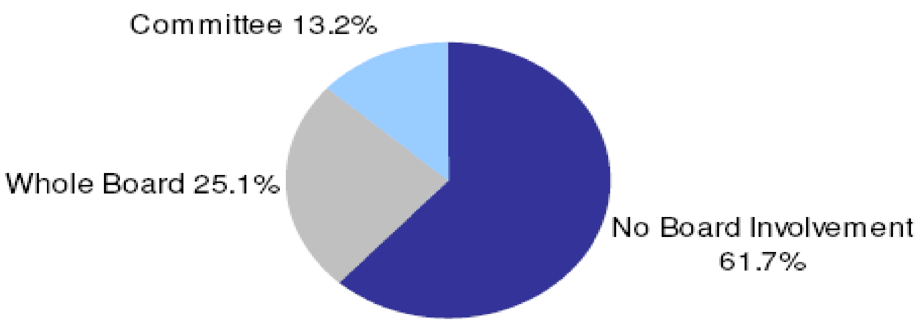

Figure 2 Manner of Board Planning Involvement in Firms Practicing Strategic Planning Adapted from Henke (1983), p.89

Furthermore, Harrison (1987) in his examination of 1982 proxy statements of 753 large American manufacturing firms could only detect 15 corporations which had reportedly introduced strategy committees. He concedes that this figure might underrepresent the actual number of strategy committees because the disclosure of this type of information on proxy statements was not required by the SEC at the time. To support the validity of his research findings, Harrison (1987) however points to the studies of Brown (1981 as cited in Harrison, 1987, p.117), Ballout (n.d. as cited by Harrison, 1987, p.117) and Henke (1983), who reported similar findings. Brown further discovered that, with the exception of two strategy committees created in the 1960s, all were established between 1972 and 1980 (see figure 3).

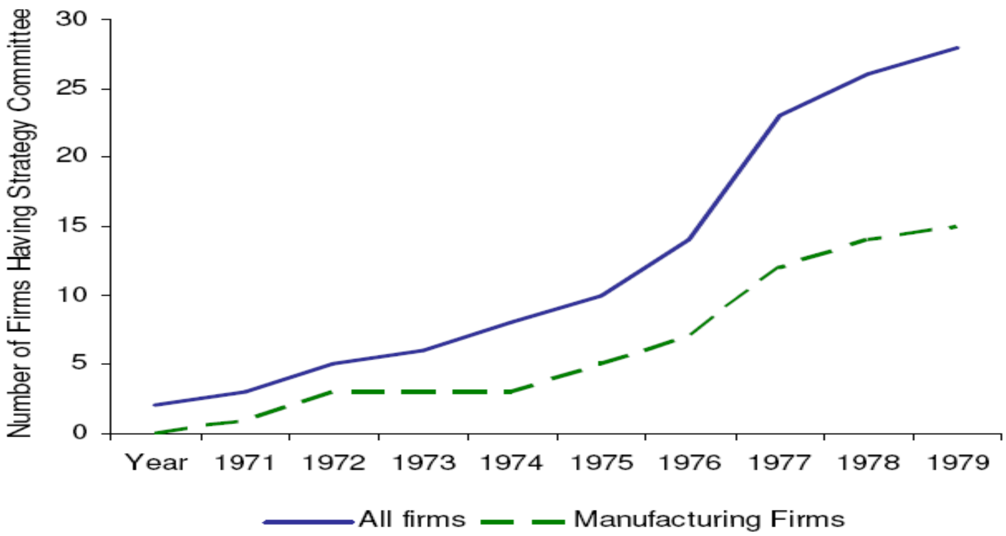

Figure 3 Strategy Committee Existence Adapted from Harrison (1987), p.118

In accordance with these findings, Rosenstein (1987) has noted that there was "no proliferation of strategy committees comparable to the rush to the audit and the nominating committees in the 1970s" (p.31). Yet, as already mentioned, he claims that by 1979 there were indications that in large US corporations, the typical board might be "on the verge of a significant degree of involvement in strategy, possibly through the addition of another major committee" (p.31).

Yet, during the 1980s, an increase of strategy committees was not to be observed (Harrison, 1987; Rosenstein, 1987). In the face of an only inconsiderable establishment of strategy committees, Andrews (1981b) suspects that his persistent calls for the introduction of such a committee might have been ignored mainly because many CEOs oppose board involvement in strategy processes. He suggests that consequently, they seek to limit directors' participation to a minimum and most importantly to keep the consideration of strategic matters out of the reach of an especially informed and qualified committee. Towards the end of the 20th century, Dimma (1998) observes that strategy committees remain uncommon. Nowadays, executive, audit, nominating, compensation, and finance committees are said to be typically installed, with audit committees being compulsory for US listed companies according to sec. 301 SOX (von Werder, 2005). Carey and Patsalos-Fox (2006) highlight that there has been a fourfold increase in the number of board of directors' retreats devoted to strategy, but claim not to have detected a sole US company which has introduced a committee to deal with the review and formulation of strategy. Nevertheless, they suggest that directors' involvement in strategic questions may soon arouse more interest, as attention starts to turn away from compliance issues and new sources of shareholder value are sought.

Benefits of a Strategy Committee

Despite the low empirical use of strategy committees, its installation has continually been recommended (Andrews, 1981a,b, 1987; Donaldson, 2000; Harrison, 1987; Henke, 1983; Welge, 2005). It is argued that a number of advantages may be derived from the establishment of a strategy committee (see table 1).

The various suggestions brought forward may be condensed to basically six major benefits of strategy committees. First of all, a committee is believed to economise board time and concentrate directors expertise on a set of specific problems (Andrews, 1987). Secondly, the existence of a strategy committee is claimed to increase directors' involvement in strategic matters (Harrison, 1987; Henke, 1983; Welge, 2005; Wommack, 1985). This idea is supported by the insight that increased size may inhibit board involvement (Goodstein, Gautam & Boeker, 1994;) insofar as the installation of a smaller committee should then have a favourable impact. Moreover, board members are supposed not only to be more involved but also better informed and more capable of discussing corporate strategies if a committee is introduced (Harrison, 1987; Henke, 1983). Next, the presence of a strategy committee might render directors in a stronger position toward the management team and increase their influence on strategic decisions (Dimma, 1998; Henke, 1983). Furthermore, the committee's work allegedly raises awareness for strategic planning processes and strategically relevant issues and helps ensure the structured and formalised examination of important topics (Harrison, 1987; Henke, 1983; Wommack, 1985). Finally, the mere existence of a committee was found to convey an impression of responsible activity and structured analysis to the external environment, irrespective of the true proceedings within the committee (Donaldson, 2000; Harrison, 1987).

Drawbacks of a Strategy Committee

As to the disadvantages of strategy committees there are three significant arguments (see table 1). First of all, the committee may expose board members to increased liability risks (Harrison, 1987). Secondly, a divide between those directors concerned with strategy matters and those who are not directly involved may be induced (Andrews, 1981b; Dimma, 1998). And finally, a strategy committee is claimed to risk crossing the line which separates the roles of the board from those of management (Dimma, 1998).

Benefits	Drawbacks
- **Economisation of board time** - **Increase in directors' involvement in Strategy** - **Improvement of directors' knowledge** - **Improved position of directors towards management** - **Raised awareness for strategic planning** - **Conveyance of positive impression on environment**	- **Increased liability risks for directors** - **Divide between committee members and remaining directors** - **Risk of board assumption of managerial duties**

Table 1 Benefits and Drawbacks of Strategy Committees

Conclusions and recommendations

The strategy committees are deeply embedded in the context of continuously evolving corporate systems and that's the reason why special attention should be given to such issues involving strategic decision-making processes.

Now that a theoretical foundation regarding strategy committees in the context of boards' involvement in strategy has been established against the background of the general corporate governance debate, it shall be of further interest to investigate the role and tasks of strategy committees in large German and Swiss corporations today.

Yet, only four companies have installed strategy committees. Upon a comprehensive review of the literature, one may ask why so few corporations have taken this decision. The advantages of installing a strategy committee seem striking. In light of the much debated globalisation of today's economy and steadily augmenting competitive pressures, companies should seek to tap into all potential sources of competitive advantage available to them. This includes the expertise of board members, their experience and analytical competencies. While it is difficult to specify what exactly the optimal committee's design would have to be, it may be suggested that they be composed of four to six non-executive directors, who take the chance to intensely discuss future business opportunities and the corporations' strategic direction.

Abstract. The dynamism of the economical environment where companies activate suppose for them a continuously search of solutions for improving over the control of activities developed. A solution is to adopt the internal audit function, and this offers answers to the questions which usually the manager of the company asks himself about how he or she and his collaborators could have a good and efficient control over the activities developed. For the positive results of the implementation of the internal audit function is necessary to be an independent function, without pressures or other influences which could stop the achieving the settled objectives. We will try to find in what measure the outsourcing of the internal audit function could determine the increasing of the quality of the internal audit, underling the advantages and disadvantages which could be generated, trying to issue few relevant conclusions.

Key words: internal audit, outsourcing,, independence, internal auditors

In present, we are confronted with a very quickly evolution and spectacular of the internal audit function on the global plan and also in Romania, and this fact is due to the conscience more and more of the companies' management for the necessity and the importance of the internal audit in the company structure. In this way, even the managers of the small companies begin to be interested in advantages of the internal audit functions. In spite of the advantages of the internal audit, the managers ask themselves:

- *Which would be the effort (cost) supposed by the settling of this function of internal audit?*
- *Are justified these costs relative to the benefits obtained after the implementation of the internal audit function in the company?*

The settling of the internal audit function in the company supposes, from an administrative point of view, to hire a internal audit team coordinated by a responsible person for leading the team, assuring the necessary conditions for working (place, equipments, etc.) and of course the salary for the hired person. On the other side, we have to consider few essential aspects in implementation of the internal audit function in order that the results to be the best. So, the internal audit function must be characterized by independence and to be free of every pressure or influence which could stop the achieving the settled objectives. The professional internal audit standards underline the double importance of the internal audit independence:

- The independence of the department inside the company, which determines the situation of the internal audit at a higher level, simple said it is subordinated only to the top management
- The independence of the internal auditor will assure the objective character of the activities and the results of the internal audit.

The independence of the internal auditors is sustained for eliminating the practical very often founded, and that is the supraconcentrate activity of the internal auditor with different duties, which don't have to be in the area of activity of the internal auditor, like: defining of the procedures and methods of work, evaluating and supervising the employees of the company, administrative activities, effective financial control or different activities of inspecting. The result of the supraconcentrate activity for the internal auditor is the loosing the independence and the objectivity of the internal audit. It is obviously that the internal auditor can't evaluate objective a procedure defined by himself.

The efficiency and the rigorous work of the internal auditor are directly damaged if the independence and objectivity are affected, from this reasons are assessed few rules which must be respected:

- The internal auditor do not have any operational department subordinated;
- Possibility as internal auditor to have access at every moment to persons from every hierarchical level, at assets and information;
- The recommendations made by the internal auditor aren't compulsory for managers of the company.

Organizing the internal audit function and placing it in the direct subordination to the top management is not enough to assure the objectivity of this activity. For an objective activity, the internal auditor has to appreciate in a neutral mode, to be impartial and to be without preconceived ideas. Is obviously that the ideal in objectivity is very hart to achieved, existing all the time a marginal risk after the internal audit activity, named audit risk. The objectivity must be the scope what should be achieved and every internal auditor has to do all the efforts for touching this scope. The independence and the objectivity are some times contested by the internal auditors which are subordinated hierarchic. Trying to eliminate this kind of problems, there were developed new approaching for the internal audit function, on global plan and also for the national plan. This approaching was centered on the outsourcing totally or partially of the internal audit function.

So, was developed more ways of approaching[387]:

- Complete outsourcing of the internal audit function ,
- Partnerships with companies of audit with relevant experience in the internal audit *(co-sourcing)*,
- Assuring the support for setting of the internal audit function (setup), and after this will be realized by a team hired inside the company.

If we look on the global plan of the internal audit activity we can see that this solution of outsourcing of the internal audit services has already some history and it is getting more and more space.

An example in this way is a study from 1999, made by two British specialists[388], through this study they issued the assumption that the potential of outsourcing of the internal audit activity will growing in the next few years achieving 25% from the total of the internal audit services of the audit companies. Another study[389] recent made in 2006 with subjects 99 companies listed on the Australian Stock Exchange underline that at least 45.5% of the companies surveyed has outsourced totally or partially the internal audit function. These companies associate the outsourcing of the internal audit with a decreasing the costs, using a better consultant, with technical competence increased which characterize the external consultant.

Another study regarding the trends in the internal audit[390], realized by the one of the big audit company from Big Four group (Ernest&Young Romania), underlines few interesting conclusions.

So, they conclude that 62% from the companies use the outsourcing in different forms, appreciating that the outsourcing of the internal audit is not a universal solution, but because of the recent economical collapses, a higher and higher number of Audit Committees claim independent revisions of the internal audit function or they use co-sourcing (using specialized resources for covering key risks for the function). The trend is to use external consultants for assuring the support or for the adviser. Also, there are used advisors for punctual needs, where the experience of the internal employee is not enough (partnership and co-sourcing). Transfer of knowledge to the internal auditor's team of the company is one of the reasons of this approaching.

The same study analyzing the possible reasons which are the base for the outsourcing of the internal audit function, and the conclusion of the study is principal causes:

- It is assured the immediately access to the best practices;
- It is significant improved the cost efficiency;
- It is increased the assurance level of the risks with the same expenses or with less expenses;

---

[390] Horlaci C. (2003), *The outsourcing of internal audit function,* november, available on-line at www.ey.com

– It is assured the unlimited access to specialists in this domain;
– It is assured the access to the investment in the methodology, human resources and technology.

The expectations of the manager (which is client in this situation) regarding this outsourcing of the internal audit function is represented by:

– The growing of the internal audit contribution to touching the strategically objectives of the company;
– The external consultant has relevant experience in the internal audit activity;
– Specialized resources, adequate to the existent needs;
– Flexible approaching, client orientated;
– Instruments and techniques for performing work;
– The bigger benefits regarding fewer cots.

In the next lines, we will synthesize in a table the principals advantages and disadvantages which are implied by the outsourcing of the internal audit, because is absolutely necessary in taking the decision of the total or partial outsourcing of this function, to know the positive and negative aspects which appears when is adopted such a solution:

The outsourcing of the internal audit (outsourcing)	
The advantages of the outsourcing	**The disadvantages outsourcing**
• From the point of view of the specialization, using the outsourcing can facilitate creation of the team with very good skills in the audited domain, having in this way assured the access to the best practices in the domain at a high competence; • The level of the objectivity can be higher comparative with the objectivity of the internal auditors hired by the company, because they (external consultants) didn't interact on the long term with the employees of the company; • Depending by the notorieties and the specialty of the contracted audit team, the audit team could have a significant support from the management of the company; • Eliminating the costs generated by the recruiting the internal auditors and the training needed for the audit team; • Eliminating the costs supposed by the investment in the methodology and technology; • Concerning of the management for the base processes; • A higher flexibility in allocating resources.	• The external consultant didn't know as an internal auditor the environment and the culture of the company as well as an internal auditor hired knows, and this can make harder the access to a series of relevant information, because the internal audit hired know where and what to search; (in combating these disadvantages some specialists like Blackmore J.[391] appreciates that in spite of the large experience of the hired internal auditor regarding the specificity of the company's activity, the external auditors can compensate or even to exceed by the relevant experience of the internal auditors from the specialized audit companies). • The internal auditor hired by the audit company (external consultant), being out of the company, can be accepted with some reticence by the audited departments, being in this way harder to develop collaborating relations which could be helpful in the investigations, being generated sometime cultural or organizational conflicts; • The availability of the outsourced internal auditor is not all the time, and every moment.

Table no.1 „The advantages and the disadvantages of the outsourcing of the internal audit"

Analyzing the advantages and disadvantages that could be generated by the outsourcing of the internal audit function, we try to lay down few conclusions:

– The outsourcing of the internal audit is a solution which has no absolutely guarantee in every situation, for a higher efficiency than the internal auditor hired;

[391] Ernest&Young, (2005), *The merits of outsourcing your internal audit function,* December, available on-line at www.ey.com

- We consider that the advantages for this solution is bigger in the case of small and medium companies, rather than the bigger companies regarding the relation expenses (costs)-benefits;
- In the process of choosing this option we must consider few essential factors like: external and internal environment where the company activates, the dimension of the company, domain of activity, the management experience.

Abstract: Transfer prices are considered the prices paid for the goods or services in a cross-border transaction between affiliates companies, often significant reduced or increased in order to avoid the higher imposing rates from one jurisdiction. Presently, over 60% of cross-border transfers are represented by intra-group transfers. The paper presents the variety of methods and mechanisms used by the companies to transfer the funds from one tax jurisdiction to another in order to avoid over taxation.

Key words: transfer pricing, intra-firm transaction, tax jurisdiction

Introduction

Globalisation of the economic activity and the rise of the multinational corporation has determined the necessity of management to adapt to the new conditions and to define new operational and financial strategies; these strategy should create an advantage to the multinationals as being an global player through the reductions of the costs, exposure or resources acquiring difficulties. Presently, when more than 60% of world trade takes place within multinational enterprises[392], the importance of transfer pricing becomes clear.

Multinational companies are acting in different countries and benefit from advantages as fiscal, foreign exchanges, capital repatriation or others offered by these countries. This way the chances to get a higher profit, on the whole increase, compared with the situation of developing operations within one country.

Multinational companies operate inter-corporate flows, through diverse mechanisms, taking advantages of the law's niches from different countries in order to benefit from the most favourable conditions. This came out under international financial markets' and shareholders' pressure for higher profitability rate, that can be obtain only by maximum exploiting of the corporations' synergies, transfer pricing or legislative niches specific to each country.

Transfer pricing refers to establish prices for goods, services, know-how and intellectual property transferred across borders within corporate networks and especially between foreign affiliates and parent corporations.

Transfer pricing mechanisms

In order to obtain higher profitability, a multinational company transfers its revenues and expanses, or parts of them, using a variety of methods from one tax jurisdiction to another, in order to reduce the tax liabilities. These methods suppose the maximum exploiting, and sometimes up to the limit, of the law's stipulations.

The most used transfer pricing methods are:

a. Intra-firm loans

[392] John Neighbour, Transfer pricing: Keeping it at arm's length,OECD Centre for Tax Policy and Administration, 2002;

Multinational companies often refer to intra-firm loans in order to finance their new established or liquidity difficulties affiliates from different countries, taking advantage of the quick financing from parent company, but also of the reduction of the taxes, due to the use of this mechanism.

a.1. The mechanism of conversion the liabilities/loans in shares is used when the interest rates in the market are high; these generate for affiliates prohibiting financing possibilities from financial institutions. So, the parent company will lend the affiliate at a very low interest rate comparing to market's rate. Generally, all over the world, the interest expenses up to a limit are deductible in calculation of the tax on profit. Such a transaction generates for the affiliate a competitive advantage, because it benefits from a capital infusion that afford the costs' reducing, the opportunity to invest in business developing and winning new market shares. The affiliate has many alternatives regarding the way and the moment of loan's reimbursement, including the debt - equity swap, that assure an almost cost free financing.

a.2. The interest rate mechanism suppose the significant funds transfer from tax jurisdiction where the tax level is high to affiliates in the countries where the tax level is low using by granting a very high rate loan. Generally the taxation method for the interest revenues is withholding tax in the country where are obtained. If there are conventions for avoiding double taxation, these prevail over national law system, and this way, important amounts can be transferred to jurisdictions with low level of taxation.

b. Royalties' mechanism is the mechanism used by the parent companies to sell the rights to use patents, licences, trademarks and similar rights to the affiliates of the group, the amounts paid being in accordance with tax level. Royalties represents payments made in order to have the right to use a patent, a trademark, licenses, know how, franchise activities, manufacturing procedures, software and any other cable, relay or satellite transmission, industrial, commercial or scientific equipment, including the right to use information and knowledge regarding to commercial or business activity.

b.1. High royalties are used by the parent company by lending or selling to the affiliates the right to use licences, patents, know how at important rates, significantly higher than the royalties applies in transactions with independent parties. The target of this mechanism is the funds transfer from the countries with high tax level to the company of the group where the tax level is low, saving important amounts.

b.2. Low royalties are used by parent companies to sell the right to use patents, trademarks, licences at lower rates comparing to the rates used in uncontrolled transactions. This way the affiliate that buy at such a low rate these right, realizes important benefits against the competitors, and transfer the resources almost free of charges, where the countries have a convention for avoiding the double taxation.

c. Commissions' mechanism **–** between the companies belonging to a multinational group may appear monetary flows as compensation for the brokerage service, financial intermediation or other services perform within the group. The volume of the paid amounts depends on the tax level in the country where the company develops its activity.

d. Performed services mechanism – represents one of the preferred methods for intra-group funds transfers towards more favourable tax jurisdiction. The reason for intensive use the easy way to proof the performance of the service, most of the time there is a simply contract between the parties implied in transfer, for the consultancy, technical assistance or other similar services. Most of the times, these services are invoiced with significant prices, due to the high rates of the experts implied, representing the pretext of important funds transfer toward favourable tax jurisdiction.

e. Preferential prices selling – suppose the use of preferential prices in the intra-group transaction, significantly different from market's prices or the prices used in relations with independent customers. Using the preferential prices for any type of intra-firm transactions (sell-buy, loans, assistance, advertising, etc.) targets two advantages:

e.1. Competition advantages

Within the multinational companies the management of individual plants and divisions is often carried out on a decentralized basis, and accounts are made out for each "profit centre", the group enterprise as a whole may require a centralized financial strategy, to ensure an efficient co-ordination of the group's multinational business operations. In this respect, a multinational company may set the transfer pricing of intra-firm flows of goods, services or other assets on a centralized basis, thereby taking control over pricing policy away from individual profit centers. This requires a mechanism for setting prices in a rational way that ensures the setting of optimal prices that create the opportunity to enter new markets, to exploit the demand's fluctuations or foreign exchange volatility.

e.2. Reduction of the fiscal debts represents the target, directly or indirectly aimed, for all the transfer pricing.

International approaches regarding transfer prices

During the last 30 years, as a consequence of economic activity globalisation, the number and the role of multinational companies have exponential increased. The increase of multinational companies leads to increase of taxation complexity issues for firms and governments, due to the fact that tax rules can not be isolated, but considered in a larger international circumvention.

The difficulty for multinational companies consists in the necessity to operate within the law that differ from country to country, but for the governments, to calculate the expenses and the revenues for a affiliate – part of a transnational group.

Most developed countries derive their transfer pricing regulations from the Organization for Economic Co-operation and Development (OECD) transfer pricing guidelines (OECD, 1995; 1996). According to them, transfer pricing methods which are currently acceptable to most tax authorities are based on the arm's-length principle.

Arm's Length Principle (ALP)[393]

According to OECD 9th article, 1997a, when conditions are made or imposed between the two enterprises in their commercial or financial relations which differ from those which would be made between independent enterprises, then any profits which would, but for those conditions, have accrued to one of the enterprises, but, by reason of those conditions, have not so accrued, may be included in the profits of that enterprise and taxed accordingly.

Methods used in transfer pricing

Cross-border transfers may be priced using any of several traditional transactional and transactional profit methods, all of which adhere to the arm's-length principle. The methods can apply to both "tangibles" and "intangible property". Tangibles include any goods, whether finished products or intermediate inputs, such as raw materials or components, that are transferred between affiliated enterprises. Intangible property includes such diverse categories as:

- Patents, inventions, formulas, processes, designs or patterns;
- Copyrights, literary musical or artistic compositions;
- Trademarks, trade names or brand names;
- Franchises, licenses or contracts;
- Methods, programmes, systems, procedures, campaigns, surveys, studies, forecasts, estimates, customer lists or technical data; and
- Other intellectual property not listed above.

*The **traditional transactional methods*** suppose the comparison of the prices used in controlled transactions between affiliated enterprises with prices used in transactions with independent companies. This is the most direct method and can be considered a benchmark, but in reality is very difficult to use, making necessary the use of less direct methods as gross margins reflected in traditional transactional methods.

A. The Comparable Uncontrolled Price (CUP) method seeks to determine the ALP by comparing the price at which a controlled transaction is conducted to the price at which a comparable uncontrolled transaction is conducted. This method is basically applied to concerns engaged in the manufacturing and selling of the product and hence to be applied to manufacturers. Typical transactions in respect to which this method may be adopted are: transfers of goods, provisions of services, intangibles, loans and provisions of finance. It seems very easy, but in reality, any minor change in the circumstances of trade, such as billing period, branding or amount of trade, may have a significant effect on the price and its makes extremely difficult to find a sufficiently comparable transaction.

---

[393] OECD Committee on Fiscal Affaires, Transfer Pricing Guidelines for Multinational Enterprises and Tax Administrations, 2002;

B. The Resale Price (RP) method compares the gross profit realized when an company re-sells goods to a affiliate enterprice to the gross profits realized by comparable entities in uncontrolled transactions.Comparable profitability is determined by calculating the ratio of the initial purchase price of comparable tangible goods to their resale price to an unrelated party. This ratio, expressed as a percentage, is then used to calculate the value of the goods in a related-party transaction. The resale price method evaluates whether the amount charged in a controlled transaction is arm's length by reference to the gross profit margin realized in comparable uncontrolled transactions. The resale price method measures the value of functions performed, and is ordinarily used in cases involving the purchase and resale of tangible property in which the reseller has not added substantial value to the tangible goods by physically altering the goods before resal; in their view, packaging, repackaging, labelling, or minor assembly do not ordinarily constitute physical alteration.

C. Cost Plus (CP) method evaluates whether the amount charged in a controlled transaction is arm's length by comparing the gross profit markup realized in comparable uncontrolled transactions. This method is generally used for the trade of finished or semi-finished goods, by adding an appropriate markup to the costs of materials, labour, manufacturing, and so on incurred by the selling party in manufacturing/purchasing the goods or services provided, with the appropriate markup being based on the profits of other companies comparable to the tested party. Cost based method calculates transfer price on the cost of the goods or services available as per the cost accounting records of the company. The method is generally accepted by the tax customs authorities, since it provides some indication that the transfer price approximates the real cost of item. Cost based approaches are how ever not as transparent as they appear. A company can easily manipulate its cost accounts to alter the magnitude of the transfer price. This method probably is most useful where finished goods are sold between affiliates and these have concluded joint facility agreements or long term buy/supply arrangements.

The most common used *non-traditional transactional profit methods* are the Profit Split method, the Transactional Net Margin method and the Comparable Profits method..

The *Profit Split (PS) method* is applied when the businesses involved in the controlled transactions are too integrated and cannot be evaluated separately for the purpose of determining the arms length of any one transaction, and so the ultimate profit derived from the endeavor is split based on the level of contribution of each of the participants in the project.

The *Transactional Net Margin Method (TNMM)* focuses on the arm's length operating profit earned by one of the entities/affiliates in the transaction. It stipulates that relative operating profit (relative to sales, costs, or assets to allow comparisons between different companies or transactions) may be a more robust measure of an arm's length result when close comparables, as required for the traditional methods, are not available. This may lead to very different gross margins (and hence the resale price method may not be easily applicable). However, the operating margins would not be expected to be materially different since the margins reflects a competitive return only.

The margin is measured pre-interest since the level of interest expense is a function of how a company decides to finance its operations and unrelated to the transfer pricing.

The *Comparable Profits Method (CPM)* determines an arm's length result using the amount of operating profit that the examined company, part of a multinational group would have earned on related party transactions with other affiliate entities if its profit level indicator were equal to that of an uncontrolled comparable transaction.

As it was shown, the transfer pricing method mostly depends on the allowance of the expenses' and revenues' treatment, but the mechanism depends on the business domain, the size of international network, the complexity of the transactions between companies of the group being able to counteract any change in a tax jurisdiction, that may dramatically affect the affiliate's or group's results. The pressure of realizing the assumed budget is quickly fined by the stock exchange investors and may have positive or negative training effects in transfer pricing policy.

The paper highlights theoretical aspects regarding corporate mandatory and voluntary disclosure. Since financial and business reporting are important information sources for different stakeholders, especially for publicly traded companies, the business reporting is increasingly oriented to the need of different users. In order to make rational investment decisions, users of corporate annual and interim reports require an extensive range of information. The increasing needs of the users persuade different international bodies and researchers to investigate the improvements that can be done in business reporting. The results of those studies usually were different reporting models. Because voluntary dimension of corporate disclosure involve the manifestation of free choice of the firm and its managers, we have considered as necessary to achieve a theoretical analysis of the main costs and profits of the voluntary disclosure policy.

Key Words: corporate disclosure, financial reporting, mandatory and voluntary disclosure

Introduction

Disclosure theory indicates that corporate disclosures are complex constructions capable of a variety of interpretations. As Gibbins, Richardson and Waterhouse (1992) have argued, organizations may disclose information to support the efficiency of exchange and production, but they also disclose information to establish their compliance with the social values reflected in regulations and informal norms.

The changes in the international business environment have imposed reviews in the nature and content of the corporate reporting. A lot of polemics have been generated between the users of business reports and different regulation organizations involved in accounting and reporting standards setting process. The breakpoint of these polemics is the users' needs regarding a better understanding and a better communication of the differences existing between the market and book value of an enterprise. Even though the traditional financial statements are based on practices and standards with a long history behind they became insufficient to solve the information needs of the actual users. Corporate disclosure is critical for the functioning of an efficient capital market. Firms provide disclosure through regulated financial reports, including the financial statements, footnotes, management discussion and analysis, and other regulatory filings (Healy and Palepu, 2001). In addition, some firms engage in voluntary communication, such as management forecasts, analysts' presentations and conference calls, press releases, internet sites, and other corporate reports. Finally, there are disclosures about firms by information intermediaries, such as financial analysts, industry experts, and the financial press. Traditionally, the corporate annual report has been seen as the primary source of corporate information disclosure. However, this is slowly changing and moving towards internet reporting.

The two dimensions of corporate disclosure. Definition, differences and similarities

Reporting and disclosure are the most important tools that companies use to communicate with their stakeholders. Disclosure is a crucial element in ensuring the effective allocation of resources in society and diminishing the information asymmetry between company and its stakeholders.

Companies have at their disposal two kinds of publishing variants through which they can diminish the informational asymmetry towards their stakeholders: compulsory and voluntary disclosure. The most important publishing variant is represented by the compulsory disclosure. The mandatory character of reporting is ruled at national or even regional level through professional organizations or government authorities, being practiced in most of the countries by all the firms regardless of their size, of their judicial, fiscal or national accounting system, the favorite finance sources and other factors with impact on disclosure policy. The second, voluntary disclosure comes to complete the mandatory reporting process that often seems to be inadequate for satisfying user's needs. Traditional financial reporting mostly provide historical information, moreover, in certain industries, conventional accounting and reporting strategies may not be sufficient to accurately represent the complexity of a firm's operations (Mohanram, 1998).

Mandatory disclosure refers to those aspects and information which must be published as a consequence of the existence of some legal or statutory stipulations, capital markets, stock-exchanges commissions or accounting authorities regulations. The aim of mandatory disclosure is to satisfy the users' informational needs, ensuring the production quality control through the laws and standards' observance.

In Romania, the compulsory character of the corporate disclosures is established in relation to the regulations of the Finance Ministry (for all enterprises) and the regulations and codes issued by National Commission of Movable Assets and Bucharest Stock Exchange (for the listed companies). The mandatory disclosure has both periodic and continuous character.

The compulsory periodic disclosure refers to the dissemination of annual and biannual financial statements, consolidated financial statements, administrator report, audit report, annual, biannual and quarterly reports and financial calendar. Terms for the publication of these reports are pre-established. As regards the deadline of reports transmission, the Romanian legislation is at the level of the developed capital markets' requests, but, unfortunately, these terms are frequently not respected by the companies listed on the stock-exchange market. Thus, the non-fulfilment of the requests regarding disclosure is the main cause of the transaction suspension of the BSE issuers.

Items, that define the mandatory character of disclosure are:

- issuer: company,
- receivers: shareholders, employees, creditors, customers and other stakeholders
- regulations: comercial law, accounting law, accounting standards: IFRS , US GAAP, European Accounting Directives, national accounting standards et al.;
- content: format and object of disclosed statements,
- periode of disclosure: annual, biannual, quarterly or ocasionaly,
- disemination means: printed or web site.

The voluntary disclosure has its sources in the past of the business development, when, as a result of the fact that owners have delegated to the managers the leading function of the enterprises, the need for voluntary disclosure appears as a consequence of the information asymmetry between the two parties: managers are better informed about the business than its owners. The development of the capital markets after the great crises in the USA in 1929 has led to a more and more emphasized manifestation of the voluntary disclosure. The voluntary disclosure regards information made public through the firm's free choice. It is influence by culture, social, economic and behavioural factors that are specific to each firm. There is no general accepted definition or theoretical background for voluntary disclosure.

Thus, we will explain the voluntary disclosure as being an additional offer of information in relation to different national regulations or international referential of business reporting, that is, something that is not compulsory by the law, but becomes voluntary through the behaviour regarding publication. In other words, the voluntary offer of information represents the excess of information, dependent both on the free choice of the enterprise leadership and on the regulations in force, the outside pressures of the capital markets, financial analysts, consulting firm's et al. and the cultural factors.

Although the voluntary disclosure represents the reporting outside the financial statements, which is not explicitly ruled through norms or laws, it is admitted that many of these "voluntary disclosures" are made in order to be in agreement with the requests of the stock-exchange commissions regarding: the companies presentation, analysis and management presentations regarding risk, opportunities and the results obtained or provisioned.

Therefore, in order to obtain capital and moreover to attract investors, companies often voluntarily disclose corporate information even in the absence of regulation. Agency theory highlights the reasons that cause managers to provide voluntary disclosures above and beyond required disclosures. Under agency theory, voluntary disclosures occur as a means for companies to minimize their agency costs, no whether its forms are: traditionally disclosure, internet or XBRL disclosure.

Voluntary disclosure: benefits and limits

Disclosure benefits. In order to orient the decision regarding the publishing policy we must balance the costs and the advantages afferent to the supply of additional information in order to answer to the request of different groups of users. We can observe two categories of users: sophisticated: brokers, financial analysts and the investment funds which need information in order to counsel the non- sophisticated users and clients: those who do not have specialized knowledge and they appeal to the first category. All these users wish to surpass the information limits offered by the compulsory information and they put pressure on firms in order to obtain useful complementary information. Under the pressure of these groups, the managers supply voluntarily the information they consider useful for stakeholders needs. But the vision on the *a priori* usefulness of the voluntary information remains a normative vision because it does not appreciate the managers' motivations regarding disclosure, they are aware of the effects of using voluntary information on their communication. It is presumed the cost of the information release being a sufficient condition in order to assure their credibility.

The benefits obtained as a result of corporate disclosure for the firms listed on the capital market can be measured through the consequences of the cash flow evolution and the transaction price increase. Eccles and Mavrinac (1995) have achieved a study through which they have investigated which the expectations of different users' categories as referring to the potential profits of the improvement of the firms' publishing system. All three investigated users categories: managers, financial analysts and investors, have considered that the greatest benefit is the increase of the firm's credibility and the next ones are in the order of the importance conferred to them by: the increase of the shares' value, the increase of the potential investors number, several suggestions from the analysts, the improvement of the access to the capital, the increase of the balance between the share's price and the share's profit, the diminution of the shares' volatility, the increase of the shares' liquidity, the improvement of the relations with the suppliers, the diminution of the political interventions to regulate the market.

Holland (1998) comparing the benefits to the costs of voluntary disclosure, states that "the management will publish until they will reach the point when they will observe that the capital agency costs reduction has equalled the increase of the information publication costs for the market and the other users."

Limits of voluntary disclosure. The competitive dynamics of the products and services markets play a restrictive role regarding the firms' voluntary disclosure policies. The managers are often forced to choose between maximizing the competitive advantage of the firm's market by not publishing information which would affect the competitive position or to publish that information in order to help the capital market to achieve an efficient evaluation of the company's shares.

Another limit would be that in the past the annual reports were involved in satisfying the shareholders' needs and not those of the employees and stakeholders. That is why, now the firms must re-examine the disclosure contracts with the employers' federations and the trade unions and to confer a greater attention to these groups' needs.

There are many factors and aspects which can influence the general policy of a firm's voluntary offer of information, as: the level, the frequency and the method of disclosure used; the objectives established by the firm regarding disclosure; the firm's size, the status regarding listing, the organisational culture and the business complexity; the number, type and culture of the firm's shareholders; the disclosure costs; the level of favourable news about the firm; the competition intensity, the market level and the profit rate obtained by enterprise. We consider that the most important of all these is the *disclosure cost*.

The first benefit of the publication of a great volume of information is represented by a better capital allocation at national and international level, which can be translated as a capital cost reduction. Through the increase of the publishing level, especially of the information provisioned, the firms can reduce the cost of the capital attainment (Healy şi Palepu, 1993). However, Thompson (1995), warns that an undisciplined expansion of the business reporting can lead to an un-necessary increase of the expenses.

The voluntary disclosure of information in the annual reports implies additional costs and the users' needs of information must be thought taking into account the costs efficiency of different reporting types. A cost-profit analysis must be done for each type of information supplied. Unfortunately, there is no general accepted technique of measuring these costs and profits that is why the process is complex, subjective and often inappropriate, sometimes inexact or even wrong. According to Malone et al. (1993) the firms which are economically stimulated to supply more information, will do it only if the marginal cost will surpass the marginal profit of the additional disclosure.

The examination of the financial managers perceptions of some multinational firms in the United Kingdom and USA on the report cost/profit achieved by Gray, Radebaugh and Roberts (1990) has led to the conclusion that the items published voluntarily which have led to significant increases of net costs are: the inflation adjusted profit, the measurement of the forecasts and the information regarding the segments reporting.

So, the voluntary disclosure is much constrained by the costs which are involved by collecting, processing, attainment and auditing of data, to which the indirect costs are added. The indirect costs have a special role regarding the danger to supply information which can be used by the actual or potential competitors.

The cost is a factor often used as a reason to limit the volume of the voluntarily disclosed information. Singhvi and Desai (1971) have shown: the cost of the accumulation of certain information is bigger for the smaller companies than for the larger ones, especially because the large companies dispose a more complex reporting system and a high level of earnings, the larger enterprises afford more easily high advertising costs which allows them to pick up the benefits of the easier shares' transaction and to obtain finance more easily. On the other hand, the small firms can put their competitive position in danger by an excessive information disclosure.

AICPA in Jenkins Report (1994) identified six constraints to reduce costs in areas where the costs of reporting under the model could be significant:

a) Business reporting should exclude information outside of management's expertise or for which management is not the best source. That is, business reporting should include only company-specific information that is within management's expertise to provide;
b) Management should not be required to report information that would harm a company's competitive position significantly;
c) Management should not be required to provide forecasted financial statements. Rather, management should provide information that helps users forecast for themselves a company's financial future, such as the information specified in the Committee's model;
d) Other than for financial statements, management need only report the information it knows. That is, management should be under no obligation to gather information it does not have, or need, to manage the business Certain elements of business reporting should be presented only if users and management agree they should be reported - a concept of flexible reporting;
e) Companies should not have to expand reporting of forward-looking information until there are more effective deterrents to unwarranted litigation that discourages companies from doing so.

Conclusions

As we can see in our days financial reporting is only a part of the business reporting. Companies are in the situation of voluntarily producing and disclosing complementary statements to cover some of the deficiencies in content of traditional financial reporting. Voluntary disclosure is an important part of the present corporate reporting practice and Internet disclosure is the future trend of current business reporting.

Information is the heart of the best functioning capital markets. A comprising, reliable, comparable, understandable and high quality corporate reporting increase the investors' confidence and the market efficiency. Despite the highly positive recognition that companies stakeholders have given to initiative of voluntary disclosure we have observed that they involve serious drawbacks that may affect the validity of this type of disclosure. As much information companies will disclose voluntary as less comparable and reliable will be their reports.

THE ANALYSIS OF THE RESULT PER SHARE– MEASUREMENT INDICATOR FOR THE PERFORMANCES OF THE ENTERPRISE

Popa Dorina Nicoleta

University of Oradea, Faculty of Economics, dlezeu@uoradea.ro

Scorțe Carmen Mihaela

University of Oradea, Faculty of Economics,

The result per share is one of the indicators most often used in the financial analyses drawn up for the financial record of the enterprises, mainly the Anglo-Saxon ones, which can operate as a basis for comparison of the financial performance for the enterprises listed, which run their activity within the same sector and it can be a useful complementary indicator in following the prospective profits in the field. This indicator does not provide though the possibility to compare all the enterprises which compute it due to the difficulties in interpreting the differences noticed from one enterprise to another, differences which can result from the different number of shares issued by each of them and from the different categories of shares issued. The paper has in view the description and exemplification of the computing model of the Result per share indicator.

Key words: indicators, result on action, performance.

The enterprises quoted on the Stock Exchange and due to be quoted, when presenting their financial activity, they use among the financial indicators the Result per share, too, an indicator providing the investors information regarding the profit obtained on the investment made and which is computed according to The International Accounting Standard IAS 33.

Result per share = Net profit of the financial year / Number of shares issued

An enterprise can issue two types of shares: ordinary shares and preferential shares, both being issued and sold in order to attract capital, yet those who invest in the preferential shares have institutional objectives different from those investing in ordinary shares.

- **Ordinary shares** are capital instruments which give the right to participate to the profit (dividends) only after the distribution of the net profit afferent to the other types of shares (preferential) Due to the fact that usually only the ordinary shares grant the right to vote, they represent a modality to control the enterprise.
- **Preferential shares** have priority before the ordinary shares in many regards: priority when dividends are paid, priority when the assets of the enterprise are distributed in case of winding up, convertibility and option of revocation (pay off). The priority of the preferential shares as compared to the ordinary shares regarding the dividends payment can be explained as it follows: the holders of the preferential shares must cash in a certain amount as dividends before allocating the dividends to the ordinary shareholders. This amount is set up in monetary units on share or as a percentage of the nominal value of the preferential shares.

According to IAS 33, the performance indicator “Result on action” is computed in two ways, that is: the result per basic share and the result per share– diluted.

The result per basic share (R/A-basis)

For the fundamental computation of the profit per share one usually starts from the net profit or loss of the period, computed according to Standard IAS 8 « The net profit or loss of the period », from which the preferential dividends are deducted. If the result of the period is a loss, the preferential dividends engaged are added to the loss before the computation of the profit per share.

The result per basic share (**R/A-basis)** is computed by reporting the net profit of the financial year, according to the ordinary shares (PnAC), to the weight average of the circulating ordinary shares in that particular financial year (MpACc) :

R/A-basis = PnAC / MpAC

The net profit of the financial year corresponding to the ordinary shares (PnAC) is determined by deducting from the net result of the financial year (RnEx) the value of the preferential dividends afferent to the financial year (Dpref):

$$PnAC = RnEx - Dpref$$

The value of the preferential dividends contains: the dividends afferent to the non-cumulative preferential shares declared in that particular financial year, the dividends owed in that financial year, afferent to the cumulative preferential shares, no matter if these dividends have been declared or not.

The value of the preferential dividends afferent to the financial year does not include the value of the dividends afferent to the cumulative preferential shares, paid or declared in the current financial year for the previous financial years.

The weight average of the circulating ordinary shares in that particular financial year (MpACc) is determined as follows:

$$MpACc = (Si + AE - AR) \times FP$$

Where:

- Si = number of circulating ordinary shares at the beginning of the financial year
- AE = number of shares issued
- AR = number of paid off shares
- FP = ponderation factor: FP = NZc / NZt
- NZc = number of days when the shares circulated
- NZt = total number of days of the period

The moment of the inclusion of the ordinary shares in the computation of the weight average is determined by the specific clauses and conditions, associated to their issue, this being usually the date of their issue. The ordinary shares which are issued only when complying to certain conditions, called contingent *shares*, are considered circulating and are included in the computation of the result per share – basis from the date all the necessary conditions are complied with.

The weight average of the circulating shares is adjusted in case of some events (others than the conversion of the potential ordinary shares) which have changed the number of the circulating ordinary shares, without determining an appropriate change in the size of resources. Such events are: a capitalization or an issue of free shares; a diminishing of the nominal value of the shares; an annulment of the diminishing of the nominal value of the shares; facilities in the case of the issue of subscription rights. The adjustment is made both for the weight average of the particular financial year as well as for the weight averages computed for all the periods presented in the financial statements.

Result per share – diluted (R/A-diluted)

When the enterprise has a complex structure of the capital, there occurs the necessity to reflect it in the financial statements, along the information regarding the result per share – basis and the information regarding the result per share – diluted.

The result per share diluted is computed to provide the users of the financial statements an indication regarding the way in which the profit per share would evolve if certain plans to attract the capital or to make the employees loyal based on the potential issue of the ordinary shares materialised in the reporting period.

