Summary: The development of digital language has caused a profound transformation of human society. Even though we can now perceive only the first stages of this transformation, we can already observe the extent in which computer networks have substantially encouraged (and helped) human interaction all over the world. Nowadays, millions of people spend a significant part of their free time surfing “cyber space.”

Internet has become a true “informational highway”, assuring a big capacity of data transmission, flexibility, decentralizing and interactivity. Sites and weblogs are now a part of everyday life, offering a large range of information, everything from public information up to personal thoughts; there’s more than enough room for everyone.

Key-words: blog, communicator, economy, innovation, internet, marketing,

1. The Blog, an innovation that offers a means of expression for everyone

A weblog is an internet site, respecting a structure of content defined by the counter chronological order of the time and date in which information is posted on the front page. The progress of this particular domain has made it accessible to the large public and the use of such a software based on the web-navigator is now a common aspect of blogging. The purpose of blogs varies, from personal diaries to weapons of political campaigning, media programs and a large number of companies and civil organizations.

Furthermore, they also vary depending on the author- they can reflect the work of only one person or that of a whole community. Many blogs allow visitors to post their own comments and thus create a whole community of readers build around the blog.

In 1995, when internet became accessible to the public, enthusiastic predictions were being made on the first publisher, envisaging written and video daily exchange of information, thoughts and ideas related to everyday subjects. Even though some early users of the internet have explored this possibility, their vision has never been fully fulfilled until now. Building a site and updating it daily implies a big amount of work and professionalism. Lately, this vision has been developed thanks to blogs and wikis, that have started competing the traditional approach.

There are blogs who register up to 75.000 visitors monthly, several times more than a local newspaper or weeklies. In the summer of 2006, the number of Romanian blogs was an estimated 12.000-14.000, now it reaches 30.000. New ones are born by the hour: their creators are normal people, courageous enough to share their thoughts and feelings on the internet and thus gain popularity.

2. Blogging- a statistical analysis

Even from the beginning, blogs have fulfilled a double function: on the one hand they are on-line diaries, on the other hand they represent an efficient means of communication. Up to 2004, blogging was an activity created for a particular segment of internet users. There existed approximately 5 million users divided into specific fields of discussion: animals, business, technology etc.

During the 2004 presidential elections in the USA, blogs started to attract more and more the attention of citizens. The more information related to candidates and the public’s personal opinion was being posted in blogs, the more journalists took interest in them. The first stage of the Euroblog study was finalized on the 30th November 2006, an ample and complex research analyzing blogs. Between the 5th and 30th November, information envisaging to the impact of blogs on communication and public relations in Europe was

collected, so that results could be published at the beginning of 2007, in the form of a study useful not only to academic but also to professional communities.

This represents the first major official research, the first truly exhaustive study, based on specific instruments not only on empirical methods. It clearly indicates that the biggest problem of PR (public relations) specialists from 33 European countries is the incapacity of exercising a total control over the communication process between the public and organizations. 40%(percent) of them have declared that they do not know how to include blogs in their company's business strategies and only 10% have complained of the amount of time required to regularly update blogs.

There have also existed surprises when considering benefices and the motivation for existing blogs and near-future projects. The first and most important reason is the occasion of being considered acquainted to the latest technologies and also fashionable. Anyone who thought that snobbism is only an individual movement was obviously wrong. It appears to be flourishing among many European PR specialists. Surprisingly, only 7% have declared that blogs are useful in order to receive feed-back.

Euroblog 2006 has provided a real image of the European PR industry. It indicated the existence of a Europe divided between two movements: that of a minority of enthusiastic specialists disposed to (prone to) new medias and the full use of the blogs potential, and that (by no means negligible) of specialists skeptic regarding the potential of new medias and too caught up in their daily routine to look forward to all that future brings.

The boom of all kinds of blogs and the permanently increasing number of users that chose to be more than consumers and become information generators, demonstrates that our society is changing. Via blogs, consumers share their opinion on brands, companies and social problems- some of these comments are positive but many more are those that offer negative feedback from the citizen on purchased products and civic problems.

The advantage of blogs opposed to usual web pages is that they are updated daily, thus reaching the top of search engines results. A study of the market shows that, as far as credibility is concerned, blog chronics are rated third after those of found in sites and newspapers. Furthermore, market studies, the monitoring of civil messages and of brands will become less expensive and it will become easier to spot new trends.

Due to the fact that the „blogosphere ” is characterized by communities of persons sharing the same interests, the target becomes easily identifiable and rapidly reached. Casing aside the “hooking speech” and the obsolete character of web pages, adopting a certain dynamics of discourse, novelties and sincerity, public institutions, companies and their transparency will arouse the public's interest through blog interaction.

3. Message- citizen interaction

In some aspects, brands resemble humans: they have personality, a particular way of expression and a set of values. The interaction between brands and people can be generally compared to human interaction in what concerns loyalty, trust, long or short term involvement and opinion expression. Thus, the traditional approach (through the unilateral perspective it offered) did not leave any room to consumer feedback.

Interactive advertising can take many shapes: small or ample events, conferences, special offers, interactive games etc. Interaction represents the safest approach to helping consumers overpass cynicism and become tolerant towards the message of a brand or of a handout.

Citizens can reject a certain brand for a period of time, especially in public places where others share their views and critical opinions, or be convinced to buy and use a line of products, despite remorse, all due to convincing (intelligent) advertising or to family influence. The civic or political perspective contributes in the same way to shaping individual opinions and convictions.

Blogging determines advertising agencies to overpass their unilateral marketing strategy. New generations of branding will include in their marketing strategies elements as audience rating and the effective communication. Thus are born innovative elements, new departments and blog administrators specialized in communicating with the new market segment of “bloggers”.

A blog administrator does not sell, but builds his own reputation, that of the company which turns him into the leader of his category (geographical or according to the field of activity). When professing PR blogging, the specialist must take part in conversations, read the comments of influent or key-people for all

products, he must be prepared to contribute with relevant information and intelligent comments, in the same manner used by journalists: by rapid and efficient response.

His civism can be contagious and thus a new opinion is born, developed and spread. The blog can be an useful instrument in crisis situations and plays an important part, offering accessible and valuable information that may have a strong impact on users. During crisis periods, blogs are essential for information spreading at a high speed. They allow companies or public institutions to control attacks targeting their image and rapidly counterattack. Some companies have prepared in advance blogs that they can post on the internet when they are most needed. This communication tool is part of the crisis-kit offered along with PR services. Blogs are also created for the purpose of initiating debate inside a company, reflecting internal PR. This brings immense advantages in the human resource sector. Quality blogs can even increase the morale of employees, citizens of a neighborhood or town.

As a blog administrator one must profess blogging with great care. In order to avoid mistakes it is vital to thoroughly know the company's politics, what is accepted and what is not. One must follow the image strategy, evade leaking financial or confidential information, elude posting crucial information before their official acknowledgment, prevent crisis situations for the PR team, avoid generating intrigue at work or damage relationships with other companies or entities. A blog administrator must be first of all a loyal employee in order to be invested in this function.

Conversation is by all means the most important characteristic of a blog. Even though human contact is unbeatable, the realities of the business field and civic space regarded globally make it impossible to meet each client or potential investor, whether using the telephone, fax, e-mail, forum comments and chat programs. None of these permit a simultaneous conversation with more people spread all over the globe (where one can find a computer and access to internet). None but the blog.

In order to be successful, a blog must be transparent and authentic. Companies and institutions should present themselves as they really are, communicate as a normal citizen would, allow people to know them through their blog and take feedback into consideration. People view blogs in order to learn what others think and know. In time, they will learn to trust companies, institutions, public messages. If you can communicate with them, they will find out who/what you represent; if you only want to sell something, they will leave and the blogosphere will be flooded by accuses of abusing of this new means of communication.

The blog has closed an era and gave birth to a new one, that of communication. In this new era, companies do not profit only by talking to people but by listening to them. Thus, blogs are more a means of direct and innovative communication rather than a mere replacement of the already existent medias. The advantage brought by blogs to companies is that of the interaction with the reader.

Blogs have not stolen people's hearts nor have they twisted citizens minds. They have free-willingly sought deeper relationships. In its complexity, business communication is impersonal. Consumers, the ones who should be serviced, do not feel appreciated by organizations, on the contrary, they hit themselves against the walls built by companies. Clients never reach a human voice on the telephone or a service that could solve their problem and they are never called back. Through internet, they now have access to such information. The only possibility that big companies are offered to survive this new consumers' trend is by learning all that which makes a blog successful. The key to success for a corporatist blog is open conversation, not monologue, nor exceeding commerciality. In exchange, the blog will offer the company countless opportunities to test new ideas, to discuss new lines of products, to introduce new brands on the market or to conduct social research as well as to create a change in public opinion and react against governmental decisions.

Blogging requires time, dedication and honesty. At the same time it provides new personal and strong connections. The blog is not an obsession. It is no longer a choice. Those companies and institutions that chose to stay out of the virtual world will at one point cease to exist. Consumers will surf the wildest online worlds in search of new products and services capable of satisfying their needs. Any respectable business must be represented on the virtual market.

4. Conclusions

From our point of view, the future of advertising is defined by the interactions between transmitted messages and citizens, brands and consumers. There exist participant(active) consumers but also creative

consumers. Let's not forget that these consumers buy a story, the story behind the brand. A good story is that which requires an opinion and thus an already debated story will be easily noticed. What is most important is telling the story to those willing to hear it and they will share it with others; establishing communication, being at the right time, in the right place, with the appropriate story.

The research conducted purposely for this article has revealed that consumers do not wish to evade from the market economy, on the contrary, that they try to impose their values and aspirations for a new, morally superior economical system, inside the same market economy, ingeniously punishing the ethical abuse of corporations and institutions, by promoting compatible economy agents and thorough civic values, viable to society.

Abstract: Over the last nineteen years public utility services have been transformed by the introduction of competition. Greater reliance on competition has been a key factor in improving the way these sectors are regulated, leading to improved efficiency, innovation and more attention to the needs of consumers. Introducing competition in different parts of public utility services is not simply a matter of removing legal barriers to entry. It is usually also necessary to introduce new regulation to ensure that new firms have access to any key inputs or services that can only be obtained from the incumbent monopoly firm. The incumbent firm may not willingly provide these inputs, especially where doing so means the potential loss of a profitable line of business to a rival. Incumbent firms can resist the growth of competition by refusing to supply essential inputs, supplying them at a lower quality, or at a higher price.

Key words: public services, competition, monopoly, restructuring public services

Regulators can and do try to prevent this behaviour, but the incentives on the incumbent firm to evade the regulation are strong, and developing a regulatory response takes time. Rather than trying to directly control the behaviour of the regulated firm, it often makes sense to instead change the incentives on the regulated firm to restrict competition. Often this can be achieved through various forms of restructuring of the regulated firm. For example, by carefully separating the regulated firm into its monopoly and competitive parts. Restructuring the regulated firm will not always be the right policy option. But certain forms of restructuring have proved effective in many industries and, as weaknesses in earlier reforms have become apparent, is being increasingly mandated in Romania now, particularly as a tool for facilitating the growth of competition.

1. Is competition possible in public utility services?

In the past it was common to treat “public utility” services (such as telecommunications, electricity, railroads, water supply and so on) as though they were monolithic natural monopolies. But the scope of the natural monopoly in these sectors is not fixed for all time – as technology develops the scope for competition changes. One of the biggest developments in regulatory thinking in the past nineteen years has been the recognition that these services are not monolithic but are made up of many separate parts. Many of these parts can, in fact, sustain competition. The following table lists, for a number of services, the parts that might be able to sustain competition (i.e., are “competitive”) and the parts that are still a monopoly (i.e., are “non-competitive”). For example, in the electricity sector, the transportation of electricity over transmission lines is usually not competitive, while the generation of electricity is usually competitive. The introduction of competition into the competitive parts of these services has transformed the way they are regulated. Experience has shown that reliance on competition, where it is feasible, usually delivers better outcomes for end-users than reliance on regulation. Although regulation of the true monopoly parts of these services is essential, regulation seldom facilitates efficient production and has a tendency to hinder the development of new services and new ways of marketing those services to consumers. Greater reliance on competition has allowed the regulators to withdraw from regulating certain areas, facilitating innovation and efficiency in those sectors, while allowing the regulator to concentrate on the natural monopoly sectors that remain.

2. Restructuring public services

In most cases, introducing competition into the competitive parts of a regulated public utility industry is not simply a matter of removing legal or regulatory barriers to entry. It is usually also necessary to take steps to ensure that the new firms entering the market have non-discriminatory access to any essential inputs provided by the remaining monopoly parts of the industry. Access regulation of some kind is therefore one essential element in the process of introducing competition into a regulated industry. We focus here on the second possible element of this process – the possible restructuring of the regulated company.

There are many different ways in which restructuring could be used as a tool for promoting competition. Breaking a firm horizontally into competing pieces, for example, might be desirable to facilitate competition between the different pieces. In some countries, for example, a monolithic electricity generator has been separated into separate competing companies, to facilitate competition in electricity generation. It might also be useful to break up a regulated firm if doing so allowed the regulator to more precisely identify the costs of providing the regulated service, or to prevent the firm shifting its costs from unregulated to regulated activities. For example, in a case concerns were raised that Deutsche Post AG was able to cross-subsidise its competitive parcels service with revenue from its monopoly “reserved” services. To prevent this Deutsche Post was required to set up a separate legal entity for the provision of its non-universal and competitive parcel services. Separation of this kind facilitates the monitoring and control of anti-competitive cross-subsidisation.

These forms of restructuring are important but were not the direct focus of this study. Instead, it focused on restructuring to promote competition in those competitive markets which depend on access to the remaining monopoly for an essential input. To understand why restructuring is important in this context it is first important to understand the problems that can arise when a monopolist supplying essential inputs is itself allowed to operate in the competitive activities.

3. What is the basic problem in vertically-integrated industries?

When the owner of essential inputs also competes in a downstream competitive activity it typically has both the ability and the economic incentive to restrict competition in that downstream activity. It has the ability to restrict competition by restricting access to the essential input – by raising the price, lowering the quality or reducing the timeliness of the essential services it provides, relative to the services the regulated firm provides to its own downstream affiliate. For example, an integrated electricity generation and transmission company could limit competition from rival generators by raising the price that they must pay for access to the transmission network. An incumbent telecommunications operator can limit competition from rival long-distance operators by raising the price at which those rivals have access to the local loop, and so on. When the owner of the essential input also competes in the competitive activity it may also have the incentive to restrict competition. This would occur, for example, when the monopoly input was tightly regulated compared to the regulation on the retail services – e.g., if regulation of the transportation prices of a natural gas transmission pipeline was more tightly regulated than the price of delivered natural gas. In this circumstance the owner of the essential input has a strong incentive to itself provide the downstream services and, by restricting competition downstream, re-capture some of the monopoly rents that it would otherwise lose to regulation. For example, if the price of delivered gas was unregulated while the price of gas transportation services was tightly regulated, a gas pipeline could enter the market for delivered gas, exclude competing gas producers and sell delivered gas at the monopoly price – recapturing the monopoly profits on its pipeline transportation business that would otherwise be lost to regulation.

The regulated firm can use all the tools at its disposal, whether legal, technical or economic to delay, to lower the quality or raise the price of access. A well-resourced regulator, through persistence and vigilance, could hope to limit the anti-competitive activity of the incumbent, but the outcome is unlikely to be as much competition as would arise in the absence of the incentive to restrict competition. Potential entrants, fearing the effects of discrimination, despite the best efforts of the regulator, may hesitate to invest in new capacity

3. What are the alternative ways of addressing this problem?

There are at least four different ways of restructuring the regulated utility to address this incentive to resist the growth of competition:

The first possible approach is separation of the ownership of the competitive and non-competitive segments of the regulated utility, supplemented by a line of- business restraint which prevents the monopolist from re-entering the competitive activity. When the owner of the essential service is prevented from competing in the competitive sector, the incentive to restrict competition is eliminated. The owner of the essential input has no incentive to discriminate between any of the firms competing in the upstream or downstream competitive sector. The owner of the essential input no longer has any incentive to restrict competition. This simultaneously reduces the need for close regulatory oversight and enhances the scope for competition. *This is the primary benefit of vertical structural separation.*

A second possible approach is joint or club ownership of the natural monopoly facility by firms which compete in the competitive activity. Since all the competing firms are part owners of the natural monopoly facility they can ensure that they obtain access on non-discriminatory terms and conditions.

A third and related approach is allocating a share of the total capacity of the natural monopoly facility to each of the downstream competing firms.

A fourth approach is to separate the ownership and control of the natural monopoly facility – allowing the ownership to remain in the hands of a firm which may also compete in the competitive activity, but placing its control in the hands of a neutral body – such as a committee made up of representatives of the industry.

4. The costs of vertical separation

The previous section highlighted the primary benefit of vertical separation – by eliminating the incentive to restrict competition downstream, vertical separation makes the job of the regulator easier and facilitates the development of competition. What might be the costs of vertical separation? It is possible to identify many different costs that could be raised by separation:

1. Separation may increase transactions costs. After separation, operations that were previously carried out within a single firm must now be carried out at arms-length through contracting and market arrangements. In many instances, the full exploitation of the essential input by a downstream firm will require a specialised investment and therefore close co-ordination with the monopoly – this co-ordination is usually easier when carried out within a single firm;
2. Separation may force the monopolist to forego efficient ways of selling the monopoly services. For example, it is well-known that it is efficient for a monopolist to sell its goods at marginal cost whenever that is feasible. While it may be feasible for the monopolist to, in effect, sell to its own affiliate at marginal cost, if the monopolist sold to other firms at marginal cost it might not be able to recover its fixed costs;
3. Separation may also force the monopolist to forego efficient forms of price-discrimination. It is usually efficient for a regulated monopolist to sell at different prices to different consumers. By bringing the monopoly firm closer to the final consumer, integration can allow the monopolist to more finely differentiate its regulated prices, enhancing overall efficiency.

Some countries also consider that allowing a regulated utility to remain integrated may also facilitate the maintenance of a given level of universal service or service reliability.

5. Alternatives to full vertical ownership separation

Recognizing both the costs and benefits of vertical ownership separation, some countries have tried other controls which seek to achieve some of the effects of separation without actually requiring divestiture. These alternatives include: 1) Accounting separation, i.e., a requirement on the regulated firm to prepare separate accounts for its competitive and non-competitive businesses; 2) Management or functional separation – i.e., a requirement that separate activities be carried out within separate, distinct divisions of the regulated firm; Corporate separation – the requirement that separate activities be carried out by a separate corporate entity (wholly or partially owned by the regulated firm). These alternative forms of separation affect neither the incentives nor the ability of the regulated firm to act in an anti-competitive manner. They are often, however, an important supplement to other forms of separation, particularly as a supplement to access regulation. The information made available through accounting separation, for example, is typically used as a basis for determining access prices, for detecting cross-subsidies and for preventing discrimination.

6. Where has restructuring been tried and what was the outcome?

Public utility services differ widely, both in the degree to which competition has been introduced and the degree to which restructuring and vertical separation is required.

For example, in the air transport industry, it is now common to have many competing airlines. At the same time, vertical integration between airlines and airports is uncommon and is often strictly prevented.

The telecommunications industry was one of the first sectors to be liberalised and one of the first to be structurally separated

Conclusions

In the end I think that the separation has both potential benefits and potential costs. The text of the recommendation proposes that when member countries are considering policy towards a vertically-integrated natural monopoly, they should carefully balance the benefits and costs of structural measures (such as vertical ownership separation) against the benefits and costs of behavioural measures (such as the regulation of access to an integrated firm).

The recommendation explicitly mentions that this balancing should take into account a number of factors such as:

- the effect on competition;
- the impact on the quality and cost of regulation;
- the transition costs (*i.e.*, the one-off costs associated with a structural change); and
- the economic and public benefits of vertical integration.

The balancing should also take into account the economic characteristics of the industry in the country under review. The recommendation also explicitly notes that the benefits and costs to be balanced should be those recognised by the relevant agencies including the competition authority. This balancing should especially take place in the context of privatisation, liberalisation or regulatory reform.

The key points of this work on structural separation can be summarised as follows:

- Regulated utility services are not monolithic natural monopolies but consist of many parts, some of which can sustain competition and some of which remain monopolies. It is widely accepted that it is preferable to rely on competition in those components in which competition is possible, to facilitate innovation and efficiency in those sectors and to narrow the focus and scope of regulation.
- When a regulated firm also provides essential inputs to its competitors in a related competitive sector, the regulated firm may have both the ability and a strong incentive to restrict competition. Attempts to control the behaviour of the regulated firm to offset this incentive are difficult and regulators may face an uphill battle.
- There are a variety of ways that the regulated utility can be restructured to overcome this incentive to restrict competition. Perhaps the simplest way is to prevent the regulated firm from competing in the related competitive sector. Other approaches include club or joint ownership of the natural monopoly facility, sharing of the capacity of the essential facility or separation of the ownership and control of the essential facility.
- Separating the regulated utility into the competitive and non-competitive parts will likely involve certain costs. In particular, separation may raise transactions costs and may prevent more efficient forms of price discrimination. There will also be the one-off costs of the restructuring itself. These costs need to be balanced against the potential benefits to competition.
- Rather than full ownership separation, certain alternative forms of separation are often used which seek to enhance the level of competition without incurring the cost of ownership separation. These alternatives include accounting separation, management separation and corporate separation. These forms of separation have their uses but also their limits. Although these approaches reveal more information to the regulator and make anticompetitive practices easier to detect, the underlying incentive to restrict competition remains. Experience as to the weaknesses of these approaches has led to calls for stronger forms of separation.

INNOVATION – A KEY-ELEMENT IN PRODUCT AND SERVICES COMPETITIVENESS

Amza Virgil Dan

Academy of Economic Studies, Bucharest, Romania, virgilamza@yahoo.com

Brătianu Constantin

Academy of Economic Studies, Bucharest, Romania, cbratianu@yahoo.com

Summary: Innovation is usually associated with novelty, creativity, performance. In essence, there are four key-elements: the commercialization of technology, informational transfer, receptiveness towards new ideas and innovative spirit. Considering the general vision of the European Union regarding the need of dynamics in research, development and innovation as well as in what concerns the investments of private companies in novelty, necessary in order to resist in a growing competition. Innovation is based on the principles of perpetual improvement, on the efforts of achieving perfection and those of diminishing losses. Thus, through the innovations introduced in any kind of activity, we bring an improvement to products and services, therefore offering necessities to the consumer.

Key-words: creativity, research, innovation, market competition, economical growth, innovative spirit.

1. Introduction

Innovation, a complex notion related to cognition, must be defined in the context of knowledge, technology and informational transfer.

Basically, innovation is formed of four key-elements, applied in distinct activities:

- The commercialization of technology- applying scientific excellence in commercially successful products and services
- Knowledge/informational transfer- promoting collaborating and exchanging through ideas and information
- Receptiveness towards new ideas- the ability of being receptive towards new ideas and to their applications
- Innovative spirit: the dimensioning of new ideas and their successful implementation in a business environment

In the eve of the third millennium, the European Council, reunited at Lisbon during the 23rd-24th march 2000 has launched a now famous strategic objective implying that Europe should become a global leader of modern society, aiming an improvement in the degree of employment efficiency, economical reform and social cohesion as part of informational economy. The Final report included two distinct chapters:

- “The foundation of an European field of research and innovation”
- “The creation of a favorable environment to the establishing and development of innovative companies, especially small and medium businesses”.

2. Aspects of innovation

Innovation represents a product/ a new or significantly improved technological process, launched on the market. Innovation is based on the results of a new technology, technical development, on the merge existing technologies or on the use of information obtained by the innovative company.

Product innovation includes a product, a completely new or significantly improved service, regarding its own fundamental characteristics, technical specifications, software or other immaterial incorporated components, the predicted way of use or the degree of use difficulty. We must also indicate that innovation should imply a novelty for a specific company, not also for the market.

Process innovation includes new or significantly improved production technologies, new or significantly improved methods of service providing and product delivering. The result should be meaningful, regarding

the level of production, the quality of the products(goods or services) or the production and distribution costs. Innovation should be a novelty for the company but could be an already used technological process

Successful innovators are active companies, involved in innovative activities, business introducing new or significantly improved products, services, new procedures. Innovations are based on the results of technological development, merges of existing technologies or on the correct use of other information asked by the company. This term covers all types of innovators: product/ process innovators as well as companies involved in unfinished innovative activities.

3. Considerations regarding innovation and durable development

Research activities should be better incorporated and coordinated on an European level in order to render them highly innovative so that one can assure attractive perspectives for the most qualified brainpower.

Regarding businesses, their competitiveness and dynamics are directly dependant of the regulation framework leading to investments, innovation and entrepreneurship, thus encouraging innovative networks (the interface between companies and financial markets, between research&development and education institutions, between services offering consultancy and technological markets).

A newly introduced element is the approach of durable development in the context of innovation, thus making innovative activities and technological developments the key to attaining durable research . In the same context, innovative politics should be integrated in developing competitiveness policies. Insuring the sources of innovation financing thus leads directly to the increase of competitiveness.

Novelty is the essential element of innovation and is shaped in produced ways.

- Invention. Applying inventions created in research laboratories represents a way to innovation, research being biggest contributor to innovation
- Acquiring ideas inspired from other business sectors and adapting them to an own process of fabrication
- Searching new market segments, unchallenged, modifying existing products and services in order to induce a perceivable favorable transformation for the eye of the consumer
- Introducing a new way of approaching the business, in order to create a new business space or the increase of profit for an existing market
- Organizational innovation, including an innovative business representation, covering marketing and advertising fields

4. Innovation and perpetual improvement

Innovation is based on the principles of perpetual improvement, the efforts to achieving perfection and loss elimination, principles that should be taken into consideration in any activity. The concept of perpetual improvement defines loss as any activity not adding value to the consumers perspective, and added value as any correct activity concretely modifying a product/service in a way that a customer would find worthy to pay for.

The methods of perpetual improvement thus share characteristics:

1. they concentrate on the improvement of performance in a given process
2. imply a minimum of employees in the fabrication process;
3. tend to encourage incremental improvement
4. must assure time continuation

Innovation is defined as the exploitation or the successful use of new materialized ideas . In this way, through perpetual improvement as well as innovations applied in any given field of activity, one can sell relevant goods to consumers.

The basic components of the innovative activity are:

- Research & development accomplished inside the company, including creative activities systematically performed in order to increase the volume of information and use them to create new applications such as products(goods/services) and new, improved processes

- Research& development activities inspired from other companies, including those mentioned above yet accomplished by other businesses or research institutes
- The acquisition of equipment and apparatus, including high-tech equipment: computers especially bought to implement products(goods or services) and /or new(or significantly improved) technological processes
- Other acquirement of information obtained outside the company, including the acquisition of copyright , inventions , licenses, know-how, trademarks , software and other such, used in innovative activities
- Personnel training- training courses (locally or abroad) offered to the employees directly involved in the process of developing and implementing innovation
- Introducing products(goods or services)of innovative activities on the market – internal or external marketing aiming at offering on the market new or significantly improved products(goods or services);it may include preliminary research conducted on the market, advertising trials, but excludes the creation of market networks
- Design and other preparatory activities for the process of production/delivery –procedures and technicalities needed for the implementation of product(goods/services) innovations as well as technical processes not included elsewhere;

5. The promotion of innovation and technological transfer

The use of specific financial resources is opportune to the assurance of the technological transfer. Nevertheless, there exist problems related to the eligibility of companies soliciting financing and thus an important objective becomes that of fulfilling the necessary criteria of eligibility.

Extending this pattern to all types of financed projects, one can consider that such a plan of financial assistance supporting the industry in its effort to adapt to regulations is a preventive measure to the future testing activities verifying the correct application of regulations.

The feasible projects of the program aiming an increase in competitiveness pursue quality and innovative aspects in their manufacturing processes as well as elements leading to the accomplishment of the objectives of durable development : environmentally, economically and socially. Through its components, the program approaches most of the elements of innovation. Applying one of the types of projects in a company, according to the principles previously defined correspond to innovative actions.

Concretely, the innovative component is the type of execution for experimental models, prototypes, assimilations of new technologies applied by economical agents based on the results of the Romanian research units. For this types of projects, one can cover expenses related to the following activities:

1. the execution of experimental models and prototypes:
 - the acquisition of equipment, components/ subassemblies and/ or materials as well as the costs for the manufacturing of equipment;
 - testing experimental models and prototypes;
 - technical assistance for the execution of experimental models and prototypes;
2. the assimilation of new technologies, acquiring new equipment, components/ subassemblies and/or materials as well as the costs for manufacturing equipment and installations;
 - manufacturing –assembling expenses for equipment and installations necessary to the assimilation of new technologies;
 - technical assistance for the assimilation of new technologies.

6. Considerations regarding the evaluation of the capacity of innovation

The speed of the propagation of innovation in the economy is crucial to productivity and economical growth. The evaluation of the capacity of innovation is an instrument that should be developed in order to support companies aiming changes. Innovation is indisputably a factor of competitiveness, the element differentiating competitors. The markers of the degree of innovation of a certain company, along with other

economical indicators represent the key-element in comparative analysis, such as benchmarking market exercises.

Among competitiveness indicators, and important art is played by markers referring to innovation. By studying a series of past company evaluations based on the indicators of competitiveness, a series of weak performances influenced by the degree of innovation emerged.

These indicators are composed of several elements and as for “Products and/or Innovative services” ,they are the following:

- A. The business capital of products and new services, referring only to products and services launched in the current business year (without taking into consideration the existent or slightly modified ones)
- B. The business capital of new market segments, appeared in the current business year (such as investments on a new business field or new appliances for a certain product/service). They must be new business fields, formally developed by an organization through good strategic decisions
- C. The business capital of new geographical markets, national or international, developed as a result of strategic decisions.
- D. The number of new clients attracted during the previous year

Any independent evaluation or auto evaluation of one’s own performances, through the perspective of innovation, substantially contributes to changes in a companies attitude. Moreover, comparative analysis to competitors , especially procedural ones clearly indicate each company’s the areas it must change in order to become more competitive.

In order to attain the objective of the industrial policy of competitiveness growth through innovation each company should take into consideration all the factors (personnel, training, management, marketing) and activities that can influence a perpetual improvement, the growth of productivity and value increase.

The major strategic and organizational changes of a company refer to all the creative improvements, regardless of the existence of innovative activities.

One can identify the following types of modifications:

- strategic : the implementation of new or substantially modified strategies in a company
- in management : the implementation of advanced techniques in a company’s management
- organizational: the implementing of new or substantially modified new organizational structures
- in marketing: significant changes in the concept/ strategy of marketing of a certain company
- esthetical: significant modifications in the esthetics of the presentation or design and other subjective changes for at least one of the products manufactured by the company

The cooperation in the domain of innovation is represented by an active participation in research-development projects and in projects shared with other businesses or institutions. Receiving contracts, without an active collaboration is not an act of cooperation.

7. The percentage of active businesses involved in innovative activities and of those lacking innovative activity, compared to the total of roumanien companies during 2004-2006

The percentages for innovatively active businesses are divided according to each type of partner, activity, size category , type of modification.

The percentages for companies lacking innovative activity are divided according to each size class and type of modification.

7.1. Data source: the National Institute of Statistics

- the statistic analysis regarding the innovative activity (INOV) of the industry and services, based on the third statistical Communitarian Innovation Study (CIS 3) of the European Union
- the statistical Register of businesses (REGIS), administrated by the National Institute of Statistics

7.2. Methodological specifications

The statistical study regarding the innovative activity has been conducted on a representative of businesses specialized in industry and services, selected according to the size of the company (the number of employees).

The conducted research studied businesses specialized in the following fields of activity:

- industry: extractive industry, recasting industry, electric and thermal, electricity, gas and water;
- services: transportation and storage, mail and telecommunications, financial activities, banking and insurance, computing science and related activities; research-development; design, urbanism, engineering and other technical services; testing activities and technical analysis.

The size of the business/company was evaluated according to the number of employees, during the reference period; according to the criteria announced by Eurostat, the specific categorization (for innovative activities) frame companies in the following:

- small businesses: 10-49 employees
- medium businesses: 50-249 employees
- large businesses: over 250 employees

8. Conclusions

Innovation lies at the core of economical growth, being its key-initiator. Successful companies and those registering the quickest growth are the businesses regularly introducing innovation and thus a big proportion of their profit is obtained from new or significantly improved products and services. The blossoming manufacturing sectors tend to register the highest levels of innovative activity. Each organization registers a certain degree of innovation. Through specific techniques one can identify the opportunities of innovation and can specify the methods to increase the innovative coefficient of a company.

The integration of innovation in economical politics has three dimensions:

1. the creation of an innovative strategy, influencing locally, nationally and at European level the behavior of companies;
2. the integration of innovation in regional strategies ;
3. the interaction of innovative politics with other strategies and the introducing of innovation through competitiveness, internal marketing, workforce distribution and environmental protection, in order to systematically check the innovative degree of legislative and politic initiatives. Thus, introducing innovation in regulations is another leading factor to the competitiveness of products.

One must insure the circumstances of the transfer of results to companies that will effectively exploit them and allow the founding of new companies focused on research activities. Informational transfer activities can substitute the lack of informational connections between the company and the scientific substrate.

Abstract: The paper contains a research study developed by the authors concerning the content and the evolution of the European and Romanian labor market from the perspective of the European policies. The paper also presents main changes in the European labor market. Other direction of approach is based on the opportunities of the European market for the Romanian qualified people. The last part of the paper contains the main changes in the European System for Higher Education and the main actions already established at the European level for the period 2007 – 2010.

Key words: labor market, occupation policy, developpe, euro careers

1.Introduction

The labor market occupation policy has always been at the edge of the European policies and was barely mentioned in the initial treaties. Its secondary role was associated to a general failure in the attempt of creating a “social dimension” of “positive” integration, which accompanies the “negative integration”. The labor market occupation policy – and its multiple forms- contributed to reordering the power and influence relations between the national and super-national levels. The national occupation policy means understanding the laws and conventions which establish the rights of the workers and the structure of the work relations, and also the measures for protecting and promoting the occupation in general. A complete understanding of this evolution is basically impossible without taking into consideration the European dimension.

However, the occupation has been and also is one of the most difficult domains of policy elaboration in the European Union, containing many obstacles. After a few decades of political initiatives, institutional and treaty innovations, experiments of a “new” way of governing, and also after creating new forums of political interaction, the labor market occupation policy became of an intense preoccupation at the EU level. Lacking solid fundamentals in the treaty, the occupation policy evolution is based essentially on the entrepreneurial capacity of the Commission of establishing the agenda and creating new coalitions around its legislative agenda, by soliciting the support of the European Justice Court (which was frequently obtained) and creating coalitions with 1) the member states, by using the social action programs and the programs which support the treaty innovations and 2) with the national and European patronages and trade unions, supporting new methods of policy elaboration. The labor market occupation policy is based on a series of policy elaboration methods, such as using the communitarian legislation method (although, with some hesitation, due to the fragile fundament in the treaty), a specific hybrid between the communitarian method and the legislation approach in post-Maastricht method of “collective agreement legislation”, and between the more moderate ways of intervention, characteristic to policy coordination and benchmarking in the EOS (European Occupation Strategy).

2. The three pillars of the labor market occupation policy at the European level

Beginning in the early 60’s, they identified three institutional pillars of the labor market occupation policy. **The first** is represented by “legal” rights pillar, which is based on the standard communitarian method, used intermittently in the occupation field during the 60’s. The policies of this pillar have been elaborated using unanimous decisional regulations and (after Unique European Act, UEA) based on a qualified

majority in the Council, they were applied using directives, in which the possibility of varying the applications has been substantially reduced. **The second** pillar is the “collective agreement legislation” pillar, which is based on the social dialogue forms, promoted in the 80’s by a Commission, at the European level of Confederations of patronages and trade unions. This was sustained by the Article 118b CEE (currently named Article 138 TCE) and officially institutionalized in the social policy agreement (Article 4, currently named Article 139 TCE) in the Treaty of Maastricht concerning the European Union (EUT). This gave the right to the social partners to demand a Council decision concerning an agreement on the occupation policy or, alternatively, to demand the application of the directives by collective negotiations and “national practice”. **The third** pillar is represented by the “European Occupation Strategy” (EOS), more recent, more experimental and more ambitious, a radical and “new” way of governance (or an “open coordination method”) and its application depends on persuasion and “soft” conformity, using the benchmarking and collective evaluation. The construction of each of the pillars has been limited by the necessity of taking into account the diversity of the member states, mentioned above, taking into account the rapid evolution of the labor markets and their challenges, the business organizations in the last decades and also the bidirectional conflict of the necessary forms and levels of legislation and of the super-national jurisdiction area. Each of the three pillars is connected to a certain policy elaboration form, in a specific governance method. In order to clarify these connections and their implications over the resulted policies, they used the typology elaborated by Treib, Buhn and Falkner (2004).

The EU enlargement opened internal market for other 10 different countries and also for Romania, starting with 1st January 2007. The extended market provided for the companies a higher level of scale economies, along with reduced costs. The stronger competition in diverse sectors lead to restructuring commercial enterprises and also lead to lower prices for the consumers. The potential of economic growth and creation of jobs evolved even if on a short term, it reduces the number of working places in certain sectors. Secondly, many economic exchanges took place but also a great degree of specialization. The commerce between Eastern and Western Europe tripled or even quadrupled, since the beginning of the 1990’s. Thirdly, there are more investment opportunities and also foreign direct investments. Calculating the percentages, the foreign direct investments represent more than 5% from the GDP of the new Member States.

Accordingly, an extended Union is more competitive. The number of workplaces created was much bigger than the ones lost after the delocalization. Moreover, the extended economic space allows the EU to face the global competition, while European companies become stronger on an extended internal market and more competitive on the international markets. That is the reason for which Romania must continue eliminating the existent barriers and must persevere in extending the internal market, including the public services. Romania has a competitive advantage in Europe, if we take into consideration the lower level of costs. Nevertheless, Romania can no longer compete by using this advantage: there is always going to be a cheaper country than Romania.

Romania is a country with a very dynamic workforce. The young represent a vivid example for the rest of the continent: they have a strong academic education, with technical competences and strong entrepreneurial and linguistic abilities. In order to fully exploit its potential, Romania must ensure it encourages a flexible economy, which can adapt to the opportunities and the threats of the global market. A series of labor market reforms must be applied and the social policies must be reviewed, in parallel with the reforms of the capital and product markets.

3. Developing a career in the European Union institutional structures – euro careers

More than 12 000 Romanians applied for a job in such a competition. Getting ready for such a career development opportunity competition can be quite an interesting and extraordinary experience from many points of view. There is no official structure program, no bibliography, the tests from the past years are rather difficult to obtain, the necessary manuals are relatively expensive for the Romanian public, with prices varying from 15 and 40 Euros and they can only be bought by using an electronic credit card. There is no such thing as an official bibliography. The Romanian educational system accustomed us with a bibliography published before the exams, which does not change as the years pass, with correctional charts which are clearly announced before or even after the exams take place. However, this system does not apply for the jobs offered in the European Union institutions. In general, no bibliography is need but in case it exists, there are certain standards applied (like in the case of jobs for correctors, where they required the STAS, or for the translator jobs, where certain grammar norms are applied, including the new Academy

regulations and the use of prestigious dictionaries). They use the reference books from every domain and the learning process is mostly individualized. The forums and the discussion groups contribute to the information exchange between participants. The percent of those who succeed in passing the pre-tests from the first try is rather low but the exam experience is the most important. You can check www.euroconkurs.ro in order to download a few tests to become more familiar with the questions referring to numeric and verbal abilities, but also to check your knowledge about the European Union. In Romania, www.euroconkurs.ro offers information about the possibility of beginning a career in the EU institutions and since May 2006, it also organizes preparation seminars for the EU competitions, with the help of a specialized trainer from Brussels. Through these preparation programs they offer the opportunity of studying the ways of resolving the verbal and numeric exercises, the ways of clarifying certain aspects and of checking the most frequently asked questions about the history and the EU policies. One must begin studying 6 months before entering the competition. The information referring to the European Union must be taken seriously because the test about the EU knowledge is frequently charged with questions about recent events. On the Europa server, the official EU source of information, they recommend in the EU section the main principles of the member states, the communitarian legislation, the history, the euro-language and the symbol of the European Union. Most of the successful candidates apply complete study strategies, combining individual study with other methods which have proven their efficiency, such as trainings, discussion groups and psychological training for the exam. EPSO is the unique contact point for those who wish to work in the European public institutions: the European Parliament, the EU Council, the European Commission, the EU Justice Court, the Social and Economic Committee, the Regional Committee, the European Ombudsman. EPSO offers information to the potential applicants and to those who participate to a selection competition; it processes the requests and organizes the selection process. The EPSO site is the most important source of information regarding the career perspectives in the EU institutions, the competitions which take place, the application procedures to follow, FAQ (Frequently Asked Questions), on-line tests to verify the knowledge and abilities, European CV model and the examination centres. The jobs offered by the EU institutions are very popular with people in Romania, as in the EU member states. The competition is higher than the one for the most wanted colleges, and the exam difficulty increases exponentially. At the EPSO/AD/47/06 Romanian Administrators in European Public Administration, Law, Economics, Audit (AD5), for which the application deadline was 20 July, the competition was hard: 42 people for one available job: 9213 Romanian citizens for 215 places. The pre-selection tests (V&N, EU knowledge) were on-line, additional information over these had been sent to the applicants of EPSO profile in the first half of August. At the similar competition for the Bulgarian citizens, EPSO/AD/46/06, even if the number of applicants was smaller, 5397 people, only 110 were available, the competition was even stronger: 49 people for one job available. This has been, for the Romanians, the toughest competition until now. However, it is still far from the usual level of competitions for EU-25, where, for example, in the EPSO/AD/25/05 European Public Administration/Human Resources, for which the pre-selection tests and the written test were held in spring, there were 19014 candidates for 210 places, which means a competition of 90 people for one job. Even if the selection procedure is pretty rigorous, the exams are difficult and the applicants need too much time to study, but the rewards of a career in the EU structures have become more and more attractive for the Romanian citizens, as the access to information for the applicants increased.

4. Characteristics of the EU labor market, from the point of view of the human resources potential in Romania

Like in Romania, as certain economic sectors began to grow, the labor market in the European Union member states is lacking qualified workforce. There is also the situation in which the companies tend to reduce the employment costs, beneficiating in exchange, from the services of highly skilled employees. The solution in such cases is to hire people from certain states in which the workforce level is much lower, as in Romania's case. Year to year, the number of those who find a job outside the border is increasing. From the Department of Working Abroad (DWA), from the total of 69774 people registered in the Workforce Migration Office, 1543 have academic background, from which 509 people obtained a work contract abroad. We mention that these figures are only the ones from the Workforce Migration Office database, in which the solicitors are registered.

The IT specialists, the engineers and the medical staff are the most wanted to work abroad, according to the recruitment agents. "The most frequently requested jobs are in the IT industry. This mainly is about the

jobs which presume developing IT applications, web programs and IT administration. Secondly, there are the engineers. Mechanical engineers are the most wanted. It is about the graduates from Electro-technical colleges. Construction engineers are also highly wanted, like the ones who have knowledge in the medical field and who can work in the medical system: doctors, nurses or technicians”, said Rudolf Fedorovici, consultant for Advice Human Resources. In Germany, for example, they must fulfill the communitarian aquis regarding the number of doctors/number of residents. That is why they want as many pediatricians, neurologists, surgeons as they can get. Moreover, there are very many requests from the automobile production area. The research shows that most of the doctors who work abroad are residents. “Most of the offers for the Romanians come from Italy, Belgium, France, Cyprus. Outside of the European Union, the top countries which appreciate Romanian workforce are the Arab Emirates, Yemen and Canada.” Most of the Labor Inspection jobs refer to: doctors (one person in 2005 and 5 people in 2006), economists (79 in 2005, 3 in 2006), engineers (125 in 2005, 74 in 2006) and one psychologist (in 2006). In general, every country has its own lack of workforce on certain sectors of activity. As the countries which undertake a reform process need engineers, the rapidly growing areas need many IT specialists. Romanian IT specialists are highly wanted in the highly industrialized countries, in which certain development programs are undertaken, such as the United States of America, Canada, Germany, France or even Israel. Then, there are also the British companies which hire people to work in the former Yugoslavian republics. In these cases, they mostly want mechanical engineers and the jobs are mostly for Project Management. The doctors can also find jobs in the Arab countries, France or Italy.

Regarding the fact that in Romania the minimum wage is much under the one in the average European states, the Romanians are seen as low cost. Moreover, in most of the cases, the Romanian employees of a foreign company are paid less than the locals who have the same position. In exchange, for a Romanian citizen, a salary of a few thousands or even tens of thousands of Euros a month represents a huge sum of money, that is one of the reasons for more and more Romanians choose to work abroad, especially because they get other benefits like health or life insurance, a place to stay or even free trips for their families to come and visit them, besides the usual payment. “Very rarely, foreign companies hire a Romanian just because he is professional and pay him the same wage as a local citizen. Only those who have lived a while in that country have a chance of getting the same salary as the locals”, as the recruitment companies researches show. According to this one, a Romanian manager earns in England between 25 000 and 40 000 pounds a year. ”The best paid Romanians are the construction engineers but this is a consequence of the hard working conditions in countries like Kazakhstan. In the IT field, the minimum wages start from 5 000 Euro, to which they add the benefits: the place to stay, sometimes a pack of benefits for the wife and the kids. However, there are smaller benefits than the ones for the foreigners who come to work in Romania”. The increasing investment in the local economy generated in the last few years a huge lack of workforce in Romania. Because 2007 is a crucial year for Romania, the workforce mobility will be free in the European Union, the acceptance of Romania as an EU member state shall increase this phenomenon. The human resources specialists estimate that most of the Romanian professionals will go and work abroad. The vacant positions shall be occupied by the citizens of the Republic of Moldova or Turkey. Of course, they are paid less than the average Romanian worker. ”For certain jobs, the European Community had placed restrictions for the Romanians until 1st January 2007. After 2007, there will no longer be this problem. This means a greater lack of specialists. More and more Moldavians, Ukrainians, Chinese, Vietnamese or Thai shall arrive in Romania, because the unemployment rate in their home countries is very high.” After 2007, the Romanian workforce will have the right of free circulation. This not necessarily means that Romania has immediate free circulation rights regarding the workforce because as the Treaty between Romania and the EU specifies, the member states can solicit the need of a certain transition period in our country. Otherwise, every EU country has the right to impose restrictions concerning the access to the labor market for the Romanian citizens, on a period of 2 to 10 years. The decision is made separately by every state, before the end of 2006.

The employment of the academic graduates in the EU countries means recognizing the diplomas and the certificates obtained in Romania. However, countries like Italy and Germany offer certain facilities in employment for certain professional categories and crafts. For example, in Italy, the university lecturers, the university teachers and the researchers who work in an Italian university can be hired outside the annual contingent. Moreover, Germany can facilitate the obtaining of a staying permit to work, without requesting the permission of the Federal Work Agency for the highly skilled personnel, the employees in leading positions and the scientific personnel. Germany, Spain, Luxemburg, Hungary, France are among the states

which have workforce exchange agreements. For example, from the Workforce Migration Department, France demands a maximum of 300 stagier Romanians per year.

As the lack of workforce in the EU countries is increasing, the number of work positions for Romanians also increases. If we take into account the jobs available in the Workforce Migration Office, in the first 6 months of this year, as many Romanians as in the whole year 2006 went to work abroad. It is about a total of approximately 42 400 people, compared to 42 700 (in 2006). Most of the Romanians, helped by the Office, more precisely, 4 out of 5, had obtained work contracts in the agricultural field. 14% of them went to work as waiters or chefs, 8% in the industrial field. Most of them went to work in Germany, Spain, France, Switzerland and Qatar.

5. Priorities for the year 2008 for the European System for Higher Education, in the perspective of EURO-CAREERS development

At the Conference of the European Ministers Responsible with the Higher Education which took place in Bergen, 19-20 May 2005, they confirmed the commitment at a European level of coordinating the educational policies of the higher education, according to the Process of Bologna, in order to establish the European Space for Higher Education (ESHE).

Organizing the studies in two cycles was implemented on a large scale, more than half of the students having applied to such programs in most of the countries. However, there are a few obstacles from a cycle to another. Moreover, an intense dialogue is needed, in order to attract Government implication, the institutions and social partners, in order to increase the chances for the first cycle graduates (licensed) to find a job, including in adequate positions in the public administration field. There are preoccupations at the European level to ensure the general framework of ESHE qualifying, the three cycles (license, MBA, PHD) including the possibility of intermediate qualifications on a national agreement basis, generic descriptors for every cycle based on study results and competences and credits distributions for the first and second cycle. Promises have been made concerning the elaboration until 2010 of the national qualification frameworks compatible with the ones for the ESHE and the beginning of their elaboration until 2007.

In most of the European responsables' interventions, they emphasized the importance of ensuring the complementarities between the general qualifications framework foreseen by the ESHE and the framework proposal for lifetime studying, concerning education and professional formation, like they are actually developed by the EU and the Bologna partner countries. The mobility of students and teachers in the ESHE remains one of the key objectives of the Process of Bologna. At a European level, they reaffirmed the commitment to facilitate the transfer of scholarships and study credits through conjoined actions, when needed, in order to transform into reality the ESHE mobility concept.

It is widely accepted that we must intensify the efforts to eliminate the mobility obstacles, by facilitating the visa liberation and giving work permits and encouraging the participation at mobility programs. Another important aspect was soliciting to all institutions and to all the students to use at a maximum capacity the mobility programs and they also pleaded to fully recognizing the study periods, concerning the fact that the European System for Higher Education should be open and attractive to other parts of the world. The contribution in ensuring the education for all people must be based on the durable development principle and to be accordingly to the measures taken worldwide in order to ensure the quality of the higher education outside the borders. They repeatedly reaffirmed the content of the principles according to which the academic values must prevail in the actions of international university cooperation. ESHE is seen as a partner of the other higher education systems across the world, which stimulates the balanced mobility and the cooperation between higher education institutions.

The priorities for 2007 in the ESHE, in the Bergen Conference are the following:

- Introducing the models of system analysis for the quality assurance agencies, as they were mentioned in the ENQA Report;
- Implementing the national qualifications framework;
- Offering and recognizing the common diplomas, including the PHD ones;
- Creating opportunities for flexible educational paths in the system of higher education, including by recognition procedures of earlier studying.

This research paper presented only a few relevant aspects for the dynamics and the complexity of the workforce occupation process at the European level. Both the opportunities and the risks were highlighted, as well as the specific conditions to keep in mind in fundament and implementation of public policies in Romania, in the work and social assistance fields but also in the role of the Romanian system of higher education, from the perspective of the opening of the European space for the workforce in our country.

Abstract: The analysis of the career management practices within the European Union organization allows the procurance of a general vision over the necessity of their existence, applying and development within the Romanian business environment. The present economical-social context requires a reconsideration of the importance granted to the activities specific to the human resources career management at an organizational level.

Key words: career, human resources management, planning

The career management is considered to be the process¹ of design and implementation of purposes, strategies and plans which allows the organization to satisfy its needs of human resources, and the individuals to achieve their career purposes. It also includes the planning and career development integration as well as the functional interdependencies of planning of the individual career, organizational career and career development.

The career management, as component part of the human resources management, can be characterized by the diversity of conceptions and practices, diversity resulting from the geographical, economic, linguistic, legislative and cultural differences between the European Union countries. At the level of organizations, the career management introduction and implementation is influenced by an ensemble of factors belonging to their general external environment, to their specific external environment and to their internal environment (see fig.1).