In order to compute the result per share diluted, the net profit assigned to the ordinary shares (**PnAC)** and the weight average of the circulating shares in a certain period must be adjusted for the diluting effect of all the *potential ordinary shares: debentures and preferential shares convertible into ordinary shares, warranties and options, plans for the employees* which allow them to receive ordinary shares as part of their remuneration, shares which are issued only after the compliance with certain conditions resulting from the contracting clauses.

It is adjusted with the influences of all *the potential ordinary shares* considered *diluting*. The potential ordinary shares are considered *diluting* when their conversion into ordinary shares leads to the lowering of the value of the net result per share indicator. Otherwise, when the conversion of the potential ordinary shares ahs the effect the increasing of the value of the result per share indicator, these are considered *anti-diluting* shares and are not taken into consideration for adjustment. The value of the net profit or of the net loss afferent to the financial year, corresponding to the ordinary shares is adjusted by the influence of taxation, too determined by the conversion of the diluting potential ordinary shares.

Relation of calculus:

R/A-diluted = (PnAC+Dob+DivEn̩)± / (MpACc +MpACs)

To compute the result per share-diluted, the net profit corresponding to the ordinary shares will be majored with the net interests:

- **Dob - Interest** – the gross value corrected with the tax on profit afferent to the potential ordinary shares (such as, for example, the shares convertible into ordinary shares)
- **Div** – the dividends to be due on the preferential shares
- Adjusted with̩ ±:
- **En =** other net elements (revenues or expenditure consisting in fees, discounts, bonuses etc.) which would have not affected the result of the financial year afferent to the ordinary shares if potential ordinary shares had not been issued, thus establishing the *diluted result.*

The weight average of the circulating ordinary shares will be majored with the weight average of the supplementary ordinary shares which would result from the conversion of all the potential ordinary shares.

We state that the potential ordinary shares which have been transformed into ordinary shares during the financial year are taken into consideration for the result per share – diluted from the beginning of the financial year to the date of conversion. It is obvious that, from this date on to the end of the financial year, the shares obtained through conversion being ordinary shares are taken into consideration both for the result per share – basic indicator as well as for the result per share – diluted indicator.

Example of computation of the result per share – basic and of the result per share – diluted

To demonstrate the way to compute the two indicators the following example is provided:

In the financial year N-1 two issues of convertible debentures have been made, that is:

- 3,000 convertible debentures, nominal value 100 lei/title, interest rate, 2%, each debenture can be converted into an ordinary share (1/1);
- 2,000 convertible debentures, nominal value 150 lei/title, interest rate 1%, each debenture can be converted into to ordinary shares (2/1).

In the financial year N-1 there were in circulation: 50,000 convertible debentures issued in the *financial year N-2* in the following conditions: the nominal value 120 lei/title, interest rate 1%, 100 debentures can be converted into 120 ordinary shares. (120/100)

At the beginning of the financial year N the company "X" has:

- 350,000 circulating shares out of which: 10,000 preferential shares. The dividend on the referential share was set up at 2 lei/title.
- Each preferential share (10,000) is convertible into 1.5 ordinary shares (1.5/1).

During the financial year N the following operations take place:

- on 10 April the company issued: 100,000 new ordinary shares.
- on 20 June the conversion was made into ordinary shares of 40,000 convertible debentures which have been issued in the financial year N-2. As a result, the company issued 48,000 new ordinary shares (40,000 x 120/100).
- on 30 October the company paid off 88,000 circulating ordinary shares.

The net result of the financial year N is of 950,000 lei, the tax quota per profit 16%.

The company declared 150,000 lei the dividends for the financial year N, out of which 20,000 lei for the preferential shares.

a) Determining the result per share – basic:

Computation of the net profit afferent to the ordinary shares (PnAC):

Net profit of the financial year 950,000 lei

- Dividends afferent to preferential shares - 20,000 lei

Net profit afferent to ordinary shares (PnAC) = 930,000 lei

Computation of the weight average of circulating ordinary shares (MpACc):

Date	Circulating period	Explanations	Shares issued	Shares paid off	Circulating shares	Ponderation factor FP
01.01.N	01.01-10.04	Si (360.000 –10.000)	340,000		340,000	100/365
10.04.N	11.04-20.06	Share issue	100,000		440,000	71/365
20.06.N	21.06-30.10	Debenture conversion	48,000		488,000	132/365
30.10.N	31.10-31.12	Own share pay off		88,000	400,000	62/365
31.12.N		**Total / Final balance**	**488,000**	**88,000**	**400,000**	

MpACc = (340,000 x 100/365) + (440,000 x 71/365) + (488,000 x 132/365) + (400,000 x 62/365) = 93,151+ 85,589 + 176,482 + 67,945 = **423,167 shares**

Result per share basic:

R/A-basic = R/A-basic = PnAC / MpACc = 930,000 lei / 423,167 shares = 2.20 lei/share

b) Determining the result per share – diluted:

Computation of diluted result:

Net profit afferent to ordinary shares (PnAC) 930,000 lei

Dob Interest afferent to convertible debentures, total **+ 43,356 lei**

out of which: 3,000 titles x 100 lei / title x 2% 6,000 lei

2,000 titles x 150 lei / title x 1% 3,000 lei

40,000 titles x 120 lei / title x 1% x <u>170/365</u> 22,356 lei

10,000 titles x 120 lei / title x 1% 12,000 lei

En : Afferent tax on profit (43,356 x 16%) **- 6,937 lei**

Dividends afferent to preferential shares (10,000 x 2) **+ 20,000 lei**

Diluted result (PnAC+Dob+Div+En) 986,419 lei

Computation of weight average of circulating and supplementary ordinary shares:

Explanations	Number of ordinary shares
MpACc	**423,167**
Convertible debentures	3,000 x 1 / 1 = 3,000
Convertible debentures	2,000 x 2 / 1 = 4,000
Convertible debentures, up to 20,06.N	(40,000 x 120 / 100) x 170 / 365 =22,356
Convertible debentures	10,000 x 120 /100 = 12,000
Preferential shares	10,000 x 1.5 / 1 = 15,000
Total (MpACc + MpACs)	**479,523**

Result per share diluted:

R/A-diluted = (PnAC+Dob+Diy ±:En) / (MpACc +MpACs)
= 986,419 lei / 479,523 titles = 2.06 lei/title

Conclusions

The stock exchange rate of the share represents the barometer of the global performance of an enterprise, officially recognised by the public on the capita market. But the variation of the stock exchange price is determined not only by the evolution of the economic – financial results of the enterprise, but also by the investors' expectations referring to its development possibilities, the evolution and the perspectives of the sector where the firm runs its activity, as well as the national and international economic tendencies. The most important factor setting up the price of a share is the ratio between the supply and demand on the capital market.

It has been noted that some stock exchange indices, regarding the level of action, have strongly influenced the stock exchange rate. This fact demonstrates the reduced relevance of the traditional financial rates when adopting the decisions to invest-disinvest as a result of the low quality of the financial-accounting information, the issuers' lack of transparency, the delay in providing information to the investors or simply, the existence of other strong motivations to purchase some apparently unprofitable firms by important investors.

The stock exchange indices had in view, listed at the Bucharest Stock Exchange re the following:

- PER = rate stock exchange price / to profit per share (it would represent how many years you have to wait to cover the price paid for a share from the afferent profit)
- P / BV = rate stock exchange price / accounting value per share (it shows what price the investors set for the company's assets)
- DIV = (dividend / price)x100 - the output of dividends (it shows what percentage of the price of a share the dividend that it brings represents and it is always compared to the term interests)
- P/S = rate stock exchange price / sales per share
- Stock exchange capitalization (it is the market value of a quoted company and it is obtained by multiplying the total number of shares issued with the stock exchange price of a share)
- EPS = net profit per share

The result per share, computed in the financial statements, arranged or not, can influence the exchange rate of the shares quoted on the Stock Exchange, but many times either they are more important in the investors' choice for the company's policy, the quality of the management, the company's assets, the policy of debts, cash, commercial fund, dividend policy, the quality of the shareholders, the development policy etc.

ABSTRACT: In elaborating the paper, we started from the idea of the necessity of knowing the reasons that determined the reconsideration of the importance of accounting information, in order to ensure survival, performance and durability of businesses in the context of the new challenges launched by the world economy. Continuous adjustments that influence companies impose the necessity of reassessment of accounting information as a management instrument, to determine the situation, to notice the opportunities and risks derived from the company's overall policy, to observe strengths and weaknesses, to make adequate decisions in time and, more than that, to control the results obtained. Finally, we concluded that the difficulty of reflection of operations generated by the phenomenon of the sustained development of organizations determined reconsideration of financial-accounting information systems and generated new terms such as: knowledge management, knowledge transfer, knowledge sharing and knowledge organizations.

KEY WORDS: Knowledge based organization, Accounting information, Management Information System, Knowledge management

Introduction - Accounting Information in the Knowledge Based Economy

During the last centuries, we have witnessed a series of changes which characterize the evolution of human society, the transition to a new economy – the knowledge based economy. This transition materialized at international level in the following main phenomena and processes: the globalization of the material and immaterial exchange flows (financial and informational) doubled by the regional integration and at national level by reviving the interest of the states for the sustainable development, regarded under the three defining aspects (economic, ecological, social).

Richness and power will result mainly from the intangible sources, from information. The information becomes the main element for obtaining high productivity and for the competitiveness of the companies, economic branches, national economies and the world economy on the whole.

The present world has been for over a century in a period of increase of the information flow. Many successful business activities were based on acquiring knowledge, on informational capital, but only recently did the entire reconfiguration of the information itself change the economy on the whole. At enterprise level, there is a significant mutation as a result of increasing the importance of the intangible. The organization as a system has the handling of the resources as its objective and implicitly involves information. In order to ensure the handling of the resources, these have to be measured, evaluated, and the means at hand is the information. The information is indispensable to the functioning of any organization, as it allows the achievement of the aims in view.

1. Can Accounting Information Be Assessed and Recognized Through the Added Value It Creates, As an Intangible Asset in Knowledge Based Organizations?

In the context of passing to the knowledge-based economy, intangible goods acquire greater and greater importance, but the importance of accounting information for the knowledge-based organizations cannot be ignored. As long as this meets the quality characteristics it generates added value for the commercial partnership which uses it. Then can we integrate the accounting information into the intangible assets?

The international accounting standard IAS 38 – Intangible assets – identifies the intangible assets as being identifiable non-monetary assets, controlled by the enterprise as a result of some previous events ", the existence of the possibility that the partnership gets "future economic benefits which can be attributed to the respective assets", and the cost of the assets to be measured correctly". But these criteria are met by very few intangible elements which make up the intellectual capital. The result is that most of the intangibles acquired through transactions are registered as assets, while the similar elements produced internally are registered as expenses of the period. Even more, because the existence of the intangible resources is difficult to check, they could be used to operate or even to manipulate the result.

Even if many researches demonstrate the importance of accounting information for creating added value, there still remains the problem of its evaluation. Can there be developed an evaluation pattern which allows the comparability of the commercial partnerships?

In the present-day economy, the element which can be most easily evaluated is cash. However, cash cannot represent the measure for anything any longer. Consequently, the management of accounting information requires the development of new methods that allow the delimitation of this notion. Among the approaches used, there can be distinguished those which adopt a purely quantitative point of view and find the justification in a financial accounting prospect and those which adopt a qualitative point of view and aim to create some devices for the enterprise.

A solution to this problem would be the use of the method called "benchmarking", through which the activity in the current year is compared to that in the previous year and with the competitors', in this way the intangible assets become visible and can be measured. However, none of the existing methods can measure exactly the weight and the flow of accounting information necessary for a competitive management of the commercial partnerships.

In his paper, Methods for Measuring Intangible Assets (Sveiby K, 2001), Karl Sveiby suggests a grouping of the evaluation methods of the intangible assets met in practice in: direct methods of assessing the intellectual capital, assessment methods based on the market capitalization, assessment methods based on the rate of return of the assets and assessment methods based on the balance score card.

Quantifying the information remains a problem open to the analysis of the professional accountants because of lack of standardization of most of the indicators used in the patterns of evaluation. The non-standardization of the indicators appears because in most cases, the existing evaluation patterns are made for a certain commercial partnership and thus they are influenced by the specific conditions of the partnership analyzed, not being representative for the whole partnership.

The information does not carry value in itself; its value derives from the change value in the decision-making behaviour from which the costs of producing information are obviously deducted. The present tendency is to have at one's disposal more information at one's disposal, particularly more up-to-date, but an item of information can be better only if this implies positive results of the decision-making process, in other conditions the information does not have value. Only after the communication and the interpretation through understanding of the data by their receiver, together with their transformation in information can there appears value, by using the information for intensifying the decision-making process.

The organization and the management of accountability is an obligation of the legal person within the market economy and represent a device of economic-financial knowledge. In all the organizations, especially in the small and medium-sized organizations, the operations are very rarely directly observed. These wait for making decisions, the preparation of plans and activity control. By using the information that can be obtained from the formal sources – for example from the MIS of the enterprise – or from informal sources, like direct discussions, phone calls, social contacts etc.

2. AIS (Accounting Information System) - Power Instrument for Advanced Management in Knowledge Based Organizations

The new challenges set on company management have led to an awareness of the necessity and importance of information in insuring the survival, performance and endurance of knowledge organizations. The difficulty in reverberating operations generated by the companies' continuous development phenomenon have generated the rethinking of their financial information systems and generated new terms such as: knowledge management, knowledge transfer, knowledge sharing and knowledge organizations. The continuous developments of large companies and industrial groups have determined a rise in information complexity. All of these alterations in the world economy impose the need for **designing an accounting information system adapted to knowledge organizations**, to ascertain the knowledge's organizations true status, reveal the opportunities and risks relevant to the knowledge organizations policy, to indicate the strengths and weaknesses, so that adequate decisions can be made at the right time, and more so, that the effects obtained from all this may be controlled.

The system proposed answers concrete questions regarding the need for information manifesting itself within the knowledge organizations, primarily destined for the decision factors that can influence the knowledge's organizations policy. In elaborating the system, we started at the need for knowing the causes which have determined the apparition of knowledge organizations, defining the group types and the relationships which may appear within the knowledge organizations.

Following this step, we established requirements for efficient operations, signaling possible restrictions which may turn up in the accounting information system's operation, named the information flows, defined WHAT?, HOW?, WITH WHAT? or WITH WHOM?, WHAT ARE THE RESULTS? of each system and who the final users of the information furnished by the two subsystems developed are. Concerning system requirements, we considered that it must provide a true view of the patrimony of the entire knowledge organizations, provide information in expedient time – for efficient management, and to be in accordance with the requirements imposed by the IAS/ IFRS. Regarding the restrictions which may occur in system operation, we defined restrictions generated by the evolution of the operation perimeter in time, legislative restrictions, fiscal restrictions, and last but not least, accounting information internal administration restrictions.

The evaluation and the recognition of the accounting information (as demonstrated in the first chapter) in financial statements ask specific evaluation models adapted for knowledge based organizations and further these organizations appear as a succession of companies' consolidation, in most of the cases. So, we defined the accounting information subsystem used for obtaining financial statements in accordance with IAS/IFRS, named the entries, the processing/consolidation algorithm, as well as the system exits.

We defined the accounting information subsystem for obtaining supplementary statements – **complementary information tools for advanced management in knowledge based organizations**. To this end, we defined the subsystem's objectives, the entries in the subsystem, named the financial information's processing and consolidation algorithms, defined the resources (material, technical and human) used in the processing/consolidation process and inventoried the exits from the subsystem.

The designed accounting information system's objective is creating a direct and on time bi-directional link between the two systems: operational and decision:

- operational – The accounting information subsystem for obtaining annual financial statements in accordance with IAS/IFRS,

Figure no. 1. Information processing scheme within the accounting information subsystem for obtaining financial reports, in accordance with IAS - IFRS

ENTRIES IN THE SUBSYSTEM	The balance sheet of every entity within the group	1. Reconsidering and adjusting the individual financial statements of the consolidated companies; the assessing of the accounting information, the application of accounting information which must permit the comparability between, evaluation method which allows the comparability of the commercial partnerships.	Consolidated balance sheet	**SUBSYSTEM EXITS**
	Profit and loss account for every entity within the group	2. Taking over and cumulating the elements within the financial statements of the companies which define the group.	Consolidated profit and loss account	

Shareholders equity variations for each entity within the group	3. Eliminating the mutual accounts and operations, as well as the internal results. 4. Eliminating the mutual accounts and operations, as well as the internal results.	Consolidated shareholders' equity variations status
Treasury funds flow panel for each company within the group	5. Eliminating the participation titles and allotment of shareholders' equity	Consolidated treasury flows panel
Accounting policy and explanatory notes for each entity within the group	**6. The information processing and consolidation algorithm according to IAS - IFRS**	Accounting policy and explanatory notes

– decision – The accounting information subsystem for obtaining supplementary statements, as complementary information tools for advanced management in knowledge based organizations.

Figure no. 2. Information processing scheme within the accounting information subsystem for obtaining complementary information tools for advanced management in knowledge based organizations

ENTRIES IN THE SUBSYSTEM		**SUBSYSTEM EXITS**
Current information required	1. Determining the mother company and the subsidiaries, determining the information holders	Daily dashboards
	2. Defining the time, company and participation percentage indicators (ID)	
	3. Exporting the transaction files which will be put up for consolidation by the subsidiaries	Recurrent dashboards: monthly quarterly biannual annual
Recurrent information required	4. Converting the information supplied by the foreign companies	
	5. Testing the information (packs) supplied by subsidiaries, made from ID indicators, measures and transaction files	Special notices (according to the events with significant impact on the group)
	6. Importing information by the mother company with data storage programs "data mart" and "data warehouse"	
Special information required	7. Processing the information imported by the mother company on the data mining system	Other reports predefined by the system
	8. Generating the dashboards, reports and notifications	
	9. Processing algorithms for the financial information **for the knowledge's based organizations management**	

Conclusions

New challenges given to company management have lead to the realizing of the need for and importance of information with the purpose of ensuring survival, performance and durability of groups. The difficulty of reflecting operations generated by the continuous development phenomenon of societies, has determined the reconsideration of financial information systems and generated new terms, such as: knowledge management, knowledge transfer, knowledge sharing and knowledge organizations. The continuous development of large companies and industrial groups has determined the growth in the degree of complexity of the information.

All of these alterations in world economy have imposed the need to project **an accounting-information system adapted to knowledge organization,** which:

a) shows the actual situation,

b) notifies the opportunities and risks related to knowledge organizations policy,

c) shows the strengths and weaknesses,

d) makes adequate decisions in due time,

e) and even more so, controls the effects obtained.

Extremely important for the decision-making process is the understanding of the way in which the individuals evolve and process the information. The possibility of setting up decision-making patterns which take into account the changeable information and which process it, at lower cost and with a higher informational relevance for the users should also be taken into consideration.

Most managers agree that information is their most important value driver, the difficulty, however, is how to manage measure and report this important asset. Any organization has countless intangible and knowledge-based resources that can be combined in limitless ways to create value. The question is, which of these assets are most critical to achieving the strategic objectives and how can they be combined to produce the ever more important, sustainable, competitive advantage.

Our country's adhesion to European Union brought numerous new specific elements to Romanian fiscality and accountancy. Among these, one extremely important is represented by the appearance of new operations in the value added tax sphere, respective of intra-communitarian deliveries and acquisitions operations.

The present study will try to emphasize the most important aspects concerning fiscal and accounting treatments afferent to value added tax for intra-communitarian acquisition operations.

Key words: intra-communitarian acquisition, registration with VAT purpose, intra-communitarian acquisition place, reversed taxing.

Concurrent to Romania's adhesion to European structures, certain legislative changes appeared in what the trade with EU member states is concerned. Thus, in what the imports from EU member states are concerned, these received a new name, the one of *intra-communitarian acquisition.* These operations refer both to goods with communitarian origin character (meaning those who were produced in an EU member state country) as well as those that were produced in a tertiary state (for instance USA, Japan), but to whom free circulation in EU was given, moment when the customs taxes were paid and it obtained communitarian character.

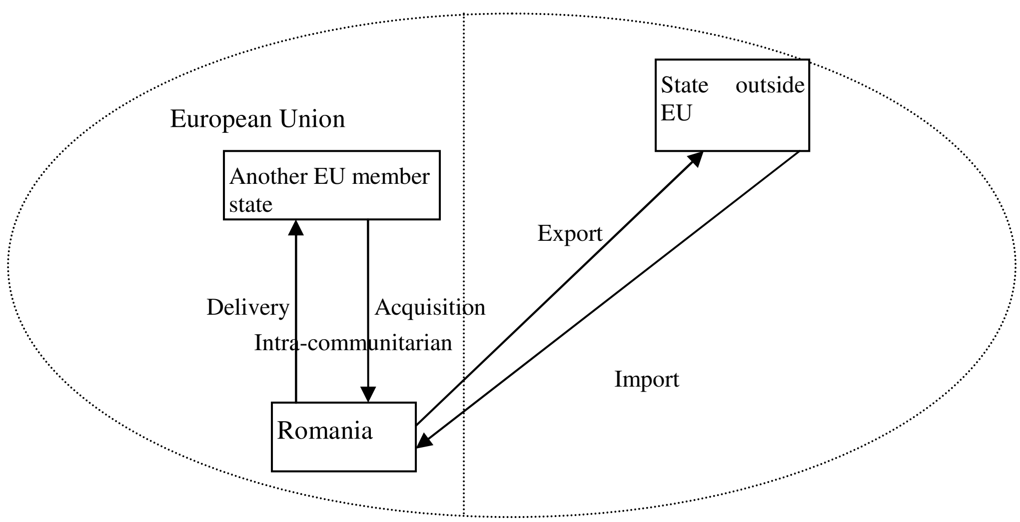

Fig.1. Romanian foreign trade's reorganization in the frame of adhesion to EU

Fiscal elements concerning the VAT afferent to intra-communitarian acquisitions

The most important consequences brought by our country's adhesion to EU, consequences with direct effect upon VAT regime applicable to Romania, are represented by:

- the relaxation of customs formalities afferent to economic relations among taxable entities that belong to different member states;

- operations generated by trade activity between EU member sates are split, in VAT purposes, in two operations:
- intra-communitarian deliveries;
- intra-communitarian acquisition;
- reversed tax principle appliance, that requires the tax effectuation in the destination member state.

It is considered intra-communitarian acquisition the obtaining of the right to dispose, as owner, of corporal mobile goods dispatched or transported to the destination indicated by the purchaser, by the supplier or by another person in the supplier's or purchaser's account, by a member state other than the departure of the goods' transport or dispatch place.

Registration in VAT purposes

The importance of correct and on time registration in VAT purposes and of exact identification of the persons obliged to register in VAT purposes is more evident in the frame of intra-communitarian transactions.

The code for registration in VAT purposes represents the code given by competent authorities from Romania to persons that have the obligation to register or to have a registration similar code given by competent authorities from another member state. The VAT code is a crucial instrument for intra-communitarian transactions' control by the quarterly "reviewing declaration", compulsory by VAT information exchange system, the VIES that allows a crossed checking for intra-communitarian acquisitions. Therefore, when an intra-communitarian delivery is reported in Romania, it will be possible to check the supplier that has reported the intra-communitarian delivery, respective whether it has a valid number given in VAT purposes in his own member state and whether the operation is declared in the respective state.

According to Fiscal Code, in Romania, the taxable entity that is not registered and does not have the obligation to register and the juridical non-taxable entity that intends to perform an intra-communitarian acquisition in Romania, has the obligation of asking for registering in VAT purposes, before the intra-communitarian acquisition's performance, if the value of that intra-communitarian acquisition surpasses the level for intra-communitarian acquisitions in the calendar year when the intra-communitarian acquisition takes place. The ceiling for intra-communitarian acquisitions is of 10.000 Euro. Also, the fiscal organ may register by fact an obliged person, if this person does not ask for benevolent registration; this registration may be cancelled afterwards if the intra-communitarian acquisition's value does not surpass the mentioned level.

For the intra-communitarian acquisitions of new means of transport effectuate by persons that are not registered in VAT purposes, the purchaser does not have to register according to 153^1 article for intra-communitarian acquisition, but it will deposit a special VAT declaration for tax payment. The same procedure is applied for intra-communitarian acquisition of excises products realized by taxable entities and non-taxable juridical persons, not registered in VAT purposes.

The intra-communitarian acquisition's place

In what the intra-communitarian acquisition's place is concerned, it can be represented by:

- the place where goods can be found in the moment when the expedition or transport of the goods takes place;
- the member state that issued the registration code if a registration code is transmitted in VAT purposes, issued by another state than the one where the acquisition takes place.

It is important to be mentioned that, if the intra-communitarian acquisition was submitted to VAT in the member state where the transport ends also, but not in the member state that communicated a VAT number too, the tax basis is reduced according to the member state that communicated a VAT number.

For a better understanding, there will be presented in what follows three examples where a series of possible situations generated by intra-communitarian acquisition territory is emphasized.

Case 1

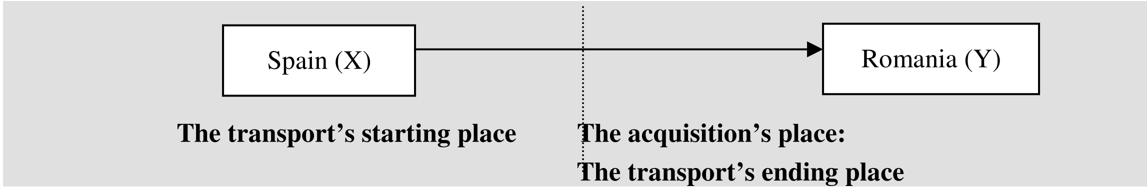

Fig.2. Intra-communitarian acquisition Romania-Spain

In the present example it is considered that the X firm is of Spanish origin, and the Y one Romanian. Romania realizes therefore an intra-communitarian goods acquisition, the starting and the delivery transport's place being Spain. The intra-communitarian goods acquisition's place is Romania, forasmuch, according to 132 article (1st) paragraph from the Fiscal Code, the intra-communitarian acquisition's place is the one where the goods are found in the moment when the transport ends.

Case 2

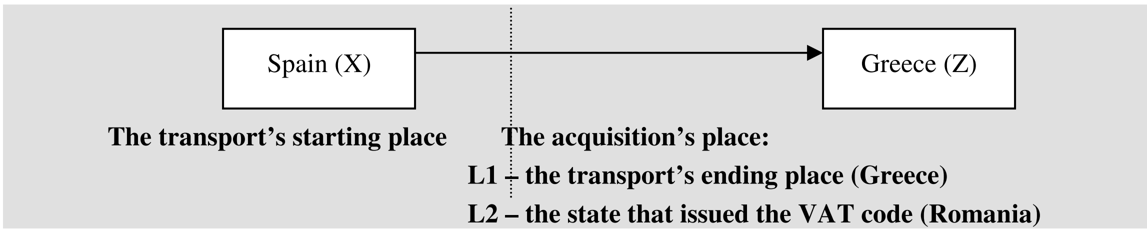

Fig.3. Intra-communitarian acquisition Greece-Spain

In the example presented above, Z, Romanian origin person, communicates to X its VAT code issued in Romania, not yet registered in Greece, intra-communitarian acquisition being therefore submitted to VAT both in Greece, as place where the transport concludes, and in Romania, as member state where the Vat code was communicated. But, according to Fiscal Code, it follows that the tax basis to be reduced as appropriate.

Case 3

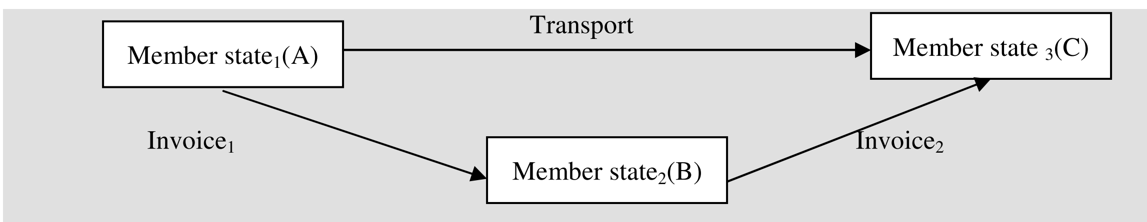

Fig.4.Triangle operation

It is noticed that it deals with the triangle operation where A is the supplier, B is the purchaser - re-seller and C is the delivery's final beneficiary.

In this above presented example three taxable entities are emphasized from three different member states, as follows: in the member state 1 (MS 1), A represents the supplier, in the member state 2 (MS 2), B represents the purchaser that re-sells and in the member state 3 (MS 3), meaning Romania, C represents the final beneficiary. As it can be noticed, two sales take place, the first sale is made by A in B's favor, and the second is made by B to C, in other words, the goods acquisition is realized by SM 2 for a subsequent delivery on Romania's territory. The transport takes place directly from the 1st member state in Romania. C will have to mention this acquisition in "intra-communitarian acquisition" from its VAT declaration and it has to apply the reversed taxing. Also, it has to rapport the local delivery in the reviewing declaration for intra-communitarian acquisitions in Romania.

Value added tax accountancy afferent to intra-communitarian acquisitions operations

The basic rule foresees that the VAT is paid in the destination state. The client, Romanian person registered in VAT purposes, will calculate and register the VAT by applying the reversed taxing mechanism. The registered person is obliged to communicate the supplier's the registration code and to deposit special VAT declaration (the form 301). Therefore, the Romanian person will register the VAT afferent to intra-communitarian acquisition, both as collective and deductive VAT in the same declaration. An effective VAT payment will not be realized towards fiscal organs.

In special cases, more exactly when the invoice was not issued by the supplier up to the 15th of the month following to tax generating fact a self-invoice is issued by purchaser.

In what the foreign currency exchange is concerned, we mention that for determining the lei value of VAT afferent to intra-communitarian acquisitions, the exchange rate communicated by National Bank of Romania will be used, by means of which the deductions from the dates will be realized:

a) extern invoice issuing, if the invoice was issued the latest on the 15th of the month following the producing of the generator fact (usually, delivery) or
b) self-invoice issuing, meaning the 15th of the month following the month when the generator aspect intervened, in the situation when the intra-communitarian partner has not issued the invoice up to that date.

In what follows, few examples accountancy operations of intra-communitarian acquisitions will be presented:

Case I

S.C. „Y” S.A., a VAT taxable society from Romania purchases from “X” society from Spain, a VAT taxable society, raw material in value of 8.000 Euro, at an exchange rate of 3,6 lei/Euro:

Raw materials	**=**	***Suppliers***	***28.800 lei***
Input VAT	**=**	***Output VAT***	***5.472 lei***

Case II

S.C. „V” S.A., a VAT non-taxable society from Romania purchases from “X” society from Spain, a VAT taxable society, raw material in value of 5.000 Euro, at an exchange rate of 3,6 lei/Euro. In this situation, the society from Spain will issue an invoice that includes also the VAT (16%):

Raw materials	**=**	***Suppliers***	***20.880 lei***

Case III

S.C. „P” S.A., a VAT non-taxable society from Romania purchases from “X” society from Spain, a VAT taxable society, raw material in value of 12.000 Euro, at an exchange rate of 3,6 lei/Euro. Because the acquisition surpasses the 10.000 Euro level, S.C. „P” S.A. has to register as VAT taxable for intra-communitarian acquisition and has to pay the VAT afferent to this transaction through special declaration:

Raw materials	**=**	***Suppliers***	***43.200 lei***
Raw materials	**=**	***VAT payable***	***8.208 lei***

Case IV

S.C. „Q” S.A., a VAT non-taxable society from Romania, but registered in VAT purposes for intra-communitarian acquisitions in Italy, purchases from “X” society from Spain, a VAT taxable society, raw material in value of 1.000 Euro, at an exchange rate of 3,6 lei/Euro. The customer is registered for intra-communitarian acquisitions and communicates this code to the supplier. SC “Q” S.A. makes an intra-communitarian acquisition taxable in Italy, for which he pays VAT based on special VAT declaration of the Italian state (VAT - 20%):

Raw materials	**=**	***Suppliers***	***3.600 lei***

Raw materials	**=**	***Other taxes and similar liabilities (VAT payable)***	***720 lei***

Other aspects concerning the intra-communitarian acquisitions

Intra-communitarian acquisitions will be enclosed in a reviewing declaration that will have to be handed in quarterly by firms registered with VAT purposes. The information from these reviewing declarations are transferred to VIES (VAT International Exchange System represents an electronic system that controls goods movement inside EU) and therefore the Member States may realize the checking of the realized operations. Fore instance, when an intra-communitarian acquisition in Romania is reported, the supplier that reported the intra-communitarian delivery is possible to be checked, respective whether it has a valuable number given in VAT purposes in its Member State and if the operation is declared in the respective state.

The elimination of customs formalities imposed the implementation of statistic system INTRASTAT, that supposes the filling in of Intrastat statistic declarations, a simplified variant of customs declarations filled in prior to Romania adhesion's to EU date. This statistic system was created and developed for collecting information directly from the firms that realizes trade activities with EU member states and it is functional from the 1st of January 1993 based on settlements that are applicable for all EU states.

The obligation for supplying statistic Intrastat data belongs to all economic operators that fulfill simultaneously the following conditions:

- are registered in VAT purposes, according to 153 article from Fiscal Code;
- realizes trade with goods from other EU member states;
- the turnover realized during the last 12 months, apart on the fluxes of introductions and dispatches surpasses a certain statistic threshold, that for introductions (intra-communitarian acquisitions) is of 300.000; (for intra-communitarian deliveries is 900.000).

The obligation of depositing Intrastat statistic declarations revives to economic operators that, even though have not reached the statistic threshold of excluding in anterior year (N-1), during the present year (N) they realize this thing. The economic operator will begin reporting statistic data starting with the month when it has reached/surpassed the exclusion threshold (for the previous months they do not report).

The economic agents that have the obligation of transmitting a "VAT Special Declaration" and that purchases goods from other EU member states, whose annual value is superior to statistic threshold, are, also, obliged to transmit the Intrastat declaration.

Intrastat Statistic Declaration (ISD) is monthly transmitted, in electronic form towards the NATIONAL INSTITUTE OF STATISTICS (NIS), until the 15th of every month (for instance: for the intra-communitarian acquisitions from January, ISD is transmitted until the 15th of February, the latest).

Under the conditions that for a certain period of time, an economic operator has not realized a transaction concerning goods movements for which is obliged to transmit ISD, then he should transmit to NIS a "NULL" declaration. This indicates the fact that the economic operator has not forgot to transmit the declaration and it will not be considered as non-respondent and the legal fines will not be applied.

The transactions that should be declared are the following:

- commercial transactions with goods that involve propriety transfer and are intended to utilization, consumption, investment or re-sale;
- movements of goods from one EU member state to another, without property transfer (for instance supply transfers, movements of goods before and after the processing, etc.);
- goods recasting;
- specific movements of goods.

CONTINUING PROFESSIONAL DEVELOPMENT – A CONCEPT AND REQUIERMENT FOR PROFESSIONAL ACCOUNTANTS

Botez Daniel

University of Bacau, Roumanie, Faculty of Economic Sciences, Bicaz, Neamt, str. Cozmitei nr. 2, danbotez@artelecom.net***, Tel. 0743826004***

IES 7 IFAC Standard prescribes that member bodies implement a continuing professional development (CPD) requirement as an integral component of a professional accountant's continued membership. Such a requirement contributes to the profession's objective of providing high-quality services to meet the needs of the public (including clients and employers).

This Standard introduces the concepts of continuing professional development as relevant, verifiable and measurable learning activities and outcomes.

Key words: continuing professional development, International Education Standards, professional accountants

Financial scandals that culminated with ENRON and WORLDCOM firms' bankruptcy provoked in USA the providing of some measures concerning the accountancy and audit. Sarbanes-Oxley law, published in July 2002, introduced public surveillance mechanisms of accountancy and audit firms, together with other measures due to assure an increased protection of investors by improving the honesty and safety of information published by the quoted companies.

On this basis, the international organism of professional accountants initiated a series of measures that have as main purpose the regaining of public's trust in the quality of services provided by its members.

Among these measures those initiated by The Committee for Education and finalized by publishing of International Education Standards for Professional Accountants (IES) may be found.

In October 2003, IFAC published the first six education standards (IES 1-6), whose stipulation foreseen, in essence, the following: the establishing of a conceptual frame of international standards for education; access requires in a professional education program (IES 1); the content of professional accountancy education syllabus (IES 2); professional skills (IES 3); the values concerning the ethics and professional behavior (IES 4); practical experience requires (IES 5); the professional capacities and competences assessment (IES 6).

In May 2004 followed the publication of International Standard of Education 7 (IES 7) entitled Continuing professional development: a permanent education program and continuous development of professional competence. The purpose of this standard is to offer references to member organisms in order for these to adopt an engagement concerning the organization of permanent compulsory education for professional accountants, as well of the resources of these programs, to establish for its members the development and maintenance conditions for professional competence, necessary for public interest protection and to monitor and assure the continuous development and maintenance of professional competence of professional accountants members.

The stipulations of this standard are based on the principle of professional individual accountant's responsibility for maintaining and development of professional competences necessary for providing high quality professional services to its clients, employees or other interested persons.

The attendance of the programs implemented by professional organisms concerning the continuous professional development constitutes an integrated part of the requires necessary for maintaining the member quality of each professional accountant.

We have proposed to present and comment upon some of this standard's settlements.

The member organisms should promote the importance of continuous professional competence improvement and should assume the obligation of continuous preparation for all professional member accountants.

Also, all professional accountants have the obligation to maintain and to develop the professional competence according to the nature of their missions and to the professional responsibility that it is presumed. This obligation concerns altogether all professional accountants, no matter whether they are involved in traditional missions of accountancy nature or in other missions.

The permanent education process starts early, in the same time with the general education, it continues with the study program designated to obtaining of the professional qualification and afterwards it is a part from each individual's professional carrier. The continuous professional training program is an expansion of education process that leads to qualification as a professional accountant. The professional knowledge, the abilities, the professional values, ethics and behavior are obtained on the basis of continuous training and are improved according to professional activities and responsibilities of each professional.

The professional organisms should facilitate their members the access to opportunities and resources concerning the continuous professional training and to assist the professionals during these activities.

Also, the professional organisms should require all the professionals the maintenance and development of relevant professional competence for missions that are exerted and in according to professional responsibilities that are engaged.

The continuous professional training program is applied to all professionals, no matter the activity sector where they work and the size of the business, because all professionals have professional ethics obligations, both for clients and for partners of professional cabinets of other interested persons, and have to prove their capacities of engaging the responsibilities in a competent manner. Also it has to be taken into consideration the involvement of all professional accountants, from all activity sectors, in the process of financial reporting, their assuming of responsibility for public and the maintenance of public's trust in professional services. The public is relaying on the good reputation of professional accountants.

More than that, all professional accountants should be aware of the fact that any lacking in competence or digression from professional ethics supposes a consequence upon their reputation and profession's importance, no matter the activity sector or the position where it works.

It should be brought under discussion the fact that all economy sectors met quick environment changes and, in consequence, have to adapt strategic business plans appealing to specific competences of professional accountants.

Professional accountants should evaluate the professional training activities and its results according to continuous professional training program' requires of the organism from where is a part. The continuous training activity may be measured in terms of effort or time, or by other recognized methods that evaluates the competences acquired or developed.

This standard is also based on the principle that a certain part of the preparation activities may be checked. This supposes that the professional training may be checked in an objective manner by a competent source. The other activities of the professional may be evaluated but not necessary verified. For this, the professionals are obliged to keep all the files and documents concerning the continuous professional training, hereby, at professional organisms' request, to be able to provide sufficient elements in order to prove the conformity to the professional organism requires.

The aim of the continuing professional development is to assist the professional accountants in developing the professional competence with the purpose of providing high quality services with the purpose of satisfying the public interest. The achieving of this aim and the fulfillment of the continuous professional training's requires may be made by three different procedures:

- The intercession based on entries, by establishing a specific number of activities as being adequate with the maintenance and developing of professional competence.

This intercession supposes that the professional organisms to solicit to their members to respect the following preparation rigors:

- To attend at least 120 hours or its equivalent during the professional training activity for each three years period, from which 60 hours of its equivalent in preparation units, to be ascertainable;
- To attend at least 20 hours or its equivalent each year;
- The training activities' evaluation procedures and methods should satisfy the above mentioned requires.

The trials that the professionals may use for checking procedure are the following:

- Courses decks, technique materials;
- Attendance dossiers, enrollment papers or confirmation papers from the organizers of the continuous professional training activity;
- The independent evaluation of the attended training activity;
- The confirmation from a lecturer or program organizer;
- The confirmation for a partner of cabinet about the attendance to internal professional training program.

The intercession based on exits, with the require that the professional accountant to prove, by the procedures that he/she followed, that the professional competence was maintained and developed.

This supposes that the professional organisms would require from the professionals to prove the maintenance and development of the necessary competence by periodic presenting of proves, concerning:

- That have made the object of a checking form a competent source ;
- That a recognized evaluation method was used.

Concerning this intercession, the following may be considered as proves:

- Verification of the obtained training or of the resulted performance;
- Evaluation on the basis of papers or materials published or reviewed;
- Publishing of articles as result of research programs;
- Periodical reexamination;
- Obtained professional qualifications (specializations or other qualifications);
- Activity consigned by objective verification, with reference to external qualification route;
- Qualification routes applied by professional organisms, others than the self-assessment and evidence supply;
- Evaluation objectives that should certify the preparation procedures from the partners of professional cabinets or of the organizers of training programs.

The combined intercession, which is realized by the effective and efficient combination of the two above mentioned intercessions, establishing a number of compulsory activities and the evaluation method of the obtained competences by other procedures.

The professional organisms should establish systematic procedures to monitor the manner in which the professional accountants fulfill the professional continuous training requires and to establish corresponding sanctions for the digressions from these requires, including for reporting mistakes and for flows in maintaining and developing their competence.

In composition of monitor procedures, the professional organisms should take into consideration the members that have increased responsibilities against the public and to establish more rigorous procedures for them.

The monitor procedures may require that the professional accountant to satisfy periodically the following requires:

- To transmit a declaration concerning the manner in which they respected the ethical obligation concerning the maintenance of knowledge and abilities necessary to be competent;
- To hand in a declaration concerning the manner in which they respected the requires of continuous professional training; and/or
- To provide an evidence of professional training activities or of verification of competence maintenance and development.

Other monitor procedures may include:

- The audit of a sample among the professionals for verification of the conformity with the requires of continuous professional training;
- It may include the reviewing and evaluation of training plans or documents by means of practice inspection procedures; and/or

- To solicit to the partners of professional cabinets to include continuous professional training plans and systems to monitor it in their own programs of quality assurance.

In order to realize the maintenance and development requires of professional competence, the professionals may train themselves by different methods, such as:

- Courses, conferences, seminaries attendance;
- Self-training modules or training programs in the frame of the cabinet ;
- Publishing of papers in professional or university environment;
- The attendance at the technique committees;
- Teaching at courses or sessions of continuous professional training;
- The elaboration of official studies concerning the professional responsibilities;
- Active attendance to conferences, sessions, work groups;
- Writing articles, books on this field;
- Research activity, including the study of professional literature of specialty press, in order to put in practice the knowledge.

Concerning these activities it should be mentioned that a single repetitive activity cannot assure the requires of continuous professional training.

It also should be mentioned the aspect that the measure unit used in evaluation activity of performances is hour. As an alternative, the course hour may be used or its equivalent. In evaluation procedures, the time used for an activity, the units allocated to an activity by an organizer of continuous professional training or the units prescribed by a professional organism may also be taken under consideration.

LES ASPECTS COMPTABLES DES OPERATIONS DE RESTRUCTURATION PAR ACQUISITIONS ET FUSIONS

Résumé: Le processus de restructuration est devenu une composante majeure du processus de globalisation par suite de la dimension définitoire des restructurations corporatistes de pays développés, mais il a été et reste un phénomène d'intérêt majeur pour les sociétés en transition aussi. La création des marchés de capital, l'évolution des investissements étrangers, les processus de privatisation sont les composantes définitoires des typologies de restructuration. Dans ce contexte, les sociétés commerciales ont joué un rôle clé dans l'ouverture de nouveaux horizons, dans la capacité de s'adapter aux fortes transformations qui ont eu lieu dans une société dynamique, tout en contribuant au développement de l'économie nationale et de la société en général. Dans l'économie moderne, consolidée, les coordonnées majeures de la dynamique des entités sont instituées par des normes juridiques adéquates, qui prévoient que les entités peuvent concurrencer entre elles et entrer dans différents rapports de coopération et association.

Mots-clé: restructuration, entité économique, fusions, acquisition, analyse comptable

1. Introduction

Dépassant la sphère des stratégies et des typologies de restructuration, du point de vue des opérations concrètes de manifestation, les fusions et les acquisitions ont été les opérations leader du phénomène de restructuration. Vu l'évolution du marché mondiale, du marché européen des fusions et acquisitions basée sur une tendance croissante, le marché roumain a été lui aussi influencé, les **fusions et les acquisitions sont, en ce moment, des processus importants du développement, étant des opérations de restructuration dont le nombre et la dynamique est en évolution.** Le développement ou l'expansion d'une société peut se réaliser, par la croissance interne ou par la croissance externe, par des **fusions et acquisitions**. Ces modalités font partie de la stratégie générique choisie par le management dans la création de l'avantage compétitif nécessaire pour obtenir une rentabilité au moins au niveau de la moyenne de l'industrie dont la société fait partie.

Analysant le mécanisme de déroulement des opérations de restructuration et les arguments de leur réalisation, nous avons considéré que, à part les types et les formes et de fusion mentionnées dans le littérature de spécialité, nous pouvons réaliser une délimitation prenant en compte la structure de l'actionnariat avant la restructuration par la fusion. Nous trouvons donc deux catégories:

- les fusions dans lesquelles les sociétés participantes présentent des **liaisons financières antérieures à l'opération de fusion,** suite à des acquisitions par étapes, suivies par l'opération de fusion par absorption; cette opération est une **fusion simplifiée**;
- la fusion proprement dite a lieu, sans qu'il existe des opérations antérieures, préparatrices; **entre les sociétés participantes à la fusion n'existent pas de liaisons antérieures**, la **fusion étant dans ce cas pure**.

2. Restructuration par acquisitions

Partant des modalités juridiques de réalisation des opérations de restructuration -combinaison, restructuration - regroupement, nous avons essayé de surprendre les aspects comptables déterminés par le déroulement de ces opérations, concrétisées dans des fusions, dans des acquisitions et scissions.

Nous avons considéré important de délimiter les acquisitions de fusions à travers la notion de contrôle. Nous avons pris en discussion les situations suivantes: si l'opération de restructuration vise l'obtention d'un pourcentage de contrôle ou un partage du contrôle, soit un contrôle direct, soit un contrôle indirect, on est en présence d'une **restructuration financière** par une opération d'acquisition; si la restructuration implique une opération de fusion, on est en présence tant d'une **restructuration financière, que d'une restructuration opérationnelle**.

Tant dans le cas des acquisitions, que dans le cas des fusions, nous sommes en présence d'une **restructuration corporative**, du point de vue de l'entité résultant de la restructuration. Du point de vue de la structuration des transactions d'acquisitions et aussi du point de vue comptable, il est nécessaire de les traiter sur deux directions: acquisitions d'actifs et acquisitions d'actions et de les analyser et du point de vue de l'entité acheteuse, et du point de vue de l'entité vendeuse:

2.1. Acquisitions d'actifs et/ou passifs (dettes)

Du point de vue des opérations de restructuration, les acquisitions d'actifs (et passifs) entrent dans la sphère de la restructuration si l'acquisition ne suppose un transfert de liquidités par l'entité acquéreur en contrepartie des actifs (et passifs) reçus de l'entité cédante. Au cas où l'entité acquéreur les actifs (et les passifs) reçus fait un transfert de liquidités, sur le patrimoine de l'entité acquéreur interviennent les modifications suivantes: une augmentation de l'actif avec la prise des actifs transférés par l'entité cédante et aussi une diminution de l'actif avec les liquidités acquittées à l'entité cédante au cas où la valeur des actifs transférés serait supérieure à la valeur des passifs assumés, et dans la structure des passifs a lieu une augmentation des éléments de dettes. Chez l'entité cédante des actifs et/ou passifs sur les éléments d'actif intervient une diminution avec les actifs transférés et une entrée de liquidités et sur la partie de passif ont lieu une diminution des dettes. Dans notre opinion, de telles acquisitions ne représentent pas des opérations de restructuration, parce qu'aucune modification n'intervient dans le volume et/ou la structure du capital chez aucune des entités participantes à la transaction; nous considérons qu'il s'agit d'une transaction de vente-achat. Si l'entité A acquiert tous les actifs et/ou les dettes de l'entité B en contrepartie de quelques actions, ces opérations entrent, selon nous, dans la sphère de la restructuration, et les modifications qui interviennent dans la structure du patrimoine des deux entités sont:

a) chez l'entité acheteuse A

- prise des éléments d'actif de l'entité B qui fait l'apport des actifs:

Elém d'actif (2xx, 3xx, 4xx, 5xx)	=	456 *Décompte avec les actionnaires/associés visant le capital*	*Valeur des actifs transférés par B (**valeur comptable**, valeur de marché, valeur juste)*

- prise des éléments de passif de l'entité B qui fait l'apport des passifs:

456 *Décompte avec les actionnaires/associés visant le capital*	=	*Elém de passif* *(16x, 4xx, 5xx)*	*Valeur des passifs transférés par B (**valeur comptable**, valeur de marché, valeur juste)*

- si la valeur des actifs transférés > valeurs des passifs transférés, l'entité émet des actions pour rémunérer l'apport (l'apport net= total actif - total dettes):

456 *Décompte avec les actionnaires/associés visant le*	=	*1012* *Capital souscrit versé*	*Valeur des actifs transférés par B - valeur des passifs transférés par B*

capital			

De la sorte, chez l'entité acquéreur se produit une modification du volume et de la structure du capital social par l'acquisition des actifs et des passifs de l'entité cédante pour rémunérer les éléments transmis. L'entité acquéreur émet des actions vers l'entité cédante pour rémunérer l'apport. Si l'apport de l'entité cède est négatif, l'entité acquéreur n'émettra plus de nouvelles actions, donc des modifications n'interviennent pas, ni au niveau du volume, ni de la structure du capital. Le raisonnement de la prise d'un apport négatif est que les actifs reçus apporteront des importants bénéfices futurs et l'opération n'affecte le cash-flow- (les liquidités) de l'entité acquéreur.

Cette situation spéciale parait au cas où la **valeur des dettes assumées par** l'entité acheteuse (acquerrant) **serait supérieure à la valeur des actifs reçus.** Dans ces conditions, nous considérons que la différence (dettes > actifs) doit être traitée par l'entité acquéreur en tant que fond commercial ou comme une perte reportée; dans cette situation l'amission d'action n'a pas lieu.

2071 *Fond commercial positif*	=	456 *Décompte avec les actionnaires/associés visant le capital*	*Valeur des passifs transférés par B - valeur des actifs transférés par B*

ou

117 *Résultat reporté*	=	456 *Décompte avec les actionnaires/associés visant le capital*	*Valeur des passifs transférés par B - valeur des actifs transférés par B*

b) chez l'entité cédante B

- le transfert des éléments d'actif vers l'entité acquéreur A:

456 *Décompte avec les actionnaires/associés visant le capital*	=	*Elém d'actif* *(2xx, 3xx, 4xx, 5xx)*	*Valeur des actifs transférés (**valeur comptable**, valeur de marché, valeur juste)*

- transfert des éléments de passif (dettes) vers l'entité acquéreur A:

Elém de passif (16x, 4xx, 5xx)	=	456 *Décompte avec les actionnaires/associés visant le capital*	*Valeur des passifs transférés par B (**valeur comptable**, valeur de marché, valeur juste)*

- si la valeur des actifs transférés > la valeur des passifs transférés, l'entité recevait, pour l'apport transféré, des actions à l'entité acheteuse (acquérrant):

26x *Immobilisations financières*	=	456 *Décompte avec les actionnaires/associés visant le capital*	*Valeur des actifs transférés - valeur des passifs transférés*

Au cas où la valeur des dettes transférées vers l'entité acheteur serait supérieure à la valeur des actifs transférés, l'entité cédante enregistrera l'apport négatif transféré sur le compte du résultat reporté, sans recevoir quelque chose en échange de l'apport transféré. Dans ces conditions, nous considérons que la différence (dettes > actifs) enregistrée par l'entité acquéreur comme fond commercial, représente pour l'entité qui a apporté les éléments patrimoniaux, un profit reporté, qui, conformément aux dispositions du Code Fiscal, article 27, alinéas (3) lettre c), est considéré transfert imposable seulement si le transfert des actifs et des passifs suppose en contrepartie des titres de participation.

456 *Décompte avec les*	=	*117*	*Valeur des passifs transférés - valeur des actifs transférés*

actionnaires/associés visant le capital		*Résultat reporté*	

Chez l'entité cédante il n'y a pas de modification de volume et/ou structure du capital social par le transfert des actifs et des passifs, l'entité continue d'exister. Après l'apport d'actifs et de dettes peut avoir lieu une opération de dissolution de l'entité cédante et le partage du capital propre entre associés.

2.2. Acquisition d'une entité (acquisitions 100% des actions)

Du point de vue des opérations de restructuration, l'acquisition des entités entre dans la sphère de la restructuration, elle suppose une modification du volume et/ ou de la structure du capital de l'entité acquise. L'acquisition suppose un transfert de liquidités par l'entité acquéreur en contreparties des actions reçues de l'entité achetée (acquise). Les modifications qui interviennent dans le patrimoine de deux entités sont:

a) chez l'entité acquéreur A

- transfert de liquidités pour les actions acquises:

26x *Immobilisations financières*	=	*5121* *Comptes courants en banques en lei*	*Valeur d'acquisition des actions*

Chez l'entité acquéreur se produit une modification de la structure des éléments d'actif.

b) chez l'entité acquise B

Si l'acquisition de l'entité se fait après la création, du point de vue comptable il n'y a pas d'enregistrement, il se produit la modification de la structure analytique des actionnaires. Chez l'entité cédante il n'y a pas de modification du volume, mais de la structure du capital social par la cession d'actions/parts sociaux, l'entité continue à exister dans ses autres éléments patrimoniaux soient affectés. Apres cette cession d'actions/parts sociaux peut avoir lieu une opération de fusion absorption de l'entité cédant, celle-ci cessant son activité par dissolution sans liquidation; l'entité absorbante, initialement l'entité cessionnaire prend le patrimoine de l'entité déjà contrôlée. Du point de vue du contrôle exercée sur l'entité acquise cette opération de restructuration représente une **acquisition complète ou intégrale: contrôle de 100%, on parle de l'acquisition d'une affaire. Si le contrôle exclusif est exercé à partir du moment de la création d'une entité, les opérations suivantes ont lieu:**

- l'enregistrement de la participation de l'entité A dans le capital de l'entité B au moment de la création de l'entité B:

456 *Décompte avec les actionnaires/associés visant le capital* *(actionnaire - entité A)*	=	*1012* *Capital souscrit versé*	*Valeur nominale de l'action détenue par les actionnaires*

- enregistrements des opérations d'encaissement de la contra valeur des actions:

5121 *Comptes courants en banques en lei*	=	*Décompte avec les actionnaires/associés visant le capital* 456 *(nouvel actionnaire - entité A)*	*Valeurs des actions*

2.3. Acquisitions d'actions

L'acquisition d'action suppose une **opération de prise du contrôle.** En fonction du contrôle obtenu par l'acquisition, on peut identifier trois grandes catégories, dont l'une est celle ci-dessus, l'acquisition d'actions 100%. Les deux autres catégories sont:

a) **les acquisitions minoritaires**, où le contrôle de l'entité acquéreur vise entre 10 et 49% du nombre de votes de l'entité acquise;

b) **les acquisitions majoritaires**, le contrôle de l'entité acquéreur vise entre 50 et 99% du nombre de votes de l'entité acquise.

Du point de vue des opérations de restructuration, l'acquisition d'actions entre dans la sphère de la restructuration; elle suppose une modification du volume et/ou de la structure du capital de l'entité acquise. L'acquisition suppose un transfert de liquidités de l'entité acquerrant en contrepartie des actions reçues de l'entité acquise. Les modifications qui interviennent dans la structure du patrimoine des deux entités sont:

a) chez l'entité acquéreur A

- transfert de liquidités pour les actions acquises:

26x *Immobilisations financières*	=	*5121* *Comptes courants en banques en lei*	*Valeur d'acquisition des actions*

Chez l'entité acquéreur a lieu uniquement une modification de la structure des éléments d'actif.

b) chez l'entité cédant les actions B

Si une émission de nouvelles actions n'a pas lieu, et uniquement une modification dans la structure du capital, du point de vue comptable, l'opération d'acquisition n'engendre pas d'enregistrement comptable. Pour le cas de l'é1mission de nouvelles actions, il faut faire les enregistrements suivants:

- enregistrement de l'émission de nouvelles actions:

456 *Décompte avec les actionnaires/associés visant le capital* *(nouvel actionnaire - entité A)*	=	*%* *1012* *Capital souscrit versé* *1041* *Primes d'émission*	<u>*Valeur nominale des actions cédées*</u> *Valeur nominale des actions détenues par les anciens actionnaires* *Diff. entre le prix d'acquisition de nouvelles actions et la valeur nominale des anciennes actions*

- enregistrement de l'encaissement de la contre valeur des actions émises:

5121 *Comptes courants en banques en lei*	=	456 *Décompte avec les actionnaires/associés visant le capital* *(nouvel actionnaire - entité)*	Valeur des actions cédées

Chez l'entité cédante a lieu une modification de volume et/ou structure du capital social par l'émission d'action, tandis que chez l'entité acquéreur a lieu une modification de la structure des éléments d'actif. Des fois, l'acquisition ne vise pas un transfert de liquidités, mais d'actions, et on parle d'échange d'actions. Par conséquent, du point de vue comptable, les éléments patrimoniaux affectés aux deux entités sont les immobilisations financières et le capital.

2. Restructuration par fusions

Pour les fusions, nous avons considéré important, du point de vue comptable, d'identifier la relation financière entre les entités participantes. Nous avons donc analysé la fusion entre entités sous **contrôle distinct qui suppose que les entités sont** indépendantes, et l'opération supposerait une **fusion pure, réelle.** Nous avons inclus dans cette typologie seulement les transactions qui comprennent l'opération proprement dite, sans autres opérations antérieures, de préparation, telle l'acquisition d'actions/parts sociaux, pour obtenir un niveau du contrôle.

Si la fusion a lieu entre entités liées entre elles par des participations et se trouvant sous et un contrôle commun, nous avons analysé la fusion comme une fusion restreinte, une acquisition finale. Dans cette typologie des restructurations par fusion, nous avons inclus les fusions qui ont été préparées par des acquisitions d'actions/parts sociaux, de l'entité cible. Ces acquisitions peuvent varier de la position d'investisseur minoritaire ou significatif jusqu'à la position d'investisseur qui possède le contrôle. Dans le cas des acquisitions 100% des actions de l'entité cible, suivi de l'opération de fusion, nous avons considéré la fusion comme étant une fusion simplifiée. Nous avons inclus toujours dans cette typologie le cas des fusions réalisées pour des raisons administratives.

Les réglementations nationales sur la comptabilisation des opérations de fusion sont comprises dans l'**Ordre du Ministre des Finances Publiques** no. 1.376 du 17 septembre 2004; ces normes sont moins restrictives, laissant à la latitude des participants la manière de traiter du point de vue comptable l'opération déroulée, en recommandant plusieurs méthodes d'évaluation des entités participantes à la fusion (la méthode patrimoniale/ la méthode de l'actif net, la méthode boursière, méthodes basées sur le rendement, méthodes mixte, méthodes basées sur le flux financier) et recommandant également le traitement comptable de l'opération de fusion par l'utilisation de deux méthodes. De cette manière, l'entité qui prend l'affaire de l'entité cédante des biens ou qui continue l'activité commerciale initiale ou celle qui développe une nouvelle affaire, indifféremment de la stratégie adoptée, comptabilisera l'opération de fusion utilisant une des méthodes suivantes :

a) la méthode du résultat, respectivement l'évaluation globale des entités, qui suppose:

- ***dans la comptabilité de l'entité absorbée***, pour mettre en évidence la valeur de l'actif transféré et la croissance de valeur résultée de l'évaluation globale l'utilisation des comptes 461 „Débiteurs divers" et 7583 „Revenus de la vente des actifs et autres opérations de capital". La sortie de l'évidence des éléments d'actif transférés se fait par l'intermédiaire du compte 6583 „Dépenses visant les actifs cédés et autres opérations de capital". La transmission des éléments de passif est reflétée par créditer le compte 461 „Débiteurs divers", et celle des éléments de capitaux propres à l'aide du compte 456 „Décomptes avec les actionnaires/associés visant le capital". De même, dans la comptabilité de l'entité absorbée a lieu la clôture des comptes de revenus et de dépenses et la régularisation des comptes 456 „Décomptes avec les actionnaires/ associés visant le capital" et 461 „Débiteurs divers".
- ***dans la comptabilité de la société absorbante sont faits les enregistrements suivants***: l'enregistrement de l'augmentation du capital social et de la prime de fusion, la prise des éléments d'actif et de passif à l'aide du 456 „Décomptes avec les actionnaires/associés visant le capital". Pour les réserves qui ont été déduites fiscalement et qu'on veut maintenir dans la comptabilité de la société absorbante on procède à leur transfert du compte 1042 „Prime de fusion/scission" dans des analytiques distinctes, après la fusion. Au cas où la prime de fusion ne couvre pas la réserve légale et la resserve représentant des facilites, le transfère se réalisera dans la limite de la prime de fusion, et la différence sera soumise à imposition.

Nous considérons qu'il y a plusieurs aspects discutables dans cette méthode. Conformément à cette méthode, le plus résultés de l'évaluation des éléments patrimoniaux de l'entité absorbée sont reflétés dans les revenus au moment du transfert des éléments et la croissance de valeur n'est pas enregistrée sur chaque élément patrimonial individuel. Les réglementations comptables imposent que „au cas où, après la reconnaissance initiale comme actif, la valeur d'un actif immobilisée est déterminée sur la base de la réévaluation de l'actif respectif, la **valeur résultée de la réévaluation sera attribuée à l'actif**, pour le coût d'acquisition/ du coût de production ou de toute autre valeur attribuée avant à l'actif" (Ordre du Ministre des finances publiques no. 1.752/2005 pour approuver les réglementations comptables conformes aux directives européennes, Monitorul Oficial al României no. 1.080 bis/30.11.2005, article 110, alin. 1).

Faut-il aussi tenir compte des dispositions du Code Fiscal qui à l'article 27 alinéas (4), lettre d) précise que „la valeur fiscale d'un actif ou d'un passif... est égale, pour la personne qui reçoit un tel actif, à la valeur fiscale que l'actif a eu chez la personne qui l'a transféré." De même, l'OMFP no. 1.752/2005 pour approuver les réglementations comptables conformes aux directives européennes précise à l'article 205 alinéas (1) que „le plus ou la différence résultés de la réévaluation des immobilisations corporelles,.., doit être reflété dans le débit ou crédit du compte Réserves de réévaluation, selon le cas, tout en respectant les dispositions visant la réévaluation des immobilisations corporelles." Les résultats de l'évaluation des éléments patrimoniaux devraient être comptabilisés avant l'opération de fusion, et dans le protocole de transmission des éléments d'actif et passif, on préciserait la valeur fiscale de chaque élément.

Conformément à cette méthode proposée, chez l'entité absorbante, le plus de la réévaluation des éléments patrimoniaux de l'entité absorbée est pris comme fond commercial. Nous trouvons que, de ce point de vue, il existe une contradiction avec la définition du fond commercial qui „...représente la différence entre le coût d'acquisition et la valeur à la date de la transaction, de la partie d'actifs nets acquis par une entité"(Ordre du Ministre des finances publiques no. 1.752/2005 pour approuver les réglementations comptables conformes aux directives européennes), Monitorul Oficial al României no. 1.080 bis/30.11.2005, article 77). Ce fond commercial, qui apparaît au moment de la restructuration des entités par groupement, représente un paiement fait par l'entité acquéreur suite à l'anticipation de quelques avantages économiques futures engendrés par les actifs pris et ces avantages ne peuvent pas être identifiés individuellement et reconnus séparément au moment où l'on prend le passif. Dans ce cas, nous parlons d'un fond commercial positif. Il peut exister la situation dans laquelle l'on anticipe des pertes, et cette fois-ci la rémunération de l'apport est inférieure à l'apport fait et il résulte un fond commercial négatif.

Pour ce qui est le traitement comptable de l'opération de fusion chez l'entité absorbée, nous propons l'élimination de l'utilisation des comptes de revenus et de dépenses pour transférer les éléments d'actif et éliminer de la sorte l'opération comptable de régularisation des comptes 456 „Décomptes avec les actionnaires/associés visant le capital" et 461 „Débiteurs divers". Nous considérons que le transfert des éléments d'actif et dettes pourrait s'exprimer uniquement seulement par l'utilisation du compte 456 „Décomptes avec les actionnaires/associés visant le capital", qui se solderait au moment de la transmission des éléments de capitaux propres, étant une opération de transmission d'un apport de nouveaux actionnaires, dans ce sens étant pleinement justifiée l'utilisation du compte 456 „Décomptes avec les actionnaires /associés visant le capital". L'argument consiste dans le fait que le transfert de l'apport net de l'absorbée vers l'absorbante ne représente un transfert imposable selon les dispositions du Code Fiscal, qui précise à l'article 27 alinéas (4), lettre a) que dans de telles situations „le transfert des actifs et des passifs ne se reflète pas comme un transfert imposable" et de la sorte la détermination d'un résultat de l'opération de fusion n'a plus de sens.

b) la méthode de la valeur nette comptable des entités

- ***dans la comptabilité de l'entité absorbée*** a lieu la transmission des éléments de capital par créditer le compte 456 „Décomptes avec les actionnaires/associés visant le capital", la sortie de l'évidence des éléments d'actif transférés et des éléments de passif, et de la régularisation du transfert de capitaux propres se réalise à l'aide du compte en dehors du bilan 892 „Bilan de clôture".
- ***dans la comptabilité de l'entité absorbante on fait les enregistrements suivantes***: enregistrement du capital social et de la prime de fusion, la prise des éléments d'actif et de passif à l'aide du compte 456 „Décomptes avec les actionnaires/associés visant le capital". Pour les réserves qui ont été déduites fiscalement et qu'on veut maintenir dans la comptabilité de la société absorbante, soit on procède à leur transfert du compte dans la comptabilité de 1042 „Prime de fusion/scission", soit on les met en évidence dans la catégorie de laquelle on les a transférés. La prise des éléments d'actif et passif de la société absorbée se réalise à l'aide du compte en dehors du bilan 891 „Bilan d'ouverture ".

Pour simplifier le traitement comptable dans le cas de cette méthode, nous proposons l'utilisation de la formule comptable composée pour éliminer les comptes en dehors du bilan.

En conclusion, analysant ces deux méthodes proposées pour le traitement comptable d'une opération de fusion, notre proposition est d'enregistrer les différences résultées de l'évaluation des éléments patrimoniaux dans chacune des entités participantes avant l'opération de fusion, et la transmission des éléments d'actif et passif, ainsi que leur prise se réalise à l'aide du compte 456 „Décomptes avec les actionnaires/associés visant le capital" parce que l'opération impose une modification dans la structure du capital, et cette modification du volume et de la structure du capital est influencée par l'apport fait.

POSITIVE THEORY OF ACCOUNTING CHOICE – USING ACCOUNTING CHOICE AS SIGNALING VARIABLE

Răileanu Adriana – Sofia

Académie d'Etudes Economiques, Faculté de Comptabilité et Informatique de Gestion, Piața Romană no. 6, Arrondissement 1, code 010374, Bucureşti, sofia_adriana@yahoo.com, 00-40-21-319.19.00

Pravăț Ionela - Cristina

Université de Bacau, Faculté de Sciences Economiques, Rue Spiru Haret no. 8, Bacau, crisspra@yahoo.com , 00-40-23-451.63.45

Besides the conflicts of interests, a new tendency of theoretical writings has recently emerged in the economic literature and then in the financial and accounting ones, regrouped under the English term "signaling". The underlying hypotheses re-tackle the idea of information asymmetry which stipulates that the directors of enterprises hold more accurate information than that available to the market.

The "signaling" theory states that the market mechanisms are enticing enough to urge even the directors to publish the available information in order for the situation not to end in a non-optimal equilibrium. That is, if the investors do not have the capacity to distinguish between the competitive enterprises and the others, the former ones will be tempted to differentiate themselves by means of a "signaling" mechanism in order to obtain advantages.

Key words: signal, performance, information, accounting policy

L'efficacité du signal dépend de son coût

Les travaux d'Akerlof illustrent bien cette nécessité.

Akerlof (1970) a été l'un des pionniers à s'intéresser à la théorie des signaux. Sa réflexion, bien qu'elle s'applique au marché des voitures d'occasion, a le mérite d'être suffisamment simple pour comprendre rapidement le phénomène de signalisation. Akerlof montre que, sans un mécanisme permettant de signaler la qualité réelle des voitures d'occasion, ce marché s'effondrerait. En effet, le vendeur dispose d'une meilleure information que l'acheteur de la voiture. A priori, l'acheteur n'est prêt à payer le produit qu'à son prix moyen pondéré dans la mesure où l'information qu'il détient se limite à la probabilité d'acquérir une bonne ou une mauvaise voiture.

Pour éviter que le marché ne s'effondre, vendeurs et acheteurs ont intérêt à éliminer le différentiel d'information par le biais d'un mécanisme de signalisation (garanties, marque de commerce, etc.). Le coût de cette opération doit être suffisamment élevé pour éliminer tout risque de duperie dont les vendeurs de voitures de qualité inférieure pourraient être à l'origine. Le coût du *signaling* doit être inversement proportionnel à la qualité de la voiture.

La théorie des signaux appliquée aux choix des méthodes comptables

Les entreprises peuvent se signaler soit par leur politique financière (politique d'endettement, de distribution de dividendes), soit par leur politique comptable. Celle-ci peut porter sur deux types d'éléments : le contenu de l'information et le calendrier de publication. La signalisation par le contenu comptable peut se faire par le choix de méthodes comptables, la gestion des informations sectorielles ou la publication volontaire d'informations prévisionnelles (Saada 1993). Seuls les choix des méthodes comptables nous intéressent dans le cadre de cette étude.

Le choix d'une méthode comptable est un moyen de résoudre l'asymétrie de l'information. Si les dirigeants possèdent une information inconnue du marché et susceptible d'avoir un effet positif sur le cours de l'action, il est dans leur intérêt de l'indiquer au marché. Il permet à l'entreprise de se différencier sur le marché financier, dont les prévisions peuvent être fonction de ces indicateurs. La gestion de l'information comptable permet donc aux dirigeants d'influencer, à leur avantage, les perceptions des investisseurs quant aux perspectives de rentabilité de l'entreprise.

Une simple annonce est insuffisante, puisque les dirigeants des mauvaises firmes peuvent mentir sur la qualité réelle de leur entreprise. Comme nous l'ont montré Akerlof et Spence, le signal doit être coûteux. Ce coût doit être supérieur à l'avantage espéré par une entreprise qui émet un message trompeur. Ainsi, l'utilisation d'une méthode ayant une incidence fiscale (l'augmentation recherchée du résultat est en partie neutralisée par celle de l'impôt) peut être interprétée par le marché comme une entreprise ayant des anticipations favorables quant à l'avenir. De même, le fait qu'une entreprise choisisse une méthode sans incidence fiscale qui diminue le résultat, serait le signe qu'elle anticipe un bon niveau de cash-flows ultérieurement. On peut par conséquent aboutir à l'hypothèse suivante (Raffournier, 1990) : "les meilleures firmes devraient choisir les méthodes qui diminuent le résultat, alors qu'en cas d'incidence fiscale, c'est le contraire".

Une illustration du modèle présenté par Damotte

Damotte (1990) montre qu'il est nécessaire que les conditions suivantes soient réunies pour que les méthodes comptables puissent constituer un signal efficace, permettant aux entreprises performantes de se différencier de celles qui le sont moins :

- seules les entreprises performantes doivent pouvoir bénéficier des conséquences favorables du choix dans l'avenir (une meilleure valorisation du stock ou boursière par exemple) ;
- les dirigeants doivent être personnellement intéressés par les conséquences économiques de leurs choix comptables ;

En effet, les dirigeants seraient incités à communiquer l'information comptable en totalité ou en partie, parce qu'ils sont soit actionnaires, soit managers intéressés à travers un système plus ou moins incitatif: primes, *stock-options*, corrélation positive avec les performances financières de l'entreprise et leur propre salaire.... Ils n'agissent que pour maximiser leur utilité.

- l'avantage immédiat que les dirigeants pourraient trouver à se signaler faussement devrait être plus que compensé par la pénalité qu'ils auraient à supporter.

Damotte applique le choix du la méthode de valorisation du stock au modèle qu'il a développé:

En supposant que les dirigeants soient rémunérés en fonction du niveau de résultat et que le principe de permanence des méthodes doit être respecté, les dirigeants d'une entreprise en bonne santé peuvent se distinguer de ceux d'une entreprise en mauvaise santé en choisissant la méthode CMP ou LIFO. En effet, ce choix est le signe que les dirigeants anticipent des futurs résultats performants dans la mesure où ils sont certains de ne pas être amenés à utiliser la méthode du FIFO pour améliorer le résultat. A l'inverse, la direction d'une entreprise qui reste très incertaine quant à ses flux futurs, aura tout intérêt à retenir la méthode FIFO craignant de ne pas respecter le principe de permanence de méthode en opérant un changement de méthode ; un tel comportement attirerait immédiatement l'attention du public qui le traduirait comme des difficultés.

L'interprétation de Saada

Suite à son étude empirique sur les choix comptables analysés par rapport à certaines caractéristiques de l'entreprise (échantillon d'entreprises cotées), Saada montre que les choix de politiques comptables peuvent constituer une variable de signalisation permettant de révéler au marché financier les caractéristiques économiques et financières de l'entreprise à partir de ces constatations :

- "les petites entreprises faiblement endettées et ayant une politique de dividendes élevés, ont une politique de diminution du résultat qu'elles exercent à travers la méthode de valorisation des stocks;
- les entreprises fermées qui sont fortement endettées ont une politique d'augmentation du résultat ;
- les grandes entreprises qui versent des dividendes élevés ont une politique de résultat élevé ;
- les petites entreprises fermées ont tendance à diminuer leur résultat en jouant sur les méthodes de valorisations du stock, la durée d'amortissement du goodwill et en retenant l'amortissement dégressif."

Cette conclusion peut sembler rapide. L'étude valide davantage les hypothèses de la théorie positive des choix comptables, selon laquelle les entreprises, en fonction de leurs caractéristiques ont tout intérêt à augmenter ou diminuer leurs résultats. Cependant, elle ne montre pas si les entreprises souhaitent réellement se signaler au marché, de leur plein gré, à travers leur politique comptable. De plus, on ne voit pas l'intérêt qu'elles ont à signaler leurs caractéristiques puisqu'elles peuvent être connues du marché à l'aide de données publiques (Saada, lui-même, les a déterminées à partir de ratios). Enfin, les entreprises saines et en mauvaise santé peuvent présenter les mêmes caractéristiques concernant leur taille, niveau d'endettement, politique de dividendes et structure de capital social.

Conclusion

La possibilité qu'ont les dirigeants de choisir ou de changer de méthodes comptables pour se servir de l'information financière comme signal, a été moins évidente à démontrer pour les théoriciens que les modèles relatifs aux politiques financières.

Ces équilibres de *signaling* sont complexes et les modèles jusqu'à présent développés sont encore relativement simples (ils comprennent beaucoup de limites) au regard de la difficulté du problème à résoudre. De plus, ils sont peu nombreux et font rarement l'objet de tests empiriques visant à vérifier la corrélation entre la survenance d'un événement concernant la firme et une décision comptable exercée antérieurement. Par exemple, Damotte n'a pas vérifié empiriquement que les firmes qui choisissent la méthode LIFO ou CMP ont des performances ultérieures supérieures. Une certaine prudence s'impose donc quant à leur interprétation, car le contenu informatif des informations comptables reste une hypothèse.

La détermination des coûts générés par la signalisation est loin d'être évidente à identifier pour certains choix comptables. Bien qu'ils soient réels, les coûts directement liés aux modifications comptables (comptabilisation, impôt, perte de comparabilité, divulgation) ne sont probablement pas suffisants pour décourager les dirigeants des firmes en mauvaise santé, d'imiter les dirigeants des firmes prospères en procédant à des changements de méthodes. Cependant, les coûts indirects ultérieurs semblent plus dissuasifs. A plus long terme, la manipulation des résultats pourrait avoir des répercussions importantes sur la réputation des vérificateurs et des managers qui émettent sciemment un faux signal.

Le problème de l'interférence entre signaux se pose également lorsque l'on considère la multiplicité des choix comptables.

De plus, il semble nécessaire d'intégrer le fait que la stratégie de signalisation est multidimensionnelle. Si un signal est trop onéreux ou non crédible, l'entreprise peut utiliser les signaux financiers (actionnariat du dirigeant, endettement, politique de dividendes...). Ces deux types de signaux peuvent être complémentaires ou substituables.

Abstract: This paper aims at investigating the existence of accounting heredity in some of Eastern European countries. Accounting heredity assumes that at the time the economic paradigm changes, a new accounting system emerges, enclosing both genes from the existing accounting system, as well as genes from a new accounting system used as an inspiration.

Data was gathered by sending questionnaires to academics in the respective countries. S-au primit răspunsuri din 5 țări. Studied countries fell into two categories: Ex Soviet countries (Republic of Moldova & Ukrane), and other Est European countries (Romania, Republic of Macedonia and the Czech Republic). It analyses the survival of communist accounting practices in the post-1990 accounting systems and identifies other eternal influences that shaped these accounting systems.

Keywords : Accounting Heredity, Accounting Change, Accounting Genes, Eastern European Countries, Accounting History

The research Conceptual Framework

Calu (2005) proposed a *genetics approach* to changes occurred when a new accounting systems is adopted due to changes in the economic and political environment, emphasizing the notion of *heredity*[395]. The premise is: the emergence of a new accounting system (in splitting points) requires the existence of two "parents": present international accounting reality, and the previous status, meaning the national accounting history. The main mechanism consists of the transmitting of concepts (genes) from one accounting systems generation to another involves the existence of *dominant* genes (that are manifest from the start, in the case of a new accounting system) and *recessive*[396] genes (that become manifest after a certain amount of time). Therefore, when a new accounting system emerges, accounting concepts and practices not found at any of the parents could have operated previously. Also, former accounting concepts and practices can be reactivated during the accounting system's existence. Although we borrow concepts

[394] Research financed by CNCSIS, grant IDEI 797/2007 "Development of Romanian Accounting Regulation Between Heredity and Tanatogenesis ».

[395] In a strict biological sense, heredity is the characteristic feature of animate beings to pass down genetic characteristics to their offspring. In a general sense, the notion can be defined as the propriety of a thing or phenomenon to depend on momentary actions and prior successive conditions.

[396] According to Calu (2005), the meaning of this term differs form its original meaning. In biology, a recessive gene becomes manifest after one or more generations, as « the segregation law » states.

and the general mechanism from genetics, this approach to accounting history does not entirely superpose to the heredity mechanisms in biology.

When a new accounting system is conceived, the fertilization takes place “in vitro”. Multiple embryonic variants are abandoned at different development stages up to the time when a certain viable embryo is selected to be implanted in the economic environment. Subsequently, given no splitting points in the economic environment, the interventions upon the accounting system are similar to genetic changes made in order to acquire a transgenic[397] organism.

Research hypotheses and data analysis

Our research framework hypotheses are the following:

H1: *The assimilation of one of the new embryos in the new economic environment generates the emergence of a new child – accounting – system which takes over genes from existing parents;*

H2: *At economic continuity moments, there are two types of changes that can be brought upon an accounting system:*

- *certain recessive genes become manifest;*
- *genetic alterations are made in order to improve future generations.*

This paper aims at demonstrating the above hypotheses during the period that followed the collapse of the socialist economy, that is, the years 1989-1990 in several Eastern European countries (Romania, Republic of Moldova, Republic of Macedonia, the Czech Republic and Ukrane). Data was gathered by sending questionnaires to academics in the respective countries. The questionnaire was emailed to accounting academics in Eastern European countries during the month of March 2008. We have received replies from academics in the following countries: Moldova, Republic of Macedonia, the Czech Republic and Ukrane. For the study of the Romanian case, we used as research method the oral history and historiography.

H1: *The assimilation of one of the new embryos in the new economic environment generates the emergence of a new child – accounting – system which takes over genes from existing parents*

To demonstrate this research hypothesis, we analysed genes transmitted from the previously existing accounting systems in the four countries as to financial statements and accounting practices.

The content of financial statements after the collapse of the socialist economy

We note that all countries display the same numerical emphasis of the financial statements (balance sheet, profit and loss account and in certain cases notes), a gene characteristic to previously existing accounting

[397] A transgenetic organism contains one or more artificially induced genes.
[398] Statement of Financial Position (some note for Balance Sheet).

systems. The lack of descriptive information, such as accounting policies and the absence of cash flow statement and the statement of changes in capital, confirm the existence of hereditary traits from the previously existing accounting system.

We also note that in former countries from the Ex Soviet area of influence, immediately after the collapse of the communist regime, disclosure of financial and accounting information was weak due to the limited requirements for presentation: The Balance Sheet and The Profit and Loss Account. In Ukrain, there was only an emerging form of additional disclosure, unlike the former Socialist countries that were not a part of the USSR area of influence, where Notes to Financial Statements existed form the beginning, which indicates a higher degree of transparency.

12.	The existence of specific accounts to recognize impairments of assets (fair value lower than the book value)	Yes	No	Yes	No	No
13.	The existence of specific accounts to recognize the provisions (probable liabilities)	Yes	No	Yes	No	No

The features exist in accounting system in the first years after the socialist economy

The first nine characteristics in table 5, genes specific to the socialist accounting system, were mostly transmitted in at least two of the four countries concerned. The exception is the use of a specific account for transportation costs on the purchase of an asset.

The characteristics 10 to 13 in table 5, genes nonexistent in the socialist accounting system manifested themselves in the three countries where a process of creating a new accounting system: Romania, Republic of Macedonia and the Czech Republic. Due to the delayed reform (1998) in the Republic of Moldova and 1999 in Ukrane, the international genes (positions 10-13) are not characteristic to the accounting system from Ex Soviet countries at the beginning of the 1990s.

H2: *At economic continuity moments, there are two types of changes that can be brought upon an accounting system:*

- *certain recessive genes become manifest;*
- *genetic alterations are made in order to improve future generations.*

To investigate this hypothesis, we analysed the genetic changes that occurred from the collapse of the socialist economy to date.

13.	The existence of specific accounts to recognize the	Yes	Yes	Yes	No	Yes

	provisions (probable liabilities)					

The features exist in contemporary accounting systems

The analysis of the evolution of accounting practices from the beginning of the 1990s to date demonstrates the disappearance of the genes specific to the socialist accounting system with certain exceptions (e.g. valuation of Goods for Resale at retail price in Romania and the legal revaluation of fixed assets in Romania and the Czech Republic).

3. Conclusions

Following the collapse of the socialist economy, we note a process of creation of a new accounting system in three of the countries analysed. The parents of this new accounting system are the accounting past and the international accounting present. On the other hand in the Republic of Moldova and Ukrane as a former USSR republic, environmental (cultures) factors delayed this process and during that time an accounting system similar to the previous one was used.

THE ANALYSIS OF THE DEFICIENCIES IN THE WARES FINANCIAL MANAGEMENT DISCHARGE

Roman Adrian

University of Piteşti, Faculty of Economic Sciences, 40 Republicii Blvd., E-mail:tindache@yahoo.com, Phone number: 0742886239

Abstract: This analysis intends to draw the attention upon the accounting issues concerning the wares financial management discharge which, due to the easiness in treating it caused troubles in appropriately presenting the turnover in the profit and loss account, in the situation in which commercial reductions are treated as financial reductions or caused issues in the inventory accounting in case the accounting judgement is not finalized.

Key words: commercial reduction, financial management discharge method, wares

Discounts represent price reductions granted to the clients either to stimulate them to buy more products or to stimulate them to pay more rapidly, or to create for them the possibility to obtain a profit from the distribution of a ware having a set price.

Commercial-type price reductions are recorded when they are granted, based on the supporting documents: invoice and based on the management decision which must be made public and must be communicated to all the buyers.

If in the initial invoice the price reductions are distinctly mentioned, the seller records in the accountancy books the invoice at the commercial net value, this representing the initial value except for the granted reductions;

Price reductions are divided into the following categories:

- Commercial-type reduction that directly influence the net size of an invoice (abatements, rebates, discounts)
- Financial-type reduction (discount)

Abatements are percentage price reductions granted by suppliers, in the sales invoices, for certain categories of material current assets (for ex. fabrics) in case there are small, but unavoidable quality-related flaws or imperfections.

Rebates are percentage price reductions granted by suppliers in the sales invoices either for a significant negotiated quantity, over a certain limit –rebate for quantity-, or for the preferential position of the beneficiary in the total number of the unit clients- reselling rebate.

Discounts refer to percentage price reductions, granted after a certain period. They are fixed and are returned to the clients for repeated shopping that exceed a certain value in a certain period, normally one year. This category of price reductions is recorded in distinct invoices issued for this purpose .

Deduction discounts are percentage price reductions that the suppliers grant and distinctly write on the invoices in case the clients pay their debts before the due date.

Following the observations made during 2 years in 40 companies we noticed that 35 of them recognize commercial reductions as if they were financial reductions. The major deficiency in recognizing commercial reductions is the fact that that economic reductions are recognized in accountancy as financial reductions influencing thus the financial year result and not the turnover as stipulated by the Ordinance of the Ministry of Public Finance 1752/2005. Recognizing the the commercial reductions granted as financial reductions is due to the loss of control over the inventory and to the deficiencies encountered in the wares financial management discharge due to the fact that the accounting judgement is not completed, especially in the entities that organize globally value management and presents their inventory at a retail sale price.

In order to demonstrate this, we shall give an example:

In the case of the wares presentation at a retail sale price the wares recording value involves: the wares purchase price, the expenses met when bringing the inventory to the necessary state for valorising it, the undue VAT and margin related to their selling price.

A company that carries out retail trading has, at the end of the month, an inventory of 20 items of the A product whose purchase price was of 500lei/item, and the applied margin is of 20%.

The company that purchase 100 items of A product at the purchase price of 500 lei/item, VAT 19%. The margin applied to wares is of 20%.

The company sells 150 items of the A product to a single client and according to the company policy grants a discount of 10% of the selling price according to a schedule approved by the management:

We register the wares supply:

371	=	%		71.400 lei
		401		50.000 lei
		378		10.000 lei
		4428		11.400 lei
4426	=	401		9.500 lei

The state of account after the supply is the following:

debit Account 371 „wares” credit

Opening balance 14.280	
Accounts payable rollover 71.400	

debit Account 378 „price differences for wares” credit

Opening balance	2.000
Rollover	10.000

debit Account 4428 „undue VAT” credit

Opening balance	2.280
Rollover	11.400

We calculate the distribution coefficient for the wares financial management discharge

$$K = \frac{Sold.Initial.378 + Rulaj.Creditor.378}{Sold.Initial.371 + Rulaj.Debitor371} = \frac{2000 + 10000}{14280 + 71400} = 0{,}140056$$

We record the selling of the wares:

5311	=	%	77.112
		707	64.800
		4427	12.312

We record the wares financial management:

%	=	371	77.112
607			54.000
378			10.800
4428			12.312

Margin discharge = K x accounts payable rollover 5311 0,140056 x 77.112 = 10800

After performing the transaction, the state of account is the following:

debit Account 371 „wares” credit

Opening balance	14.280	
Rollover	71.400	
		77.112
Total amounts	85.680	77.112

Final balance	8.568	

debit Account 378 „price differences for wares” credit

Opening balance		2.000
Rollover		10.000
	10.800	
Total amounts	10.800	12.000
Final balance		1.200

debit Account 4428 „undue VAT” credit

Opening balance		2.280
Rollover		11.400
	12.312	
Total amounts	12.312	13.480
Final balance		1368

As you can notice above this accounting representation is not faithful, since although physically all the wares are sold, in the financial accounting books there are still wares recorded in amount of 8.568 lei.

The accounting profit presented in the financial statements, which is the difference between income and expenses is, in our situation, of 64.800 -54.000 which equals 10800, does not coincide with the accomplished profit, which would have to be the difference between the wares selling price out of which we deduct the VAT and the wares purchase price out of which we deduct the VAT which is 64.800 – 60.000, which equals 4.800, so the profit is overestimated with 6.000.

As a consequence by removing this inconvenience we have to perform the following steps:

- We carry out the wares financial management discharge at the difference between the value of the wares, reduction excluded and the value at which we perform the endorsement which is 85.680- 77.112 = 8.568 lei;
- We also discharge the margin by multiplying the price differences distribution coefficient by the reduction value. 0,140056 x 8568 = 1200 lei;
- We also discharge the undue VAT TVA by applying the simplified quota to the reduction value 0,15966 x 8.568 = 1.368

We carry out the financial management discharge of the commercial reduction:

%	=	371	8.568	
607				6.000
378				1.200
		4428		1.368

debit Account 371 „wares” credit

Opening balance	14.280	
Rollover	71.400	
		77.112
		8.568
Total amounts	85.680	85.680
Final balance	0	

debit Account 378 „price differences for wares” credit

Opening balance		2.000
Rollover		10.000
	10.800	
	1.200	
Total amounts	12.000	12.000
Final balance		0

debit	Account 4428 „undue VAT”	credit
Opening balance		2.280
Rollover		11.400
	12.312	
	1.368	
Total amounts	12.312	13.480
Final balance		0

We notice that the financial management discharge is made at the wares entry value, as a consequence in accountancy the wares value is 0 and the profit is dimished with 6.000, which is the value of the profit overestimation before the financial management discharge of the commercial reduction.