<u>I ECONOMIC FACTORS</u>	<u>II POLITICAL FACTORS</u>
<ul style="list-style-type: none"> - the access to the capital market and the obligations towards the stakeholders; - the competition accentuation on the internal and international plan; - the crediting policy, the inflation and the rates of exchange; - the stage of economy and its development perspective; - the availability and the workforce cost. 	<ul style="list-style-type: none"> - Work legislation and the European norms regarding the working schedule, the income levels and work practices; - the attitude regarding social corporative responsibility; - the government policy regarding the continuous training; - the legislation regarding the environment and work health and safety.
<u>III SOCIO – CULTURAL FACTORS</u>	<u>IV TECHNOLOGICAL AND ORGANIZATIONAL FACTORS</u>
<ul style="list-style-type: none"> - the demographic factors (number of population and households); - the lifestyle (the attitude towards work, rest and family structure); - changes regarding the cultural values and the consumption habits; - regional factors (levels of education, skills availability, locations attractiveness, time allotted to business trips). 	<ul style="list-style-type: none"> - changes regarding the communication and production technologies; - the extension of process and product innovation within the industry; - the need of research and development investments, - the technological transfer rate, - the need of drawing knowledge from external sources; - work organization.

Fig. 1: The factors influencing the career management²

The economical and social environment analyst, who monitor the changes, suggested that individuals no longer take into consideration the development of a “lifetime career” in only one job or organization, but they assume the responsibility of managing their own career routes. The arguments aim at the changes within the European economy as well as at the changes within the organizations’ management, elements which lead to the reduction of the confidence in the possibility of a linear, progressive career. Nevertheless, the studies performed³ show that most of the employees are attached to the organization in which they activate, hope to work at least 5 years within it and expect to be promoted during this interval. There are a few organizations which renounced to the employment contracts for an undetermined period of time or to the traditional elements of career management such as the succession plans or the inside promotion.

Nevertheless, the ones who accepted the traditional career’s decline are the young people and the highly qualified professionals, who lay the stress on a professional development able to assure their competitiveness on the labor market. Also, more and more individuals approach the success in a career from a wider perspective which takes into account the personal life objectives, the spare time allotted to vacations and to the community in which they activate. To the support of this affirmation comes a recent study⁴ regarding work in Europe, study which shows that the employees within the Union consider health, family, friend and spare time to be more important than work, which occupies only the 5th rank in their priorities.

The tendency according to which the employees assume the responsibility of their own career development becomes more and more obvious, but these employees need the support of the organizations in which they activate.

Thus, through the career management practices, the organizations can approach in a coherent, consistent and proactive manner their employees professional support and development. Due to the fact that they cannot promise a lifetime workplace, the organizations must take into account their employees personal aspirations, they must contribute to the development of their professional skills in order to increase their competitiveness on the work market and to assure a better financial safety. Also, the correlation of the organizations strategic objectives with the employees’ objectives became an element necessary to the procurance of the competitive advantage; a motivated and co-operative personnel is an essential element in the assurance of the company’s competitiveness on a continuously changing market.

In the present conditions of the labor market, where the employers from the European Union are confronted with difficulties of recruiting the necessary personnel, the employees development is highly important for guaranteeing the future of the organization and for sustaining the competitive advantage.

The strategies of the European companies regarding the administration of human resources aimed at the increase of employees’ performance during the last few years, and the main *action directions*⁵ were:

- encouraging the *continuous training* by means of the individual skills upgrade courses, online courses and mentoring; **Obs.:** In the latest European⁶ investigation regarding the work and life conditions it has been noted that the access to the professional training has not been improved during the latest 5 years, noticing as well a training deficit during the entire life for older or less skilled workers, in spite of the work legislation modifications within the union and of the financial support by the European Social Funds; also, the part time and temporary employees benefited quite rarely of training courses as compared to the full time employees.
- *Keeping the persons valuable* for the organization by elaborating strategies regarding the old personnel, the knowledge management, the completion of the databases with practical information;
- Promoting a *policy of equal chances* by equitable trainings, diversity encouraging policies etc.

³ CIPD Research report, Pressure at work and psychological contract, Guest and Conaway, 2002;

⁴ Capital no.11/March 15, 2007, Euro barometer 2007, page. 36-37;

⁵ www.fedee.com: „Human resource management in an expanded European Union”;

⁶ www.eurofound.europa.eu; The European Foundation for Improving the Life and Work Conditions,2007.

- Encouraging the reach of the *balance between the professional and the personal life* by rendering the work schedule, the benefits and compensations, etc. more flexible; **Obs.:** In EU 27, the work schedule includes, in average, 40 hours/week (the central and northern countries have shorter schedules - France 35 hours, Holland 33 hours – and the eastern and southern countries have longer work schedules, over 40 hours) , allowing thus the performance of a balanced life for 80% of the European people.
- The improvement of the *professional performances* by:
 - using the performance management methods: benchmarking, reengineering, objectives management, employees evaluation through the 360° feedback method, quality circles introduction etc.
 - improving the recruiting process by sponsoring students, the online recruiting which allows the automatic CV-s selection, the head-hunting;
 - creating evaluation and development centers;
 - conceiving and applying the succession plans;
 - reducing the rate of absenteeism through the motivation programs, through the monitoring of the long-term absences and so on ;
 - assuring a pleasant work environment, bearing the transfer costs, various types of help in critical situations and so on.

The career management is approached differently within the organizations, according to the size of the company, to its economical and financial power, to the geographical area where it performs its activities as well as to the importance that it grants to human resources management in general.

Most of the companies conceive and develop activities of *careers administration*⁷ for the employees with development potential, especially for the superior and average level managers. There are yet few organizations that have created strategies which take into account all the employees.

The most used career management practices aiming at the entire personnel are the following:

- the existence of a *job posting system*, namely of an internal site presenting the vacant jobs within the company to which all the employees can apply;
- the formal evaluation / the evaluation of the career development plan with the manager ;
- informal support from the direct superior/ human resources managers / functions managers, regarding the career;
- career movements administrated by the organization;
- succession plans;
- formal mentoring activities;

The activities addressing to all the employees are especially informal and not always effective; they imply especially performances evaluation within certain employee/manager discussions, moment in which the career development level is also assessed.

The employees consider that the most effective activities regarding career management are:

- the internal jobs market;
- the evaluation and development centers;
- the development programs aiming at work/career experience;
- the career counseling by individual trainers;
- the coaching regarding the career;
- the formal performances and career development evaluation;
- the career plans for the employees with high development potential;
- informal support from the human resources and/or department manager;

⁷ CIPD: Managing employee career: issues, trends and prospects, 2003;

A very important role in applying the career management is held by the *company superior management*, by: changing the line managers' attitude in the sense of rendering them more responsible, assuring the necessary resources and correlating the human resources activities with the business necessities.

At present, the employees consider the acquiring of experience and the development of new professional skills and competences, elements allowing them to change the organization, to work in other countries and even to change their activity field, to be more and more important. This situation will lead to the career management transformation in a strategic instrument of the human resources management from any organization.

THE PLACE OF MEDICAL EVALUATION IN THE SELECTION SEQUENCE

Aurelian Sofica

Bebeş-Bolyai University, Faculty of Business, Horea 7, Cluj-Napoca, 400174, România, sofica@tbs.ubbcluj.ro, 0740230130

The paper explores in a phenomenological manner the importance of medical evaluation in selection process sequence. The topic of research is narrow and follows apparently microscopic aspects of human resource management. This level of reduction for the research theme is supported by the disproportionate effects a small choice can have over various actors involved directly or indirectly in the process. The paper is mainly theoretical and tries to provide new lenses in understanding the construction of a specific reality.

Key terms (human resources, selection, medical evaluation)

Medical evaluation is a step of the selection process often seen as a legal requirement and not as a functional tool in a complex, interconnected, sequence of steps carefully choreographed for the perfect sorting of human resources. If is a legal requirement (the employment contract is invalid without it) then it must be placed at the front of the selection process. This is not always the case but happens frequently enough and when these choices are made, a chain of events are generated.

The nature of the problem scrutinized in this paper is the fact that the order of selection steps influence in a powerful manner the selection process. The placement of medical evaluation as one of the first steps in selections is an unfortunate choice from various reasons. Using as starting points two case studies, we will try to outline the shock waves an apparently small choice generates on the labor market for certain actors involved with or without their consent.

The paper is a fundamental research and details in an exploratory manner the legal guidelines and the placing of the medical evaluation in the selection process as in the literature; presents two case studies relevant for the research; introduces the concept of “butterfly effect”; underlines what employers stand to lose if they don’t understand the causal connections and draws few conclusions in the end on the basis of data accumulated.

Legal guidelines for medical evaluation

Almost all discussions about medical evaluation in the employment process are based on the legal foundations. The meaning of this step of the selection process seems legally and not functionally constructed. So to outline the concept we started with a sort presentation of the legal background and try to structure a meaningful web of relations between various provisions.

Medical evaluation for employment reasons are a legal requirement for every job on the market. This kind of test has to prove that the candidate is able physically and biologically to perform the specific tasks of the job (International Labor Office Staff, 1999). The rigorousness of the criteria varies accordingly with the activity domain, with the physical and mental effort and with responsibility required. For the public alimentation, medicine, education, defense, or other alike, the standards are higher, then for other domains with little or no social impact. The legal background for medical testing for employment reasons is given by the Labor Code (24/01/2003, Art 27 and Art 28). A relevant excerpt is presented in the following line:

Art. 27. Mandatory medical certificate upon employment

- (1) A person may only be employed on the basis of a medical certificate, attesting that the concerned person is able to perform the respective activity.
- (2) The breach of the provisions in paragraph (1) shall void the individual employment contract.
- (3) When the employee submits the medical certificate after the conclusion of the individual employment contract, and the content of the certificate indicates that the person concerned is able to work, the contract thus concluded shall remain valid.

(4) The competence and procedure for issuing the medical certificate, and the penalties applicable to the employer when employing or changing the place or type of work without a medical certificate shall be laid down in special laws.

(5) The request, before employment, of pregnancy tests, shall be prohibited.

(6) When employing in the health, food and beverage, education and other fields laid down in regulatory documents, specific medical tests may be required too.

Art. 28. Mandatory medical certificate – special cases

A medical certificate shall also be mandatory in the following cases:

- a) when resuming the activity after a pause in excess of six months, in the case of workplaces exposed to professional nuisances, and one year, in all other cases;
- b) in case of posting or transfer to another workplace or another activity, should the working conditions change;
- c) at the beginning of a mission, for the employees employed under a temporary employment contract;
- d) in the case of apprentices, interns, pupils and students, when they are to be trained in trades or professions, and also when changing the trade during the training;
- e) regularly, for those exposed to professional nuisances, according to the regulations of the Ministry of Health and Family;
- f) regularly, for those performing activities entailing the risk of disease transmission and those working in the food and zootechnics sector, in drinking water supply plants, children communities, health units, according to the regulations of the Ministry of Health and Family;
- g) regularly, for those working in organizations with no risk factors, by medical examinations differentiated by age, sex and health status, according to the regulations in the collective labour agreements.

Few things from the legislation clearly come forward: the cost of the medical evaluation is not placed on the shoulders of employer – in fact there is no mention of this responsibility; the medical certificate can be submitted after the conclusion of the individual employment contract so employers are not legally bounded to place the medical evaluation at the beginning of the selection and the legislation tries to limit the unethical use of medical testing for discriminatory purposes – pregnancy tests. The general impression is that legal background seem to be under evolved, with a lot of gaps and misinterpretations, and that the general problem of the legal system, a lot of general legislation but few implementation and reinforcement institutions, is present here also.

The placing of medical evaluation in the selection process

The placing of the medical testing in the hierarchy of selection methods is of vital importance. The lack of attention, or the inertia of habit, can create unwanted effects for the employer, for the candidates and for the various institutions involved in the process. It is interesting how a single choice of order can create so many unforeseen problems. If the medical evaluation is one of the first in the selection process then, from various points of view: financial, time, public relation etc, the employer undermines its own success. If the employer have enough patience and knowledge to leave medical evaluation at the end of the selection process, then success is one step closer. Unfortunately this is not always the case.

First we discuss the logical order of the selection process and its steps. This logic is created on the ground of financial efficiency; short timetable; good image projected on the labor market and the order of the selection steps influence for good or for bad this logic. We can imagine the selection process as a system of successive sieves sorting the candidates in according to the jobs requirements and personnel specifications, in the end remaining only the “golden candidates”. The steps of the selection process under discussions are compiled from various sources (Armstrong, M., 2006; Werther, W. B. and Davis, K. 1993; Klinvex, K. 1998) in the figure 1.

Selection steps	Initial candidate number:	150
Preliminary reception of applications (application form, CV, intention letter)		75
Employment tests (performance, knowledge, psychological and attitude tests)		10
Selection interview with a HR specialist (structured, behavioral, in stress etc.)		5
Reference and background check (checking factual information)		4
Medical evaluation (physical and biological adequacy)		3
Supervisory interview (team adequacy and specific technical interview)		2
Realistic job previews (an insight in to the job)		2
Hiring decision (job offer, individual contract and job description)		1

Figure 1 Steps in the selection process of human resources – the successive sieves effect

Two case studies

The first case study regards Cluj-Napoca County Office for Work and Equal Opportunity. It was the year 2000 and in the recruiting process for the position of human resources inspector, interested candidates were asked to apply for the job with a dossier containing four pieces: curriculum vitae, a cover letter, a criminal record and a medical evaluation for the job. The arguments for this rare application procedure regarded the need to find qualified, healthy and honest candidates for the job in this public institution. People responsible were mighty proud of the system created for the applicants. As background information we mention that: because of the privatization and economical transition the unemployment rates were high in Cluj-Napoca; there were few people trained in human resource management - this was a relatively new area in Romanian organizational management; the lack o knowledge and human resources was a big problem for public institutions also and the number of respondents for the recruiting advert was around 200.

The second case study regards a local branch of C.E.C Bank, in the year 2007. In the recruiting message the candidates for the job of account administrator were asked a dossier with: cover letter, curriculum vitae; copies of studies documents; copies of work paper; copy for identity card; copy for military discharge paper; criminal record and medical certificate. The labor market was in its best moment (1% unemployment rates), the number of people on the market with economic education high (Cluj-Napoca is an important academic center). The selection process was an ongoing one (“the selection process will repeat itself until the appropriate person is found”).

The butterfly effect

We can see in both cases that the recruiting process creates a lot of administrative effort for the candidates to apply (at least for major steps are required), but what is invisible at a first glance for employer is the amount of social distress he creates for the candidate as well as for himself. A small judgment mistake can produce, like in the chaos theory or the butterfly effect, huge secondary unanticipated effects for both actors involved and unfortunately for third parties also (Figure 2 – Negative effects of the medical evaluation in the early stages of election process). And usually what people or employers don’t see or know, don’t hurt them.

Negative effects for candidates	Negative effects for employers	Negative effects for third parties
Time consumed: almost ½ days, per person, spent to plan, pay, travel, be examined, take results and obtain certification.	More documents to be processed - the selection process in this first stage grows in complexity	Crowded medical centers: few medical centers are accredited and dozens of employers take this approach
Money spend unnecessary: (almost 500.000 ROL in 2000 and almost 150 RON in 2007 per	More time invested in the selection process	Unsatisfied clients for medical centers – waiting time increase and the quality of the medical
	More money allocated to the	

person) Possible traumas suffered by candidates: radiation exposure, invasive procedures, people pass out during blood sampling.	process The differentiation of the candidates resulted in this initial stage on the basis of medical evaluation is poor, because the majority of the candidates are healthy.	act decrease. Overworked medical staff: the numbers of patients increase dramatically, pushing their limits and increasing the number of errors.
---	---	---

Figure 2 Negative effects of the medical evaluation in the early stages of the selection process

Let us take the worst case scenario – case study number one (a very plausible one) and see some real effects. First 200 people spend half a day, that’s 100 working days. Second, 200 people spend 500.000 ROL, that’s 100.000.000 ROL. Third, supposing one in twenty people are very nervous about blood analysis process, that’s 10 people in great discomfort. Fourth, the employer has maybe 195 more certificates to evaluate than is efficiently needed. Fifth, 195 medical certificate take almost one day to be evaluated and this costs extra. Sixth, the differentiation obtained between candidates is minimal, often all the candidates are medically fitted for the job. Seventh, in a small town like Cluj-Napoca, if five employers think alike, then the medical centers have in a short period 1000 more clients than usual... and the chain of events can go on.

The solution to the problem is not so hard to spot, but in a region with a legalistic approach to organizational culture, with a great degree of bureaucracy, and little training on human resources the beaten track is always the safest one. “This is how things are done around here” is an argument for the lack of causal thinking, for an over-hierarchical system of management, for the lack of creativity and causal thinking, or even for the lack of time.

In an efficient approach, the place of the medical evaluation is at the end of the selection process, or at least in a position where the number of people affected by this step is short. We can wait for the preliminary reception of the applications, selection tests and interview to narrow down the candidates (3-5) and then ask them to do the medical evaluation. The impact over candidates, third parties and employers is drastically reduced. A simple change of perspective, change for the better the efficiency of the selection process, removes the “bugs” in the system and project a responsible approach of the employer.

What employers really have to lose beyond time and money?

If we go beyond internal cuisine (time and money) and try to understand the impact of a mediocre selection process over the clients or the potential clients we can see that *from the public relations point of view things can go really bad*. All the steps of the selection process are moments of public relations. Majority of the candidates will not be employed and the quality and the professionalism of their treatment will create the external image of the organization. The social networks of disgruntled candidates can spread a negative image with multiplying effects on the labor market and between clients.

Another lose for an employer is that viable candidates get tired to complete the complex initial process of recruiting and selection: write curriculum vitae, write a cover letter, get the criminal record and then obtain the medical certification. This kind of recruiting/selection packages *reduces the pool of candidates on other criteria than competence*. Especially medical evaluation is a time and money consuming process. If this complex recruiting scheme is intentionally used to sort the only determined candidates when the labor market abounds with labor force, the arguments in its favor can be understood; but when the labor market lacks the resources to provide a decent pool of candidates, then the complexity of this approach have no argument.

Externalities represent a concept from micro economy relevant for this paper purpose. Externalities “arise when one party’s actions have consequences (positive or negative) for others that are not accounted for in market transactions” (Marshall, G. 2005, p.20). In our case, the choices made by employers (medical evaluation as a first step in the selection process) have negative consequences over other parties that are not accounted in the market transactions (clients of the medical centers) and maybe positive effects over other third party (medical centers), increasing the number of clients and their revenues – so *we are clearly dealing with a case of externality in the selection process* and more specific in the medical evaluation.

Conclusions

The “butterfly effect” is a problematic phenomenon in the field of human resources. Some employers are not able to see or anticipate in a causal manner the impact of their actions on other people. Other employers are able to see and anticipate the effect of their actions on other people, but from various reasons choose to ignore them. The ethical implication of this behavior is important either way because of the *social distress* a simple decision in the selection process produces. Financial losses; time or the lives of main actors and third parties are consumed in a futile manner; people are traumatized and crowded, other businesses are affected... these are few of the main effects. The “externalization” of the transaction costs by the employer summarizes this in an effective manner.

If we change perspective and put ourselves in the shoes of the employer we believe that understanding, even in an egotistic manner, the effects of their actions over their own business, the butterfly effect will be drastically reduced. All the complexity of the process doesn't create a solid, thorough selection process, but deepens the ineffectiveness, and digs *employers own grave* by giving him more documents to be processed, consuming more valuable time and money and all with a poor differentiation effect between candidates.

A phenomenological approach is needed to see the causal context of this kind of decisions in a different light. Extensive training on selection process; rethinking of every step of the selection in a neutral light of people involved, time and money and a fresh new start, different from the “ways things are done” are vital elements for future success. An educated employer means fewer anomalies and fewer resources wasted on labor market.

THE IMPACT OF MANAGER-EMPLOYEE RELATIONSHIP ON IMPROVING PERFORMANCES IN TOURIST INDUSTRY

Babaita Carmen Mihaela

The specific tourism activity, its complexity given by the variety of its components, is important for recruiting and selecting the necessary personnel, its structure, and training in order to maximize the efficiency of work force. Employees' motivation refers to a right correlation between their personal needs and the objectives of the organization. The role of the manager is to identify and decide to what extent the organizational objectives are similar to employee's personal needs. The motivating-coaching function covers up the set of work processes that determine the staff of a company to set up and achieve the planned organizational objectives. There is no standard pattern of motivating the staff; employees' motivation is based both on personal and external factors.

Key words: human resource management, motivation, reward, satisfaction, manager-employee relationship

1. Human Resource Management

1.1 Tourism Human Resource Management

Human resource management is the entire set of activities focused on providing, developing, motivating and retaining the human resources within the organization so that the main objectives should be reached efficiently and the employees' needs satisfied.

The extent and quality of tourism activity is mainly determined by the number of employees and the level of their qualification, the correlation between their professional training and the position hold, their professionalism and promptness in reaching the objectives. Thus, tourism evolution is directly related to the human resources structure and dynamic, underlining the great importance of human capital.

The specific tourism activity, its complexity given by the variety of its components, is important for recruiting and selecting the necessary personnel, its structure, and training in order to maximize the efficiency of work force.

1.2 The specific features of tourism labour

The relationship between tourism and human capital is a complex one, of inter-conditioning, each of the two elements having the cause-effect role. Tourism is covered up by numerous and various activities and the work in this domain is characterized by a series of features mainly reflected by the need of work force and the results of utilizing it. Among the most important features we can mention a great consumption of workforce, superior moral and material liability, direct customer-employee relationship, seasonal period, using the work pattern partially. The specific features of working in tourism influence the number and the qualification of employees, the structure of human resource, work productivity level, mutual motivation, recruitment and selection policies, as well as professional training.

2. Labour satisfaction, motivation and reward

2.1. Satisfaction

According to its definition, satisfaction is a subjective state as a result of needs fulfillment, lack of tension and anxiety. Depending on the purpose, an action should be finalized with a moral or material satisfaction. If the efficiency of individual involvement in team activity is low, with no satisfaction, then, one can speak about a state of dissatisfaction, a state of mind that can cover the whole group, the organization, leading to frustration.

The main factors influencing work satisfaction are: pride, career advancement, professional challenge, organization prestige, work benefits, job security, etc.

2.2 Motivation

Motivation is defined as a sum of internal and external energies that initiate, conduct and maintain an effort targeted to organization objectives, fulfilling also the personal needs. (Robbins, 1998).

The effort made by the employee will contribute to a greater extent to the outcome expected by the organization, as long as the personal goals are similar to those of the organizational ones. For an individual to be motivated at the workplace, he must be sure that performing a certain job will help him fulfill his own needs.

Employees' motivation refers to a right correlation between their personal needs and the objectives of the organization. The role of the manager is to identify and decide to what extent the organizational objectives are similar to employees' personal needs.

Motivation is one of the managers' most important responsibilities; they must find the best way of motivating their employees to get the best performances at their workplace.

Reward

Staff motivation is the basic method to involve the employees in achieving organizational objectives and it refers to the correlation between fulfilling employees' needs and interests and the tasks they perform.

Rewards consist of those formal and informal, economic or moral-spiritual elements that are granted to employees fulfilling certain individual or collective needs in order to motivate them to bring their entire contribution and achieve the company's objectives.

There is no standard pattern of motivating the staff, employees' motivation is based both on personal and external factors.

The motivating-coaching function covers up the set of work processes that determine the staff of a company to set up and achieve the planned organizational objectives.

3. A comparative survey concerning staff motivation

This survey was carried out in two three-star hotels in Timisoara: Hotel no. 1 and no.2 Hotel. A questionnaire has been distributed to the employees in order to collect the necessary data. An important segment of employees of both hotels was subject to this research.

3.1 The importance of this case study

This case study is useful to all managers working in hotel industry. It is very important for them to be aware of the impact manager-employee relationship is having on customer satisfaction. The case study comprises not only the findings obtained by data analysis, but also recommendations that may help the hotel managers to design new strategies in order to improve their business performances.

3.2 A presentation of two analyzed hotels.

No.1 Hotel: It is situated in a peaceful, less centered area of the town, it has a restaurant, a bar, 10 single rooms, double rooms, and apartments equipped with TV sets, air-conditioning, mini-bar and telephone. The customers can enjoy the following services: parking, card payment, gym, sauna, barbershop, and internet access.

There are ten employees working in the hotel, a segment of 100% of the employees has been questioned.

Hotel no. 2: It is situated in the very cultural and historical centre of Timisoara; the atmosphere is very elegant and comfortable. The hotel has 150 single, double rooms and apartments, differently decorated with an excellent view over the town during the day and night.

To meet the demands of its customers the hotel has a restaurant, a bar and a conference room where conferences, cocktails, banquettes, parties or festive dinners may be organized. This hotel has an excellent reputation for the services provided such as: parking, washing-cleaning services, gym, sauna, massage, hairdressing saloon, internet access, secretarial services. They also provide additional services such as: transport from the airport to the hotel and sight seeing.

This hotel has 160 employees; an important segment of 60% has been questioned.

3.3 The analysis of the questionnaires distributed to the employees of No.1 Hotel and No.2 Hotel

a) A description of the targeted segment

By analyzing the employees' distribution according to their age one can notice the following: Hotel no. 1 has employees of 31-40years old (70%), whereas the age of the employees working for No.2 Hotel is between 20-30 years old (52%). Hotel no. 2 has also employed people between 41-50years old (11%) and people over 50 years old (4%).

By analyzing the employees' distribution according to their gender one can notice that both hotels have a predominant number of women, but in a different percentage: 86% No.1 Hotel, 52% No.2 Hotel.

By analyzing the employees' distribution according to their education one can notice the following: a 57% of the employees working for Hotel no. 1 have been employed for a period of time between 3-5 years, 29% have 1-2 years of work experience. This might be explained by the fact that it is a new hotel in contrast with Hotel no. 2 where the most employees have between 5-10 years of service(30%), followed closely by those with 3-5 years of work experience (29%). One can also notice the presence of employees a work experience of over 11years (11%).

b) The inner motivation

Most of the employees of hotel no 1 consider their work activity as being interesting 43%, a percentage of 29% enjoy their work, 14% consider it over demanding and 14% say that their tasks are constantly changing. The employees of No 2 Hotel consider their work activity as being interesting and they enjoy it (48%), but being a large hotel, fully occupied, a 4% claim their work is over demanding sometimes.

Regarding the employees' skills one can notice that the staff of both hotels state they have the necessary skills suitable for the position held, some are positive about it and others tend to believe that. Still there is a percentage of 29% at the Hotel no. 1 and 11% at the Hotel no. 2 who are not sure about this question. A 4% of the employees of No.2 Hotel claiming their skills are not suitable for the positions they hold.

With reference to reaching the personal and professional goals the employees of both hotels are not satisfied: No.1 Hotel 86% and No.2 Hotel 81%.

With regard to their professional development the employees of both places are not satisfied, most of them stagnating. They are not very optimistic about their professional advancement within the company, because the company ladder has only few levels and career advancement is a slow process.

c) Employer- employee relationship

One can notice that at both hotels the employees have a positive reaction towards management: No.1 Hotel (57%) and No.2 Hotel (52%), with a small exception of 4% of the second hotel's employees, who have a different opinion.

With reference to managers' flexibility and new ideas one can notice that most of the employees agree with this statement; No.1 Hotel (42%) and No.2 Hotel (59%).

The performance appraisal questions has underlined the following: the employees of the no.1 Hotel stated the staff appraisal in their hotel is a honest and objective process(57%), but there is a percentage of 29% employees who are not quite sure about this and 14% who have doubts concerning the manager's

objectivity. The employees of no.2 Hotel appreciated the manager's objectivity and honesty (42%), 50% are not sure and 4% think the manager is not objective.

One can easily notice that the management the first hotel is much more flexible in the process of decision making 57% of the employees can make their own decisions compared to a 26% of the second hotel.

d) Remuneration and reward

In both cases employees think that they should get more money for their work: 57% no. 1 Hotel and 93% no.2 Hotel. Only 7% from the second hotel think they are paid according to their work, and 42% from the first hotel think they are paid according to their work. None of the employees think they are well-paid.

e) Work conditions

Regarding the salary one can notice that at the first hotel 43% of the employees have answered that the salary was not the reason that made them get that job, 43% stated that the salary was the main the reason for their employment, and 14% said the salary motivated them to get the job to a less extent. At the second hotel we have the following situation: 52% of the employees have answered that the salary was not the reason that made them accept that job, 4% said that the salary was important, but not to a great extent, and 44% answered the salary was an insignificant reason.

With reference to work experience issue, one can notice that it is the main motivation for employment at both hotels. At no.1 Hotel 43% of the employees have answered that they have got the job for the career opportunity offered, also 43% think their career is not so important, 14% did not take this issue into consideration. At no.2 Hotel most of the employees got the job for career advancement, 19% think their career is not so important and only 7% did not take this issue into consideration.

Regarding the issue of working conditions and environment we have the following data: at no.1 Hotel most of the employees are satisfied with their working conditions (57%), 29%of them are not so satisfied with it and 14% of them are not satisfied at all. At no.2 Hotel most of the employees are not satisfied with their working conditions and environment (56%), but there are a percentage of 26% employees who are very satisfied with their working conditions.

There is an obvious difference between the two hotels: no. 1 hotel has managed to attract a large staff to work for them 72%, even if they used to work for other organizations, whereas most of the people of the second hotel were unemployed when they applied for this job (74%).

f) The analysis of open questions

By analyzing the answers of the open questions, one can notice the main reasons of employees' dissatisfaction and the suggestions they make.

The answers provided for this open question: *What would you do if you were the manager of your hotel?* (Chart no.1)

1. I would promote employees according to their performance
2. I would offer financial rewards to hard working employees
3. I would provide trainings
4. I would encourage competition among employees
5. I would implement a modern management, a more effective one
6. I would grant employees moral and material incentives

Chart 1. Staff motivation within the hotels

What do you need to become a motivate worker? What makes you an unmotivated worker? (Chart no.2)

Answers:

1. Low salary
2. Reduced opportunities for career advancement
3. No professional training
4. Company's lack of development/opportunities

Chart 2. Analysis of employees' dissatisfaction

4. Conclusions and Suggestions

Conclusions: the findings of research have underlined the fact that most employees are not satisfied with their salaries and their professional training. Their personal initiatives are not taken into consideration because there is no efficient system of collecting and using data.

Mainly, the managers used to focus on getting a rapid profit, but currently more and more managers have realized the importance of having well- prepared, well-trained employees within the company. Thus, they must focus on motivating their staff to increase their productivity level and job satisfaction.

To improve the system of management and the services provided to prospective clients, we underline the following suggestions:

Professional development

To increase employees' satisfaction towards their professional development, the organizations should focus on the following areas:

- To elaborate and implement a system of drawing up and revise the job description
- To outline the role of each employee within the company
- To design training programs according to each professional group
- To set objectives within a certain period of time (3 months-1 year) and to monitor the progress constantly(involving the employees in this process)
- To delegate responsibilities
- To increase the number of jobs
- To involve the employees in the decision-making process

Performance appraisal

Performance appraisal system may take various forms within organizations:

- To develop a system of competition among all levels
- To appraise employees' good results in public providing concrete examples
- To be granted individual rewards (financial rewards) periodically

Liability

Regarding employees' work liability, one can state that only few organizations grant their employees freedom to express their own ideas and opinions. Thus, few organizations take fully advantage of their employees' potential. Thus, it is recommended for them to:

- Delegate responsibility
- Develop training for managers concerning the process of delegating responsibilities
- Design and implement systems of collecting employees' suggestions and recommendations so that all of them should be involved in the process of improving their work.

Advancement

Among all analyzed parameters, this one has registered the lowest figures compared to the ideal level. Thus, it is recommended for them to:

- Draw up job description, to have a clear job specification so that each employee should know exactly their responsibilities
- Design and implement a career planning policy
- To increase the employees' liability progressively so that they should be prepared to climb the company ladder

Working environment

This is an area where the most spectacular progresses are made within Romanian companies. It seems like Romanian managers are willing to create a pleasant and efficient work environment in spite of low budgets.

More and more companies implement quality systems to be successful and when they are seconded by a performing human resource management, one can speak about successful companies.

Payment

By analyzing the questionnaire one can easily notice that more than half of interviewed people were not satisfied with their payment, and their suggestions and recommendations were focused on this topic. The employees are also dissatisfied with the level of their salaries in comparison with the other peers' salaries or the salaries on labour market. This internal or external inequality may appear because most of the employees are not aware of the payment system criteria.

To improve the level of salaries, managers should take into consideration the following:

- Developing and implementing evaluation policies and strategies
- Investigating the level of salaries on the market

It not only the salary that is taken into consideration, but also the fringe benefits such as: medical insurance, life insurance, company car, discounts or free products, subscriptions to gyms, a day off, nursery school for employees' children, rewards granted for good suggestions, or meeting the deadlines, surprises, gifts on somebody's birthday, trainings, and seminars etc. thus, it is important for managers to:

- Develop payment policies and strategies
- Develop and implement appraisal performance policies
- Develop payment systems base on achieved performances

USING STRATEGIC MANAGEMENT STUDY CASES IN ROMANIA

Băcanu Bogdan

Transilvania University of Brasov, Faculty of Economic Sciences, str. Eroilor 9, e-mail: b.bacanu@unitbv.ro

Abstract: The paper discuss the use of study case in the teaching of strategic management and the translation of the method from United States to Romania. Some technical aspects of American experience in strategic management case researching are underlined, with a focalised approach on financial analysis and their informational context. The basic weaknesses of the method are also analysed in order to understand the practical problems in Romanian educational environment. The general value as a tool in achieving participation and in developing communication is magnified with a specific Romanian one: gathering direct information.

Key-words: case study, strategic management, qualitative data, financial analysis, firm classification

Introduction

The use of case studies has been the most popular method of teaching strategic management and business policy for about one hundred years. The method was used on large scale in business school, especially at Harvard Business School in USA, and after 2nd WW the “American standard” has spread in Europe and Asia, becoming a worldwide instrument that provides the opportunity to move in the real business environment.

After 1990 the case studies begins to be used also in East Europe, accompanying the introduction of some new courses in business and economic faculties, as the strategic management course. In Romania the strategic management course replaced the planning course, designed in the ‘80’s old “Soviet style” and after 1995 became a permanent discipline in so-called management specialization of faculties of economic sciences.

Generally, in strategic management the case method is a tool that offers students the possibility to translate from a very specialized and technical view to a broader, less precise analysis of the overall organization. The situations presented are actual and real business situation and enable to examine the application of theoretical concepts. They are intended to serve as a basis for class discussion and are not intended to be a comprehensive collection of teaching material. This approach gives students the feel for what it is like to face analyzing, making and implementing strategic decisions and strategic management.

Some Characteristics of a Case Study in “American Standard”

There are different approaches to the process of analyzing qualitative data. The case study commence from a deductive position, meaning that the researcher will seek to use existing theory to shape the approach in research and data analysis (Saunders *et al.*, 2003). Yin (2003) suggests that, where you have made use of existing theory to formulate the research question and objectives, it may also use the theoretical propositions that helped you do this as a means to devise a framework to help you to organize and direct your data analysis. The preference for devising theoretical propositions prior to data collection as a means to analyse data leads to two analytical procedure: the procedure termed *pattern matching*, that involves predicting a pattern of outcomes based on theoretical propositions to explain what the researcher expect to find, and the procedure, labelled by Yin (2003) *explanation building*, that involves an attempt to build an explanation while collecting data and analyzing them, rather than testing a predicting explanation.

An overview of case studies written for American textbooks reveals a very technical approach, based on financial analysis. All the well-known textbooks (i.e. Wheelen and Hunger, 2008) have extensive recommendations concerning this segment of strategic analysis, underlined its decisive importance for the success of the entire work. For marketing, human resource or production it doesn’t exist a similar standardized approach, but some strategic tools as SWOT analysis or portfolio matrix offers a rationale and comprehensive perspective.

A typical financial analysis of a firm begins with official financial statements. The first recommended step is the use of ratio analysis from data in these statements. It is done to identify possible financial strengths or weaknesses as a part of SWOT analysis. Ratios are useful and they enable the researcher to compare a firm's ratios with industries averages. A number of steps, including the correction for inflation, ought to be done in a basic analysis in order to reveal, according to American standards, the "real" situation and the developing trends. Looking for inconsistencies and aggressive accounting methods, some financial experts proposed special checklist of items to examine for so-called red flags that suggests an underlying problem.

Many resources for financial information are available for American academics or students. The companies' annual reports, Standard and Exchange Commission Report Forms (www.sec.gov), regional and national statistics, economic indicators and other online information could be used for a study case. But if the study case is focalised on a multinational corporation, the financial statements can get very complicated and difficult to understand. On the other hand, if the study is focalised on a small or medium new firm operating in an emerging industry the information could be inconsistent or difficult to collect.

For other activities of the firm the technical advices are not as clear as in the case of financial analysis (Ambrosini *et al.*, 1998). The direct observation is very costly and unusual for the American educational environment. The available information is from indirect sources, like newspapers or magazines articles. But even in the case of an expert or academic opinion there are considerable pressures to cite the approaches that the author of the study believes their audience views as legitimate and credible (Locke, 1997).

„There is no one best way to analyze or present a case report” is the sentence that the textbooks use as a conclusion for the chapter labelled „suggestions for case analysis” (Wheelen and Hunger, 2008). In fact, each instructor has personal preferences for format and approach. An overview of best American and English textbooks (i.e. Johnson *et al.*, 2008) show a preference for a „functional” approach of the firm, meaning a distinct discussion of marketing, operations, research or financial activities. A modern approach includes the discussion of new issues like organizational culture, information systems or corporate social responsibility.

A different vision regarding the case study is provided by Mintzberg (2004). Henry Mintzberg underlines the problem of this instruction instrument's utility in management, considering the Harvard Business School approaches have become stereotype and enough focused on figures to lose sight of the product, the client and the organization. Consequently, even the utility of the research approach appears to be doubtful at last, because both the specific and the social content of the management act are eluded (Mintzberg, 1975).

One may conclude that the intrinsic drawback of the case study research, in the way Americans utilize it, consists in the detachment from practice and, finally, from reality. An American student is asked to prepare a case study research on an important American company, sometimes quasi-unfamiliar to him from the products' and technologies point of view. He goes to the library, that implies to use the computer and the Internet, gathers some financial, bookkeeping or eventually economical pieces of information, and introduces the into a Harvard type diagram. If the company wasn't listed on the stock market (usually on NYSE) and wasn't mentioned in various newspapers and magazines, the work would be impossible to prepare using this approach.

What is astonishing about most of the case study researches of this kind is that they are grounded upon an impressing set of references, but anyway they leave the impression of “second hand” information. Sometimes is obvious that the product is only superficially known and the associated process is unfamiliar (Pascale, 1984). On the other hand, the focus on figures, especially on those economically significant, generates some of the most peculiar effects. This way, the fact that human beings and concrete objects are at stake is omitted, and their place is taken by abstractions. Direct observation is replaced by a computer game and the sensation that a person having manual dexterity is more “competent” than the one who thinks is apt to generate dark thoughts about this manner of learning.

The criticisms of Mintzberg, who quotes more caustic than himself researchers, are devastating for the American way of case study research fashion and for “the Harvard style”. A more serious fact is that these criticisms are supported by case study researches about “the making of”, statistics and dissimilar examples, from the industrial management of the Vietnam War to the Enron case. Some of these phenomena seem to have “duplicates” in the post '89 Romanian actuality.

Romanian Style in Researching the Case Situation

In Romania, the practice of utilizing this research and study instrument is limited, even if there are many interesting to analyze elements: affairs, organizations, persons. At present, is being more widespread the utilizing of case study research about organizations abroad, with which Romanians are more familiar due to media articles than due to concrete manifestations of a concrete activity in the national area.

The maturation of research field, formed by the strategic management, means for the business environment and for Romanian universities the appearance of case study researches, which are focused on domestic or operating in Romania organizations. Even if interesting researches appeared during the last decade, they were rare and much too insufficient anyway for a transitional economy.

The theoretic utility of the case study researches is provided by the fact that learning from others' success or failure would be more economical than learning from your own mistakes. People should also learn that a more transparent behaviour of the organizations, including private companies, is apt to encourage the improvement of the business climate.

Because in this field only few steps forward were made, the database concerning the Romanian economy realities is rather precarious. The official statistics are too general and the mass-media information is mostly superficial and summary, even at the level of specialized publications. The Bucharest Stock Market is concerned with only about fifty important companies. If the information concerning the public sector generates certain credibility doubts, it is no wonder that in the private company area the available information is either vague or totally absent. Even the specialized information regarding certain categories of market research, information, provided for a price, is available in a quantity which is far from the steady economy standards in the Europe and in the world.

In this context, to realize a case study research concerning a company which operates in Romania requires without fail its voluntary collaboration. The internal sources are necessary to provide consistency and credibility for such a research. Only for relatively few companies and industries there is a public database available, sufficiently developed to support an analysis which leaves aside the internal sources.

The first barrier in using internal information sources is to get the approval of the chosen organization's management to realize the research, excluding an approach using "grey information" or illegal practices. The mentioned barrier immediately reveals a series of problems that multiply rapidly, combining with technical and organizational problems, with those associated with a certain mentality type or a certain management style. In an important organization, even for acquiring common information, the highest executive or even the owner approval may be necessary. The education of many top managers is poor, as Livingston (1970) observed, and that explain the difficult dialog with a researcher.

This situation usually reveals an organization deficiency or a deformed perception of the problem. At this stage the first difficulty shows up, because it is hard to approach these people, due to certain hierarchic filters and to their lack of availability for being involved in such an insignificant considered matter. A situation of interest for management emerges when the necessity of conveying such a message constituted as a case study research is not understood, the business environment and the studious youth being ignored.

Certain organizations have an opposite attitude perceiving the necessity of conveying a message by means of a case study research. They react promptly to this kind of challenge and totally support this research, considering it an opportunity to prove good corporative citizen manners.

For the 2007 Romanian student, the danger to be "drowned" by figures is limited, which appears to be a positive aspect connected with case study researches. This makes him do "field research", to have a knowledge of the product, to know the people, to ask the customers and eventually, to put himself in their place, to realize different experiments and other public activities. It is true that from "white information" one may imperceptibly pass to "grey information" and, using various experiments, one may easily slide to immoral zones, but usually good intentions prevail. It should be practically and clearly recognized that this passage is encouraged and morally justified by the ambiguous and deceitful behaviour of the organizations whose co-operation is asked. According to this pattern, one may formally approve, when in fact he consciously provides distorted information for obtaining free advertising or other commercial effects. A summary check on the received information may move the researcher to the "grey zone".

Interesting things may be realized about the statistic data available in Romania but, essentially, one can remark they cover the nowadays reality only superficially. For instance, it is difficult to estimate the size of a specific market and of the market shares belonging to the various competitors, in the way this can be

done in the Western Europe. The eventual market information comes from private sources, but even here there is a significant distortion, due to the way general data are produced.

Due to these general reasons, the case study researches in Romania make a direct field research necessary. This approach implies visits to the respective organization, the familiarization with its products, discussions with numerous persons who represent a larger stakeholders range. The dialogs with managers, consumers and providers are essential. Only in the field one can estimate if the carefully selected images, used in the advertising campaigns, correspond to the reality. Only in the field one can observe the organization personnel's behaviour.

From the content's point of view, the emphasis should shift from the financial part of the organization to the technical and human matters to escape the simplifying trap of financially significant figures. The Enron scandal and failure, or the disaster of the Romanian tourism suggests one cannot reduce business to financial relations and money, but assuming major strategic risks.

The product and context oriented approach is justified by the fact that the case study research mainly addresses to the economy students. They have limited knowledge associated with the product realization process; therefore, a familiarization with the technical aspects is needed. We must underline that understanding the way one organization works cannot result from reading the bookkeeping reports only. This is more valid in Romania, where the double or triple accountancy habit and the existence of the "taxes department", specialized in "correctly" avoiding the law, are a rule. This reality is reflected in the underground economy proportion, which represents one third from the official one (Schneider, 2005). Too many financial reports leave the impression that management is turning into a computer game that requires a certain fingering (even if the "dexterity" concept may be creatively used).

The company to contact being chosen, we searched for a communication channel. HERE the interesting part of the research began, "about the making of" and the first differences to be analyzed and commented upon appeared between companies.

The multitude of companies which can constitute case study research subjects may be divided into three groups, according to the external signal reception and to the opening of the external communication channel (Bacanu, 2007):

- "the hedgehog companies" represent hard to identify and to utilize companies, having narrow communication channels;
- "the black hole companies" represent the companies which have communication channels, but the signal reception is not to be seen;
- "the window companies" represent the companies which have open communication channels to the top of the pyramid and point out the signal reception.

From the answer's promptitude point of view, one may also discern three categories of companies (Bacanu, 2007):

- "the coral companies" represent the companies which certainly received the stimulus, but showed no answer reaction;
- "the dinosaur companies" represent the companies which received the external stimulus and convey an answer after a several weeks period, unreasonably long from the functional point of view;
- "the samurai companies" which represent the companies which answer rapidly, as a samurai sword blow, be their answer yes or no.

One cannot understand the management of an organization, according to the given research philosophy, without thoroughly studying the essential person of the business: the owner or the highest rank executive. The analysis means to know the person, his place of work, his assistants and close collaborators. It is also important to listen to all these people. If the dialog takes place in "their natural environment", the value of "collateral information" improves. Any apparently insignificant detail is important in a puzzle type inlaid work, which represents a vivid image of the organization, more suggestive than a position occupied sometimes only for one year at the middle of Romanian Capital Magazine Top 300.

On the other hand, the signals concerning the Romanian organizations which can be received from the Romanian media must be treated with more reticence. For instance, discussing the media articles, specialized media included, one may observe that many of them are written by people with limited

competence and experience, sometimes even by students. Other authors, even renowned in the nowadays press, cannot refrain from expressing “opinions” about unfamiliar fields. The same doubts increase when the analyses slide to the quantitative side, being ignored the essential aspects associated with economical, social or technical basic mechanisms.

Conclusions

Strategic management is beginning to mature in both theory and method for teaching. The educational methods used are becoming more sophisticated and valuable in building a knowledge base of how to strategically manage business organizations. Even under academic criticism and under the pressure of alternative modern methods, the study case remains the main instrument for strategic management in American business schools.

In Romania the use of study case for teaching strategic management is at the beginning. The main problem in a case study construction is to obtain reliable data. For a Romanian student or case studies’ writer in 2008 this problem could be avoided by an intelligent choice of an “open” organisation. The direct observation and the work on the field become the advantages of Romanian style in the construction of strategic management study cases.

STRATEGIC OBJECTIVES IN HUMAN RESOURCES MANAGEMENT AT OLTCHIM S.A RM.VALCEA

Bălan Daniela Adriana

Universitatea Spiru Haret, Facultatea de Contabilitate și Finanțe, Rm. Vâlcea, str. G-ral Praporgescu, nr. 22., Email: adrienne_ws@yahoo.com, Tel. 0745768369

Popescu Loredana

Universitatea Spiru Haret, Facultatea de Contabilitate și Finanțe, Rm. Vâlcea, str. G-ral Praporgescu, nr. 22., Email : popesculrdn@yahoo.com, Tel. 0745885587

This comunicacion concentrates on personnel strategies at Oltchim SA Ramnicu Valcea. There is a problem at human resources department in recruiting qualified employees, therefore they have to focus on implementing HR strategies in such way they could reach their objectives in thea area of attracting valuable personnel as well as respecting their general management policy.

Here are some ideas in doing all of these by developing training and mentoring services either from inside or outside the company.

Is this for sure that implementing such services inside Oltchim SA is about organizational culture, managerial skills and effectiveness, and the role of emotions in organizational life.

Key words: Human Resources(HR), HR Management, motivation, mentoring, emotional intelligence, personnel strategies, training.

Speaking in terms of HR politics, there are some problems in recruiting qualified personnel as engineers and physicians at Oltchim SA Rm.Valcea but not only.

The audit of the qualifications realized by “Romanian National Observatory”(hosted within the Institute of Education Sciences(IES) showed that business environment changes quickly and because of that, there appears new needs of personnel qualifications and new ways of increasing the productivity. The same audit remarks that at the level of production and maintenance, there is a tremendous deficit of specialists corresponding to a high level of technology development.

Oltchim Rm Valcea could keep a competitive advantage for medium and long term, by focusing on human resources strategies that can reach the following specific actions:

- The human resources orientation over client (marketing orientation), by fulfilling the project orientation objectives.
- Maintaining the transparency of information needed all over the HR department, opening and keeping new communication channels, improving communicational climate, both formal and informal.
- Developing professional abilities and interpersonal communication skills(cooperation, improving motivation and dealing with emotions in organizational behavior, team work, etc) of the human resource;

The personnel strategy proposed by Oltchim SA Rm.Valcea consists in:

- A large perspective and a dynamic vision over human resources;
- The definition of the general objectives for medium and long term concerning human resources strategies.

For establishing its own personnel strategy, Oltchim SA works on these following elements:

- Increasing, integration, diversification and developing of the production market;
- Increasing the efficiency of the products on the national and international markets in a way that Oltchim SA can get a higher profit level in the company.

- Developing the scientific and technical capacities of the most valuable employees in the domains considered strategic for the company.
- Cooperation with companies specialized in providing professional training services.

In the context of what we presented before, the future priorities in the area of human resources are:

- **Elaboration and improving the personnel strategy by:** The continue analyze of the entire activity for Oltchim SA Rm Valcea which includes:

h) general evaluation of the company focusing on a good business plan.

Business planning might appear very complex but in essence it's common sense, and begins with some very simple business start-up principles.

- i) The analyze of the human resources that the institute has and the chances and risks specific, by:
- ◆ Establishing the portfolio of human resources;
 - ◆ The analyze of the existing situation, of the distributed tasks and of the motivational system.
- j) Creation of a favorable external medium for the Oltchim SA, by:
- ◆ A good advertising for Oltchim SA.
 - ◆ Creation of interesting jobs;
 - ◆ Developing strategies for attracting valuable personnel.
 - ◆ The increase of the rate of occupation in the areas with high potential of added evaluation.
- k) To be in consonance with European politics in human resources the company will adopt its own strategy.
- l) Establishing derived strategies, in specific areas of the personnel activities, in consonance with the concrete conditions of the moment
- **Professional training of the personnel by:**
- a) actions which consist in :
- ◆ internal courses;
 - ◆ developing partnerships for elaboration and implementation the strategies in continuous professional training;
- b) Assuring the adequate resources for the continuous professional training:
- ◆ Financing by OLTCHIM of some activities for professional training ;
 - ◆ Attraction of external financing by common programs of professional training;
 - ◆ Extension of the collaboration with the net of suppliers by professional training.
- c) Easier access to continuous professional training :
- ◆ Identification of the tasks of training, focusing on the basic components;
 - ◆ Approaching the professional training initial and continuous by the perspective of activity areas;
 - ◆ Access to the market offer for continuous professional training;
 - ◆ Utilization of the obtained knowledge ;
 - ◆ Financial support of the institute for the employees which participate to the professional training forms;
 - ◆ Noticing the evolution of the access to the continuous professional training.
- d) Promoting professional training:
- ◆ Increase the access to a job which is superior to the wage –class;
 - ◆ Remuneration according with studies.
- e) Increasing the number of employees with superior qualification :

- ◆ Reducing the personnel with medium studies;
 - ◆ Increasing the number of personnel with scientific titles;
- f) Promoting the work teams from different areas , internal and external.

• **Promoting the adaptability of the personnel and increasing the work productivity by:**

- a) Noticing the aspects which influenced the personnel, presentation to the decision factors of the complicated situations and the proposal for solving them:
- ◆ Establishing the causes which increase the emigration of personnel;
 - ◆ Material motivation for the specialists;
 - ◆ Politics for keeping the personnel with high qualification;
 - ◆ Implementing periodical brainstorming meetings for collecting good ideas in the complex area of motivating the personnel.
- b) Implementation of the legislation concerning the security and the health of the personnel, including the work time, for:
- ◆ Encouraging the progress in career ;
 - ◆ Assuring a good equilibrium between professional life and family;
- c) Professional training for adaptation to the job:
- ◆ Access to information;
 - ◆ Teams from different areas;
 - ◆ Giving support and trust; involving in the specific decisions of the job by creating a mentoring program.
- **Prolonging the active life by:**
- ◆ Flexible work schedule;
 - ◆ Attracting in consultancy activities;
 - ◆ Promoting the adaptability;
 - ◆ Work teams with personnel with different ages.
- **Increasing income policy for motivating personnel:**
- ◆ Assuring attractive salaries ;
 - ◆ Improving the conditions and the remuneration system.