Abstract*: The paper approaches the socially regulated character of accounting practice through norms (standards) and judicial regulations, and the role of professional judgment within this context.*

Key words*: accounting, standards, normalisation, convergence, accounting policies, judgment, practice.*

The accounting practice, which was, at its beginning, seen as a skill based on the empirical knowledge of those who practiced it, became, at a certain moment during its evolution, a profession which is socially regulated by means of norms and standards.

As a social practice, accounting is, nowadays, regulated by means of norms (*standards)* and judicial statutes, being a 'normalised representation' of an entity on the grounds of more or less regulated conventions.

The concept of '***normalising accounting'*** contains, besides the process of elaborating norms, defined by the concept of 'accounting regulation', which represents the 'nucleus of normalisation', and the conceptual aspects of accounting[399], respectively the elaboration of a suitable framework for the proper application of these rules, with the aim of ensuring the comparability, in time and space, of the relevance and reliability of the accounting information.

The norms represent precise rules of evaluation, registering, classification or presentation of the accounting information. The French PCG defines the norm as 'reference data which results from a reasonable collective choice with the aim of solving repetitive problems.'

Accounting normalisation became, in the latter half of the 20st century, a reality and a direction in the development process of accounting and, after World War 2, national and international institutions were created with this purpose.

Accounting normalisation was firstly determined by pragmatic necessities, having as objectives[400]: *the regulation of accounting practices*, thus determining an amelioration in accounting; the increase of the efficacy of accounting information in decision-taking; the creation of an environment of mutual trust between the capital owners and the business managers; the granting of a certain extent of protection for the financial auditor by limiting his responsibilities (the auditor limits his responsibilities to a representation of reality in compliance with the acknowledged accounting norms and not to an faithful representation of the economic reality); it also functions as a referee among the different parts taking part in the economic life and particularly as a referee between the producers of the accounting information and the financial auditors who certify the quality of the information, therefore ensuring the social validation of the accounting information; it allows for the consolidation of the accounting information at the level of society-groups; it permits the elaboration of statistics.

Additionally to these pragmatic objectives we must also add the fact that accounting normalisation contributes to the development of the 'accounting theory', because the products of normalisation constitute themselves in real theoretical assemblies, like the 'generally accepted accounting principles', 'the national accounting plan', or the 'conceptual frame of accounting', which form the normative theory of accounting.

We can thus consider that the normalisation process stimulates and improves both the accounting practice and thinking, contributing to the perfecting of accounting, to the appearance and checking up of accounting

theories and hypotheses, representing the premise of the accounting research of a normative type/ normative accounting research.

The first operational variant of the normative theory took the shape of *accounting principles* which were outlined in the former part of the 20th century, in the United States of America. The formulation of accounting principles by the American normative agent was initially elaborated starting from the observation of accounting practices or from their application, and, because of that, they reflected, as Colasse considers, a 'theorised practice'[401], a normative-inductive accounting theory. As these principles had a descriptive character, they represented theoretical directions related to the manner in which the accounting information should be elaborated and presented by various companies. Due to the fact that accounting principles could not ensure a theoretical basis for the elaboration of coherent accounting norms, subsequently, after 1970, the American accounting profession drew up a normative-deductive accounting theory, under the form of the '*conceptual accounting framework*', destined to serve as a conceptual basis for the formulation of accounting norms, or, in other words, to ensure 'the theoretical foundation of firm accounting'.

The American accounting conceptual framework contains: the objectives of financial statements, the qualitative characteristics of the financial and accounting information, or the accounting principles and concepts employed for the preparation of financial statements.

As it is known, the American accounting conceptual framework has had an important influence on the national or even international accounting doctrines. It has also represented a source of inspiration for the conceptual frameworks drawn up by many countries, and even for the *Framework for the Preparation and Presentation of Financial Statements* drafted by the international accounting standard-setter namely IASC (International Accounting Standards Committee), renamed as IASB (International Accounting Standards Board) after its reformation in 2001.

In the majority of continental European countries (France, Germany, the Soviet Union, Spain, Italy, including Romania), the normative accounting theory manifested under the form of the '***national accounting plan***' consisting of: the accounts system (the designation, classification, codification and the functioning rules of accounts); the organisation of accounting documents and registration, validation, and operation-control procedures. Such a type of normalisation does not define the objectives of financial statements and the qualitative characteristics of the accounting information.

The problem of accounting normalisation, after the 60s, went beyond the national borders. The International Accounting Congress which took place in New York, in 1962, developed as a major study theme *the professional accounting principles and practices* which could be taken into consideration for the prospect of an international normalisation[402].

International normalisation involves the elaboration of norms and rules which could be applicable – entirely or partially – in some states or at the level of similar enterprises from different states. As an effect of this phenomenon, the financial statements of the enterprises will contain financial information which is more reliable, more transparent and comparable, and this is necessary for the efficient running of stock exchanges, banks and foreign investors.

Accounting normalisation, which takes place on the grounds of a necessity for universality in accounting, also enforces its complement, namely *international harmonisation* (the harmonisation between national, regional and international). This does not imply that there is a unification of accounting at an international level, but it entails universality in the accounting doctrine, not in the accounting procedure as a system of correlating signs, which is exercised within a previously codified conventional framework that cannot be available everywhere, and at the same time.

By means of the harmonisation process, which is a flexible and an open process, the national accounting norms and practices, often differing or even contradictory from a country to another, undergo certain improvements so as to reduce the major differences, aiming at facilitating the comparability of the financial statements which are elaborated and published by companies from different countries.

Pursuing the elaboration of an *international accounting doctrine,* respectively the formulation of some fundamental conventions to which any drafting, interpretation or application of the accounting and financial reporting norms would make reference, in 1989, IASC approved and published the *'Framework*

[401] Ion Ionaşcu, *Dinamica doctrinelor contabilităţii contemporane*, Editura Economică, Bucureşti, 2003, p. 22.
[402] André Cibert, *Comptabilité générale*, septième edition, Paris, 1986, p. 84.

for the preparation *and presentation of financial statements'* – a specific case of normative accounting theory.

This Framework assists the IASC/ IASB team in the elaboration of future standards and in revising the existing ones, as well as in the promotion of harmonising accounting regulations, standards and procedures related to the presentation of financial statements by advancing a basis to reduce the number of alternative accounting treatments allowed by IAS/IFRS. Additionally, the Framework helps the national authorities in the development process of national standards, it also enables the assisting preparers of financial reports to interpret the standards and to tackle the aspects constituting the subject of IAS/ IFRS, it assists the auditors to express opinions regarding the conformity of the financial statements to IAS/ IFRS, and it helps the users of financial statements to interpret the information in the financial statements elaborated in compliance with IAS/ IFRS.

The international organisation IASC/ IASB cooperates closely with national accounting standard-setters, among which a privileged position is held by the American body for accounting normalisation, namely the Financial Accounting Standards Board – FASB. In fact, it is considered that[403] the international accounting environment draws on two recognized international referential boards: IASB and FASB.

A common process is the convergence between the international referential accounting system and the American one. Besides the Norwalk agreement in September 2002, in which the two organisations concurred on a calendar and on a method regarding the convergence process, IASB and FASB also signed an agreement to establish ***a new conceptual accounting framework***.

We must also specify the fact that the representative normalising agents in the entire world work on this new image of the 'accounting constitution', specifically a ***single conceptual framework*** (a common conceptual framework) a reference document for the elaboration of international standards of financial reporting ***based on principles***.

Numerous voices demanding the elaboration of principle-based standards instead of those grounded on rules are becoming more and more visible. In addition, such an alteration in the logic of normalisation is pushed forward by the new American regulation represented by the Sarbanes-Oxley law from 2002, a law enforced after the bankruptcy of Enron and WorldCom. Thus, in July 2003, SEC published a report in which it recommends that the 'normalising agents should be heading more systematically towards the elaboration of principle-based standards'.

It is known that the two important accounting systems internationally recognized comprise distinct normalising reasoning[404]:

- in the case of Europe (and implicitly in the case of IFRS, adopted by the majority of countries, including Great Britain) there is a certain number of **principles** to be complied with; in accordance to these, auditors can invite an enterprise to correct the accounting evaluation;
- in the case of the USA, there is a comprehensive list of **rules**; the 'generally accepted accounting principles', the US GAAP, form a volume of approximately 140,000 pages which answers the majority of interpretation problems, but an imaginative accountant will still find the possibility to invent 'stylisations'.

In order to achieve the convergence, IASB struggled for the implementation of the best accounting practices at the international level.

The shift towards the application of the International Financial Reporting Standards (IFRS) which allow for the existence of numerous options to accounting treatment for a certain element or event, is a challenge for the professional reasoning, the accounting policies and the 'methods becoming increasingly proficient and difficult'[405].

The implementation of International Financial Reporting Standards by means of resorting to professional judgment, offers the accounting professional increased abilities and powers, being, at the same time, an additional element of responsibility.

[404] Feleagă (Malciu) Liliana, Feleagă Niculae, *Contabilitate financiară – o abordare europeană şi internaţională,* vol. I , Editura Infomega, Bucureşti, 2005, p. 256.

[405] Ristea Mihai, *Opţiuni şi metode contabile de întreprindere*, Editor Tribuna Economică, Bucureşti, 2001, p. 9.

Experts maintain that a national deregulated normalisation of accounting should be imposed, in which 'professional reasoning and its complement, *materiality,* enforce the rule in the selection of accounting policies and treatments'[406].

Professional reasoning is carried out when we formulate the *accounting policies*. From among the spheres in which the estimates and the judgment of managers, or of accounting professionals play a significant role we mention the following[407]:

- the recognition of certain elements in the balance sheet (assets or liabilities) or in the revenue and expense accounts (income or expenses);
- the determination and taking into consideration of the signification point in order to establish the presentation manner in the financial statements of certain elements (assets or debts) in distinct classes if they are significant, or globally, in a general (common) category, if they are insignificant;
- the choice of the methods for assessing in the balance sheet for the various reported elements, respectively:
    - the option for: basic treatment or accepted alternative treatment and, in the latter case, the option for fair value or present value;
    - the option for stock assessment methods: CMP, FIFO, etc..
- in the case of tangible and intangible assets which can be amortised:
    - the determination (estimation) of the useful life of an asset to be depreciated;
    - the determination (estimation) of residual value;
    - the determination of the depreciation method;
    - the periodical revision of the useful life, of the residual value and of the depreciation method.
- in the case of financial investments: classifying financial investments in 'current' or 'non-current' ones, depending on the estimates referring to the time span in which these investments are kept;
- making adjustments for assets;
- the determination of provisions and contingent liabilities;
- etc..

Synthesizing, professional reasoning is exercised either on the occasion of current assessment, initial recognition of the elements in financial statements or their derecognition, or on the occasion of assessment for the presentation of information in financial statements, when:

- we opt for one of the allowed treatments (the capitalization of expenses or the recognition in the revenue and expense account);
- we opt for one of the permitted evaluation methods for assets;
- we opt for a particular depreciation method;
- we perform accounting estimates.

The Romanian national regulations concerning accounting also assume the concept of accounting policies stated in IFRS. These are defined as representing the specific 'principles, foundations, conventions, rules and practices adopted by an entity in developing and presenting financial statements'.

Accounting policies related to the drawing up and presentation of financial statements are based on the requirements in the IFRS standards and the IFRIC interpretations. When there are no specific requirements (in other words, when there is no standard or interpretation which applies particularly to an event or to a transaction), the enterprise management, by means of the experts in the field, will make use of **its**

[406] Ristea, Mihai, *Normalizarea contabilității – bază şi alternativ,* Editura Tribuna Economică, Bucureşti, 2002, p. 9.
[407] See Ministerul Finanțelor Publice – *Ghid practic de aplicare a Standardelor Internaționale de Contabilitate* – Partea a I-a, Ed. Economică, 2001.

professional judgment [408] so as to draw up and apply an accounting policy which leads to information that is relevant to the users' necessities in taking economical and credible decisions.

Therefore, each company must establish accounting policies for the activities performed. The accounting polices must be prepared, taking into account the particular nature of the activity, by the experts working in the economic and technical domain, who are ***specialists in the performed activity and in the company's strategy, respecting the general accounting principles stated in the regulations.***

Along the ages, the idea that 'a good manager is the one who has a good accountant' has been widely spread. We consider that the syntagm is even more valid under the conditions of applying the IFRS, but not understood as appreciating the accountant's skill due to his efforts to minimize the 'fiscal basis (the fiscality) of the business', but owing to the accountant's ability to understand the real situation of the firm, and to obtain, by professional reasoning, financial statements with relevant, plausible and useful information for the wide range of users.

For the information presented in the financial statements to be reliable, it must answer, among others, the condition of completeness. But, for its accomplishment, the applied accounting treatment must be presented in the notes to the financial statements in their entirety.

Accounting normalisation is able, by issuing norms (standards), to restrict the accounting options for the same category, or to limit the role of professional judgment.

Despite all the normalisation efforts, there will always be a certain advance of accounting practices over accounting norms. Reality is much more complex than the provisions of a regulation, and when there is some insufficiency or even a deficiency in norms, the conveyance of an accounting solution would be possible only on the basis of professional judgment. Such a solution would be controversial, involving a high degree of subjectivity considering the experience of that professional. This is why an enhancement of ***accounting conceptualisation*** is necessary, the starting point being represented by the concept or, more generally, by the ***accounting theory*** and not by the norm, an accounting theory which comprises sufficient hypotheses that correspond to the reality. A proficient accounting theory would enable the reflection of reality with a 'reasonable amount' of subjectivity[409] if there is no norm or if it is insufficient.

Starting from the limits of accounting principles/conventions, the producers of accounting information resort to different methods so as to 'mould' – even up to 'deformation' – the financial position and the performance, the practices employed being formalized, in an elegant manner, under the designation of 'accounting policies', or 'result-adjustment policies'.[410]

The application of professional judgment, which takes advantage of the existing gaps in the norms and of their flexibility, allows for the manipulation of accounting figures and for the transformation of financial statements from what they should be into what their makers want them to be.

Such a method of exercising professional judgment could lead to the example of 'creative accounting' techniques. Due to them, accounting experts use their knowledge with the aim of manipulating the values of the information reported in the financial statements. These techniques could be directed in the following ways:

- increasing or diminishing the value of income;
- decreasing or increasing the value of expenses;
- increasing or decreasing the value of assets;
- decreasing or increasing the value of liabilities;
- inaccurately classifying the assets or the liabilities;
- avoiding the presentation of significant information in the explanatory notes;

These have as final effects the variation of the income and the variation of the equity and, consequently, the alteration of the indicators' dimensions of profitableness, liquidity, financial independence and indebtedness, or, in other words, they 'beautify' the financial position and the performance of the enterprise.

Even though accounting is a universal necessity, it still remains a local practice. According to some authors[411], the internationalisation of financial flows will not lead to the 'transformation of accounting in a uniform worldwide practice, under all its aspects', but it will only lead to the harmonisation of financial reporting, because the local context will retain its specificity, namely: the existence of more business cultures, different levels of economic development, diverse tax systems, or the dissimilar relation of accounting to the legal system and to fiscality etc.

PERFORMANCE ASSESSMENT OF RESPONSABILITY CENTERS BASED ON INTERNAL TRANSFER COSTS

Sgărdea Florinel Marian

***A.S.E. Bucharest,* Faculty of Accounting and Management Information Systems** *sgardeafm@gmail.com*
Mobile: 0741.210.80.40

Internal transfer costs (ITC) are the costs, which assess the internal performance available between the "seller" responsibility centres and the "buyer" responsibility centres of a company. A profit centre can receive some deliveries from the centres of the same company. Furthermore, it can sell (transfer) part of its production to other centres of the company. At centres level profit (or cost) shall be determined following the assessment of the internal performances based on the internal transfer costs.Internal transfer costs do not change the overall result of the company. The term of transfer costs is used when internal transfers occur between two different juridical entities, and assessment of goods and service transfer results in fiscal effects (e.g. transfer of secret benefits from a country to another or results distribution per branches). This paper will not approach the fiscal issues of transfer costs. Upon choosing of internal transfer costs, a wide range of factors should be considered, as follows: nature of responsibility centres, supply sources, company's strategy.

Key words: internal transfer costs, John Dearden pattern, Robert Eccles pattern ,optimum program

Roles of internal transfer costs in performance of management control

Internal transfer costs shall follow three main objectives, such as: optimization of the economical decision, motivation of personnel and control of responsibility centres.Transfers costs are basic tools while making decisions in order to provide optimum resources and maximize the company's profit. They should encourage the responsible of profit centres to have productivity profit, which will result in growth of the company's competitiveness.

Transfer costs encourage the convergence of the company's objectives and members. They should not direct the responsible of the profit centres to improve their own results in the disadvantage of the company's overall earning profit.

Transfer costs shall allow to evaluate fairly and realistically the long-term activity of the responsible of the profit centres. Centres activities (client or supplier) should not impact other centre's results. A 90s study undertaken in the French companies shows the transfer costs are widely used in making decisions in order to: maximize the profit; obtain a higher market share; maintain a supply source; control the services; evaluate the responsible performances; improve the productivity; co-interest the centres in their own results; place the margins on reasonable criteria. The study's results indicate the optimization of the economic decisions to the detriment of the evaluation of the centre performances.

However, internal transfer costs cannot solve all management issues of a complex company and its scopes can often be contradictory. Performance evaluation and responsible motivation can seldom be incompatible. The scopes opposition is not particular only to the internal transfer costs, but to the general management control. ***How could we evaluate the actors not to determine them to develop deviated behaviour?*** Transfer costs system may become a dynamic and motivating factor to the personnel and may turn into an excellent management tool, as well. Responsible of a profit centre, in charge to increase the centre margin, might be still needed to make decisions which would impact the neighbouring centres.

Factors affecting the selection and determination of internal transfer costs (ITC)

Upon selection of internal transfer costs, various factors should be considered such as: nature of responsibility centres; supply sources; company's strategy.

The first factor, *nature of responsibility centres,* supposes selection of ITC based on each centre scopes. Actual cost or recalculated (reconsidered) market cost can be applied to deduct the services provided between profit centres. Internal transfer costs based on costs are preferred for the services provided between the cost centres or between the cost centres and profit centres. The table below highlights the relation between the nature of responsibility centres and parameters of applied internal transfer costs.

Table 1: Selection of transfer costs based on the centres nature

Nature of responsibility centres	**Characteristics**	**Transfer cost ITP**
Pure profit centre	Scopes: in profit terms Request: internal and external	Real market cost Reconsidered market cost
Impure profit centre	Scopes: in profit terms Request: internal	- complete cost + margin (real or standard) - marginal cost + margin
Cost centre	Scopes: in cost, quality, and deadline terms. Offer: internal and/ or external	- complete cost (real or standard) - marginal cost

The second influence factor is the supply sources or John Dearden pattern. In an *Harvard Business Review* article published in 1960, John Dearden determined a relation between the type of manufactured product and selection of supply sources.

Table 2: John Dearden pattern

Products type	***Characteristics of supply sources***	***Applied ITC***
Class A	***Solely internal supply***	***- complete cost + margin***
Class B	***Mix supply***	***- complete cost + margin*** ***- market cost***
Class C	***External supply***	***- market cost***

Therefore, in respect to the A class products (products, which can never be produced by an external supplier), the author proposes a transfer cost established based on the cost plus a margin. Why external suppliers cannot produce A class products? Because: either the company does not wish to due to manufacturing secrete reasons (this secrete is the key success factor), or the company does not find a supply source able to comply with its supply restrictions (deadlines, quality, quantity, etc).

B class products are the products for which the decision on change of supply source could be implemented only at a subsequent stage, on long-term. Such decision is grounded on the investments, which the company would like to make profitable. In this case, more solutions shall be taken into account to determine the internal transfer costs. We will use either the market cost on long term (calculated based in the current costs practice outside the company or costs paid to the external suppliers), or the cost increased by the benefit margin.

C class products are the products for which the supply sources can be expeditiously changed. They do not need specialized equipment and there is almost a pure and perfect market for such kind of products. The recommended transfer cost is the current market cost. *Supply* intern centre *is being present on the external market and is running large and significant contracts and orders.*

The last evaluated factor is the company's strategy, founded on Modelul Robert Eccle pattern. In his paper, *Internal transfer costs, published in 1985,* Robert Eccles establishes a connection between two strategic sides: vertical diversification and integration and organisation parameters of the company represented by: strategy nature and planning process; main control means of the general direction; performance assessment criteria and their effect on reward-sanction. These criteria haven used to devise the following pattern regarding determination of the internal transfer costs. We have identified four types of organisations to which we could have assigned a pattern for determination of internal transfer cost:

1. Collective type is not fitted to internal transfer if:

- Vertical integration is poor (technical or commercial interdependence between responsibility centres is at a very law level)
- Diversification level is poor (e.g mono-product companies).

2. Competition type is proper to the much diversified, but poorly vertical integrated companies, (e.g conglomerate or holdings). Their strategy is defined by each responsibility centre. The group is based on a financial logic, where the general direction control depends on the scope results control. Decisions are made in a decentralized manner and supply is free. The adopted transfer cost is defined by reference to the market cost.

3. Cooperation type is proper to the strongly integrated but poorly diversified companies (e.g ferrous metallurgy or agro-alimentary companies). Their strategy is conceived for a group as a whole. The group is based on an industrial logic type where internal supplies prevail in order to make a profit of large investment. General direction control is much organised as a hierarchy and defines the actions of the company or of responsibility centres. The performance will be measured by comparison of the results or budgets. The decisions that might affect the group results will be centralized. Transfer cost determination will depend on the costs (preferably on the standard complete cost increased by a ratio calculated based on the investments profitability rate). Actually, the transfer cost strengthens the cooperation between the client centres and supplier centres. Client centres will jointly agree the investment decisions made by the supplier centres.

4. Participative type is proper to the much vertical integrated and diversified companies. They combine the features of the competition type organisation and the features of the cooperative companies. Inasmuch the transfer, priority lays on the internal supply (characteristic to integration) but the transfer cost is based on the market cost.

Optimization of overall performances by predicted transfer costs

General Direction could require an internal transfer cost able to optimize the company's results, taking into account the production constrains predictable at each responsibility centre level. On the other hand this optimal transfer cost should negotiate (conciliate) the profit scopes of the seller centre and buyer centre. Internal transfer cost will be defined according to the following relation: Internal transfer cost = margin cost of seller centre + margin result. Linear planning will provide assistance to determine the optimal quantities and the marginal result appropriate to a unit variation per manufactured product.

Example:

A profit centre called "A" manufactures two intermediate products: Pi1 and Pi2. They are yielded (transferred) to B profit centre that uses them to produce finite products X1 and X2. Part of P2 production can be sold to the third parties, outside the company. The scope of the General Direction is to maximize the margin of the variable costs. Considering the production constrains, General Direction should determine the quantities to be produced, the appropriate transfer costs which allow compliance with the respective scope.

Data:

Centre A	**Product Pi 1**	**Product Pi 2**
Variable unit cost	***€ 30***	€ 40
Unit market cost	Not applicable	€ 60
Production output (maximum)	9.000 pcs	10.000 pcs

Centre B	Product X1	Product X2
Market cost	€ 400	€ 380
Technical standards per product piece	1 product P1 4 products P2	3 products P1 2 products P2
Other variable unit costs	60 €	10 €

Looking for company's overall optimum rate

Calculation of unit margin per variable costs related to the products sold outside.

Explanations	P2	X1	X2
Selling cost (€/pcs.)	60	400	380
Variable cost P1		-30	-90
Variable cost P2	-40	-160	-80
Other variable costs		-60	-10
Margin per variable costs	**20**	**150**	**200**

We will mark by p_2, x_1, x_2 the quantities of P2, X1 and X2 products sold outside. Variables e_1 and e_2 are the quantities of intermediate products P1 and P2 which production would be given up if the production output could not meet the needs. Linear planning will be used to solve out this issue. The program which maximizes the margin per variable costs reads the formula below:

$$p_2, x_1, x_2 \geq 0$$
$$x1 + 3x2 \leq 9.000$$
$$p2 + 4x1 + 2x2 \leq 10.000$$
$$\max Z = 20\,p2 + 150\,x1 + 200\,x2$$

Standard type supposes to enter the variable e_1 and e_2 into the pattern:

$$p_2, x_1, x_2, e_1, e_2 \geq 0$$
$$x1 + 3x2 + e1 = 9.000$$
$$p2 + 4x1 + 2x2 + e2 = 10.000$$
$$\text{Max } Z = 20p2 + 150x1 + 200x2 + 0e_1 + 0e_2$$

- *Simplex patter* will be sued to solve out the issue*:*

Optimal program requires to produce 1.200 pieces X1 and 2.600 pcs X2 and P2 should not be sold outside the company. Transfer of A centre to B centre to allow production of x1 and x2 will raise to:

- Products P1 (1.200 + 3x2600) ………………..9.000 pcs.
- Products P2 (4x1.200 + 2x2.600)……………10.000 pcs.

ΔZ coefficients indicate the unit margins which could be reached should another solution be chosen:

-outside sold of one P2 would mean to lose € 5.

-giving up of one P1 or P2 production would mean to lose € 50 or € 25. The last amounts are the margin results per one P1 and P2 which should be added to the variable costs to obtain the internal transfer costs for the two products. Determination of internal transfer costs is revealed in the table below.

Explanations	**P1**	**P2**
Variable costs (Euro/pcs.)	30	40
Marginal resul per company (Euro/pcs.)	50	25
Internal transfer cost (Euro/pcs.)	***80***	***65***

Looking for local optimum rate

We will check whether based on this transfer costs, the production program is also optimum for A seller centre. Calculation of a unit margin per variable costs of products yielded by A centre

Explanations	**P1**	**P2 yielded to B centre**	**P2 sold**
Transfer cost (Euro/pcs)	80	65	60
Variable cost (Euro/pcs.)	-30	-40	-40
Margin per variable costs at A centre (Euro/pcs.)	50	25	20

Linear planning. We will mark by p1 – the quantity in P1 yielded to B, by p2 – the quantity P2 yielded to B, by p3 – quantity in P2 yielded outside the company. Ecart variables e1 and e2 are the quantities of intermediate products P1 and P2 which production would be given up.

Program regarding maximization of margin per variable costs at A centre is:

- Canonic type

$p1, p2, p3 \geq 0$
$p1 \leq 9000$
$p2 + p3 \leq 10.000$
$\text{Max } Z = 50p1 + 25p2 + 20p3$

- Standard type

$p1, p2, p3, e1, e2 \geq 0$
$p1 + e1 = 9.000$
$p2 + p3 + e2 = 10.000$
$\text{Max } Z = 50p1 + 25p2 + 20p3 + 0e1 + 0e2$

Optimum program for "A" centre requires production of 9.000 pcs P1 and 10.000 pcs P2 (which will be yielded in full to B centre). This is the same with the optimal program determined before. ΔZ coefficients show the unit margins which would be lost should another solution be selected: selling of one p2 outside the company would mean to lose € 5; giving up to yield one unit of the semi-fabrication units made by A centre would mean to lose € 50 for P1 or € 25 for P2 .

Disadvantages of planned transfer costs lay on their determination manner, which is the linear planning method is not agreed by the public. If the market restrains (e.g the amount of products sale to the clients, supply deadlines) are not met, then the seller centre could not cover their fix expenses, which would entail significant variations of results. Although by applying Solver function in Tool menu, Excell, appropriate results could be obtained in a satisfactory time period.

LE TRAITEMENT COMPTABLE DES ELEMENTS INCORPORELS

Sgărdea Florinel Marian

A.S.E. Bucureşti, Piata Romana No.6, tel. 0741.21.80.40, *sgardeafm@gmail.com*

Cette étude se propose de synthétiser les éléments spécifiques des immobilisations incorporelles. A l'heure où l'IASC travaille sur un projet de norme sur les immobilisations incorporelles, un aperçu de la pratique dans divers pays d'Europe peut être intéressant à plusieurs titres. Il permet d'abord d'apprécier la diversité des approches, et leur liens éventuels avec les cultures nationales. Il pose bien évidemment le problème de l'harmonisation internationale des pratiques en matière d'incorporel. Enfin, cette comparaison permet d'illustrer la diversité des interprétations du terme "incorporel", et la richesse des spécificités nationales. Dans cette optique, après un rappel des normes comptables des pays européens les plus caractéristiques (Allemagne, France, Italie, Pays-Bas, Royaume-Uni), nous verrons où en est l'état de la pratique en ce qui concerne la comptabilisation et la reconnaissance des éléments incorporels.

Mots Clés : actifs incorporels, Goodwill, frais d'établissement, frais de R&D

Différentes classifications des pratiques comptables internationales

En matière de comptabilisation des incorporels, on peut essayer de regrouper les pays européens en groupes homogènes, pour distinguer les différentes approches de la notion d'incorporel. Toutefois, il est nécessaire d'établir de multiples critères (impact du droit, de la fiscalité, caractère de précision - et donc liberté d'interprétation - des textes, traitements comptables alternatifs, etc.). Comme le souligne C. Nobes, on aboutit vite à autant de rubriques que de pays, et le seul avantage de ce type de classement est qu'il montre que chaque pays possède une spécificité qui mérite d'être signalée.

Distinction entre charges et investissements

Le problème conceptuel qui se pose en matière d'éléments incorporels est : à partir de quel moment la dépense engagée sur un exercice a-t-elle un impact sur la rentabilité future de l'entreprise ? A partir de quel moment une dépense cesse-t-elle d'être une charge pour devenir un investissement ou un actif ?

Un premier critère de comparaison entre pays consiste à étudier si cette distinction charges / investissements est clairement faite pour les éléments incorporels. Etant donné que la règle générale veut que les dépenses incorporelles soient passées en *charges* de l'exercice, ceci revient à étudier les conditions d'activation des dépenses incorporelles suivant les normes adaptées par chaque pays.

L'activation des dépenses incorporelles n'est autorisée que si ces dépenses répondent à un certain nombre de critères. Le critère commun à tous les pays et tous les actifs est que *l'engagement de la dépense doit induire une génération des ressources futures*. Pour certains pays (par exemple l'Italie), c'est la seule contrainte réglementant l'activation d'une dépense incorporelle. Toutefois, la plupart des pays européens fixent plusieurs critères nécessaires pour qu'une dépense puisse être considérée comme un investissement, et puisse donc être activée au bilan.

Bien que chaque pays aie sa terminologie, on peut regrouper ces critères en fonction du but recherché :

a. *le projet sur lequel porte la dépense incorporelle est identifié de manière précise*

Ce critère permet de ne retenir pour l'élément à activer que les coûts qui lui sont spécifiques : ceci sous entend que l'entreprise doit procéder à une comptabilisation *analytique* de ses dépenses.

b. *il y a une grande probabilité de succès technique / de commercialisation du projet*

Ici, les textes entendent en général *possibilité technique démontrée* ou *possibilité de commercialisation*. Dans la pratique, la notion de *rentabilité* du projet est rarement abordée.

c. *l'entreprise a marqué sa volonté de mener à bien le projet*

Ceci implique autant une volonté clairement affirmée par la direction de l'entreprise, que l'existence de ressources suffisantes pour mener le projet jusqu'à son terme.

Le rôle de la fiscalité dans la reconnaissance des actifs incorporels

Comme le proposent notamment G. G. Mueller ou C. Nobes, on peut distinguer deux modèles de pays, qui induisent deux types de pratiques :

- - le modèle continental (Allemagne, Belgique, France, Espagne)
- - le modèle anglo-américain (Royaume-Uni, Pays Bas)

Dans le premier cas, les pays assoient l'imposition des sociétés sur leurs documents financiers. Cela implique les documents financiers présentés correspondent à une vision juridique, fiscale, et codifiée de l'entreprise : les actifs incorporels ne sont reconnus que s'ils ont été *acquis* (puisque la transaction dégage un montant taxable), s'ils bénéficient d'une *protection juridique* (cette protection matérialise l'existence d'un droit, et permet donc de lui assigner une valeur) ou si l'on peut prouver qu'ils contribuent à l'augmentation de la valeur du patrimoine de l'entreprise. Par exemple, dans des pays dont les documents financiers répondent strictement à des critères fiscaux (l'Allemagne, la Suisse), les éléments incorporels développés en interne (i.e. non acquis) ne peuvent être inscrits à l'actif du bilan.

Dans le second cas, les documents financiers sont dans une large mesure indépendants du calcul de l'assiette fiscale : la comptabilité doit servir à la représentation économique et à la prise de décision. La reconnaissance des actifs incorporels ne se limite pas à des aspects fiscaux, et les textes sont très libres. Nous verrons que le Royaume-Uni en est un exemple.

La valorisation et l'évolution de la valeur des éléments incorporels

Tous les pays européens valorisent leurs éléments incorporels à leur prix d'acquisition (cas d'un élément acquis) ou à leur coût de production (cas d'un élément développé en interne), c'est-à-dire en coût historique. Mais cette homogénéité de traitement disparaît en ce qui concerne l'évolution de la valeur des éléments incorporels.

Cas d'une diminution de valeur

- - si cette diminution de valeur est considérée comme une perte *irréversible*, elle doit être constatée sous forme d'amortissements ;
- - si elle est considérée comme une perte de valeur *réversible*, elle doit être constatée sous forme d'une provision.

L'apparente simplicité de cette règle, qui s'applique relativement facilement aux actifs *corporels* des sociétés, soulève des questions complexes dans le domaine des incorporels. Une telle règle pose des problèmes de *classification* des actifs incorporels, entre ceux dont la valeur se déprécie régulièrement au fil du temps (et sur quelle durée ?) et ceux qui sont censés ne perdre de la valeur que de façon accidentelle et irrégulière.

En ce qui concerne les éléments incorporels, on peut citer trois types de pratiques comptables :

a) *amortissement de l'actif incorporel sur une durée fixée légalement.*

Cette durée est souvent fixée à cinq ans pour les éléments incorporels considéré comme étant à forte dépréciation (ex : les frais de R&D, les logiciels utilisés par l'entreprise ; en ce qui concerne l'amortissement du Goodwill, l'Espagne et l'Italie fixent une durée d'amortissement maximum de 10 ans).

b) *amortissement de l'actif incorporel sur sa durée de vie économique.*

Dans ce cas particulier, il n'y a pas de limite fixée légalement à la durée d'amortissement. On voit ainsi dans la pratique des éléments incorporels être amortis sur des durées pouvant aller jusqu'à 40 ans.

La seule contrainte porte ici sur la légitimité du choix d'une durée, cette légitimité conditionnant la *déductibilité* fiscale des charges d'amortissement.

c) *maintien de l'actif incorporel pour sa valeur d'origine, et dépréciation éventuelle par provisions.*

Cette pratique est souvent utilisée pour les actifs incorporels qui ont un fort caractère de permanence : c'est le cas des marques inscrites au bilan.

Cas d'une augmentation de valeur

En règle générale, il n'est pas possible de réévaluer les éléments incorporels inscrits au bilan. Seul le Royaume-Uni autorise cette pratique en Europe, tandis que tous les autres pays pratiquent le principe de prudence et n'autorisent pas de réévaluation. Il existe toutefois un cas particulier aux comptes consolidés : certains éléments incorporels peuvent être réévalués dans le cadre de l'affectation de l'écart de première consolidation suite à une acquisition.

Le goodwill (comptes consolidés) ou fonds commercial (compte sociaux)

Pour tous les pays, le Fonds commercial regroupe des éléments incorporels *acquis par l'entreprise*, éléments qui confèrent à cette entreprise un droit ou un avantage en terme d'activité. Les modalités du traitement comptable du Fonds commercial sont les mêmes que pour les comptes consolidés, à l'exception de deux cas :

- - tous les pays, sauf la France, amortissent globalement le Fonds commercial : la France n'amortit pas les éléments du Fonds commercial qui bénéficient d'une protection juridique, par exemple le droit au bail ;
- - la CEE n'autorise pas la déduction du Fonds commercial en réserves dans les comptes individuels.

Les frais de R&D

Certains pays établissent une distinction que l'on peut reprendre ici :

- la *recherche fondamentale* regroupe les travaux réalisés soit par pure curiosité, soit pour apporter une contribution théorique à la résolution de problèmes techniques ;
- la *recherche appliquée* permet soit de discerner des applications possibles d'une recherche fondamentale, soit de trouver des solutions nouvelles permettant d'atteindre un objectif déterminé choisi à l'avance ;
- le *développement expérimental* représente des travaux fondés sur des connaissances obtenues par la recherche ou l'expérience pratique, effectués en vue de la production de matériaux, dispositifs, produits, procédés, systèmes ou services nouveaux, ou leur amélioration substantielle.

La distinction entre recherche fondamentale et développement n'est pas établie dans ces pays. Aussi, toute dépense de R&D, quelle que soit sa nature, est potentiellement activable pour peu qu'elle réponde à certains critères. Néanmoins, en pratique, on voit que la recherche fondamentale ne peut que rarement répondre à ces critères : en Belgique, les textes demandent une contribution aux profits futurs de l'entreprise, ce qui tendrait à exclure la recherche fondamentale ; en Espagne, les critères sont les mêmes qu'en France, et demandent une réussite technique et/ou un succès commercial ; au Pays-Bas, les critères d'activation (existence d'un marché ou d'un besoin interne à l'entreprise) semblent exclure aussi la recherche fondamentale ; enfin, la Quatrième Directive européenne s'en remet aux législations nationales pour les critères d'activation. Dans ces quatre cas, la recherche fondamentale semble être implicitement *non activable*.

Les frais d'établissement

Les *dépenses de constitution* regroupent les frais administratifs de création de l'entreprise ainsi que les coûts d'augmentation du capital.

Les *dépenses de premier établissement* regroupent les frais engagés lors de la création d'une société, d'une filiale, d'une nouvelle activité, ou du développement de la capacité de production. Ces dépenses, quoique n'étant pas rattachées à un actif spécifique, sont censées générer des produits dans le futur.

En Belgique, les dépenses de premier établissement ne sont en général pas activables. Toutefois, les frais de restructuration peuvent être activés si l'opération de restructuration est clairement définie et est censée générer des produits futurs. Aux Pays-Bas, la loi comptable n'inclut pas les frais d'établissement dans les postes potentiellement activables, néanmoins le Conseil de la Comptabilité est favorable à leur inscription à l'actif. La rubrique Frais d'établissement n'existe pas dans le bilan britannique. La plupart des dépenses de constitution et de premier établissement peut être passée en charges ou imputée sur les réserves au passif. Les frais concernant le lancement d'une nouvelle production sont passés en charges constatées d'avance.

Les autres éléments incorporels

Selon IAS 38 sont reconnus comme *éléments incorporels* au bilan les éléments qui sont détenus par l'entreprise, et sont susceptibles de procurer des avantages économiques futurs, et qui ont un coût ou une valeur nettement identifiables. Les méthodes d'évaluation des actifs corporels peuvent être appliquées aussi pour les *éléments incorporels* (ex : coût de production historique, coût de remplacement, valeur vénale, etc.).

En règle générale, les actifs incorporels ne seront pas amortis, sauf s'il y a amoindrissement de leur valeur au fil du temps. Bien évidemment, les méthodes d'évaluation, choix de politique d'amortissement et tout changement de méthode doivent être clairement spécifiés dans les rapports annuels.

Selon la Communauté Européenne la quatrième Directive européenne identifie les éléments incorporels suivants : concessions, brevets, licences, marques déposées ... et tout autre droit ou actif assimilable et autorise leur inscription au bilan s'ils ont été acquis en tant qu'actifs et qu'ils sont distincts du Goodwill, ou s'ils ont été créés par la société en interne. Leur évaluation doit être faite en coût historique (d'acquisition ou de création) et ils doivent être amortis s'ils ont une durée de vie limitée. Leur valeur d'origine est leur coût de production, ou leur valeur économique si elle est inférieure. Ces actifs doivent être amortis sur leur durée de vie économique. Contrairement aux cas déjà cités (Goodwill, dépenses de R&D, dépenses de formation), il n'y a pas de limitation à la durée de vie économique retenue pour ces autres éléments incorporels, et donc pas de limitation à la durée d'amortissement retenue.

En Allemagne les concessions, brevets, licences et autres droits similaires sont considérés comme des actifs incorporels pouvant être inscrits au bilan *uniquement dans le cas où ils ont été acquis par l'entreprise*. Les éléments incorporels développés en interne ne peuvent être activés au bilan.

En Belgique on peut considérer comme des actifs incorporels devant être inscrits au bilan : les concessions, brevets, licences, marques, savoir-faire et autres droits similaires ; les acomptes versés sur immobilisations incorporelles .

Leur valeur d'origine est leur coût de production / d'achat, ou leur valeur économique si elle est inférieure. Les actifs qui ont une durée de vie limitée doivent être amortis sur leur durée de vie économique. Contrairement aux cas déjà cités (Goodwill, dépenses de R&D, frais d'établissement), il n'y a pas de limitation à la durée de vie économique retenue pour ces autres éléments incorporels, et donc pas de limitation à la durée d'amortissement retenue. Pour les actifs qui ont une durée de vie non limitée, il n'y a pas de dépréciation régulière : en cas de réduction de valeur de l'actif, une provision vient réduire la valeur inscrite au bilan.

En Espagne sont considérés comme des actifs incorporels pouvant être inscrits au bilan : les brevets, marques déposées, et tous droits de propriété industrielle. Leur traitement comptable (i.e. valorisation et amortissement) n'est pas précisé, mais, dans la pratique, il correspond au traitement des frais de R&D ; les logiciels utilisés par l'entreprise. Si ceux-ci ont été développés de manière interne (et non achetés à des tiers), l'entreprise ne peut activer les coûts de production que si ces logiciels sont utilisés sur plusieurs années. Ces logiciels sont amortis sur 5 ans maximum ; le droit au bail, amorti sur sa durée de vie économique ; les biens acquis en crédit-bail, si leur caractère d'*investissement* est montré (en pratique, cela équivaut à montrer que la valeur du bien, sa valeur de rachat, et les montants payés en loyers, sont comparables à un investissement par endettement) ;

En France sont considérés comme des actifs incorporels pouvant être inscrits au bilan: les concessions, brevets, licences, procédés, marques et autres droits similaires, i.e. *tous les droits qui assurent à l'entreprise une protection juridique pour un élément lui procurant des avantages économiques*. Cet élément peut avoir été acquis ou développé en interne. Dans ce dernier cas, les modalités d'inscription à l'actif dépendent de plusieurs critères (protection juridique ou non, intégration ou exclusion des dépenses dans le coût de production en fonction de leur nature, usage exclusivement interne ou non, etc.) ; les logiciels achetés ou développés par l'entreprise, dans un but d'utilisation interne ; le droit au bail ; le fonds commercial. Celui-ci intègre les éléments *acquis* par l'entreprise et qui constituent des avantages économiques.

Le Plan Comptable Général Français indique que la dépréciation d'un élément d'actif doit être appréciée en fonction de son caractère : si elle est considérée comme une perte de valeur *irréversible*, elle doit être constatée sous forme d'amortissements (s'il existe une protection juridique, la durée maximale retenue pour l'amortissement correspondra à la durée de la protection, mais le Plan Comptable Général autorise le choix d'une durée plus courte) ou- si elle est considérée comme une perte de valeur *réversible*, elle doit être constatée sous forme d'une provision pour dépréciation.

Certains éléments incorporels peuvent être réévalués, dans le cadre de l'affectation de l'écart de première consolidation. Il s'agit des éléments qui n'obéissent pas à la règle de l'amortissement i.e. dont la valeur n'est pas censée se déprécier avec l'usage au cours d'une durée de vie fixée. D'autre part, les éléments bénéficiant d'une protection juridique ne peuvent être réévalués, puisque cette protection juridique leur donne une valeur certaine. Les éléments incorporels susceptibles d'être réévalués sont donc les marques, enseignes et noms commerciaux, les réseaux commerciaux, parts de marché et fichiers. *Cette réévaluation peut porter sur des éléments qui n'étaient pas présents auparavant à l'actif du bilan.* Ainsi, l'affectation de l'écart de première consolidation permet d'inscrire au bilan des éléments qui ne sont normalement pas reconnus en comptabilité.

En Italie sont considérés comme *actifs incorporels* toutes les dépenses qui sont censées générer des bénéfices futurs. La règle permet donc - en théorie - d'activer tout type de charge pour peu qu'elle soit susceptible de générer des bénéfices futurs (ex : des dépenses de publicité). Les éléments incorporels cités sont classés en : brevets, droits de propriété intellectuelle, logiciels ; concessions, licences, marques et droits assimilés ; immobilisations en cours et autres immobilisations incorporelles. L'amortissement se fait en fonction du type d'actif incorporel, sur une durée fixée par l'administration fiscale - en règle générale, la durée de vie économique.

Aux Pays-Bas on peut identifier les éléments incorporels suivants : dépenses liées aux concessions, licences et autres droits de propriété intellectuelle ; avances et acomptes sur des actifs incorporels ; autres éléments incorporels (ex: logiciels, frais de lancement, marques).

Ces éléments, qu'ils aient été acquis ou développés en interne, peuvent être inscrits à l'actif et doivent être amortis sur leur durée de vie économique. La durée de vie restante est examinée chaque année : le cas échéant, un amortissement exceptionnel est passé pour justifier d'une dépréciation plus rapide de l'actif incorporel.

Au Royaume-Uni :

Les textes anglais n'identifient les éléments incorporels que de façon assez floue, en les définissant *a contrario* : sont considérées comme immobilisations immatérielles toutes les immobilisation ni monétaires, ni matérielles. Les éléments créés par l'entreprise ne peuvent être activés. Leur traitement comptable est peu précisé : leur valorisation est faite au coût d'achat. Ces éléments peuvent faire l'objet d'une *réévaluation* et dans la contrepartie est passée en réserve de réévaluation au passif ; pour l'amortissement, les règles portant sur les actifs *corporels* sont applicables i.e. amortissement sur la durée de vie économique.

En Roumanie on peut identifier selon le Plan Comptable les éléments incorporels suivants : frais de constitution, frais de developpement, concessions, brevets, licenses, marques commerciales et autre droit et valeurs similaires, fonds comercial et autres immobilisations incorporelles.

Abstract The company's performance reflects its capacity of generating future cash-flows, as well as the efficiency of its resources. The information on the performance and profitability is essential for estimating the potential variations of companies' resources that are to be controlled in the future. The information on performance variation is also useful for anticipating the entity's capacity to generate cash-flows using its existent resources, and for analyzing the efficiency of using new resources.

Keywords: the company's performance, profit and loss account, financial statements, income, *expenses*

Methodology

This paper sets out to analyze the accountancy viewpoints referring to revenues and expenses of the current period, by applying the principle of revenue-expenses-connection and also showing in which manner the performance of the company may be affected. This principle is actually the result of the commitment accountancy according to which the revenues are present in the profit and loss account by associating directly the costs with certain revenue elements**.**

The profit and loss account – faithful image of the financial performance of the enterprise

The profit and loss account has been regarded for a long period of time as a completion of the information present in the balance sheet, reflecting elements and costs, expenses, losses, income, earnings and result. The increase of the information needs of the users for the financial statements concerning the performance of the company has determines an increase of the role that it has begun to play the account of profits and loss in the structure of the financial statements, the enterprise offering in this manner information presented and recognized in an unitary way regarding the performance.

The concept of result has a very subjective character and this due to the existence of some very different user's category, each one having its own center of interests, and sometimes finding themselves in a conflict of interest's relationship. As well, the existence of some accounting principles accepted shunt in a certain accounting system, as well as in the accounting policies regarding the evaluation determines a relative character of the result.

If we have in view the increase of the importance given to the professional reasoning in the interpretation of an event or of an economic transaction, then the result is characterized more by subjectivism. At this, we add the fact that a series of events and transactions suppose the use of the estimations and of the professional judgments, such as: the estimation of the useful life duration, of the residuary value, different methods of evaluation of the stocks.

- from the point of view of the owners, the result represents the difference between the income and the expenses, including the financial and personnel expenses;
- from the investor's perpesctive, respectively of those that bring the capital, independent of the fact that they are owners or creditors; the result is the difference between the income and the expenses, with the exclusion of the expenses with the interests that become affections of benefits in favor of the creditors. This is the economic result;

- from the point of view of the whole categories of factors that take part in the life of the enterprise, such as owners, creditors, employees, state, the result is the added value, situation in which the tax and the personnel expenses become affections of the benefit.
- in case of the company held integrally by its personnel, the global result of the company is the added value, calculated between income and intermediary results.

Finding some solutions for insurance of the presentation of the information regarding the result, with relevance as big as possible for the financial statements users has been and is one of the interest centers for the specialists in the specialty literature. Thus, a very interesting proposition is that states that for the insurance of a maximum utility of the information regarding the result, it is necessary to find a method that would insure the premises for a correct interpretation.

This implies not only a correct dimensioning but also a relevant classification modality. Comes with the proposition to classify the information presented, at present, in the profit and loss account from the perspective of the management, in two categories: variable and fixed elements, starting from the premises that the investors will be interested that those enterprise for which the management insures a maximization of the profit.

The main advantage of the presentation of the elements by classification in fixed and variable elements is determined by the possibility of determination and analysis of the concept of earning power that can be assimilated to the concept of financial performance, the model allowing also the presentation of a marginal indicator regarding the performance of the management of the enterprise. But, an advantage of this method of classification is that it would be difficult enough to separate correctly the expenses in fixed and variables, so that the information presented should be more relevant and credible.

The profit and loss account in the vision of the European directives

As in the case of the balance sheet, the IV the Directive stipulates schemes mandatory for the presentation of the profit and loss account, existing the possibility of option between these schemes, with the condition of maintaining the chosen scheme. Due to the fact that the space of the European Union has represented and represents the confluence space of two different accounting cultures, such as the French- German, based on the preference of presentation of the revenue and expenses after their economic nature, and the Anglo-Saxon , that classifies the expenses and the revenues on functions of the enterprise, the IV the Directive has left at the latitude of the member states the choice between the two classification of the expenses and the revenue in the profit and loss account.

So, the IV the Directive recommends four models of presentation of the profit and loss account differentiated on one hand after the classification of the elements and on the other hand after the form of presentation .

The major difference between the four formats appears, actually at the classification within the exploitation expenses. Thus, in the format after the nature, the expenses are divided in expenses with the raw materials and the consumable, other external expenses, expenses with the personnel, adjustments of value of the assets fixed and current and other exploitation expenses.

The classification after the destination delimits three categories of expenses: production expenses; Distribution expenses; administration expenses.

Also, as in the case of the balance sheet, there is the request of the presentation of a minimal content, leaving the freedom to present cumulatively certain elements.

The IV the Directive stipulates in the fourth section certain special dispositions concerning the profit and loss account:

- Defining the net turnover, as value resulted from the sales products and the typical services of the normal activity, after the deduction of the commercial reduction, of the added value tax and other taxes connected to the turnover;
- Defining the elements of revenue and extraordinary expenses, like those elements resulted from other activities than the normal activities of the company. If there are significative in the appreciation of the company performances, such elements must be explained, after their type, in the explication notes;

- Accumulation of the values of the revenue tax from the ordinary activities and extraordinary activities in the Profit and loss account, with the condition of explanation in the explanation notes;

The Conceptual frame IASB by IAS 1 Presentations of the financial statements stipulates that as a component of the financial statements, a statement named. The statement of the modifications of the equity ownership, and which must reflect the following elements: period of the profit and loss's ach element of revenue and expense from the period that is directly recognized in the equity ownership and the total of these elements; total of the income and expenses during that period (as a sum of the elements mentioned above) detailing separately the total sums attributed to the shareholders of the society- mother and the minoritary interests; the effect of the changes of the accounting policies and the correction of the errors, according to the IAS 8 Accounting policies, modifications of the accounting estimations and errors, for each component of the capital.

According to the IAS 1 Presentation of the financial statements, the profit and loss account must contain at least the following elements: revenue, finance costs, part of the profit or the afferent loss for the associated entities and the associations in participation, tax expenses, a unique amount containing the total of the profits and losses after taxing from the interrupted activities and of the profits and losses recognized at the just evaluation minus the cost of sale or at the cession of the assets or of the groups that constitute interrupted activities, and the profit or the loss. Also, the profits must be registered separately, respectively the losses that must be associated to the minoritary parties, as well as the earnings, respectively the losses that are attributed to the owners of the capitals of the enterprise- mother. The succession of the posts indicated does not have to be mandatory respected, but the according posts must be registered relevantly for the users of the financial statements.

The profit and loss account in the vision of the Romanian standardizes

This component of the financial statements, the profit and loss account is in the present regalement by the OMFP 1752/2005, modified and completed by the OMEF 2374/2007. This normative document chooses the scheme list, where the elements are classified after the nature, asking for the taking and dividing the elements of exploitation from the content of the explanation notes. The efficiency of one of the other of these presentations has been analyzed in the specialty literature by, who has started from the indicators that can be calculated on the basis of the two schemes: for the classification after nature, the indicator turnover and for the classification after destination, the turnover and the cost of the goods sold.

The conclusions that the author has drawn up were that:

- The presentation after the nature offers information useful for the factors that take part at the creation and distribution of the added value (investors, employees, creditors, etc.) as well as the financial analysts (the financial side of the performance)
- The presentation after destination is destined more to the needs of the management because the costs are reported on functions of the company and associated to the sold production (economic side of the performance)

Another novelty is that they renounce at the notions provisions afferent to the assets and they introduce the notions of value adjustments for assets. An advantage of the presentation of the profit and loss account under the form of a list is that from the informational point of view it facilitates the knowledge of the result after each level of activity. On the other hand, maintaining only one format of presentation of the profit and loss account it reflects a rather fiscal character of the supplied information but also for statistic needs of the state.

The actual order maintains the variations of the stocks in the exploitation revenues, as well as in the IV the Directive. A controversial element as far as the format of the profit and loss account is concerned is that connected to the presentation of the element Variation of the stocks of finished products and production in course of execution as an element component of the revenues. Thus, the Romanian regulations maintain the variant stipulated according to the IV the Directive by placing this element into the category of the exploitation revenue.

The issue is if it is correct to integrate this element in the category of the revenue, taking into account the fact that the cost of production, that is translated by economic benefits consumed and not obtained. In the specialty literature the opinions regarding this aspect are divided.

Our option, for a better quality of the image released by the financial statements, for the integration of this element within the structure of the production costs.

Conclusions

According to IFRS, the profit and loss account is the main financial sheet that reflects the performance of an entity, and detailed information on revenues is essential for the performance analysis. The profit and loss account is actually the main financial sheet that reflects the company's performance, by highlighting how the results were formed, and is the main information source used by those who will predict the future results of the company's activity.

Therefore, we can conclude that the moment when revenues are identified influences significantly the performance of the company; that is why it's very important to choose the right moment when revenues are identified and registered.

The profit and loss account is also very important for those who use the financial-economical information, each of them trying to satisfy own informational needs; the investors and credit institutes can analyze precisely the value of the entity where they are shareholders, and the credit institutes can easily determine how the company refunds its obligations. Therefore, the performance is actually a result and a permanent target for any company, which stimulates the development of excellence strategies and success.

EXIGENCIES AND RISKS CONCERNING THE MISSION OF FINANCIAL AUDIT

Staicu Constantin

Abstract: The realization of a mission of financial audit in our country is realized with the respect of the International Standards of Audit, which confers the general frame adequate to such a step. The practical activity proved however that the actual realization of the mission involves detail elements which, at the extent at which they are considered, can contribute to the increase of the quality of the audit in its entirety. Having as premise the ones exposed, within the present work we debate aspects like the assumption of some increased responsibilities and exigencies in exerting the mission, the reduction of the risk regarding the incorrect information as well as the influence exerted by the particularities of the sector of activity of the entity audited that in our opinion have to be considered by the auditors during the entire duration of the mission assumed.

Key words: accounting information, financial audit, exigencies, risks

Introduction

The financial audit represents a relatively new profession in our country that defined itself and developed significantly with the creation and consolidation of the market economy. Most of the specialists from the field admit and we agree to such opinion that the foundation of this profession has been laid as far as the actual regulations are concerned as well as regarding the insurance of an adequate frame for the exertion of this one through the Chamber of Financial Auditors of Romania. This way the professionals in the field have professional standards, an ethical code and regulations that allow them to exert the missions responsibly, objectively, professionally and independently, thing denoting that the premises necessary for ensuring the performance of the financial audit services under conditions of exigency and high quality have been created.

Despite all these, the exertion of each mission of financial audit represents a true challenge, because diversity and complexity characterize the practical reality by and the auditor has to prove his competence and experience so that the general objective of the mission is reached successfully. This assumes preoccupations regarding the improvement of the professional, theoretical and methodological knowledge adequate for the audit of the financial situation afferent to an economical entity with a certain specificity of activity, the use of the professional reason, the adequate adaptation of the procedures and instruments of work used for the accomplishment of the engagement assumed.

Increased responsibilities and exigencies within the context of the corporate governance

It is well known and accepted that the audit of the financial statements represent a service of certification by which a written report is issued and within this one it is expressed the opinion of the auditor regarding the conformity of the financial statements of an entity with certain pre-established criteria that are normally the standards generally accepted in the field. This report becomes more and more an essential instrument used in the substantiation of the economical decisions or of the ones concerning the public interest.

Although this report is useful and interesting for a large category of beneficiaries (partners, financers, banks etc), the main users of this one are the shareholders of the entity. This ones cherish the insurance given by the auditor due to the independence from the management of the entity as well as to his knowledge in the field of the financial reports.

We think that this aspects also has to be considered from the point of view of the corporate governance and we are going to briefly present a few reasons that sustain this approach below.

As we know the shareholders of an entity are divided from the point of view of the structure in two significant categories: dispersed, encountered especially in the United States of America and in Great Britain and concentrated, specific for the European space and especially for Germany and France. When talking about the realities specific for Romania, the structure of the shareholders registers in the second category mentioned characterized by the existence of a dominating group of shareholders that have the control over the company and pay the main part in the appointment of the executive management of this one. Under such circumstances, we consider possible the existence of a relatively high level of risk as far as the managerial assertions from the financial situations are concerned meaning that there can be misrepresentations that favor the shareholders that own the majority of the shares and whose interests are most of the times different from the ones of the other shareholders or of other parties that have interests within the entity. Also, the specialty literature underlines the fact that the main problem of the corporate governance in this type of property structure is the relations between the group of shareholders that have the control and the others shareholders of the company. Within this context, we consider that for the expression of his opinion of fidelity the auditor has to obtain audit evidence that are enough and adequate as length, this way acting for the reduction of the risk mentioned by the creation and execution of some adequate work procedures that are according to the International Standards of Audit, to the legislative and regulation referential also relaying on his professional judgement, on his aptitudes and practical experience, especially as far as the nature and length of the procedures of audit is concerned. Such a demarche is even more necessary because in our country the principles of the corporate governance weren’t a major preoccupation of the companies, aspect favored among others by the legislative insufficiencies like the concept of independent management that isn’t found not even in the listing conditions at the stock exchange. Moreover, we can remember that the implementing of the principles mentioned within the companies among which the transparency occupies a main place, has been made very slowly in order to protect the interests of the shareholders that own the majority of the shares and who in many situations represent a single shareholder. The relevant aspects give us the right to assert that it is imposed an increases responsibility of the auditor in such situations who by his position of independence can participate at insuring the exigencies regarding the transparency and implicitly at the diminution of some undesired effects of the corporate governance. We also mention the fact that the transparency, as principle of the corporate governance, has a relatively large scope, including the operations of the entity, the process of audit on the whole and the communication regarding the financial results obtained (Morariu and Stoian, 2006).

The risk regarding the offer of incorrect information

Another important aspect for the accomplishment of a mission of financial audit is the preoccupation for the increase of the level of credibility of the information contained in the financial statements and implicitly, the significant diminution of the risk regarding the communication of distorted information. The auditor can’t neglect the fact that by the opinion expressed within the audit report can influence favorably or unfavorably the decisions that can be adopted by the beneficiaries of this one, aspect due precisely to the increase of credibility given to the financial-accounting information. The risks reminded could be considerable decreased by the rigorous use of all the work procedures and techniques that are imposed, without reductions as far as the volume of work is concerned. In our opinion, this problem has to be considered in a larger context that regards one the one side the management vision over the process of audit and on the other side elements that belong to the strategy of the auditor regarding the development of his business.

The managers act within the entity as employees of the shareholders and bear the exclusive responsibility for the elaboration of the synthesis financial statements. Simultaneously they want the maximization of the incomes of the company because the personal remunerations are in close connection to these ones. Therefore they are interested in presenting annual financial statements that advantage them and they also want to have the confirmation of an independent professional that these situations don’t have significant deviations from the pre-established criteria. Within this context, the managerial demarche is oriented towards the contracting of some audit services that ensure the credibility in front of the shareholders, inclusively by the independent opinion of the auditors that might not be as documented as necessary this not being able to formulate assertions that disadvantage them. We sustain that this assertion by the fact that there are situation in the practical activity when the conclusion of the contract of audit is made with delay for each financial exercise and the conclusion of this type of continuity contract is avoided almost systematically, for more than one consecutive exercise so that the auditor can't make detailed investigations.

There also are auditors who, from the wish of developing the business easily accept such a engagement, thing leading to the increase of the risks of detecting the significant aspects that can influence the fidelity of the statements presented. In such situations there are reduced possibilities of knowing the client, of planning and adequately exerting the mission, with negative influences over the sufficiency and adequacy of the evidence obtained and implicitly over the conclusions that are reached (Staicu and Mihai, 2006). Moreover, such engagements are also characterized by relatively reduced or even insignificant honorariums that don't stimulate the making of good quality works.

Such situations that clearly don't characterize the audit services from our country are possible in the practical activity because of the fact that as it has been mentioned before, the principles of corporate governance do not represent a feature belonging to the Romanian business environment and the market of this kind of services can't be considered as active, there being some cases of obviously disloyal competition.

In such situations it is necessary that the auditor, for the fulfillment of the wish regarding the diminution of the risk concerning the communication of distorted information and for increase the credibility of the annual financial statements perform a laborious activity permanently reported to the general principles of audit and to the demands of the Code of ethics of the accounting professional issued by the International Federation of the Accountants governing his professional responsibilities. Only this way it is possible that the professional can resist any exterior pressures (Dobroteanu and Dobroteanu, 2002) and to be able to adopt decisions according to the reality investigated.

Another aspect regarding the communication of distorted information that in our opinion can be encountered frequently in the missions of financial audit regards the managerial assertions concerning the application of IFRS 1 and for this we mainly consider the application of the rules of acknowledgement of the assts, liabilities, provisions etc based on the exigencies imposed by the IFRS standards. This way the auditors have to give increased attention to the ways in which the management formulates assertions regarding the compatibility of the information, this supposing work procedures adequate for the verification of the correctness of the elaboration of the opening balance from the date of moving to the use of the IFRS referential.

Within the same general context, referring to the specific environment of the organizations from the economy of our country we remark a series of factors that can significantly influence the annual financial statements, among which we remind: the insufficiency of the personnel from the financial-accounting compartments that have to deal with the major modifications intervened within the applicable accounting referential as well as with the accounting and fiscal current operations; the insufficient involvement of the administrators in the organization of the accounting of the company; the inadequate collaboration between the financial-accounting compartment and the others compartments of the unit, with negative influence over the fulfillment of some fundamental demands regarding the registration of the operations and the balance assessment; the frequent involvement of the auditors in the drawing up of the annual financial situations with negative consequences over the independence of these ones etc.

As far as the reduction of the informational risk is concerned we also remember the fact that once created the premises of keeping this one under control through the audit done by an independent professional increases the possibility of the entity of obtaining the capital at a reasonable cost. This aspect is in our opinion very important for the business environment from our country in the near future; on this line we consider the integration within the European structures and implicitly the increase of the opportunities concerning capital obtaining. We equally consider that the increase of the exigencies of the auditors in this regard can lead to the recovery and development of the business environment therefore to the increase of the market for the audit services and to the decrease of the negative aspects presented before.

The particularities of the sector of activity

In close connection to the ones exposed before we also mention the need of giving the adequate attention to the particularities of the activity of the entity subject to the audit because it is unanimously admitted that there isn't a universally valid way that once applied ensures a complete audit and a guaranteed result. It is very important to know those elements that individualize the entity audited as far as the nature of its activity, the organization and the operational methods used are concerned. Most opinions expressed in the specialty literature disclose that one of the best ways of satisfying those exigencies is obtaining information from the headquarters of the client, variant called "from top to bottom" (Arens and Loebbecke, 2003), meaning a close analysis of the economical strategy of this one, of the risks threatening this strategy and in the end of the mechanisms conceived by the management to answer the risks. On this line, besides the information obtained through direct observation at the headquarters of the company, it is imposed the use of the analytical procedures based on data that reflect the company on the whole and simultaneously, the performance of comparisons with the situations existing in the respective branch in the previous years and also with the prior data of the entity audited.

The utility of a good knowledge of the specificity of the activity and branch of the entity subject to the audit can be motivated with at least three elements that are presented here (Dragan, 2004).

- The detail knowledge of the particularities regarding the organization and management of the accounting, being a known fact that within many branches of activity like constructions, railway transports, chemical industry and others there are specific operations and events that need adequate accounting solutions, this way influencing the presentations within the financial situations elaborated by the respective entities.
- The identification of the risks specific for very branch that influence the way of appraisal of the risk of audit at an acceptable level as well as the making the decision concerning the acceptation of the mission. Within this context we mention that many specialists consider the branch risk as one of the most important risks. Analyzing the specificity of the Romanian economy we can consider that this factor acquires a special signification because of the deep reorganizations that take place in present, as well as because of the potential ones, seen through the near integration in the European Union.
- The identification and assessment of the inherent risks, because we can make a grouping of these ones according to the specificity of the branch of activity.
- The knowledge of the market conditions namely the follow of the demand of products, the positions of the competition, the short and middle term perspectives of these ones, of the influences exerted by the technological development etc

As far as the aspects presented are concerned, we think that the auditors from our country could adopt the solution of specialization on economical branches so that they can have the information necessary for the higher degree knowledge of the activity of the clients and this way to offer them services with higher added value, aspect that can be found within the companies with tradition in the field. This way the incomes of the auditors can be increased because of the possibility of also offering some non-audit services, at high standards.

Under such circumstances, having an adequate volume of information that allows his the understanding of the economical, social and institutional environment where they perform their mission and also applying with professionalism the general audit methods and techniques, the auditor has the possibility of expressing a correct opinion and saying on much more solid grounds if the financial statements audited offer or not a true and fair view of the financial position of the company on the date of the report, of the results of its activity and of the cash flows for the period audited, within the context of the regulations in force.

Conclusions

Although there is an adequate theoretical frame for the exertion of the mission of financial audit, the auditor has to also have in mind other elements like the ones exposed in the present work. Such a demarche is even more necessary when we can easily notice on the one side that in the field of audit there isn't yet an adequate culture and a correct understanding of its role for all the beneficiaries of information offered through the annual financial statements and on the other side that the principles of the corporate governance aren't yet a major preoccupation of the Romanian economical entities.

Durch die geplante Umsetzung des sogenannten Bilanzrechtsmodernisierungsgesetzes (kurz: BilMoG) kommt die größte Reform auf die deutsche handelsrechtliche Rechnungslegung seit dem Bilanzrichtliniengesetz von 1985 zu. Der deutsche Gesetzgeber will das bewährte Handelsgesetzbuch (HGB) im Vergleich zu den internationalen IFRS noch attraktiver machen. Es soll die Aussagekraft des HGB-Abschlusses erhöht und die Aktualisierung des HGB für nicht kapitalmarktorientierte Unternehmen als Antwort auf die IFRS erfolgen.

Schlusselwörter:BilMoG(Bilanzrechtsmodernisierungsgesetzes),Handelsgesetzbuch(HGB),

Einzelabschluss,Regelungsberieche

Einführung in die Problematik

Um dieses Ziel zu erreichen, muss das HGB modernisiert werden, möglichst ohne jedoch die Komplexität der IFRS zu übernehmen. Dabei wird aber verkannt, dass die IFRS - bis auf wenige Ausnahmen - nicht die Ursache der Komplexität sind, sondern die abzubildende wirtschaftliche Realität mit immer neuen Vertragsmustern, die eine Einordnung in klassische Rechnungslegungsgrößen stark erschweren, dafür ursächlich ist. Als Beispiel sei hier auf die Diskussion zur Behandlung von Leasing, Mezzanine Kapital oder Derivaten verwiesen. Es ist daher nicht überraschend, dass letztlich über das BilMoG an einigen Stellen eine Übernahme der IFRS-Regelungen in das HGB erfolgt, um die Modernisierung zu erreichen.

Das HGB wird letztlich durch die Abschaffung von vielen Wahlrechten, der Abschaffung der umgekehrten Maßgeblichkeit sowie durch die Anpassung einiger Ansatz- und Bewertungsvorschriften deutlich in Richtung der IFRS verschoben. Da zusätzlich zu erwarten ist, dass die an die neuen Normen anzupassenden bzw. neu zu entwickelnden Grundsätze ordnungsmäßiger Bilanzierung eine noch stärkere Anlehnung an die IFRS bewirken werden, wird zukünftig auch der (freiwillige) Übergang zu den IFRS vielfach nur einen kleinen Schritt darstellen. Somit bleibt abzuwarten, ob das vom Gesetzgeber angestrebte Ziel tatsächlich erreicht werden kann, das HGB auch in Zukunft als eigenständiges, verbindliches Regelwerk zu verankern, oder ob das BilMoG nur einen Zwischenschritt auf dem Weg hin zur allgemein verbindlichen Anwendung einer IFRS-gemäßen Rechnungslegung auch in Deutschland darstellt.

Unabhängig davon bedeutet die angestrebte Verbesserung der Aussagekraft des HGB durch das BilMoG aus der Sicht der Interessenten des Jahresabschlusses unzweifelhaft bessere Einblicksmöglichkeiten. Allerdings stellt insbesondere die Umstellungsphase hohe Anforderungen sowohl an die Erstellung und Prüfung des Abschlusses als auch an dessen Interpretation. Zudem wird es zukünftig schwieriger, die

Bilanzpolitik des Managements einzuschätzen, da es durch die fehlenden Wahlrechte und deren Beschreibung an klaren Signalen bezüglich der Richtung der geplanten Bilanz- und Ergebnissteuerung mangelt.

Nachdem über dieses Gesetzesvorhaben bereits seit einigen Jahren diskutiert wird, hat das deutsche Bundesjustizministerium den 234-Seiten starken Referentenentwurf des BilMoG am 8.11.2007 veröffentlicht. Da Teile der Änderungen, wie insbesondere die Erhöhung der Schwellenwerte, bereits rückwirkend ab Anfang 2008 Gültigkeit erlangen sollen, ist auf eine schnellere Abwicklung des weiteren Gesetzgebungsverfahrens, in das neben dem deutschen Bundestag (Parlament) auch der Bundesrat (Vertretung der 16 Bundesländer) involviert ist, zu hoffen.

Der größte Teil der neuen Vorschriften soll erstmals auf Geschäftsjahre Anwendung finden, die im Kalenderjahr 2009 beginnen. Im Januar fanden bereits Anhörungen diverser Verbände und Interessensgruppen statt. Ursprünglich sollte daher schon bis März 2008 – nach erfolgter Auswertung der Ergebnisse aus dem Anhörungsverfahren - ein sogenannter Regierungsentwurf des Gesetzes, als zweiter Stufe der verfahrensrechtlichen Gesetzgebung, erfolgen. Bis zum jetzigen Zeitpunkt liegt jedoch noch kein Regierungsentwurf zum BilMoG vor. Es ist nicht wahrscheinlich, dass das Gesetzgebungsverfahren vor Ende 2008 abgeschlossen sein wird.

Wesentliche Auswirkungen durch das Bilanzrechtsmodernisierungsgesetz auf den handelsrechtlichen Einzelabschluss als Kompromiss zu den IFRS

Wichtiger Eckpunkt der Reform ist die Aufhebung der bestehenden handelsrechtlichen Rechnungslegungspflicht für Einzelkaufleute und Personenhandelsgesellschaften (z.B. Offene Handelsgesellschaft, Kommanditgesellschaft), soweit diese die Schwellenwerte 500.000 EUR Umsatz und 50.000 EUR Gewinn pro Geschäftsjahr in zwei aufeinander folgenden Geschäftsjahren nicht überschreiten (§ 241a Entwurf-HGB). Somit werden bestimmte Kleinunternehmen ganz von der Rechnungslegungspflicht befreit. Da jedoch auch diese Unternehmen steuerpflichtig bleiben oder Fremdkapital bei Kreditinstituten benötigen, wird es in der Praxis bei einer Art der Buchhaltung bleiben müssen. Der Gesetzgeber geht in seiner Begründung zum Referentenentwurf des BilMoG davon aus, dass durch die Senkung der Schwellenwerte für kleinere Unternehmen eine Entlastung dieser Unternehmen von bis zu insgesamt einer Milliarde Euro pro Jahr realistisch sein kann.

Allerdings wird auch weiterhin eine nach HGB erstellte Bilanz sowie Gewinn-und Verlustrechnung die Grundlage für die Bemessung der Ausschüttung an die Gesellschafter sein. Viele kleinere Unternehmen stellen daher erst seit kurzer Zeit handelsrechtliche Bilanzen auf, um bessere Chancen für die eigene Kreditgewährung zu erhalten. Es ist daher davon auszugehen, dass kleinere, mittelständische Unternehmen auch weiterhin freiwillig bilanzieren, selbst wenn sie zukünftig nach dem BilMoG dazu nicht mehr verpflichtet sind. Voraussichtlich geht diese Befreiungsmöglichkeit des Gesetzgebers somit faktisch ins Leere.

Das deutsche Handelsrecht befindet sich schon seit einigen Jahren im Spannungsfeld der internationalen Rechnungslegungsentwicklung. Eine wichtige Veränderung des europäischen Bilanzrechts wurde bereits im Juni 2000 mit der Veröffentlichung einer neuen Rechnungslegungsstrategie durch die EU-Kommission angestoßen. Hauptziel dieser neuen Strategien war die Schaffung eines internationalen Rechnungslegungsstandards, durch den die europaweite Vergleichbarkeit und die Transparenz der Jahresabschlüsse erreicht werden sollte. Zwischenzeitlich wurden mit der sogenannten „IAS-Verordnung“ vom 19.07.2002 auf EU-Ebene die IFRS in das europäische und somit auch in das deutsche Bilanzrecht eingeführt und damit Kapitalmarkt orientierte Unternehmen verpflichtet, ab dem Jahr 2005 beziehungsweise 2007, ihren Konzernabschluss nach den IFRS aufzustellen.

Neben mittelgroßen und kleinen Kapitalgesellschaften müssen auch große Kapitalgesellschaften für Zwecke der Gewinnausschüttungen und der Besteuerung weiterhin einen zusätzlichen Abschluss nach den geltenden deutschen HGB-Vorschriften aufstellen. Einer vollständigen Übernahme der IFRS in den Jahresabschluss (Einzelabschluss) hat der deutsche Gesetzgeber bis zum jetzigen Zeitpunkt zu Gunsten des HGB nicht umgesetzt.

Welche Gründe könnten bestehen, dass der deutsche Gesetzgeber die IFRS für handelsrechtliche Zwecke bisher nicht auch für den Einzelabschluss ausschließlich übernommen hat? Es bestehen unterschiedliche Zielsetzungen der Rechnungslegung nach IFRS und nach HGB.

Nach der Informationsfunktion, die im Vordergrund der IFRS steht, soll die Rechnungslegung die verschiedenen Abschlussadressaten über die wirtschaftliche Situation und Entwicklung des bilanzierenden Unternehmens informieren. Der Jahresabschluss nach HGB richtet sich an viele Adressaten. Hierunter fallen z.B. aktuelle oder potentielle Anteilseigner, Gläubiger, Arbeitnehmer, Lieferanten, Staat sowie Öffentlichkeit. Der deutsche Gesetzgeber strebte bislang einen Ausgleich der zum Teil sehr unterschiedlichen Interessen der unterschiedlichen Abschlussadressaten an. Dies geschieht durch die strenge Anwendung des Vorsichtsprinzips. Man hat dem deutschen Handelsrecht oft vorgeworfen, es würde sich zu sehr am Vorsichtsprinzip orientieren und den Blick in die Zukunft vergessen. Das handelsrechtliche Vorsichtsprinzip ist gerade dadurch gekennzeichnet, dass festgestellte Risiken im Jahresabschluss unmittelbar erfasst werden müssen, Chancen jedoch erst nach deren jeweiliger Realisierung.

In der Rechnungslegung nach IFRS hat das Vorsichtsprinzip eine eher untergeordnete Rolle. Bei den IFRS steht nahezu ausschließlich die Informationsfunktion des Jahresabschlusses im Vordergrund. Danach besteht ein Hauptziel der IFRS Rechnungslegung darin, Informationen zur Entscheidungsfindung für Investoren, die dem Unternehmen Risikokapital zur Verfügung stellen könnten, bereitzustellen. In dieser speziellen Ausrichtung auf die Informationsbedürfnisse der Investoren besteht der wesentliche Unterschied im Vergleich zum deutschen HGB.

Außerdem beinhaltet der IFRS-Abschluss keine Funktion zur Bemessung der Ausschüttung an die Gesellschafter.

Das primäre Ziel der IFRS-Rechnungslegung besteht darin, die Vermögens- und Finanzlage einschließlich deren Veränderungen um die wirtschaftliche Leistungsfähigkeit eines Unternehmens unter Fair-Value-Aspekten darzustellen.

Eine Besonderheit im deutschen Recht ist der sogenannte Grundsatz der Maßgeblichkeit der Handelsbilanz für die Steuerbilanz. Nach § 5 Abs. 1 Satz 1 Einkommensteuergesetz (EStG) ist bei der steuerlichen Gewinnermittlung das nach den handelsrechtlichen Grundsätzen ordnungsmäßiger Buchführung (GoB) auszuweisende Betriebsvermögen anzusetzen, soweit dem nicht steuerliche Vorschriften (z.B. Verbot des Ansatzes bestimmter Rückstellungen) entgegenstehen. Der handelsrechtliche Jahresabschluss bildet somit grundsätzlich die Ausgangsbasis für die steuerliche Gewinnermittlung. Unter Berücksichtigung von in den Steuergesetzen geregelten Ausnahmen, ist bisher die Steuerbemessungsfunktion ein nicht unwesentlicher Nebenzweck der handelsrechtlichen Rechnungslegung gewesen.

Im Rahmen der Ausgestaltung der IFRS, insbesondere durch die Fokussierung auf eine Fair-Value-Bilanzierung, spielt die Steuerbemessung jedoch gerade keine Rolle. Durch das BilMoG und das damit verbundene Festhalten am HGB in veränderter Form hat sich der deutsche Gesetzgeber deutlich für die Aufrechterhaltung des bestehenden Grundsatzes der Maßgeblichkeit der Handelsbilanz für die Steuerbilanz entschieden. Diese Entscheidung ist ausdrücklich zu begrüßen.

Faktisch kann man den Referentenentwurf zum BilMoG als einen Mittelweg bezeichnen, der in einer Modernisierung und Aktualisierung einzelner Rechnungslegungsvorschriften des HGB besteht. Nicht mehr zeitgemäße Bilanzierungs-und Bewertungswahlrechte sollen abgeschafft werden. Das Gesetz ist gerade keine völlige Hinwendung zur anglo-amerikanischen Bilanzierung.

Kurzüberblick über wesentliche Regelungsbereiche des Bilanzrechtsrechtsmodernisierungsgesetzes

Aktivierung von selbsterstellten immateriellen Vermögensgegenständen

Eine der wesentlichen Neuregelungen ist die Aktivierungspflicht für selbst erstellte immaterielle Vermögensgegenstände des Anlagevermögens zu Herstellungskosten, soweit diese auf die Entwicklungsphase entfallen.

Nach derzeitigem Rechtsstand besteht hierfür ein strenges Aktivierungsverbot (§ 248 Abs. 2 HGB). Nach den geplanten Regelungen des BilMoG sind jedoch eine Ausschüttungssperre und erweiterte Anhangsangaben vorgesehen, um Gläubigerschutzgesichtspunkten weiterhin gerecht zu werden. Auch in Zukunft sind Forschungskosten nicht aktivierbar, da diese durch eine zu große Ferne zum eigentlichen Herstellungsprozess gekennzeichnet sind.

Der bilanzielle Ausweis soll durch eine neu zu schaffende Bilanzposition „selbstgeschaffene gewerbliche Schutzrechte und ähnliche Rechte und Werte“ erzielt werden.

Die Aktivierbarkeit selbsterstellter immaterieller Vermögensgegenstände ist strittig. Das bisherige Verbot einer Aktivierung war als strenge Ausprägung des handelsrechtlichen Vorsichtsprinzips zu verstehen. Als

Begründung für die Nichtaktivierbarkeit wurde zutreffend angeführt, dass gerade für die selbsterstellten immateriellen Gegenstände (z.B. Patente, Schutzrechte etc.) oft kein regelmäßiger Markt besteht, auf dem sachgerecht und transparent Marktpreise zur Vergleichbarkeit der Buchwerte ermittelt werden können.

Der geplanten Ausgestaltung des BilMoG kann diesbezüglich auch entgegengehalten werden, dass keine gesetzliche Definition für die immateriellen Vermögensgegenstände gegeben wird. Zu begrüßen wäre hingegen die gezielte Einführung einer Ausschüttungssperre in Höhe der aktivierten Beträge.

Sollte die Regelung in der geplanten Form umgesetzt werden, müsste die Kommentarliteratur und Rechtsprechung sicherlich entstehende Konfliktbereiche lösen. Die Orientierung an den IFRS als Hilfestellung zur Auslegung des HGB sollte vermieden werden.

Zwingende Aktivierung des derivativen Geschäfts- oder Firmenwertes

Für einen entgeltlich erworbenen Geschäfts- oder Firmenwerts besteht nach den gegenwärtigen handelsrechtlichen Vorschriften ein Aktivierungswahlrecht. Nach dem bisherigen § 255 Abs. 4 HGB darf als Geschäfts- oder Firmenwert der Unterschiedsbetrag angesetzt werden, um den die für die Übernahme eines Unternehmens bewirkte Gegenleistung den Wert der einzelnen Vermögensgegenstände des Unternehmens abzüglich der Schulden im Zeitpunkt der Übernahme übersteigt. Der Betrag ist in jedem folgenden Geschäftsjahr zu mindestens einem Viertel durch Abschreibung zu tilgen. Die Abschreibung des Geschäfts- oder Firmenwertes kann aber auch planmäßig auf die Geschäftsjahre verteilt werden, in denen er voraussichtlich genutzt wird. Bisher galt der entgeltlich erworbene Geschäfts- oder Firmenwert noch nicht als Vermögensgegenstand, sondern war ein „Posten besonderer Art“. In der Literatur wurde dieser Posten auch als Bilanzierungshilfe bezeichnet.

Nach dem BilMoG ist der derivative Geschäfts- oder Firmenwert als Vermögensgegenstand anzusehen und daher zu aktivieren (§ 246 Abs. 1 Entwurf-HGB). Er ist planmäßig über seine voraussichtliche Nutzungsdauer abzuschreiben, wobei eine widerlegbare Vermutung gilt, dass die voraussichtliche Nutzungsdauer in der Regel fünf Jahre nicht überschreiten soll. Sollte eine außerplanmäßige Abschreibung erforderlich sein, ist bei einer späteren Wertaufholung keine Zuschreibung vorzunehmen, da es sich bei dieser Wertsteigerung wiederum um einen selbstgeschaffenen Geschäfts oder Firmenwerts handeln würde (§ 253 Abs. 5 Entwurf-HGB). Selbstgeschaffene Geschäfts- oder Firmenwertes sind jedoch im Gegensatz zu anderen selbsterstellten immateriellen Vermögensgegenständen auch weiterhin nicht aktivierungsfähig.

Im Gegensatz zu IAS 36, wonach ein entgeltlich erworbener Geschäfts- oder Firmenwert nicht planmäßig abgeschrieben werden darf, sondern nur einem jährlichen Impairment-Test zu unterziehen ist, hält der deutsche Gesetzgeber in seinem Referentenentwurf zum BilMoG weiterhin an der grundsätzlichen planmäßigen Abschreibung fest.

Diese Verfahrensweise ist zu begrüßen, da der entgeltliche erworbene Geschäfts- oder Firmenwert ein Posten besonderer Art in Form eines vom Unternehmen aufgewendeten Betrages ist, der grundsätzlich auch einem zeitlichen Wertverzehr unterliegt.

Veränderte Abgrenzung der Herstellungskosten und Änderungen im Bereich der Folgebewertung von Vermögensgegenständen

Die handelsrechtlichen Herstellungskosten sollen zukünftig neben den Einzelkosten auch zwingend sämtliche variablen Gemeinkosten umfassen (§ 255 Abs. 2 Entwurf-HGB). Diese Veränderung entspricht faktisch einer Angleichung an die steuerliche Untergrenze der Herstellungskosten und auch einer Annäherung an die IFRS. Bisher bestand die Untergrenze für die Ermittlung der handelsrechtlichen Herstellungskosten ausschließlich in den Einzelkosten, also denjenigen Kosten, die einem Kostenträger direkt zurechenbar sind. Nach geplanter Rechtsänderung sollen nur noch angemessene fixe Gemeinkosten ebenso wie diejenigen Fremdkapitalzinsen, die auf den Zeitraum der Herstellung entfallen, wahlweise in die Herstellungskosten einbezogen werden können.

Auch in der Zukunft dürfen keine Forschungs- und Vertriebskosten, aufgrund der mangelnden Nähe zum Herstellungsprozess, aktiviert werden. Die Abänderungen sind aus Gründen der Annäherung an das Steuerrecht und der damit verbundenen Bewertungsvereinheitlichung grundsätzlich zu begrüßen.

Ferner war es bilanzierenden Unternehmen bisher möglich, im Rahmen der Folgebewertung ergänzende außerplanmäßige Abschreibungen auf Vermögensgegenstände des Umlaufvermögens wegen „künftiger Wertschwankungen“ sowie Abschreibungen im Rahmen „vernünftiger kaufmännischer Beurteilung“

vorzunehmen. Diese beiden Formen der Abschreibung wurden in der Bilanzierungspraxis eher selten angewendet und in der Literatur dahingehend kritisiert, dass es sich oft um nur schwer nachvollziehbare Bewertungsvorgänge handelt. Außerdem wurde den anwendenden Unternehmen dieser Abschreibungsformen häufig der reine Zweck der Umsetzung von Bilanzpolitik vorgeworfen. Die Abschaffung dieser Abschreibungen ist daher aus Gründen der Vereinfachung des HGB zu begrüßen. Es werden dadurch bisherige Bilanzierungsspielräume verringert. Die IFRS kennen derartige außerplanmäßige Abschreibungsformen nicht. In Zukunft ist ferner eine voraussichtlich nicht dauerhafte Wertminderung auf Vermögensgegenstände nur dann vorzunehmen, wenn die Gründe für die mögliche Abschreibung nicht innerhalb von 12 Monaten nach dem Bilanzstichtag wieder entfallen sind. Auch diese Regelung ist aus Gründen der Bilanzklarheit sinnvoll.

Die auf die Bewertungs- und Verbrauchsfolge zielenden Bewertungsvereinfachungsverfahren des bisherigen § 256 HGB werden mit dem BilMoG neben dem Standardverfahren des gewogenen Durchschnitts auf das LIFO- ("last in - first out") und das FIFO- ("first in - first out") Verfahren beschränkt. Somit sind weitere Verfahren, wie etwa das preisorientierte HIFO ("highest in - first out") zukünftig verboten. Es bleibt bei der Angabepflicht der Methode und des gegen den Marktpreis gerechneten Unterschiedsbetrages gem. § 284 Abs. 2 Nr. 4 HGB im Anhang. Auf eine weitere Einschränkung, wie sie etwa nach IFRS erfolgt ist, wird mit dem Verweis auf die Zulässigkeit der LIFO- und der Durchschnittsmethode im Steuerrecht verzichtet.

Zusammenfassende Würdigung

Die skizzierte geplante Fortentwicklung des deutschen Bilanzrechts durch eine Verschlankung bestehender Ansatz- und Bewertungswahlrechte im Einzelabschluss orientiert sich zum Teil (wenn auch mitunter stark abgewandelt) an den geltenden internationalen Rechnungslegungsvorschriften. Der deutsche Gesetzgeber geht jedoch mit der Umsetzung des BilMoG und dem Festhalten an einem eigenen Handelsgesetzbuch einen besonderen Weg. Für Einzelabschlüsse gelten daher weiterhin verbindlich die Regelungen des HGB.

Die Ausgestaltung des BilMoG ist grundsätzlich auf die Beibehaltung des bisher geltenden Maßgeblichkeitsprinzips der Handelsbilanz für die Steuerbilanz ausgerichtet. Ob sich dieses Prinzip letztlich unproblematisch anwenden lässt, muss die endgültige Fassung des BilMoG in der Praxis zeigen.

Es wurden wesentliche geplante Änderungen einzelner HGB-Regelungen erwähnt, wobei diese im Hinblick auf den Gesamtumfang des vorliegenden Entwurfs zum BilMoG (insgesamt 234 Seiten) nur einige wichtige Änderungen sein können.

Zu welchem Zeitpunkt das BilMoG tatsächlich verabschiedet wird und in welcher konkreten Fassung steht zum jetzigen Zeitpunkt noch nicht fest. Voraussichtlich wird das Gesetzgebungsverfahren aber noch bis zum Ende des Jahres 2008 abgeschlossen sein. Ob die dann geltenden veränderten Vorschriften in der Praxis problemlos angewandt werden können, werden die ersten Jahresabschlüsse nach neuem Recht zeigen.