Implementation and reporting personnel strategy:

- a) noticing the efficiency of the programs and measures adopted by:
- ◆ creation of an informational net between sectors;
 - ◆ noticing and informing about occupancy of personnel;
 - ◆ periodical evaluations of the taken decisions about personnel;
- b) Mobilization to all implicated factors in implementation of the personnel policy by:
- ◆ Improving the importance of HR department;
 - ◆ Improvement of informatics system;
 - ◆ Dissemination of the specific information;
 - ◆ Working with specific procedures;
 - ◆ Maintaining the dialogue between administration and the representative of the employees, in purpose of solving immediately the problems which may appear in implementation of the work rapport in the different areas of activity.

Taking in consideration the structural modifications from romanian economy, the present strategy sets the general frame for establishing derivate projects and programs.

Implementation of the strategy of personnel at Oltchim SA Rm Valcea, goes to:

- Increasing the efficiency of all activities;
- Consolidation of the personnel stability;
- Promoting the adaptability of the personnel;
- Assuring equal chances on the work market;
- Regaining the central position of the scientific research, technological development and rising the performances in this area to the global standards.

The priorities and the objectives of the General Strategy for Oltchim SA Ramnicu Valcea for the period 2006-2013 take in consideration the area of scientific research, technological development and innovation, respecting the European Policy in the system of research in Chemistry.

For assuring the contribution of Oltchim SA Rm Valcea to the romanian integration in european environment, the company researchers will follow as a priority the participation of Oltchim SA in both national and european programmes.

For this, Oltchim SA Rm Valcea developed an infrastructure which sustains the creation and the development of its own specific areas of research.

The investments program of Oltchim SA Rm Valcea is taking in consideration the realization of the National Excellence Center for Research in Chemistry.

Development of a Conferences Center at the national and international standards where the company could promote its specific products as a result of activity of research- development departments would be other two goals of Oltchim SA in the next future.

The directions of development from the General Strategy of Oltchim SA Rm Valcea open opportunities for partnership and collaboration to the national, european and international level.

In the meantime, creating new management strategies has an important place in identification and finding the foudns for programs/projects with major impact for the environment and life quality.

For promoting the results of research, the investments, OLTCHIM SA Rm Valcea will participate consequently to the market and exhibitions, national and international, workshops, conferences.

Oltchim SA Rm Valcea will organize an anual conference with international participation, in chemistry.

Oltchim SA will publish promotional materials with the results of the research –development activity which can be applied in socio – economic environment.

In the context of development of high technology areas, which will be promoted by General Strategy and follow adaptation of the european standards, Oltchim SA intends to improve constantly the extension of services for tests, standardization, certification, examination, control and inspection.

A special place will be taken by promotion of the Oltchim SA Rm Valcea strategy in the human resources area, developing the professionalism in research-development departments and exchanging specialists at the national, european and international level.

From the above point of view, we strongly believe that Oltchim SA Rm Valcea needs specific strategies in motivating people as far as it is very well known that workers need support at different levels of their careers and this support could be offered by attracting specialists in mentoring.

Despite the fact this bunch of staff is rather less known in Romania, it would be very wise from HR management department of Oltchim to take in consideration implementing mentoring pairs at different levels of personnel.

Mentoring is very complex. It varies from one situation to another. It is interpreted in different ways by different people. It is important that the purpose and intentions of mentoring in a particular context are explicit. Stakeholders, particularly mentor and mentee, should debate what mentoring is to be in their particular context in order that a mutual understanding and vision of mentoring can be shared as they embark on their relationship.

The mentoring programs usually work on emotions and it is a very good idea that a company could “speculate” the feelings and the emotional intelligence of its employees. “Speculate” might be a strong word but is important to create the relevance of the personnel feelings in the fight for profit as the most important goal of each company.

Exactly what is Emotional Intelligence?

Daniel Goleman, author of "Emotional Intelligence" says that the term encompasses the following five characteristics and abilities:

1. **Self awareness** – knowing your emotions, recognizing feelings as they occur, and discriminating between them.
2. **Mood management** – handling feelings so they're relevant to the current situation and you react appropriately.
3. **Self motivation** – "gathering up" your feelings and directing yourself towards a goal, despite self-doubt, inertia and impulsiveness.
4. **Empathy** – recognizing feelings in others and tuning into their verbal and nonverbal cues.
5. **Managing relationships** – handling interpersonal interaction, conflict resolution and negotiations.

The same author believes that in corporations, the inclusion of Emotional Intelligence in training programs has helped employees cooperate better and motivate more, thereby increasing productivity and profits.

"Emotional Intelligence is a master aptitude, a capacity that profoundly affects all other abilities, either facilitating or interfering with them" – Daniel Goleman, **Emotional Intelligence**, p.80.

Peter Solovey and Jack Mayer describe the emotional intelligence as being the ability to recognize your own emotions, to access and generate emotions as much as they support your own style of thinking and the meaning of it.

Anyway, implementing such revolutionary programmes as mentoring, means that the corporation understand that all this staff is about competency based education.(CBE).

CBE incorporates and recognizes prior learning as an essential element.

Fundamental principles of CBE are:

- Learning is a personal and voluntary process.
- People learn at different rates and in different ways.
- Learners are responsible for planning and managing their learning.
- Prior learning is recognized and credited where competence is maintained.
- Learning is evaluated through performance using performance criteria based on industry standards that may be qualitative and quantitative.

The demonstration of performance includes the attributes of skills, ability, related knowledge, associated attitudes and values that collectively demonstrate competence. However, Oltchim SA Rm.Valcea is determined to take care of these from above, in order to implement new strategies in the superior HR management as well as in its general development policy.

Appreciated as a brave and complex practice, having as object the finding of the efficiency, through the prism of the report cost-performance marginally maximally acceptable, the evaluation medical-economical is regarded with quite reserve, even reticent by the sanitary environment, the elements which explain this concern being of ethical nature. In exchange, for an economist, taking into consideration the economical aspects represents an ethical necessity which leads to the permission to the maxim level of health with a given budget and distributed in a good manner, taking into consideration the existent compulsions. Questions like: “From what perspective are we treating the evaluation? What are its instruments? What is the typology of the costs and how do we quantify them? Are we taking into consideration the time and space effect? It constitutes problems specific to the analyzed models, opened to debates and controversies capable to combat the famous line “The cost is an illusion”.

Key-words: the lottery method, the time trade off method, quality adjusted life years, decisional shaft, willingness-to-pay, cost-utility, cost-efficiency, cost-utility.

1. Marriage – medical evaluation-economical evaluation- disputed necessity of the health programs

The appearance of the evaluation and of the medical-economical analysis as a new discipline, which adds to the medical criteria those economical ones, is regarded with quite reservation, even reticent we could say, by the people in health care. Thus, questions like: “*How can financial natured criteria be introduced in a domain as essential as that of health?*” “*Wouldn't it be shocking that from economical considerations we refuse certain medical cares?*” “*Is the suzerainty of the doctor, which has the liberty of prescribing to take into consideration only the good of the patient, according to him the best treatment?*” determine that the medical institution should not take into consideration the economical consequences of the decisions.

In exchange, the economist in the health domain will complete this simple instrument which offers the necessary information in terms of expected effects and consumed resources for a program given with: *a theoretical efficiency evaluation of the health programs* which quantify the therapeutical benefits for a patient in a situation defined as being an ideal one; *a practical evaluation of the health programs* which has as main purpose the integration of the patients' adhesion too the therapeutic benefit; *an evaluation of the health programs availability* which aims at the selection of the studied population. **General principles** generators of controversies have into consideration:

I. Where do we place and from what perspective are we regarding the evaluation? The evaluations can be realized from the point of view of several actors. This way, we can focus only *on the patient and its family* (example for the *cost of the dialysis we can analyze the expected repercussions on the patient's company*); further on we can extend the perspective on the *health institution* (example *what services in the ambulatory can be effectuated in order to improve the budget of some structures*) or on the *collectivity viewed as a whole – the state*. No matter in what hypothesis we recognize our situation, the adopted point of view must be specified, because on that depends the nature of the elements taken into consideration and the calculation of the costs:

The perspective	The cost of the health program
The system of social protection	It is equal with the sum of the reimbursement of expenses which it creates, being evaluated starting from the nomenclature of the papers published by the disease insurances.
Patient	Corresponds to the fees and eventual expenses on the disease and treatment not reimbursed by social insurances.
Hospital	It is evaluated from the prism of the financial results, materials and human necessary for starting of the program.
Employer	Corresponds to the production losses which include the stopping of the patients' work.
Society's global	Correspond to the value that society accepts to pay for health, to the prejudice of some other budgetary chapters, being evaluated by assuming the costs induced by the programs previously mentioned.

Table 1. The definition of the cost of some health program depending on the chosen perspective

II. The typology of costs. In general we distinguish the following types of costs:

(a) The direct costs – represent the ensemble value of the resources directly consumed for the treatment of some disease, being divided in: **Direct medical costs** – are those induced by the direct expenses on the patient – example, the cost of the intervention, tests, medicines, and the treatment of the side effects. ; **Direct non-medical costs** – transportation costs, domicile help. Another classification of the direct costs has in mind: **Variable costs** – which are in function of the activity level – example the number of the rectal cannula used during a surgical intervention and **Fix costs** – are independent of the number of effectuated actions – example the depreciation of the constructions.

(b) Indirect costs – reflect the value of the disease consequences which were not taken into consideration in the direct costs, in their turn, these ones are divided in two categories: **Tangible costs** – example the losses of production which concern the professional activity of the patient and which present, from the point of view of the society, in lost physical unities without value; and **Intangible costs** – refer to the loss of the quality of the patients' life (human cost) – example the psychological consequences appeared due to a handicap.

The table below regroupes the costs taken into consideration:

Study	Direct costs	Indirect costs
Cost-benefit	YES	YES
Cost-efficiency	YES	RARELY
Cost-utility	YES	NO

Table 2. The costs are taken into consideration depending on the nature of the medical-economical study, in the global perspective of the society.

III. The evaluation instruments. The experts in the health domain are becoming more and more preoccupied by problems such as: Is it necessary to launch a program of detecting the breast cancer?; Does a laparoscopic surgical intervention need to be privileged when comparing with the classical one?; What certain type of antiasthmatic treatment needs to be foreseen and for what type of disease?; For what type of surgical intervention need we to foresee a smaller number of days of hospitalization?. The answer to all these questions can be given after the evaluation of the reports cost-results of the different health programs, which presupposes three types of interventions: the costs measurement, the costs measurement and the combination of the two elements. The economical evaluation presupposes the marriage cost-results viewed from an integrated perspective. The evaluation of the costs can be realized through the models **cost-efficiency, cost-utility, cost-benefit**. In all the cases we must estimate the long term consequences of the program, the instruments used being the **modeling** and the **sensibility analysis**.

The modeling represents a simplified representation of a real analyzed phenomenon, the most frequently used method being the decisional shaft. This one decomposes the health program tested in a succession of events whose modalities vary depending on the patient's answer. To each modality it correspond a probability. The cost, respectively the efficiency of the program will be the sum of the costs, respectively of the efficiency of all the well-balanced possibilities with their probability of realization. Another variant is constituted by the modeling of the disease history through its presentation as a succession of stages followed by the patient until death.

Example: each decisional shaft is built in the manner of dichotomy: any medical decision (exam or treatment) leads to two opposite eventualities: success-failure, survival-demise, and favorable evolution-complications, each of them having a probability of specific appearance notified by the domain experts or extracted from the specialty literature.

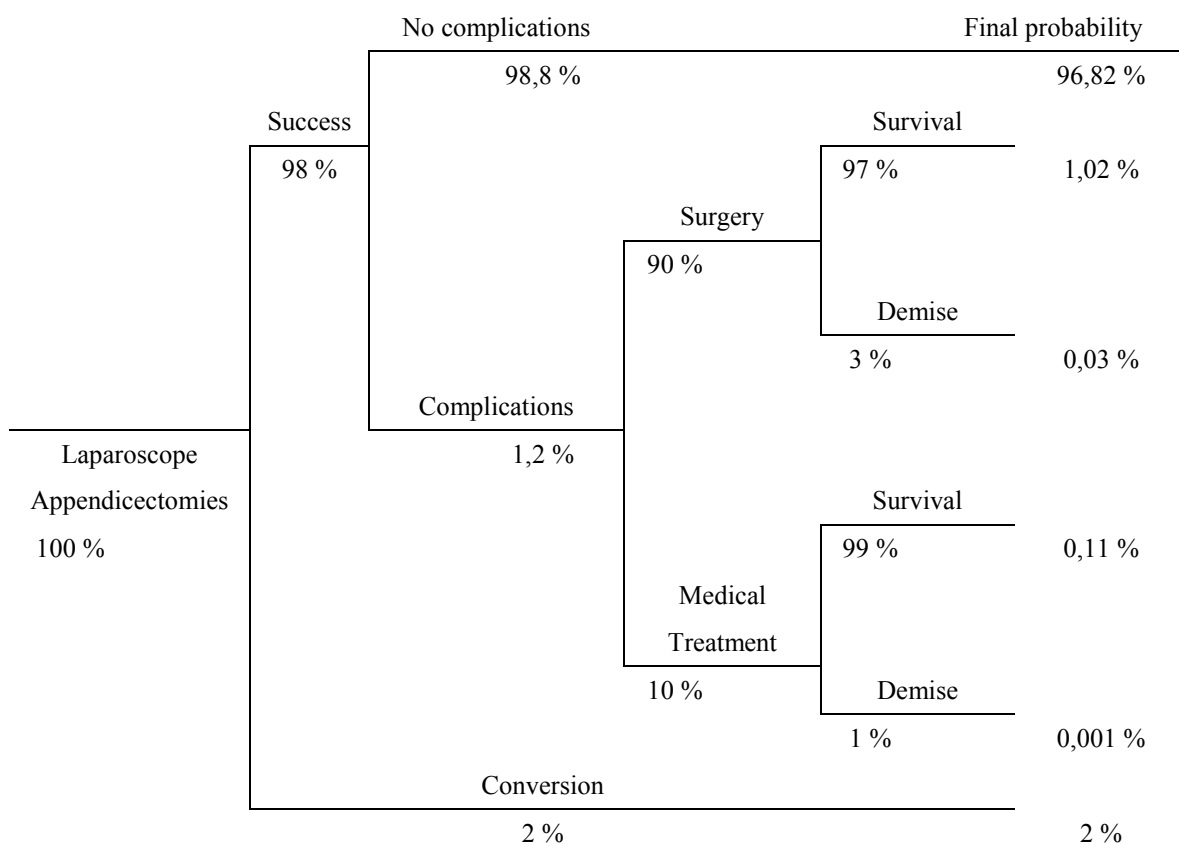

Table 3. Example regarding the decisional shaft

The sensibility analysis. In all the cases, the results of a medical-economical study need to be subdued to a sensibility analysis, whose objective is to analyze the variations of the study's conclusions depending on the hypothesis established for certain parameters. *For example, in the measure in which the cost of a*

treatment is approximately 500 u.m. but varies at other patients between 200 u.m. and 700 u.m. the analysis will be effectuated taking into consideration the two extremes.

IV. Particularities –Taking into consideration the time – the actualization. The medical-economical studies analyze in general health programs whose costs or consequences extend in years. The time intervenes both at the level of realizations (for example long term treatments which need devices with a long period of availability) but also at the level of consequences (the avoidance of a long term disease). Due to this fact if we desire to compare different periods of time it is important to account them with the same unit of measure, technique called *actualization*, which takes into consideration the population's preference and which benefits of health programs in the present time but which will be paid in time in the future. Health regarded as a non-transferable good in time and which does not belong to the market, raises in the domain of actualization the following problems: *what rate of actualization must we use? Are we actualizing only the costs or the results too? In the case of an affirmative response, is the actualization rate the same?* By convention, the used actualization rate is of 5%, although some authors recommend a rate of 3%, rate which results from the *option of fictive price of the capital*, in which the costs are transformed in consume losses, and the advantages in consume earnings.

An example regarding the actualization: we consider two health programs: A which saves a life only if it is applied continuously for 6 years and whose actual cost is of 100 m.u. and B which saves the life in the present moment with an actual cost of 500 m.u. the question is what program will be preferred?

In the case of program A, it is necessary only the actualization of the effects, the costs being propagated right from the first year.

Using a rate of actualization of 5%, the value actualized of a saved life = $1 / (1 + 5\%)^6 = 0,74$, value translated like this: a life saved in 6 years means in equivalence 0,74 saved lives actualized at the present time. The cost per saved life for program A = $100 \text{ m.u.} / 0,74 = 135 \text{ m.u.}$, while program B has a cost of 500 m.u. the choice being in A's favor.

2. The medical-economical studies: objectives, methodology and limits

I. The studies cost-efficiency are searching the health programs with the maximal efficiency for a given cost or with a minimal cost for a given efficiency. In this type of evaluation it is compared and analyzed: for many strategies, the obtained costs and results, the latter ones being measured with physical units (for example the diminution of the sanguine pressure expressed in mm/Hg); different types of strategies on domains (example the interest of a campaign of tracing out the colon cancer; the treatment of the corneal renal insufficiencies by dialysis or grafting; the treatment of the myocardium infarcts through three different medicinal strategies); the financial sum necessary for the gaining of a year of life in the case of serious diseases. **The analysis cost-efficiency** utilizes more measurable criteria in monetary units and one criterion of medical efficiency. The comparison of the possible options is done upon some cost-efficiency indicators in the case in which the cost varies linearly with its efficiency or, contrarily, upon some marginal cost-efficiency indicators. These analyses reflect the realizations in the state of the patients' health, in the reduction of the disease impact, obtained through a specific intervention in report with the cost of this intervention. At the same time, this kind of analysis leads to the comparison of the cost and of the alternative methods efficiency having as purpose the optimal selection. On this occasion it is established the most efficient method which allows the reach of the objective by using a minimum of resources.

II. The studies cost-utility. Constitute in fact a development of the studies cost-efficiency, in the way that, within these ones, the efficiency is pondered by the quality of life before evaluating the utility of the measured action. In these methods the cost of the strategy is faced with the result of an action appreciated in the future, starting with a smaller measure which at the same time incorporates the quantity and the quality of the gained life. Methods of measuring the utility:

(a)The lottery method consists in the search of an indifference grade of a patient (marked with g), grade situated between two options: the first one is uncertain and aims at applying the health program, and the second one is certain – “nothing to do”. If the patient chooses not to do a thing, he is assured that he will live a certain number of years in a state of health equivalent with a handicap. If the decision of the patient is to intervene, he will have to establish a demise risk which he will have to take as a consequence of the surgical intervention in order to survive the same number of years, but recovering from the handicap (risk

of demise with a probability of g%). The value of the utility for an individual is determined as the difference 1-g.

(b)The time trade off method – consists in the variation of the number of years marked with “n”, this being the starting point in which the patient is indifferent to survival in a certain state of handicap for a period of “t” years until his death time or to live in a healthy state until demise time for “n” years. The utility for the patient, associated with this health estate, is obtained calculating the report $1/n/t$.

(c)The evaluation the quality adjusted life years (QALY). The utility which were associated with each health estate allow the calculation for each program of its equivalent in terms of QALY.

Example. Be it a treatment A which: If it is efficient (demonstrated 7 of 10 cases) allows the survival for 6 years in a perfect health estate – utility associated 1; if it is inefficient (demonstrated 3 of 10 cases) allows the survival for 6 years but in a health estate associated with a handicap whose utility is of 0,4% and which, at 3 cases of 10 causes the demise of the patient – utility associated 0.

The QALY calculation for this treatment: $(0, 7\% \times 6 \text{ years} \times 1 \text{ utility}) + (0, 3\% \times 6 \text{ years} \times 0, 4 \text{ survival utility}) + (0, 3\% \times 0 \text{ utility for the demise}) = 4, 92 \text{ QALY}$. If we have in view the actualization with a rate of 5%, the calculation QALY becomes: $(0,7 \% \times 6 \text{ years} \times 1 \text{ utility}) / (1 + 5 \%)^{6 \text{ years}} + (0,3 \% \times 6 \text{ years} \times 0,4 \text{ survival utility}) / (1 + 5 \%)^{6 \text{ years}} + (0,3 \% \times 0 \text{ utility for the demise}) / (1 + 5 \%)^{6 \text{ years}} = 4,66 \text{ QALY}$.

Example regarding the studies cost-utility. We consider 4 health programs P1, P2, P3, and P4 whose utilities were evaluated through the method time trade off, the study being realized from the society perspective. The cost of the effects was actualized using a rate of actualization of 3 %. The costs in millions m.u., the utility in thousands QALY, as well as the calculation of the rate cost-utility incremental and the comparison of the health programs are presented in the table below:

Program	Total cost(A)	Total Utility (B)	RATE (A/B)	Incremental cost of $C=A_{1+1}-A_1$	Incremental utility $D=B_{1+1}-B_1$	Incremental rate (C/D)
P1	7.010.200.000	1.610.700	4352,2691	-	-	-
P2	7.020.200.000	1.610.704	4358,4668	10000	4,0	2500
P3	7.070.200.000	1.610.705	4389,5064	50000	1,0	50000
P4	7.080.200.000	1.610.706	4395,7121	10000	1,0	10000

Table 4. The calculation of the rate cost-utility incremental and the comparison of the health programs

Interpretation: the incremental cost of the program P2 versus the program P1 is 10.000 m.u. and the earning in QALY is 4. So, we deduct a rate of 2.500 m.u. on QALY for the program 2 comparing with program 1. The interpretation of this rate is: a quality adjusted life year gained within the program P2 (more expensive) comparing to the one obtained with program 1 is associated to an over cost of 2500m.u.

III. The studies cost-benefit. The studies cost-benefit and cost-utility are in particular interesting within the decisions due to a small number of strategies. Although, they have two types of limits: on one hand, they do not take into consideration the non-tangible consequences of the health actions, and on the other hand although the costs of the strategies can be compared between them, the results will never be the same (how do we compare for example a diminution o the crisis number of an asthmatic patient with the increase of the perimeter of movement for an arthritis patient?). The studies cost-benefit remedy these inconveniences by evaluating the costs and the benefits of the health programs in currency terms, the comparison being possible because they are expressed with the same unit. For the appreciation of the results in currency units there are used two methods. The first one, already obsolete, presupposes the measurement of the human life price starting from the human capital theory. It consists in the evaluation of the lifetime days or health days lost because of a disease as a sum of the productive value of the patient. The second method, *willingness-to-pay*, also named by *the contingent evaluation*, measures the sum which the patient accept to pay for the improvement of their health.

Example of the willing-to-pay method application: we consider a program of prevention whose unitary value is of 20 m.u. per case. The total cost of the program for 100 patients will be of 20 m.u. .x 100 patients=2000 m.u. For the calculation of the benefits brought by the willingness-to-pay method it will be realized a test among those 100 patients, the demanded question being: “How much are you willing to pay in the benefit of the program?” The results are presented in the table below:

Number of cases	Willing to pay	Total
3 cases	30 m.u.	3 x30=90 m.u.
12 cases	25 m.u.	12 x25=300 m.u.
55 cases	20 m.u.	55 x20=1.100 m.u.
10 cases	15 m.u.	10 x15=150 m.u.
16 cases	5 m.u.	16 x5=80 m.u.
4 cases	0 m.u.	0
Total 100	The cost of the programs' benefit	1.720 m.u.
The difference cost benefit		2000 m.u. -1.720 m.u. = 280 m.u.

Table 5. The application of the method willing-to-pay

The social sector or social economy is still in the developing stage and the concept of social entrepreneurship is just in the emergence phase in Romania. There is still a lot to do in this field, in order to create sustainability among the actors of the social economy or social sector.

The paper will attempt to emphasize the differences between entrepreneurship in NGO's and social entrepreneurship and clarify the two terms in relationship with the Romanian social sector. It will discuss what needs to be taken into consideration for the future development of this sector in Romania, in the context of EU membership.

Key Words: social entrepreneurship, non-profit organization, social enterprise, sustainability.

Introduction

The importance to the European economy and society of co-operatives, mutual societies, associations, foundations and social enterprises (which together are sometimes referred to as the Social Economy) is now receiving greater recognition at Member State and European levels. Not only are they significant economic actors, they also play a key role in involving their members and European citizens more fully in Society. Social Economy enterprises are helping to meet the demands of a changing Europe. They are important sources of entrepreneurship and jobs in areas where traditional "investor driven" enterprise structures may not always be viable.⁸

In the context of EU integration, it is very important to look at the state of social economy in Romania. It is essential to distinguish between terms in order to look at the situation in our country.

Entrepreneurship in non-governmental organizations is the process of engaging in economical activities as well as having an entrepreneurial attitude towards the activity they develop as a non-profit.

Social entrepreneurship is the process of setting up a social enterprise, a distinct for-profit organization that would sustain financially a non-profit organization. Social enterprise is the result of social entrepreneurship. Social enterprises become the result of achieving sustainability as a non-profit organization in order to survive and solve social problems. Social entrepreneurial activities in the form of creating a social enterprise can be considered itself a measurement of performance, since it is the next step in the development stage of a non-profit / non-governmental organization.

Entrepreneurship in non-governmental organizations vs. social entrepreneurship

Entrepreneurship is the process of starting a enterprise as a result of identifying an opportunity or a need. Entrepreneurship is characterized by the process of creating new markets, creative use of resources and opportunities, innovation, the introduction of new technologies, new industries and new products and creation of employment. A real engine of economical development, a strong entrepreneurial culture is at the basis of progress.

⁸ <http://ec.europa.eu/enterprise/entrepreneurship/coop/index.htm>

We can encounter entrepreneurial activities in more than the traditional for profit sector and the creation of small and medium size companies.

The idea of entrepreneurship in non-governmental organizations can be easily identified in the activities that NGO develop as a need to fulfill their social mission.

There are several aspects that characterize as **entrepreneurial a non-profit organization**, that deliver certain forms of entrepreneurship in NGO's. First of all, they exist as a private individual or collective initiative, with a mission, vision and aim that address a certain need, opportunity, for the good of the society. This means that either at the starting point of the organization or further on, we will identify a strategy and most of the time a business plan, aiming to fulfill that mission. In order to perform effectively and efficiently their activities they need coordination, human resource management, good leadership, financial management and development of economical activities.

Non-profit organizations run projects and programs that need management. These projects create **temporary organizations** within the NGO, who are partly independent, run by project managers. A NGO devotes resources separately from the every day activities and create temporary structures within the mother organization. The planning, implementation and evaluation of a project implies entrepreneurial skills of the project management team, mainly because of the need to address in a creative manner the social need identified by the organizations, along with tools that help classic entrepreneurs run their businesses.

Federations are structures created as an association of two or more non-profit organization. Federations are created by non-profit organizations that have resembling or identical missions, in order to achieve a greater impact. This association of non-profits creates a new structure and new initiatives that need to be managed in an entrepreneurial manner.

The following examples in Table 1 are proving of the existence of an entrepreneurial attitude in non-profit organizations.

Organization	Business	NGO	Public
Social Enterprise	X	X	-
Project based work	X	X	X
Federations	X	X	X
Cooperation / Protected units	X	X	X
Community Development Corporations	X	X	X

Table 1. Entrepreneurial, non-profit and public forms

At the borderline of business and non-profit there is another type of organization that combines best the characteristics of both sectors, **social enterprises**. If the discussion about entrepreneurship in non-profit organizations brings to light the existence of entrepreneurial attitude in the activity of an NGO, *social enterprises are a hybrid, of business and non-profit, created as a vehicle to create sustainability for and NGO.*

The European Union definition for **social enterprises** is the following: "Social enterprises are part of the social economy sector. They constitute a collection of organizations that exist between the traditional private and public sectors. Although there is no universally accepted definition of a social enterprise, its key distinguishing characteristics are social and societal purpose combined with an entrepreneurial spirit of the private sector".⁹ It is quite interesting to confuse the public sector with the social sector, since there are so many NGO active in providing social services without any support from the public sector. Our

definition of the social enterprise definitely excludes the participation of the public administration as a shareholder in these types of activity.

What is new about the concept is *the overlapping of the lines that define the business and the social sector*. Compared to traditional non-profit organizations, **social entrepreneurship** includes activities that generate profit, like a bank for community development organizations that combine the elements specific to the business and non-profit sector (e.g. shelters that run professional conversion courses and offer jobs in that field). **Social entrepreneurs** create social value throughout a continuous process of innovation and bring to light new opportunities, but always putting the social benefit before the personal one¹⁰, or at least at the same level.

A comparison between the traditional concept of entrepreneurship and social entrepreneurship is synthesized in Table 2.

ENTREPRENEURSHIP	SOCIAL ENTREPRENEURSHIP
Creates new markets	Creates new markets for social needs
Creates new jobs	Creates new jobs and social equity
Mobilizing resources	Mobilizing resources to address social issues
The introduction of new technologies, industries and products	Creates social capital
Addresses clients	Addresses beneficiaries and clients

Table 2. Comparison between entrepreneurship and social entrepreneurship

Social Enterprises – Types And Characteristics

A basic definition of the social enterprise places it at the borderline of the business sector and non-profit, and it presents social enterprise as a hybrid. The change in the expectations of the non-profit organizations to achieve social impact at a large scale and at the same time to diversify the financing resources is considered to be at the roots of the appearance of such a hybrid, partly profit and partly non-profit. Social enterprises are situated at this point of overlapping between non-profit and for profit business sector. All social enterprises are for profit, or profit oriented enterprises, being a business, not a charity.

Social enterprise classification

There are several ways to classify social enterprises. One of them takes into consideration the mission and the level of embodying the social program into the business activity. As far as the mission is concerned, there are three types of social enterprises:¹¹

Mission – centered

The social enterprise is created with the main purpose to promote the social mission, using a self-financing scheme. Examples of an organization of this kind are the ones that employ people with disabilities or micro financing institutions that focus on disadvantaged areas.

¹⁰http://ec.europa.eu/enterprise/entrepreneurship/coop/social-cmaf_agenda/social-enterprises.htm

¹¹ Nicolae Bibu, Loredana Orhei, Entrepreneurship in nongovernmental organizations in Romania – achieving performance through social enterprise, Entrepreneurship and economic growth: international conference : 28 – 29.03. 2008, Cluj-Napoca, Editura Abel, 2008, 978-973-114-061-2

Mission – related

The social enterprise is associated to the NGO mission or to the social service. This type of organization is based on synergy, creating social value for programs and generating economical value in order to sustain financially the social programs and/or overhead expenses.

Mission - unrelated

The mission of the social enterprise is not linked to the mission of the NGO, or it is meant to encourage a mission other than the one to generate income for the NGO's social programs and overhead costs. A social enterprise can function in an industry which is not linked to the sector in which the NGO operates; the potential profit is the only reason for setting up a for-profit organization, in order to cover the expenses of the nonprofit one, through donations, or sponsorship of their entire profit.

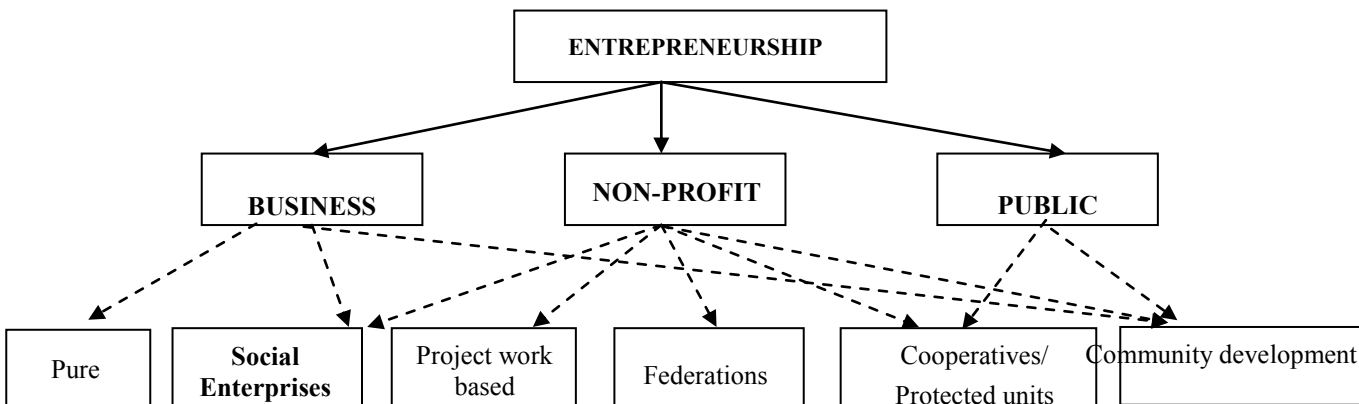

We have identified two types of mission unrelated social enterprises

- First, the NGO owns over 50 % of the shares of the enterprise
- Second, the NGO owns less than 50% (In the case of less than 50 % up to 30 % in the share of the enterprise, as a significant minor share holder. Eventually it should be mandatory for the shareholder to give out the dividends to the NGO according to the percentage of their share ownership)

Entrepreneurship is present also in another sector of society, the public sector. There are a few examples of joint structures that are present under the category of non-profit: the **co-operative unites for people with disabilities and protected units**. These organizations are a type of joint-venture between NGO's and local administration, and sometimes businesses, NGO's and local administration. Their main characteristic is that the mission they address is strongly social and because many of the times it is an important social issue for the local community, the public sector needs to become involved, at least in the early stage of work. Another form of entrepreneurship in public sector is Community Development Corporations, very active in USA as an organizational entity aimed towards local development of a specific community, in which are partners businesses, NGO's and local authorities.

In a research paper dedicated to a Romanian NGO that deals with the integration of people with mental disabilities, Ersing brings to light a new concept related to the activity of entities that contribute in one way or the other to the well being and development of the community. He talks about **interdisciplinary community development**, which he says: "often lies in creating working partnerships that incorporate diverse members, both internal and external to the community itself. Each different partner brings power, insight, and resources to the development process". We can consider this term as a summarization of the role of the agents presented above, but with the comment that the focus is on the community, and not society as a whole.¹²

In the figure below we present the various types of enterprises we have discussed in this paper.

¹² Social enterprise and the rights of persons with intellectual disabilities: A case study of Romania's Pentru Voi Fundatia, Robin L. Ersing, PhD, Diane N. Loeffler, PhD, Martin B. Tracy, PhD, Laila Onu, MSW, Haworth Press, Binghamton, NY, Journal of Community Practice

Social economy in Romania

At the time of the EU accession as a member with full membership, the civil society sector was considered a consolidated one and therefore there had been strong withdrawal of international financing from Romania. In the same time, this leaves the civil sector with the mission of developing self-sustainability schemes in order to pursue their social mission.

The social sector in Romania is composed of associations, foundations, federations. There is no legal definition of a social enterprise.

We consider that the non-profit NGO's definition is the closest to the one of the social enterprise. Even if there is a strong social aim to their activity, the reason why they do not fit the full description is the accessory character of economical activities that NGO's do. They are allowed to set up commercial companies, with the aim of supporting their activity, but there is not a legally clear framework for this.

There are several **forms of enterprises** which comply, more or less, with the three necessary characteristics for considering them social enterprises (social aim purpose, entrepreneurial spirit and non-profit distribution).

In our opinion, social oriented non-profit associations, foundations and federations are the organizations that best fit the definition of a social enterprise. There are also two other types of enterprises: first, co-operative units for people with disabilities and, second, protected units. The first category does not respect the non-profit principle because it is for profit oriented and has no social mission. The characteristic is that minimum 30% of employees have to be people with disabilities. The second type, protected units, can be either for profit or non-profit oriented, and are under the protection (funding by) of the local authorities or state agencies in some cases.

The **income** of the associations, foundations and federations is coming from dividends of the commercial companies they establish, from direct economical activities, donations and, excepting the foundations, from members contributions. The financing from public national funds increased too. In the context of a not so healthy civil society, the financial independence of the NGO's is becoming a problem.

Social entrepreneurship and the social economy sector are just beginning to take shape in Romania. Because NGO's have the most important role in providing social services (72 % of the providers of social services registered in Romania are NGO's), the representatives of these organizations are lobbying for financial independence. This is why; most of the non-profit organizations could also generate profit to finance their activities, mostly because the need for such services on the market is really high. According to the executive director of FDSC Romania, Ionuț Sibian, in Romania there are approximately 45.000 non-profit organizations out of which less than half are active¹³.

The main areas of activity of the non-profit organizations are social services, health, culture, sports, environmental protection, business, human rights, education, philanthropy, international cooperation and religion (The catalogue of associations and foundations, edited by FDSC Romania). Most of the non-profit organizations in Romania have benefited from financial support of foreign organizations.

At the moment, **in Romania we are discussing only about entrepreneurship in non-profit organizations and not about social entrepreneurship**. In Romania, the concept is not well known and there is no legislation for this activity, in order to allow social enterprises to work, yet. In the present conditions, where NGO's depend strongly on sources from outside the organization, it is essential to focus on creating a scheme that would create financial sustainability. This can be achieved by the set up of social enterprises, in the conditions of a legal framework that encourages this.

Changes after EU accession are taking place: aid agencies are retiring; sources of financing are diminishing, high expectation for huge financing from EU funds, improving legislation for sponsorship. Because the status of EU membership implies a high enough level of development, of both the economy

¹³ Gabriel Botezatu, ONG-uriile vor sa devina intreprinderi sociale, www.curierulnational.ro

and civil society, starting 2007 foreign aid agencies withdrew their financing from Romania and has left room for individual efforts of the actors of the civil society as well as of the European Commission. The financial support for non-profit will take the shape of finance from the structural funds and other programs that pursue the development of the social sector. Until the accession of those funds as many non-profit are left without financing sources. This created a gap that encourages NGO's to find alternatives and the creation of a social enterprise is a viable one. Also, the EU policy regarding governmental local administration aid is very restrictive, so there is need for self-sustenance and strategic management from the non-profit part in order to pursue social missions.

In order to be able to benefit from the structural funds provided by the EU, there are also a number of criteria that non-profits have to fulfill in order to be eligible. This is due to the bigger impact that the projects run by NGO's have to achieve and the need to address social problems in a more organized and structured manner. It is the drive to become sustainable and less and less dependent on state aid or individual donors. In this regard, the EU supports the concept of social enterprises as a way to achieve self-sustainability, having as examples different member states which have successfully implemented this concept in order to create sustainable social change. Such countries are U.K., Italy, Cyprus or Lithuania.

Proposals for Romania

One of the purposes of this paper was to look at where Romania is as far as the social sector and identify how it can improve the situation. In our opinion, the not so widely spread concept of **social enterprise** is a tool that could help non-profit organizations reach a higher level of independence and achieve better social impact. In this regard, we are proposing a definition that will suit the Romanian society and might encourage the creation of social enterprises. Our proposal is the following: *A social enterprise is a for-profit organization, created by one or several non-profit organizations in order to financially sustain the parent organization in achieving its social goal. The non-profit organization should own at least 50 % of the shares and should have private individuals as shareholders, as well as other for profit entities like businesses, with the exemption of the public sector. The social mission of the NGO can be included in the mission of the social enterprise; however it should not be mandatory. The dividends from a financial year should be received by the parent NGO in order to sustain its own activity or, if the parent NGO decides, the profits could be invested in the social enterprise for growth purposes that will generate future income for the main shareholder, the non-profit organization.*

This definition could be considered a first step towards encouraging the creation of social enterprises. There should also be *support from the central and local administration as far as fiscal facilities and easy access to consultancy services.*

The first legal proposal concerns the tax on dividends that exists in Romania. If social enterprise could be exempted from the 16 % tax on dividends when it concerns the dividends that belong to the non-profit, it could benefit the parent organization and encourage future activity of the social enterprise. All the other taxes paid by any business do not need to become fiscal advantages for social enterprises, since we consider that being a hybrid of business and non-profit, the social enterprise should bring its contribution to the economical development and national income.

CONSIDERATIONS ABOUT THE INFLUENCE FACTORS ON THE COMPETITIVENESS OF SME'S FROM WESTERN REGION OF ROMANIA

Abstract: There are many ways in which the firm competitiveness can be understood in the related literature. The purpose of this research is to undertake a better understanding of expectations and concerns of small and medium sized enterprises from Romanian Western region, in term of competitiveness. This study presents preliminary results of a finished grant focused on SME's competitiveness. There are some positive and negative factors in our research which are influencing firms' competitiveness. This study has confirmed our hypothesis. The external environment influence on the competitiveness of SME's is strong and contributes decisively to their performance.

KEY WORDS: SME's, competitiveness, growth, external factors, Romania

Literature review

In the related literature there are many ways in which the firm competitiveness can be understood. There is not a universally accepted definition of competitiveness and there is a lack of precise definition of this concept. The terminology comes from business literature. We discuss here about firm competitiveness.

Firm competitiveness is the basic capability of perceiving changes in both external and internal environment and the capability of adapting to these changes in a way that the profit flow generated guarantees the long term operation of the firm. There is an ongoing struggle for survival. (Chikan, 2001).

Tyson (1993) argued that competitiveness is the ability to produce goods and services that meet the test of international competition, while the citizens enjoy a standard of living that is both rising and sustainable.

Competitiveness should be understood as the ability of companies, industries, regions, nations to generate, while being and remaining exposed to international competition, relatively high factor income and employment on a sustainable basis. (OECD 1998)

The opinion of Krugman (1994) is that competitiveness is nothing but a different way of saying productivity, taking into account the rate of growth of one firm relative to others.

The concept of competitiveness reminds of competitive advantage, an important subject in strategic management studies. A firm's performance is affected by its competitive advantage.

Firm level competitiveness indicates its ability to design, produce and market products superior to those offered by competitors. Competitiveness is considered synonymous with success (achievement of company objectives).

The enterprise's level of competitiveness, according to S.A Khader, would mean that the enterprise should be able to achieve the following: ability to retain the customer base as well add on to it and to enhance its market share; acknowledged demonstration of growth; ensuring continuous improvement in productivity, quality service, product development.

G. Johnson și K. Scholes (1993) shows the importance of external environment in formulating competitive strategy in an uncertain environment. The competitive position of an enterprise in the industry in which competes depends on many factors: market share, the quality of used resources, answers flexibility to market pressure, financial performance. On the other hand, A. Thompson și A. J. Strickland (1998) argue that firms have great chances to become profitable and gain success in their industry if they obtain and keep durable competitive advantage.

Competitiveness is determined by productivity, and depends on firms strategies, it is partially, the results of relationship between firms and local business environment, depends on social and economic objectives synergy and is influenced by factors from external environment. (M. Porter).

The firm level of competitiveness can be measured by the capacity to invest, ability to generate and introduce new products in current markets and the ability to compete in foreign markets (ANIMMC, 2006)

A competitive firm knows how to use its strengths to exploit environmental opportunities and to reduce the negative influences of some external environment factors. (Dănaiață, Bibu, Predișcan, 2006)

In related literature we have identified find some indicators of competitiveness performance, such as the following:

- market share
- growth in sales (our firms succeed in this)
- growth in exports (not for our firms)
- new product introduction
- good image and reputation

As we know, firm competitiveness is basically a function of two factors:

1. the extent a company can identify those value dimensions that are important for their customers, and
2. the sum of resources and capability that makes a firm able to create and deliver the identified important value dimensions for the customer (Gelei, 2004).

Starting a new business requires more than just an idea. It requires a person, an entrepreneur who has used his judgment and professional and managerial skills with his risk taking to ensure the success of his own business. Before presenting our findings, we must ask a simple question: who are entrepreneurs? Are they special people? We fully agree with the following definition „Entrepreneurs are those individuals who discover markets needs and launch new firms to meet those needs” (Longenecker, Moore, Petty, Palich, 2006)

Research Methodology

This study presents the final results of a CNCSIS grant, for the period of 2006-2007, focused on SME's competitiveness. The research method included mail survey, telephone, personal interviews of small business owners. Contact lists was received from official firms database, based on previous research of our research team colleagues. The sample included only firms with income statement, balance sheet (1000 firms from Timis county).

We have received and processed through SPSS program, 134 questionnaires with 125 valid responses. We did an explorative research.

The research team has identified 7 topics:

- firms and the their evolution during the last 5 years;
- the entrepreneur profile;

- the firms profile (resources);
- the characteristics of the change management process;
- the external environment analysis;
- the EU integration effects on competitiveness;
- the entrepreneur and ethic.

The firms questioned are from *different fields*: production (30,1%), trade (39,3%), financial and other services (8,3%), construction (8,35%), communications and transports (3%), others (19.5%). The majority of questioned enterprises are in front of *first 50% of competitors*.

We have designed a *questionnaire*, with 4 pages, 6 sections and 26 questions. The first section contains information about founder, firm and field. The following *sections* contain information about:

1. turnover evolution in the last 5 year;
2. strengths and obstacles;
3. the changing management process characteristics;
4. the analysis and prognoses of external environment;
5. the effect of EU integration on SME's competitiveness.

Our research was based on the following *assumptions*: the SME's evolution, and SME's growth is both a development and a change process, influenced by external environment and by the entrepreneur profile and competency. The SME's competitiveness in the researched firms is dependent on external and internal environment of that company.

The firms were divided into 4 categories, for statistical reasons: 1. very low dynamic firms, 2. low dynamic firms, 3. high dynamic and 4. very high dynamic firms. We are presenting here only the results concerning the influences of entrepreneurs and external environment on SME's, and some strengths and obstacles for their business.

Discussion Of Results

a) about entrepreneurs

Data processing began with company, entrepreneur and its activity. About the entrepreneur *position in company*, 7,5% are owners, 53% are also managers and 39,6% have an other position than manager. It is important that 92,5% entrepreneurs are also managers in their company, in most than 50% cases they are top managers.

Only 28,4% of respondents are women and 71,6% are men. This is an interesting situation in Romanian business environment, and, of course, in our region, in the last years, more women became entrepreneurs. We do not have relevant research study about this phenomenon in our region but we believe that there are some environmental factors including socio-cultural and economics factors (Timis county is a well developed county, also local culture more open to western influence, urban location of companies) which are influencing women decisions to become entrepreneur.

We are sure that there are some similarities and differences between the types of entrepreneurial features associated with different types of organizations. One conclusion is that new firms were founded by entrepreneurs who are young and middle-aged.

In our study, entrepreneurs according to *age*, we found the following:

- the average age for entrepreneur is 42,4 years.
- the younger age was 21 year and the oldest was 66 years.
- from 21 years to 55: 29,6% , 35 to 55 years: 62,8%; more than 55 years: 7,6%

We don't have information concerning identification of entrepreneurial typologies.

Questions were asked about the education, training and business experience. The owners/managers have higher education (58,8%) and 33,6% have followed managerial training programs. Some entrepreneurs (30%) have some experience in the field, before starting a business. They worked in different state or private enterprises, prior to starting their first business.

The managers in our research have identified some success factors for their business. One of them is related with managerial competence. They believe that the management team has good managerial competency (64,1%); while only 9,6% entrepreneurs have acceptable managerial competences.

b) business evolution

Also, we have found the following results:

- turnover was growing slowly during the last 5 years (2002/2006);
- the profitability rate was 18% (average for the whole sample) with some differences: IT, (40%), industry-service (18-20%), constructions (12,5%), trade (16%);
- the products are sold especially in the domestic market, Romanian one;
- the majority of the questioned enterprises are in front of first 50% of their competitors;
- the owners/managers have higher education (58,8%) and 33,6% have followed managerial training programs;
- the managerial teams are perceived with having adequate competence (64%).

The net profit growth was continuous, and the average rate of growth was 9.55% / year. Only one enterprise have reported a very high level of growth in IT. The main factors identified for sustaining continuous growth were:

- improvement of managerial skills
- distribution channels
- cost reducing
- modernization in technology,
- growth in production capacity
- improvement in people motivation.

Work productivity, which reflects the efficiency in human resources used has increased in the last 5 year through modernization in technology, improvement in people motivation and improvement of managerial skills.

c) business obstacles and strengths

Our research reveals some success factors for small and medium enterprises. Some researchers argued that the overall competitiveness of an enterprise comes about by the performance in the following areas: economic productivity, quality, customer focus and social productivity

Firms economic strengths and successes are primarily determined by their internal management, the characteristics of the national and local business environment.

The managers of our research have identified some success factors for their business:

1. the quality of their products/services
2. the relationship with customers
3. the professional experience
4. managerial competencies
5. marketing politics
6. business financing.

One of the important strengths identified is the owners/managers having higher education.

Of course, there are some obstacles for their business, as we found:

1. the payment for delivering products is difficult
2. the workers qualification is not always at he required level
3. the weak financial power
4. the hard access to financing.

The fact that 2/3 from their entrepreneurs do not have a special degree in management field is a weakness for firms. A significant number of entrepreneurs may have had previous entrepreneurial experience.

d) external environment influences

The external environment, which is complex, unstable, is influencing the small and medium sized competitiveness, and of course, management decisions.

Entrepreneurs-managers have identified some external factors with positive influences: growth of demand for their products in local markets; growth of demand for their products in foreign markets; infrastructure modernization; opportunities for financing their investments; simplified access to loans; attractive interest rates for borrowing; better quality of raw materials; modern production methods and technologies; growth in the buying power of the population; positive modifications in rules, and governmental policies.

45, 5% from questioned firms recognized that growth demand for their products in local markets is a very strong positive factor for their business, especially for firms with low performance. For most performing firms, this factor is not so important. For 84% of SME's the opportunity for financing their investments is also very important for business development and for profit growth average rate. For 78% of SME's simplified access to loans is not so important for their profit growth average rate. Infrastructure modernization is not important for 72,7% of respondents on profit growth average rate.

The governmental and states institutions have an important role in firms activities. Managers considered that government and non government organizations can be more involved in consulting activities, training, creating a favorable environment for small and medium business. The most important communication channel between firms and government are county organizations for SME's, chambers for industry and trade.

Respondents considered that government can influence the market mechanisms and make them to function efficiently, and can create a favorable environment, that enables entrepreneurs to seek profits.

Conclusions

The external environment influence on SME's competitiveness is very strong. The world is changing, the environment is more uncertain, the competition is strong, the environment protection regulations are more restrictive. All these require rapid, efficient and effective answers.

Firm competitiveness must be shown like a part of territorial, local competitiveness. Economic development is a cooperation process between government, local administration, firms, research institutes and education.

The findings of this paper contribute to the study of local private small and medium size enterprise development and competitiveness.

MANAGEMENT IMPROVING METHODS FOR PRE-UNIVERSITY EDUCATION IN FRANCE

Birlădeanu Gheorghina

Agora University, Oradea, gheorghina_birladeanu@yahoo.com

Summary. Educational Management is a new discipline necessary for efficiency and productiveness in educational relations and for the stimulation of personal development both for learners and teachers. The management of the learning and teaching system has a real and primordial importance due to the fact that the manager has an active role in the work of children or young learners who represent the future of society. The evolution or involution of any nation depends completely on them. This is the reason why we should pay a special attention to this section of management. There are material competences which were given to collectivities and teaching competences strictly belonging to the detriment of the state. This gives a general endowment of decentralization in local collectivities for the latter to be able of competences regarding the functioning of teaching institutions, other times belonging to The Ministry of National Education.

Key-words: educational management, educational system, educational institution, decentralization, administrative responsibilities.

1. The L'EPLE Management- pedagogical institution

In France, education is national. The curriculum and trend is decided by the ministry. The services of the ministry correspond with the central administration of the educational system, which mainly shares out credits to support the teaching in educational institutions.

The institution's staff comprises firstly, those who are directly implied in the learning process. Except for the principal and the deputy manager, the main educational counselors are dealing with the book-keeping of the institution.

The supervising part, since year 2003, is completed by educational assistants who gradually replaced boarding school teachers and supervisors (MI-SE). All in all, the number of high school and college teachers is 420000.