FINANCIAL ACCOUNTING AND MANAGEMENT ACCOUNTING SUPPLIERS OF INFORMATION ABOUT COSTS IN COMPANY'S MANAGEMENT FROM ROMANIA

Şuiu Ion

Universitatea Spiru Haret, Facultatea de Contabilitate şi Finanțe, Rm. Vâlcea, str. G-ral Praporgescu, nr. 22., Email :nelusuiu@yahoo.com, Tel. 0721926984/0745780074

Resume: Now, according to the Romanian law, the companies stipulated in the law must organize and lead their own accountancy, financial accountancy according to the Accounting Law and the management accountancy adapted to the specific of the company.

The differences between the financial accountancy and management accountancy generate a double classification of the expenditures:

in the financial accountancy according to the criterion of the economic-financial condition (exploitation, financial and extraordinary expenditures)

in the management accountancy according to the criterion of expenditures destination (the expenditures of the main activity, the expenditures of the auxiliary activity, indirect production expenditures, general management expenditures and sale expenditures).

Key words: Production costs, profit brute increase with partial costs, variable costs, fixed cost, cost of period, direct expenditures, indirect expenditures.

In present time, in Romania " Companies, national companies, government –owned corporations, national institutes for research and development, co-operative companies, and others legal entities have the obligation to organize and manage their own accounting , financial accounting , according with accounting law, and management accounting adapted to the specify of the activity".

Financial accounting is" the activity specialized in measuring, evaluating, knowledge, management and control of the assets, debts, and own capital, also of obtained results from the activity of legal entity and natural person" authorized. Accounting "must assure chronological registering and systematic, processing, publishing, and keeping information about financial position, financial performances and cash flows, also for internal tasks, and in relation with investors present and potential, financial and commercial creditors, clients, public institutions, and others users".

Management accounting is destiny, mainly, for registration of the operation about collecting and distribution of the expenses on destinations, respective, on activities, departments, fabrication phases, deduction of the production and calculus of the production costs for the products, executed works, performed services, including production in execution. Why we use production cost?

First of all, production cost, use as base for grounding of selling price. It is understood that selling price is establish by the market. But less theoretical must be a Base, according to relation:

$$P_V = C_P + M_{BP} (1)$$

We have "Selling price"(P_V),"Production cost"(C_P) and" Gross Margin of the Profit"(M_{BP}) We noticed that selling price is higher than production cost and the company is recovering production(operating) expenses and get profit, in invert situation , the expenses are not recovered and the company is pointing to bankrupt.

Second of all is useful for evaluation and recording of the inventories of finished products, in financial accounting (getting in financial administration): 345=711….(C_P). Finished products could be recorded also to the recording price: 345=711…..(Pi) when production cost is unknown. Anyway this should be calculated in the moment when we know all its components and must establish and recorded the differences of price (D_p) or deviation between “Production cost” (C_P) and “Recording price” .(Pi) 345=711…(D_p), in black or red depending the differences positive or negative.

Coming back to the accounting record 345=711 , at the first impression it influenced results account by the incomes from the account “ 711 – Variation in stocks “. In reality the things are a little bit different because the company for producing make consumptions recorded as expenses, such: raw materials, and outside services, electric energy, fuel and water, salaries of personnel. All that expenses will contra balance, in profit and loss account, incomes in variation in stock which is recorded at production cost. If we are referring strictly to those recode, results account will be affected in situation in which the production cost is identify with incomes from the stoked production don’t incorporate strictly the expenses that where done foe realization of those products. In that case the results will suffer temporally lack of poise, more or less significant, thing that we will present in the following:

Even more, inverse accounting formula: 711=345… at (C_P) or (Pi) which is used in unloading the financial administration, doesn’t present importance because the sale take place in the period of calculus and income tax. Our approach is based on the difficulty of effectuation of an exact calculus of the production cost; otherwise there are no nets sure for finding them. The difficulty of the calculus results, mainly, in identification of same categories of production costs, common for produced manufactured and conventional relocation of those costs.

Production cost (C_P) represent, as we are mentioned before, the totality of operating expenses occasioned by the producing of a product, service, (calculation object –P, L, S): $C_{P(P,L,S)=\sum CH_I}$ (2)

The notion of cost was extended in specialized literature concerning those partial costs, as: variable cost (totality of expenses that are modified with the volume of the production), fix cost (totality of expenses that rest constant with variation of the volume of production), period cost (totality of costs for a period), the cost of a costs sector, which are used mostly in profitability analyses than in accounting records.

If at the production cost we are adding the general expenses for administration and distribution we have complete cost or commercial of those.

Operating expenses are recorded by there nature in the accounts from the 6-th class in the financial accounting and will regrouped for calculation of the costs by destinations in the accounts from the 9-th class in the management accounting. For the calculus of the production costs are used different procedures specify for every situation

The relation between financial accounting and management accounting is illustrated in the following table:

<table>

</table>

The differece betwen financial accounting and management accounting generate a double clasification of the expenses:

- In financial accounting the criteria is economico-financial nature(operating expenses, financial and extrordinary);
- In management accounting the criteria is the destination of expenses(base activty expenses, auxiliary activity expenses, indirect production expenses, general administration expenses and distribution expenses)

In conclusion there are two independent circuits of accounting, every circuit realising a pointed prelucration on objectives.

On the other hand are two forms of aplication of the same technique that supply different information .

The start for management accountig is taking from financial accounting of the operating expenses that will be analysed toghether with operating incomes, why management accounting is called internal accountng, analitic, or management.

By management accounting legal entities can get information that assure an efficient administration of the assets, respectiv:

- information about costs of goods, works, services, for legal entities that have production activities, services, and the cost of the sales goods for legal entities on trade;
- Information that stay on base of budgeting and control of the operating activities;
- Necesary information for the financial analysis pointing the foundamantation of the management strategies about internal management;
- Others information requaired of a performnt management.

Informational system of management accounting could be defined by its functions:

- *Function of measure of the cosumptions destinated for production and trade;*

This function includes others functions of the organization, (production function, personnel function, trade function) in a certain structure technico- organisational. The importance of this function is given by its capacity to measure the raport cost/ efficency.

– *Function of prediction for the two components: planning and prognose.*

Plannig is refering to the short and medium periods of time and regarde especialy microeconomic sector, while the *prognose* is reffering to the long periods of time beeing utilised in macroeconomic sector.

– *Function of optimization*

This function is refeerin to the alocation of the limitted resources according with existing pririties. Optimisation is related with foreseeing founction and is realised by mathemathical methods.

– *Function of folowing, control and regulation.*

Its role is to explain the differences between planed levels and realised levels, based on income and expenses budgets.

In the following scheme is represented the place and the instruments of action of accounting as component part of the general process of administration.

The place of management accounting in general management process

Abstract. Entities, no matter what operating system they have, private, public, banking, have as a purpose the value adding. The internal audit has its contribution to the achievement of this goal. This research explains the tridimensional approach of the concept of internal audit and identifies the elements that emphasize, in a tridimensional way, the internal audit. The steps of the reaserch take into consideration a synthesis of the materials published by the national and international accounting standards, by professional bodies, papers on this theme proposed for debat, as well as materials of the economic entities.

Key words: internal audit, internal public audit, banking internal audit, risk, plusvalue

1. The internal audit concept, a tridimensional approach?

Coming into being from Ancient times, the internal audit has had the sense of an administrative proceeding which consists in checking the documents, taking an inventory of goods and reporting the past events to the responsible persons. The internal audit concept was founded during the economic crisis from USA in 1929, when the officially quotated entities had the obligation to certify the financial situations by the external auditors. In order to diminish the costs of the external auditors' fees, the entities created internal audit departments to carry out the preceeding audit works, the external auditors' job remaining the one of certifying the financial situations. After the economic crisis ended, the internal auditors has continued their mission in a way which allowed the extension of the audit domain, being necessary a specific function for the internal audit activity within each entity. So, it begins to settle into shape the internal audit function, which has been recognized in France since 1960, based on its accounting control origin.

The evolution analysis of the internal audit concept, reveals that the risk concept emergence has influenced the internal audit concept, too. The internal audit development has known three stages: risk identification and analysis, internal control systems, audit of activities with emphasis on risks (Namee & Selim, 1997). In general terms, the risk is defined by the combination of event occurence and its consequences. Thus, the risk is a series of challenges to confront in the context of making major decissions because it diminishes the emphasise on success and restrains results achievement.

In terms of the International Standards of Internal Audit, the risk is the possibility of an event occurence that could have impact on the objective accomplishment.

In terms of the internal control – internal audit relationship, the risk is an assembly of occurences that could have negative consequences upon an entity whose internal control and internal audit have as a mission the ensurance of a good control upon them.

Though different, the presented definitions have as a common denominator the incertitude and the negative impact on the financial performance of entities.

Setting out the Internal Auditors Institute (IAI) and giving a complex definition to this concept have led to the development of the internal audit. In terms of the International Standards of Internal Audit issued by IAI, the internal audit is an independent and objective activity which gives to an entity assurance regarding the degree of controlling the operations, offers guidance to the entity in order to improve its operations and contributes to an additional value. Internal audit helps this organization to achieve its objectives, evaluating, by a systematic and methodologic approach, its risk management processes, its control and management processes, helping it with proposals of effectiveness consolidation.

Adhesion to the European Union and economies globalisation led to the internal audit creation in Romania in 1999. The major objective of any entity, that is progress, is sustained by the internal audit, too. In this regard, the concept of internal audit has been defined for each system: private, public and banking.

In the private system entities, the internal audit is the activity of objective examining of the economic activity assembly in order to provide an independent evaluation of the risk management, control and leadership processes. When the organizational frame involves state participation, the entity receives the title of a public entity, and the audit becomes a public internal audit. The public entity concept nominates the public authority, public institution, autonomous regia, national company/society, commercial society where the state or an administrative-territorial unit is a majority shareholder and bears juridical personality.

The national regulations define the public internal audit as being the independent and objective activity which offers assurances and couselling to the managing board for the good administration of public revenues and expenses, improving the activities of the public entity; it supports the public entity to achieve its objectives by means of a systematic and methodological approach that evaluates and improves efficiency and effectiveness of the leadership system based on the risk, control and administration process management.

The public sector entities development, and implicitly the economy development, cannot be sustained without the existence of a secure banking system. The national regulations in the banking field do not offer an appropriate definition for the internal audit in the credit institutions or the given definition was in accordance with the banking system existing five years ago: the internal audit is an independent activity assigned for the credit institution improvement, either by accomplishing certain audit agreements or by awarding certain consulting services to the audited structures/entities.

Thourough examination of the internal audit definitions in private-public-banking terms shows that all of them emerge from the internal audit definition given by the Inernational Standards of Audit. No matter what sector of activity it applies, the internal audit follows the same main goal: to add plusvalue, to support the entity in achiving its objectives by missions of assurance and counselling which take into consideration the risk, operational control and governance management. The internal audit major responsibility is also sustained by Morris (1992) who appreciates the vital role of the internal audit and the support given to the managing board ”to take charge of the internal control”. This opinion consolidates the internal audit role, regardless of the operating system, those of certifying to the managing board the quality of existing internal controls, the way of applying them, the implemented strategy correctness and effectiveness, offering courage and trust. In our opinion, we consider that the tridimensional delimitation of the internal audit is not conceptual but rather on regulation and activity area.

2. The internal audit tridimensional characteristics

Though the internal audit concept is unique, there exists a series of elements which defines this concept in a tridimensional way. As regards to the applicability, the internal audit in the private sector is compulsory only for the entities whose annual financial situations are examined either as a result of law or as a decision of the shareholders. For the entities which have no obligation of financial situations audit, the implementation of the internal audit function represents a measure whose opportunity and necessity are appreciated by the managing bodies, and the norms applicable to the fuction and to those who bear it keep the character of recommendations.

In the public system, the entity has the obligation, by law, to organize and assure the mission of public internal audit. Besides the attributes at micro level, of promoting the economic development and implicitly the social one, by creating the appropriate frame and sizing the appropriate prises, the state takes part differently, according to the fields, in specific markets being interested in an optimum management of the resources involved. In addition, for the public entities, having the role of satisfying the community interests at local or national level, of accomplishing certain economico-social objectives within the responsibility area of the state and adminstrative-territorial units authority, the existence and way of functioning of the managerial function of internal control to be monitorized by means of an internal audit mission represent indispensable attributes, instruments whose usage assure the guarantee of increasing the success chances and, last but not least, of a good and responsible manager image which the public percieves regarding the state and its institutions.

In the banking system, the risk is a permanent companion for any transaction or process developed by the credit institutions, with negative consequences upon them by impairing the quality of affairs, diminishing the profit or even registration of losses leading to the alteration of the institution functioning. Thus, the internal audit has become compulsory by law, instrument by means of which the banking system can be monitorized and any infringement of regulations can be immediately notified, analysed and monitorized till their solving.

The internal audit tridimension is more evident from point of view of the objectives taken into account.

For the private system, the internal audit covers the assembly of the economic entities activities, each of them, individually or cummulatively, possibly being the weak link of the processual chain to affect the accomplishment of the entity goals in efficency conditions.

In the public sector, according to the national regulations, the internal audit focuses on the following aspects:

- Financial activities or with financial implications developed by the public entity from the moment of concluding the agreements until the use of funds by the final beneficiaries, including the funds from external assistance;
- Establishing the public revenues, respectively the certification and establishment of credit bonds, as well as the facilities awarded at their incashing;
- Administration of the public patrimony as well as the purchasing, pledging, concessioning or renting of goods from the state private/public domain or the domain of administrative-territorial units;
- Financial and control management systems, including related accounting and informatics systems.

By this research we consider that the creation, use of public funds and administration of public patrimony represent the characteristics which delimit indubitably the public internal audit from the private one, respectively the banking one.

On the opposite side there is the banking internal audit, which has the role of offering to the managing board information in order to diminish the negative consequences generated by risks in achieving the goals of the credit institution, as well as the efficiency of the risk management process.

The internal audit tridimensional characteristics are emphasized by its typology in the following way:

Internal audit in the private system	The regularity (conformity) audit checks if the entity does what it says it does, if the rules and proceedings established by the entity itself are rightfully applied
	The effectiveness audit answer the question regarding the management of the entity with maximum of effectiveness and efficiency
	The management audit is interested in the existence of the management policy, the integration of the sectorial policy in it, knowledge and apllication of this policy
	The strategy audit confronts the entity policies and strategies with the environment and among them, having as a goal the assurance of global coherence
Public internal	The system audit is a detailed assessment of management and internal control systems in order to establish if these systems operate in economic, effective and efficient ways for identifying the defficiencies and for enouncing recommendations for their correction

audit	The performance audit examines if the established criteria for the implementation of the objectives and public entity's tasks are right for evaluating the results and it appraises if the results are in line with the objectives
	The regularity audit checks the actions upon the financial effects taking into account the public funds or the public patrimony, under the compliance with the principles, procedural and methodological rules which are applied to them
Banking internal audit	The financial audit checks the accounting and informatics system credibility and the credibility of the financial situations
	The conformity audit checks the compliance with the laws, regulations, policies and proceedings
	The operational audit has as objective the check of systems and proceedings quality and adequacy, the critical analysis of the organizatoric structure, evaluation of the methods and resource adequacy in relation with the established objectives
	The board audit assesses from qualitative point of view the way in which the management function is undergone for the accomplishment of credit institution objectives

Tridimensional approaches of the internal audit typology

The analysis of the internal audit typology from private-public-banking view emphasizes the fact that although the internal audit forms interfere with the three systems, it has different titles and the public system characteristic is reflected by the performance audit characterized by the application of the principles of economy, efficiency and effectiveness and dominated by the analysis exigence ”if the public money was properly spent”.

Conclusions

The undertaken analysis shows that no matter what property form the capital bears, the entities organization, the operating system – private-public-banking, the internal audit concept is not tridimensional. Independence, objectivity, competence and professional competence represent the fundamental principles governing any internal audit mission. Its goal is unique: to ensure the degree of control upon the operations for the entity, to guide the entity in order to improve its operations and to contribute to the adding of a plusvalue.

The tridimensional delimitation of the internal audit is based on the objectives and the activity area, and all the further differencies are generated by these delimitations. The tridimensional characteristics analysis of the internal audit emphasizes that for the private system the internal audit covers the economic entities' assembly of activities, each of them, indicivually or cumulatively, possibly being the weak link of the processual chain to affect the accomplishment of the entity goals in efficency conditions. For the public system, the internal audit is focused on what has influence upon the good administration of public revenues and expenditures.

On the opposite side there is the banking internal audit, which has the role of offering to the managing board information in order to diminish the negative consequences generated by risks in achieving the goals of the credit institution, as well as the efficiency of the risk management process.

Eight years ago, in a specialty paper, the authors appreciated that "the trade societies censors can be considered a combination between the own control and the external one of the enterprise". Starting from this statement, the authors of the present paper are asking a question, which can be formulated in a concise way like this: Which is in present the place, but more special the role of the censorial control in the frame of the Romanian economic units? Giving an answer implies the approach in the present paper of the aspects that regard the censors of the trade societies and the activities developed by those in the native patrimonial entities, based on the legislative regulations in this moment in our country.

Key words: censorial control, external control, trade societies, financial audit

In general by control is understood "a permanent analysis or periodical of an activity, situation and so on, by following its course and by taking measures of improvement"[412]. This is taken also at the level of the patrimonial entity (microeconomic) and at the level of the sub-branches and at the branches of activity, economic sectors and national economy (macro economy), because represents an efficient and necessary function of the management, an human activity which "works" in every field of the social-economic activity; the control being imposed as a necessity of information of the decisional factors, regarding the management way of the patrimony, of the material resources, human and financial and of the contribution of those to the creation and development of the performance.

The organizations palette and the colours of the aspects which characterize the activities given by those, claims the existence of many control forms that are put in frame by different juridical persons (authorities, institutions) or physical persons. One of the criteria namely the position of this (of the comptroller or comptrollers) which make the verifications in report with the organization of which activities are submissive to the comptroller, allows us to distingue two forms of the comptroller: on a side, [a] *the external control*: is realized outside the organization, regular by the state, through specialized authorities, and on the other hand [b] *the intern control*: is that of own control of the organization, which is made in the inside of this by one ore more of the employed persons.

In 2000 when it was published a specialty paper, the authors were appreciating that "the trade societies censors can be consider to be a joint between the own control and the external one of the enterprise"[413] . Those explain the phenomenal through we quote "when it started the reconstruction of the juridical mechanism of the trade market, the Romanian regulations gave priority to the … to some field of work existent before the communist era neglecting the fact that mean while the European countries and the others capitalist countries evaluated in a alert rhythm becoming something else from what they were before the war". It ends with the next consideration: "obvious, when we will reach to a considerable trade economy, the censorial control will become a real independent external control and it will be treaty in the theory of the organization of the financial economic control as a part of the financial-accounting audit".

Starting from this point of view, we ask the question, which can be succinct formulated like this: What is now the place but especially the role of the censorial control in the frame of the Romanian economic entities? Formulating an answer implies to approach the aspects that regards the trade societies censors and the activities taken by those in the native patrimonial entities, based on the legislative regulations from nowadays on the Romanian territory.

413 I. Florea, R. Florea (2000) *Controlul economico-financiar,* Bucureşti: CECCAR: 91

In our country, the normative act which regulates at present the activity given or the control taken by the censor is the Law no. 31/1990 regarding the trade societies, republished with all the modifications and supplements subsequent, in the Official Monitor no.1066 from November the 17 2004. The regulation regards especially the societies with certificates of stock and those on partnership of certificates of stock which are obliged to have three censors and three substitutes if by the constitutive act does not foresee a bigger number. In all the cases, the number of the censors must be odd. For the societies with limited liability, the regulations of those can foresee the choosing one or more censors, and if the number of the associates passes over 15, the naming of the censors is compulsory. To those it will be applied depositions foreseen by the law for the censors of the societies with certificates of stock. In the lack of the censors, each one of the copartners which is not an administrator will exercise the right of control which the copartners have in the societies in collective name.

The trade society's censors are chosen and are named by the general meeting of the copartners, at the beginning from the constitutive one and subsequent from the regular one. Those must practice personal their mandate which has duration of 3 years with the possibility to be reelected after that. The censors must give a declaration on their own responsibility from which to say that those accomplish the requests foreseen by the law, document that comes with the register petition of the society in the register of trade. According to the law[414] at least one of the censors must be an authorized accountant or an auditor. The censors are obliged to deposit before they are invested in the position a third part from the insurance requested for the managers. Are excluded from this obligation the auditor censors or the authorized accountants if they make prove of the insurance of professional civil responsibility. At the same time the censors can be copartners of the society excluding the auditor censors and the authorized accountant which can be third which practice individual the profession or in associations' forms.

The members of the board committee and the directors of a society with stocks will not be without the authorization of the administration board, censors in other competitive societies or having the same object, neither to have the same trade or other competitive on their own or to another person, under the penalty to recalling and damaging liability [art. 145, paragraph (5)].

According with the regulations (art. 161), in a trade society there can not have a censor mandate (can not be censors, and if they were elected they are dismissed from their mandate):

a) the relatives and including the persons to the fourth near relations or the spouse of the managers;
b) the persons that receive under any form from the managers or from the society a payment or a payment for other functions besides the on of censor or of which employees are stipulated in the contract or are in competition with this;
c) to the persons to which is forbidden the manager function namely they not have the capacity (are not capable) and the ones that suffered convictions for management facts or in administration (ill management, confident abuse, fake, use of forgery, fraud, dilapidation, false perjury, giving or taking bride);
d) the persons which during they attributions offered by this quality, have attributions of control in the frame of the Ministry of Economic Affairs and Finance or to other public institutions, excepting the situations foreseen deliberated in the law.

Giving up from the function of censors it can be done by the recalling them, by renunciation or by stopping the mandate in decease case, physical or legal impediment. Recalling the censors will be made only by the general committee with the vote requested to the extraordinary meetings. This means that is necessary the presence of the copartners representing the third part from the social capital, and the decision to be taken with the vote of a number of copartners which to represent at least a half of the social capital. The same extraordinary meeting will choose in this situation another censor. When releasing the function the censor in all the cases will be replaced with the oldest one. If in this way the number of the censors can not be completed the remaining censors name other persons in the vacant places which will be on a determinate period of time, till the meeting of the most appropriate general meeting. In the case that their does not remain in function no censor the society administrators will convoke the urgent general meeting, which will choose other censors.

[414] *Law no. 31*, *regarding the trade societies, republished in* (2004) Official Monitor of Romania no. 1066: art. 159, 16

By law of trade societies there are given a series of *attributions, responsibilities, rights, obligations, liabilities and interdictions of the censors*. Which we will present further on in chronological order mentioned by the mentioned regulation:

- the censors can not be stock holders with main dividend without the right to vote [art. 95, paragraph (3)];
- at the general meetings, the censors must notice by proceedings the deposit to places shown by the constitutive act or by notice and on time (at least 5 days before the meeting) of the certificate of stocks for the stockholder which have bearer stocks for those to benefit from the vote right. The certificates of stocks will remain deposit till the general meeting but will not be retained more then 10 days from this date [art. 123, paragraph (1)] ;
- releasing of a certificate by the censor from which to result the deposit of the administrators of the insurance requested by the law, which must be presented to the office of trace register, in the same time with the signatures for the function of administrator [art. 141];
- administrators are responsible with their immediate predecessors if they know by the disorders made by those and they do not communicate them to the censors or to the financial auditors [art.148, paragraph (4)]; In the societies that have more then one administrators the liability for the acts or for the omissions does not get to the administrators that made the establishment, in the decisions register of the administration council against them and told about this in write to the censors and in some cases to the financial auditors [art. 148, paragraph (4-5)];
- the right to be convoked to the meetings of the administration council [art.151];
- any stockholder has the right to claim the censors acts that they think that must by censored, and those are obliged to verify them and if they find them real to take into account for the report of the general meeting. If the claim is made by a fourth part of the stockholders from the social[415] capital they are obliged to convoke immediately general meeting. On the contrary they must refer to the first meeting. The committee must take a decision of the claims made [art. 154];
- another mission of the censors is the administrators naming. So if one or more administrators is/are on vacation the other administrators together with the censors and deliberating on the presence of two third parts and with absolute majority proceeds if by constitutive act is not disposable in another way, to the naming of a temporary administrator till the general meeting. When the society has only one administrator and this can not deal with its attributions (decease, physical impediment), the temporary naming is made by the censors but the general meeting will be convoked urgently in order to name the administrator. Also if this whishes to withdraw it will convoke the general meeting [art. 156];
- the censors are obliged to supervise the management of the society, to check if the financial situations are legal and in concordance with the registers, if the last ones are right keep and if the evaluation of the patrimony elements was made according to the established rules for the indite and presentation of the financial situations. The censors will make and present to the general meeting a detailed report in relation with all those and also the proposals which they consider necessary regarding the annual financial situations and the profit[416] repartitions. Is to specificity that the general meeting will not be able to approve the annual financial situations if those are not with the censors report[417] or in other case of the financial auditors. Also the censors are obliged to make every month unexpected inspections to the house and to check the titles existence or values that are the property of the society or they were received as deposits, guarantee or storehouse. Another obligation of the censors is the one to convoke the ordinary meeting or extraordinary one when this was not convoked by the administrators. In

[415] The fourth part from the social capital is proved by depositing the stocks to the Romanian banks or to the units of those, namely by blocking the stocks in the account in case the stocks will be deliberated in immaterial form

[416] In order to accomplish this obligation the censors must vote together; they can make case if there is any disagreements, reported separated which will be presented to the general meeting. In exchange the others obligations imposed by the law the censors must work separately

[417] The report of the censor must be made at least 15 days before the general meeting

the same time the censors have the obligation to take part to the general meeting those can even ask to put down some distinct points on the agenda proposals that they believe necessary. By the censors' obligations is the one to see the regular deposit of the insurance from the administrators. Those have the obligation to see if the law depositions and the one of the constitutive act are accomplished by the administrators and by the liquidator. In order to accomplish those obligations foreseen by the law the censors can take part to the administrators meetings with the right to vote. They also have the right to obtain every month from the administrators a situation regarding the operations functioning. The censors must notice the administrators about the disorders in management and the disorders from the legal depositions and from the foresights of the constitutive act which they find and the important cases will be told to the general meeting without telling them to the stockholders in particular or to the third persons referring to the society operations, found during their mandate [art. 163-164];

- is forbidden to the censors to present as a mandatory the stockholders in the general meeting [art.171];
- referring to the annual financial situations verification of the trade societies we have to specify the fact that the administrators have the obligation to present to the censors at least a month before from the established day for the annual financial general meeting for the previous financial exercise with their report and the justificative documents [art.181];
- in the case in which the trade society goes into liquidation, the liquidators are accomplishing their mandate under the control of the censors [art.253]. In the same time the liquidators can not in the absence of special depositions in the constitutive act or in the act of their naming to make mortgages on the society goods if their will not be authorized by the instance with the censors approval [art. 255, paragraph (2)]. After the liquidation is finished the liquidators make the final financial situation showing the part for each certificate of stock from the repartition of the asset of the society, accomplished by the censor report or in case the report of the financial auditors [art. 268].

The censors from the trade societies have important responsibilities of which area and effects are determined by the mandate rules. Those are responsible to the society for the; reality of the payments made by the stockholders/copartners the real existence of the dividends paid, for the existence of the registers requested by the law and their right maintenance the exact accomplishment of the decisions of the general meeting the strict accomplishment of the duties that the law and the constitutive acts impose. Before their entrance in function those must deposit a guarantee that represents the third part from the guarantee requested for the administrators.

The findings made by the censors during their mandate and also all their deliberations will be put down on a special register for the trade societies on certificates of stocks existing the compulsoriness to keep this document through the censors care.

The censors report together with the one of the administrators and/or of the financial auditor is used as a fundament of the discussion approval or modifications of the annual financial situations. Also to the chapter of reports needs to be mentioned that according to the law to the certificates of stocks societies one or more stockholders have at least 10% from the stocks representing the social capital, they may ask-individual or together – to the court to establish one or more experts, to analyze certain operations from the society management in order to be analyzed and to be taken right measures.

For the activity developed the censors of the trade societies are paid with a fix sum. The measure of this is determined through the constitutive act or is stipulated by the general meeting that named them, than being able to change. Also will be given to the censors any others sums or advantages but only based on the decision of the ordinary general meeting. Information's regarding the payments of the censors is presented in note 10 "Other information's" to the annual financial situations.

At the chapter offences the Law no.31/1990 tells us that the punishment with prison is: from a month to a year or with fine the censor that does not convokes the general meeting in the case in which he is obliged by law; and to 3 months to 3 years the persons which accepts or keeps the duty of censor, contrary to the depositions [art.161, paragraph (2)].

According to the art.161 from the Law no. 31/1990, the financial situations of the trade societies which enter under the incidence of the accounting regulations harmonized with the European norms and the international standards of the accounting will be examined by the financial auditors- physical or juridical persons- under the conditions foreseen by the law. In exchange to the trade societies of which the annual financial situations are not submissive to the financial audit the ordinary general meeting of the stock holders can decide to get a financial audit or naming the censors in case. Also to the societies with limited liability will be applied the depositions we discuss [art. 199], in this case the meeting of the stockholders can name one or more censors, this having the obligation to name the censors, to revoke or to decide the contraction of the financial audit when this does not have an obliged character [art. 194].

But, which are the societies that enter in the category of the units which annual financial situations must audited according to the law? The response is given by the Order of the ministry of public finances no. 1752/2005 for the approval of the accounting regulations according to the European norms which at art. 5 tells us that the annual financial situations made by the juridical persons which at the date of the balance sheet pass over the limits of two from three criteria's (total assets: 3.650.000 euro, the net number; 7.300.000 euro, medium number of the employees during the financial exercise: 50) are audited according to the law. The audition is realized by one or more physical persons or juridical authorized. The financial auditors must express their opinion regarding the grade of the report of the administrators with annual financial situations fro the same financial exercise. The financial auditor is physical or juridical persons that gets this quality under the law conditions and the financial audit represents the activity of examination, with the purpose to express by the financial auditors the opinion on the financial situations according with the audit standards, harmonized with the international audit standards and approved by the Chamber of Financial Auditors in Romania.

On the other side the annual financial situations simplified are checked according to the law, the juridical persons which by the time of the balance sheet does not pass over the limits of two of the criteria's of measure foreseen not having the obligation of the audit of the annual financial situations. The accounting regulations does not nominate the censors as being responsible for the annual accounts checking, as well as in case of the financial auditors, saying just that the annual situations of those entities is being checked according to the foresights of the law.

In the end, we conclude. The censor control claims the belonging to the external control. The censors of the trade societies must by guarantees of the reality, fidelity and credibility of the accounting documents, for all the external users of the accounting information. The essential condition in order to satisfy this request is that those to have a neutral position given to the enterprise and to act as competent professionals, independent and full responsible fro their work and for their opinions.

Abstract: The contemporaneous evolution of the accountancy is characterized through strong tendencies of international accountancy normalization and adapting. This signifies that in most countries the accountancy is supported by common rules and that it drafts synthesis documents whose models are identical for all economic entities. Through the subject approached, this article has in view as main goal presenting the main accountancy operations the companies have as regards acknowledging, assessing and reassessing the tangible assets. The accountancy options concerning the issues mentioned are analyzed with the help of means specific to the financial accountancy in the context of applying the International Accountancy Standards and the International Financial Reporting Standards. The practical examples within this paper will have as role emphasizing the fact that the companies can now choose the most favorable option among the accountancy options allowed by the international standards.

Key words: long term assets, recognizing, assessing, amortization, standard, cost, value.

Defining and recognizing the tangible assets

In the circumstances of applying in Romania the International Financial Reporting Standards, the accountancy options as regards long term assets must be analyzed according to the provisions of IAS 16 "Tangible assets". This standard is applicable to the tangible assets held by an entity. For the tangible assets held by an entity in order to be sold, the standard mentioned will not be applied but there will be taken into account the content of the International Financial Reporting Standard IFRS 5 "Tangible assets held for selling purposes and interrupted activities". The biologic assets corresponding to the agriculture activities are comprised in the application domain of IFRS 41 "Agriculture" and the exploitation and assessment assets are subject matter of IFRS 6 standard "Exploiting and assessing mineral resources". The long term assets created or developed by an economic entity for subsequent usage as real estate investment are regulated by IAS 40 "Real estate investments". For studying the accountancy options concerning the tangible assets there will also be analyzed the provisions of other standards such as: IAS 23 "Costs of being indebted", IAS 36 "Assets depreciation", IAS 17 "Leasing", IAS 20 "Including in the accountancy the governmental subsidies and publishing the information connected to governmental assistance" and IAS 8 "Accountancy policies, accountancy estimations and errors".

A tangible asset is a long term asset held in order to be used for producing goods or for supplying services, in order to be rented to third parties or for administrative purposes and which it is expected to be used for a period of time greater than one year. An element of the tangible assets is recognized as being am asset if the following two conditions are fulfilled at the same time: the asset will generate future economic benefits for the entity; the asset's cost can be credibly assessed.

An economic entity assesses all costs of its tangible assets when they occur according to the principle of acknowledging. These costs imply initial costs for purchasing or building some elements of tangible assets, as well as the costs incurred subsequently for adding or replacing a part of that long term asset. The costs for maintaining and current repairing the tangible assets are not acknowledged in the accountancy value of those elements because they do not observe the two conditions for acknowledging them as assets.

Assessing and reassessing the tangible assets

An element of the tangible assets which is acknowledged as an asset will be initially assessed according to its price that can be, according to the manner that element entered the patrimony, purchasing price or production price. The purchasing price for the tangible assets comprises:

- buying price, including the custom duties and the non-recoverable charges, after deducting the commercial discounts and the abatements;
- any costs that can be directly assigned to bringing the asset to the location and in a condition required for it to operate in the manner desired by the management;
- the initial estimation of the costs for demounting and moving the element and for restoring the location where it will be moved;
- indebt costs that can be directly assigned to purchasing an asset according to the alternative treatment allowed in IAS 23 “Costs of being indebted”.

If paying the purchasing price is postponed over the crediting term, the difference between the cash price and the total payment made is acknowledged as interest for the crediting period of time aside the situation when such an interest is acknowledged in the accountancy value of the long term element according to the alternative treatment allowed in IAS 23 “Costs of being indebted”.

The production price for a tangible asset comprises: costs for raw materials and materials required for the production; costs for salaries of the staff directly involved in the production, as well as any contributions corresponding to them; share of the indirect production expenses, rationally assigned on the production costs; initial estimation of the demounting and moving costs as regards the element and for restoring the location where it will be moved; indebt related costs that can be directly assigned to purchasing an asset according to the alternative treatment allowed in IAS 23 “Costs of being indebted”. Examples of costs that are not included in the price of the tangible asset are[6, p.910]: costs for opening a new plant; costs for introducing a new product or service (including the costs for advertising and promotional activities); costs for directing the activity in the new location, including the costs for preparing the staff; administrative costs; initial exploitation losses, such as the ones registered at the time of increasing the demand for the product produced by that tangible asset; costs for relocating or partial or full reorganizing the entity’s activities; abnormal costs for waste, labor or other resources registered for building on its own an asset; costs registered for remaking functional an asset or for ones resulted from exploiting it below its regular capacity.

The initial value of some tangible assets used by a lessor within a leasing contract is determined according to the rules set out by IAS 17 “Leasing”. Thus, the tangible assets are registered either according to their honest value provisioned in the contract, either according to the updated value of the minimal payments provisioned in the contract, if the latter’s value is lower than the honest value. The accountancy value of the tangible assets can be diminished by the size of public subsidies according to the standard ISA 20 “Including in the accountancy the governmental subsidies and publishing the information connected to governmental assistance”.

Applying in the Romanian accountancy the aspects connected to the initial price of a tangible asset, dealt in IAS 16, will be emphasized through the following two examples:

Example 1: An economic entity in the wood industry purchases a plant in the following conditions:

- price negotiated with the supplier lei 80 000;
- transport, mounting and packing expenses invoiced by the supplier lei 2 000;
- costs for arranging the production section in order to mount the plant invoiced by a specialized company lei 1 000;
- costs for partially reorganizing the activity of that entity as consequence of introducing the new plant 900 lei;
- the architect’s fee lei 800;
- costs for training the staff that will operate that plant lei 1500.

The costs elements	The purchasing price elements	The period related expenses
Price negotiated with the supplier	80 000	
Transport, mounting and packing expenses invoiced by the supplier	2 000	
Costs for arranging the production section in order to mount the plant invoiced by a specialized company	1 000	
Costs for partially reorganizing the activity of that entity as consequence of introducing the new plant		900
The architect's fee	800	
Costs for training the staff that will operate that plant		1 500
Total	83 800	2 400

Table 1: Assigning the cost elements

Registering the patrimony entrance for the plant according to its purchasing price assumes:

2131 "Technological plants"	=	%	83 800	
		404 "Long term assets suppliers"		82 000
		401 "Suppliers"		1 800

Example 2: During a financial year a company produces on its own a building incurring the following expenses:

- raw materials lei 60 000; supplies lei 5 000;
- manual labor expenses lei 12 600;
- expenses for maintaining and operating the plants (indirect expenses) rationally assigned on the production cost lei 4 000;
- expenses for the interest corresponding to a loan contracted for building the real estate lei 1 000 (according to the alternative treatment allowed in IAS 23 "Costs of being indebted");
- expenses for salaries as regards the administrative staff lei 3 000.

After analyzing the expenses mentioned and after observing the regulations in IAS 16, we can notice that in the production price cannot be included the salary expenses concerning the administrative staff. As a consequence, the building's production cost is:

60 000 + 5 000 + 12 600 + 4 000 + 1 000 = 82 600 lei.

Receiving the building will be registered in the accountancy thus:

212 "Buildings"	=	722 "Incomes from producing tangible assets'	82 600	82 600

A tangible asset can be purchased through a total or partial exchange with another tangible asset of the same type or with another asset. The cost for such a tangible assets element is assessed, according to the circumstances, to its hones value or to the accountancy value of the asset assigned. The honest value will be used only if the exchange transaction is not commercial. If the tangible asset received is not assessed to its honest value then it will be assessed according to the accountancy value of the asset assigned. The economic entity determines if the exchange transaction is commercial through analyzing the degree in which the future treasury flows are forecasted to change as result of the transaction. An exchange transaction is commercial if:

a) the value, the frequency of the cash flows and the risk connected to them generated by the asset received are different of the ones of the transferred asset; or

b) the using value of a part of the entity's activities influenced by the transaction is modified as a result of the exchange and

c) the differences resulting in a) or b) are significant as against the honest value of the exchanged assets.

There must be emphasized that in the Romanian accountancy practice there are not observed the provisions of IAS 16 as regards exchanging assets. As a consequence, the assets exchange is reflected through simultaneous buying and selling operations.

Example: An economic entity exchanges an "A" vehicle assessed to an honest value of lei 37 000 for a "B" vehicle assessed for lei 40 000. The registration value (initial cost) of the "A" vehicle is lei 48 000 and the amortization registered until the date of the transfer is lei 27 000. Registering the exchange upon observing the provisions of IAS 16 is made thus:

- net accountancy value of the "A" vehicle = 48 000 – 27 000 = lei 21 000;
- amount to be paid in order to compensate the honest value difference = 40 000 – 37 000 = lei 3 000;
- value with which it is diminished the initial cost of the vehicle = 48 000–40 000 = lei 8 000;
- income obtained of the exchange made 40 000–21 000–3 000 = lei 16 000.

2813" Amortizing the plants, the transportation means, the animals and plantations"	=	%	27 000	
		2133 "Transportation means"		8 000
		5121 "Accounts in lei with banks"		3 000
		7583 "Incomes from assigning the assets and other capital operations"		16 000

After its initial registration as asset, a tangible asset can be registered in the accountancy registers either according to its cost less the accrued amortization and any loss in the accrued depreciation, either through reassessing. Reassessing the tangible assets held by a company will be made on a regular basis in order to ensure that the accountancy value is not too much different of the one determined through using the hones value on the balance date. The value resulting from reassessing a tangible asset is its honest value on the reassessment date less the subsequent cumulated amortizations and the subsequent cumulated value losses. The value losses must be analyzed according to IAS 36 "Assets depreciation".

The honest value of the lands and buildings is, regularly, determined by qualified experts. This honest value is, in general, the market value. The market value is the estimated amount for which a real estate (a land or a building) will be exchanged, on the assessment date, between a decided buyer and a decided seller, through a transaction having an objectively determined price, after an adequate marketing activity, in which the parties acted knowingly, prudently and without constraints. The estimated amount for determining the market value is the best price that the seller can obtain, in reasonable manner, and the most favorable price that the buyer can obtain. A decided buyer is a buyer being motivated, but not constrained to buy, a buyer that is neither anxious to buy, neither determined to buy at any cost, a buyer that purchases according to the realities of the present day market and not of an imaginary market. A decided seller is neither anxious nor constrained to sell, nor forced to maintain a certain price. The honest value of the production plants is, usually, their market value determined through estimation means. For the strictly specialized tangible assets that are not subject matter of some regular transactions, the hones value is identified, most times, with its replacement costs, less the amortizations.

An asset cannot be reassessed in an isolated manner. The reassessment must be applied to the ensemble of assets in the same category, in other words, for all assets having an identical type and using manner. Through reassessing the assets in the same category, it is avoided at the same time a greater heterogeneity in the manner of assessing different issues in the financial statements. When the accountancy value of an asset will increase as a consequence of a reassessment, the growth also has as effect increasing the reassessment reserves as elements of the own capital. To the degree a positive reassessment compensates a negative reassessment of the same asset, previously to including it for expenses in the accountancy register; the positive reassessment must also be registered in the accountancy books for incomes. When the accountancy value of an asset is diminished, as a consequence of a reassessment, this reassessment must be registered in the accountancy books as expenses. Although, there must be for a negative reassessment to be directly charged to the corresponding reassessment reserves to the degree such a reduction would not surpass the size of the reassessment reserves concerning the same asset. The reassessment reserve comprised in the own capitals can be transferred, in a direct manner, to the result carried forward, when the reassessment reserve is obtained. The entire reassessment reserve is obtained on the occasion of removing from operation or assigning the asset. Still, a part of the reassessment reserves can be obtained to the degree the asset is used by an economic entity. In such a case the size of the reassessment reserves obtained is the difference between the amortization relying on the reassessed accountancy value of the asset and the amortization relying on the entry cost of the asset. [2, p. 101].

As regards reassessing tangible assets, the problem arisen would be the manner for dealing the amortization on the reassessment date. A method would be re-calculating the amortization pro-rated with the gross accountancy value of the asset thus that after the reassessment the accountancy value of the asset to be equal to its reassessed value. The second method assumes eliminating the amortization of the gross accountancy value of the asset, thus performing only the reassessment of the net accountancy value. This method is often used for buildings.

Example: An economic entity holds buildings that have been purchased for a price of lei 900 000 and the registered amortization until the reassessment date is lei 300 000. The honest value determined by the accountancy experts is lei 1 000 000.

According to the first reassessment method:

- it is calculated the ratio between the honest value and the net accountancy value of the buildings:

$$1\ 000\ 000/\ (900\ 000 - 300\ 000) = 1{,}66$$

- - the cost of the long term assets and the cumulated amortizations are reassessed through applying the growth coefficient which leads to:
  - the reassessed cost of the constructions: 900 000 x 1,66 = lei 1 494 000;
  - reassessed cumulated amortizations: 300 000 x 1,66 = lei 498 000;
  - value that an be amortized after the reassessment: lei 996 000.
- - registering the reassessment operations:

212 “ Buildings”	=	%	594 000	
		2812 “Amortizing the buildings’		198 000
		105 “Reassessment reserves”		396 000

According to the second reassessment method:

- - it is annulled the registered amortization and it is diminished the amortization size of the value of buildings costs:

2812 “Amortizing buildings”	=	212 “Buildings”	300 000	300 000

- - reassessing the constructions:

212 “Building”	=	105 “Reassessment reserves”	396 000	396 000

- - value that can be amortized after the reassessment = 900 000 – 300 000 + 396 000 = 996 000 lei.

After analyzing the two methods it is noticed that any of them results in the same value that can be amortized after the reassessment.

As regards the reassessment, the Anglo-Saxon accountancy has a series of particular characteristics as against the international standards’ regulations.[5, p. 110] For this there must be mentioned that in Great Britain a complete reassessment of a tangible assets category can be made every five years and an interim assessment can be made during the third year. If the full reassessment is made by an internal assessor, then it must be reviewed by an independent assessor through sampling.