But other people are essential for the well functioning of the school. They are called educational administrative staff (CASU) in bigger institutions, main attachés and attachés of university and school administration (APASU and AASU), university and school administration secretaries, agents and administrative adjuncts deal with administrative issues, book-keeping, judicial and financial analysis. The servicing and cleaning staff is charged with the fixing and up keeping of the building.

In conclusion, the staff directly involved with the leading of an educational institution is:

- The Manager (Principal at college and Proviseur in high school);
- The Deputy Manager;
- The Intendant responsible with book keeping and administration;
- The Main Counselor of Education responsible with school issues;
- Boarding school teachers and supervisors, educational assistants and auxiliaries, practical work leader who coordinates the technology teacher's work;
- The Deputy Manager of the Special Education Department (SES) also named (SEGPA)¹⁴.

¹⁴ SEGPA= section d'enseignement générale et professionnel adapté

1.1. The Public Teaching Institution (L'EPLE) (high school-college)

If the educational system is characterized by an organization which can seem complex and hierarchical, the local public educational institutions have the duty to be the final stage of putting in practice of educational policies.

1.2. L'EPLE: an administrative institution

The order issued at 30th August 1985 gives college and high-schools (regarded as local public educational institutions) individual competence and a relative autonomy. The complete responsibility of educational institutions belongs to the administrative, financial and pedagogic field.

Responsible from the judicial point of view in the security, hygienic and health issues as well as financially, the school principal has a great autonomy in organizing education. The county and academic authorities' attributes a global endowment per hour¹⁵ and pedagogical credits that are shared out according to regulations and priorities presented in school projects. The functional credits and the construction and renovation of buildings belong to the local collectivities which take the responsibility of the construction and renovation of buildings.

The characteristic of educational institutions is that the principal assumes a double role. He is both the executive of the administration council empowered to take decisions and the representative of the State who is expected to assure the national coherence of the educational system in school.

Beginning with the 1st of September 1985, a college or a local public high-school is an educational institution (EPLE) run by a principal called "proviseur" in high-schools and "principle" in colleges. The responsibilities of a principal are of paramount importance. He is followed by a deputy manager who under his authority has the same administrative, pedagogical and educational competences and an administrator named intendant, which takes care of the material and financial administration.

The principal of the school has the following prerogatives:

- Presides the administrative council of the school, permanent commission, delegation committee- pupils, various instances;
- He is in charge with financial income and outcome of the school;
- After the CA permission, concludes over every school convention;
- He has authority over every employee of the school;
- He establishes the duties of each teacher in the school respecting their status;
- He supervises the process of teaching and the continuous control of skills and knowledge;
- He is responsible for order in school and makes sure that the internal rules are respected;
- He declares the penalties, warnings or temporary expelling (of maximum 8 days for pupils);
- In case of serious difficulties he can prohibit the access in the school and the suspending of courses.

The administration of the school (EPLE)

The administrative council of the institution of school EPLE is made of 24-30 members, depending on the number of the pupils in the school. Its composition is based on principles with representatives from the staff of the school, with pupils and parents and also representatives of the administration and local collectivities. The administrative council according to the decree 85-924 from the 30th of August 1985, establishes the principles of putting into practice the pedagogical and educational autonomy and especially the rules of organization, votes the financial budget. The permanent committee of the administrative council is made of the members who are in the administrative Council (CA). This is the function of preparing the decisions of the administrative council.

¹⁵ DHG-each school receives global endowment established by the rector for high-schools, by the academic inspection for colleges taking into account the sum received from the Ministry of National Education

The principal of the school is in the same time the president of the CA council and the executor of decisions. He is also the representative of the state in the educational institution and this way he supervises how laws are respected and courses are kept.

The order of orientation towards education (89-486 from the 10th of July 1989) created a Superior Council of Education (CSE) which is a consulting institution presided by the Ministry of National Education and made of teaching staff representatives, parents of pupils, pupils and students, local collectivities and economic, educational and cultural interests. This gives notice concerning the objectives and functioning of the educational system, the regulation of the curriculum, the examinations and the delivery of diplomas, the relative aspects of private institutions, and the issues regarding the teaching staff.

National education represents the most important administration in France. Beginning with the 1980's the state started a huge operation of decentralization of the responsibilities and decisions which increased the power of local administration (in every county).

The local administration of National Education is organized around the inspector of academy- principle of Judicial Services in national education (IA- DSDEN). The representative of L'IA – DSDEN is in charge to put off and to put in practice the educational policy of the ministry responsible for the local education. He has main competences in the education of grade 1 but also in that of grade 2.

2. The Administration of the First Grade Teachers

a) L'IA-DSDEN¹⁶ must program the needs of the means of education and to share them out among the schools of the county. These attributions empower it to decide the beginning and ending of classes at kinder gardens and elementary schools, to facilitate and repeal work places as teachers and the administration of the means of replacement.

In this frame, it issues in the county, the promotions and shifts among teachers holding the first grade.

L'IA-DSDE has access to the Services of the County Academic Inspection, to assure optimal results. He is followed by an Administrative and Universal counselor (CASU) who is a General County Secretary responsible with the administration of services in the big counties, an Inspector of The National Education (IEN) who must coordinate the inspectors of first grade teachers. Some counties have a Deputy Academic Inspector.

IA-DSDEN decisions are subject to various parity comities such as: the County Council of National Education including representatives of local collectivities, auxiliary teaching staff, and the County Parity of the Technical Council (CTPD), Administrative Parity County Committee (CAPD) for administering the first grade teaching staff.

b) Pedagogical coordination

The situation of the first grade teachers depends on the IA-DSDEN as responsible for the National Education Inspectors (IEN). The IEN inspectors of the first grade teachers each have a circumscription of schools and they are responsible for the administration of schools, thus they are the superiors of school teachers. Except for the administrative responsibility, the IEN inspectors must evaluate the first grade teachers and they respond for the pedagogical postponements in the area.

Certain IEN inspectors are endowed with the school adaptation and integration (IEN-AIS) and in this case, they are responsible for the re-evaluation of the teaching staff.

3. Local competencies of grade 2.

Administrative competences

- The competences of the IA-DSDEN inspectorate in the education of grade 2 are extending. It takes responsibility in the educational organization of colleges (division of educational skills) and gives advice (notes) the rector regarding the organization of high-schools. IA-DSDEN is in charge with giving opinion (list, map) about professional formation and about the investment and educational development;

¹⁶ L'IA-DSDEN=the Academy Inspector- Manager of County Services and National Education

- The decisions of the academic inspector – principal of local services of National Education are put under the control of local technical council (CTPD) mostly preparing for the new school year and organizing the administrative services of the institutions of grade 1 and 2.

The academic inspectors- principals of local services in National Education are empowered with essential competences at the level of the county. The administrative decentralization movement tends to sustain these competences for a long time¹⁷.

Ameliorating measures

On the 18th of November 2004, François Fillon, the minister of National Education presented various measures regarding the improvement of school, which as a rule of orientation and programming, would be appreciated at the beginning of school. These measures echo in different challenges. They follow the creation of a more efficient, correct and open school¹⁸.

A more efficient school

- Creating a High Council of the school, a superior independent authority, rearranging The Superior Council of evaluation and The national Council of the curriculum, with the aim to provide basic knowledge that every French young person should possess at the end of the year;
- The compulsory learning of a foreign language from the elementary school CE1 and learning of one or two foreign languages from the 5th grade;
- The evaluation of the gained knowledge at the beginning of CE2, at the beginning of the 6th grade and at the end of the 3rd grade;
- Putting in practice of a new diploma in colleges with written papers and a continuous control and the possibility of obtaining supplementary points with a B2 diploma in informatics and a grade for school life by the class council for diligence, discipline and taking part in the school program.
- Reducing graduation to 6 exams;
- Creating in every college and high-school of a pedagogical council ran by a principal and having as members a teacher from each department and the class principals to define the pedagogical projects of the school;
- The complete rights of the class council to decide repetition of class at every level

A more correct school (righteous)

- Increasing of the numbers of hours for continuous training;
- Issuing an individual contract between the school and the pupil's family and for primary school containing 3 hours of French and mathematics;
- Giving scholarships on social criteria starting from 1000 euros per year for the pupils who received a B or an A.

A more open school

- Generalizing of the option "Discovering your profession" that should contain 100 000 pupils in the year 2010;
- Developing a 3 year professional baccalaureate so that in 2010 500 000 pupils should be able to finish school;
- Language classes in the last year of study.

Abstract

The study of organizational culture represents nowadays a constant preoccupation of researchers, managers, companies, due to its part within any organization. Just as, by studying national culture certain similarities or differences between cultures can be established, both weak or strong points being identified for an entity, the study of organizational culture allows differentiation and in accordance to this criteria, of the contemporaneous enterprises.

Within this present article, we tried to identify the impact that organizational culture, over the enterprises' competitiveness, observing the fact that knowing this concept, being aware of organizational culture existence, as well as preoccupation towards its improving become very important, in the view of achieving better results.

Key words

Competitiveness, organization, organizational culture, performance, quality, price, human resources.

The concept of organizational culture

Each organization, no matter the size or of its activity field, it has an own organizational culture, which depends upon own history, by the manner of approaching the problems and of practices or managing activities. Its organizational culture reflects the feature of personalities and or leadership styles, marking the manner of how things will be accomplished, how changes will be made, thus manifesting the organizational personality and psycho-social climate. Using a simple analogy, the organizational culture represents for an organization what the personality represents for an individual, having its origin on interaction of inter-personal relationship, on organizational level.

The organizational culture can be defined as being the specific manner of thinking, feeling and acting, which people of an organization understood as result of procedures assembly conceived of managers, but of social environment influence too, where they lived and formed. The organizational culture is represented by the values system, by the common convictions of the organization's members, as concerns its existence and functioning, of rituals, myths and happening, which determine the manner how employees think and action.

Orientation of organizational culture within high performance spirit

In the view of creating performance, all the elements of the organization have to be taken into consideration, which give value to achieved results, meaning:

- the economic elements – profitableness, competitiveness;

- the juridical elements – the legal conformity and solvency;
- organizational elements – competency, coherency, efficiency;
- social elements – synergy, involvement, satisfying the staff, professional development, quality of work, inter-human relationship.

The concurrency, as active form of free initiative, represents the opened confrontation, the rivalry between economic agents, in the view of attracting on their part the clientage. It owns a main part in business, leading to continuous improving and making efficient the production, thus determining the elimination of wastage and reducing the costs, so that the selling price to become smaller than of others.

A country's competitiveness, in its restrained way, can be analyzed by its commercial balance point of view, and on large way, by the economy point of view. *"The Americans, as Europeans also, understand that without production and manufacturing (which includes the productive services), the competitiveness and economic power cannot be conceived"*, affirmed into a published article of central quotidian, a Romanian economist of the present.

It becomes very important on analyzing the concurrency position of the company, which differentiates it of the companies that acts on that market, by the view of key factors of success. Supplementary, the organizational culture, which differentiates an enterprise of other, should be considered a factor of success.

The strategic position of the company becomes important because the companies that dispose of a strong strategic position are more dynamic and more rentable than other concurrent companies.

Also, if the economic environment is characterized by a high inflation rate, the turnover of companies that carry on that market will be decreased, an especial impact over the turnover it has had by the policy of market prices, as well as each company. In conclusion, those three elements (the strategic position, rate of inflation and prices policy) are on strong interdependency relationship, thus influencing the company's performances.

Any economic agent, being importer or exporter, producer, distributor, wishes to sell more products and services so that it has to earn more. Unfortunately, the products and services accomplished in Romania are generally not competitive, and mostly by quality, price and accomplishing term. The consequences are dramatic, especially for the Romanian exporters, which cannot succeed on selling products or services. On the macroeconomic level, the lack of competitiveness represents the fundamental cause of Romanian economy decline. A solution that has to be taken into consideration to each company's level is represented by the analysis of organizational culture and changing of it on direction of improving the quality of products and services, meaning of company's competitiveness.

For many Romanian companies, it has to be act over the determinant factors of products and services competitiveness:

- technical factors (technical characteristics of products, which have to correspond better to consumers' exigencies, the quality, innovation and research);
- financial factors (price/tariff, payment conditions, payment facilities over loyal customers);
- supporting factors (auxiliary services associated to a product or service in the view of growing its added value);
- factors of sale and retail (the term of delivering, delivering conditions, modalities of distribution and selling).

The organizational culture, by its elements, contributes also beside the above mentioned factors, on growth of company's competitiveness. In measure on which organizational culture means respecting of normative and ethics on business, maintaining and improving the inter-personal relationships, the team activity, maintaining and perpetuating the tradition in that field, creating and transmitting the most powerful values and convictions, the company's competitiveness being supported.

The managers, by their activity, have to have continuous in view the impact of organizational culture over policies and company's objectives. Not taking into consideration the part of organizational culture means losing, day after day, a part of its identity. A company that doesn't analyze and doesn't improve the organizational culture is a company without personality, which cannot function on a contemporaneous market so much on competition.

W. Eduard Deming, recognized as pioneer within statistic control of quality, has elaborated a comprising strategy of management, upon basis of the next philosophy:

“A company doesn't have never to stop on improving the products or services and have to have a unique objective on satisfying the customers”.

This philosophy represents “the shared vision” or common objective that connect the employees and managers. For having success, an organization has to embrace and implement this philosophy, transforming the entire culture of the company.

W. Eduard Deming considered that “the management should not concentrate over the dividends and growth of market stock holdings, but on serving better the stock holders, knowing the permanent improvements of products quality, fact that would determine the reducing of costs, enlarging the market, creating new work positions and better profits”.

The content and the importance of competitiveness

The actual context, marked by the globalization of phenomenon and recognizing more and more the interdependencies, imposed new play rules, meaning: prosperity of nations, supposing competitiveness on international markets and prosperity of enterprises, supposing integration within chains of world wide values.

As result, the problem of competitiveness has become an essential theme at each economy's actor level, from that of economic regions, up to that of each organization. Simultaneously, an evolution of competitiveness in the direction of passing from static competitiveness, where the competitive advantage was given by endowment with technical factors, to dynamic competitiveness, whose motor factors is the technical progress, increasing the employees and modern methods of management can be observed, this fact directing on exceeding the economic dimension by the competitive advantage: the growth of financial and productive power of the country, the education, the security, the quality of life, all being component of the concept.

Defined as the degree on which a nation, in conditions of free and honest market, can produce goods and services that have to pass the sample of international markets, simultaneously succeeding on maintaining the real income of its citizens, the competitiveness represents therefore a challenge that has to be applied not only in situation of nations, by also of all regions and cities/stations of the world.

A nation's competitiveness is influenced by the level of competitiveness accomplished at the level of each national economy's actors. In other words, for the accomplishment of a nation's competitiveness, the contribution is brought by all national economy's sectors, and implicitly all national economy's branches, to all organization of each branch.

Therefore, the productive sectors of the national economy, contribute, by the growth of their competitiveness, on GDP growth, on added value, while other branched bring their support, by its developed activity, on growing the quality of life (health, culture, social assistance), on forming a qualified labor force (education), on assuring the efficient functioning of justice, protection of private ownership and of citizen's security, on decreasing the criminality rate (policy), on reducing he risk of political instability, the growth of social cohesion, reducing the social disparities (the extreme wealth and poorness), and of discrimination against women and minority's groups.

On its turn, the level of a nation's competitiveness influences, on certain measure, by means/instruments that has at disposal, the plans and national politics, especially by the percent given from GDP in the view of developing the different branches as: education, preservation of health, scientific research, justice, policy and army, culture, environment, and other.

A complete analysis of indicators that influence, and finally express the level of competitiveness of a nation, was accomplished by one of the most important business schools of the world, IMD Lausanne, which having an experience of over 50 years on developing the leadership competencies of the international companies managers, established 323 criteria grouped in accordance to competitive factors, that established the elaboration of „The World Competitiveness Yearbook” (the most recognized yearly report over nations competitiveness), which analyze the conditions offered by the economic and business environment of each country, in the view of supporting the companies' competitiveness.

This report analyze 60 competitive countries and economic regions, upon basis of four competitive factors and of specific criteria f their appreciation. The four competitive factors emphasized are: the economic

performance, the governmental efficiency, the business efficiency and the infrastructure. As concerns a company's competitiveness, this can be defined as being: "a company's feature on meet competition to other companies, similar on a certain market".

An enterprise is competitive on a certain market, when it succeeds on achieving certain economic indicators: turnover, profit, profitableness, segment on the market comparable or superior to those of other concurrent enterprises, which act on the same market. The competitiveness represents a complex notion, being greatly influenced by the ability of understanding and correctly adapting to the world that surrounds it. It can be regarded both globally and to each company's level. In this way, the specialists emphasized the fact that, global competitiveness of a company is determined by the competitiveness of each following components/category of competitiveness: financial, commercial, human, managerial, technical, and organizational.

The actuality of competitiveness problem is accentuated also by the fact that European Union proposed, at the Lisbon's Council, which took place in year 2000, to become until 2010, the most competitive and the most dynamic economy of the world, able to assure a yearly economic growth of 3% of work positions, better and increased of social cohesion. The decreased competitiveness of the new countries that adhered to EU made that at first analysis of accomplishing the objectives and concrete targets established to observe that this objective will be impossible on carrying out. As result, EU 27 has to re-update and fortify the competitiveness strategy, fact that supposes that each entity, from the continental economy of European Union with those 27 member countries up to the work position of any organization, having to solve prior on XXI century the problem of increasing the competitiveness and of value.

Adhesion to European Union supposes that, on mean and long term, the Lisbon Agenda is also a priority of Romania, the development logic of Europe becoming the development logic of Romania. As result, elaboration of recovering strategy of Europe of competitive discrepancies towards the Central Europe mean was begun. On applying this strategy, comparison is made towards the development stage reached by Poland. Romania made progress on informational field, in the last years the number of Internet users and of mobile communication users being increased. In change, the technological progress remained low, the expenses for research – development, the state helping being at fifth times less than the mean of EU, the research and development weren't being supported, all these showing the structural weakness of Romania's economy. The Romania's competitiveness, at its existence, is basing upon cheap work force and upon money sent in country by Romanians that work abroad. The risk of loosing the Romania's credibility on the market in favor of other competitors, which become more and more numerous, will situate our country in conditions of not meeting the concurrencies pressure, of the European market.

As concerns the global efficiency of a business, this can be increased by optimizing each component element, among which the most important is that concerning *the human resources*.

"The humans have the tendency of isolating themselves of the external environment", said Peter Drucker, "but the efficient organizations are not created for themselves, but for satisfying the consumers' needs".

Many specialists agree that a business success and accomplishing the economic and social objectives established depend greatly upon the management of that organization, assured by an organizational and managerial culture of performance.

Improving the human resources performances – a condition of growing the company's competitiveness

Among the resources that are situated on basis of achieving the stipulated results, a very important part is owned by **human resources**, *goods that present a powerful determination and cultural significance*.

Human resources represent, in fact, those that put into motion the other resources categories. In this way, a manager orientated towards material and moral motivation of employees, taking into account their values and convictions, will achieve the maximum of productivity, from his subordinates. The companies that offer increased attention to employees' values and convictions (IBM, General Electric, General Motors Corporation, Cincinnati, and Procter & Gamble) had also a high level of performance.

A company's interest on reaching the established objectives without taking into consideration the staff that has at disposal, can determine a decrease of production, of profit/profitableness and not accomplishing the objectives, within a study performed over 34 corporations, the author Denison made conclusions that organizations that own participant organizational cultures, with employees strongly involved on

establishing decisions, not only that register superior performances towards those that do not own such cultures, but these performances grow in time.

In the view of emphasizing the relationship between the organizational culture and efficiency in business, the role of human factor has to be taken into consideration, on achieving the stipulated results, meaning:

- the organizational culture, by specific values, influences directly the work environment and implicitly the level of satisfying on work the employees;
- the organizational culture performs a pressure over each employee's behavior, which is directed towards all tasks and responsibilities accomplishing;
- the individual performances unite synergic and compete on growing the company's efficiency.

Therefore, on direct manner, the involvements of organizational culture over company's efficiency are major and very important. Upon quantity and quality of human resources the efficient capitalization of material and financial resources depends, on which a company dispose, fact that means reaching the level stipulated of turnover, the market quota or added value.

On maximal use of knowledge, of the experience and capacities of employees, contribute, among others, also the values, the beliefs, the quality of life, work environment within company, economic and social conditions of the employees. All these factors, which influence the way people work, are manifested by the behaviors and attitudes of employees towards work, company, towards managers and colleagues and even towards life, generally.

The organizational culture, by its forms of manifesting (symbols, behavioral normative, rituals, ceremonies, histories, prestige and authority of managers and employees), influence and determines a series of behaviors and attitudes, so that employees can capitalize the entire potential of disposing, in the view of accomplishing the proposed goals.

The managers have to have in view creation of a courage culture, such as Nokia represents in present, because in 1995, the company had serious problems on managing the logistics, fact that brought to a decrease with 50% of stock holdings. Eliminating the fear from an organization is an essential evolution because it encourages the people on assuming more risks, responsibilities and initiates. Remarkable results can be achieved, if the performance will be adequately measured and if it will choose on direct reward. The modern systems of management try to line better the employees' interests with those of the company, trying to reward the team work, making work more interesting and promoting the values and rules.

The teams made of happy employees determine the growth of productivity for an enterprise. Establishing such team and creating certain strong social relationship within company can represent real challenges for the managers. "Vivification of a team is an art", as Herve Bourdais said, consultant in management and expert on social relationship, within Copernic Program of training on management, developed in Romania at the end of 2005.

When within a company, the decisions and actions converge towards the same aim, the result signifies competitiveness on all levels, thus assuring the development of organization on short, mean and long term.

Conclusions

The decreased performances or failures of many Romanian enterprises are due mostly to their inability of adapting to market's requirements and to its rules of functioning. Within this context, the organizational culture plays an important part. Practically, not knowing by many Romanian managers of the organizational culture importance, made possible supporting the high performances.

On such a dynamic market, as that external, the Romanian enterprises can reach and can exist only if they own products and/or innovating services, with different features towards those of concurrency, correlated to attractive prices. All these become possible in measure as Romanian enterprises can evaluate the organizational culture and try to improve it. A company reaches to become competitive on the market, if it owns a strong, positive organizational culture, able to mobilize people, energies, in the view of reaching the wished aim.

Perfecting the organizational culture is imposed in situation of registering certain decreased performances, of the existence of products area and/or services not adapted to the market, in situation of taking over, of fusions, so that the known "cultural shock" to be easily to exceed. Meeting of two different organizational

cultures with values, rules, beliefs and different rituals, supposes a cultural adapting, both for those expatriate managers, and of autochthonous workers. Complex and lasting process, the cultural adaptation has to be supported by applying certain concrete and fast measures. Many of the privatizations accomplished in Romania and resulted with failure, were due to both cultural incompatibility, and to undervaluation of organizational cultural importance, on functioning and developing the new enterprise.

Implementing the cultural perfecting process is possible only after an adequate evaluation of the existing culture, determining the weak and strong points of that culture. Upon basis of this analysis, the eventual measures that managers can apply in the view of perfecting the organizational culture can be established. Evaluation and then perfecting the organizational cultures have not to represent isolated actions, but have to be performed any time are necessary, in the view of improving the company's performances and on increasing the market competitiveness.

Abstract

The customer relationship management is one of the most dynamic fields within organizations' management. The simplest possible truth, as specialists say, is the fact that all profits are provided by customers: if there is no profit, there will be no business; and if customers aren't, there will be no profit; therefore, if there aren't customers, there will be no business. The opened and sincere orientation towards solving the customer problems is the key with which the marketing opens the gate to success. For business, there are only two ways of creating and supporting the superior performance on long term: an exceptional care towards the customer and a constant innovation.

The reality of these affirmations is supported by the fact that a transition from one management model focused on product towards a model focused on customer can be observed.

Key words

Management, customer, efficiency, business, competitiveness, performance.

CRM (Customer Relationship Management) – represents a fashioned term or part of something hiding after an actual abbreviation

On nowadays complex business, the advantage over the concurrency is much more difficult on achieving – and more difficult on keeping – than it was in the past. Within the global communications and omnipresent information era, within an economy led by information, the ability of really understanding the market and customers becomes essential. The business success in these conditions suppose the ability of transforming this information in obvious knowledge, which are allowed to be practiced and at last depends of how well the organization will respond (in speed, level of knowledge and decision) to the needs/preferences continuously increasing of the customers and to continuously changing strategies of the concurrency.

Each company has its own procedures, own culture and own mean of approaching the customer relationship, which determines that into the beginning of 21st century, **the scheduled and aware management of customer relationship** becomes more and more often a strategic problem. The companies and institutions, which in the view of reaching the strategic objectives, especially stand on exploiting the customer relationship, finalize the relevant plans and objectives, therefore developing a strategy and an action CRM, taking into consideration the present and future customers' characteristics.

Comparing to previous decades, the nowadays customers represent to organizations “targets on moving”. The markets do not have a relatively stable structure, being extremely dynamic, with segments and parts, which profile progresses. Within this context, CRM has as view the attraction and reservation of profitable customers, by means of developing long term relationship and by stimulating the customers' loyalty. The progresses of information technology field contribute on founding the most adequate developing strategies of relationships, with each customer of organization portfolio frame.

Certain definitions

Over the time, a series of definitions were elaborated, as concerns the CRM concept. Therefore, in accordance to Gartner Group, CRM is a business strategy intended to optimize the profitability of enterprise upon basis of increasing the customer satisfaction. For applying this strategy, an organization has to adjust its behaviour and has to implement processes and technologies able to support the controlled interaction with customers, by all channels of communication.

In accordance to CRMguru.com, **CRM represents** a business strategy, by which customers are selected and managed in the view of optimizing their value on long term. CRM needs a managerial central culture on customer, which has to support efficient processes of marketing, sales and service. CRM applications can contribute on making efficient the customer relationship, in conditions when organization has at disposal the managing, strategy and adequate culture.

Defined of some specialists as an application of information technology, by others as a valuable development of relational marketing principles, the Customer Relationship Management represents actually a strategy of business, aiming towards increasing the enterprise performances upon basis of increasing customers' satisfaction, by creating a profitable relationship and of long term with these, thus gaining a substantial competitive advantage.

As result, CRM does not identify with specialized informatics solutions, for the management of information as concerns the customers, but basing upon IT solutions, for a better understanding of expectations and needs of customers, of their behaviour on buying, in the view of designing able strategies on generating the value for customers.

Arguments or the need of CRM

As result of powerful competition environment that exists, more and more enterprises recognize the essential need of adapting their internal processes in the view of increasing the level of customers' satisfaction, the alternative being represented by the risk of losing in favor of concurrency. In accordance to studies, the mean companies lose between 20% and 50% of customers in each year and find difficult of reaching the loyalty on their best customers. The free market, diversifying and globalization stimulated a dramatic growth of competition. These realities of market forced the companies on changing the approach focused on product within an approach based in customers.

Therefore, more and more managers reach to conclusion that identification of specific groups of potential customers, as well as their serving in more efficient manner, thus representing a sure way to success. This probably explains the interest more and more on growing of companies on applying CRM (customer relationship manager).

Many people considers CRM as a business software, but the fact that technology is only the mechanism for making efficient the company's activities, while the self process represents CRM has to be well understood. A CRM process defines the methodology of all actions necessary on transforming a potential sale into an effective one, of having satisfied customers and, why not, of determining them on buying more.

There are a number of reasons well grounded for which the companies' direction toward a CRM solution:

- the companies loose customers outside the competition – or do not win enough – and thus recognize that they do not respect all needs of own customers;
- the concurrent companies already adopted a CRM solution and the first results began to appear;
- the failures on making profit on present market opportunities determined that companies to realize that something goes wrong.

For many companies, the most obvious and simple reason is represented by the wish of reducing the costs and of improving the services offered to own customers. Finally, everything is reduced to efficiency, productivity and has a great basis of satisfied customers. All companies aim towards their growth, and their identification with successful implementing of CRM solution is a strong reason on achieving such application.

It was proved that maintaining the old customers significantly costs less than purchasing the new customers. That is why, while companies extend their customers basis, they do not have to loose of view

the maintaining and increasing the better of them. Increasing the “customer’s activity” – in other words, the business quantity that each customer offers – becomes as much important as the growth of market activity. Through a good managing of the good customer relationships, the profitableness can be increased. And this is in fact, the **Customer Relationship Management**.

The most usual arguments are:

- the acquisition cost of a new customer is fifth time greater unless that of maintaining certain existing customer;
- the probability that a customer to remain loyal to his provider varies between 70 and 45%, depending on his satisfaction degree;
- an unsatisfied customer will share his bad experience to other 10 persons, different for a customer that will appreciate then supplier on other 3 persons;
- the displeasing is the reason for which 80% of the displeased customers migrate towards the concurrency;
- only 4% of the displeased customers make complaints, the rest of 96% of displeased customers leave a company, without making any complaint as concerns the quality of services or supplied products.

The advantages of assimilating this concept of strategic and operational level are:

- the growth of customers number and, by assuring a superior satisfaction level, of their profitableness;
- the growth of companies efficiency on marketing (by a more precise target, automation of companies, complex segmentation of customers etc.);
- automation of complex processes (Sales Force Automation, Marketing Automation etc.), which simplifies the organization and internal processes, by earnings in time and efficiency;
- improving customer relationship and their loyalty by applying a leasing manner directed towards the customer and his needs satisfying;
- economic advantages generated by the decrease of fault products weight, by decreasing of customers number which leave towards other companies and the decrease of their non-satisfaction.

To all these seducing offers, lately was added that of possibility of generating by means of CRM (more precisely by that-called Analytical CRM) of reports and complex analysis in real time, which represents an essential instrument for a company’s management. Within this kind of certain argumentation, it results that implementing a CRM solution is a major imperative for each company that wishes to survive on market. Even for the small and middle companies, as NextApplication study says (December 2005), which shows that for 53,7% of small companies, CRM represents an instrument that can significantly contribute on ameliorating their productivity and which is not anymore reserved to companies.

Companies’ attention towards customers – major tendency in new economy

Within the world mature economies, the quality of product/service – mostly being on the highest possible level – is regarded as a mean for assuring a company’s domination on the specific market of performing. By this, the occidental point view radically differs in other countries, in which the product’s quality is regarded firstly as aim of reaching. In these economies, it starts from the compulsory condition of regarding the problem of product/service quality from the customer’s point of view.

The variant 2000 of ISO 9001 explicitly defines the aim, underlying those management system requirements of quality are firstly directed towards achieving the customer’s satisfaction over his needs, by applying the system, improving it and preventing the non-conformities. In accordance to the above mentioned standard, no matter the organization acting, it becomes compulsory that it has to respect the customer’s requirements, in situation these were defined and accepted by the both parts, previously. It is important for an organization to know which its image is towards the customer, how satisfied a customer is, considering as reference what was initially established. Thus studies can help managers on improving the organization – customer relationship, in two directions: reducing of operating costs and increasing the customer’s satisfaction.

Attention towards the customer means that everything that a manager does has to be done upon basis of care for respecting all exigencies, no matter if there is a very profitable or less profitable customer. This thing should signify all what is accomplished in strategic level – establishing the priorities, elaborating decisions, planning certain different types of managerial projects – on focusing over the needs in continuous changing on customers.

The main characteristics of this approach imposed within present economy are the following:

- attention towards repeating the customers' acquisitions;
- frequent and customized contacts of all employees in customer relationship;
- focusing over the value offered to customers;
- the high level of services quality offered to customers;
- the aim to be achieved is "delighting" the customers.

The opened and sincere attention towards solving the customer's problems is the key with which the management opens the gate to success. In business only two ways of creating and supporting the superior performance on long term exist: an exceptional care towards the customer and a constant innovation.

A company has to see on its customers the main force that leads on its activity's back, considering that business can resist only if it succeeds to satisfy its needs. On market economy, the buyers can choose what, when and from where they have to buy or they have to buy or not a product,

Therefore, in the view of having success on attracting the consumers, the logical point of view for a company consists on identifying what customers want and then to try on accomplishing these requirements into a more efficient manner than the competition. On long term, a company doesn't have to satisfy the requirements of consumers, and to take money of it. As the offer of company synchronizes better with requirements and wishes of consumers, more they will be disposed on paying more, thus generating profit for the enterprise.

The best way on achieving an attention towards the customer is that of cultivating advantageous relationships and on long term. Within this type of enterprises, the customer is no longer considered as generator of costs for the enterprise, but that of bringing the profit. The attention of managing is directed towards satisfying all the customers' requirements, with the hope of their loyalty achievement. *Maintaining a relationship with the customer is wished also after evaluation of transaction among the two parts, not only before.*

Most of companies adopt an approached oriented towards loyalty of customers, but observe that also the competitors proceed the same way, and the result consists on a totally lack of differentiation, instead of expected competitiveness. Before establishing the satisfaction and loyalty of customers as basic objectives of companies, these have to know that preferences and perceptions of customers are the result of a learning process. The objective of management strategy on customers' relationship is that of adapting the company to customers' exigencies, so that this learning process has to be performed in companies' advantage.

It is obviously the moment that satisfying the consumers wishes to become the main objective of existence to a company. Understanding the concept of customer can have a decisional role for the success of an organization in conditions of world wide economy.

For being able of managing among competitiveness, a company has to create and maintain the profitable customers.

Creating of customers – means for a company monitoring the business environment for reacting to changes that intervene within the needs of potential consumers, so that these have to become loyal customers.

Maintaining the customers – refers to the ability with which the company reduces to minimal or avoids the threatening on base of customers, wither because of changes appeared in their needs, or because of changes appeared within concurrency. The profitable customers of the company are those that bring incomes that exceed the costs of its production. The economical agent has to focus and center his attention on profitable business activity, and not on attracting the customers at any price.

Orientation towards the customer is met when the company is preoccupied of reaching the needs of its customers. In many cases, the company is preoccupied by production and afferent technological processes, not succeeding on observe that customer needs were modified and that his products do not correspond to these needs.

In these situations, the opportunity for concurrency is created for entering on the market and if offering products and services that have to satisfy better these needs, the company in discussion meeting hardness more and more bigger simultaneous with the products.

Satisfying the customers – element of competitiveness and performance

The satisfaction is the result felt by a buyer after his relationship with a company, whose performances reached to his expectations level. The satisfied customers remain loyal for long time, buy in great quantities, are less influenced of price and present to other persons the company within a favorable light.

It is considered, as was previously mentioned, that it is more exhausting to attract new buyers than maintaining those existing. Satisfying the consumers has benefic effects both for these and for the supplier.

A satisfied *consumer*:

- will repeat the buying activity, thus transforming into customer;
- will transmit the after-buying feeling of satisfaction to others (friends, relatives, and colleagues), thus favorable lightening the offering company;
- the self trust will increase, as concerns the good choice;
- gives a less attention to concurrent products and of their advertising.

For the *supplier*, satisfying the consumer will have as effects:

- owing and transforming this into customer;
- creating a favorable image and of notoriety, of market prestige;
- increasing the sales volume (and implicitly of profit) by enlarging the market (buyers), as result of promotional activities accomplished by the satisfied consumer;
- efficient using of human, material and financial resources.

Many products appeared in the market as simple effect of company's attention towards satisfying the customers' needs; that is why, adapting the offer to customers' particularities (and even to their simple manipulation). Certain producers make mistakes on giving more attention to material goods instead of services offered by these. That is why, they consider selling a simple product and not of offering solution for a certain need.

Understanding and satisfying the customer, together with the continuous improvement of internal processes offer the key of success for reaching the financial result: increase of income and reducing the internal costs.

If finally, the satisfaction of those involved is accomplished, from among if course, the customer, as well as company's wellness, the organization will have a great chance of long time success.

A quality management system that is introduced for the first guarantee of the conformity should lead on continuous improving and finally, to a system able to allow the existence of a product and/or service in progress, thus anticipating the future directions.

This will lead on small and stable results (conformity), by progressive and continuous results (development) to significant and long term results (anticipation and excellence in business).

Conclusions

The costumer relationship management (concept consecrated in specialty literature and practice of business under name of CRM - Customer Relationship Management) is a philosophy of business which describes a strategy that places the customer in centre of process, activities and cultures of an organization, basing upon creating and developing certain personalized relationships with these, in the view of growing the profitableness.

Once the market is consolidated, and the suppliers become more efficient on offering the service or products, the rival offers become more and more difficult on differentiating. In the same time, once the quality of services and of products is improved, the expectations and pretences of customers grow. For as long as the customer has the possibility of changing his suppliers, it becomes more and more difficult for a company to keep his loyalty. As result, it is very important for a modern company to have a system by which the time of reaction has to be shortening as regards the customers' requirements, thus offering

support and quality to the offered services, and especially to identify needs of these, about whom not even they have knowledge about.

It was proved that maintaining the old customer costs about 5 up to 10 times less than achieving a new one. Here can be mentioned the old rule of Pareto 80/20, in accordance to which 20% of customers bring 80% of the sales. That is why, while companies extend their customers data basis, they do not have to loose attention over the maintenance and adding of best of them. The growth of "customer's action" – in other words, the business quantity that each customer offers = becomes as much important as growing the market action. By means of well relationship management with a good customer can increase the profitability, and this is essentially the *Customer Relationship Management*

As conclusion, it can be said that not only life duration of a customer is important, but also the profit generated by the customers is that bringing value on long term to the company.

Most strategies stumble in the implementation phase. This paper outlines the ways for optimizing implementation. This implementation process focuses on the critical timeframe immediately following formal strategy selection, when broad objectives need to be translated into specific actions, schedules, budgets, and metrics. Often strategy development receives significant attention and resources, but its implementation is often neglected, with disastrous consequences. Using a straightforward approach, format and process, managers can bridge the gap between rhetoric and reality; they can succeed in accomplishing what they set out to do, thinking and acting strategically. Implementation lies at the core of strategy, and deserves as much attention as the formulation of the strategy.

Key words: strategy, telecommunication, providers

1. Introduction

For all the energy and resources invested in the pursuit of the perfect strategy, it's surprising to consider how little effort is directed towards implementation. Most strategies stumble in the implementation phase, regardless of their merit. Managing the process of implementation is often more difficult than coming up with the strategy in the first place – but ideas that cannot be translated into action serve little purpose (Michael Allio, 2005). Much literature is devoted to the study of the content and/or ex ante process of strategy formulation; much less literature focuses on the ins and outs of the ex post implementation of the selected strategies (Boone and van Olffen, 2001). The relative absence of implementation issues in the literature is not in balance with its importance for organizational performance in practice. It is widely accepted that several strategies may be viable in the same environment as long as managers are able to shape coherent configurations in which strategic choices, structures, systems and processes are carefully aligned (Miles and Snow, 1984; Snow and Hrebiniak, 1980). Strategy implementation skills are not easily mastered. In fact, virtually all managers find implementation the most difficult aspect of their jobs – more difficult than strategic analysis or strategy formulation. Managers themselves report that less than half the plans resulting from these efforts are ever implemented. Strategies that are not implemented constitute little more than academic exercises. The ability to implement strategies is one of the most valuable of all managerial skills. Managers intent on implementing strategy must (Miller, 1998):

1. master systems thinking to be able to coordinate a broad range of interconnected efforts aimed at transforming intentions into action, and
2. take care of the factors impeding strategy implementation.

Never is strategy implementation more important than when innovation is at the heart of a strategy. When it comes to innovation, execution is not about fulfilling the script. It is about constantly rewriting it. Innovation always involves treading into uncertain waters. And as uncertainty rises, the value of a well-thought-out, but static, enterprise strategy drops. In fact, when pursuing entirely new business models, no amount of research can resolve the critical unknowns. All that strategy can do is give you a good starting point. From there, you must experiment, learn, and adapt. (Govindarajan and Trimble, 2004). However, for a proven business, strategy implementation is about performing at or above known standards. For an

experimental business, strategy implementation is about zeroing in on the best possible strategy and in the process, discovering what standards are possible.

2. Guidelines and steps in strategy implementation

Can be identified five steps in strategy implementation programs. Figure 1 presents an overview of this steps (Michael Allio, 2005).

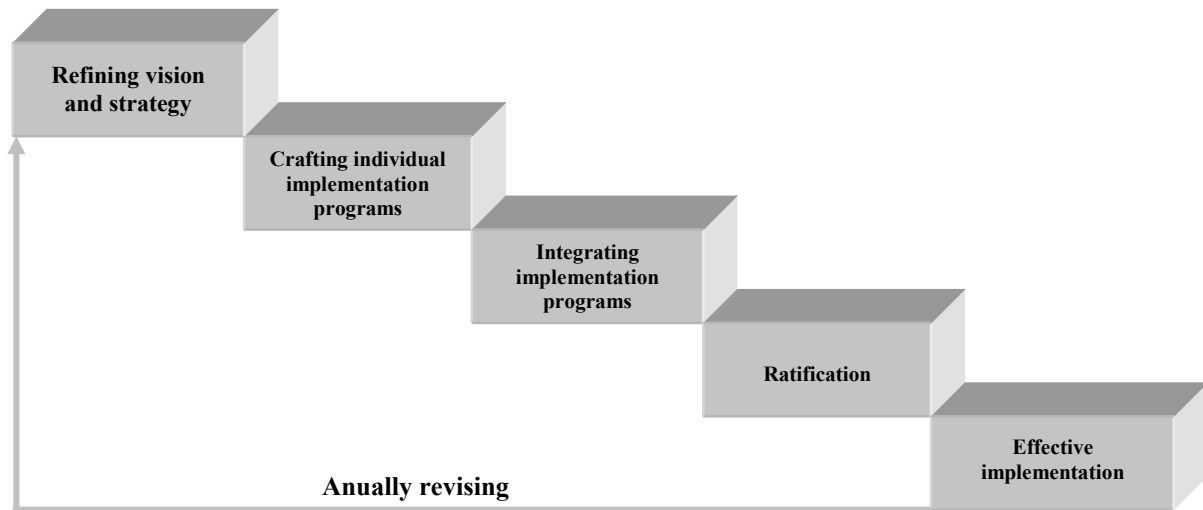

Figure 1 Implementation process

Source: Michael K. Allio, A short, practical guide to implementing strategy, Journal of Business Strategy, Volume 26 Number 4 2005 pp. 12-21.

Step 1: Refining vision and strategy

Good implementation starts with good strategic input. If we assume the management team has done a reasonable and thorough job formulating strategy, the critical output from the annual strategy session is a transcript capturing:

- a draft vision statement;
- a set of broad strategies;
- preliminary performance measures;
- preliminary resources required and expected results;
- critical issues; and
- the underlying (strategic) rationale for these decisions.

Step 2: Crafting individual implementation programs

Implementation only works when there's a clear and shared understanding of who does what, when, at what cost. Collaboration among strategy managers is critical, as they'll often be competing for the same resources (people, money, equipment); programs are often interdependent, and tradeoffs are to be expected.

Step 3: Integrating implementation programs

Once each strategy manager has fleshed out his or her respective programs, the strategy managers convene to compare notes. This critical juncture involves rolling up the programs, resources required, performance metrics, and issues, and assessing the overall shape of the sum: Is it all feasible? Can we afford it? Are we keeping our eyes on the original, strategic goals? Can the firm manage the timing or sequence of activities described? Typically, something has to give, and the strategy managers negotiate the tradeoffs. The fruits

of their efforts will be captured in a presentation by the entire strategy team to the board (or management decision-makers), described below.

Step 4: Ratifying the strategies and implementation programs

Management and board debate and ratify implementation programs. When ratified, the managers are ready to roll.

Step 5: Effective implementation

Immediately following the formal ratification of the firm's vision and set of strategies, effective implementation can begin in earnest. Perhaps the greatest challenge managers face when translating “strategy” into actions is communicating and monitoring implementation in terms that everyone can understand.

Follow-up were outlined eight practical guidelines for implementing strategy.

1. Simplicity

Implementation of even the most straightforward strategy tends to be a complex affair, requiring the intricate and dynamic interplay of people, resources, and market forces. Paradoxically, one of the most effective management tools is “simplicity” – the distillation of disparate elements into a single, coherent document and game plan.

2. Establishment of a common language

Different interpretations of the language used to describe strategy hopelessly confound implementation efforts. Before implementation starts, strategy managers should carefully define and review the key terms used to drive implementation to help ensure that everyone's singing from the same choir book:

- Strategy;
- Programs;
- Metrics;
- Milestones;
- Resources required;
- Critical issues.

3. Assessment the roles, the responsibilities and the timeframes

Implementation often calls for cross-functional support and collaboration. It's not unusual, therefore, to find the same program appear within several strategies, or to assign program managers from other functions or departments. Teamwork is the secret of successful implementation.

4. Balancing short term with longer term

Most managers associate their implementation aims with short-term targets; a natural tendency, as the future is fraught with uncertainty. Healthy implementation plans balance the short with the longer term, and strive to portray the full arc of the implementation process.

5. Accuracy

Imprecise language come over to implementation, confuses the rest of the team, and unnecessarily prolongs work sessions and documentation. It may also rob the management team of opportunities to springboard off each other's efforts.

6. Usage of a common format to enhance clarity and communication

Many managers opt to create their own summaries of programs, in formats they invent or import (often reflecting their comfort level with a particular software program, or preexisting data).

7. Regularly, structured and time-limited reunions

Implementation plans are destined to change: customer and competitor responses, technological advances, and resource allocation shifts will all impact the timing, and in some cases, the scope of implementation programs. Firms that establish a concrete framework for implementation, and empower managers to modulate in order to keep their teams on track, generate the best results. Good teams meet regularly, in well-structured, punctuated sessions, to share information and reconfirm priorities. A well-defined time limit encourages managers to prepare their presentations in advance.

8. Link up implementation activities with the firm's financial infrastructure: budget, metrics, rewards

It seems axiomatic that the actions and resources required to implement a strategy must be reflected in the firm's budget. Once strategy has been developed, high performing firms recalibrate their managerial systems to support, and encourage implementation. When the metrics used to judge a department or a manager are fine-tuned to track and reward strategic behavior, for example, implementation accelerates. Primary factors which impeding strategy implementations are (Miller, 1998):

- The organizational immune system. Strategy implementation is inextricably connected with organizational change. All organizations resist change and try to maintain the status quo, sometimes even if it yields unsatisfactory results.
- Numerous complex variables. To translate planned intervention activities into actions that bring desired organizational outcomes requires incorporating numerous variables: individual behavior, social factors, organizational arrangements, physical settings, and technology.
- The interconnectedness of elements affecting change. Changing one organizational element has a ripple effect that impacts other parts of your organization, which in turn have their own ripple effects, and so on.
- The need to change "Everything at once". Changing only one or two things seldom brings any significant overall organizational change. There are no "magic bullets" that would change entire organizations. To redirect your organization, you must address many overlapping and related issues, and the resulting impression of needing to change "everything at once" can be overwhelming.

3. Strategy implementation phases

Strategy implementation can be segment into three phases, as shown in Figure 5:

1. Ratification phase.
2. Middle phase of implementation.
3. Finale phase.

Figure 5 Implementation progress

In this trend senior management hopes for a smooth implementation trajectory (the “ideal” line), but progress usually tracks closer to the “reality” line. In the long slog of phase 2, surprises, setbacks, resource constraints, and an uneven tempo buffet implementation teams. With the right systems and scrutiny applied, phase 3 can represent a surge in performance and accomplishment.

Senior managers achieve better results when they manage their teams’ expectations and activities through each of these distinct phases.

Phase 1

The management team's (CEO's and middle management) present their consensus results (accomplished in two to six weeks) to the board or management decision-makers in meeting which it call the „ratification reunion”. The agenda for the meeting typically includes:

- revisiting the firm's vision, values, and conclusions regarding strategic context (as captured at the workshop, and probably revised during the intervening weeks);
- scrutinizing and constructively challenging strategy managers’ individual implementation plans;
- addressing individual and collective critical issues;
- highlighting overlaps or interdependencies among programs;
- rolling up the combined resources required, apportioning funds;
- approving/endorsing the plans; and
- outlining a communications program.

Once the firm's leaders have formally approved the implementation plans, they will:

- integrate the strategic plans into the budget;
- align managerial systems (including information systems, metrics, and rewards) to facilitate implementation; and
- communicate the completed strategic plan to stakeholders.

A concise and succinct presentation of the firm's new vision and strategies – and the process the firm will use to monitor implementation – are key signals to the rest of the stakeholders: handled improperly, they undermine both the process and the team's credibility; handled correctly, they clarify the firm's priorities, galvanize the team and help guide behavior throughout the organization.

Phase 2

Efforts to implement two- to three-year strategic plans typically flag after six months. Several original assumptions may have proven off-base, or competitive realities may have shifted since the beginning of the cycle; despite best efforts, programs, dates, and milestones will no longer be well-calibrated. It is essential at this point to revisit the original strategies and the programs developed and re-tune them. The term “living document” may have become clichéd, but the useful implementation plan is one that is updated easily and frequently to remain relevant. Formal quarterly meetings help the team compare notes, adjust priorities, and capitalize on from their experiences. An annual recap of status, progress, successes, obstacles, and responses to the challenges faced helps reinvigorate the team, and re-establishes the integrity of the programs and the process.

Phase 3

By the end of the implementation cycle, most teams have encountered significant unforeseen obstacles, and have prevailed against many. A rewards and compensation system that ties individual and group rewards specifically to success in implementation are, again, one excellent method for underscoring how valuable these contributions have been. Managers who have succeeded in implementing strategy need to be publicly recognized and rewarded. A formal review and presentation of overall implementation results, in advance of new assignments or initiatives, is also helpful, and can do wonders to encourage and reinforce staff morale, paving the way for future commitment.

4. The Key Strategies of the European Telecommunication Providers

The most important telecommunication European companies are: British Telecom, Deutsche Telekom, France Telecom, Telia Swedish, Ptt Holland, Teledanmark, Telecom Italy, Telefonica Spain, Magyar Telekom and Ote Greece. The liberalization and mobile development represented massive changes with a profound impact on the competitive environment reconfiguration on the Eastern - European markets together with the opening of the fixed phone markets competition and the development of the mobile services. On every market there are companies that try to gain on their side the clients of the fixed phone companies using a diversity of strategies. However, the users adopted with enthusiasm the mobile revolution in the region: the mobile phone possession reached the saturation point in countries such as Czech Republic, Hungary and Slovenia, the rest of the markets going fast towards this direction. Thus, the key strategies of the providers are: costs reduction, efficiency growths, traditional services protection and development of new sources of income. In the countries with worldwide developed economies, the telecommunication industry grew in 2003 with 10% compared to 2002. At the end of 2004, the industry knew a weak grow, the most of the most important players on the telecommunication market hardly regaining their financial stability.

4.1 Cost reduction

The providers take drastic measures, but adequate regarding the costs. Taken into consideration the diminishing incomes of the fixed lines, the only way to maintain the profitability is to reduce the costs, proportional to the incomes' reduction. The 2 key fields that they were focusing on were the reduction of the employees' number and capital expenses, these being the most controllable expenses.

The employees' salaries are, usually, some of the highest operational costs for the telecommunication providers, so it is not surprising that most of them continue to take radical measures linked to these costs. RomTelecom reduced with 12% the number of its employees, followed by Cesky Telecom with 10% reduction in 2003. But, not all the providers attended the same level in their efforts to reduce the employees. A way to evaluate their position is to report their employees' costs to incomes. Eesti Telecom didn't take the measure to reduce its employees because its employees' costs structure was already very good: its employees' costs represent only 11% from its incomes. Matav follows with 14% and Cesky Telecom with 15%.

The capital costs forms another relatively easy measure to reduce costs. For instance, Matav moves on the Internet the customer relationship service from the en detail stores, assuring the routine on line services such as order taking and defection reports. At its turn, TPSA (Polland) transforms the services operations for customers in a unified call center. This strategy was recently adopted by RomTelecom as the providers' representatives informed on the Communication Day (Romexpo, 21 April 2004).

4.2 Efficiency growth

The efficiency growth goes hand in hand with cost reduction for providers, whose main objective is to give up to the inefficient image of slow providers. They made progresses in this regard, even though in a slow rhythm. The national Eastern-European providers made progresses. The employees' reduction lead to a growth of the report of incomes per employee. Matav is the leader to this index with annual incomes per employee of 183 000 USD, followed by Cesky Telecom with 145-147 000 USD. However, RomTelecom has much work to do for the efficiency improvement: its incomes per employee were only of 30 000 USD in the first 9 months of 2003.

4.3 Traditional services protection

The majority of the national providers entirely changed their way to commercialize their voice services. A key change was the process to rebalance the access tariffs also to the local calls, which were traditionally priced under costs. However, the reduction of calls at distance (interurban and international calls) was due to the imminent competition. Moreover, some providers introduced a diversity of prices in view of protecting and developing fixed mobile incomes. Cesky Telecom introduced free minutes as part of the subscription, whereas TPSA offered a package with unlimited minutes (for a higher subscription fee). Matav introduced prepaid fixed charges to counteract the attraction of the prepaid mobile cards, with no success in preventing the fixed lines decline.

4.4 The development of new income sources

The national providers that have a contribution to the mobile development throughout their own mobile businesses compensate somehow the decline of the telephonic services. Cesky Telekom that operates on a Czech market, in which 89% of the population has a mobile phone, registered a decline. In exchange, TPSA managed to have a powerful growth of the mobile incomes on the Polish market, where the penetration reached only 42% in September 2003.

The Internet in large band is in its first phases of development in the Eastern Europe. The demand is still weak, despite a rapid growth in 2003 from a restraint group of users. The high prices of DSL (Digital Subscriber Line) combined with the low income of the population remain the main barriers in adopting DSL and other broadband services. As a consequence, DSL will be a solution for small and medium enterprises and affluent individual customers, on a medium term. Alike to the DSL services, the data mobile services have a cold welcome in Eastern Europe. Throughout the GPRS networks (General Packet Radio Services), almost all the providers offer a large range of advanced data services, such as MMS, mobile email and location based services. The main reason is that these services need expensive terminals, besides the fact that they are relatively expensive and this is not in accordance with the low income of the population.

4.5 Incomes

Besides the growth of the mobile services incomes, there are less ways to compensate the incomes in decline of the fixed telephony. The result is that only the providers that own growing mobile operations manage to obtain a growth of their total incomes. The others registered static or declining incomes due to the fact that the markets they operate on are filled (Cesky Telekom) or they have no direct interest in a mobile operation, besides the administration of a static or negative growth of the fixed lines. When the mobile markets will arrive to saturation and the fixed mobile competition will intensify, all the providers will face the same difficulties in the growth of incomes.

The first effects of the liberalization were felt by the companies in the field that confronted themselves with the provocation and opportunity to develop their businesses in totally new conditions. That's why, the main objective of the National Authority for the Regulation in Telecommunication (NART) was the creation of direct communication channels with the industry. The principles of this relationship were the transparency, the continuous informing and public consultancy. The liberalization led to benefits for all the users of the communication services, making possible the prices reduction, the offer diversification and the risen of services quality. The RomTelecom prices diminished with 63% in medium for the international calls in fixed networks and with 20% for the interdepartmental national calls in the network. However, the alternative suppliers and, especially, the ones that use the TV cable support, propose significant prices under those of Rom Telecom.

A diversification of the used technologies was registered. So, if the main network access mean was the traditional telephonic cable, after the 1 January 2003, new technologies were introduced within the entrance on the market of new suppliers: coaxial cable, radio support and optical fiber. The telecommunication industry came back to profitability, but the VoIP technology development will mix up the role and the business model of the traditional telecommunication companies, creating pressures for a new approaching modality for the industry regulation. Thus, in the Central and Eastern Europe, the importance and the market share owned by the VoIP services, compared to the fixed telephony, still remain modest. However, the disadvantages associated with the VoIP services' use, play an important role in the postponement of their mass adoption in this region. In the first 30 worldwide developed countries from the economical point of view, the telecommunication industry grew in 2003 with 10% compared to 2002. At the end of 2004, the industry knew a weak grow, the majority of the most important players on the telecommunication market hardly regaining their financial stability.

One of the main conclusions is that the higher popularity of the telephony throughout Internet and the VoIP services threaten the traditional fixed mobile providers' incomes, especially for the international calls. The fixed mobile providers have a more powerful competition from the part of some companies on one hand, but also from the adoption of the VoIP services by the alternative providers of other platforms, such as the TV cable networks and fixed wireless networks, on the other hand. Moreover, the VoIP services can present a competition even for the mobile telephony that currently owns much more subscribers than the fixed telephony in many countries.

5. Conclusion

A survey highlighted that less than 10% of strategies that are effectively formulated are effectively executed (Miller, 1998). Whilst formulating competitive strategy is very important and is the right thing to do, it does not guarantee success and results. Further, according to analysts, most companies spend close to 40% of their capital budgets on investments that are not aligned with corporate strategies, primarily due to a lack of clarity and visibility of strategic and investment goals.

Implementation lies at the core of strategy, and deserves as much attention as the formulation of strategy. If the process is healthy, after the first cycle, the methodology will be refined or customized to the firm's particular information systems and culture, and the improved tools (templates, language, meeting schedule, etc.) can be deployed throughout the organization. Strategy managers and the program managers they've tapped to help guide implementation, become versed in the language and process of strategy: they become ambassadors to the rest of the firm for thinking and acting strategically.

Résumé : Le milieu externe international de la compagnie de théâtre, le cadre économique du secteur théâtral de l'Europe des 27 pays et le comportement du consommateur de culture sont les principales préoccupations de notre recherche. Les multiples différences entre les systèmes de théâtre de chaque région européenne sont un sujet de grand intérêt dans la réalisation des stratégies et du futur « projet » de la compagnie théâtrale. La caractéristique commune, si on peut la nommer ainsi, c'est l'unité dans la diversité, chaque compagnie ayant un système unique d'activité concernant la création artistique. L'attraction du public vers le théâtre offre à celui-ci la purification et l'enthousiasme dont il a besoin dans la société contemporaine, dominée par la violence, les drogues, la vulgarité, les nouvelles incendiaires etc., en la conduisant sur le chemin de la normalité existentielle de l'être humain vers les valeurs morales et spirituelles naturelles.

Mots-clé: le management théâtral, compagnie de théâtre, culture.

Regard général sur la situation du théâtre européen

Le secteur culturel européen, si on peut le nommer ainsi, représente un mélange curieux entre les ressources économiques, qui répondent aux signes normales de la marche en extension, et celles de la créativité et de l'inspiration. ***Pas occasionnellement, le secteur au plus grand nombre de chômeurs est le théâtre, parce que les gens ne deviennent pas des acteurs pour gagner, mais pour la nécessité de s'exprimer. La culture suppose une aventure dangereuse. En Roumanie, la culture a réussi à résister à bureaucratie du régime communiste. Le secteur culturel n'est pas réglé par une législation européenne, ce qui affecte fortement son moyen d'affirmation. Chaque état membre ou candidat doit avoir la possibilité de s'exprimer en fonction de sa propre spécificité. Cela signifie en fait la richesse et la diversité culturelle que représente l'Europe. On ne peut pas parler d'une culture européenne, mais d'une culture française, espagnole, hongroise, roumaine, polonaise, plus exactement de cultures, car il faut penser aux particularités régionales. Dans l'Europe unie, la culture doit vivre et se développer [1].***

Les préoccupations des professionnels dans le domaine artistique, aussi des managers que des artistes, essaient à répondre à la diversité et à la multiplicité des relations créées dans l'espace européen. On se réfère souvent à l'unité dans la diversité comme une caractéristique de base de l'Europe élargie. Il n'est pas convenable d'aborder une analyse des programmes culturels européens, car ceux-ci sont beaucoup médiatisés et facile à consulter sur les multiples sites Internet qui les promeut. Il est clair que ceux-ci ont les grands mérites dans la promotion de la culture, car les cultures doivent devenir plus accessibles.

Le statut et la mobilité de l'artiste créateur dans une Europe unie doivent devenir une préoccupation de tous les militants de ce secteur économique. En même temps, celle-ci est le plus actuel thème de débat. Cette vaste union, où la flexibilité et la liberté du mouvement deviennent prioritaires, conduit vers la nécessité de la connaissance des systèmes de culture qu'ont les états membres. *Il est très important que cette liberté ne se limite pas seulement aux activités purement économiques. La dernière idée où je veux m'arrêter se réfère au fait que, souvent, la culture est entourée par un mûr protecteur, pour que d'autres cultures ne puissent pas y pénétrer. Dans la culture, comme dans la guerre, une politique défensive conduit à l'échec.*

[2] La culture est le titulaire de valeurs représentatives et identitaires. Je citerai dans ce sens Andrei Marga, qui, il y a 10 ans, à l'inauguration de la Faculté d'Etudes Européennes, a affirmé : « Bien sûr que nous sommes européens, mais pas seulement parce que nous habitons entre l'Atlantique et les Urales, mais en premier lieu parce que nous partageons des valeurs européennes, non parce que, évidemment, nous

consommons des valeurs européennes, mais parce que nous sommes capables de les utiliser et les intégrer, non parce que nous en tenons compte, mais parce que nous participons à leur multiplication”.

De moyen nécessaire, dans notre étude nous nous sommes posé le problème de la situation du théâtre en Europe afin de pouvoir identifier comment regardent les autres européens le théâtre et les activités des compagnies de théâtre indépendant. Ainsi, du point de vue des modèles d’organisation et des politiques de soutènement, on peut identifier une seule Europe avec 27 systèmes différents de théâtre. Si on commence seulement avec l’analyse des écoles d’enseignement artistique, on constatera les différences de structure organisatrice et de fonctionnement, mais aussi des différences significatives entre les méthodes et les concepts de pratique artistique.

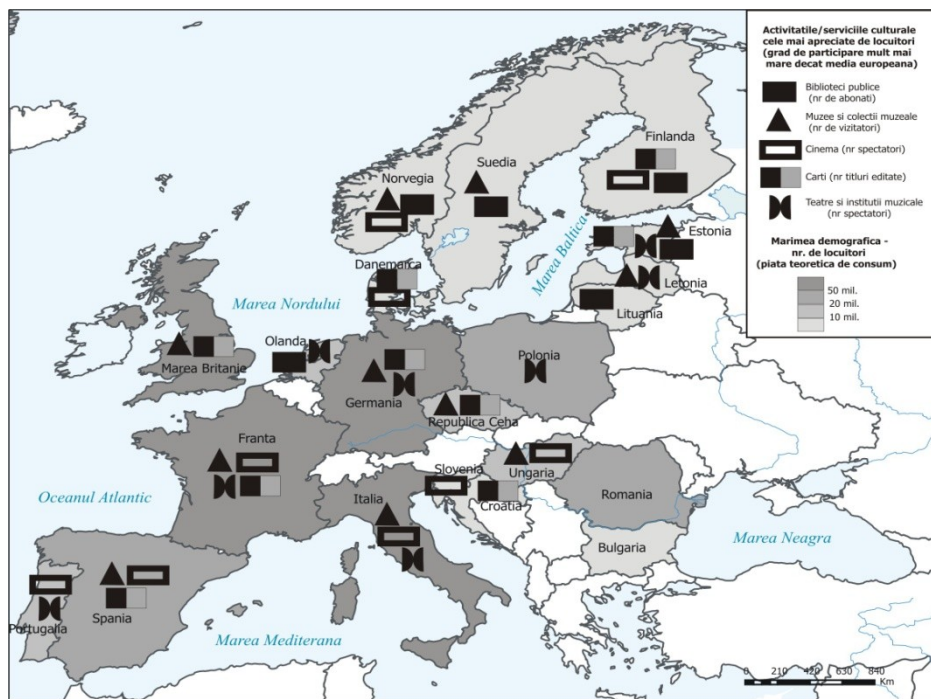

La vie artistique européenne, où on inclue implicitement son public aussi, est directement déterminée par l’existence des festivals, cela pouvant être considéré un indicateur concret des résultats des créations européennes. Ces manifestations jouent un rôle d’une grande importance pour le rapprochement, l’identification et le perfectionnement des professionnels de la vie artistique européenne (professionnels, amateurs et leur public spécifique). Les gens qui ont dédié leur vie à la scène, plus que jamais (acteurs, metteurs en scène, scénographes, décorateurs, costumiers, maîtres de lumières et du son, techniciens de scène etc.), sont de plus en plus tentés à exercer leur profession à l’étranger. La mobilité des artistes est dépassée par les directeurs de festivals et les critiques de spécialité, qui utilisent l’avantage de l’Europe unie pour circuler afin de « chasser » les œuvres les plus valeureuses et les faire connues au public européen.

Dans la même idée, *l’eupéanisation des professions de théâtre* commence du sommet de la pyramide des compétitions artistiques : si celle-ci s’ajoute à la valeur de la représentation, alors le champ de recrutement du personnel s’ouvre à l’international. Ce schéma souffre trop de cas particuliers et trop d’anomalies pour recevoir la forme d’une loi de mobilisation ou un cadre général d’ouverture. De nombreuses voies et réseaux culturels, ouverts aux artistes et au personnel du théâtre, la logique et les politiques nationales diverses conduisent à l’impossibilité de définir un système européen du théâtre et surtout lorsqu’il s’agit du management théâtral. Dans cette profession il y a moins d’exemples de mobilité volontaire et des cas rares d’implémentation réussite, d’un système de management théâtral, ayant en vue spécialement les facteurs externes du milieu de l’organisation, mais aussi les facteurs internes (qui tiennent plutôt de la culture de la compagnie, qui fonctionne comme *culture de clan*).

La prédisposition des habitants de certains pays européens pour certains segments de l’offre culturelle, telle qu’elle est suggérée par notre analyse, elle est rendue synthétiquement plus basse dans la page. Celle-ci est suivie d’une carte qui montre les goûts culturels dominants dans la plupart des pays européens, après quoi on a exposé plusieurs appréciations, observations et commentaires pour les principales activités/services culturels et leur moyen de réception/fréquentation dans les pays européens.

Il est suffisant de nous rappeler seulement des coutumes et des traditions populaires qui sont différents dans la même région, seulement à quelques kilomètres distance, sans rajouter encore la politique du financement de la culture si différente en fonction de la ville. La culture européenne est assez puissante pour pouvoir mener plus loin la tradition et pour s’ouvrir à l’innovation. Plus bas en page, il est réalisé un tableau avec les préférences culturelles dominantes dans certains pays européens. Pour les compagnies de théâtres roumains le milieu externe européen est généralement en ce qui regarde leurs activités, ainsi :

- a) La participation aux festivals internationales de théâtre dans : la Hollande, l’Angleterre, le Danemark, la France, l’Italie, la Portugal.
- b) Pour opéra et les autre institutions musicales, la participation aux manifestations internationales, plutôt avec du public très intéressé, dans : l’Estonie, la Lettonie, l’Italie, la Portugal, la Pologne.

Les préférences culturelles dominantes dans certains pays européens

Source: Centre des Etudes et Recherche dans le Domaine de la Culture

En ce qui concerne la collaboration internationale entre les artistes, il n'est pas suffisant d'utiliser seulement l'anglais, choisie d'entre 3 ou 4 langues, pour que les artistes et les techniciens s'entendent... ils sont nécessaire en plus la connaissance et la maîtrise des éléments de droit, de comptabilité du pays respectif, connaissance de ses institutions, respectivement des procédures. Les fonctions relatives à la production et à la diffusion des spectacles sont moins soumis aux contraintes imposées à un marché mondial, comme la quasi-totalité des branches économiques aussi, comme celles d'un milieu influencé par l'exercice du pouvoir public. Ainsi dit, les considérants et les instruments des politiques culturelles (nationales, régionales et locales) appuient sur les mécanismes de la demande et de l'offre (à l'échelle planétaire ou continentale), et déterminent le type d'œuvre artistique, la carrière des artistes, comme la vie des compagnies de théâtre aussi.

Alors, la dominante du contexte social avec « la nation artistique » se manifeste même par la mesure des dépenses des fonds privés (sponsorisations et mécène), des compagnies indépendantes, dont les sommes et la réputation diffèrent visiblement d'un pays à un autre, grâce à la législation diverse qu'à la tradition contrastante aussi, ou à la politique de la région de laquelle appartient la compagnie.

Le comportement des citoyens des 27 pays varie visiblement en ce qui concerne *les activités de loisir*. En admettant qu'elles peuvent être mesurées à l'aide des indices comparables – la fréquence aux théâtres, aux salles de spectacle et concerts, aux spectacles boulevardiers etc. – elles évoluent encore plus en fonction des revenus de la population, comme en fonction des « désires » aussi, plus ou moins des « vices » de l'état et du lieu de la résidence et bien sûr en fonction de la profession et du niveau d'instruction de chacun.

L'introduction dans les traités de l'Europe, par la décision de la majorité qualifiée (refusée par la France et par ses partenaires), d'un principe commun, premièrement de la notion d'*exception* et puis de *diversité culturelle*, il sera donc insuffisant de préparer l'unification de l'*Europe du spectacle*. Ce fait demande un espace divisé en tant de compartiments que des professions impliquées par l'activité du théâtre. A l'intérieur de ces cadres, la singularité/l'unicité de chaque profession et l'originalité de chaque localité ou territoire, compose un paysage fulminant de détails. Pour les identifier il est nécessaire un travail de grande précision et extrêmement ponctuel en tenant compte que, parmi d'autres aspects, à chaque profession de théâtre on défend les droits par des associations ou syndicats spécifiques.

Pour réaliser ses projets communs, dans les pays européens sont apparus les premiers réseaux dans les deux dernières décennies. Les forums de discussions entre les programmeurs de spectacles, des clubs de

producteurs, des ligues des écoles de théâtre, des confédérations syndicales, des alliances entre des centres de ressources, des groupes de pression sur les instances communautaires, ces organisations ayant toutes les formes juridiques possibles.

De nombreuses organisations restent assez souples en dépit du succès de leur congrès annuel, initié par *Informal European Theatre Meeting*. D'autres adoptent des structures rigides comme *la Fondation Marcel Hicter* [4], qui a commencé des cours de formation de managers en art. Toutes ces organisations militent pour l'augmentation des budgets culturels européens, mais seulement une petite partie réussit à augmenter leurs ressources de fonctionnement durables. Mais la majorité vit des cotisations des membres ou des petites subventions nationales.

Exemple de deux structures théâtrales importantes qui réunissent de différentes compagnies aussi de l'espace communautaire que du dehors de celui-ci : *l'Union Théâtrale Européenne* (UTE) et *la Convention Théâtrale Européenne* (ETC). Celles-ci réunissent des théâtres importants des différents pays et représentent les principaux acteurs culturels qui militent pour les droits des gens de théâtre.

Les compagnies indépendantes en Europe – la situation actuelle

Dans l'ensemble du paysage théâtral européen, *Le théâtre de répertoire* représente un modèle dominant. Lancé dès le début du XIX^{ème} siècle à Moscou, par Stanislavski et Nemrovici Dancenko, en même temps que l'apparition du théâtre d'Art, « l'ensemble » ou la troupe permanente est aujourd'hui une forme d'organisation prédominante en Europe.

Ainsi, on peut encore identifier une série de points forts de ce système :

- La tradition de la troupe
- Prestige gagné en temps
- L'existence des subventions importantes
- Symbole d'une nation ou communauté
- Présentation d'un vaste répertoire
- Possède une forte identité esthétique
- Permet une pérennité relative des productions
- Facilite les relations de fidélité avec le public
- Offre la stabilité du travail aux employés sur des périodes moyennes et longues de temps

La transition politique dans l'Europe Centrale et de l'Est fournit une « occasion unique d'analyse des éléments de continuité et de discontinuité entre le monde fragile confidentiel de *l'art dissident* et le marché qui naît dans les sociétés postcommunistes ». [5]

En faite, si le spectacle est devenu selon la transition démocratique un véritable lieu de débat, il se confronte maintenant avec une augmentation des productions commerciales, mais aussi un évident désintérêt de la part du public. Cela ne signifie pas qu'il est devenu une culture d'opposition, mais il a seulement perdu son auréole de pertinence sociale. Sous le socialisme de l'état, l'existence ou non des compagnies indépendantes résistent en grande partie seulement grâce au degré de tolérance du régime : si les formes d'organisation théâtrale (qui ne se trouvaient sous la direction de l'état) étaient totalement réprimées en Roumanie ou en Tchéquie, les scènes alternatives étaient très développées en Pologne (Kantor, Grotowski) ou semi tolérées en Hongrie (Le Théâtre Kaposvár). Comme le critique polonais Piotr Gruszczynski soulignait « les années 1990 ont conquis effectivement avec l'effondrement du mouvement alternatif initial de Grotowski: ses résultats théâtrales en matière de jeu et dialogue avec le public dans les années '70 – '80 ne fonctionnent plus dans le nouveau contexte. » [6]

Parmi d'autres, les compagnies indépendantes en Europe Centrale et de l'Est on les retrouve fréquemment résultées des « Studios », annexes des théâtres ou des lieux moins « notables », préfigurant sans doute par cela une recrudescence d'intérêt pour les endroits intermédiaires, ces endroits de répétitions plus ou moins tolérés qui logent des collectifs artistiques. Depuis la transition démocratique, les plus importantes réformes dans le secteur du théâtre ont été, sans contester leur création, de véritables « open stages » dans quelques capitales centrales européennes : c'est le cas du Théâtre d'Archa, Prague, The Red House à Sofia, Trafô de Budapest ou MAD Center en Bucarest. Fonctionnant déjà comme un petit réseau, elles logent

des productions de l'Europe Occidentale, mais aussi des échanges est-est, mais qui souffrent à cause des rationnements financiers

Ces endroits restent les exceptions d'un large paysage culturel dominé par les théâtres de répertoire et les troupes permanentes, mais ils ont gagné en même temps une importante notoriété par leur rôle de « plateformes de productions », même s'ils étaient modestes pour les compagnies débutantes et indépendantes. Des réseaux européens et internationaux de diffusion, spécialement les festivals (Avignon, LIFT de Londres, Sophiensaele de Berlin, RomaEuropa, Passages de Nancy), dès leur création en 1998 de THEOREM, accorde une attention remarquable à ces nouveaux modèles de production, encourageant les possibilités de création, de production et de circulation des œuvres des artistes en Europe. La reconnaissance internationale des artistes (Hudi, Schilling, Warlikowski, Jarzyna, Ivan Staned, etc.) ne fait pas moins perméable la frontière entre le monde des « indépendants » et celle des structures institutionnelles, même si une petite passerelle entre les deux commence à être visibles. Par exemple, en Allemagne, des personnalités comme Sasha Walz ou Franck Castorf, sortis de la scène indépendante, ont pu accéder aux directions des théâtres institutionnels, même importants, mais ce phénomène ne s'est pas encore manifesté dans l'Europe Centrale. La compagnie Krétakör du metteur en scène hongrois Arpád Schilling attend depuis plus d'une dizaine d'années la possibilité de répéter dans un endroit fixe, et la compagnie fonctionne grâce aux tournois réalisés dans l'Europe Occidentale. Par exemple, ses coûts de fonctionnement ont été dans la saison théâtrale 2002-2003 supportés intégralement par la compagnie française MC93 Bobigny, un total de 4.000 € destiné au Fond Culturel Hongrois, ce qui a permis de couvrir à la limite les dépenses de location des salles de répétition.

Dans une étude réalisée par la Fondation Soros, la directrice artistique de la compagnie The Red House de Sofia, Dessy Gavrilova, insiste sur le fait que, si dans son pays un procès de réformes des structures a commencé effectivement en 1997, au sens de l'apparition de quelques endroits de diffusion et de production des spectacles, ceux-ci sont très peu pour les 50 compagnies qui étaient apparues dans les derniers 10 ans. [7] Conforme à la commission de statistique de l'Union Européenne - EUROSTAT, en 2007 dans les 27 pays européens un pourcentage de 28,8 % des employés du secteur culturel déroulaient leur activité comme indépendants. [8]

La fragilité des compagnies de danse contemporaine (dominée dans l'histoire des dernières années par une forte théâtralité) marquée par de nombreux problèmes socio-économiques a déterminé un véritable exil de certains chorégraphes, comme c'est le cas de Mihai Mihalcea, à Berlin ou celui de László Hundi à Paris. Evoquant une soirée de danse contemporain à l'Opéra Nationale de Talin, le critique estonien Tiit Tuumalu écrivait : « Cette soirée mémorable démontre [...] au spectateur moyen – et avec encore plus de conviction – qu'il y a très proche de lui un autre monde où on ne parle pas la langue des arabesques et ni la langue du « *pas de deux* », qu'on peut penser et comprendre la danse de plusieurs moyens [...]. La danse estonienne ne vit pas seulement parce que ses adeptes sont des fanatiques. Seulement deux opéras-ballets – l'Estonie et Vanemuine – reçoivent des subventions fixes. Par rapport à nos voisins finlandais ou suédois, notre gouvernement ne finance pas les compagnies de danse contemporaine, et les danseurs se trouvent dans une situation très précaire. »

Les festivals, fréquemment soutenus financièrement par les municipalités, ont un rôle majeure et déterminant dans la consolidation de ces réseaux d'artistes indépendants, et surtout dans leur ouverture vers l'international : Tanec Praha, Le Festival d'Automne de Budapest, Bratislava en Mouvement, le Festival de Théâtre de Nitra (Slovaquie), Baltoscadal de Rakvere (Estonie) ou le festival La Nouvelle Action Dramatique de Vilnius sont des événements indispensables à la circulation des compagnies théâtrales dans l'Europe élargie. Ces derniers exemples sont les seuls à la disposition d'un réseau et ils représentent des expériences propres qui garantissent le succès de leurs projets. Grâce à ceux-ci, les échanges internationaux gagnent en dynamisme.

LA LUTTE CONTRE LA DISCRIMINATION EN ROUMANIE DANS LE CONTEXTE EUROPÉEN (RESSOURCES HUMAINES)

Abstract: In the Romanian society, the fight against discrimination is both a necessity and a challenge. A necessity, because Romania committed itself on a way without compromises, that of building a real democratic society, a society in which the respect for the human rights and fundamental liberties is a reality and the european models and values are transposed on a social, legislative and administrative level. A challenge because this fight does not only mean the building of an integrated institutional legislative system, but also, in many cases, the chancing of the deep rooted mentalities.

Les mots-clé : les droits, la discrimination, l'égalité des chances, le cadre législatif.

La discrimination, concepts

La Convention internationale au sujet de l'élimination de toutes les formes de discrimination raciale, adoptée par l'ONU, en 1965, donne la définition la plus complète et la plus reconnue de la discrimination. Elle vise toute distinction, exclusion, restriction ou préférence, fondée sur la race, la couleur, l'ascendance ou l'origine nationale ou ethnique, qui a comme but ou effet de détruire, ou de compromettre la reconnaissance, le bénéfice ou l'exercice, dans des conditions d'égalité, des droits et des libertés fondamentales de l'homme, dans les domaines politique, économique, social, culturel ou dans tout autre domaine de la vie publique.

La doctrine spécialisée, mais aussi la législation en domaine, nous montre que la discrimination directe se produit au moment où une personne est traitée moins favorablement qu'une autre. Même si on pouvait la traiter d'une manière similaire. La discrimination indirecte se produit au moment où une prévision, un critère ou une pratique, en apparence neutres, désavantage certaines personnes appartenant à une minorité, excepté le cas où ces prévisions, critères ou pratiques sont justifiés objectivement par un but légitime, et les méthodes utilisés en vue d'atteindre ce but sont adéquates et nécessaires.

La notion de discrimination est ainsi liée au traitement accordé à une personne, par rapport à celui dont une autre ou d'autres personnes jouissent, elle étant le résultat d'une action ou non-action qui porte à une inégalité de traitement. Certainement, elle doit être une inégalité injustifiable, conformément à la loi, parce que, dans la vie quotidienne, il y a des choix, des sélections qui ne sont pas interdites, mais qui s'appuient sur des critères de compétence et de professionnalisme. Les actes de différenciation, actions ou non-actions, même s'ils peuvent être jugés injustes ou arbitraires, ne deviennent pas illégaux, sauf s'ils violent le droit d'une personne ou l'égalité en droits, par rapport à des autres personnes.

Les théories économiques de la discrimination

La théorie économique trouve son point de départ dans la vision de Becker, mais elle a été développée par Arrow. Ceux-ci considèrent que les gens manifestent certaines attitudes envers leurs collaborateurs, envers ceux qu'ils surveillent et envers ceux d'où ils achètent des biens et, de plus, ils demandent une compensation pour travailler avec les membres du groupe discriminé. Si tous les engagés et les employeurs manifestent la même attitude en ce qui concerne la discrimination, le groupe discriminé va recevoir des salaires moins consistants, pour compenser les discriminateurs. Conformément à l'opinion de Becker, il existe deux types de discrimination :

- la discrimination par „goût” ;

- la discrimination par intérêt.

La discrimination par „goût” a été mise en discussion d’abord par Becker, puis elle a été développée par Arrow, qui a analysé les effets économiques des attitudes discriminatoires.

La discrimination par „goût”, en cas des engagés, apparaît au moment où ceux-ci manifestent une certaine aversion vis-à-vis d’un groupe minoritaire, leur salaire étant moins consistant que la productivité du travail. Du point de vue du travailleur, ce type de discrimination apparaît lorsqu’un groupe majoritaire a une certaine aversion vis-à-vis d’un groupe minoritaire et, par conséquent, il sollicite des rétributions plus importantes pour pouvoir travailler ensemble.

La discrimination par intérêt peut être déterminée par les consommateurs, s’ils préfèrent un certain bien de certaines firmes. Si c’est le cas, ils paieront davantage pour qu’ils soient servis par le groupe en question. Ce type de discrimination se produit lorsqu’une firme ou un groupe de salariés manifeste une position dominante, qui empêche les autres à dérouler leur activité.

Si le coût pour certains groupes de travailleurs est surévalué ou si la productivité de leur travail est sous-évaluée dans le but de s’intégrer sur le marché du travail, ceux-ci devront offrir leurs services pour des rétributions moins considérables que les autres travailleurs, pour pouvoir compenser l’aversion des employés envers certains salariés.

Si c’est le cas d’une discrimination, le producteur peut réaliser un profit inférieur qu’en cas contraire, à force des coûts supplémentaires déterminés par la l’existence de la discrimination. Si la firme embauche des employés appartenant à ces deux groupes, dans le but de fidéliser les membres du groupe majoritaire, elle devra leur offrir des salaires plus consistants, en vue de les motiver. Cette „prime” est financée justement de la diminution des salaires des travailleurs appartenant au groupe minoritaire.

Au moment où les travailleurs sont embauchés, une firme n’aura jamais la possibilité de connaître le taux exact de productivité de ses futurs salariés. Pour pouvoir procéder à un choix, l’employeur est obligé à réaliser une appréciation de leur efficacité (individuelle), ayant comme point de départ un nombre réduit d’informations, comme par exemple : l’âge, l’éducation, la nationalité, le sexe, la race, l’expérience professionnelle, tous ces éléments étant corrélés d’une manière imparfaite au niveau de la productivité du travail.

La discrimination statistique est déterminée par cette imperfection de l’information et elle a été étudiée, pour la première fois, par Arrow et Phelps. Cela veut dire que, lorsque deux personnes ont un niveau de la productivité identique, mais elles appartiennent à des groupes divers, elles auront des trajectoires différentes.

Parmi les effets de la discrimination, on peut énumérer : l’existence de l’incertitude sur le marché du travail ; l’augmentation du coût, mais aussi de la durée de recherche, pour le groupe discriminé ; le coût d’opportunité est moins significatif pour le groupe minoritaire que pour le groupe majoritaire, car les bénéfices potentiels de ceux-ci sont inférieurs ; l’existence du chômage et des employés découragés (qui fait sentie sa présence à cause de l’augmentation des frais en vue de la recherche d’en emploi) ; l’échec du marché, parce qu’il génère des coûts moyens d’investissements supérieurs aux cas comportant une attitude égale.

Dans le modèle proposé par Arrow, les préférences discriminatoires des employés sont remplacées par les perceptions „de ceux-ci sur la réalité”. Le modèle proposé par cet auteur a à la base deux hypothèses : l’employeur ne dispose *a priori*, d’une information parfaite concernant la productivité des employés. L’employeur se confronte à deux types de travailleurs, dont une partie sont des personnes hautement qualifiées, pendant que les autres ne disposent de la même qualification. Arrow analyse le niveau de qualification d’un travailleur à base du résultat d’un test de vérification et il introduit la notion de conviction subjective en ce qui concerne la probabilité qu’un travailleur appartienne à un certain groupe.

Dans le modèle de Phelps, la différenciation salariale entre les deux groupes n’est pas en relation avec les goûts discriminatoires ou avec certains préjugés erronés des engagés, mais elle est en rapport avec la qualité de l’information (c’est-à-dire la fiabilité du test).

A cause du fait que des salaires différents sont accordés à divers groupes qui présentent des niveau de qualification (les connaissances acquises avant l’insertion sur le marché du travail) identiques, l’équilibre sur le marché du travail est considéré un équilibre discriminatoire, mais, sur un marché compétitif les discriminatoires seront éliminés par les non-discriminatoires.

La lutte contre la discrimination

Le cadre législatif

Le droit de tous les individus à l'égalité devant la loi et à la protection contre la discrimination est un droit fondamental et essentiel, pour le fonctionnement normal de la société démocratique. Cela contribue à l'accomplissement des objectifs de promotion du progrès économique et social, par le développement de la cohésion économique et sociale. L'Union Européenne soutient les droits fondamentaux, la non-discrimination et l'égalité des chances pour tous. Le Parlement Européen et le Conseil de l'Union Européenne ont déclaré l'année 2007 – l'Année Européenne de l'Egalité des Chances pour Tous, en vue de la participation en plénitude de chaque personne à la vie économique et sociale, sans exception.

Conformément à l'Eurobaromètre spécial du mois de janvier 2007, 64% des citoyens européens estiment que la discrimination fondée sur l'origine est la forme de discrimination la plus répandue en Europe. La plupart des Européens perçoit également les discriminations dues à l'handicap (53%) et à l'orientation sexuelle (50%) comme étant répandues. Les Européens sont partagés à propos de la discrimination du point de vue de la religion et des convictions. 44% la jugent répandue, et 47% la qualifient de rare.

Parmi les critères susceptibles de désavantager à l'emploi les personnes ayant les mêmes compétences professionnelles, les Européens citent d'abord "le look, la façon de s'habiller et se présenter" (51%), le handicap (49%) et l'âge du candidat (49%). L'origine constitue le quatrième critère le plus fréquemment évoqué (45%). 87% des Européens soutiennent l'adoption de mesures en faveur des handicapés afin d'assurer l'égalité des chances dans le domaine de l'emploi. 51% des citoyens européens estiment que "l'on ne fait pas suffisamment d'efforts" dans leur pays pour lutter contre les discriminations.

En 1997, réunis à Amsterdam, les chefs des Etats et des gouvernements, de tous les pays membres de l'Union Européenne, sont tombés d'accord à renforcer sa capacité d'action dans le domaine de la lutte contre la discrimination, par la présence de l'article 13 du Traité de constitution de la Communauté Européenne, qui accorde à celle-ci des attributions spécifiques d'action afin de combattre la discrimination sur des critères de sexe, origine, raciale ou ethnique, religion ou conviction, dis habilités, âge ou orientation sexuelle.

En juin et respectivement novembre 2000, à base des propositions de la Commission, le Conseil de l'Union Européenne a adopté trois instruments clef, voués à prévenir et à combattre la discrimination du point de vue de l'origine raciale ou ethnique, religion ou convictions, âge, dis habilités, sexe ou orientation sexuelle.

- La Directive du Conseil 2000/43/CE, concernant l'implémentation du principe du traitement égal entre les personnes, indépendamment de l'origine raciale ou ethnique (ou la Directive de l'Egalité Raciale) – celle-ci interdit la discrimination du point de vue de l'origine raciale ou ethnique, dans une multitude de domaines tels l'éducation, l'emploi, l'accès aux biens et aux services ou à la protection sociale.
- La Directive du Conseil 2000/78/CE, concernant la création d'un cadre général en faveur du traitement égal à l'égard de l'occupation de la force de travail et des conditions d'emploi (ou la Directive de l'Egalité dans l'Emploi) – celle-ci interdit la discrimination dans emploi et exclut toute discrimination sur des critères de religion ou convictions, âge, dis habilités, sexe ou orientation sexuelle.
- Le Programme Communautaire d'Action pour Combattre la Discrimination (La Décision du Conseil Européen no.750/2000) – ce programme est destiné à appuyer et à suppléer les efforts au niveau communautaire pour la promotion des mesures initiées par les Etats membres, mais aussi par les Etats candidats.

La Roumanie a été parmi les premiers Etats candidats ou en cours d'adhésion qui ont soutenu une législation spéciale anti-discriminatoire. D'ailleurs, en 2000, a été adoptée l'Ordonnance du Gouvernement no. 137, concernant la prévention et la sanction de toutes les formes de discrimination. Cet acte normatif a été modifié et complété à plusieurs reprises, jusqu'à un niveau de réglementation qui remplit, en grandes lignes, les demandes de la Commission Européenne, concernant l'alignement de la législation interne aux prévisions de l'acquis communautaire.

La loi touche quelques domaines généraux de mise en pratique :

- l'égalité dans l'activité économique, dans l'emploi et du point de vue professionnel ;

- l'accès aux services publics administratifs et juridiques, de santé, à d'autres services, biens et facilités ;
- l'accès à l'éducation ;
- la liberté de circulation, le droit au libre choix du domicile et l'accès aux endroits publics ;
- le droit à la dignité personnelle.

L'institution habilitée à assurer le respect du principe de l'égalité de traitement et de la non-discrimination est le Conseil National pour Combattre la Discrimination, qui fonctionne en tant qu'organisme de spécialité de l'administration publique centrale, ayant personnalité juridique, étant sous-ordonné au Gouvernement. Il a été créé en 2002, à base de l'Ordonnance du Gouvernement no. 137/2000, concernant la prévention et la sanction de toutes les formes de discrimination et il déroule son activité conformément à l'arrêté gouvernemental no. 1194/2001, qui concerne l'organisation et le fonctionnement du Conseil National pour Combattre la Discrimination, avec les modifications et les annexes ultérieures.

Les principales attributions du Conseil sont :

- l'investigation des faits de discrimination, à base des saisies et des auto-saisies ;
- la sanction des faits de discrimination ;
- la proposition et l'institution de mesures affirmatives pour la prévention des faits de discrimination ;
- la proposition de projets d'actes normatifs dans le domaine de la non-discrimination ;
- la notification des projets d'actes normatifs au sujet de l'exercice des droits et des libertés, dans des conditions d'égalité et de non-discrimination ;
- la collaboration avec des organisations non-gouvernementales, qui ont comme but la protection des droits de l'homme ;
- la collaboration avec des organisations similaires et avec des organisations non-gouvernementales du domaine des droits de l'homme, dans d'autres pays, mais aussi avec d'autres organisations internationales en matière.

Le Conseil fonctionne à la suite de l'accomplissement des engagements assumés par la Roumanie, pour transposer l'acquis communautaire dans le domaine de la non-discrimination et, conformément aux appréciations de la Commission Européenne, la Roumanie a été le premier des Etats candidats ou en cours d'adhésion qui gère un organisme pour la promotion de l'égalité, fonctionnel, tel que l'acquis prévoit.

L'amélioration du mécanisme national anti-discrimination

Pour remplir les engagements assumés dans le procès d'intégration européenne, en ce qui concerne l'existence d'un mécanisme efficace anti-discrimination et pour l'alignement complet aux préventions de l'acquis communautaire en matière, le Conseil a initié un projet de loi dans le but de prévenir et de combattre la discrimination.

Par la promotion de ce projet on a eu en vue, principalement :

- La garantie de l'indépendance du CNCD et la clarification de ses attributions, par :
 - la réorganisation du CNCD et sa définition, en tant qu'institution autonome sous contrôle parlementaire, le garant de l'intérêt public et des personnes, dans le domaine du respect du principe de la non-discrimination ;
 - la modification de la composition du Collège directoire du CNCD, par l'augmentation du numéro des membres de 7 à 9 et l'introduction d'une nouvelle procédure de nomination – deux membres par le président de la Roumanie, le Sénat, la Chambre des Députés, le Gouvernement, respectivement un membre par les représentants de la société civile ;
 - la nette spécification du statut et des compétences des membres du Collège directoire ;
 - la création des bureaux régionaux du Conseil (au niveau de chaque département) ;
 - l'ajustement de la procédure légale appliquée par le Conseil avec les prévisions du Code de procédure civile ;
- Le recouvrement des défauts de réglementation existants dans la législation en vigueur

Le projet de loi introduisait des notions importantes, telles la discrimination multiple, l'instigation à la discrimination, les standards usuels dans l'emploi, l'inversement de la charge de la preuve. La Commission Européenne a attiré l'attention à plusieurs reprises, principalement sur la nécessité de sa réglementation. D'ailleurs, on a étendu l'aire des critères de discrimination, afin d'éloigner l'existence des cas en pratique non-recouverts, du point de vue de la réglementation.

- La nette spécification de certains termes ou notions

La signification des plus importantes notions est expressément définie au corps de la loi, afin d'éviter l'existence des confusions ou interprétations différentes.

Un mécanisme efficace contre la discrimination ne peut fonctionner sans avoir des structures implémentaires correspondantes. Dans cette direction, le Conseil a eu comme but la consolidation de sa capacité administrative par l'implémentation d'un projet de type twinning.

Le Projet intitulé „Construction institutionnelle dans le domaine de l'anti-discrimination” (RO/03/IB/SO/05), a été financé au cadre du programme Phare 2003 par la Commission Européenne. L'objectif général était le renforcement de la capacité opérationnelle du Conseil National pour Combattre la Discrimination (CNCD), ainsi que l'augmentation de l'impact de cette institution sur la société roumaine. Au cadre du projet, la Hollande a assisté au CNCD et à d'autres institutions et organisations de Roumanie dans le domaine de l'anti-discrimination.

Le projet, coordonné par le Ministère de la Justice hollandais, a impliqué des experts appartenant à plusieurs institutions et organisation de Hollande.

Le but du projet a été l'amélioration des ressources humaines, matérielles et juridiques du CNCD, ainsi que l'amélioration des politiques publiques, par l'implémentation des mesures suivantes :

- le renforcement des structures institutionnelles du CNCD et du réseau externe de partenaires, par l'amélioration du profil institutionnel du CNCD et la préparation du personnel de l'institution dans les domaines de la communication interne, de la culture organisationnelle et de la communication avec le public ;
- l'amélioration de la législation roumaine dans le domaine de anti-discrimination par l'évaluation de la législation en vigueur et l'élaboration de quelques propositions d'amélioration de la législation;
- l'amélioration des connaissances du personnel du CNCD et des représentants des autres institutions et organisations remarquables en matière et l'amélioration de leur coopération par la qualification du personnel dans le domaine de la législation nationale et internationale, des procédures légales, le développement des politiques publiques dans domaine de l'anti-discrimination ;
- l'information du public en ce qui concerne la problématique de l'anti-discrimination par le commandement et l'évaluation d'un sondage d'opinion à l'égard du degré de connaissance du phénomène de la discrimination et du CNCD rangé le public, par l'assistance accordée, afin d'aider au développement d'un plan de communication et par la préparation accordée en vue d'une meilleure communication avec les moyens d'information en masse. On a développé, implémenté et évalué une compagnie-pilot pour la conscientisation concernant la discrimination.

RATIONALIZING THE STRUCTURAL ORGANIZATION OF THE SALES ACTIVITY

Brutu Mădălina

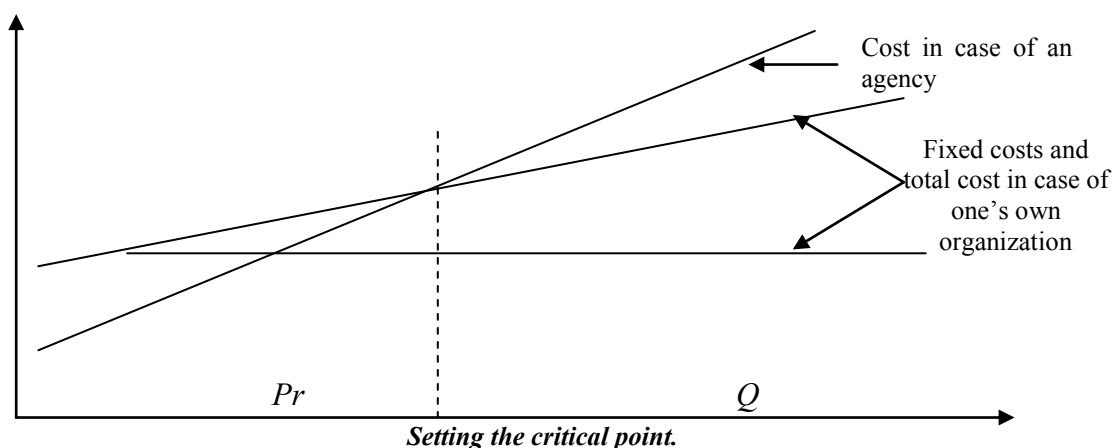

University of Pitești, Faculty of Economic Sciences, Pitești, Aleea Lacului, Str. Argedava, Nr. 3, Bl. A3, Ap20, madalinabrutu@yahoo.com, 0721242301

Summary: When we intend to improve the performances of the sales activity, rationalizing its structural organization can prove to be a successful solution. The work presents the possibilities for improving the structural organization, by analyzing two methods for dimensioning the sales personnel (The method of the sales potential and the Incremental Method) and by proposing a range of complex organization structures.

Key words: sale, structural organization, rationalization, the method of the sales potential, the incremental method.

The great dilemma of the sales activity consists in **choosing the services of certain sales agents exterior to the company or organizing one's own service**. Sometimes we can even reach a compromise between these two variants, by using a combination of them. Optimization between the two variants can be made by evaluating each form of action. Evaluation can rely upon economic factors as well as upon factors which are determined by the company strategy and by its control possibilities.

a) **Economic factors.** These factors can be found in the costs of sales involved by the two variants. Based on these costs we can apply the critical point method and according to it we can determine the activity volumes that are in favour of one variant or another:

The graph and the economic reality point out that in case of a small sales volume, one should appeal to sales agencies. The small sales volume and the low profit obtained from its valorisation would render inefficient the creation of one's own sales structure. As the sales volume increases, the efficiency of the organization of one's own sales structure also increases.

b) **Factors depending on strategies and control activity.** Agencies are not always able or do not wish to apply the company strategy in the sales field. These agencies are basically some companies that develop them too their own strategies. Although in practice the productive company strategy intersects with the sales agency strategy which obviously represents a significant disadvantage.

Concerning the control, the influence can be found especially in the possibility of a corrective action which can and must appear. As we know, the efficiency and effectiveness of the corrective actions is as high as the control is anticipative and reactive. In the case of sales agencies the reaction time is extended so the control is mainly based on effects and not on their anticipation.

Another improving possibility aims at the **correct dimensioning of the sales force**, as we know it is quite expensive. The specialty literature provides methods for dimensioning the personnel, methods which can prove their efficiency:

The method of the sales potential

Through this method we can carry out a sales forecast based on the management objectives and on the market share. Starting from the premise that all the sales agents accomplish the tasks mentioned in the job description, we can calculate the average level of individual productivity (by also taking into account the losses caused by holidays, approximately 10% each year). The formula for calculating the sales personnel dimensions is the following:

$$N = S/P + T(S/P) \text{ or: } N = S/P + (S)(T)/P$$

Which is equivalent to: $N = S/P (1+T)$, where: N – the number of sales agents; S – the sales forecast; P – the level of the individual productivity; T – the fluctuation of the sales personnel, in percentages. Supposing that $S = 20$ millions £, T is 10 %, and P is 500.000 £, dimensioning the sales personnel: $20/0,5 \times (1 + 0,10) = 40 \times 1,1 = 44$ people.

A minus of this method has in view the accuracy with which we can estimate each variable and especially P and T , under the conditions in which the necessary time for recruitment, the lost sales effect and the level of the estimated individual productivity are also variable. The method also supposes the presence on a relatively static market, the reality being often different.

The Incremental Method

In order to go beyond the deficiencies of the other methods we proposed this new method. The presented formula is an extreme simplification of the economic factors related to the sale. We start from the hypotheses that the product mix is uniform, and the external factors in each covered area can be correctly estimated before. The costs related to the selection, recruitment or dismissal of the sales agents can be seldom estimated in an exact manner, and the forms of promotion (such as advertisements) can have effects that vary from one potential client to another. The simple formula, based on the direct relation between the sales volume and the commercial activity of each sales agent, under the conditions in which the other factors are constant is not valid. The market dynamics (correlated with the economic increase and decrease patterns) distort the calculations concerning the efficiency of the sales agents from the point of view of the sales function reaction speed. The season, cyclic and competition fluctuations create a market uncertainty which leads to the risk of having an excessive sales personnel, a thing that may cause a deficiency from the point of view of costs. These problems can be worsened by hiring additional salesmen during the periods when the profit is positive. These aspects are formalized in the following manner:

$$S(P) - C > 0, \text{ where: } S - \text{sales volume; } P - \text{margin of profit resulting from sales; } C - \text{costs with the sales agencies.}$$

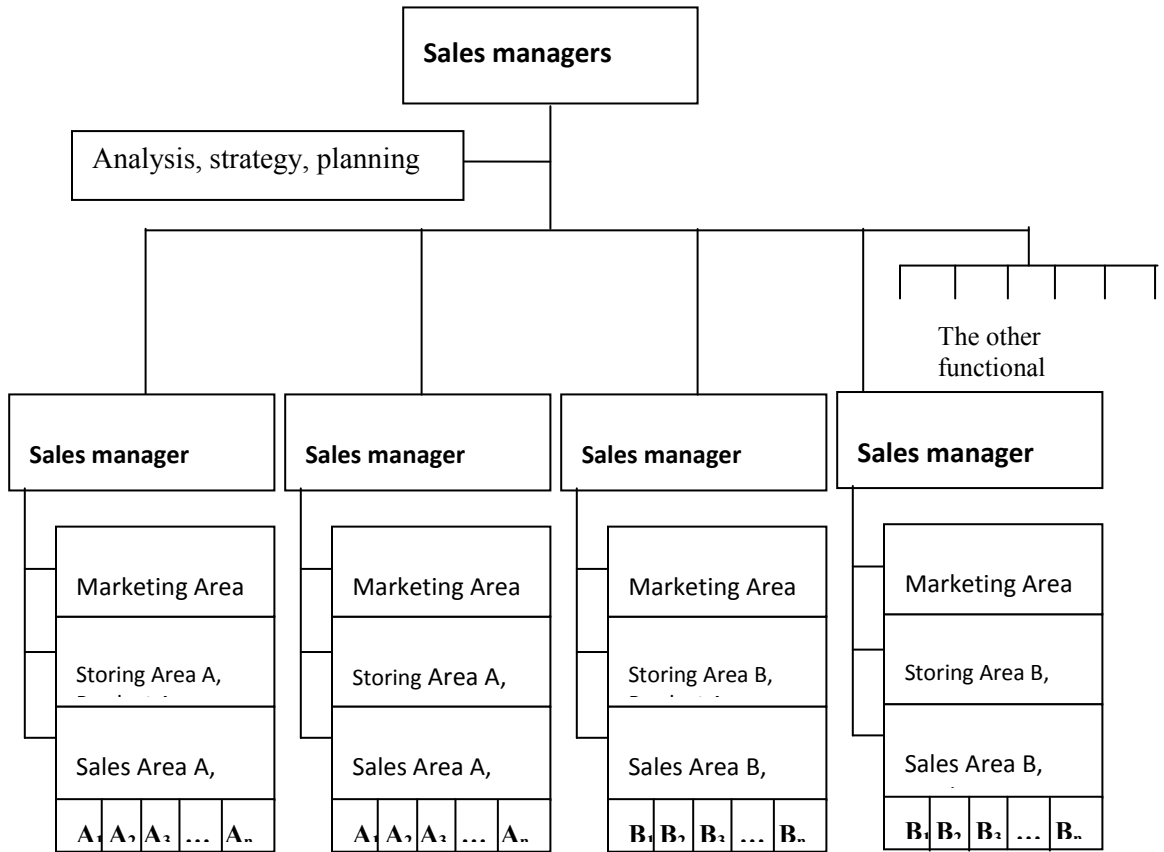

The major deficiency of this method consists in the fact that sales agents become sales dependant rather than sales creators. The formula also does not take into account the effects of the differences in point of capacity, knowledge, skills and aptitudes of the sales agents.