Conclusions

The economic entities must apply the accountancy policies and options as regards the tangible assets in order to supply a clear, complete and trustworthy image of the long term assets in the financial statements. For each long term assets category the financial statements will supply the following information: assessment basis for determining the entry accountancy value, used amortization methods, using durations, gross accountancy value and the cumulated amortization (together with the losses accrued from the depreciation) at the begin and at the end of the period. In order to reconcile the accountancy value at the beginning and at the end of the management period, it is recommended to be made reference to information on: the long term assets' entries, the assets held for selling purposes according to IFRS 5, increasing or diminishing during the period of time and resulting from reassessment, the evolution of depreciation related losses, amortization, other modifying. The existence and the value of the tangible assets created as security, mortgage, or granted as guarantee for certain debts of the entity will be mentioned separately in the financial statements. The economic entities must not neglect the value of the long term assets in progress of being purchased or in progress of being built. For this, we will include in the financial statements the value of the contractual obligations for purchasing some tangible assets and the value of the costs acknowledged in the accountancy value of a tangible asset during its creation.

In this article has been approached the subject of reassessing the tangible assets, emphasizing on the two methods for managing the amortization on the reassessment date. After analyzing the examples supplied it is noticed that both methods generate the same amortizable value after reassessment. No matter if one method or the other will be chosen, the economic entity will have to supply, in its financial statements, the following information: date when the reassessment will enter in force, whether the entity employed an independent assessor, the significant methods and assessments applied for estimating the hones value of the elements, the reassessment excess, thus identifying the modifying corresponding to the period of time and the limitations as regards distributing it to the shareholders. For each reassessed category of tangible assets it is necessary to mention the accountancy value that would be obtained if the cost model would be applied.

We must take into account that improving a company's performances involves the operative and as exact as possible measuring the efforts and the effects, as well as efficiently using the tangible assets. Organizing and leading the accountancy management of the tangible assets relies more and more on careful researching the structure and dynamics elements, but especially on decoding the evolution tendencies of the phenomena that occur in the company and in its external environment. An economic entity will be able to change its accountancy option as regards the tangible assets' elements only if it will prove that the new option will have an important effect in the current period of time or in the next periods. The main effect of adopting the new option must be more accurately and more authentically presenting the tangible assets in the financial statements.

Abstract: Performance creation and measurment in the public sector entities has become a priority in the Romanian public sector. Limited resources, many and different requests for quality services compel the government to have a greater control upon the way of spending public money and providing economy, efficiency and effectiveness services. By this constructive research we define the performance concept, identify the ways of measuring and assessing the degree of performance achievement in the public sector from Romania.

Key words: performance, economy, efficiency, effectiveness, audit of performance

1. Performance aproaches in the public sector entities

Taking into account the recessions, limited resources and the public's claims for diverse and qualitative services, performance in the public sector entities has become a priority.

Generally, performance is the synonym for the best result of an activity. Literature offers different aproaches of performance concept.

Performance bears the terms of progress, effort, doing always the best […] (Bourguignon,1995).

Rudman (1995) states that performance is a process by which an entity tries to achieve its objectives. Peters & Waterman (1982) approach entity's performance by means of social performance. Thus, performance is assimilated to excellence, which is based on four determiners: efficiency, social identity, achieving objectives, reputation/fame.

Alzarad & Sépari (1998) consider that performance implies a global view of interactions between internal and external indicators, quantitative, technical and human indicators, physical and financial indicators of management.

The above approaches emphasise that performance in the public sector is important, complex and difficult to define. Though different, they have a common denominator: performance is defined according to the way the human, material, informational and financial resources are used in order to achieve the proposed objectives at the beneficiaries' expectations.

The definition of performance has not been a major concern for the national standards. The development of the public sector entities' accounting by the assimilation of the International Accounting Standards for Public Sector (IPSAS) underlines the concept of performance (2002). This is defined by means of financial performance, reflected by patrimony result (excess/deficit).

2. Performance measurement in the public sector entities – a paradox?

It is difficult to undertake performance measurements in the public sector entities due to the public system dynamics and complexity. Jones&Pendlebury (2000) argue that the difficulty and complexity of performance measurement in the public sector result from the fact that the entities try to accomplish both commercial and non-commercial objectives. Bouckaert & Balk (1991) have tried to establish if it is really possible, appropriate or even necessary to measure the public sector performance.

Meyer & Gupta (1994) state that performance measurement in public sector is a paradox. They refer to a weak correlation between performance indicators and performance itself. The performance paradox is explained by the tendency of performance indicators to run down over time: as performance gets better, indicators lose their value of detecting bad performance; on the other hand, when entities have learned which aspects of performance are measured (and which are not), they can use that information to manipulate their assessments. The same opinion is sustained by Wilson (1989) who brings into discution the elusive character of the policy objectives, because public policies often have multiple and contradictory goals.

In opposition, the advocates of performance measurement in the public sector propose the measuring of performance in terms of indicators, results, in terms of the trinom economy – efficiency – effectiveness, from point of view of management and policy.

Smith (1990), Likierman (1993), Stewart & Walsh (1994), suggest performance measurement in the public sector entities by a set of indicators. Thus, Likierman (1993) considers that performance indicators in the public sector are valuable managerial tools if properly used. Indicators could ensure that resources are not wasted and managerial actions are not distorted. Based on a research carried out during a three year period involving 500 middle and senior grade public service managers using performance indicators, he categorizes his research findings into four groups: concepts, preparation, implementation and use. Likierman outlines the desired components and activities that need to be considered under each of the four mentioned groups when implementing performance indicators as managerial tools. His arguments are that these activities would help the entity to use performance indicators to better effects. Moreover, the system of indicators can help to evaluate the managerial actions.

Kaplan & Norton (1996) propose that performance of an entity could be based on a performance monitoring system, called ”balanced scorecard”. This method helps the entity to unify the long-term strategies with the short-term actions. According to ”balanced scorecard” method, performance can be measured from four interacting perspectives: 1) translating the vision into objectives; 2) communicating and linking strategies at all levels of the organization; 3) activity planning; 4) feedback and learning.

Performance measurement through economy – efficiency – effectiveness trinom, a new paradigm into the public sector, appeared in 1982, under the name of « value for money». This shows the economic way of resources procurement and their efficient use in the process of achieving the public management objectives while respecting simultaneously the conditions of « the three Es », respectively : economy – efficiency – effectiveness. Thus, it can be said that « the three Es » significantly influence the process towards performance.

Leory (1991), respectively Jones & Pendlebury (1993) are the advocates of measuring performance by economy, efficiency, effectiveness. By their researches, Jones & Pendlebury conclude that economy measures are relative and usually concern the inputs. In opposition, Rudman (1995) states that the focus is on inputs related to outputs and proposes the completion of economy measures with efficiency and effectiveness measures, arguing that economy measures are not sufficient to measure economic performance. In order to use efficiency measures, Rudman categorizes them into two classes: accounting efficiency, which concentrates on performance of the entity and economic efficiency, which is based on achieving a pareto-optimal allocation of resources.

Another view states that performance in the public sector can be measured through result. But Jones & Pendlbury (2000) say that the result is difficult to assess in many public sector entities because of its nature.

Stewart & Walsh (1994) approach the issue of performance assessment in the public sector entities depending on the politics perspective, outlining that these entities are owned and controlled by government. They consider that the assessment of performance will shift as the political debate shifts and, therefore, the performance measures used by these entities will have limitations.

The opinions sometimes divergent, from the literature on public sector have a common denominator: performance measurement is a very important process and, at the same time, a very difficult process. But without reference to performance, managers and not only, cannot evaluate objectively and consciously the quality of made decisions.

According to the national regulations, performance in the public sector is explicitly financial and it is measured through the patrimony result. This is reflected by the patrimony result account and is determined on the basis of agreements accounting, as a substraction between the achieved revenues and the expenses from the current financial exercise. Searching the components of the financial situations, we have also discovered other methods of performance measurement, such as: operation result, treasury result, global result. Will co-existence of four methods of performance measurement, though three are not explained, allow managers to focus on results and on the best strategies in order to achieve those results, or will it generate an information surplus which will create difficulties to management?

Performance measurment through economy, efficiency and effectiveness in the public sector from Romania is still a challenge. This method of performance measurment implies elaboration and implementation of a new system of performance monitoring which is continuously growing as *learning organizations* in the process of achieving the best performance level.

3. Audit of performance – instrument of independent assessment of performance in the public sector entities

Related to the concept value for money, performance audit is an audit of money value. According to the International Standards INTOSAI, the audit of performance is an evaluation or an independent examination of the degree an activity, programme or entity operates efficiently and effectively, respecting the economy measure. A performance audit can be an audit of economy, efficiency and effectiveness or a combination of two of them. In national regulations view, the audit of performance examines if the established criteria for the implementation of the public entity's objectives and tasks are correct for the assessment of results and it appraises if the results are in line with the objectives.

The above mentioned approaces, though different, outlines the fact that the audit of performance is focused on the trinom of «the three E», respectively, on the assessment of the measures undergone regarding the accomplishment of the principles of economy, efficiency and effectiveness:

- Economy means minimazing the cost of the alloted resources for achieving the forecast results of an activity, mentaining the appropriate quality of these results. It is concerned with lowest costs possible for highest quality achievement.
- Efficiency is represented by the ratio between outputs and inputs. The entity is considered to be efficient if it produces maximum results using a given quantity of resources, or it uses a minimum quantity of resources in order to achieve a result of a certain quality and quantity.The ratio result is bigger than the one planned. It is based on the relation between results and the resources used for their production.
- Effectiveness is the ratio between the achieved results and the planned ones and it reflects the degree of accomplishing the programmed objectives for each of the activities. It is concerned with the achievement of certain forecast objectives whose result can be compared to the objectives.

A thourough search of these three principles outlines the fact that the audit of performance answers the followiong questions: Was the work done correctly? Was it done what it had been necessary? By the given answers, performance audit limits the waste of resources, fraud and corruption possibilities and it detects on time the anomalies and defficiencies. The consequences of the public entities' lack of economy, efficiency and effectiveness, the consequences of legal provisions infringement and, implicitly, of a vicious management are felt at level of the entire society and are materialized in the faulty use of available resources, with negative effects regarding the objectives achievement, as well as the internal process operation without remarkable performances.

Conclusions

In the public sector, entities create their image upon the quality of provided services and their capacities of satisfying the public. This image becomes difficult to create in terms of lack of resources and the constantly growing needs of various and qualitative services.

Will the Romanian public service entities succeed in overpassing these impediments and in creating a favourable image? The undertaken research offers the answer and identifies the strategy. The answer is affirmative and it is based on the couple of performance and audit of performance. Performance, as a simple result, proves to be an old fashioned concept if it is not analysed the way performance has been achieved. The triad economy – efficiency – effectiveness explains the process through which the entities achive performance. The audit of performance evaluates the way in which the entities comply with the principles of economy, efficiency and effectiveness in spending the public money, offering recommendations to the managing board to improve the triad.

The Impairment test is one of the most important topics of the IFRS, that's why it is an obliging low value test for the assessment of the fixed assets. The execution of the tests requires in many cases a capitalized value of potential yield inquiry by a Discounted-cash-flow method.

An impairment test is carried out for a line of business (cash Generating Unit). Under certain requisites, a whole line of business is tested on a decrease in value, not only single objects.

US-GAAP and IFRS ask a periodical judgment of possible indicators of a lasting value impairment. It is the aim that the assets aren't shown in the balance more highly than her obtainable value.

Werthaltigkeitstest, Cash Generating Units, Wertminderung, Wertaufholung

Als einer der wichtigsten Themenbereiche der IFRS, ist der Werthaltigkeitstest (*Impairment Test*) ein verpflichtender Niederstwerttest zur Bewertung des Anlagevermögens. Die Durchführung der Tests erfordert in vielen Fällen eine Ertragswertermittlung durch ein Discounted-Cash-Flow-Verfahren.

Ein Impairment Test wird für einen Geschäftsbereich (Cash Generating Unit) durchgeführt. Unter bestimmten Voraussetzungen werden – wie etwa bei der außerplanmäßigen Abschreibung des Firmenwerts nach HGB – nicht nur einzelne Vermögensgegenstände, sondern ganze Unternehmensteile auf eine Wertminderung getestet.

US-GAAP und IFRS verlangen eine periodische Beurteilung von möglichen Indikatoren einer nachhaltigen Wertbeeinträchtigung. Das Ziel ist, dass die Aktiva nicht höher als ihr erzielbarer Wert bilanziert werden.

Ergibt sich aus dem geplanten abgezinsten Cash-Flow der Folgeperioden ein Verlust, so ist entsprechend das Anlagevermögen abzuschreiben, in der Reihenfolge:

- Goodwill
- Immaterielle Vermögensgegenstände
- Sachanlagen

Entsprechend IAS 36.2 gilt der Werthaltigkeitstest für alle Vermögenswerte mit Ausnahme von: Vorräten (IAS 2), Fertigungsverträgen (IAS 11), aktiven latenten Steuern (IAS 12), Vermögenswerten aus Leistungen an Arbeitnehmer (IAS 19), Finanzinstrumenten (IAS 39), Immobilien für Zwecke der Wertanlage nach IAS 40, Agrarprodukten (IAS 41), bestimmten Vermögenswerten aus Versicherungsverträgen (IFRS 4) und mit Ausnahme von zur Veräußerung stehenden langfristigen Vermögenswerten (Gruppen langfristiger Vermögenswerte; IFRS 5). Also Wertminderungen von immateriellen Vermögenswerten, von Sachanlagen und des Firmenwerts betreffen IAS 36.

Stellt man eine Wertminderung fest, wird eine außerplanmäßige Abschreibung erfordert. Doch, nach IAS 36.59, darf eine außerplanmäßige Abschreibung nur dann erfolgen, wenn die Bedingungen des Werthaltigkeitstests erfüllt sind.

Bei der außerplanmäßigen Abschreibung von Sachanlagen berücksichtigt man Rückgriffsrechte oder Versicherungsentschädigungen nicht, sondern ertragswirksam als Forderung angesetzt, sobald der Forderungsanspruch entsteht (IAS 16.65f).

1. Anhaltspunkte für eine Wertminderung *(Trigger Events)*

Besteht ein Anhaltspunkt für eine Wertminderung, dann führt man ein Werthaltigkeitstest grundsätzlich durch (IAS 36.9; *trigger events).* Diese Anhaltspunkte ergeben sich aus externen und internen Informationen, insbesondere aus den folgenden Merkmale (.12):

- erheblich gesunkener Marktwert;
- eingetretene oder drohende nachteilige Veränderung der rechtlichen, wirtschaftlichen oder technischen Rahmenbedingungen;
- Anstieg der langfristigen Zinsen oder der erwarteten Renditen, die den Barwert künftiger Mittelzuflüsse zur Berechnung einer Wertminderung wesentlich verringern;
- der Buchwert des Eigenkapitals des Unternehmens ist höher als seine Marktkapitalisierung;
- Änderung in der Nutzung des Vermögenswerts, Verkaufs- oder Stilllegungspläne;
- Informationen aus der Kostenrechnung, die auf eine verschlechterte Wirtschaftlichkeit hinweisen;
- Verschlechterung der Netto Cash Flows aus der Nutzung des Gegenstands oder Nichterreichen budgetierter Netto Cash Flows.

Auch wenn keine Anhaltspunkte für eine Wertminderung bestehen, sind die immaterielle Vermögenswerte mit unbestimmbarer Nutzungsdauer, noch nicht betriebsbereite immaterielle Vermögenswerte und der Firmenwert (IFRS 3) jährlich auf Wertminderung zu testen. Jedes Jahr muss der jährliche Werthaltigkeitstest zum selben Zeitpunkt durchgeführt werden, sonst können verschiedene Vermögenswerte zu verschiedenen Zeitpunkten getestet werden. Bei immateriellen Vermögenswerten mit unbestimmbarer Nutzungsdauer sind auch Erleichterungen vorgesehen. IAS 36.10 besagt, dass bei Anhaltspunkten einer Wertminderung ggf. ein zusätzlicher Werthaltigkeitstest erforderlich ist.

2. Umfang der Wertminderung

Eine Wertminderung liegt dann vor, wenn der erzielbare Betrag *(recoverable amount)* unter den Buchwert gefallen ist, laut IAS 36.59. In diesem Fall kommt es zu einer außerplanmäßigen Abschreibung.

Nach IAS 36.6, versteht man als erzielbarer Betrag entweder:

- der Fair Value abzüglich Veräußerungskosten *(fair value less cost to sell)* oder
- der Nutzungswert *(value in use*).

Der höhere Betrag ist entscheidend. Wenn einer der beiden Beträge über dem Buchwert liegt, dann muss der andere Betrag nicht mehr ermittelt werden. Soll der Vermögenswert ohnedies veräußert werden, ist regelmäßig nur auf den Fair Value abzüglich Veräußerungskosten abzustellen (IAS 36.21).

Der beste Hinweis auf den Fair Value abzüglich Veräußerungskosten ist der Preis in einem verbindlichen, fremdüblichen Vertrag, vermindert um zusätzlich für die Veräußerung anfallende Kosten (.25). Unter Veräußerungskosten versteht man alle der Veräußerung direkt zurechenbaren, zusätzlich entstehenden Kosten, nicht aber Finanzierungskosten und Ertragssteuern (.6). Mögliche Kostenvorteile aus der Veräußerung dürfen nicht gegengerechnet werden (.28).

Als Nutzungswert versteht man der Barwert der erwarteten, zukünftigen Cash Flows, die aus der Nutzung des Vermögenswerts und gegebenenfalls aus einer zukünftigen Veräußerung zu erzielen sind (IAS 36.6).

Der erzielbare Betrag darf mit dem Nutzungswert gleichsetzt werden, als ein Ausnahmefall der IAS 36.20, wenn der Fair Value abzüglich Veräußerungskosten sich nicht verlässlich ermitteln lässt.

Laut IAS 36.39, alle Einzahlungen, die mit dem Vermögenswert erwirtschaftet werden können, einschließlich Veräußerungserlöse werden von den Cash Flows umfasst. Die direkt zurechenbaren Auszahlungen zur Aufrechterhaltung der Einzahlungen sind abzuziehen (IAS 36.41).

Folglich IAS 36.43f und IAS 36.50, nicht zu berücksichtigen sind Zahlungen:

- die anderen Vermögenswerten zurechenbar sind,
- im Finanzierungsbereich,
- für aktivierungspflichtige Verbesserungen der Anlage oder für Umstrukturierungen des Betriebs,

– für Gewinnsteuern (bzw. aus Steuerrückzahlungen).

Es existieren zwei Verfahren für die Berechnung der Discounted Cash Flows (.A2): der traditionelle und der Erwartungswertverfahren. Nach dem ersten Verfahren werden Trends in der Cash Flow-Prognose, Inflation, Marktliquidität und Risikoprämien im Diskontierungszinssatz berücksichtigt. Nach dem Erwartungswertverfahren werden diese Faktoren bei der Berechnung der einzelnen Cash Flows berücksichtigt.

Kann ein Unternehmen seine zukünftigen Cash Flows nicht eindeutig schätzten, verlangt das Erwartungswertverfahren eine Gewichtung unterschiedlicher Szenarien nach deren Eintrittswahrscheinlichkeit (vgl. IAS 6.A11).

Vor Steuern sind die maßgeblichen Cash Flows, deshalb setzt man auch ein Zinssatz vor Steuern für die Abzinsung ein (IAS 36.55). Dieser Zinssatz entspricht dem langfristigen Marktzinssatz und berücksichtigt die Inflation und das Risiko der Investition.

Existiert ein direkter Zusammenhang zwischen einem Vermögenswert und den damit erzeugten Cash Flows, dann kann der erzielbare Betrag festgestellt werden. Die Cash Flows müssen unabhängig von jenen anderer Vermögenswerte sein (IAS 36.22). Wenn man den Vermögenswerten keine weitestgehend unabhängigen Cash Flows zugerechnet werden können, dann soll man folgendermaßen vorgehen:

– man darf einen angemessenen Näherungswert für den Nutzungswert bzw. den Fair Value abzüglich Veräußerungskosten ermitteln. Dieser Näherungswert kann anstelle des exakt ermittelten Nutzungswerts verwendet werden, wenn der Näherungswert nahe am Fair Value abzüglich Veräußerungskosten liegt (.22f);
– kann man keine angemessenen Näherungswerte feststellen, dann fasst man die funktionell zusammengehörige Vermögenswerte zu einer *cash generating unit* („zahlungsmittelgenerierenden Einheit“) zusammen und diese werden danach insgesamt einer Bewertung unterzogen (.66 und .69).

3. Wertaufholung

Nach IAS 36.109ff ist eine Zuschreibung geboten, wenn den Fall einer Wertaufholung einer in der Vergangenheit erfassten Wertminderung existiert. Diese Wertaufholung ermittelt man aber nur dann, wenn Anhaltspunkte für einen höheren erzielbaren Betrag bestehen (IAS 36.110). Die Anhaltspunkte entsprechen jenen für die Feststellung der Wertminderung.

Der Zuschreibungsbetrag ermittelt sich aus dem Anstieg des erzielbaren Betrags. Die Anschaffungs- oder Herstellungskosten bzw. begrenzen die Wertaufholung (IAS 36.117).

Im Vergleich zum HGB können sich erhebliche Gewinnfluktuationen ergeben, wegen den vorübergehende Wertminderungen die unter den dargestellten Voraussetzungen abzuschreiben und ggf. wieder zuzuschreiben sind.

Dem Konzept in IAS 36 konnte sich das amerikanische FASB nicht anschließen: Zinsen werden durch der Abschreibung auf den Barwert künftiger Überschüsse vorangestellt. Es kommt eigentlich im Laufe der Zeit zu einer Wertaufholung in Höhe der Zinsen, weil der Barwert kontinuierlich ansteigt. Nach US-GAAP liegt ein impairment nur dann vor, wenn der undiskontierte Gesamtbetrag künftiger Cash Flows unter dem Buchwert liegt.

IAS 36.124 lässt keine Wertaufholung beim Firmenwert ist zu, denn ene einmal festgestellte Wertminderung kann nicht mehr rückgängig gemacht werden; eine Zuschreibung käme der Aktivierung eines selbst erstellten Firmenwerts gleich.

4. Test von Cash Generating Units

Wegen des Mangels einer direkten Zurechnung von Cash Flows zu einzelnen Vermögenswerten, kann man in vielen Fällen den Nutzungswert nicht ermitteln (IAS 36.22). Dies gilt insbesondere für den Firmenwert *(goodwill)*, weil es auch Cash Flows nur in Verbindung mit anderen Vermögenswerten erzeugt.

IFRS 3.54f verbietet eine planmäßige Abschreibung für den Firmenwert. Deshalb testet man es, wie immaterielle Wirtschaftsgüter mit unbestimmbarer Nutzungsdauer, in jeder Periode auf eine Wertminderung zu, auch wenn keine Anhaltspunkte einer Wertminderung vorliegen.

Die Wertminderung wird auf einer übergeordneten Ebene ermittelt, der *cash generating unit*, wenn Cash Flows den Vermögenswerten nicht direkt zugerechnet werden können. Nach IAS 36.6 definiert sich eine *cash generating unit* als die jeweils kleinste identifizierbare Gruppe von Vermögenswerten, die Mittelzuflüsse (Cash Flows) erzeugen, die weitestgehend unabhängig von den Cash Flows anderer Vermögenswerte oder Gruppen von Vermögenswerten sind.

Die Einteilung von *cash generating units* hängt von der Messung der Leistung des Unternehmens ab oder von der Entscheidung über die Weiterführung oder Aufgabe von Unternehmensteilen oder Vermögenswerten. In IAS 36 findet man eine sehr allgemeine Definition dieser, gerade um dem Unternehmen eine möglichst sinnvolle und flexible Einteilung entsprechend der internen Leistungssteuerung zu ermöglichen. Die *cash generating units* befinden sich auf der untersten Ebene der Leistungssteuerung, weil sie die kleinstmöglichen Messeinheiten sein müssen.

Beispiele für selbständige *cash generating units* währen:

- Filialen einer Handelskette, wenn bei diesen z.B. der Erfolg einzeln gemessen wird und sich die Einzugsgebiete nicht überlappen;
- eine Produktionsstätte, die Vorprodukte für die Weiterverarbeitung in anderen Produktionsstätten erstellt, aber einen Teil der Vorprodukte auch an Dritte über einen aktiven Markt veräußert oder veräußern könnte.

Beispiele, in denen keine selbständigen *cash generating units* vorliegen:

- ein Gebäude im Besitz eines Produktionsunternehmens, das zur Hälfte als Verwaltungsgebäude genutzt und zur anderen Hälfte für Wohnzwecke vermietet wird; der Hauptzweck des Gebäudes ist die Verwaltung, die Mieteinnahmen sind daher nicht unabhängig von den Gesamtumsätzen des Unternehmens, die ein Verwaltungsgebäude erfordern;
- ein Bergbauunternehmen betreibt seine eigene Bahnstrecke zum Transport der Abbauprodukte. Da die Bahn nur zum Schrottwert veräußert werden kann und keine unabhängigen Cash Flows generiert, liegt keine eigene cash generating unit vor.

Der Werthaltigkeitstest einer *cash generating unit* ist verhältnismäßig aufwendig. IAS 36.96ff sieht auch Vereinfachungen vor, weil der Firmenwert zumindest jährlich zu testen ist, auch ohne Anhaltspunkte für eine Wertminderung:

- Der Test kann jederzeit während des Abschlussjahres durchgeführt werden, solange er in jedem Jahr zur selben Zeit stattfindet. In der Praxis erfolgt die Prüfung meist im dritten Quartal.
- Wurde schon in der Vorperiode ein Werthaltigkeitstest über den Firmenwert durchgeführt, dann dürfen die Ergebnisse des Vorjahres auch für das Abschlussjahr herangezogen werden, aber mit der Bedingungen, dass sich die Zusammensetzung der *cash generating unit* seither nicht wesentlich geändert hat, der erzielbare Betrag deutlich über dem Buchwert lag und sich aus der Analyse der zwischenzeitlichen Ereignisse ergibt, dass eine Wertminderung unwahrscheinlich ist.
- Wenn der Firmenwert im Jahr eines Beteiligungs- oder Unternehmenserwerbs noch nicht vollständig den einzelnen *cash generating units* zugeordnet werden kann, dann darf die Zuordnung auch in der folgenden Periode erfolgen.

Grundsätzlich fasst man in der *cash generating unit* nur Vermögenswerte zusammen, die zu den Mittelzuflüssen der *cash generating unit* unmittelbar beitragen, während die Schulden nicht zuzuordnen sind, weil ihre Zuordnung die Abschreibungsbeträge vermindern wurde. Deshalb ist die sinnvolle Zuordnung von Vermögenswerten und Schulden zu einer identifizierten *cash generating unit* ein Hauptproblem des Werthaltigkeitstests.

Schulden, als Ausnahmefall, werden dann zugeordnet, wenn der erzielbare Betrag der *cash generating unit* nicht sinnvoll ohne die Mittelabflüsse für diese Schulden ermittelt werden kann. Der Buchwert der Schuld wird in diesem Fall vom Nutzungswert und vom Buchwert der *cash generating unit* abgezogen (IAS 36.78).

Die Zuordnung des Firmenwerts ist auch nicht leicht, denn laut IAS 36.80 soll der Firmenwert jenen Unternehmensbereichen zugeordnet werden, die von den Synergien des Unternehmens- oder

Beteiligungserwerbs profitieren, also kann es sowohl erworbenen Unternehmensbereichen als auch vor dem Erwerb vorhandenen Unternehmensbereichen zugeordnet werden, soweit sich Synergien ergeben.

IAS 36 enthält keine konkreten Bestimmungen oder Beispiele für die Verteilung des Firmenwerts auf *cash generating units*. Ist die Zuordnung nicht eindeutig möglich, dann soll man aus mehreren *cash generating units* eine Gruppe bilden und der Firmenwert wird dann gemeinsam mit der Gruppe auf eine Wertminderung getestet (.80).

Aus der Zusammenfassung sollten sich die kleinstmöglichen Gruppen ergeben. Diese ist aber begrenzt, denn eine Gruppe kann nicht den gesamten Konzern umfassen. Nach IAS 36.80 gelten als Obergrenze die Segmente im Sinne von IAS 14 zur Segmentberichterstattung.

Bei der Gruppenbildung ist wichtig jene Ebene, auf welcher der Firmenwert durch die Unternehmensführung im Rahmen der internen Leistungserfassung gemessen wird (IAS 36.81 spricht von *„internal management purposes"*, es meint also die operative Unternehmensführung, nicht notwendigerweise den Konzernvorstand).

Die einzelnen *cash generating units* müssen auch jeweils für sich getestet werden, trotz der Gruppenbildung, ohne Zuteilung eines Firmenwerts. Dieser Test findet aber nicht jährlich statt, sondern nur bei einem Anhaltspunkt für eine Wertminderung (.88).

Für das allgemeine Konzernvermögen *(corporate assets)* ist dasselbe Verfahren wie für den Firmenwert vorgesehen (.100ff). Dieses ist ebenfalls den einzelnen *cash generating units* zuzurechnen, soweit dies eindeutig und konsistent möglich ist.

Existiert nicht die Möglichkeit einer Zuteilung zu *cash generating units*, dann ist folgendermaßen vorzugehen:

- Zuerst testet man jede *cash generating unit* für sich auf Wertminderung (d.h. ohne Zuteilung allgemeinen Konzernvermögens) und man schreibt es ggf. ab.
- Danach bildet man die kleinstmöglichen Gruppen von *cash generating units*, denen das allgemeine Konzernvermögen eindeutig – ganz oder teilweise – zurechenbar ist. Der so ermittelte Buchwert jeder Gruppe ist dann ggf. auf den niedrigeren erzielbaren Betrag abzuschreiben.

Soweit es möglich ist, sollen der Firmenwert und das allgemeine Konzernvermögen beim Test der *cash generating units* bzw. Gruppen gleichzeitig zugerechnet werden (.104 erster Satz). Die Zurechnung von allgemeinem Konzernvermögen vergrößert daher die potentielle Firmenwertabschreibung.

5. Wertminderung bei *Cash Generating Units*

Ein Ausgleich zwischen Firmenwerte verschiedener *cash generating units* ist nicht möglich, weil der Firmenwert nur auf Ebene der *cash generating units* bzw. deren Gruppen auf die Werthaltigkeit getestet wird.

Ist der erzielbare Betrag niedrigerer als der Buchwert, dann ist eine Abschreibung notwendig. Erstens wird die Wertminderung vom Firmenwert der *cash generating unit* bzw. Gruppe abgeschrieben. Existiert der Fall einer größeren Wertminderung als der Firmenwert, dann sind auch die übrigen Vermögenswerte der *cash generating unit* bzw. Gruppe wertgemindert.

Die Abschreibung wird proportional zu den Buchwerten der übrigen Vermögenswerte abgesetzt (IAS 36.104). IAS 36.105ff spricht auch über die Einschränkungen der proportionalen Abschreibung, um dabei keine stillen Reserven zu legen:

- Der erzielbare Wert jedes einzelnen Vermögenswerts soll nicht unterschritten werden. In diesem Fall ist die Wertminderung proportional auf jene Vermögenswerte zu verteilen, deren Buchwert noch über dem jeweiligen erzielbaren Wert liegt.
- Können die erzielbaren Beträge nicht einzeln ermittelt werden, soll das Unternehmen die Wertminderung nach eigenem Ermessen innerhalb der *cash generating unit* oder Gruppe verteilen.

Im Konzernabschluss werden auch Beteiligungen von weniger als 100 % vollkonsolidiert, man spricht von Minderheitengesellschafter. Aber im konsolidierten Beteiligungsbuchwert ist nur der Firmenwert enthalten, der auf den Anteil des Mutterunternehmens entfällt. Weil auch der erzielbare Betrag jenen Anteil am

Veräußerungswert bzw. an den Cash Flows, der den Minderheitengesellschaftern zukommt umfasst, muss daher der Firmenwert um einen fiktiven, den Minderheitengesellschaftern zustehenden Firmenwert erhöht werden (IAS 36.92).

Ist es die Rede um eine einer Beteiligung von z.B. 50 % wird der Firmenwert verdoppelt (Multiplikator: 100/Prozentsatz der Beteiligung des jeweils übergeordneten Konzernunternehmens). Diese Erhöhung wird aber nicht verbucht, denn sie erfolgt nur in einer Nebenrechnung zur Ermittlung der Wertminderung.

Im Falle einer Wertminderung werden zuerst die Firmenwerte reduziert. Immerhin ist der Minderheitenfirmenwert nicht in den Büchern erfasst, deshalb wird auch die auf Minderheitenfirmenwerte entfallende Abschreibung nicht verbucht (.93). Wenn nach der Abschreibung beider Firmenwerte noch eine Wertminderung bleibt, werden die übrigen Vermögenswerte nach IAS 36.104 abgeschrieben.

Der Werthaltigkeitstest beim Firmenwert vergleicht Buchwerte mit dem erzielbaren Betrag. Wurden seit dem Erwerb stille Reserven aufgebaut, wird dadurch ggf. die Firmenwertabschreibung verhindert. Ein Extremfall wurde heißen, dass der aktivierte Firmenwert nur durch stille Reserven gedeckt ist, was die Firmenwertabschreibung verhindert. Der „implizite Firmenwert" wird nach US-GAAP ermittelt und folglich wird der Wert einer Einheit *(reporting unit)* mit dem Fair Value der Vermögenswerte, anstatt dem Buchwert, verglichen.

6. Zur Veräußerung stehende langfristige Vermögenswerte (IFRS 5)

Für langfristige, zur Veräußerung stehende Vermögenswerte enthält IFRS 5 Sonderbestimmungen hinsichtlich Ausweis und Abschreibung.

IFRS 5 betrifft langfristige Vermögenswerte (idR Sachanlagen oder immaterielle Vermögenswerte) oder Gruppen von langfristigen Vermögenswerten und Schulden**,** die zur Veräußerung stehen (*non-current assets held for disposal; disposal groups*), Ausweisfragen bei aufgegebenen Geschäftsbereichen, sowohl auch Beteiligungen assoziierter, Gemeinschafts- und Tochterunternehmen (IAS 28, 31 und 27), wenn sie bereits in Weiterveräußerungsabsicht erworben wurden (IFRS 5.3 iVm .6ff). In diesen Fällen erfolgt die Bewertung nach IFRS 5, nicht nach den vorgesehenen Methoden in IAS 28,31 und 27.

Ausgelassen werden die aktive latente Steuern, finanzielle Vermögenswerte nach IAS 39, das Restvermögen aus gedeckten Pensionsplänen (IAS 19) und die Vermögenswerte im Sinne von IAS 40, IAS 41 und IFRS 4.

Wenn der im Restbuchwert verkörperte Nutzen vorwiegend aus der Veräußerung realisiert werden soll, stehen die Vermögenswerte oder Gruppen von Vermögenswerten zur Veräußerung (IFRS 5.6).

Ist das Vermögen im gegenwärtigen Zustand bereit zur Veräußerung zu marktüblichen Konditionen und die Veräußerung sehr wahrscheinlich, dann wendet man IFRS 5 an. Eine Veräußerung ist sehr wahrscheinlich nur unter den folgenden Bedingungen, die kumulativ erfüllt sein müssen:

- das Management verfügt über die ausreichende Kompetenz zur Veräußerung und hat einen Verkaufsplan;
- ein aktives Programm zur Käufersuche ist angelaufen;
- das Vermögen wird aktiv und zu einem marktüblichen Preis zum Verkauf angeboten;
- die Veräußerung führt innerhalb eines Jahres zur Gewinnrealisierung;
- noch nötige Veräußerungsmaßnahmen werden wahrscheinlich nicht zu wesentlichen Änderungen im Veräußerungsplan führen.

Laut IFRS 5.15, die zur Veräußerung stehende Vermögenswerte oder Gruppen von Vermögenswerten und Schulden sind mit dem Buchwert oder dem niedrigeren Fair Value abzüglich Veräußerungskosten anzusetzen. Die Abwertung kann von einem höheren Nutzungswert nicht verhindert werden, wie es bei IAS 36 der Fall war, denn es kommt nicht auf den Nutzungswert an. Nach IFRS 5.17, erfolgt die Veräußerung erst nach der ein Jahresfrist, dann ist der Barwert des Fair Value abzüglich Veräußerungskosten heranzuziehen.

Sonderbestimmungen gelten dann, wenn das Vermögen mit dem Ziel der Weiterveräußerung angeschafft wurde, insbesondere bei der Kaufpreisallokation im Rahmen der Kapitalkonsolidierung.

Die tatsächliche Abnutzung würde einen niedrigeren Fair Value und damit eine Abschreibung ergeben, weshalb eine Überbewertung nicht zu befürchten ist (IFRS 5.BC32).

Eine erfolgswirksame Aufwertung der Vermögenswerten oder der Gruppen von Vermögenswerten findet statt, wenn der Fair Value abzüglich Veräußerungskosten in der Folgeperiode steigt. Immerhin dürfen nur Abschreibungen im Sinne von IFRS 5 oder IAS 36 aufgeholt werden. Die Wertaufholung ist daher folgendermaßen begrenzt:

- auf die Anschaffungskosten bei nicht abnutzbaren Vermögenswerten;
- auf die bis zur Einordnung unter IFRS 5 planmäßig fortgeschriebenen Anschaffungs- oder Herstellungskosten bei abnutzbaren Vermögenswerten.

Unter IFRS 5 fallen ebenfalls die zur Veräußerung stehende Gruppen von Vermögenswerten und die damit verbundene Schulden. Die entsprechend zurechenbaren Firmenwerte gehören auch zur Gruppe, wenn es eine oder mehrere *cash generating units,* denen nach IAS 36 ein Firmenwert zuzurechnen ist, umfasst.

Für die Aufteilung des Abschreibungsbetrags auf die Vermögenswerte der Gruppe sind die Bestimmungen zum Werthaltigkeitstest anzuwenden (IFRS 5.23 iVm IAS 36.104(a), 36.104(b) und 36.122). Die Abschreibung wird zuerst vom Firmenwert und dann von den langfristigen Vermögenswerten innerhalb der Gruppe vorgenommen.

Wenn der Wert der Gruppe wieder ansteigt, sind ebenfalls nur die Abschreibungen nach IFRS 5 und IAS 36 aufzuholen (IFRS 5.22). IFRS 5 verweist dazu auf die Bestimmungen zur Wertaufholung in IAS 36; daher darf insbesondere ein einmal abgeschriebener Firmenwert nicht mehr aufgewertet werden (IFRS 5.23 iVm IAS 36.122).

IFRS 5.38ff deutet auch Ausweisbestimmungen an: die zur Veräußerung stehende Vermögenswerte und Schulden sind getrennt in einer Zeile auf der Aktiv- bzw. Passivseite der Bilanz auszuweisen und diese dürfen nicht saldiert werden.

Neben der Bewertung und Darstellung zur Veräußerung stehender langfristiger Vermögenswerte regelt IFRS 5 auch die Darstellung aufgegebener Geschäftsbereiche im Jahresabschluss.

THE BUDGET OF THE EUROPEAN UNION

Văduva Liliana

Facultatea De Economie Si Administrarea Afacerilorm, Craiova, Vaduvaliliana@yahoo.com

The growing deficit after the adhesion to the EU and its volatility represents a serious problem. Our country must have more ambitious budgetary objectives, in order to avoid the breaching of the rules of the Pact for stability and growth and to limit the growth of the external deficit and the inflationist pressures, that constitute a risk for the macroeconomic and financial stability.

According to the law of the budget for 2008, the budgetary deficit will represent 2.7% from the Gross Domestic Product. The level of the deficit is an economic condition foreseen in the Pact for stability and cannot exceed 3% from the Gross Domestic Product in the countries member of the European Union. At the same time the increase of the deficit is essential for the adhesion of Romania to the unique European currency

Key Words: budget, deficit, states member

The money of the contributors is used by the Union for the financing of the activities that all the states member and parliaments agreed in the treaties. The sum of money that can be put at the disposition of the Union is limited by an agreement of the states member and the parliaments. At present, the maximum is fixed at 1.24% from the gross national income of the Union for the payments realized from the budget of the EU. In comparative terms, approximately 45% from the gross national income of the Union is allocated to the national public costs, regional and local within the states member.

A large number of activities are financed in the states member, for example in the agriculture, fishing, infrastructure (construction of roads, bridges and railways), education and formation, occupation of the working force and social politic, health and protection of the consumer, research, to mention just a few fields. Also, there are in process initiatives to offer the citizens of the EU a space of freedom, security and justice without internal frontiers. A part of the budget of the EU is spent for the financing of economic development in the world and for the humanitarian aid offered to the countries from outside the EU, which are affected by natural disasters and other crisis situations.

The budget covers the expenses of all the institutions of the Union. It fixes the income and costs fro that year, enumerates all the activities that are to be financed and establishes the total sums of money, as well as the available personnel for each of the. Also, cites the documents of authorization for every action. Before being able to be put into practice, almost all activities require also a legislative communitarian document – a document of authorization or a juridical basis – proposed by the Commission and approved by the legislative authority – the European Parliament together with the Council of Ministers, in many cases.

The costs of the EU are limited also by a multi-annual agreement finalized between the members of the European Parliament, the Council of Ministers and the European Commission. This agreement contains a 'multi-annual financial framework'. The most recent cover plans of the costs for periods of seven years, from 2000 until 2006 and from 2007 to 2013.

The general budget of the European Union is structured on sections, titles, chapters, articles and positions. The most important component is the chapter, this being the one that indicates the competence of the budgetary authorities able to authorize certain transfers from one chapter to another.

In realizing budgetary incomes there were realized two stages: until the year 1970, the budget was conceived entirely on the basis of direct contributions of the states member, so that afterwards the budget be financed through the 'own resources' of the Community, which actually represents the incomes agreed by the states member to represent legal communitarian resources.

The budgetary resources had the following structure:

- custom taxes for imported goods from outside the community, by applying the common tax;
- the custom drawings on the import of agrarian products (from 1995 there were replaced with the custom taxes);

- the VAT resource collected in each of the states member according an applied tax to the VAT cashed by each state member (1% in 1979,1,4% in 1986,0,75% in 2002 and 0,5% in 2004).

This modality of determination of the proper resources proved to be inadequate because:

1. As consequence of the multilateral negotiations GATT it was realized a reduction of the custom taxes over the imports realized by the community and this led to the diminishing of the contribution of this resource to the communitarian budget;
2. It were reduced gradually the imports of agrarian products as a result of growth of the communitarian agrarian production what it determined the diminishing of the budgetary incomes at the expense of these custom drawings;
3. There stagnated also the incomes coming from the VAT due to the decline of costs for consume realized by the people from the European Community.

The effect of these factors concretized in the apparition of a true budgetary crisis at the middle of the ninth decade of the 20th century.

It was conceived a new system of the budgetary incomes based on:

1. the principle of growth of the VAT brink to 1.4% in 1986;
2. the maintenance of own resources coming from custom taxes and drawings to the import of agrarian products;
3. the adding of a new resource named ‘the fourth resource’ created on the basis of the reform program, known as ‘Delors package’, in 1988. this fourth resource results from the application of a rate on the PNB from all the states member, fixed each year and has the role of covering the total level of costs registered within a budgetary exercise. It must offer the necessary incomes for the covering of supplementary costs, so that the total volume of resources would represent maximum 1.2% from the GDP of the European Union. This fourth resource gained a great importance and position within the communitarian budget that in 2000, for example, was representing 48.3% from the budgetary incomes.

In what regards the costs from the general budget, they are structured and ordered on six sections: European Parliament – I, Council – II, Commission – III, Court of Justice – IV, Court of Accounts – V, Economic and Social Committee and Regions’ Committee – VI.

The payments realized at sections I, II, IV, V and VI are called payments (credits, costs) of functioning, that is administrative, while those from the section III, European Commission, are grouped into two categories: credits (payments, costs) of functioning and are meant to cover the costs of the Commission with the personnel, buildings, materials, publications, informational system, specific missions, pensions for officials etc, and operational credits.

The operational credits administered by the European Commission have the following destinations:

1. financing of agriculture within FEOGA, section guarantee;
2. financing of structural actions: European Fund for Regional Development (FEDR), European Social Fund (FSE), FEOGA - Section Orientation; Fund for Cohesion, The Financial Instrument of Orientation of Fishing (IFOP);
3. the covering of the costs from the educational field (Socrates program), professional formation (Leonardo program), audio-visual (media program), culture, social relations, public health;
4. the covering of the costs allocated for energy;
5. the covering of the costs allocated for the improvement of functioning of the internal market;
6. financing of the programs for research and technological development;
7. financing of costs connected to different actions of economic and financial cooperation with third parties;
8. the covering of the costs generated by the actions within the external politic and common security;
9. guarantees and reserves (non-usable credits at the moment of voting the budget) that will be used during the budgetary exercise.

Starting with the 80s the rule according to which the general budget of the Communities is equilibrated and entirely financed from own resources it started not to work, because in many years the cost exceeded the estimated incomes. As first remedy was the passing to the national budgetary contributions.

The causes that triggered the financial crisis were: the growth of communitarian agrarian costs; the expansion of structural funds; the tendency of reducing the charges from custom taxes; the reduction of charges due to the custom tax applied to the import of agrarian products; the growth of the restrictions volume for the export of agrarian products, the reduction of the cashing from the VAT within the communitarian countries.