These two forms do not represent perfect methods for determining the size of the sales personnel and the dynamics of the marketing environment increase the complexity of this issue. The two methods, even if they are not perfect, can be adapted and improved in practice, according to the specific nature of each company and of the sales. **The specialty theory shall never provide miraculous solutions that can be used in all the cases, but solutions that must be adapted to each single case. The mastership of the Sales System consists in adapting the theoretical concepts to the own sales system (which is always an unique system) in a rational and competitive manner.**

Implementation must be accomplished after we decided which would be the role of personal sale within the marketing mix. The sales manager, if he wishes that the activity he coordinates is a successful one must take into account the necessity of choosing an efficient form of structural organization.

If the classical forms of the structural organization are not efficient for the activity that is performed, the sales manager can appeal to a combination of them which leads to the accomplishment of certain complex structures. Such a complex structure can be accomplished through the combination of the territorial one

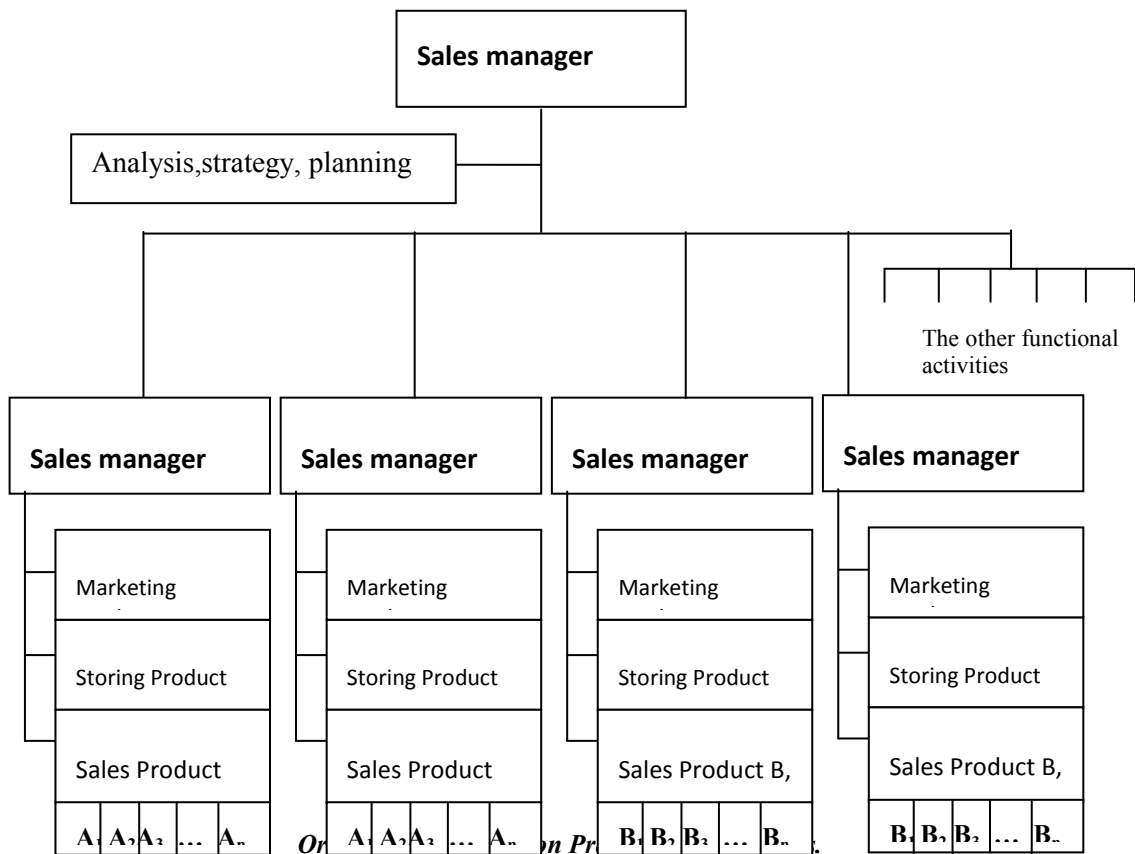

and on products. This form of organization is efficient when the company sells products of completely different categories in different areas.

Organization on areas and on products.

Obviously, this is an extreme example since certain activities such as marketing and storing can remain centralized or can be common within the area of all the products. Especially, it is rational that the storing activity remains common within an area.

The combination can also be performed inversely: on product and on areas; under these conditions the organizational chart would look like this:

Other combination possibilities aims at areas and clients, clients and areas or areas, Products and clients, according to the needs, opportunities and type of the sales activities.

As a conclusion, rationalizing the structural organization of the sales activity represents a n actual solution for improving the performances of the sales activity and of its management.

THE APPLICATION OF THE TOTAL PERFORMANCE SCORECARD (TPS) PROCESS IN THE SALES MANAGEMENT

Brutu Mădălina

University of Pitești, Faculty of Economic Sciences, Pitești, Aleea Lacului, Str. Argedava, Nr. 3, Bl. A3, Ap20, madalinabrutu@yahoo.com, 0721242301

Summary: Total Performance Scorecard represents a combination and also an extension of the concepts Balance Scorecard, Total Quality Management and Competences Management, being defined as a systematic process of continuous, gradual and routine improvement, development and learning, the process being focused on the solid increase of the personal and organizational performances. When we intend to improve the sales management, TPS can represent a feasible solution. This concept can be more successful than traditional ones (where improvement is often cosmetized), since real change and organizational improvement can be obtained if people change and improve themselves from the inside, this interior involvement being an integrant part of TPS whose purpose aims at maximum involvement and loyalty of all the involved persons, as well as encouraging individual learning, learning within a team and creativity.

Key words: Total Performance Scorecard, Personal Balanced Scorecard, Organizational Balanced Scorecard, Total Quality Management, Competences Management, Kolb learning cycle, Sales Management

Total Performance Scorecard (TPS) is a holistic management process of improvement and change; within this concept, improvement, development and learning are treated as cyclic and ethical processes through which the development of personal competence, of the organization as well as the internal implication are reciprocally consolidated.¹⁹ This concept represents a combination and also an extension of the concepts Balance Scorecard, Total Quality Management and Competences Management, being defined as a systematic process of continuous, gradual and routine improvement, development and learning, the process being focused on the solid increase of the personal and organizational performances.

The process consists of the following elements²⁰:

- **Personal Balanced Scorecard – PBSC** that involves mission and vision, objectives, performance indicators, targets and actions for personal improvement, including the continuous improvement of abilities and personal behaviour, concentrating on personal wealth and success in society. At a personal level, mission, vision and essential roles are named personal goal, and self-guidance, self-development and self-management are in the centre of PBSC, being addressed to all the employees of an organization (either if they are management staff or simple accomplishees).
- **Organizational Balanced Scorecard – OBSC.** This involves mission and vision, basic values, success critical factors, objectives, performance indicators, targets and actions for organizational improvement. Mission, vision and basic values are named here the common goal of the organization. The concept includes continuous improvement and the control of the functional processes within the organization, as well as the development of the strategies that focus on obtaining competitive objectives for the company. OBSC is communicated and transformed into scorecards within the departments/activity units, scorecards within the team and performance plans for the employee. In OBSC the stress is laid upon the strategy development and implementation.

¹⁹Rampersad H.K., Total Performance Scorecard: bases, Didactic and Pedagogic Publishing House, Bucharest, 2005, p. 17.

²⁰ Idem, p. 27 – 29.

- **Total Quality Management – TQM** is a disciplined way of functioning within an organization whose central pillar is continuous improvement. TQM lays the stress upon mobilizing the entire organization with the purpose of complying with the clients' needs. Here the accent is laid upon learning.
- **Competences Management** involves the continuous development process of the human potential within an organization, having as a purpose the continuous supply of top performances with motivated and developed personnel and focusing upon the employees' maximum development and on the optimum use of their potential with the purpose of fulfilling the goals of the organization. The process involves the development of the competences related to the job requirements. Information, abilities, experience, skills, standards, values and principles are focused on skilfully complying with the job requirements. The main part is here the development cycle which is made up of the following stages: *Results planning; Guidance (coaching); Evaluation and development of the competences related to the job requirements.*
- **Kolb learning cycle.** The process of instinctive learning or learning through experience is noticed in all the four management concepts mentioned hereinabove. These learning forms have as a result individual and collective behaviour changes. Kolb learning cycle has four stages and it is used for creating the necessary conditions for efficient organization change: *Gaining practical experience; Noticing this experience, analyzing it and afterwards evaluating the experience; Drawing conclusions from this experience and transforming the perceptions into rules, concepts, hypotheses, models and theories with the purpose of learning to draw conclusions from similar experiences and Testing these ideas through experiments, out of which new behaviours and experiences will come out.*

After the planning of the above steps, the cycle is resumed.

Elaborated at the beginning of the 90's²¹ by Robert Kaplan and David Norton, TPS provides a method for maintaining equilibrium between the financial and non financial indicators and for making the connection between the strategic and operational management.

When we intend to improve the sales management, TPS can represent a feasible solution. In this case the **Organizational Scorecard Balance** transforms itself into the **Sales System Scorecard Balance**, and this includes: mission, vision, critical success factors, objectives, performance indicators, the improvement targets and actions within the sales system. In this sense, the concept would include continuous improvement and functional processes control within the *Sales System* as well as the development of certain strategies that focus on obtaining the competitive advantages of the sales activity.

For example, for the „clients" section, the **Balanced Scorecard** of a company in the wood processing industry will look like the one below:

Critical success factors	Strategic objectives	Performance indicators	Targets	Improvement actions
- The dominant share on the global market	- Bigger market share	- Market share	- 10% increase during 10 years	- Extending the company activity in other areas
				- Developing objectives-oriented marketing programs
				- Developing a direct marketing plan
				- Communication with the clients using E – business tools

²¹Rampersad H.K., quoted work, p. 30.

	- A more profound knowledge of the global market concerning the wood products demand	- Potential incomes	- 20% increase during 5 years	- Elaborating a market survey for the markets aimed at - Creating a data base that includes the characteristics of the potential clients
- The clients' first choice for furniture	- Improving the clients' satisfaction level concerning wood products, services and employees	- The number of surveys concerning the clients' satisfaction	- At least 10 per year	- Periodically carrying out surveys among the clients - Remarks concerning the clients' purchasing habits
		- The clients' satisfaction level	- At least 75% in 3 years	- Creating assistance centres for the clients - Developing guides for the clients' optimal satisfaction
- High quality wood products and additional services	- Clients' high level of satisfaction and trust for the provided wood products and additional services	- Number of complaints from the clients	- Decreases with at least 30% per year	- Providing additional bonuses to client-oriented employees
		- Clients' loyalty level	- Increase of 30% in 4 years	- Elaborating a procedure for solving the clients' complaints and permanently executing it - Measuring the clients' loyalty level
- Image	- Improving the level of the company knowledge by the	- The knowledge level – as a company that provides high quality products and services	- Increases with at least 70% in 4 years	- Benchmarking concerning the clients loyalty - Carrying out image surveys

***The Balanced Scorecard of a wood processing industry company,
for the section „CLIENTS”***

(Source: Rampersad H.K., **quoted work**, p. 105 – 106 + the **author's opinion**.)

- **Personal Balanced Scorecard (Personal Balanced Scorecard – PBSC)** shall include the same elements for the sales personnel, either they are chiefs or simple executives. An example of Personal Balanced Scorecard, for a sales manager ad interim is the following:

Critical success factors	Personal objectives	Personal performance indicators	Personal targets
<i>FINANCIAL</i>			
- Financial health	- More incomes	- Salary increase	- At least 5% per year

	- Safer incomes	- Labour agreement	- From a temporary labour agreement (as manager ad interim) to a permanent labour agreement (on an undetermined period) during 2 years
		- Pension	- 13% of the gross salary
		- Insurance	- 5% of the gross salary
	- Expenses control	- Percentage of the income destined to expenses	- To increase with at least 5% in two years

EXTERNAL

- To be appreciated by family, friends, colleagues and employer	- To be appreciated by the life partner	- The number of times you went out together in a nice place	- At least once a week
	- To be appreciated by one's own children	- To be sympathized by one's own children	- Every time there is an opportunity for this
	- To be appreciated by friends	- The number of true friends	- Increases according to the circumstances
- To provide high quality work	- To be appreciated by the employer	- Level of the received reward	- Increases with at least 5% per year
	- The employees' improved satisfaction level	- The employees' satisfaction level	- At least 80% in 1,5 years
	- Higher amount of trust from the employer in carrying out my work	- The employer's satisfaction level	- At least 80% in 1,5 years

Critical success factors	Personal objectives	Personal performance indicators	Personal targets
INTERNAL			
- To fight for physical and psychial health	- To be physically and psychically in good health	- The percentage of sick leave	- Less than 2% in 1 year
		- The pressure level	- Decreases with at least 50% in 2 years
		- The immunity level under stress conditions	- Decreases with at least 50% in 2 years
	- More spare time	- The number of paid holiday days per year	- At least 17

	- To enjoy good thinks in life	- Pleasure	- Must be determined
KNOWLEDGE AND LEARNING			
- To have initiative, to learn from one's own mistakes, to improve myself and to develop myself continuously	- Increased work productivity	- Work productivity	- Increases with at least 25% in 2 years
	- Improved management competences	- Number of efficient initiatives	- Increases with at least 30% per year
- To learn every day	- Self-improvement opportunity in the management field	- Number of success strategic success improvements proposals	- Increases with at least 30% per year
		- The percentage of available management competences	- 85% in 2 years
	- Leadership abilities improvement	- The number of attended management courses	- 3 courses per year
		- The number of read new management books	- At least 10 courses per year
		- The percentage of employees that feel they work under an efficient leadership	- 85% in 2 years

***Personal Balanced Scorecard of a sales manager ad interim in the wood processing industry
(Source: Rampersad H.K., quoted work, p. 70 – 72 + the author's opinion.)***

- **Total Quality Management – TQM** shall aim at the disciplinary functioning within the *Sales Management* having as a main pillar continuous improvement.
- **Competences Management** shall aim at the continuous human potential development process within the *Sales System*, with the purpose of providing top performances with motivated and developed personnel. The process shall involve the development of the competences related to the job requirements within the *Sales System*, and the information, abilities, experience, skills, standards, values and principles shall be concentrated upon skilfully complying with the job requirements.
- **The Kolb learning cycle** shall include four stages and shall be used for creating the necessary conditions for the efficient change in the *Sales System* in the wood processing companies.

Obviously the **Total Performance of the Sales System Scorecard** depends on the organization TPS, mutually influencing each other.

The process starts from the entire organization and develops itself towards each department, team or employee so that the sales management improvement and change occur in the context of the general management change and improvement in wood processing companies.

Here is how TPS can represent another real possibility for improving the sales management in wood processing companies, this being a systemic process of continuous, gradual and routine improvement, development and learning. This concept can be more successful than traditional ones

(where improvement is often cosmetized), since real change and organizational improvement can be obtained if people change and improve themselves from the inside, this interior involvement being an integrant part of TPS whose purpose aims at maximum involvement and loyalty of all the involved persons, as well as encouraging individual learning, learning within a team and creativity. The main argument brought to this theory is that, if an employee's personal goal corresponds to the organization purpose, then he will think and work in the direction of reaching the company's shared purpose.

INNOVATION - THE CHARACTERISTIC TOOL OF ENTREPRENEURS

Bucurean Mirela

University of Oradea, Faculty of Economics, No.1, University str., e-mail: mbucurean@uoradea.ro, tel.:0259408796

Abstract: The entrepreneur's actual innovation and innovative spirit are of great importance. Many entrepreneurs are very capable and obtain expected results in production or product opening, but very few know how to sustain a creative innovative activity or to stimulate the creativity and innovative spirit of the staff he is working with in research. The implications are the more obvious if we consider the fact that the force of modern development consists in the capacity of inventing and then in the capacity of creating new products based on innovations. To be able to adapt to these imperatives, the entrepreneur needs to embrace the new and challenge it.

Key words: innovation, creativity, entrepreneur, challenge

The entrepreneur is defined as being the one who “creates something new, something different”, the one who “changes or transforms values”. Specialists in economy also use the term entrepreneur with the meaning of enterprising person. An entrepreneur's work is based on a complex of theoretical knowledge and practical skills. Through all these, the entrepreneur has the possibility to understand the theoretical bases of the entrepreneurial activity, to collect a fund of expertise documentation, to outline standards regarding performances, conduit and ethic criteria. Intelligence, energy, far-sightedness, decision-making, capability and initiative emotional balance, intellectual flexibility, intuition, passion for working with employees, receptivity towards technical and social progress, honesty, good intentions, integrity and justice are among the most important features of entrepreneurs. An enterprising person is somebody who starts his own business, who organizes, leads and assumes responsibility for any possible risks encountered along the way. Some specialists in economy also sustain that an enterprising person can create an economical activity “out of nothing”.

The experts divide an entrepreneur's assets into several categories. One of the categories is created on the basis of individual talents, entrepreneurial knowledge and entrepreneurial expertise, and characteristic features, while the other is created on the basis of the actual content of the activities, expertise and experience and talent in working with human beings. In certain situations when an entrepreneur has to possess other features too:

- tolerance,
- the will to listen to others,
- quick evaluation,
- recognition of the good side of things and employees.

The following features are also vital:

- intellectual capacity,
- intellectual efficiency,
- enthusiasm,
- power to express your thoughts and opinions.

Psycho-socio-professional requirements of the entrepreneurial activities necessitate for the entrepreneur to have additional characteristics besides the ones presented above. These characteristics are in close correlation with:

- creativity,
- imagination,
- temper,

- character.

The entrepreneur has to respect a sum of basic principles, besides those mentioned above:

1. The limitation of founder members or partners strictly to those who are really interested in investing and are aware of the risks involved.
2. The clear delimitation and specification of the business background, of its activity and of the company's goals, in precise terms which have to also refer to the type and size of necessary acquisitions, to the way of their concretization, to the reasons of a certain acquisition.
3. The concentration of all available resources of the company towards realizing two or at most three highly important specific operational objectives, specifying at the same time the necessary period of time in which they will be achieved.
4. The existence of a written plan of action which must define the tasks, responsibilities and authority of every person in the company.
5. The strategic employment in key positions of successful people in their field of activity to carry on the company's essential achievements according to its value scale.
6. The rewarding of individual performances which exceed the standard requirements in order to assure the necessary motivation and professional competition, succeeding in increasing the activities efficiency.
7. The realization of methodical expenses, taking into consideration the ratatability and the favorable balance.
8. The planning, controlling and maintaining, of the business's cash flow, in order to ensure- in a sufficient amount the necessary liquidities that will create the company's credibility in front of the creditors and business partners.
9. Permanently keeping an enlarged image, as objective as possible, over the parameters and terms of the activity's development and at the same time over the business's perspectives.
10. Having a permanent preoccupation regarding the anticipation of possible changes so that the business plan can adjust to their content and to the market's realities.
11. Focusing the management activity on objectives, on innovation and on materializing opportunities.

Creativity is one of man's superior aptitudes, one of the psyche's processes that helps identify new, original possibilities of combining heterogeneous, more or less related elements, consisting in knowledge accumulated through study or experience, combining which represents a scientific, technical or artistic creation that forms a material or spiritual asset that turns out useful for society for a certain period.

Most economists claim that the creational process has four stages:

1. Preparation -the stage in which the creator receives and memorizes diverse information, after which he distances himself from the problem that is preoccupying him-
2. Incubation -prepared by the distancing from the problem, it consists in its projection from the conscious to the preconscious where the combining activity, which unleashes the attention, permitting it to gather new information which becomes supplementary reference elements for new associations with the projected problem in the preconscious-
3. Illumination -the stage that can occur anywhere and anytime, in which the combining of distanced elements, which is mostly instantaneous, in a new way, is accomplished as well as the projection of the combination in the conscious field-
4. Realization -the stage in which the creator returns to reality, resorts to logic and concrete means of communicating the result of his creation and verifying its validity-

The creativity requires native abilities:

- superior intelligence,
- intuition,
- a rich imagination

which appropriately cultivated and developed amplify one's creative capacity.

Innovation is the characteristic tool of entrepreneurs; it is the means through which they exploit change as a possibility to accomplish different businesses or services. It is necessary for entrepreneurs to consistently search for innovation sources, their changes and symptoms, which indicate the possibilities of realization of successful innovations. Nowadays, because of acerb competition, entrepreneurs have to practice systematic innovation. Change is the one who is always offering opportunities to create something new, something different. Systematic innovation therefore consists in the organized, purposed search for change and in the systematic analysis of the opportunities that these changes provide for economical or social innovation. Systematic innovation represents the identification of the seven sources or factors that favor innovation:

- The first four sources are located in the interior of the enterprise .They are mainly symptoms, but they are also very secure change indicators of the changes that have already taken place or that can be easily accomplished:
 - The unpredictable: unexpected success, unexpected failure, the unexpected exterior event;
 - The discrepancy between the actual reality and the way it is thought to be or the way it 'should be';
 - Innovation based on operational necessities;
 - Changes in the structure of the industry or market that surprise everyone;
- The second group of innovation sources implicate changes outside the enterprise or branch of activity:
 - The demographic phenomenon (changes in the structure of the population);
 - Changes of perception, disposition and signification;
 - New knowledge, both scientific and unscientific;

The seven sources claim a separate analysis because each of them has its own characteristics. But neither of them is more important or productive than the other. However, the order in which they will be analyzed differs, as they are presented in the descendant order of credibility and possibility of being anticipated.

Some specialists consider innovation a process that attempts 'to couple' imaginative people's ideas with current realities in science, technology and market –it represents a continuous creative flow, which begins from the initial idea and moves through the stages of the research-development activity, as it is oriented towards finding the best solutions of harmonizing the different factors' requests and incidents, appropriate solutions during a certain period and, therefore, changing.

The indispensable conditions for accomplishing a successful innovation are:

- the existence of a clear strategy, of perspective, regarding the orientation of the creative potential, the innovating efforts and their stimulation;
- the setting for limited periods of precise objectives to which all innovating efforts should be devoted;
- the availability of all necessary resources for the innovation effort;
- the thorough knowledge of market request, the anticipation of future requests;
- the harmonization of technical solutions with commercial ones, the adopting of selection and evaluation of innovation projects criteria so that the necessary harmonization is assured;
- the maintenance of a close contact with beneficiaries, the thorough acknowledgement of their needs;
- the realistic evaluation of one's own innovation potential;
- the profound integration in the scientific and technical activity, both nationally and internationally;
- the existence of a scientific and technical personality leading the innovating organization, capable to polarize, to guide and use to the full all creative energies through formal and professional authority, through experience and energy.

Innovation at enterprise level is conditioned by a series of specific factors, both to the enterprise as an institution, as well as to the people, as they are: the coherency of strategy, the clarity of the objectives, a sufficiently high enough financing degree and a proper management of the innovating activity, the existence of complete teams, capable of solving complex problems which may appear during the development of the project, the existence of clear results' and people's work evaluation, the existence of a competitive climate, both inside and outside the enterprise.

In order to stimulate creativity and innovation, the entrepreneur can appeal to four modalities:

1. the organizing of the creative and innovating week, that reunites the ones who take on the problem to reflect on present and future aspects and outline the concrete measures that will be presented to the manager;
2. the construction of a special team, reunited only when needed to use their ideas and intelligence in order to stimulate creativity in the unit;
3. the constitution of a permanent creativity department, whose leader receives, regroups, sorts out and processes new ideas;
4. the selection of a permanent creation group that reunites once a week and to who all problems are revealed;

The innovation is a necessary ingredient for stimulating growth. To achieve successful economic development, a country must experience both economic growth and "fundamental changes in the structure of its economy" (Gillis, 1996). Despite their typically unappreciated role, entrepreneurs orchestrate these transformations and create new channels for economic activity and employment. Thus, all countries that wish to pursue continued development must encourage entrepreneurship.

THE MAIN PERFORMANCE CRITERIONS FOR BUSINESSMEN

Bucurean Mirela

University of Oradea, Faculty of Economics, No.1, University str., e-mail: mbucurean@uoradea.ro, tel.:0259408796

Abstract: The purpose of this paper is to describe the main performance criterions for businessmen. This criterions are appreciated differently from one region to another or from one social class to another. Businessmen's morality is more important than profit, than the power of their businesses, their organizational structure or their creativity. The company of the future is a moral company, a company where the changes will appear; all the companies will have to keep up with these changes if they wish to stay competitive. But what remains unknown is the nature of these changes, their magnitude and the fields in which they will be most obvious.

Key words: criterion, morality, innovative, change

An businessman's work is based on a complex of theoretical knowledge and practical skills. Through all these, the businessman has the possibility to understand the theoretical bases of the entrepreneurial activity, to collect a fund of expertise documentation, to outline standards regarding performances, conduit and ethic criteria.

In the future the changes will appear. A source of these changes would be the innovative spirit that springs from each and every young enterpriser, their freshness and anticipative spirit in business field. All these qualities always maintain a business at the top. After previously choosing a business idea, which would not be by all means new-after achieving a competent marketing study-which must include information regarding the customers, the company's field and its competitors-after the elaboration of a business plan, the entrepreneur has to further develop the business.

The business system is affected by many forces, both external and internal. The system approach-the viewing of any organization or entity as an arrangement of intereereelated parts that interact in ways that can be specified and to some extent predicted-provides a rational means for examining these interactions. Use of the systems approach inevitably leads one to conclude that every organization,indeed every system, is an open system. An open system is an organization or assemblage of things that affects and is affected by outside events.

Top management has perhaps the greatest concern for the external forces, while management at all levels must be concernedwith the forces of the internal environment. Managers at lower levels of the organization, however, confront an internal environment that is markedly different from that encountered by management at more senior levels. Within these complex external and internal environments, the business system operates; inputs are converted to outputs through a transformation process directed and controlled by managers.

Factors that management must consider in the external environment include the labor force, legal consideration, society, unions, stockholders, competition, customersand technology. Managers approach changes in the external environment proactively or reactively.

- A proactively response is takig action in anticipation of environmental changes.
- A reactive response is simply reacting to environmental changes after they occur.

Organization exhibit varying degrees of proactive and reactive behavior. A firm may be either reactive or proactive in any matter, legal or otherwise.

Factors to be considered I the internal environment include the firm's mission, its corporate culture, the management style of upper managers, policies, employees, the informal organization, other units of the organization and unions.

Management's job is to direct the transformation of resources-inputs in an effefficient manner to produce desirable goods or services-outputs. In the course of this process, managers plan, organize, influence and

control. They monitor the input and the transformation process and upon analyzing feedback from the output, make the adjustments necessary in the production process to obtain the desired results.

In order to be able to aim high and have high expectations, a young person has to know the features and main characteristics of a successful entrepreneur, to be well acquainted with the environment in which he will carry out his economical activity and perhaps be familiar with other successful entrepreneurs' activity which could be a source of inspiration. In order to refer to the economical environment in which young Romanian entrepreneurs carry out their activities, I will further present a statistic which provides information regarding the most important qualities an entrepreneur should have, from the Romanian's point of view.

The project "Zece pentru Romania" defines the main attributes of a native Romanian entrepreneur. The first three most relevant performance criteria Romanians guide after when judging businessmen's value are of moral nature, according to the survey on which the project "Zece pentru Romania" is based on.

Businessmen's morality is more important than profit, than the power of their businesses, their organizational structure or their creativity- this is the most important conclusion of the study. The survey, which was made at a national level by four important survey institutes (INSOMAR, IMAS, TNS-CSOP and CURS, on a sample of 4.304 subjects), reveals the fact that Romanians evaluate businessmen on similar criteria with those applied to politicians, congressmen or ministers.

Honesty is the most important criterion on which Romanians appreciate businessmen (42%), followed by the care shown regarding the employees (36%) and regarding the community through the payment of taxes (32%). Profit is only occupying the 8th place, with 14%, even if, probably, through businessmen's perspective, profit is the most important measurement of success. The honesty criterion is appreciated differently from one region to another or from one social class to another. In conclusion, honesty and fairness of businessmen are most appreciated in Bucharest (49%) the other southerners do not consider it that important (39%).

Romanians with high social status (classes A, B ESOMAR) appreciate fairness of businessmen more than those with lower social status (classes D,E ESOMAR) – 45% superior social classes, 40% inferior social classes.

The second most important performance criterion – "makes sure that his employees earn well"- is the least appreciated in Bucharest (26%) and the most appreciated in Oltenia (43%). These results confirm, practically, "the map of financial earnings", Bucharest being the financial leader and having at the same time the lowest unemployment rate. Because financial earnings are not a major problem for people living in Bucharest, it is less appreciated here than in other areas of the country.

Finally, the third criterion guiding the Romanians in appreciating the value of businessmen is the payment of taxes. This criterion is perceived differently according to the social status: to educated Romanians with a superior social status, taxes paid by a businessman are more important than to those who belong to inferior social classes-34% to 30%.

This study reveals a very important aspect: for those with superior studies, it is more important that the businessman pays his taxes (34%) than to make sure that his employees earn well (30%). An explanation of the result could be that Romanians with superior studies seem more responsible and more conscious of the fact that taxes paid in community backup projects for more people and scientifically prove that these people have a more developed civic sense than other social classes and, as a consequence demand the same thing from businessmen.

Another interesting conclusion revealed by the study is the fact that donations are a relevant criterion in appreciating a businessman only for 19% of the people interviewed.

Surprisingly, Romanians still believe that the state can administrate the funds that come from the taxes paid by businessmen better than the businessmen themselves could, through administrating the directions taken by the funds for community. An explanation can be the fact that a businessman who is making a donation can be perceived by many Romanians as somebody who is trying to create an undeserved image for himself.

Performance criteria for businessmen are:

1. Plays fair, uses concrete means of obtaining contracts/works 42%
2. Makes sure that his employees earn well 36%

3. Pays his taxes 32%
4. Provides decent work conditions for his employees 29%
5. He creates new workplaces in Romania 29%
6. He is able to solve every problem 27%
7. He helps people in need/makes donations 19%
8. Makes a large profit 14%
9. Works hard for his business 14%
10. He extended his business by his own means 13%
11. He built one or more than one powerful companies 11%
12. He is an organized person 11%
13. He is creative 8%
14. He received national or international awards 1%
15. No answer 3%

To be effective, a businessmen must possess and continually develop several essential skills. Conceptual skill is the ability to comprehend abstract or general ideas and apply them to specific situations. Technical skill is the ability to use specific knowledge, methods or techniques in performing work. The ability to understand, motivate and get along with other people is human skill.

There are both pros and cons in becoming a businessmen.

The pros include:

- An obvious reason to be a businessmen is the increased income;
- Many desire the respect and influence that normally go with a managerial job;
- The manager's job offers special opportunities for accomplishment;
- Businessmen have greater freedom than employees;
- Businessmen have special opportunities to help people.

The cons include:

- Some businessmen think their pay is not too high;
- In addition with their own concern, businessmen must struggle with the problems of others;
- Businessmen are held answerable not just for their own actions but for the actions of others;
- Some managers do not enjoy making the tough decisions that go with the job.

It is not at all easy to become a consummate businessmen, you have to be vigilant at all times, to respond for the consequences of your own actions, to be creative and innovative, to be inspired and informed about financing. However, with the help of scholarships and programs created especially for entrepreneurial development, the sinuous road of becoming "professionally mature" in the business field may be successfully finalized.

The decision represents the center of management activity, because it insures the fulfillment of the organization functions. This paper aims to analyze the decisional system of a public organization: Bacau County Council in association with Slanic Moldova Local Council. The study attempts to mark out, in the limit of possibilities, the modality in which the decision of investment in Slanic Moldova Ski Park was made. The opportunity of studying the necessity of this investment consists in the appearance of the Phare Program 2004 – 2006 Large Projects for Regional Infrastructure which is financing, up to 90%, the investments in tourism infrastructure, like ski tracks with necessary equipment or balneary centers. The structure of case study develops three important directions of analysis: identifying and definition of the problem, formulation of alternative decisions and decision making.

Key words: managerial decision, economic development, project

Slanic-Moldova: present status

The study aims to mark out the modality in which the decision of investment in Slanic Moldova Ski Park was made. This section desires to analyze the decision making frame for developing Slanic Moldova resort through Ski Park project, initiated by Bacau county Council and Slanic Moldova Local Council. The investment decision aims the building of a ski track in Slanic Moldova, endowed with snow equipment, chair lift and nocturnal illumination. We must take into consideration the fact that the decisions regarding this policy are being taken since year 2004, so the data and information are related to that moment.

Also known as “*Pearl of Moldova*”, the resort is located in south-west part of Bacau County. It is one of the 12 balneary resorts of national importance. Its mineral springs were honored with different medals on international competitions. From the point of view of distances from main cities, Slanic is located at 86 km from Bacau City, 210 km from Iasi City, 160 km from Brasov City, 350 km from Cluj City, and 330 km from Bucharest. The airport from Bacau City can sustain the local tourism by insuring the travel of persons within national aerial network and through Otopeni Airport, within international network. Also, the airport from Bacau City has a direct connection with cities from north of Italy, with a stop over in Timisoara City.

SWOT analysis regarding Slanic Moldova resort

Strong points:

- Natural balneary and landscape potential, demonstrated by the declaration of Slanic Moldova as touristic resort of national importance through the Government Decision HGR 1122/2003;
- Qualified personnel in the field of touristic services;
- Existence of modern treatment centers.

Weaknesses:

- Insufficient development of leisure facilities of the resort;
- Unilateral development of touristic offer (balneary component).

Opportunities:

- Existence of European road E85;
- Existence of George Enescu International Airport in Bacau City;
- Modernization of Perla Hotel (4 stars);
- Reopening of Casino, renovated in year 2005.

Threats:

- Migration of qualified work force;
- Lack of investments in modernizing the touristic lodging;
- Lack of investments in road infrastructure.

Identification of main problems

As we shown in the paragraph regarding the reality perception, the main problems of Slanic Moldova resort consists of insufficient development of leisure facilities, in unilateral development of touristic offer on balneary component, in lack of a stable development of an economic alternative to tourism.

The aim of the project regarding the arranging of a ski domain in Slanic Moldova resort is the diversification of touristic offer, in view of increasing the attractiveness of balneary resort and stimulation of entrepreneurial spirit. At the same time, the project Slanic Moldova Ski Park tries to respond to a large demand for leisure services, if we take into the consideration that in all the aria of center and south of Moldova there is no other skiing domain properly arranged. The inhabitants from different counties: Bacau, Iasi, Braila, Vaslui, Vrancea, Galati and Moldova Republic have to turn to other destination like Vatra Dornei, Borsa, Poiana Brasov or Predeal for spending relaxing hours on the ski tracks. And that, in the condition in which, at an accessible distance, there are the ramps and the descents of Slanic Moldova resort, on which it can be set up a very attractive ski domain.

Entering of the problem in formal agenda and identification of evaluation criteria

The economic development of Bacau County and Slanic Moldova resort were in the center of the authorities concerns since the beginning of 1990. The lack of concrete solutions for improving the situation kept the problem into public agenda and in the formal agenda in a general manner. The opportunity of real integration into formal agenda was offered by the launching of Phare Financing Program 2004 – 2006 Large Projects for Regional Infrastructure, which are financing up to 90% of the total amount, investments in tourism infrastructure, like ski tracks endowed with necessary equipment or balneary centers.

In the case of initiation of this policy, the decision makers are Bacau County Council and Slanic Moldova Local Council.

The evaluation criteria of resolving the problem of economic underdevelopment of Slanic Moldova resort aims the necessity of identification of a efficient and popular solution that can lead to the solving of this problem. In this matter, the efficiency appeals to accessing European funds which can be used with maximum benefice form the community. The efficiency refers to identifying a feasible solution for solving the problem. At last, the popularity refers to necessity of community support for the policies that will be adopted in this matter.

Decision making

The decision represents the central point of public management activity, because it insures the fulfillment of function for which the public administration was created. At the same time, the integration of local community in the economic environment depends on the quality of the decision, because it influences the decrease of costs, efficiency of funds utilization increase of profit, coordination of main activity field, obtaining the desire efficiency, solving and mediation of conflicts and all other problems that an organization can encounter in its activity.

At the end of year 2004, the decision making related to the initiation of development policy for Slanic Moldova was in the center of public attention. The realization of *Environmental Impact Assessment* which is necessary in this kind of situations, led to the opportunity of consulting the inhabitants regarding the

impact on the community by building a ski track. The entire community, from civic servants to business men, from specialists to citizens from Slanic Moldova resort agreed on the necessity of realization of the ski track and other equipment and annexes. From this moment, there was left only the decision of the authorities: Bacau County Council and Slanic Moldova Local Council.

Resuming the analysis until this point, the solving of the problem of economic underdevelopment of Slanic Moldova resort has gain a large weight together with the opportunity offer by the appearance of Phare Program 2004 – 2006 Large Projects for Regional Infrastructure, which are financing up to 90% of the total amount, investments in tourism infrastructure, like ski tracks endowed with necessary equipment or balneary centers.

In the case of *Slanic Moldova Ski Park*, the decision makers are Bacau County Council and Slanic Moldova Local Council.

Local public authorities have analyzed several solutions which can resolve the problems in the region. From these decisions, taking into consideration the specifics of Phare Program criteria, there were left to discuss the following *two alternatives*:

1. arranging of a balneary park;
2. development of a ski domain.

There was made a SWOT analysis and a cost-profit analysis for each alternative, after which was left only the solution regarding the ski domain. The main argument for the ski track was that through its development there will be an increase of touristic offer of the resort and will be attracted new segments of tourists especially in cold season, generally with low occupancy degree. Also, it is important to mention the fact that the ski track will increase the occupancy degree of lodging amenities, it will bring the development of other services and trade (specific sport articles, handicraft items, alimentary products, etc) and it will lead to the development of the entire area.

After the generic establishment of the project theme, followed the analysis of different locations for the project, as well as the establishment of endowment and all the technical elements. Regarding the location of the ski track, it was established a list of possible locations for the project. In the next faze, there were consulted specialists in the field for establishing the optimal location.

The main constraint was related to the location of the ski track on the north descent of the mountain, for having a longer period with snow. Also, an important element was to facilitate the easy access to the ski track and especially the arrangement of a suitable parking space closer to inferior station of the chair lift.

In this context, the optimal location, chosen after analysis of all possible locations, was established to be on the north-eastern descent (ramp) of Cerbu peak of Nemira Mountains, at an altitude between 470 and 720 meters, with the point of arrival located between the Cerdac touristic complex.

Another important decision which was supposed to be made was referring to *endowment of the ski track*. The considered alternatives were:

1. realization of a classic ski track;
2. realization of a modern ski track, at European standards, endowed with nocturnal illumination and snow cannons and snow compacting machines..

Analyzing both alternatives, under all aspects, it was decided in favor of the second alternative, respectively the modern ski track with all the endowment. The choice was simple, being the only alternative considered on medium and long term, in the conditions in which is lacking the competition in the area at this moment, but in the future years there are premises for appearance of new ski tracks. We mention that there were considered probabilities of realization of this ski tack in other counties Neamt and Suceava.

The following decisional stream appeared when it was needed the decision for *optimal alternative for chair lift*. In this case, there were considered the following alternatives:

1. fixed chair lift with vehicles with 4 seats, always connected to a tractor cable;
2. declutching chair lift with vehicles of 4 seats and an automated coupling system to the tractor cable.

It was made the decision of choosing the fixed chair lift, which had lower initial costs, and also a cheaper maintenance. For reducing the speed in embarking and increasing the safety of users, it was chosen the endowment with a rolling lane in the embarking station.

Finely, regarding the traction system, there were considered the following alternatives:

1. classical (with tickets, respectively with season tickets);
2. magnetic access cards.

The chosen solution was the classic one, because the implementation costs for this system are more reduced. Plus, in distinction with Bucegi Mountains, where there are many ski tracks that can be accessed with only one magnetic card, in Slanic area there are no other similar facilities, so there is no justification in utilizing the card system, which implementation is more expensive.

The study regarding the decision making for Slanic Moldova Ski Park aims to analyze also if there is a justification for decision making in creating a ski track in Slanic Moldova on two major directions, technical and economical.

In which regards the technical opportunity, the opportunity study demonstrated the feasibility, from a technical point of view, of the construction of a ski track at Slanic Moldova. This conclusion can be sustained on the following arguments:

- from a technical point of view, considering the geo-technical characteristics of the land, difference of level, north orientation of the ski track and the fact that both its left and right parts are covered by woods, in the chosen perimeter it can be made a ski track;
- The endowment of the ski track with chair lift, nocturnal illumination and artificial snow determines the ski track to correspond to the highest national and European standards;
- Road, train and aerial access is facile;
- Average leaning of the ski track is 18,9 %, which determines an easy access to the ski track for all the tourists;
- The land on which the ski track will be made is property of Slanic Moldova Local Council, so the pre-condition of accessing the financing from Phare Program is fulfilled.;
- Taking into consideration all these aspects, we can sustain that the project is feasible from a technical point of view for the construction of a ski track in Slanic Moldova.

Regarding the economic opportunity, we considered it necessary and feasible the construction of the ski track in Slanic Moldova, because of the following arguments:

- The local economic characteristic is given by the large percentage of the touristic activity in the general economy of Slanic Moldova resort; still, the lack of investments in tourism and the lack of development of new attraction led to a decline of tourism; given the success of Azuga resort, where the appearance of ski track conferred an economic growth of the area, the realization of the ski domain in Slanic Moldova is a chance of economic development, in the conditions in which in the area there is no other modern ski track;
- Through the creation of the ski track it will be diversified the services in the area, in a direct manner (there will appear services like ski and winter sports, track climbing with chair lift, in different seasons) and indirect through the appearance of related services (like school for skiing, renting and selling centers for sport equipment, places with commercialization of food and beverages for skiers, development of handicraft products and souvenirs, new hotels and agro-touristic hostels, renovation and increase of the degree of comfort of accommodation and meal facilities);
- Regarding the competition, through the construction of the ski track in Slanic Moldova, endowed with chair lift, snow machines and nocturnal illumination, this resort will reach the level of other famous resorts in Romania, like Poiana Brasov, Sinaia, Busteni, Azuga; compared to the ski tracks from Azuga and Busteni, which, on similar endowment, they have an average level of difficulty, translated in the leaning of the track, the ski track from Slanic Moldova has a level of descent which categorized it on easy level, being able in this matter to attract all categories of tourists, including the beginners; the characteristics of the ski track from Slanic Moldova are similar to those of from Sinaia and Poiana Brasov; but considering

the price levels from these resorts (Poiana Brasov, Sinaia, Busteni, Azuga), and also the considerable distance between target counties from North-East Region and partially from South-East Region (Iasi, Braila, Bacau, Vaslui, Vrancea, Galati), we can state that for the areas mentioned above, the resort from Slanic Moldova has a great potential, being able to attract many tourists in averse of the resorts endowed with ski tracks from Valea Prahovei and Poiana Braşov; another comparable advantage of Slanic Moldova resort towards the resorts from Valea Prahovei and Poiana Brasov consists in the fact that Slanic Moldova resort is a balneary resort, the tourist being able to combine the health tourism with the sport tourism, in report of Durau ski track, which is no equipped with nocturnal illumination and artificial snow machines, the one in Slanic Moldova will have all the modern endowment; in this way, being projected with an artificial snow installation, the ski tack from Slanic Moldova will have a larger period of utilization in one season, without the dependency on the snow; plus, in the busy days, the period of skiing during a day can be extended on the night time, because of the nocturnal illumination. in conclusion, regarding the competition, the resort from Slanic Moldova (given the circumstances – advantages and disadvantages mentioned above) can have deal with success with the competition on the winter sports market from Romania.

- After all the above, we can conclude that the ski track which will be made in Slanic Moldova will constitute into an opportune and feasible investment from the economic point of view.

So, taking into consideration all the arguments mentioned above, we can affirm that the realization of the project *Slanic Moldova Ski Park* is opportune and feasible, from the economic, technical and political point of view, all the institutions with attributions in the field and all the parties manifesting support for the realization of this investment. At the moment, the project Slanic Moldova Ski Park is in the implementation period.

STRATEGIC ANALYSIS OF CARGO TRAFFIC THROUGH CONSTANTA PORT

Ceașescu Andreea

*Christian University „Dimitrie Cantemir”, Faculty of Touristic and Commercial Management,
Constanta, 23, Enachita Vacarescu st., Constanta, andreea.ceauescu@consulting.ro, 0241 60 66 22*

Constanta Port is both a maritime and a river port. Daily, more than 200 river ships are charged or discharged or waits to be operated in the Port. Constanta Port facilities allow the entrance any tip of ship. The link between Constanta Port and Danube is realized through the Danube – Black Sea Canal and represents one of the major advantages of Constanta Port. Due to low costs and high volume of cargo transported, Danube represents one of the most advantageous transport routes, representing an efficient alternative road and railway transport of Europe. Large cargo quantities are transported between Constanta Port and Central and East European countries: Moldova, Bulgaria, Serbia, Austria, Slovakia and Germany. For Constanta Port, river traffic has an increased importance, representing about 23,3% of total traffic in 2005, when about 8.800 river ships had arrived in the Port.

Traffic analysis, harbor, berth, seaport, strategic analysis, cargo

Constanta Port

Constanta Port is situated to the south-east extremity of Constanta city and along the Black Sea shore, between Peninsula, in north, and Eforie Nord, in south, on length of 13 km.

Constanta Port has an annual operating capacity of over 100 million tones, using 156 berths, from which 140 are operational. Total length of quays is of 29,83 km, while the depth vary between 7 and 19 m.

These characteristics are comparables with those offers by the major important European and international ports, allowing the access of tanks of about 165.000 dwt and dry cargo ships with a capacity of 220.000 dwt. Nowadays, a series of investment projects regarding construction of new facilities for cargo operation and improving the transportation routs between the Port and hinterland are under run. These projects are mainly located in the south of Port.

Cargo traffic through Constanta Port

Constanta Port position of “Eastern Europe Gateway”, due its strategic and economic position of Port, has a new understanding, under the new circumstances: Romania being a member of European Union starting with 1 January 2007; this lead to its transformation in “Easter European Union Gateway”. Today, we can say that, truly, Constanta Port is the largest and deepest Port from the Black Sea, and why not the biggest container terminal in the Black Sea.

Following, we analyze the cargo and ships traffic through the Port between 1998-2006:

Year	1998	1999	2000	2001	2002	2003	2004	2005	2006
Traffic (millions tones)	39,90	32,50	33,10	33,80	40,50	43,20	50,40	60,60	57,10

Global Traffic between 1998-2006

Global Traffic Dynamic between 1998-2006

Between 1998-2005, total cargo traffic registered an ascending trend, but in 2006, it decreases suddenly by 6%.

Year	1998	1999	2000	2001	2002	2003	2004	2005
Traffic (millions tones)	28,90	23,30	23,60	26,00	30,80	33,40	38,90	46,50

Maritime Traffic Evolution between 1998-2005

Maritime Traffic Dynamic between 1998-2005

During the period under analyze, the cargo volume in maritime ports registers a positive evolution, having a rate growth of 20%.

Year	1998	1999	2000	2001	2002	2003	2004	2005
Traffic (millions tones)	10,90	9,20	9,50	7,80	9,80	9,80	11,60	14,40

River Traffic Dynamic between 1998-2005

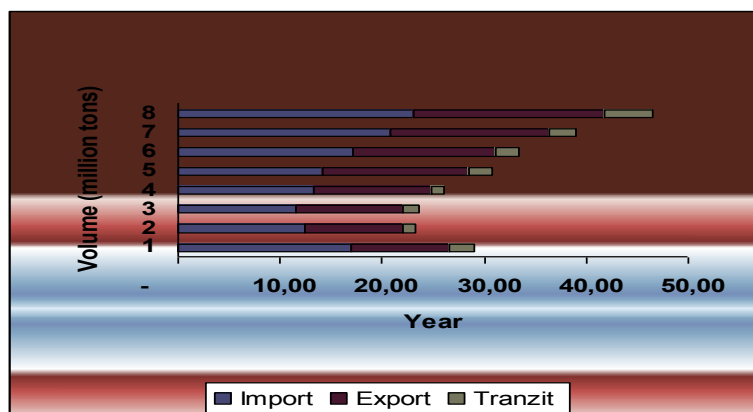

River Traffic Dynamic between 1998-2005

River traffic, as well as maritime traffic, has a cyclic evolution, more precisely, between 1997-2000; they decreased, followed by an increased ascension until 2005. Then up to 2006, a new descending curve was observed²².

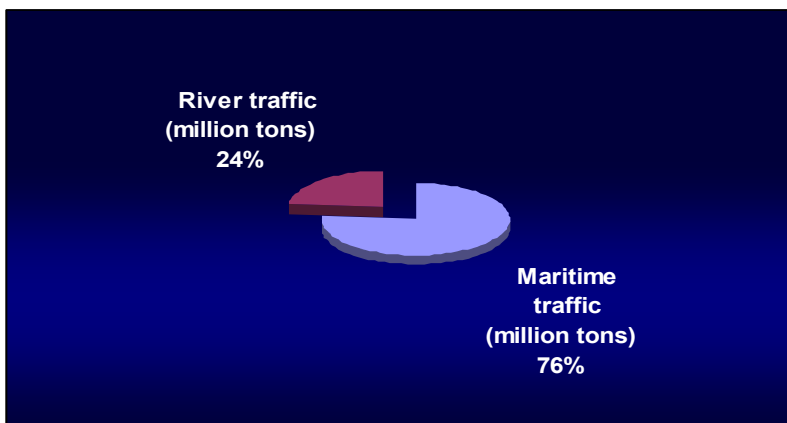

Year	1998	1999	2000	2001	2002	2003	2004	2005
Global traffic (million tons)	39,90	32,50	33,10	33,80	40,50	43,20	50,40	60,60
Maritime traffic (million tons)	28,90	23,30	23,60	26,00	30,80	33,40	38,90	46,50
River traffic (million tons)	10,90	9,20	9,50	7,80	9,80	9,80	11,60	14,40

Cargo Traffic Structure between 1998-2005

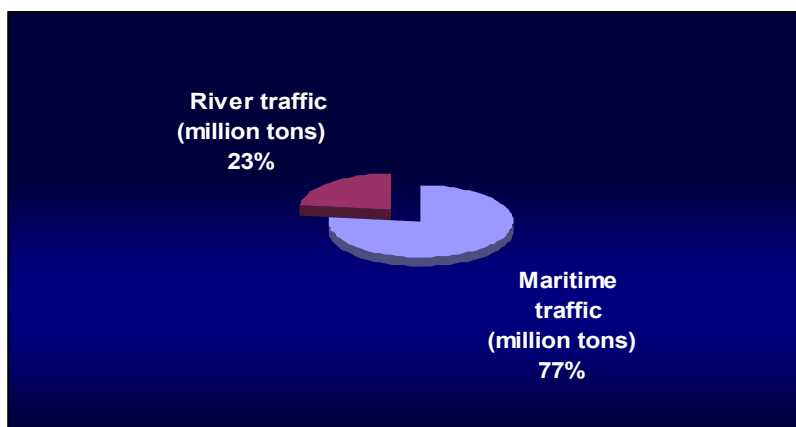

Cargo Traffic Evolution on Components between 1998-2005

²² From the information available, it results that until 15.11.2006, maritime traffic reached 31,992 million tons and river traffic 0,11 million tons

River and Maritime Traffic Weight in Total Traffic in 2005

River and Maritime Traffic Weight in Total Traffic in 2004

As it can be seen from the statistical data presented in the previous tables and figures, maritime traffic represents over 2/3 of total traffic, and the river one about 1/3.

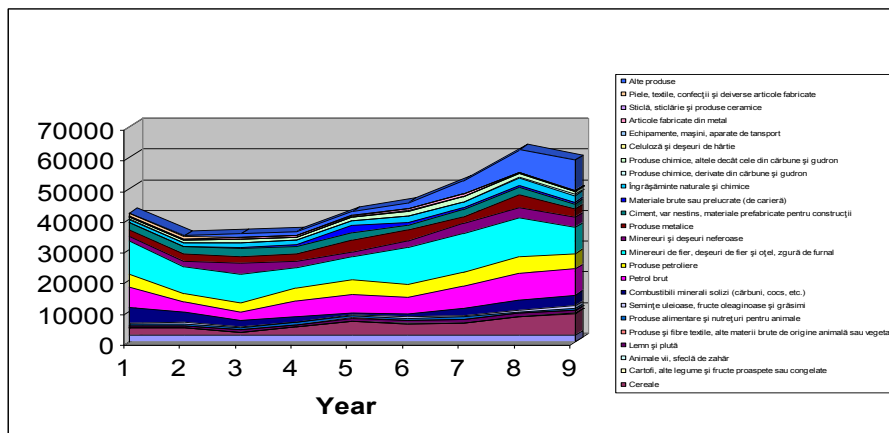

Year	1998	1999	2000	2001	2002	2003	2004	2005
Maritime traffic (million tons)	28,90	23,30	23,60	26,00	30,80	33,40	38,90	46,50
Import (million tons)	17,00	12,40	11,50	13,30	14,20	17,20	20,80	23,10
Export (million tons)	9,60	9,70	10,50	11,50	14,30	14,00	15,60	18,60
Transit (million tons)	2,40	1,20	1,60	1,20	2,20	2,20	2,50	4,80

Maritime Traffic Structure between 1998-2005

Cargo in-flows and out-flows, including transit in 2005

Maritime traffic structure remains about the same for the period under analyze, thus: import represents about 50-60%, export 40-50% and transit vary around 10% of total maritime traffic.

Cargo traffic by Main Groups between 1998-2006

As presented in the above figure, the main cargos operated in Constanta Port are iron ore, crude oil and derivatives, followed by cereals and construction materials.

Traffic Cargo Evolution by Main Groups between 1998-2005

Except for cereals, which had an ascending evolution starting with 1998, all other cargo categories registered unusual evolutions, finishing in 2006, with decreased of operated quantities. The most dynamic group of cargo is iron ore, which until 2004, had an ascending trend, followed by a decreased between 2005-2006. Together with the national economic factors that directly influenced these evolutions, international market play an important role, the basic tendency being in favor of containerizable goods. Thus, between 1998-2006, container traffic through Constanta Port increase constant, reaching in 2006, a level of 9.815.800 tons, 1.037.068 TEU, respectively.

Container Traffic Evolution between 1998-2006

Container Traffic Structure between 1998-2006

After analyzing the cargo traffic through Constanta Port, we legitimately ask ourselves: where do the goods go and from where do they come? Or how are the goods transported (by river or sea). Starting from these questions, we prepared a traffic analysis by provenience and destination, on the main group of cargo.

Traffic Structure by Provenience of goods in 2006

Traffic Structure by Destination of Goods in 2006

By provenience of cargo, the main “suppliers” for Constanta Port are: Russia - 33%; Brasilia - 6% and USA - 5%. By destination of cargo, the main “clients” of Constanta Port are: Turkey - 25%; Spain - 6% and Italy - 5%.

Conclusion

Following the analysis of Constanta Port traffic, we can conclude that the traffic registered a dynamic growth in terms of quantities operated in the Port and it is requested an emergent review of Constanta Port strategy on medium and long term so that it could reach its main objective to be the Eastern Gate of Europe and attract the transit cargo from the neighborhood economies.

TO THE EDGE OF MARKETING WARFARE. APPLYING MILITARY STRATEGIES IN A COMPANY FROM THE MOBILE TELECOMMUNICATION SECTOR IN ROMANIA

Cernat-Gruici Bogdan

As military strategy preceded firm strategy, it is natural to state that firm strategy took the majority of its main concepts from the military. Nowadays, the business environment plays an important role in adopting strategic decisions. This implies that in the center of a company's view, competition stands for one of the important factors. The interactions between economic agents become more and more intense, leading to firm cooperation, strategic partnerships, firm cluster and firm networks. However, there are also many ways for companies to engage in conflict. For smaller companies the most suitable approach on conflict is guerrilla warfare. We considered a company from the mobile telecommunication sector in Romania and showed how the several identified military techniques improved the company's performance. In addition, we made a number of recommendations based on the principles of running a guerrilla war.

Key words: guerrilla warfare, marketing strategy, military strategy, corporate strategy

Rationale

The marketing strategy adopted by a company for a certain period is the result of combining the experience, the intuition and the expectations of the marketing managers, of the knowledge and art these one possess; is the result of confrontations, compromises and negotiations. Habitually, the companies elaborate their strategies on short, medium and long term with clear, solid and precise objectives that are detailed through the corresponding tactics. Along these lines, the companies act in response both to the instant requests of the business environmental changes and to ascertain of a long terms demeanour, fact that consents a unitary and coherent vision.

However, the most relevant issue regarding the present marketing strategies is represented by the customer-oriented policy, which can be encountered at the basis of the majority of marketing approaches. The famous slogan "Our Customer is our Master" can be considered inconsequential nowadays. "The Master Customer" has vanished. The justification is quite straightforward: the customer oriented approach and the establishment as main objective the fulfilment of the consumer needs in optimal conditions applies for the growing markets. Customers revealing not as much as a natural need to fulfil but as an urge consume characterize the most part of the contemporary markets. Therefore, such a customer will not be convinced to consume by a lower price or a better offer as he consumes due to the compulsion to act in such a manner.

Therefore, we state that a company that operates on such a market should not count on the new customers in order to raise its revenues but should focus on its competitors' clients. Consequently, this company should conceive an aggressive strategy aimed towards its competing companies, towards their destabilization and even exclusion from the market. This is the bridge between military strategy and firms' strategy based on competition – *the conflict management*. At first glance, it may seem overstated to employ

in business strategies designed to exclude the competitors. We consider that it is not longer the case for a manager to believe that if maintaining a passive position on the market his competitors will do the same. The main purpose of a manager should be the identification of the main revenue source on the market. Taking into account the issues stated above, the intuitive answer would no longer be “our customers’ funds” but “our competitors’ clients’ funds”. We can notice a double advantage: every new client taken from the competition means both a growth in the company’s revenues and a diminishing of the competitor’s revenues.

As military strategy preceded firm strategy, it is natural to state that firm strategy took the majority of its main concepts from military strategy. Because the two had an independent evolution, an orientation demarcation took place regarding the concrete applicability. Albeit in passing years the problem of adapting a series of mainly military techniques for business use was raised, the time’s economists quickly undermined those ideas. They stated that war and conflict, in general, lead to a decrease in economic value of activities and that the only way to obtain prosperity is to develop a company and direct its financial and human resources towards production and internal development.

Nowadays, we consider things in a different manner. Even though the main objective of every company remained the same – to obtain profit, it is well recognized the importance of the business environment. This implied that in the center of a company’s view, competition became one of the most important factors. Today, the interactions between economic agents became more and more intense, leading to firm cooperation, strategic partnerships, firm clusters and firm networks. These partnerships share much with military alliances, both from operational and functional points of view (alliances confer psychological safety, ensure easy access to resources and information shared between group members, and provide an overall economic strength).

However, these alliances created a new favorable context for the development and application of aggressive military strategies. The fact that peaceful strategies had worked, implied that there is a possibility that offensive strategies could be used successfully. Thus, military strategies were successfully applied in marketing situations, the managers that adopted this aggressive way to run their business had results that exceeded expectations regarding market share. If we take into consideration the simple aggressive human nature, we can explain the aggressive behavior of companies. An alliance is able to provide a whole lot of opportunities, but it cannot provide the power possessed by a market leader. Using aggressive military strategies aimed towards the competition, some formidable competitive advantages could be obtained by firms that decide it is best to defend their market share, and by companies that consider the attack the only solution. Considering the free market, using military strategies does not represent a time consuming process because the concepts taken into consideration are clear-cut. The manner of employment these concepts stand for the *innovative* matter.

In the late 80’s, experts from the firm strategy field, realized that there was a vast knowledge “database” dating some thousand years that they barely analyzed. They turned their attention towards military in order to find a series of principles that could be used in order to elaborate firm strategies. A series of well-known works like “The art of war” by Sun Tzu and “On war” by Carl von Clausewitz became instant classic business books. From Sun Tzu we can learn the tactical part of military strategy. On the classical principle of strategy “the advantage of the first move”, Sun Tzu said “In general, the one that occupies the field of battle first and awaits the enemy is tranquil, and the last to arrive, rushes to the fight and is both mentally and physically tired”. From von Clausewitz we can learn the unpredictable dynamic nature of military situations. Von Clausewitz considered that in chaos and confusion situations, the strategy should be based on flexible principles. The strategy does not derive from a formula or rule of thumb, but from adapting current actions. He called this concept “friction” (events that unfolded minute by minute).

In a company, one could apply three types of military strategies: offensive, defensive and guerrilla strategies. Offensive strategies represent a type of business applicable strategies designed to ensure the achievement of an objective; usually the rise of market share in spite of a competitor. Defensive strategies represent those kinds of strategies designed to protect one’s market share and maintain profitability and market positioning.

Guerilla warfare represents a distinct way on war approach. This type of war means weakening the enemy through a series of minor attacks. The guerrilla forces, instead of organizing themselves in compact groups, which are divided into small taskforces that attack in a selective manner enemy weak spots. The general frame in which the strategy progresses is represented by a succession of attacks and withdrawals. It is a

well-known fact that guerillas do not win wars; instead, it determines the adversary to loose it. The efficiency of guerrilla warfare resides in the series of strong points, as follows: a) due to the fact that a full confrontation with the enemy will never take place, the guerrilla will conserve its resources; b) a guerrilla force is very flexible and can be adapted both for offensive and defensive operations; c) a guerrilla is hard to counter using classical means.

In marketing, guerrilla warfare could be used in various ways: a) advertising that compare own products with those of the competitors, b) short term alliances c) selective reductions in price d) negative publicity.

Guerilla tactics are very easy to use by small firms that naturally have high flexibility and have limited resources. A small firm can easily abandon market sectors, can easily change their product range, and from a managerial point of view, can easily change its objectives. If we consider a large company that runs mainly on efficiency principles, it will be unproductive for that company to make efforts to remove a small company that tries to expand, because the expenses involved in the process will surmount by far the short and medium term potential revenues. Small firms also have a major advantage over large companies regarding client proximity. A small firm is far closer to its clients and can interact with them on a human level. This in turn creates opportunities to make low cost advertising and even zero cost advertising.

Case Study. Overview and Recommendations

A very important economic sector stands for the mobile telecommunication market. After 1997, this sector developed into a significant part of the Romanian economy by the entering on the market of the mobile telecommunication companies. Our study will consider a Company that crossed the threshold of the medium-large companies within the telecommunication market in 2006 by employing the military strategies – mainly the guerrilla ones.

In 2005, the Company launched itself under a new brand. For 2005, the revenues from services were about 8 million euros, while the number of customers at the end of the year counted for about 50.000. Furthermore, the financial reports for the first nine months of 2006 disclosed revenues of about 27 million euros. To this result contributed both the significant growth regarding the number of clients to over one million and the revenues per capita.

The strategy of the Company for the first year of activity on the Romanian market distinguished itself by large investments (over 220 million euros), aimed to transform the organization into a reliable participant on the telecommunication market and to accomplish the pledge of making the mobile-phone accessible to as many consumers as possible. Therefore, the Company expanded the telecommunication network coverage to 95% of the residents and 82% of the area and strengthened its distribution network. The Company continued within the following years the investment decisions regarding the brand consolidation as well as the development of the products that aimed to be accessible and relevant for the growing number of clients.

We can notice that the investment plan for the first three years of activity on our market sums up to 500 million euros. In addition, in accordance with the Company's strategy with reference to the providing of the most advanced technologies, there were performed investments regarding the i-mode technology that provides the customers express access to a large array of theme content and e-mail applications through the mobile phone. Therefore, the Company continued in 2007 the aggressive investment policy as well as the launching of products designed for the Romanian customer.

As far as the market positioning is concerned, the Company continues to place itself on the third position in Romania. Nonetheless, we consider that the studied Company was a very successful one, managing to expand the number of customers significantly. However, the *market share* of the Company is still small in comparison with the other two large participants of the market.

The military techniques that should be applied by the mobile telecommunication Company are the *guerrilla* ones and, when necessary, the *flanking attacks*. Within 2006, we can identify a range of successfully used military techniques aimed to penetrate the market. Therefore, the flanking attack was performed by circumventing the market segment intensely disputed by the other two participants within the market – the post-pay services segment – and “attacked” the prepay market for the young people with low budgets. Not only did they follow the number one rule regarding the efforts concentration but they also pursued the principle stating that a *flanking attack evades the disputed point and invades into a vulnerable area*.

The guerrilla warfare is that type of war that should be practiced by those companies with a small market share, being the means of combating of the small companies against the large ones. In addition, the guerrilla warfare is represented by a flexible and scattered operational approach. In addition, this approach not only that has the due time, but it also allows the reallocation of this one – as an important economic resource, among the most important operations regarding one company’s activity.

The guerrilla stands more for a positioning conduct than for an organizational one: the army – company situate itself and its resources in such a manner that the competitors cannot detect or use the latter ones. Following this principle, its aim regards detection and employment of the competitors’ resources. Consequently, a small company is not necessary indigent, but it cannot afford to lose resources because their achievement stands for a large financial and strategic effort. Therefore, the essence of applying the guerrilla techniques by companies resides in dominating a market segment discriminated by the characteristic of being as contracted and easy to preserve as possible. In addition, this technique allows an effortless manner of leaving, without losing the economic, financial and strategic resources.

The company, adept in guerrilla warfare must follow a series of general principles in order to ensure its market success. Among these, we can mention principles of paramount importance for the Company. First, “a guerrilla must enforce its successes and abandon its failures”. This principle explains the fact that the a company cannot permit itself to waste financial resources trying to mend an unfavorable situation, in turn abandoning a cause is much more advised because the company must maximize every source of revenue. While the company’s competitors can afford to be present all across the country, their services must be easy to acquire in every town, our guerrilla company should focus to operate only in selected territorial sectors, thus it can have a stronger presence in several major towns, making the local residents their loyal customers. Of course that in the case of the selected areas the company can make efforts to keep customers happy and loyal, developing new ways to keep them interested in their products. In essence, the company must develop a strong sense of property and “fight” only on “friendly ground”.

Alongside the before mentioned conduct principle, there are two managerial mentalities that could “destroy” a guerilla. The first one is more dangerous as on the market are few players. “We did it! Now we are playing along the high rollers!” is the thing that should never be thought by the Company’s managers. They must understand that only because they acted as they did – as small firm, using guerrilla techniques – they managed to be successful on the market. If they change their behavior, if they believe that after a series of successes they became a “big fish”, and can act accordingly, the result will be disastrous, implying the cancellation of all the efforts made until now and the loss of the competitive advantages and the invested capital due to the fact that a large company has a different approach on running it’s business. The Company cannot yet mimic the behavior of its competitors because it does not yet have the same amount of available capital.

“I didn’t succeed, no matter I run a small firm anyway”, is another wrong mentality that a manager can have. A winner alongside the necessary resources used to win must also have the correct attitude and mental state. If we start by assuming that the success rate of a small firm is reduced or inexistent, then the positive results will fail to appear. It is highly possible for the Company to continue be successful on the Romanian mobile telecommunications market provided it uses the right tools and has the right mentality.

The Company is the first on the market where the usage of military techniques can be observed. There are distinct military strategy elements that one can identify, which follow closely a series of principles. Among these, the first principle states: “one must find a weakness in the enemy’s defense and attack that point”. The Company thoroughly assessed the market niches where the presence of the competition was the least strong and found that the “prepay card” sector was perfect to make their entrance. Another principle states: “the assault should be carried out on a narrow front as possible”. Indeed the Company only took into consideration for the moment independent consumers, considering only later firm and company users. Finally yet importantly, one should mention the principle that “an attack must be carried out swiftly; the surprise attack is worth more than brute force”. The fact that the Company decided to buy an existing but unsuccessful company and to develop the available network represented that the managers achieved the most important step in entering the Romanian market: they took the existing competitors by surprise.

It is said that reaching the top is not the hardest thing to achieve but maintaining the position, is. The application of military strategies in the Company proved the potential of using classical combat techniques in the economic field. The Company achieved positive results in a short time interval. There is a reason why we should study the use of military strategies from a practical perspective, mainly because it is the

only way to properly determine the advantages and of course the disadvantages of certain actions. It is very important for the considered company to continue to enforce its aggressive behavior, and continue to use the same winning strategies. Also just as important is to keep in mind at least two severe mistakes that can be made. First, it would be a severe mistake to emulate the behavior of the two large competitors and participate in a long-term show of force, trying to offer lower and lower prices. Second, the Company should not consider the present results to be spectacular, become complacent or adopt a defensive position, knowing that its competitors will retaliate.

The Company's success proves from two points of view the usefulness of applying military strategies. First, it proves the vulnerability of larger companies because they failed to properly assessing smaller companies and insuring the fact that newcomers could not penetrate the market and discouraging and undermining the smaller firms already on the market. The two large market leaders were too busy attracting new customers and under-valuated the threat of a new small company that could easily seize a market niche.

Conclusions

Generally, on a market disputed by two giants there should not be any opportunity for a newcomer except with immense financial efforts. The fact that a small operator became a medium-large operator in such a small period proves the low reaction power of the leaders. The Company could have used these facts alone to raise its notoriety among the customers, seeding a feeling of doubt regarding its competitors. Second, there are facts that indicate that the usage of military strategies and principles aided in the process of entering on the market. The decisive way all the actions were performed, the concentration of all the available resources in order to achieve the goal, the way the least disputed market sectors were identified and used and the fact that priorities were established based on the actions of the competitors, were undeniably effective to fulfill the main objectives of the Company.

ORGANIZATIONAL LEARNING AND KNOWLEDGE MANAGEMENT

Chivu Iulia Mirela

Stanescu Aurelia

Nen Madlena

ASE Bucuresti, Iuliac@ase.ro, Aurelia_stanescu06@yahoo.com

Although at first the terms organizational learning and the learning organization were interchangeable, slowly the two concepts separated into two streams at the beginning of the 90s. The learning organization is at this point the prescriptive stream, oriented towards practice. This perspective centers on the characteristics of an organization that promote learning and facilitates the creation of a certain type of organization.

On the other hand, organizational learning is the descriptive model, centering on the process of learning in the organization. The roots of this concept are in social and cognitive psychology, and it has a strong academic orientation. The main question being how do organizations learn, this type of research often quotes the work of Argyris and Schon (1978, 1996), although an analysis these authors make of the two streams (1999) positions them as integrators.

knowledge management, learning organization, organizational learning

The last decade has witnessed an exponential growth of interest in organizational learning and knowledge-based management. This comes as a natural consequence of the ever more widespread understanding of the knowledge-based economy as a revolutionary change in the global economy. A series of publications have received widespread acclaim, reflecting the penetration of the concepts into the collective conscience: *Infinite wealth: A new world of collaboration and abundance in the Knowledge Era* by Barry Carter, *The Wealth of Knowledge: Intellectual Capital and the Twenty-First Century* by Thomas A. Stewart, and most of all the most recent publication of the famous futurologists Alvin and Heidi Toffler: *Revolutionary Wealth*. These books confirm the results of academic research and indicate a major change in production factors, namely that capital, as the traditional production factor, is losing out to knowledge and intellectual labor. Moreover, at the global level, knowledge is ever more accepted as the main source of competitive advantage (Harvey and Denton, 1999). Simultaneously, trends in IT and communication technologies have radically transformed the capacity of organizations of any dimension to *access, keep, manipulate, share and disseminate knowledge* (Pemberton and Stonehouse, 2000). This technological and informational infrastructure creates the necessary conditions for organizations worldwide to compete or collaborate to create new economic results (Friedman, 2006). The importance of these concepts for the Romanian economy is reflected in the INFOSOC research initiative – Strategies and Solutions for the Knowledge Society in Romania, coordinated by the Artificial Intelligence Research Institute.

Research demonstrates that individual learning does not easily transfer to organizational learning. On the other hand, new technologies now allow organizations to collaborate, think and act globally, as well as innovate at a scale and rhythm that was impossible up to now. Great managers, like the former HP executive Carly Fiorina, recognize that collaborating and leading horizontally requires a totally different set of skills and management from traditional hierarchical systems.

In order to prepare instruments, techniques and systems that will allow firms to go beyond these barriers and make use of efficient knowledge based management, research adapted to local cultural and economical factors is needed, but also research based on a strong integrated theoretical base. Proposed research will integrate theoretical economical, cognitive and socio-cultural contributions in order to obtain a model of organizational learning that is applicable to Romanian reality, which will be a base for future applied research.

The fundamental research role will involve the investigation of the current state of related research, as well as provide personal contributions through the development of a new theoretical approach, as well as identifying new research problems.

The importance of organizational learning for achieving successful management in the new economy is reflected both in theoretical literature (Pemberton, 2000) and in practical research on integrating the two concepts in industries such as healthcare networks (Addicott, McGivern and Ferlie, 2006), construction (Lemons, 2005), logistics and supply chain management as well as large-scale manufacturing (Coe, 2005). Pemberton concludes: *Successful learning organizations create an organizational environment that combines organizational learning with knowledge management.*

Similarly to the knowledge-based economy and management, organizational learning is also a concept that has been around for quite some time, but has only recently become widespread. Beginning in the 60s and 80s, organizational learning has surfaced as **an answer to the challenges of organizational change**. Change was seen as a mechanical “repair and upgrade process necessitating external, authoritative experts. In the late 60s, a paradigm centered on the concept of organizational health surfaced (Bennis (1996) in Yeo, 2005), leading to an organizational, wholistic theory of the organization based on biological metaphors. This was the background that allowed the evolution of the concept of organizational learning, promoted by Argyris and Schon since 1978. However, it was Peter Senge’s popular *The Fifth Discipline: The Art and Practice of the Learning Organization*, published in 1990, that pushed the concept into the mainstream of management frameworks and systems. Senge’s model of the five disciplines was enhanced by further research proposing new organizational learning enablers (Buckler (1996), Reynolds Şi Ablett (1998), Steiner (1998), Teare and Dealtry (1998) in Yeo, 2005).

Although at first the terms **organizational learning** and **the learning organization** were interchangeable, slowly the two concepts separated into two streams at the beginning of the 90s. The *learning organization* is at this point the prescriptive stream, oriented towards practice. This perspective centers on the characteristics of an organization that promote learning and facilitates the creation of a certain type of organization. Research is done mainly by practitioners: Drew and Smith (1995), Benoit and Mackenzie (1994), Moilanen (2001) (quoted in Sun and Scott, 2003), and Senge’s work is the foundation of these types of research. On the other hand, *organizational learning* is the descriptive model, centering on the process of learning in the organization. The roots of this concept are in social and cognitive psychology, and it has a strong academic orientation. The main question being **how do organizations learn**, this type of research often quotes the work of Argyris and Schon (1978, 1996), although an analysis these authors make of the two streams (1999) positions them as integrators.

An analysis of the definitions given to organizational learning reveals a wide variety of themes, such as: **theory in action** (*In a learning organization, individuals are the key where they are acting in order to learn, or where they are acting to produce a result. All the knowledge has to be generalized and crafted in ways in which the mind and brain can use it in order to make it actionable.*, Argyris, 1993); **renewal** (*Organizational learning is learning about learning. The outcome will be a renewed connection between employees and their work, which will spur the organization to create a future for itself.*, Braham, 1996); **organizational change** (*Organizational learning is the ability to adapt and utilize knowledge as a source of competitive advantage. Learning must result in a change in the organization’s behaviour and action patterns.*, Denton, 1998); **systems** (*Organizational learning involves developing people who learn to see as systems thinkers see, who develop their own personal mastery, and who learn how to surface and restructure mental models collaboratively.*, Senge, 1990); or **even team-building** (*A learning organization is one that learns continuously and transforms itself where the organizational capacity for innovation and growth is constantly enhanced.* Publishing House, Watkins and Marsick, 1993).

At the center of learning organization theory is the distinction between **single and double loop learning**. The distinction goes back to Piaget’s cognitive adaptation and development theory (Wadsworth, 1989), which postulates mental schemata (similar to the mental models central to Argyris’s work). From the perspective of the new cognitive theories of the firm (Grant, 1996 and Kogut, 2000), piagetian and neo-piagetian cognitive theories have renewed relevance in the organizational framework through the concepts of single and double loop learning. The literature also mentions triple-loop learning, dealing with the organization’s values, mission and vision.

The area of individual learning is well represented, and practical results are satisfactory. However, organizational learning has a profounder sense than this, and this is reflected in the research of Steiner

(1998) on the barriers to organizational learning. Steiner sees learning at three levels: individual, team and organizational. Each level is more complex than the one before, and double or triple loop learning happens at the team and organizational levels. However, knowledge transfer does not happen properly between these levels. Empirical research (Elkjaer, 2001) confirms that in the absence of factors that can catalyze knowledge transfer beyond the barriers, individual learning will not impact organizational learning.

Efforts to evaluate and measure organizational learning have two main areas of focus: the quantitative approach proposed by Moilanen (2005), which offers a complete instrument based on an eclectic model of organizational learning, and the qualitative model, proposed by Smith and Tosey (1999), who prefer an heuristical approach and offers instruments that can be used by organizational members to evaluate the learning environment in their own organization, starting with the idea that the decision to implement an organizational learning system is not based on results reflected in accounting.

As a forward-looking area, efforts to create learning organizations have often been sustained by scientific research. Research by Massey and Walker shows the role of consultants in organizational learning, showing special importance of negotiated and real roles for both the consultant and the client.

Obviously, a good part of research in organizational learning centers on the role of human resources. **In the new economy, knowledge is the main strategic resource, while the main strategic tool is organizational learning.** Success depends on the culture that exists in a knowledge-based organization (Thite, 2004). For an efficient human resources management in the context of organizational learning, a philosophy based on trust, recognizing the need to learn, and on well defined policies for recruitment, selection, evaluation and motivation of intellectual capital in multinational context is needed. Publishing House New information and communication technologies give access to intellectual capital, regardless of location, creating the premises for strategic alliances.

The literature of organizational learning deals with learning and knowledge transfer in strategic alliances through empirical research (Simonin, 1997) and through theoretical exploration based on cognitive theories (Ghosh, 2004). The incipient Romanian literature on organizational learning (Albu, 2005) is fundamental in nature but views the area from an accounting perspective, centering on individual learning. To conclude, the literature of both organizational learning and the learning organization is in full development, offering new techniques, methods and models that can be used by practitioners.

Knowledge management represents one of the greatest challenges in the life of any organization. Implementing the information and knowledge management is essential especially in the case of organizations using an important amount of information during their activities, as well as of organizations where the access to information is restricted or simply of organizations where structuring the available knowledge and disseminating it to all the employees are set objectives.

At present, document management and preparation have become an increasingly difficult task for companies, as they are time and space-consuming activities; as a consequence, finding documents is an extremely exhausting activity, involves an enormous amount of human effort, while stocking them supposes major costs. All these problems have modern IT solutions. In this respect, a large range of services has been developed, such as: evaluating the situation concerning the information and knowledge management; elaborating the strategy associated to the information and knowledge management; assistance in the creation of a company portal, including selecting and implementing the most appropriate IT tool; designing assessment and motivation systems, defining document management and information flows; assistance in extending the concept of information within a company.

Key-words: knowledge management, information, public sector, transparency, innovation

Knowledge management has recently developed as a result of the organizational need to gain a competitive advantage and a strategic differentiation in the context of globalization and informational boom, thus becoming a valuable tool in ensuring success. The industrialized countries consider that, in the last years, we entered a third stage of development, which is not based on agriculture or industry, but on **information and knowledge**.

The concept of knowledge management is not new. Ever since 1950, Peter Drucker has introduced the notion of “knowledge workers” to define people able to use the organization’s knowledge to create intangible products. Many organizations would informally, though not deliberately use knowledge management techniques in their decision-making process or in producing goods and services.

What is new in knowledge management is **the act of being aware of the existence of a knowledge management process**. Knowledge management can be perceived as an aggregate of instruments and skills which every organization must develop in order to manage the knowledge as resource and asset.

The notion of “knowledge” is one of the most confusing aspects in the theory of knowledge management, because of the misinterpretation of concepts like knowledge, information and data. While data reflect the numeric or alphabetical description of an action, process, fact or phenomenon, information brings a plus of knowledge by presenting an aggregate of data structured in various models and forms and knowledge reunites a mixture of information with a strong human and contextual determination. In this respect, knowledge describes information acquired or applied to certain contexts by means of human thinking. A significant difference between information and knowledge can be found in the way they are transferred. While information can be easily passed on from one person to another, knowledge is much more difficult to transmit, as it also involves a psychological, social and contextual message, which reflects the intuition, the creativity and the experience of the person who has it.

We must understand the way in which an organization can exploit its knowledge to its advantage, in order to maintain its position on the market. Not long ago, we used to perceive economic growth as a result of

the capital offer, of the amount of work and of the quantity of natural resources involved. The successful Japanese companies have embraced four fundamental principles²³:

- A preconception on progressive development;
- A systematic interest for their competitors' activities;
- Creation and ruthless capitalization of a competitive advantage;
- A financial strategy and a human resource policy consistent with the previous principles.

In conclusion, the Japanese managers put the equality sign between:

<i>SURVIVAL = PROGRESSIVE DEVELOPMENT</i>
--

If Western managers find dramatic to see their profits sink, for the Japanese ones there is an even greater risk: being outdistanced by the competition.

The absence of progressive development can mean two things: either the activities developed by the company belong to fields at the peak of their evolution, which is no good news for the future, either the company regresses in comparison with its competitors in developing fields.

The key-factor of prosperity and emergence of new jobs is the degree in which the innovation and new technologies are implemented in the economy. Growth is based not only on the increase of the capital offer, but mainly of the enrichment of knowledge and on the high number of innovations, on their fast adoption and dissemination on a large scale. The economy of knowledge represents not only an economy base on knowledge, but also on:

- The management of knowing all the human processes.
- The unprecedented dissemination of knowledge to all the citizens

The new style of management – knowledge management – uses the concept of intellectual capital, by means of which we identify and define the goods and the intangible assets – the knowledge which can be converted to profit – on which the economic organization is so dependent nowadays.

An innovation process – conceiving an idea and putting it to work, which involves financing and a certain technological procedure, a new presentation, a new organization, new methods of work management and organization etc, a successful impact on the market and a strong protection – can only be completed if the new knowledge is assimilated and is producing a certain value, such as:

- Generating flexibility and operational efficiency;
- Attracting new categories of customers or penetrating a new extended global market;
- Improving the degree of customer satisfaction;
- Offering new products and services;
- Redefining the fabrication process or the business model.

In the public administration, huge amount of data are transmitted, most of the associated activities concentrating on generating information and knowledge for the citizens, the business environment, and the society. Most of the final products of the governmental activities are delivered as information and knowledge. As information and knowledge stand for the “heart” of public administration, the capacity to collect and generate useful information is a defining aspect for any modern state. Information is used to produce more information.

It is extremely rare that this information is combined so as to obtain systematic knowledge. In this respect, the article presents the opportunities arising from the implementation of the knowledge management's techniques in the public sector, as an important method to use in the development of a modern administrative structure.

The evolution of the transition to the informational society, based on knowledge, is necessary first to ensure the durable development in the context of the “new economy”, relying mainly on intensively-intellectual products and activities, and second to create an advanced social and human civilization. The organizations have concluded that **their main values are what they know and the ability to use that**

²³ Theory sustained by the consultants of BCG from Tokyo, James Abegglen and Georges Stalk in their work „The Strategy of Japanese Companies”.

knowledge on technologies and organizational processes, as to obtain a competitive advantage. If in the industrial society there were different types of organizations, coordination, technological and financial product and resource planning, in the informational society, based on knowledge, the aim is to find principles, methods and techniques of investigation, planning, organization of the critical resource – knowledge.

Knowledge differs from information in the sense that:

- knowledge is a human act
- knowledge is the result of thinking
- knowledge belongs to the communities
- Knowledge is transmitted in different ways within the community.

Knowledge can be classified within an organization as it follows:

- Explicit, easy-to-transmit knowledge, distributed as data, scientific formulas expressed by means of words and numbers. In their turn, this knowledge falls into structured and unstructured knowledge. Structured knowledge is made of specifically-organized information and data, so as to be found later (documents, databases, calculation sheets, etc). Unstructured knowledge (e-mails, images, audio and video selections) cannot be used in regular finding operations.
- Implicit, personal, difficult-to-transmit knowledge, deriving from the experience and characteristics of individuals. It is less concrete than the explicit knowledge, more difficult to gain access to and often not shared with another person (many people are unaware of the knowledge they possess or of their value to others²⁴)

Knowledge management is the process through which the knowledge organization and coordination take place. It involves:

- grouping different types of knowledge into categories, starting from the main organizational sources, and up to the emergence of the internal memory.
- stocking knowledge, which means keeping it in safe conditions in the knowledge infrastructure of the organization.
- classifying knowledge, in order to assess it and prioritize the specific bits that reflect the quality of knowledge, respectively the degree of adaptation to the requirements of processes.
- selecting knowledge, which allows the user to apply specific criteria to identify the most appropriate knowledge.
- disseminating knowledge, through which knowledge stocked under various forms (tacit or explicit) are accessed by all the members of the organization and even by its stakeholders – clients, suppliers, etc.

The identification and codification of assets represented by knowledge are often achieved by concentrating on using the information systems during these processes, so that they can be exploited as a source of competitive advantage. However, most of the times, this obsession for instruments and techniques make the implemented systems fail, as they do not take into consideration some basic factors. On the one hand, whenever the human factor manifests resistance, even the most effective systems can fail (they overestimate the effects of using the IT technologies on organizational performance), on the other hand, we suppose that knowledge can be codified, which is not always true.

For a system to work properly, people should be willing to contribute to the development of the knowledge database and to use the knowledge stocked in this system, a highly optimistic supposition if we consider the problems that might arise from understanding other people's mental models. This situation is not unusual, especially in the interdisciplinary fields.

²⁴ Michael Polanyi used to say „ We know more than we can tell”. Polanyi is considered the founder of the modern theories of understanding the tacit knowledge. He understands knowledge as a process in which individual aspects and culture interact. In this context, Polanyi's research focuses on the idea that it is impossible to express the entire amount of knowledge in current communication, because at the foundation of every person's acts lies his/her individual experience.

For the private sector, the specialized literature describing the aspects, the challenges, the opportunities and the solutions of using knowledge management is plentiful; on the contrary, for the public sector, very few analyses have been made so far.

In the public administration, huge amount of data are transmitted, most of the associated activities concentrating on generating information and knowledge for the citizens, the business environment, and the society. Most of the final products of the governmental activities are delivered as information and knowledge. As information and knowledge stand for the “heart” of public administration, the capacity to collect and generate useful information is a defining aspect for any modern state. Information generates information, but the pieces of information are rarely combined to obtain systematic knowledge.

The dimension and geographical dispersion of the public sector make some pieces of knowledge available in a certain place and unavailable in other. In this respect, measures have been taken to eliminate these differences by **introducing new governance techniques** known as electronic governance (e-Governance), which allow the electronic collection and distribution of knowledge situated at the core of the relationship between the citizen and the state, such as the detailed presentation of political and administrative activities, which determine the decision factors to become more responsible, the governmental auctions, the population statistics and the cadastral survey techniques, etc.

Although it was suggested that successful techniques be applied both in the private and the public sector, the significant differences between the human resource management policies and practices, the ethical aspects management and the decision-making process imposed special knowledge management strategies for the public sector. The main differences are featured as it follows:

- the pressure of competitiveness and the efforts to diminish the costs are less important than in private companies, although their impact has recently started to grow, thus knowledge have become a critical determinant factor of the competitiveness in the public sector. In an economy of knowledge, *governments are more and more confronted with competition on a national and international level in the field of service delivery and policy implementation*. On the international level, the non-governmental organizations and the governmental institutions enter in competition with similar structures from abroad, which provide similar services. On the national level, the competition between the public organizations is encouraged by the process of decentralization.
- the private companies produce goods and services which are more and more intensive in intangible capital, thus directly competing with public sector organizations providing services such as education, security, science, knowledge. For example, by means of distance learning and on-line courses and information, the private companies have an increasing influence upon public education, traditionally provided by the public sector.
- in the public organizations, there is a vertical hierarchy from the point of view of the management and fewer stimulants for innovation and team work, and the results are less clear and measurable.
- The activities of public organizations involve much more knowledge and information, and the personnel should be highly qualified. These organizations cannot function properly if specific mechanisms for knowledge management are not implemented. **Knowledge is** an important element in a competition and **a strategic resource in the process of governing**. And efficient governance is based on the proper acquisition and dissemination of knowledge.
- The public sector operates in an environment which favors transparency and access to a large amount of information.
- The frequent transfer of staff from one department to another creates the opportunities to preserve knowledge and institutional memory.
- The analyses made in several countries show that many senior public clerks are due to retire in the next 5 to 10 years (in the United States, 71% of them retired in 2007, in Finland, 85% will retire by 2012) (OECD [12]). This is why the public organizations must take immediate measures, so that their knowledge is preserved in the organizational memory.

Declared a priority research field, knowledge management knew its first analysis on specific practices in the public organizations in the OECD member states in 2004. Unfortunately, on Romanian institution took part in the elaboration of the above-mentioned study. The general conclusions of this study were:

- Knowledge management is on the agenda of most of the inquired organizations, ranking among the first five management priorities.
- Despite the fact that the increase of transparency of applied policies and of the level of investment in IT technologies has led to the improvement of efficiency in the public sector, some of the expected structural reforms, resulted after applying knowledge management practices, have not been materialized. Among these, we can count: the increase of competitiveness of public clerks, the promotion of further education, etc.
- Perfecting the knowledge management practices, apart from using new instruments, processes and strategies, involves a long-term effort, if a change at the level of the organizational culture is intended.

While analyzing the basic elements which must be taken into account in the knowledge management applied in the public sector, we have noticed that they concentrate on:

- the human factor and the organizational culture, in order to stimulate and develop the knowledge transfer and exploitation skills;
- the processes and methods of localization, creation and transfer of knowledge;
- the technology, so as to stock and make knowledge acceptable, as well as to allow team work without the effective presence of people at the same place;

Out of the above elements, the human factor is the most important, as knowledge management depends on people's willingness to disseminate and re-use knowledge.

Primăria Sectorului 1

The performances of water supply public service are influenced by a large number of organisations from public or private sector, of different importances and sizes. The actions of those “actors”, defined in the context of this paper as “stakeholders”, have a great impact on the key performance indicators related to the water supply market. By identifying the connections between the importance and influence of the key stakeholders, on the one part, and the management performance and service quality, on the other part, we can evaluate the efficiency and the potential risks of the current organisational and functional framework of the supply system. This analysis can be used to identify way of action in order to implement european directives regarding the operators regionalisation and the promotion of local council associations in order to access the financial resources needed to sustain regional development projects.

Water supply system; stakeholder analysis; regional development projects

The performances of water supply public service are influenced by a large number of organisations from public or private sector, of different importances and sizes. The actions of those “actors”, defined in the context of this paper as “stakeholders”, have a great impact on the key performance indicators related to the water supply market. This impact can be splitted in three categories:

1. Technical impact:
 - the quality of the service;
 - the rehabilitasation of the supply network;
 - restructuring and reorganisation process;
 - the usage of modern technologies for water treatment, its distribution monitoring, and for the losses reduction;
 - the setting-up of purifying stations.
2. Economical impact:
 - the correct determination of the investments efficiency within external financing programs;
 - the promovation the economical analysis, according to the European standards;
 - a scientific base for the determination of the two-part tariff structure for water supply public services;
 - establishing the organisational and functional structure necessary for the external payment of public services taxes and the introduction of the unique bill;
 - setting-up possibilities for the implementation of specific management methods and techniques regarding the competition conditions or the natural monopoly;
 - introduction of unique indicators of benchmarking in order to monitor the operators activity efficiency.

3. Social impact:

- the correlation of the population affordability level for these public services with their economic costs;
- the reorientation of the operators activities in order to satisfy the needs of the consumers/beneficiaries;
- conditions for economical water consumes, environment and limited natural resources protection.

Considering the fact that the public water system is used by most of the inhabitants and private companies, the water supply service must fulfill certain standards and quality criteria. For this reason, when we refer to the stakeholder problem, we must consider that in this category can be included many other organisations, not just water supply operators, which play different roles in planning, controlling, informing the consumers, and taking decisions in the areas covered by operators. Generally, we can identify *seven stakeholder categories*: operators, consumers, public administration authorities, governmental agencies and authorities, professional associations, research and development organizations and financing institutions.

We consider that the principal management technique that can be used in the analyse of the stakeholder sector for water supply services is the **stakeholder matrix**. In order to define the importance and influence of each stakeholder, we can consider the following **criteria**s:

- The *capacity* of the stakeholder to influence positively or negatively the performances of the service, that can be quantified by using an international benchmarking system such like the benchmarks developed by IWA (International Water Association) and IBNET (International Benchmarking Network for Water and Sanitation Utilities) or the ones promoted by World Bank. The capacity of the stakeholder is determined by the power to promote and sustain his interests on the market, by controlling important resources or key informations.
- The *influence area* of the stakeholder, which is determined by the number of inhabitants that are affected by his decisions, and by the covered geographical area of the service.
- The *economic power* of the stakeholder, described by the principal techniques and financial indicators of his activity, by the quantity and quality of the controlled resources, and by his capacity to attract financing institutions.
- The *interest* manifested by the stakeholder regarding the achievement of a high efficiency and efficacy level for the management and quality of the service.
- The *social position* of the stakeholder, which is given by his visibility and credibility at local, regional, national or international level.

Considering this criterias, we can promote a classifying system for the stakeholders of water supply public service that groups them in 4 categories (A,B,C,D) and 16 subgroups (Figure no. 1).

		Stakeholder Importance			
		Unknown	Little/ No Importance	Some importance	Significant Importance
Stakeholder Influence	Significant Influence	C		A	
	Some Influence	C		A	
	Little/ No Influence	D		B	
	Unknown	D		B	

Figure no. 1 Water supply service stakeholder matrix

The first area (A) includes the most powerful stakeholders from the water supply market, who have the greatest influence on the service performances. This means that any strategic action (legislative modifications, operators regionalisation, implementation of the binom tariff etc.) must satisfy their interests. In the A category we can identify the following „actors“:

- a) *The most important water supply operators* in the region, that covers a large geographical area and many beneficiaries. Generally, those stakeholders operates in big cities and has operating licences (from class I to III) from the National Regulatory Authority for Municipal Services). Also, they have a much greater financial capability then the other operators in the region.
- b) *Regional Council*, that administrate the public and private domain and is responsible to develop strategies, forecasts and economical development programs. This stakeholder can influence decisively the management of the service at tactical and strategical level, by increasing the cooperation between the local councils of the region, especially the small ones.
- c) *A serie of operatos with moderate influence and importance*, that operates in medium towns with more than 30.000 inhabitants. Their influence is limited to the covered area. Ussually about 15-20% of the region’s population is supplied by operators from this category.
- d) *Local Councils*, whith moderate influence which is gived by their lack of capability to attract external financial resources. This is why European Union recomends their association in order to obtain finances to sustain regional development projects. Presently, in most of Romania’s small towns, local councils are also water supply service providers.
- e) The *Ministry of Administration and Interior*, with moderate influence because of his responsibility to analyse the legal situations of the water supply public services.
- f) *Other ministeries, authorities and governamntal agencies* (ANRSC- National Regulatory Authority for Municipal Services, Ministry of Environment and Water). ANRSC has a direct influence on the service performace by licensing the operators from the market, and the Ministry of Environment and Water is one of the principal organizations that can accelerate the process of infrastructure and service quality development by promoting european financing programs like FEDR (European Fond for Regional Development).
- g) *Representative international financial institutions* (European Bank of Reconstruction and Development, European Investment Bank, World Bank, Council of Europe Development Bank etc.), with medium influence on the market considering the fact they control a large ammount of financial resources, but their influence does not affect directly the quality of the service. In this context, a priority that operators must consider in order to increase the interest of these stakeholders is the use of some specific techniques such as: masterplans, cost reduction programs, post-fesability studies, mathematical models for forecasting evolution of the tariff etc.

The second area (B) includes the stakeholders that are very important for the continuity of the service, but with small influence on the service performance. Although, considering their significative importance, there is a strong need to protect their interests. In this category we can identify the following stakeholders:

- a) *Consumers* (population and companies), which represents the beneficiaries of the service. These stakeholders are affected first of all because of the monopolistic character of the service. Also, their actions are limited because of the lack of visibility and preoccupation of the organisations responsible for promoting the interests of the consumers, such as the Office for Consumer Protection, the Regional Directions of Public Health, some research&development organisations and the representants of civil society.
- b) *National Administration of Romanian Water*, represented by regional departments, who has the quality of unique operator for the surface and subsurface water resources. This stakeholder has a direct influence because of his responsibility to approve the regional water management strategic plan.
- c) *Federations and professional associations* (Romanian Water Association and Romanian Local Authorities Federation). The influence of this stakeholders is insignificant and hard to be cuantified, but their importance is high because they can accelerate the transfer of knowhow, disseminate best practices and increase the operators visibility. Those are premises for an intensification of investments in research and development and training of operators personell.

The third area (C) includes stakeholders with moderate influence on the market. Also, these stakeholders doesn't have a direct interest to increase the managerial performance and the quality of the service. For this reason, they can be considered a significant source of risk. Zone C includes:

- a) *A group of medium sized operators* with small importance and influence because they cover a small part of the market (cities between 10.000 and 30.000 inhabitants).
- b) *The Prefecture* of the region, that cannot be considered a stakeholder with significant importance, but that strongly influence the performance of the service. This stakeholder monitorise the implementation of projects which are financed by international institutions and verify the legality of the local public authorities decisions in the field of water supply service.
- c) *National Authority for Consumer Protection*, represented by her regional offices, who monitorise the way operators respects the rights of the water supply service consumers.

Finally, **the fourth area (D)** includes the stakeholders with limited or unknown influence and importance. Even so, their interests must be considered in the regional development strategy. The stakeholders includes *the rest of the water supply operators*, who operates in small sized villages, with less than 10.000 inhabitants. Even their influence and importance is very limited, if they are grouped in associations, they can become a powerful decision unit. Generally, about 30-40% of the region's population are supplied by this type of stakeholders.

By identifying the connections between the importance and influence of the key stakeholders, on the one part, and the management performance and service quality, on the other part, we can evaluate the efficiency and the potential risks of the current organisational and functional framework of the supply system. This analysis can be used to identify way of action in order to implement european directives regarding the operators regionalisation and the promotion of local council associations in order to access the financial resources needed to sustain regional development projects.

RISKS MANAGEMENT. A PROPENSITY SCORE APPLICATION

Constangioara Alexandru

Oradea University, Faculty of Economic Studies, email sandu_oradea@yahoo.com

Abstract Risk management is relatively unexplored in Romania. Although Romanian specialists dwell on theoretical aspects such as the risks classification and the important distinction between risks and uncertainty the practical relevance of the matter is outside existing studies. Present paper uses a dataset of consumer data to build a propensity scorecard based on relevant quantitative modeling.

Key Terms: Risks Management, propensity scorecard, business application

Introduction

Suppose that you work for a mail order enterprise that sends out a catalog of furnishings and housewares each month. As part of an upcoming sales campaign, you want to distribute a special catalog that is devoted to fine dining and contains kitchenware, dishes, and flatware. It's too expensive to send this catalog to all of your customers, so you need to target those most likely to buy. You do this by developing a propensity model and then using it to produce a new mailing list. Fortunately, you have an extensive record of customer purchases. The data includes variables that indicate whether customers bought kitchenware, dishes, or flatware in the past two years. This purchase history has been used to create a data set, which contains 65 variables and 1765 observations. A variable that is labeled TOTAL DINING (kitch+dish+flat) has been created. It contains the sum of the variables that are labeled Kitchen Product, Dishes Purchase, and Flatware Purchase. This variable will be the basis of the model you build, as its values indicate an interest in dining wares. Based on this variable the DINEBIN target variable has been constructed. A profit matrix is computed based on costs and incomes associated with each action. Present analysis takes into consideration the prediction accuracy of different models and the probability threshold is assigned based on maximizing the profits. Oversampling has been used to obtain the training dataset in order to boost the occurrence of subjects interested in buying dining wares.

The Model

A summary of the statistical methods for assessing credit risk is offered by Hand and Henley (1997). Statistical scoring uses predictor variables to yields probabilities of default or to predict the repayment behavior of borrowers. Schreiner (2003) argues that Regression estimations, Discriminant analysis and Decisional trees are the most prevalent statistical methods that are used in assessing credit risk. However more sophisticated methods such as nonparametric smoothening, mathematical programming, Markov chains, recursive partitioning, genetic algorithms or neural networks are also available. Present analysis begins with considering Tree Analysis, Regressions and Neural Networks. Preliminary results allow us to drop Tree Analysis as comparatively inefficient.

A comparison between prediction accuracy of Regressions and Neural Networks is presented in Figure 1.

Figure 1 Prediction accuracy of Regression and Neural Networks

As one can see Neural Networks analysis leads to superior prediction accuracy. After training and validation of the model, you can see that it accurately predicts a purchase approximately 35 percent of the time for the top 10 percent of scores. This in turn has same implication about profits, as presented in Figure 2.

Figure 2. Non - Cumulative Estimated profits

The **Profit** chart calculates anticipated profits by combining response rates with the information that provided in the target profile. You can see that the neural networks model, if it's applied to the top ten percent of scores, should yield an average profit of about \$20 per target. The decision tree model should bring in an average of \$ 15, thus, combining the two strata yields a rough average of \$ 17 per target. Profit chart confirms the superiority of Neural Network model.

Table 1. Models main results

	Neural Networks			Regression		
Average Profit	4.18	2.99	2.90	3.71	2.75	2.81
Misclassification Rate	0.48	0.49	0.53	0.48	0.50	0.52
Average Error	0.61	0.66	0.66	0.62	0.66	0.66

Taking into consideration average profit, misclassification rate and average error Table 1 confirms the superiority of Neural networks model. Propensity scores based on this model are presented in Table 2.

Table 2. Propensity score abstract

Obs	DINEBIN	P_DINEBIN1
1	1	0.52
2	1	0.52
3	1	0.52
4	1	0.52
5	1	0.52

6	1	0.52
7	1	0.52
8	1	0.52
9	1	0.51
10	1	0.49

We see that our model is accurate in predicting propensity scores. The propensity scorecard employs the top 30% of scores which maximizes profits.

Conclusion

Neural Networks analysis has proved superior to regression in modeling the propensity scores in present risk management application. The prediction accuracy of the model is very good for top scores. Analysis predicts an average profit of \$ 4.18 with a maximum of \$ 20 for the top 30 % scores.

RISKS MANAGEMENT. DATA ISSUES WITH RISKS ESTIMATIONS IN CONSUMER CREDIT

Constangioara Alexandru

Oradea University, Faculty of Economic Studies, email sandu_oradea@yahoo.com

Abstract Risk management is relatively unexplored in Romania. Although Romanian specialists dwell on theoretical issues such as risks classification – existing today as many classifications as papers on risks – practical issues of modeling risks were neglected. This paper focuses on important data considerations that affect directly the estimations' results.