The reduction of the budgetary incomes generated tensions between the resources and the communitarian needs, the Communitarian Institutions signed and Inter-institutional Agreement between the Parliament, Council and Commission in which it is agreed about the budgetary priorities defined in the financial perspectives of the Union. These indicate the maximum size and the structure of costs.

The elaboration of the budget is realized by the Ministry of Public Finances according the budget projects of the main commanders of credits n order to improve the budgetary procedures, there were realized the following progresses:

- the improvement of management of public costs, through the extension of the budget based on programs to a number of 13 main commanders of credits, from a total number of 53;
- towards a number of 11 special funds that functioned in 2000, in the state budget were included 7 special funds, this leading to the simplification and growth of transparency of the budgetary procedures;
- the growth of the local economy, by decentralization of some public services and the financing of these from local budgets.

The elaboration of the budget project is based on new rules and principles, which circumscribe to the following goals:

- the realization of the multi-annual previsions of incomes and budgetary costs;
- the extension of the financing according programs;
- the restructuring of the budgetary costs, in report to the resources and strategic priorities of each domain of activity.

We consider that the report between the funds received by our country from the budget of the European Union and its contribution to the general budget must be similar to the proportions applied to the States Members with the lowest level of the GDP/citizen from the European Union.

The transitory arrangement required is justified through the considerable financial efforts that must be realized during the period after the adhesion, as well as the fact that the entire payment, from the moment of adhesion, in the conditions of a reduced level of the GDP/citizen, would diminish the rhythm of real convergence – economic and social – of Romania to the European Union.

The budgetary effort of Romania (engagements) is determined according the principles of co-financing established through the methodologies of access to the structural funds and of cohesion of the European Union, as well as from the calculation of Romania' s contribution to the budget of the European Union. Romania' s contribution to the budget of the EU is calculated applying a percentage of 1.14% to the Gross Domestic Product of Romania forecasted at the level of the years 2007-2009. It result a budgetary effort of Romania (engagements) of almost 7.4 billions euro, for the period 2007-2009.

The budgetary effort of Romania (payments) is determined according the principles of co-financing established through the methodologies of access to the structural funds and of cohesion of the European Union, as well as from the calculation of Romania' s contribution to the budget of the European Union. Plus, in this case intervene also the necessities of co-financing induced by the deduction of the funds of pre-adhesion engaged in the previous years (until 2006).

The net balance of financial transfers between Romania and the European Union is calculated as the difference between the proposed payments of the European Union through the financial package and the contribution of Romania to the budget of the EU.

The macro-economic impact of the financial package cannot be reduced only to the absolute value of the sums granted to Romania. This because the programs and structural actions developed from that sums can generate and support a process of durable economic growth, at least in the field of agriculture, infrastructure and environment, of human resources, a growth of social cohesion through the rural development and equilibrated regional development.

The budget of the European Union is the document that authorizes every year the financing of the ensemble of activities and communitarian interventions. According to this there can be observed every year the priorities and political communitarian orientations. Its evolution in time reflects the successive transformations of the European construction. In 1970, the budget of the community was of 3.6 billions ecu (at January 1st 1999, 1 ecu = 1 euro) and was constituted almost entirely from funds for costs connected to the common agricultural politic. Today the budget of the EU is endowed with approximately 93 billions euro. Here there can be found the politics of the EU: the costs of the agricultural common politic, the politic of regional development, research costs, education, formation, actions of international cooperation etc.

But after the first year after adhesion, our country contributed to the European budget with approximately one billion euro.

Our country is one of the countries that plead for the maintenance of the actual quota of contribution to the European budget and for the maintenance of the funds for agriculture and the funds of cohesion. The tensions within the European Union about the budgetary projection for 2013-2020, when France and Great Britain, beneficiaries of some important finances from the EU, dueled in arguments, because none wants to renounce to its own facilities.

France is the biggest beneficiary of the Common Agricultural Politic – that was up to approximately 44 billions euro annually, that is 40% from the entire European percentage. France is the unique big producer of cereals from Europe and a big exporter of meat. Great Britain, on the other hand, benefits of the so called 'rebate' return of two thirds from the difference between the sums coming from the VAT that pays to the communitarian budget and the European funds used in the United Kingdom. The rebate has come to worth approximately 5 billions euro annually, leaving unsatisfied many of the European leaders who appreciate that the situation of Great Britain has improved during the last 20 years and no longer needs these funds.

Beyond the interests of each state member, the reform of the budget cannot be postponed beyond the actual budgetary exercise – it needs more flexibility and transparency without touching the 'fiscal sovereignty' of the states.

The budgetary strategy proposed by our country for the following years is not compatible with the careful fiscal prudence needed to keep under control the growth of the external deficit and the inflation pressures that threaten the process of convergence.

The proposed program shows a continuation of the politic of high budgetary deficits, existing also the risk of an excessive deficit (over 3% from the GDP, n. red.). Our country has not made enough progresses in order to reduce its budgetary deficit below 1% from the GDP in 2011. Taking into consideration the risks presupposed by the budgetary targets and the necessary adjustments after 2010, it is less probable that the objective of reducing the budgetary deficit below 1% from the GDP in 2011 be reached.

Our country had so far a period of strong economic growth. But the growth of the external deficit and its volatility, represent reasons of worry. Romania must have healthier budgetary targets in order not to breach the Pact for Stability and Growth (that is in order not to exceed a budgetary deficit of 3% from the GDP) and in order to keep under control the growth of the external deficit and the inflation pressures that endanger the macroeconomic and financial stability.

There are strong risks – on the basis of the actual internal politics and the external shocks – that the disinflation process be harder to sustain. If these risks will be fed with relaxed fiscal politics and with big deficits, then these may lead to an inflation spiral, but also to a deepening of the public debt.

Romania renounced, in 2005, to the direct assistance of the FMI, after which, on January 1st 2007, it adhered to the European Union. The integration in the EU proves that the economy is sufficiently mature to no longer need the 'guidance' of the international financial organisms?

The renunciation to an agreement with the FMI in 2005 was a wrong decision. The agreement promoted at the end of 2004 had in view exactly the continuation of the reforms from the period 2000-2004, the strengthening of the public administration and the growth of the capacity to attract resources from the EU. The last three years proved that, in the absence of internal determination for the continuation of the structural reforms and the strengthening of the fiscal and commercial politic, the side-slips accentuated, the course of exchange and the inflation had unpredictable trajectories, and the external perception on the national economy started to degrade.

We consider that it is needed a new model of relationships that our country must have with the international financial organisms, for the rebuilding of the external credibility. In lack of a strategy, our country is perceived as a country that does not know where is heading to.

As longs as the incomes, as poise in the GDP, are modest and are not realized entirely the economy starts to lose the competitiveness. The budgetary resources must be kept, consolidated and efficiently spent. They cannot be wasted in the context in which the financial affluxes from the European Union are bigger and bigger, and the need for resources internally will be more pronounced.

We consider the budgetary strategy fixed in the program is not in conformity with a prudent fiscal politic, necessary to limit the growing external deficit and the inflations pressures that threaten the macroeconomic and financial stability as well as the process of convergence.

Romania became member of the European Union at the end of 2007 and should, according to the treaty of adhesion, adopt euro. Two of the three essential conditions for entering in the euro area are the tempering of the inflation and the maintenance of the budgetary deficit below 3% from the gross domestic product (GDP). The progresses for reaching the budgetary equilibrium for mid term are insufficient, despite the perspectives of solid economic growth. Taking into consideration the risks at the address of the budgetary targets and the significant adjustments that will be necessary after the period of the program, is unlikely that the objectives for mid term be reached until 2011.

THE BALANCED SCORECARD IN THE SOCIAL DOMAIN

Vărzaru Anca Antoaneta

University of Craiova, Faculty of Economics and Business Adminstration, A.I.Cuza, 13, varzaruanca@yahoo.com, tel. 0722.368.988

Abstract: In the conditions, in which human resources are recognized as the main wealth of an organization, appears as a paradox the fact that all the implied disciplines in its activity are not ready to offer qualitative information in this domain. The accountancy, the finances and the management of which analysis and synthesis is generously when it's talked about material and financial resources, fix capital; they were in debt and never knew how to adapt to the new requirements generated by the social management. The apparition of the social scorecard to the management's initiative whishes to be a good start in the action of informational recovery connected by the human resources function and a signal towards the specialists of other disciplines, which have to involve in this kind of process. The present paper proposes an analysis of the social scorecard evolution and highlighting of the rules and principles which allow to each initiative in this sense to succeed.

Key words: previsional system, pay politics, social development, social climate, instrument of measure

I. The social information system and the balanced scorecard

Martory (2003) defines the social information system as "one of the information sub-systems of the organization, which is necessary to the human resources and managements' function for the good achievement of their mission". Peretti (2003) defines social balanced scorecard as "an assembly of simple or compound indicators, chosen to serve to the management of an organization's management in the human resources domain. The choice of the indicators, their degree of globality and the frequency of their change depend on the pursuit level. The most useful data compares the simple indicator with historic or prevision references."

Objectives. The objectives which the managers and the responsibles of the human resources function are looking after through the implementation of a social balanced scorecard are multiple and contingent.

1. *The organization of the social management*. In numerous cases the social information contributes to the segmentation of the social management. Although it can be said that the social balanced scorecard determines the human resources management of an organization, it comes to increase and resolve of the main problems of organizing the social management, at least through defining the responsibilities and the hierarchy of the authority.
2. *The observation of the legal duties and the achievement of an essential minimum of the social management.* In the developed EU countries is compulsory the achievement of a social balanced scorecard for the organizations which exceed a number of 300 employees, but also the negotiation with the social partners or the answers that have to be offered to the organizations' administration of state locals or centrals, in case of other organizations. These duties have to represent the occasion to form a minimum informational system materialized in some essential tables.
3. *The endorsement of the decisional process in view to increase its reactivity.* The social decisions are most of the time submitted to the pressure of events, with the occasion of the negotiation with the internal or external partners. If we dispose of automatic operational information's system, the decisions can be taken fast and have a reactive character.
4. *The improvement of the previsional aspect of the human resources function*. The concernments of the human resources and financial management refer to two imperatives, the first one bounded by the complex prevision of the effectives and competences, and the second one of knowledge of wages' evolution and salary funds

5. *The achievement of some social balanced scorecards to the compartments' level*, with information that can be easily taken and put into the organization, obtained after precursory determined procedures and which can ensure their fast combination.
6. *The observation of specific restraints of social management*, in order to facilitate the decision in a changing medium. Studies realized by several researchers identifies five types of restraints, as administration of important data basis, respecting the confidential information, following an evolutionist legislation, acting in a simple and independent manner, editing various documents, proper to more receivers (tables, graphics, letters etc.).

Followed domains

The practice from social management relieved four main domains in which concerns offering information thus four main chapters of social balanced scorecards. The first chapter is *managements' effectives and of human resources*, which refers to the assembly of practices that points out "the right man in the right place". It refers to recruitment, effective's statistics', human resources demography, provisional management of personnel, knowing the potentials and careers' organization. The second chapter refers to the *management of social climate, of employee's comportments and of social dialogues' development*. The management of an organization imposes that it can be in measure to appreciate periodically the employee's behaviors and of its groups. *Appreciation of the performance and following the investments in training* represents the third informational pillar of the social balanced scorecard. The position of the employees as the main resource of concurrent advantages, explains the role of appreciation and it's inclusion through the main chapters of social balanced scorecard. On the other side the appreciation has multiples bonds with other main activities of human resources function, as remuneration and managements' career. Thus*, the scheduling and the highlighting of wages and social costs* form the forth chapter followed in this important instrument. The information refers most of the times to knowledge of financial engagements that concerns human resources, wage politics etc. All these instruments claim an accounting and financial information, autonomic compared to classical accounting systems.

The role of informational filter

The filtration of information's and its aggregation are more important as it's more useful on the hierarchical scale. The reserved data covers three progressive levels of selection:

- *data basis*, which represents a first selection of information useful to the socio-economic management and are archived on informatics support which allow automatic integration; it refers to wage and allow realization of an social-management following working time, being bounded by accountable basis and management control;

- *statistical documents*, which is a first selection and present in a coherent manner data basis on different themes; in case of human resources function is going to be realized an detailed analysis of effectives upon sex, categories, age etc, which will be available to the responsible of its' inner;

- *social balanced scorecard,* instruments which includes a selection and a presentation of the key information in view to take some decisions. For answering to this sort of objective it has to be easy to read, be very selective and adapted to every user.

II. Elaboration of the social balanced scorecard

The fact that human resources have certain inertness, meaning that it can't be transformed as quickly as other factors, as the materialists or financial ones, leads to the conclusion that the management of effectives and of competences deserves to lean on a prospective informational system but also on a complete pilotage. Social management is organized in three times that is of designing the objectives, realizing the activities and measuring the deviation, and the last one of preparing the following phases.

Designing a target suppose to fix some social and socio-economical objectives. It could be about reaching a lower level of absenteeism or realizing a development of wages planned in the beginning of the budgetary year. Information system formalizes and presents the objectives facilitating the elaboration of the social plan who can present the strategic choices of the unit.

The way to this target requires a periodic measurement of the deviations compared to the idealistic trajectory towards the objectives. In this environment the information system provides from one day to another objective data which qualifies the environment evolutions. It allows the elaboration of some periodical indicators and provides information to the punctual studies which support the process of taking the social decisions.

Putting the rules into practice means the achievement of the trajectories for defining new targets, better and less inadequate in the conditions in which the environment changes and it's, most of the times, unpredictable with the realization of the previsions. This phase is essential for realizing the pilotage and requires the utilization of all the competences that the pilots have. The social balanced scorecards allow the determination of the deviations to the chosen objectives measures it and decomposes the significant ones among it. Thus options of social information are not the same in all the organizations, because their organizational and strategically options are different. In practice there are three progressive levels of implementation for the social balanced scorecards. The first level is the maiden in the organized construction of the social information and it refers to formalizing the mandatory data. The second and the third levels mark a progress, adding information and especially, realizing a bound and in thus a real system.

Level I, the essential minimum. In this first stage information are prepared which represent legal social obligations. The effort of realizing such a scorecard is big and supposes a presentation of some favorable data's for coming to a decision, a periodicity of work out which can be bigger than the one required by the legal obligations and a repartition of the information towards the concerned responsible. Thus is being set up a first structure of a social information system all round the social balance that is legal obligation. Thus a trading company with 280 employees from social and sanitary sector prepares a social balance. With this occasion it organizes a structure of social information that can allow comparisons with the same type of companies and prepare its legal obligations by the time of reaching the critical threshold of 300 employees. From this social balance it will be extracted significant data, as external mobility (turnover), pyramid of ages, remuneration levels, which will be included in the central balanced scorecard.

Level II, the transitional system. The main system is enriched with prospective character information, as projections on medium term of the personal effectives for the key components or foreseeing of wage fund, but more detailed, which can allow more profound analysis, as analyze of the difficulties on services, on personal categories, on time etc. *Level III, the advanced system*. It is characterized by a progressive integration of data concerning the fundamental aspects of the employee's management. Every decision that concerns the employees affects simultaneously all the social and economical equilibriums of the organization.

The social balanced scorecard - principles of formation and usage. The experience of some organizations that have successfully projected and utilized the social information system has permitted the highlighting some principles which ensures efficiency and pertinence of the social balanced scorecard:

1. Avoiding an initial informational surcharge, who weight the process of selection and refinement of data and who can determine the abandon of this type of project even from this phase;
2. Utilizing to the maximum information in the mandatory informational system, as social balance, pay system, legal documents etc and head working of the optimization process of the proportion between quality and costs of the selected data;
3. Scheduling the process' consolidation of selection and refinement of data to the level of localized structures, for it to be operational to the foreseen term; this is necessary for making the balanced scorecard to the high level, but also because this instrument is one who represents power and mobilizes compartments' responsible;
4. It does not have to be forgotten, also, that the ship is not sailed by the steering wheel, or the pilot and the balanced scorecard does not replace the strategic strength and the desire to realize an adequate social pilotage.

III. About the content and the relevance of the social balanced scorecard

Both literature and practice of human resources management (Mendoza and Taieb, 1988; Kaplan, 1998; Martory, 1999) relieve the structural variety of social information systems and specific social balanced scorecards and identifies six domains which answer most frequent to the requirements of the organizations.

The management of effectives and of structural changes. The object of this chapter aims to present a demographic analysis of human resources and of equilibriums that have to define, in view to avoid some penury and redundancy of personnel. The human resources equilibrium is vital for the organization, and regards some more elements, as age, the distribution of competences upon compartments, the organization of some more elements mobility.

For the analysis and the assurance of these equilibriums are being utilized three groups of indicators:

- a first group aims the monthly situation of the effectives, disinterested of their type and the measurement is done in number of registered persons, allow of effective work-time;
- follow up the structure of the effectives, respective to their distribution upon categories, the analysis of employment indicators, structure upon age with the specified pyramids (the second group);
- the foreseeing of the effectives upon 1-3 years based on age pyramids and/or job matrices on type of job which are determined in the percent of achievement and more evident in difficulties of enlistment.

Management of competences. Balanced scorecard that is mentioned here suggests managing correctly the collective intelligence of the organization. As for the individual information it takes the form of a situation of competences to the admittance in the organization, of following the careers and the training stages. The information given by the balanced scorecard is quantitative in most of the part but also qualitative, which makes this instrument to allow the access, selection and exploitation of qualitative information.

Management of the remunerations and wages. The management of the remuneration system implies knowledge of a real evolutionist system: wage politics that makes the object of a periodical review, the equilibrium of the remuneration system itself, which has to be flexible due to the environment evolutions. Afore of a system in a continuous transformation, information has to be continue, and that is why this chapter is the most important. The groups of the most utilized indicators in the construction of a balanced scorecard are specific to:

- following the structures of individual wages, which concerns the rapport between basis wage, representative from the competences view, the remuneration of the manner in which the job is occupied, legal and contractual peripherals: participation, gains, retirement system, insurances system etc;
- following the structure of collective wages, meaning of remunerations upon categories, on age levels, on type of professions etc, going from periodic exam of medium wage, of median wages, of gauges between different levels of remunerations;
- examining the global evolutions of wages, more precisely following the different components of wage and explicit factors' of these evolutions.

The measurement and development of the collective intelligence. The restrictions of the investment process determines the organization to have information instruments that allow the management of the accumulation process of intelligence, instruments that will be included in the social balanced scorecard. These are:

a) scheduling of the training, meaning the realization of some difficult adaptations between individual requirements and collective strategies, then the organization of the probations cater for legal frame and identification of some anomalous situations that concern the monthly individual frequency in stages of some persons;
b) following intellectual accumulations realized through training by treasuring up of some competences levels;
c) managing an investment in performance going from its results this tendency beyond the simple identification of the efficacy of some efforts in training.

The social climate. The degradations represent pertinent alert signals in measuring the social climate. The degradations represent significant alert signals according as are considered indicators in relation with the social climate. But even the notion of risk has to be taken and managed correctly. The risks appear shortly after the practices and social structures of an organization have significant losses in rapport with others. There is no secret that the social risks observed today are going to induct the developing of tomorrow's contra performance. Among specific inquiry of diagnosing the social climate or satisfying the employees, which are utilizable in more sophisticated balanced scorecards, in practice are being utilized more frequently three groups of indicators:

a) for the conflict stage appear: number of days lost because of the conflicts, incidents, claims etc;
b) the absenteeism will be reserved in its ensemble (number of hours and days of absence on a period of time) or through a good indicator of the climate, represented by the micro absenteeism, as for example, number of hours of reduced absence (under 2-3 days) related to the number of theoretical hours of work;
c) internal or external mobility (turnover) is, for example, a rich indicator that has double sense, if it's to reduced indicates a situation of an exigent rooted ness on posts, routine and diminution of performances and if it's to high characterizes inopportune measures of leaving due to a management with problems or to an inefficient integration.

The measurement of the socio-economic performances

The evolution of the organizations in the complex environment nowadays reveals that the social performances from today will determine the future economical performances and will ensure the basis of ways long term development. Also, following the performances gives ways of realizing socio-economic benchmarking, more than necessary in the conditions of an acerb concurrence. Balanced scorecards will include indicators that measure the social efficacy (degree of reaching the objectives) and, if it's possible, social efficiency, referred to the rapport between the utilized capital goods and the obtained results. The best indicator of efficiency is considered the productivity of work, defined as a rapport between the values of the obtained production and the realized work volume. To numerator it can be used the turn-over realized, added value and to denominator it can be chosen between total costs of work, wage fund, hours of work.

Conclusions

The future of the social balanced scorecard reveals its addition with strategic indicators of value creation conditions. The most precocious model of "balanced scorecard", realized by Kaplan and Norton (1996), introduces an analysis of process that allows the explanation of performances or financial contra performances of the organization. To the origin of amelioration of performances the two authors design a representative pedestal of "employees' competences", which initiates the possibility of amelioration of process and guarantees creation of the value in time. These proposals and those of Epstein and Manzoni (1997) have determined sustain of a double demarche that regards to fill the balanced scorecard through strategic indicators on long term. First of all, it's about the developing of some quantification of social and organizational factors that determine the performances. In the second place, it's about measuring in time the offer of the investments in competence and organization. The additional indicators aim to measure a capital of individual and collective intelligences, and not the flux of performance that appear in the traditional social balanced scorecards. Thus this instrument goes beyond the role of sustaining the management and conduces to developing the creation of social added value in time.

THE PERFORMANCE AUDIT. THE EXPERIENCE OF OTHER SUPREME AUDIT INSTITUTIONS

Voiculescu Şerban

The « Titu Maiorescu » University, The Faculty of Economic Studies, Bucuresti, str. Govora, nr. 2, bl. 74, sc. 4, et 1, ap 50, sector 4, idmsv@yahoo.com, 0722219513

Tătaru Violeta

Executive Manager with the Court of Account from Gorj County, Str 1 Decembrie 1918, Nr 80 A, Tg Jiu, Gorj, tataru_violeta@yahoo.com, 0724 364697

People using financial records, such as stockholders, bankers, creditors, governmental authorities and the public must be persuaded that the company's image, as presented, is not confusing. That is why the laws in force stipulate that the general manager has to obtain a second opinion, belonging to an expert outside the company, known as the financial auditor. The auditor does not depend on the company's management and does not represent a group of interests. The financial records are credible due to his expertise, education, integrity, practice of professional reasoning and, the most important of all, due to his independence. The auditor is responsible in front of the stockholders having designated him.
Key-words: external audit, international auditors, performance audit twinning

The performance audit of the financial resources in the public sector, as well as of the state public and private patrimony management has become the most evolved expression of external audit, which the supreme audit institutions in western countries are progressively adopting nowadays.

Performance audit in the public sector stands for an independent evaluation of the degree of effectiveness and efficiency of a certain activity, program or institution, while observing the principles of cost-effectiveness.

The Supreme Audit Institutions (S.A.I.) from countries such as Great Britain, Sweden, Netherlands or United States have taken the first steps towards measuring the cost-effectiveness and the efficiency of using public funds ever since 1980, therefore they have improved the work techniques and methods on a permanent basis.

The National Audit Office of the United Kingdom of Great Britain and Ireland (N.A.O.) considers that „measuring the performance represents a necessity managers at all levels, in order to get a clear image of their objectives, to assess and to weigh the results of the respective objective, wherever possible".

In the near future, the performance audit in Romania will have the same objectives as the performance audit in Great Britain.

The public audit in Great Britain is regulated by the National Audit Law, dating from 1866, amended and completed in 1921 and 1983, when the right of the Controller and Auditor General to carry out the performance audit came into force.

The British National Audit Office's motto is: „Let's help the nation spend wisely!"

In the United States, the General Audit Office of Public Accounts (G.A.O.) considers that performance audit is „an objective examination of reality in order to provide a systematic performance assessment of a major organization, program or activity, so that it obtains information concerning the use of public funds and the ease in the decision-making from the part of the responsible with monitoring and implementing corrective measures."

The objectives in view refer to the cost-effectiveness and the efficiency of using public money, as well as to the program audit, which includes determining the degree in which the expected results and benefits are reached, or whether the entity has observed the main laws and regulations concerning the respective programs.

Since 1989, The Swedish National Audit Office (S.N.A.O.) has had a separate division in charge with the performance control, designed to make more than examine the entities, monitor the activities and record the defaults, that is to pay more attention to analytical measures and substantiated recommendations.

In this country, the performance audit has therefore set the objective to assume a more active role in changing the efficiency and effectiveness of the governmental administration, wherever necessary.

The Dutch Chamber of Accounts examines "whether the money has been well spent, and also whether it would have been better spent elsewhere." The performance audit is defined as a scrutiny over the efficiency and effectiveness of the governmental policy, considered as a starting point.

The supreme audit institutions' competency to carry out performance audits, as well as the dimension and scope of the respective audits are regulated by the Constitution or by special laws of organizing and functioning.

The World Bank's experts recommend the countries which decide to adopt or to improve the performance audit (such as the Romanian Court of Accounts) to choose strategies implemented in countries with a substantial experience in the field.

Thus, the performance audit carried out by the General Office of Public Accounts from U.S.A. meets the requirements of the legislative power, interested in knowing whether the government's activities are efficient. The G.A.O. examines every program, activity and function of the federal government of the United States and draws up pertinent and substantiated conclusions.

Over the last century (the G.A.O. was founded in 1921), the Congress solicited the respective body to identify imperfections in the governmental activity, so that to eliminate the waste and inefficiency in public spending; the G.A.O. also confirms if the governmental funds are legally spent and if their evidence is accurate. Moreover, the G.A.O. decides if the program objectives are achieved within the established costs, and if changes in the governmental policy are necessary, it suggests what decisions should be made by the Congress in this respect.

The recommendations issued by the G.A.O. have triggered positive effects, reflected in significant cuts in budget expenses, as well as in revenue increases, estimated at about 100 billion dollars by the World Bank. Each year, the G.A.O. carries out over 1,000 performance audits, its representatives presenting themselves in front of the Congress committees around 300 times a year, in order to hand in reports on the audits.

Before initiating a performance audit, the G.A.O. establishes if such a measure is justified. In this respect, the body prepares a series of surveys and organizes debates around its responsibilities, to make sure that the audit can accomplish its mission and that the estimated budget is covered by the final results.

The final report takes into account independent viewpoints, supervised at various levels within the G.A.O., concerning the response to objections and the modifications brought to the initial forms.

The G.A.O. has also introduced a system of subsequent quality assessment of the performance audit, in order to amend the procedures; the system uses independent staff taking notes on deviations from the audit standards and procedures.

Due to this subsequent audit evaluation system, the G.A.O. brought in 1998 a series of amendments to its audit standards, known as the "Yellow Book"; according to the World Bank's experts, the "Yellow Book" stands for the highest quality standard in the field of performance audit.

Following the initiative of the Committee of Public Accounts within the British Parliament, in 1983, the performance audit was legislated; thus the National Audit Office of Great Britain became one of the top supreme audit institutions, being characterized by rigor, quality and objectiveness.

The N.A.O. carries out the most part of the performance audits on a specific theme or subject, nevertheless its works are monitored by several government departments.

The main N.A.O. objective is "to help the nation spend wisely."

Its primary role is "to verify and to independently inform the Parliament upon the way in which the governmental departments, the executive agencies and other public bodies accounts for and use the tax payers' money. It also helps these bodies to implement a better financial management."

The N.A.O. certifies the annual budgetary execution accounts of the public bodies, thus being responsible with the regular financial auditing of almost the entire amount of government expenditure (around 540 accounts); it is entitled to audit approximately 4,000 bodies receiving public funds for housing, education, professional formation, etc.

About 40% of the annual N.A.O. budget is directed to the performance audit, almost 50 reports being issued each year.

The quality and value of these reports have mainly grown as a result of applying strict audit methodologies and themes, of using audit experts, of identifying the possibility to set up a financial economy.

One of the priorities during the reform of the audit process with the Romanian Court of Accounts, and probably the most important one, is developing the financial audit, implementing the performance audit and harmonizing all these with the modern audit standards used by similar institutions in Europe and on other continents, much more advanced in this field.

This priority was also highlighted by the experts coming from the U.N. the World Bank and from the E.U. They benefited from the assistance of the SIGMA specialists in drawing their conclusions to the SIGMA reports between 1999 and 2005.

Based on the conclusions and recommendations included in the Reference Act and the Final Report, the Romanian Court of Accounts elaborated and approved the Strategic Development Plan between 2001 and 2004, setting as a strategic top objective of the institution "enhancing the institutional capacity to increase the degree of administrative responsibility in the legal and efficient use of public funds in Romania".

The peer-review between May and June 2000, as a stage in the strengthening of the institutional capacity of the Romanian Court of Accounts, reflects the major preoccupation for a fast integration in the process of institutional reform generated by the perspective of Romania's adherence to the European Union.

As a consequence of the recommendations received, several amendments were brought to the Romanian laws at the time; the audit area extended not only to the field of privatization, but also t the way of administering, managing and using the public funds and the public and private state patrimony; these were responsibilities consistent to the strategies of other Supreme Audit Institutions or Chambers of Accounts.

The differences appeared when auditing the financial management, the efficiency criteria, the cost-effectiveness and efficiency in using public funds. This situation was due to the lack of a strategy and a performance audit guidance book, which include indicators and performance criteria; also, the conclusions of the supreme audit institution from Romania reported to the Parliament did not have a pertinent finality, and the few recommendation were adopted by the beneficiaries.

Starting with the year 2000, the Court of Accounts has enjoyed EU funding through the PHARE programs. Thus, by means of the PHARE 2000 program, aiming at strengthening the institutional capacity, two components were financed:

- The twinning component created in collaboration with the U.K. N.A.O. (with the contribution of the Greek Audit Court) and completed in September 2003. The main activities included were the development of legal activity, the update of the legal framework, the development of human resource management and organization, the development of the IT component and the introduction of computer-assisted auditing techniques.
- The investment component, having as objective "The Development of the IT Infrastructure of the Chamber of Account, the Control and Human Resource Formation".

In December 2002, the reunion of the Presidents of the Supreme Audit Institutions from Central and Eastern Europe, Cyprus, Malta, Turkey and the European Court of Accounts took place in Bucharest. Special guests from the Russian Federation and the United States were invited to the debates on the transition process of the financial control structures from Romania.

The transition involved reshaping the monitoring mechanisms of the public finance management, of the efficient and effective use of public funds in the legal framework.

Still, this period also generated dangerous phenomena, which imposed joining efforts to find solutions to counteract corruption and fraud, flourishing due to the lack of legal framework, of the confusing status of property during the economic reform, as well as of the state's weakness.

The close ties with the similar European Supreme Audit Institution will lead to the harmonization of the Romanian laws, of he means and methods of financial audit with the European model.

Since 2003, the Romanian Court of Accounts, as Certifying Body of the financial assistance within the SAPARD program, has benefited from the technical support granted to the SAPARD Agency by another PHARE program, comprising two axes:

- The first axis, based on professional formation, included training courses for the staff involved in the activity of certifying the SAPARD funds (completed in 2003), in order to improve the theoretical and practical knowledge of employees responsible with auditing the funds allotted through the SAPARD program.

- The second axis, oriented towards long-term assistance and consultancy in the field of the SAPARD auditing programs was finalized at the end of 2004.

In 2003, the Romanian Court of Accounts received from the E.U. non-reimbursable financial assistance within the framework of another PHARE program, aiming at improving the institutional capacity, comprising two components:

The 0.8 million euro twinning component, materialized as a Twinning Convention between the Romanian and the Spanish Courts of Accounts, in collaboration with the German Court of Accounts, had the following objectives:

- Developing the auditing activities of funds granted by the E.U. and other international financing sources, in conformity with the European and international standards of external auditing of budgetary funds;
- Organizing training courses for staff involved in the privatization process;
- Continuing the development of the financial audit, both on local and central level;
- Improving the skills of the Court's personnel, in order to audit the following fields: health, banking, subsidies or other state-supported forms of financial assistance;
- Training courses for the Court's auditors, in order to give them the possibility to identify criminal activities (fraud, corruption, tax dodging, money laundering), to establish the legal measures to be taken and to apply them on the culprits.

The Twinning Convention was signed in November 2003 and extended over a period of two years.

- The investment component was directed towards linking the Romanian Court of Accounts to other public institutions, towards developing an information system concerning the control/audit activity, towards equipping the Romanian Court of Accounts with IT systems, as wells as towards modernizing four professional training centers.

In the monitoring reports issued by the E.U. Commission in October 2003, it was revealed the fact that the external audit systems from the adhering countries were much more developed than the internal control/audit ones, which led to a more intense cooperation in order to harmonize the professional standards in all the countries members of the EUROSAI (European Supreme Audit Institutions).

The PHARE program for institutional development between 2004 and 2006, addressing the Romanian Court of Accounts, stipulates a twinning contract with similar institutions in Spain and Germany, in order to set up an independent external control/audit institution for public funds, a professional, reliable entity, able to comply with the E.U. membership conditions.

In order to accomplish the above-mentioned objectives, we must: introduce modern auditing methods, consistent with the international audit standards and with the best European practices, employ well-trained personnel, constantly preoccupied with improving their professional skills, use modern technical support, prove an appropriate internal and external communication.

In the spirit of the permanent collaboration between the Supreme Audit Institution members of the EUROSAI, the Romanian Court of Accounts benefited from a financial assistance program set up by the International Development Department of the British Government, responsible with promoting the development and fighting against poverty on a global level.

The program has three stages, respectively:

- The first stage (October 2000-October 2001) referred to the technical assistance, having as main objective the improvement of the audit activity concerning the public expenditure in Romania, based on European and international standards.
- The second stage (2002) focused on training the 170 employees within the Romanian Court of Accounts in auditing the privatization process in accordance to the EUROSAI standards.
- The third stage (2003-2005) aimed at implementing the financial and performance audit in conformity with European and international standards.

- The main specific objectives of this program contributed to the improvement of cost-effectiveness and efficiency of public expenditure in Romania, to the initiative of supporting the Romanian Court of Accounts in the process of European integration, as well as to the carrying out of audits according to the International Audit Standards, the Rules of implementing the INTOSAI standards and the best European practice.

At present, the Training Program developed by the KPMG and the BPP for the Romanian Court of Accounts, with the support from the E.U. is in progress, as part of the project called “Authorizing the financial controllers of the Romanian Court of Accounts as international auditors”, implemented with European financing.

By raising the professional level of the public auditors in the field of financial, IT and performance audit, as a result of further formation and improvement programs with European assistance, the Supreme Audit Institution will be able to present the Parliament interesting audit reports and the public administration will be able to act following the Court’s recommendations. In the same time, by ensuring the transparency of the financial and performance audits, the institutions will prove reliable, both for the citizens, and for the international institutions and bodies interested in protecting their financial resources.

By modifying its organizing and functioning law, the Romanian Court of Accounts will have competencies in the field of financial and performance audit, thus accomplishing the proposed objectives; it will be also able to hand in to the Romanian Parliament, the E.U, to other institutions and to the public opinions high quality reports concerning the legal and effective use of public money.

Nowadays companies are facing with intense competitive pressure. Market conditions are characterized by aggressive competition, more and more demanding customers who pose serious questions about competitive strategies and underline the importance of an efficient management information and cost system.

In order to with the current requirements, to improve internal and external communication, there is a demand for accurate, reliable and versatile information on financial, internal processes and costs. Therefore the quality of management decisions and performance measurement is tightly linked to the quality of management and cost calculation systems and performance measurement systems.

The purpose of this paper is to cover the available literature in this field and to demonstrate that new and complex cost systems and cost calculation methods represents major innovations within an organization and permits not only cost calculation and analysis but also performance measurement, strategy definition are oriented through competition and customers.

KEY WORDS: costs system, cost calculation methods, performance measurement, strategy

1. INTRODUCTION

The American Accounting Association defined accounting in 1966 as: "The process of identifying, measuring and communicating economic information to permit informed judgements and decisions by users of the information."

This is an important definition (Collier, 2003) because:

- it recognizes that accounting is a process: that process is concerned with capturing business events, recording their financial effect, summarizing and reporting the result of those effects, and interpreting those results
- it is concerned with economic information: while this is predominantly financial, it also allows for non-financial information
- its purpose is to support informed judgments and decisions: this emphasizes the decision usefulness of accounting information and the broad spectrum of users of that information.

Managers need financial and non-financial information to develop and implement strategy by planning for the future (budgeting); making decisions about products, services, prices and what costs to incur (decision-making using cost information); and ensuring that plans are put into action and are achieved (control). This function is called **management accounting**.

Management accounting was defined by the National Association of Accountants (NAA) as "the process of identification, measurement, accumulation, analysis, preparation, interpretation and communication of financial information, which is used by management to plan, evaluate and control within an organization."

According to Johnson and Kaplan (1987) a management accounting system must provide timely and accurate information to facilitate efforts to control costs, to measure and improve productivity, and to devise improved production processes. The management accounting system must also report accurate product costs so that pricing decisions, introduction of new products, abandonment of obsolete products, and response to rival products can be made.

Since the 1980s global competition, that has taken place, has left management accounting behind in terms of its decisions usefulness. Traditional cost systems, such as job order costing or process costing, were no longer effective and efficient, they have lagged behind because they were not useful in a "high tech" environment (Cooper and Kaplan, 1989) and managers had different and various information need.

In time, developments and innovations appeared. Organizations confronted with automation of production processes and technological evolution developed new and complex cost and management systems. The decline of manufacturing and rise of service industries led to the need for "accurate knowledge of product costs, excellent cost control and coherent performance measurement." (Johnson and Kaplan, 1987:220) And the challenge of today's competitive environment is to develop efficient and effective management and cost systems which also allows to measure performances and provides timely and accurate information to facilitate efforts to control costs, to measure and improve productivity, and to devise improved production processes.

In this way, management accounting is now implicated with (Collier, 2003): value-based management, non-financial performance measurement systems, quality management approaches, activity-based costing and management and strategic management accounting in order to help managers to increase the value of the business.

2. Advanced management and cost systems and their relationship with performance measurement

2.1 Activity Based Costing and Activity Based Management

Activity Based Costing (ABC) is an alternative to the traditional way of accounting. Traditionally it is believed that high volume customers are profitable customers, a loyal customer is also a profitable one, and profits will follow a happy customer. Studies on customer profitability have unveiled that the above is not necessarily true. ABC is a costing model that identifies the cost pools, or activity centers, in an organization and assigns costs to products and services (cost drivers) based on the number of events or transactions involved in the process of providing a product or service. As a result, ABC can support managers to see how to maximize shareholder value and improve corporate performance.

The benefits of Activity-Based Costing include:

- Identifying the most and least profitable customers, products and channels.
- Determine the true contributors to- and detractors from- financial performance.
- Accurately predict costs, profits and resource requirements associated with changes in production volumes, organizational structure and resource costs.
- Easily identify the root causes of poor financial performance.
- Track costs of activities and work processes.
- Equip managers with cost intelligence to drive improvements.
- Facilitate better marketing mix
- Enhance the bargaining power with the customer.
- Achieve better positioning of products

Calculating and managing costs for all activities is related with using certain specific calculation techniques and its combination with proper managerial procedures. In order to measure up to these expectations the Activity Based Management is added to Activity Based Costing.

Activity Based Management (ABM) is considered by some authors as an improved version, others a sub product of ABC. Anyhow, most authors agree, that ABC/ABM couple is a complete management instrument, with the remark that ABC is a cost calculating system, while ABM is a philosophy of performance management. (Diaconu et al., 2003)

Managers use ABM (Albu, 2005) to learn how the structure of costs and their behavior influences the profits, being able to produce changes in the development of the sale prices or to eliminate the waste, to make the necessary changes in quality, efficiency, speed, and to select the suppliers and also to facilitate the decision making process on long terms though a process oriented thinking.

While ABC provides the necessary information in managing the activities, ABM uses these given information for improving the internal processes. It goes beyond the simple cost calculation and budgeting, it supports the strategic decision making among the companies, creating a relationship between the financial and non – financial information due to the cause - effect relationships.

More and more companies are implementing ABM and ABC techniques because (Barfield et al, 2001:911) "ABM is concerned with increasing throughput by reducing non-value-added activities; ABC is concerned with long-run, rather than short-run, cost measurement. ABM and ABC can provide information on the overhead impact created by reengineered processes to streamline activities and minimize non-quality work. As quality improves, management's threshold of "acceptable" performance becomes more demanding and performance is evaluated against progressively more rigorous benchmarks."

2.2 Balanced Scorecard

Performance measurements should concentrate on things that create customer value. Measures can be quantitative or qualitative, financial or non-financial. Measurement selection should be related to the performance that management wishes, usually the two most important performance measures of businesses at this time are quality and service.

A **Balanced Scorecard** was originally developed "to provide top managers with a set of measures that give a fast but comprehensive view of the business. The balanced scorecard includes financial measures that tell the results of actions already taken. And it complements the financial measures with operational measures on customer satisfaction, internal processes, and the organization's innovation and improvement activities—operational measures that are the drivers of future financial performance." (Kaplan and Norton, 1992:71)

A balanced scorecard can help an organization to assess its performance through the use of financial and non-financial as well as internal and external measurements. The four areas of the scorecard are (Kaplan and Norton, 2001:90):

1. ***Financial perspective*** – refers to the strategy for growth, profitability, and risk viewed from the perspective of the shareholder.
2. ***Customer perspective*** – refers to the strategy for creating value and differentiation from the perspective of the customer.
3. ***Internal Business Processes* –** refers to strategic priorities for various business processes that create customer and shareholder satisfaction.
4. ***Learning and Growth* –** refers to the priorities to create a climate that supports organizational change, innovation, and growth.

The scorecards four perspective reflect the dissimilar activities in which an organization must engage to prosper and survive. By analyzing these processes managers are able to monitor present performance but also try to capture information about how well the organization is positioned to perform well in the future.

Managers can use the Balanced Scorecard to:

- clarify and gain consensus about the strategy,
- communicate the strategy throughout the organization,
- align departmental and personal goals to the strategy,
- link strategic objectives to long-term targets and annual budgets,
- identify and align strategic initiatives,
- perform periodic and systematic strategic reviews,
- obtain feedback to learn about and improve strategy.

2.3 Quality management and quality costs

In order to be globally competitive in today's tumultuous environment, organizations place an increased emphasis on quality and productivity.

Total quality management (TQM) is an effort in this direction. TQM (Shim and Siegel, 1998:340) is a system for creating competitive advantage by focusing the organization on what is important to the customer. Total quality management can be broken down into:

- ***total*** - that is, the whole organization is involved and understands that customer satisfaction is everyone's job;
- ***quality*** - the extent to which products and services satisfy the requirements of internal and external customers; and "management" -the leadership, infrastructure, and resources that support employees as they meet the needs of those customers.

TQM is essentially an endless quest for perfect quality. It is a *zero-defects* approach. It views the optimal level of quality costs as the level where zero defects are produced. This approach to quality is opposed to the traditional belief, acceptable quality level which allows a predetermined level of defective units to be produced and sold.

Costs of quality are costs that occur because poor quality may exist or actually does exist. More specifically, quality costs are the total of the costs incurred by

1. investing in the prevention of non-conformances to requirements;
2. appraising a product or service for conformance to requirements; and
3. failure to meet requirements.

Quality costs are classified into three broad categories (Shim and Siegel, 1998:340-341):

- ***Prevention costs*** are those costs incurred to prevent defects. For example: amounts of money spent on quality training programs, researching customer needs, quality circles, and improved production equipment.
- ***Appraisal costs*** are costs incurred for monitoring or inspection; these costs compensate for mistakes that are not eliminated through prevention.
- ***Failure costs*** may be internal, for example scrap and rework costs or external for example product returns due to quality problems, warranty costs, lost sales due to poor product performance, and complaint department costs.

In order to achieve quality management and quality costs it is necessary to review, improve and facilitate the existing cost and management systems, the planning, control and decision making processes. By doing this managers can use quality cost information to implement quality programs, to evaluate the effectiveness of the existing quality programs and to elaborate short and long term strategies for business decisions.

3. CONCLUSIONS

Traditional cost and measurement systems have sprung from the finance function and focuse on control. These systems specify the particular actions they want employees to take and then measure to see whether the employees have in fact taken those actions. In that way, the systems try to control behavior.

New and complex cost and performance measurement systems, on the other hand, put strategy and visions to the centre. Financial and non-financial measures must be part of these systems for employees at all levels of the organization. Front-line employees must understand the financial consequences of their decisions and actions; senior executives must understand the drivers of long-term financial success. These systems are more than a collection of quantitative and qualitative measures they represent a process driven by the mission and strategy of the business units.

By combining the financial, customer, internal process and innovation, and organizational learning perspectives, and using both quantitative and qualitative, financial and non-financial information these systems helps managers to understand interrelationships within an organization, helps them to focus on continuous improvement and customer orientation and leads to the improvement of the decision making process.

Facing the intensive competitive pressure and environment, knowing the managerial needs regarding costs, strategies and performances each company needs to consider what cost and management system and performance measurement system contributes to their unique needs. These systems must help organizations to improve and achieve quality costs and quality management, to develop cost systems and evaluate managerial efforts that accurately measures costs, profitability and performances.