Key Terms Risks management, business application, data issues

Introduction

Following the significant development of consumer credit market after the 1980's, the risk management of consumer lending has become critical to protect the interests of both lenders and consumers. Modeling default probabilities has received considerable attention, both in theory and in practice.

I have used an anonymous Hungarian dataset of 5060 observations of existing accounts of loans for personal needs. There are three groups of variables. A first group consists of demographic characteristics. A second group of variable refers to the financial situation of the borrower and the third refers to the loan and re-payment history. The old scoring date variable has been used to determine the tenure of the accounts. In the analysis I have constructed several banded variables.

Results

I ahve employed regression analysis of the default cases. Main results are presented in what follows.

Tabel 1. Regressions' main results

Label	Estimates	T-scores
Intercept	-3.60	-0.27
Current account NO	0.27	2.54
Employer CO W UNLIMITED	2.51	0.19
Employer LTD	1.73	0.13
Employer OTHER	-0.16	-0.01
Employer PENSIONER	0.31	0.02
Employer STUDENT	-6.03	-0.07
Employer PRIVATE ENTREPRENEUR	0.94	0.07
Marital status DIVORCED	0.61	1.80
Marital status MARRIED AND COMMON-LAW	-0.54	-1.85
Marital status SINGLE	0.00	0.02
Residence ownership FAMILY	-0.80	-2.83
Residence ownership OTHER	0.12	0.19
Residence ownership OWN	-0.70	-2.64
Residence ownership RENT	0.75	1.33

Table 1 presents the main estimates and their statistical significance. A stepwise procedure was employed so the coefficients are statistically significant by definition. We see that estimates have the appropriate sign.

Figure 1 and 2 presents how well our models do in terms of predicting default cases.

Figure 1. Cumulative estimated default

Figure 1 shows that our models does well comaped with baseline model . However the question regarding its accuracy is still on.

Figure 2. Non - cumulative estimated default

Figure 2 shows that for top 30 predicted default model does better than the baseline underlying model. However the Table 2 shows a different perspective underlying the existence od several data issues.

Tabel 2. Predicted default

Obs	Default	P
1	NO	0.22
2	No	0.20
3	NO	0.19
4	NO	0.17
5	NO	0.17
6	NO	0.17
7	NO	0.17
8	NO	0.17
9	NO	0.16
10	NO	0.16

Concluding remarks

There are several issues that might bias the analysis of credit risk. A first issue is that the monitoring period of arrears is short, which raises the question regarding the maturity of the accounts. Immature accounts are considered those which do not have time to “go bad”. In practice behavioral scorecards need to rely on at least a two years observation period.. On the other hand, using data on existing accounts to predict default probabilities is problematic because of selection bias issue. Furthermore empirical papers underlines that the developing sample must include an equal number of defaults, non-default and rejected cases. Another issue that might compromise the results is the population drift. This refers to changes in time in the distribution of population. This issue is particularly relevant for transition economies, as Natasa Sarlija et al (2007) have found in a study using Croatian data.

A STUDY OF HUMAN RESOURCE MANAGEMENT PRACTICES IN ROMANIAN PRIVATE COMPANIES

Conțiu Lia Codrina

„Petru Maior” University, Faculty of Economics, Law and Administrative Sciences, 69 Livezeni Street,
Târgu-Mureș, liacontiu@yahoo.com, 0740094636

In a society based on knowledge, the human force becomes the best card to get a competitive advantage. The HRM practices can make the difference in an environment in which competitiveness becomes the main element and the economic growth is influenced by diverse factors.

In the past, researchers focused almost exclusively on how changes in HRM practices affect employee performance or satisfaction, but now researchers are beginning to ask how organizational conditions shape HRM practices.

In our paper we aim to diagnose two private organizations from human resource management practices perspective, the hypothesis being that HRM practices differ based on the company's size and activity length.

Key words: human force, human resource management practices, private companies

Human Resource Management Practices – Literature review

Human resource management (HRM) practices are being increasingly treated as dependent rather than independent variables. Whereas in the past researchers focused almost exclusively on how changes in HRM practices affect employee performance or satisfaction, researchers now are beginning to ask how organizational conditions shape HRM practices. Examples of organizational conditions hypothesized to impact HRM practices include strategy (Hambrick and Snow 1987; Snow and Hrebiniak 1980; Olian and Rynes 1984; Lawler 1984; Hambrick and Mason 1984; Gupta and Govindarajan 1984a, b; and Miller, Kets de Vries and Toulouse 1982), organizational life cycle stage (Kochan and Chalykoff 1987; Kerr 1982, 1985), technological change, union presence, internal labor markets and even whether or not an organization has a personnel department (Osterman 1984; Pfeffer and Cohen 1984; Cohen and Pfeffer 1986).

Until recently almost all HRM research was dominated by the *technical* perspective. The technical perspective presumes that organizations wish to plan, staff, appraise, compensate, train and develop their employees in order to ensure that the right people (skill-wise) are in the right place (job) at the right time (Collins 1979). The technical perspective leads to research designed to develop techniques for maximizing the match between employees' knowledge, skills and abilities on the one hand and the demands of the jobs on the other (Schneider 1985). The presumed result of good matching is organizational effectiveness, from which individual employees and the organization as a whole both benefit.

The *control* perspective views HRM practices as a means for organizations to ensure the predictability and reliability of social interactions. The goal is to ensure that employees behave as solid citizens, living according to organizationally approved norms and values (Noland and Bakke 1949; Hollingshead 1949; Bowles and Gintish 1976; Edwards 1976; Collins 1979). This perspective recognizes that organizations attempt to govern social performances in addition to job performance. Desirable social behaviors presumably include getting along well with others and acting as a good citizen who shows concern for the organization's functioning.

The *institutional* perspective posits two major explanations as to why organizations use particular HRM practices: organizations copy the practices they see being used by others, and/or they adopt practices to gain legitimacy and acceptance (Meyer and Rowan 1977; Zucker 1977; Meyer 1980). The institutional perspective assumes that legitimacy and acceptance are important objectives for most organizations because constituencies have the power to offer and withhold resources which, in the long run, may determine the firm's economic performance.

The *political* perspective holds that HRM practices reflect the distribution of power in an organization. For example, having an extensive set of HRM practices implies a powerful personnel department upon which others must depend when making personnel-related decisions (Osterman 1984; Pfeffer and Cohen 1984). But existence of other powerful groups-such as unions or competitors who minimize their labor costs-may act to countervail or suppress the expression of the personnel department's wishes (Doeringer and Piore 1971).

As suggested by Kochan and Chalykoff (1987) the *economic* perspective can also explain variations in HRM practices. Relatively affluent conditions in an organization permit it to pay higher wages. This in turn enables an organization to attract more job applicants and be more selective. Higher selectivity (lower selection ratios) diminishes the need to train employees. Furthermore, the attraction of more highly qualified individuals may lead to conditions that give more power and discretion to the employees, thus reducing the attractiveness to them of collective bargaining. The reverse scenario holds under less affluent economic conditions (Osterman 1984).

Based on the five perspectives previously presented which help explain some of the variation and similarity in HRM practices across organizations, we aim to diagnose two private organizations from human resource management practices perspective.

Our **hypothesis** is: HRM practices differ based on the company's size and activity length.

Method

Sample

One of the private organizations (organization 1) is a society of financial investments services, with 120 employees and 20 certified offices at national level. It was set up in 2005 and its portfolio range between mining industry, pharmaceuticals, chemical industry, construction materials industry and car spare parts.

Organization 2 is member of a Romanian holding having entirely private capital. It was set-up 14 years ago and its main activity is civil and industrial constructions. Its current portfolio of clients contains individuals, companies and public institutions at local and national level. The company has 900 employees specialized in different fields.

Questionnaire

In our study we used a quantitative method – a questionnaire with 56 questions addressed to the human resources manager. It contains mainly closed questions, the respondents have either to rank a set of values or to choose one value at the expense of another in a forced choice format, but there are also some open questions specific to the human resources management practices.

Procedure

The questionnaire was developed in Romanian and self-administered and it took approximately 20 minutes on average to complete.

Results

The first set of questions refers to HR recruitment, selection and integration.

Organization 1 has an *open* policy, the recruitments being done according to the current and prospective needs; organization 2 has a *prospective* policy, the employments being done in order to raise the organization's potential on a medium and long term. The privileged population for both companies, when it comes to employment, is composed of *young people without much experience*.

In the candidates' prospecting, organization 1 uses ads in the written media, radio and on specialized sites, and organization 2, besides the previously mentioned method, uses prospecting in schools and universities which justifies its prospective policy in recruiting future employees.

The two analyzed organizations systematically redefine the positions and the profile of the appropriate candidate, using diverse selection procedures. Organization 1 prefers interviews and practical tests; and organization 2 uses, besides the previously mentioned techniques, questionnaires or tests.

In the candidates' final selection there are no other elements that interfere in the case of organization 1, but organization 2 uses, besides the initial criteria, recommendations. The rejected candidates are informed on the rejection motives, in both organizations.

The integration of the new candidates is realized through a tour of the organization. In the case of organization 1, the new employee gets a copy of the Organization and Operation Regulation. In both cases, the information of the new candidate regarding his/her responsibilities and management's expectations is carried out by his/her direct boss.

For the new employees, regardless the hierarchical level, there is always a probation period (organization 2) and only sometimes in organization 1. In the case of a probation period, both organizations define appropriately and communicate the employee the duration of this period and the evaluation criteria. If, after this probation period, the management of the two organizations come to the conclusion that the new employee can not be retained within the company, he/she is told in detail the reasons of such a decision and he/she would be helped to find another job (usually on another position within the company – organization 1).

The second set of questions regards the ***HR prevision management***.

Both organizations calculate the HR necessary according to their forecasting regarding the activity evolution. It is taken into account the fluctuation and absenteeism, the forecasting being adjusted based on the new businesses contracted. The management of organization 1 makes alternative scenarios for situations in which the activity volume increases, but the management is not concerned with the decrease of the activity volume, maybe because the organization's activity is developing. The management of organization 2 makes alternative scenarios both for the increase and decrease of the activity volume; as such an analysis is useful in the case of a demand fluctuation.

The third set of questions regards the ***HR training and career development***.

Both organizations consider the development of employees' competency as a major objective, HR training and career development being seen as a strategic investment. Annually, both the management of organization 1 and organization 2 evaluate the training needs, the starting point being different. Organization 2's evaluation is based on the *needs and objectives defined by the organization's management*; and organization 1's evaluation is based, besides the previously mentioned elements, *on the needs or objectives expressed by the employees*. Both organizations design a plan for HR training and career development, and annually they evaluate the training activities, as well as the results obtained regarding the employees' performance improvement. Regarding the notable performances in the HR training recorded in the last 12 months, only organization 2 has specified the *promotion of the trained personnel*.

The fourth set of questions regards ***the reward management***.

The level of the average salary in organization 2 is identical with the brunch salary, and the payment systems used are: global salary agreement, hourly fees payment, payment for performance. The management of organization 2 uses non-financial rewards as: free access or with a lower price to the company's wellness spa. The management of organizations 1 uses pay for performance and there are no non-financial rewards.

The fifth set of questions refers to the ***HR evaluation and promotion***.

Both organizations practice annual systematic HR evaluations, the results being communicated to those concerned. When these evaluations are positive (together with the training attended by the respective person), they are used as the basis of internal promotions in both organizations.

The sixth set of questions regards the ***working conditions***.

Regarding the level of endowments at the working place, respectively offices and execution area, it is a *good* one for organization 1 and a *very good* one for organization 2. This means that there is room for improvements in the working conditions within organization 1, even though *good* is a positive aspect.

As regards the level of endowments with protective and working equipments, as well as with sanitary materials, the same level is recorded in both organizations.

The seventh set of questions refers to the ***social relationships***, including *working conflicts* and *social protection*.

There are recorded no working conflicts, either officially declared or spontaneous, and there are no vindications formulated by the labor unions or the employees representatives in the last year. Also, there are no vindications considered right by the management of the analyzed organizations but for which they could not find solutions or financial resources.

Regarding the social protection there have been taken into consideration a few aspects that can improve the relationship and the employees' performance. The companies provide no lodging for their employees. In the case of organization 2, the employees have the transportation assured by the company, there are two buses used for this service.

In the case of organization 1, the top management and the execution personnel (approximately 10% from the total number of employees) use company cars. In organization 2, the company cars are used by 70 employees and the administrative personnel.

All the employees of organization 2 benefit from lunch tickets and the company provides meals for 200 persons in the company's canteen. Organization 2 has a doctor and a contract with a dentist. Through this contract a part of the fees are supported by the company. There are 34 employees in organization 2 who have private health insurances paid by the company.

The eighth set of questions regards the *communication with employees*.

Both companies have a systematic policy to inform their employees, the results obtained and main orientations, as well as the objectives of the company are being periodically communicated to the employees. None of the organizations have an internal publication for employee. In the case of organization 2 the management uses forms of upward communication (suggestion boxes, quality circles, internal memos). Both organizations use employee counseling methods.

Conclusions

Based on the analysis, we can conclude that both companies are efficient from HRM point of view. Both organizations are continually developing, having a market in expansion, the difference between them, which may influence the HRM practices, are the size and the activity length: organization 2 is large and relatively old compared to organization 1. The differences recorded are related to prospecting, selection methods, training needs evaluation, working conditions, and social protection area where organization 2 is more developed.

From the five perspectives presented, only three are representative for the analyzed organizations. The technical perspective presumes that organizations wish to plan, staff, appraise, compensate, train and develop their employees in order to ensure that the right people (skill-wise) are in the right place (job) at the right time. That is why both organizations are carrying out trainings for their employees and the trained people usually got promoted.

The political perspective holds that HRM practices reflect the distribution of power in an organization, having an extensive set of HRM practices implies a powerful personnel department upon which others must depend when making personnel-related decisions. The results of the analysis point out that human resource department of the two companies are relatively strong and well organized. There are no conflicts, which can mean that either the employee are satisfied with their work and rewards or the labor unions are not very strong compared to the management and HR departments of the companies.

The economic perspective can also explain variations in HRM practices. It is well illustrated by the analyzed organizations as they have a continually growing activity volume which means that they can give higher salaries. In the case of organization 2, which is larger and relatively old compared to organization 1, the management offers, besides rather good salaries, non-financial benefits. Also, the social protection is more developed in the case of organization 2.

Based on all these results, we can conclude that our hypothesis is confirmed, HRM practices differ based on the companies' size and activity length.

Business, as an object of the strategy, has been an attraction point for many established strategic management writers - I.H. Ansoff (1965), M.E.Porter (1980), H.Mintzberg (1988), M.Gervais (1995), J.Chevalier (2002), etc. In what follows, I will try to foreground a few of the most complex and pertinent typological approaches.

Strategy, strategic management ,generic strategies

1. Igor Ansoff’s approach

In 1965, **Igor Ansoff** suggested a matrix with four strategies which rapidly became very well known – **penetrating the market, product development, market development** and **diversifying**. 15 years later, Michael Porter introduced what will later become the most known typology for generic strategies: **based on costs, on differentiation** and **focused**. But both approaches are incomplete: while Ansoff’s is concentrated on the *extension* of the strategy, Porter’s focuses on *identifying* the strategy and bringing it to the foreground.

Ansoff’s approach is based on a 2x2 matrix, resulted from combining four elements: product, market, existent, new, as shown in figure no. 1:

EXISTENT PRODUCT	NEW PRODUCT	
PENETRATING THE MARKET	PRODUCT DEVELOPMENT	EXISTENT MARKET
MARKET DEVELOPMENT	DIVERSIFYING	NEW MARKET

Figure 1. Igor Ansoff’s Generic Strategies
(by I. Ansoff, Corporate strategy, McGraw Hill, New York, 1965)

Penetrating the market strategy wants to increase the sales volume for a product that is already on the market. The strategic objectives consist of obtaining an important market share or the position of market leader.

The product development strategy wants to increase sales by improving an existent product or by creating a new product which fits the demands of the market. This strategy is accessible to companies with a big innovating potential, with a new organizational structure or which use human resources through project teams or interdisciplinary teams. The management of these firms is orientated towards valuing distinctive competencies, towards indentifying and exploring the opportunities offered by the competitive environment.

The market development strategy wants to increase the sales volume for an existent product by penetrating new markets. This strategy aims at the geographical expansion of the company, but also at conquering new

market segments by creating new uses or adding new characteristics to the products, according to the consumer's needs.

The diversifying strategy aims to extend the existent business portfolio by adding new products, by using new technologies, new distribution ways to the ones the company already has. This strategy can offer the firm the advantage to use emergent or distinctive competencies.

2. Michael Porter's approach

Michael Porter (1980) thinks there are two types of competitive advantages a company can own: low cost and differentiation²⁵. These two combined with the essence of the company's operations – the aimed market segments – generate *three generic strategies* – *low costs*, *differentiation* and *focalization (based on costs and based on differentiation)*, as shown in figure no. 2.

COMPETITIVE ADVANTAGE		
Low costs	Differentiation	
1. LOW COSTS	2. DIFFERENTIATION	THE STRATEGY'S ESSENCE The entire aimed market
3a. FOCUSED ON COST	3b. FOCUSED ON DIFFERENTIATION	

Figure 2. The generic strategies' matrix (source: M.Porter, Competitive Advantage of Nations, Mac Millan Press Ltd., Londra, 1980, p.3)

The four quadrants of the matrix are then reduces to three basic types of strategies:

- *The domination through costs strategy*, specific to companies which produce and sell standardized products. The aimed market is vast, with numerous segments. Adopting this strategy implies intensifying the investments, which afterwards implies a productivity growth, a better organization of the production processes, rationalizing the products gamut, etc. This strategy is generally used by firms with a big financial power;
- *The domination through differentiation strategy* is adopted by companies which offer strongly individualized products. This strategy gives the firm a domination power exactly because of the uniqueness of the product's characteristics or services. It also implies a growing attention to maintain this advantage in front of the competitors;
- *The focusing strategy* implies the firm to concentrate over a narrow market segment on which they will try to obtain superior advantages from the ones obtained by the industry in its ensemble, by optimizing the differentiating cost. This strategy is generally adopted by small and medium companies, in order to avoid direct confrontation with stronger competitors.

According to Porter's generic strategies, we could consider the following:

²⁵ M.Porter, Competitive Advantage of Nations, Mac Millan Press Ltd., Londra, 1980, p.11

- the pragmatic value of a strategy is the realistic projecting of getting comparative advantages, which aim either the materializing of a low cost for the products or services, or their differentiation, according to one or more criteria, in comparison to the competitors' products.
- ensuring a low cost, under the costs' average from the respective field, is the first type of competitive advantage. Obtaining this advantage is the result of the actions taken over all the price's components (tied to aspects of the firm's internal environment, such as: infrastructure, human resources, technologies, the distribution logistics, the primary products and materials' production's logistics, marketing and sales, post-selling services, etc). In order to reduce as much as possible the cost of the finish product, the company must maximize production by counting on the savings obtained from large-scale or mass production. The firm can also practice other methods to reduce costs: the preferential access to raw materials, applying major innovations, etc.
- in order to obtain a different product in comparison to the competitors, a product preferred by consumers, the company's management must choose, by strategy, one or more attributes for the product, which are known as being critical for the people who will purchase the product (intrinsic quality, functions, the product's reliability, the delivery method, the promotion, the facilities offered at purchasing, etc);
- in reality, the two types of competitive advantages are combined in different proportions. At the same time, the intent to combine in equal measures the two strategies is impossible. The desire to obtain a perfect product, from the points of view of the price and quality, is meant to fail in the context of the existent highly competitive markets. This is why the managers must choose the strategies which prioritize one of the strategic advantages, while leaving the other advantage to a minimum level.

3. Henry Mintzberg's approach

Henry Mintzberg, an author with numerous contributions to the development of the strategic management and to the strategies' substantiating, classifies the strategies in accordance with two criteria²⁶:

- depending on their character and evolution: *static strategies* and *dynamic strategies*;
- depending on the development vector: *penetrating strategies*, *market development strategies*, *product development strategies* and *diversifying strategies*.

At their turn, the differentiating strategies can take many forms:

- **Price differentiating strategies** represent the easiest way to differentiate a product or a service. This strategy can be used by the companies which can't differentiate themselves otherwise. Thus, the producer can get a competitive advantage on the basis of smaller marginal costs or by accomplishing a big sales volume.
- **Image differentiating strategies** are based on creating a special image for the product. It can also include a simple "make-over" of the product, by using new wrapper, more attractive for the consumers, which doesn't lead to major changes in the structure or performance of the product.
- **Support activities (auxiliary) differentiating strategies**. This strategy is tied to the differentiating methods of the product connected to the support activities – delivering conditions, service, guarantee and post-guarantee services or for complementary products or services. This idea is sustained by Theodore Levitt also, who claims "no matter how difficult it is to obtain differentiation by projection, there is always a way to get a different type of differentiation, especially with the help of support activities"²⁷.
- **Qualitative differentiating strategies** target those characteristics of the product which make it *better* than the competition's product (and the product is not necessarily fundamentally

²⁶ H. Mintzberg, J. Lampel, J.B. Quinn, S. Goshal, The strategy process, Fourth Edition, Pearson Education International, 2003, p.120-125

²⁷ H.Levitt, Marketing Success Through Differentiation – of Anything, Journal of Marketing, nr.6, 1980, p.8.

different). This strategy refers to: the trust in the product, its durability and superior performances.

- **Design differentiating strategies** confer to the product something really different, which breaks all the conventional design patterns and give the product unique characteristics.
- **Non-differentiating strategies**: in the context of a vast market, of a poorly performing management, the only way to get an advantage is to copy existent products from the market.

Mintzberg also delimits the strategies, in accordance to the *position of the main business in one of the technological process' phases*, as follows²⁸:

- **Strategies of the primary development phases**, namely the phases in which one or more raw materials are combined in order to result different basic products with multiple uses. These phases tend to be intensive in technology and capital, more so than intensive in human resources and are rather looking to obtain a strategic advantage by keeping costs low.
- **Strategies of the secondary development phases**, namely the phases in which the use of a raw material allows obtaining semi-manufactured goods, which combined lead to finished products;
- **Strategies of the tertiary transformation phases**, namely the phases which include the product's assembling, transportation and distribution to consumers.

Another classification of Mintzberg, which has as criteria *the distinctive characteristics which allow an organization to get the competitive advantage*, gives him the possibility to delimit the following strategy types²⁹:

- **Projection strategies** which target fields like research and product development;
- **Processing strategies** which target: process and operations (fabrication, assembling, etc) developing;
- **Resources ensuring strategies** (materials, human, financial);
- **Delivering strategies** which are concentrated on the marketing domains (market channels, promotion), sales, distribution and service;
- **Support strategies** which target fields like: the legal domain, inspection, training, etc.

According to *the market opportunity's proportion*, Mintzberg offers another classification of the strategies, as follows³⁰:

- **Non-segmentation strategies** – the firm wants to take over an important part of the market with a product which has a basic configuration;
- **Segmentation strategies** – the company can choose to cover all market segments, or can be selective by positioning itself only on certain market segments;
- **Niche strategies** – allow the company to focus its attention to one market segment;
- **Individualization strategies** – represent the segmentation of the market to the point in which each consumer represents a unique segment. *Individualization in its purer form* represents the process in which the product is thought in its smallest details in order to satisfy the consumer's needs. In this case the entire value chain is influenced: the product is delivered in specific conditions, not only fabricated and assembled in this manner, but also specially created for a certain type of consumers. *Partial individualization* aims at basic design of the product, which is subsequently modified according to the consumer's needs and wishes. *Standardized individualization* – the finished product is assembled from standard components to which particularization elements from the consumer are added (the color of the car, the optional package, etc).

Abstract: Performance measurement techniques historically developed as a means of monitoring and maintaining organisational control, which is the process of ensuring that an organization pursues strategies that lead to the achievement of overall goals and objectives. This paper compares two of the most widely adopted performance management frameworks – EQFM and Balanced Scorecard. These methods are used to explain how strategic control and performance measurement can aid in the implementation of strategy and the improvement of organizational performance.

Key words: Performance measurement, Strategic control, EQFM, Balanced Scorecard

Introduction

Competitive pressures from within the industry, as well as external political, economic and other considerations are forcing the industry to re-examine and improve its *modus operandi*. The Royal Society of Arts, Manufactures and Commerce (RSA) said about the role of tomorrow's company:

„To achieve sustainable business success in the demanding world marketplace, a company must use relevant performance measures .”

The weaknesses in the current practice and highlighted areas of further work necessary to ensure the use of performance measurement is sustained and adds value to the industry. Andy Neely gives seven reasons why performance measurement is now on the management agenda. All of the points are relevant to any industry: the changing nature of work; increasing competition; specific improvement initiatives; national and international quality awards; changing organisational roles; changing external demands; and the power of information technology.

Performance Measurement Systems(PMS) and Strategic Control

Traditionally businesses have measured their performance in financial terms, profit, turnover, etc. These financial measures of performance have been the sole measures of a company's success. Performance measurement that has been based around financial measures has been deemed to be out of step with recent changes in industry, particularly relating to new technologies and increased competition.

Performance measurement is furthermore criticized because it often focuses narrowly on easily quantifiable criteria such as cost and productivity, while neglecting other criteria important to competitive success. The traditional performance measures, developed from costing and accounting systems, have been criticized for encouraging short-termism; lacking strategic focus; encouraging local optimization; encouraging minimisation of variance rather than continuous improvement; not being externally focused.

The subject of performance measurement is vast and numerous authors continuously add to the body of literature on the subject. The amount of literature on the subject demonstrates the problems that exist with performance measurement and its importance within the business community. Most authors agree that managers measure for two main reasons. Either they want to know where there are and what they have to improve; or they want to influence their subordinate's behaviour. Strategic control includes both of these

reasons. Initially strategic control was seen as enabling managers to see if their chosen strategies were being successfully implemented. This view has since been extended. Humans can be seen as "calculative receptors", their behaviour can be influenced by a strategic control system. They receive a stimulus, interpret this, assessing the perceived costs and benefits of various responses and are likely to chose whichever course of action will maximise their gain. Control through measurement and feedback follows action. Rewards or sanctions are then used to reinforce or modify behaviour depending on the employee's performance and on the appropriateness of the action pursued. A broader view is that strategic control systems will: co-ordinate the efforts of employees; motivate individual managers; and alter direction dependent on circumstances. Another view is that strategic controls can be used as a means of:

- clarifying what good performance is;
- making explicit the trade-offs between profit and investment;
- introducing individual stretch targets; and
- ensuring that corporate management knows when to intervene because business performance is deteriorating.

Andy Neely and Mike Bourne summarise that strategic control systems have multiple roles to play and, given that many authors argue that performance measurement is part of the strategic control process, then it follows that performance measures also have different roles to play. The multiple reasons why organisations measure performance can fall into one of four distinct categories:

1. Checking position. Establishment of current status and monitoring of progress over time and against benchmarks.
2. Communicating position. This can be a requirement, quoted firms must release annual reports, safety statistics must be submitted in construction, they may be expected by customers or employees, and also as a means of marketing themselves.
3. Confirm priorities. Performance data provide insights into what is important to a business, exposing shortfalls allowing organisations to rationalise and focus on what the priorities should be.
4. Compel progress. The measures can help the organisation focus on specific issues and encourage people to search for ways to change and improve performance. The measures communicate the priorities and can form the basis for reward.

J. Smullen identified five attributes for any PMS: acceptable - they can be understood; suitable - they measure important things; feasible - they are easy to collect; effective – they concentrate on encouraging the right behaviour; and aligned -non financial measures must link to financial goals. Other key attributes include: it must be the subject of a learning process; must be balanced; cascading scorecards; embody strength; not over financial; and it must be able to be implemented.

Performance measurement models

There are many types of performance model, for the purposes of this paper we will briefly consider two of the better known: the EFQM Excellence Model and the Balanced Scorecard,

The EFQM Excellence Model

The EFQM Excellence Model is a non-prescriptive framework, designed to allow companies to assess where they are on "the path to excellence", understanding the gaps and stimulating solutions. It is a tool to help define and assess continuous improvement of an organisation, and is based on their eight fundamental concepts of excellence: results orientation; people development and involvement; customer focus; continuous learning, innovation and improvement; leadership and constancy of purpose; partnership development; management by process and facts; and public responsibility.

The Excellence Model has been developed to enable the assessment of excellence against the above fundamental concepts (see Figure 1).

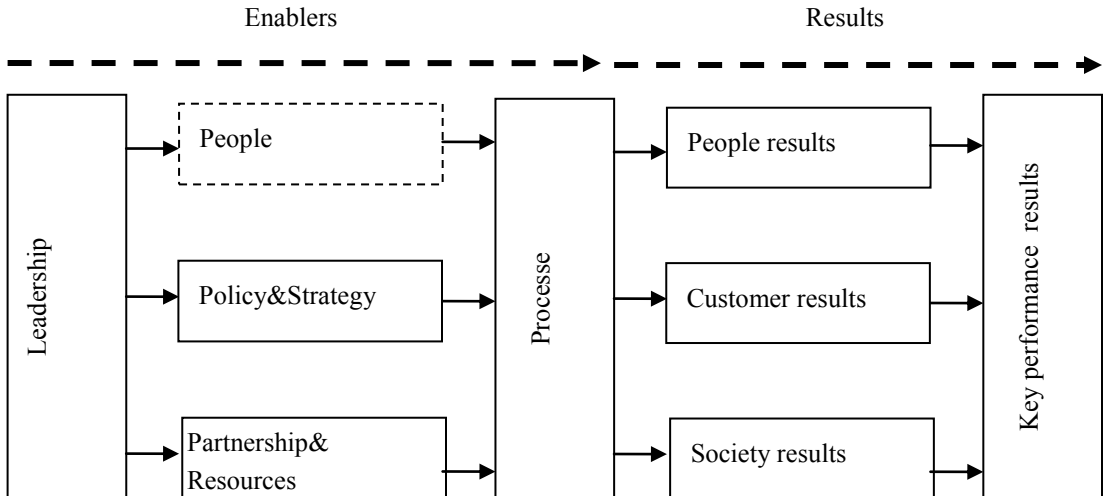

Figure 1. The structure of EQFM Excellence Model

The model has nine criteria and starts on the left-hand side with Leadership, This is one of the five enabling activities which drive the four sets of results. The model flows naturally from the left to the right. The analogy of an arrow going through the centre of the model starting on the left, can be used to explain how the model works and how the different criteria are intrinsically linked. Any decision or action of an organisation requires leadership. This leadership decides the company's policy and strategies, drawing on the capabilities of its people and its partnerships and resources. Having decided on its policy and strategy and ensured that its people, resources and partnerships are capable of supporting them, it then defines its processes which will deliver its customer results and its own key performance results. In delivering these results it also affects the employees (people results) and also the society in which it sits (society results). The model also requires continuous improvement through innovation and learning, so having achieved the results, the leadership must review them, alter the policy and strategy accordingly, develop the people and resources to implement the changes required and ensure that the processes are adapted to deliver the desired results. The cycle is continuously repeated,

The model is devised to be used as a self-assessment tool, which enables a comprehensive, systematic and regular review of an organisation's activities and results referenced against criteria within the model. There are five different approaches to self-assessment recommended by the EFQM. Dependent on the level of maturity with the excellence model, then the EFQM recommend the appropriate method of assessment. All the approaches deliver a score although only the more robust methods produce a score, which is comparable with those of the Quality Award Schemes.

The primary objective of the EFQM and their promotion of the use of the Excellence Model is to improve performance. The numeric score that is achieved is only used as a benchmark against which future performance is assessed. The primary objective of self-assessment is therefore the identification of strengths and of areas for improvement. The hope of the EFQM is that this process that will create the energy to improve the organisations performance. The EFQM have developed the RADAR Scoring matrix. The RADAR logic is cyclical and continuous, forms the areas of assessment on the matrix and is at the core of the EFQM Excellence Model. It can be applied to most business situations that involve a process (see Figure 2).

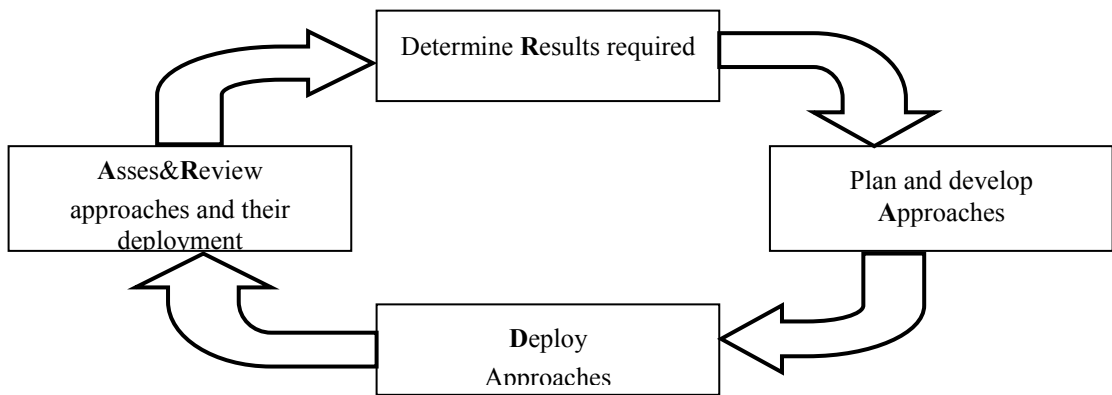

Figure 2. The RADAR logic

The Balanced Scorecard

The Balanced Scorecard is a framework in which to understand the relationship between objectives, activities and results and integrate the management process. It can aid precise articulation of the organisation's objectives, the formulation of strategy, the generation of plans and budgets, and the setting up of an information system for performance monitoring and management. It also leads to a cascading set of indicators which will enable the units within the organisation to co-ordinate their targets and behaviour with the overall strategy of the organisation. The Balanced Scorecard uses specific KPIs to assess the companies' performance. They must measure key strategic mechanisms for implementing and judging strategy for business. There are four areas where indicators are developed. These are:

- a) The financial perspective. How do we look to our shareholders?
- b) The customer perspective. How do our customers see us?
- c) The internal perspective. What must we excel at?
- d) The innovation and learning perspective. Can we continue to improve and create value?

There are key practical issues that are necessary for effective change within an organisation. These include top management support, and J. Smullen also recommends that a pilot project is used to develop the scorecard, suggesting that one is produced for a particular business unit and one for a critical business process. The other key issue is the development of and understanding of the strategy. The senior management must clearly identify the goals and how they are attempting to achieve these goals and also what are the constraints of the business in achieving these goals.

Types of performance measures

As mentioned previously, for KPIs to be used successfully, they need to be part of a PMS. When developing the measures for a PMS a clear understanding of the different types and applications of measures is required. The most significant problem with the KPIs ,in their current format, was that they do not offer the opportunity to change. They are designed to be used as post result "lagging" KPIs. Lagging measures are used to assess completed performance results. They do offer the opportunity to change performance or alter the result of associated performance. They are used only as a historic review. Leading measures do offer the opportunity to change. They are measures of performance whose results are used either to predict future performance of the activity being measured and present the opportunity to change practice accordingly, or to enable future decisions to be made on future associated activities based on the outcome of previous activities.

The EFQM Excellence Model identifies three specific types of measures. They distinguish between KPIs, KPOs and perception measures.

KPIs. KPIs are measures that are indicative of performance of associated processes. An industrial measure of absenteeism within companies is also a KPI. A high level of absenteeism could be indicative of problems with morale, which may have been caused by a number of different reasons, poor leadership, lack of work, poor working conditions, etc. If this measure is used as a leading indicator, then it can be used to

give an early warning, identify a potential problem and highlight the need for further investigation. This provides an opportunity to change and to take appropriate corrective action. The "cause and effect" relationship between the result being measured and the associated cause may be difficult to establish in a business environment. This is why a KPI can only be indicative of future performance.

The KPI s can be divided on three levels (see Figure 3).

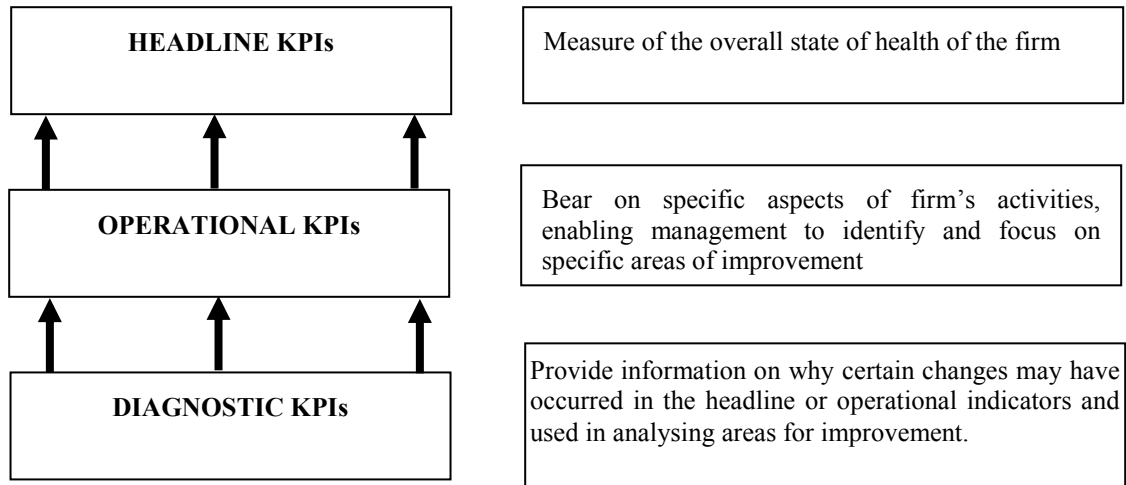

Figure 3. The levels of KPIs

For all types of measures benchmarking is very important. It is particularly important for KPIs because they are only indicative of associated performance. It is therefore the understanding that the KPI is indicative of predictable performance. For the performance to be predictable then benchmarked data through experience are required. If benchmarked data are not available then the decisions based KPI data, are based only on intuition. This level has been set based on benchmarked data either through experience of use or through testing. The user therefore knows that action needs to be taken to prevent the problem occurring.

A key part of a PMS is the use of results to aid the decision-making process. A strategic benchmarking initiative has most to contribute towards their change culture, process, improvement of performance and productivity. Benchmarking enables an organisation to identify its performance gaps and opportunities, and develop continuous improvement programs for all stages of their process.

KPOs are results of a completed action or process. They therefore do not offer the opportunity to change. Business KPOs include measures of profit, share price, market share etc They can also be used to measure the results of processes and sub processes, whose results in themselves cannot be altered. However the results could be used to make decisions to change how the next processes are carried out. For example, if one of the sub processes finished late by two days. The sub process KPO would indicate a two-day overrun. This sub process is complete and the result cannot be changed. However in order to achieve the overall result, additional resources could be utilised on the next processes to address this overrun. In this way the sub process KPO can be seen as a leading measure in the context of the overall result. The measure is of an enabling activity, a leading activity that will deliver a business result.

Perception measures can be used at any stage. They require direct feedback on past performance. They can be leading or lagging measures. For example, client satisfaction is measured after the completion of the project. This is therefore a lagging measure, which cannot be changed. However, if client satisfaction is measured at various stages during the project then these can be described as being leading indicators, ones which provide the opportunity to change future actions to affect the overall desired end result. Perception measures are usually carried out by direct question or survey. There is a danger that because employees and especially clients will become increasingly asked for feedback, the results could become negatively influenced. Some companies are starting to use employees to anticipate the perceptions of their clients.

Conclusion

It is clear from the research that performance measurement is only part of the business improvement process. Unless action is taken based on the results attained then the measures are meaningless, costing money to obtain and not adding value to business . Performance measurement must therefore be part of a system, which reviews performance, decides on actions and changes the way in which the business operates. It is the translation of the results into action that is crucial to achieving to improved performance.

Abstract: Human relations are very complex and important; they represent, in fact, the texture on which life itself stands, the structure of successes, the miracles or human disasters. Characters and attributes, human facts (good or bad), looks and gestures – all can create a code, a model or a style of inter-human communication. Communication, in its full meaning, as a transactional act, unavoidable in interaction situations, becomes essential, fundamental, for personal life as well as for individual social life. Therefore, concepts like “communication”, “idiom”, and “language” have many meanings. This fact arises not only from the intrinsic complexity of each concept, but also from the fact that they represent the researching object of many scientific fields of study, such as linguistics, psychology, sociology, cybernetics etc.

Key words: concept, study, communication, knowledge, education, information

The Psychological and Etymological Meaning of Communication

Clarifying the psychological and etymological meaning of this concept manifests like a necessity, especially if we consider its anchorage in an inter-disciplinary system. Therefore, in Latin, the verb “communication” comes from the adjective “munise” whose meaning was “doing its duty, helpful, polite”. The word created, by derivation, a very big lexical family from which we mention “immunize”= exempt of tasks, exempt from a duty (e.g.: “imun” means exempted from contracting some disease, not having the disease). According to some researchers, “communise” means to “share tasks with somebody else”. In classical Latin, as the meaning of its current follower it meant “which belongs to many or all”. Afterwards, “Comunicus” initiated the verb “communico”, reaching in Romanian through French, together with a range of neologisms from the last century and a half. Communication as an act, system, code or way, stands to the basis of social organization and development, influencing horizontal and vertical report between humans – interfering even in their intimate goals, but also in knowing reality.

Various specialists accept the idea that the capacity to formulate and send thoughts in verbal terms is representative for humans. More than this, any skill or ability and the possibility to communicate through a fluent language represent universal and specific characteristics for humans. Concepts that are related together in order to discover communication functions and explanation are: idiom, language, message, brain activity etc. Some aspects have to be mentioned in order to analyze the unity between idiom and thinking. On the one hand, idiom has a main function in expressing thinking, and on the other hand, thinking can be made only in linguistic forms. It is recommended to approach the concept of communication from a wider psychological perspective, with strong social nuances. Thinking started from a primal level, developing by itself when it was confusing and difficult supported by a more abstract, and, at the same time, more systematic language.

Since in this work we do not have the intention to expand the connection sine qua non which exists in relation with language, thinking and the language system, we only suggest some patterns in their approach. Nevertheless, all concepts will be related to the most common binding matter, which is communication. The possibility of a total conversion of our thinking and experience in language is questionable, because of the contradiction between their infinite variety and its limited number of code elements, which are used to send messages to speaker (some dozens of words, from which only 2000 are currently used). M. Zlate (1994) demonstrated that ever since 1969 “communication exists for us, whenever there is an exchange of

meanings”. We record the concept of exchange, but its content can be mentioned and the meanings can be sent by either verbal or non-verbal means.

Norbert Sillamy (1965) insisted on the feed-back character of communication. When information is sent, it produces an action upon the receiver and a retroactive effect upon the sender.

Anzieu and Martin (1969) highlight the component elements of communication as well as its orientation. Therefore, communication in education represents the set of psychical and physical processes by which the operation of connecting the teaching staff with the students takes place, in order to achieve the objectives of transmitting information to students about the field of study and required explanations in order for students to understand and learn.

Due to the communication-understanding process, many entities which communicate can reach conclusions, goals, norms, values and common principles, being able to create intra-group structures.

By the process of communication, communities are not only created but they also develop and, unfortunately, destroy. Communication is a process in which information is given and received. It is an implicative process in which members’ participation of a certain group is necessary. This participation should not be understood to exist only at the communication process level because the existence of groups and their common actions involve participation. Co-participation represents a partial involvement. There is a constant core in any group, and it effectively participates in achieving the goal and it manages the entire difficulties of actions. Therewith, there are some elements which are neither hostile, nor passive, but which participate, sometimes, only in certain actions in order to achieve common goal.

Consequently, we can consider communication-participation and co-participation extremely important in creating, maintaining and developing of the cohesion phenomenon regarding the inner group as well as about individual-group relation or the relation between two or more groups. Group existence and especially formal social structures within their frame involve automatically organization, alongside with norms, laws, regulations and hierarchy. We can state that one of the main advantages of actions’ organization is represented by the shortening of time period needed to reach the target goal. Another great advantage of the organization is to increase the safety level to group members as well as confidence in reaching target goal. The ultimate important advantage which we mention about organization is represented by the possibility of controlling actions.

In the Romanian education, at the macro system level, communication-organization divides in two, resulting the intra-systemic communication-education, case in which, focusing is inside of the system and inter-systemic communication-education, in which actions are based on the connection system-educational system.

Society continues to exist through transmitting, communication, but it is correct to say that it exists in transmitting and communication. It is more than a verbal relationship between words like common, community, communication. People live in community due to their common things, and communication is the modality by which they reach to collectively possess these things. To form a community or a society, they should have common goals, beliefs, dreams, knowledge – a common understanding – “same spirit” according to sociologists. Communication is the one which assures similar emotional and intellectual moods, similar ways of responding to expectations and requirements.

In order to know and manage an education unit, it is needed to identify facts and events which generate data, by precisely delimitating knowledge and management objectives, by establishing information carriers, as well as modalities to collect and register data, methods and tools to operate this data and information destination, their transfer to public receiver. The communication-information process, which is realized between school and local community, is important especially through transmitting messages capable to make citizens and their children interested in school.

Communication in the Educational Process

The didactical process which satisfies student’s needs according to its social, scientific and educational description is made through communication. The communication process has many agreements which we will present bellow. An agreement is based on informational transfer and counter-transfer. In other words, the agreement is based on information transmission, perception and giving a direction to this kind of information. The agreement between two entities (teaching staff and student) is realized according to the following principle: any sender entity (teaching staff) should have the capacity to transform itself in a

receiving entity and any receiving entity (student) should have the capacity to transform into a sender entity. Communication process, as agreement, is a circular one, in which the two participant entities constantly change their roles. Circular communication in didactical process is the most indicated in promoting active-participative methods. Otherwise, the didactic process could have only one direction, from sender (professor) to receiver (student), an old process which is not used nowadays.

A modern didactical process is the one in which the student participates to its entire development communicating with teaching staff on the debate topic, in this way succeeding in understanding the essence of the received information before leaving the classroom. This kind of communication process is presented in the bellow chart:

Based on the communication-understanding process, students communicate with the teaching staff and between them, reaching to common conclusions, goals, norms, values and principles, therefore, being capable to easily integrate in the social and economic structures, intra-group. Understanding is the positive valence under which we generally recognize communication, and misunderstanding is the negative one which can often have a positive effect.

Misunderstanding can appear between sender and receiver when the information flow is jammed or when the noise source is too high. Communication-misunderstanding can be also caused by non-crossing or crossing on very small portions of participant entities repertoires to the informational transfer or counter-transfer. Another cause of misunderstanding between two or more entities is represented by difference of opinions, of beliefs, but especially because of their different interests. Misunderstanding benefits to a group if this phenomenon does not pass some limits, if this leads to a constructive confrontation of ideas. It can also be a source of non-monotony but also a reason to divide the group in subgroups based on contrary interests. Thus, we can state that misunderstanding between two or more entities can create conflicts with enormous consequences.

Communication is done on three levels:

- Logical
- Para verbal
- Non-verbal

Experimental psychology studies on communication allowed the elaboration of a complex and systematic overview chart, for phenomena which are a part of this set of human activity – this does not mean that methods, purpose or effects are definitively explained. Methodologically, the communication study supposes two main aspects:

- the global approach of group communication;
- the details' neglect in the communication processes and mechanisms with warnings about the possible segmentation of global process.

There is clearly an interaction between various factors which influence didactical processes and the educational context which influences communication. Even if the obtained results in experimental psychology have a partial value, communication can be studied. In this kind of research papers, the factors which influence communication have only a relative importance. The set of factorial structures represents instead the level at which the interaction of the factors determining communication networks should be approached.

Some researchers of the fifth and sixth decades of our century suggested the approach of the communication structure from the perspective of a working group and also from discussion groups. The methods used as well as the communicated problems in the communication study show that this is one of the social life constituent; it is necessarily present in this group. Communication appears almost at the same time with the exchange of information. By its social nature, communication has an intermediary situation

in the sequences: purpose, means, and effects. Communication, as a circular phenomenon, modifies initial status due to its effect, modification which determines the inter-relationship process. Methodological consequences of the communication theory, from the perspective of “communication networks”, refer to:

- limitation or restraint of the communication phenomenon according to vocal emission;
- limitation or determination of temporal off cut of communication processes;
- limitation or determination of communication effects.

As we can easily see, according to Scheriff and Fraise, communication between two subjects is made based on the number of units transmitted phoniatrically, adding the temporal segment. The communication process involves decomposition of the set in communicational units and sequence of units approached by each group member or by the group, as a whole. The unit of communication is the message or the speech transmitted by a person through a sender.

In experimental psychology research papers, the isomorphism between the communication structure and mechanisms is also mentioned, which is present in communication networks. Implicitly, communication processes are understood as intermediate phenomena which diversify according to certain situations, that are defining various purposes or that require communication with various “intensity”. Studies about leadership often considered the problem of researching the communication phenomenon. Communication theory can be nothing more than a connection of non-varied relations among social situations and meanings on the one hand, and a part of a relation between means capable to assure achieving goals in various situations, on the other hand.

Fauchex and Moscovici noticed that groups tend to have a centralized communication, and centralized structure is the most powerful limit situation. There is a generic orientation in experimental psychology to determine reports, categories and situations as communication type. Communicational categories are defined based on the relations established between the persons that are in inter-communication. According to Bales, the classification of communication (including the pantomime which transmits communicational aspects) is based on a logical and psychological construction of the group. Communication categories and communication styles are related to the sender which manifests or enters a communication process.

By using symbols associated with reality, the information transmitted through the process of communication is used to describe the specific order and organization in studying the meditation process, getting proper meanings for each field of knowledge. Generally, the information resulted from the communicational process is treated like knowledge, a reflection of objective reality into human knowledge.

The information is described mostly by its degree of subjectivity-objectivity, referring to its dependence on the user, the time cell to which it refers, but also to quantitative and qualitative aspects. The information should have a utility value and a savings hope, calculated as the difference appeared between the effects of a promoted decision, with or without the “knowledge” element of the related information. The utility value of information is strictly dependent on its physical aspect, but also on its moral aspect, a priority aspect caused by an environment described by a maximization of its dynamism.

The information in the educational process is under a high risk of damage, inducted by production and diffusion actions, actions which result from the multiple and complex interaction with the sum of environmental information. The risk of damaging information is influenced by execution of the conditioning process in a certain space and time, by the sum of users, students, as well as by their attitude against a certain process.

In order to efficiently solve their school tasks, students should learn to directionally address and to shortly and conspicuously communicate with teaching staff and between them, according to needs. As receiver of information, they must be able to discern exactly what their professors and discussion partners transmit. The student and its teaching staff should have a motivation, about the subject and the reason of communication, before sending a message. This is why the speaker will cover a process of searching, which helps to activate all relevant data for the debated topic.

School Secretary and Communication Categories

A school secretary is gradually transforming into a central of information commutation, where it converges from all parts of the school and from the outside. Modern secretariat work is characterized by processing, registering and transmitting information in vary ways: data, texts, graphics, images and speaking, the

output being usually, the documents. Besides the one that contain only text or numbers configuration, mix documents appear more and more often. Since the issuing of documents does not represent a purpose in itself, it is important to distribute it to receivers.

The secretariat represents an important communicational channel, an intermediary in transmitting information or a sender of information. The secretariat transmits information upward, to managers, in order to support them in making decisions and in establishing school objectives. The secretariat selects information by direct methods or authority delegation obtained from managerial departments.

Types of ascending information:

- - law articles
- - statistical information about the activity developed in school
- - abstract from certain documents
- - mail information which has been sorted and archived.

The secretariat receives information from managers about decisions already made which should be applied and done by subordinates. Transmitting this information can be done verbally or in writing by elaborating orders, decisions, dispositions or collective reports. Control information is transmitted ascending and in this way managers are informed about the way in which their decisions were done. This information is used by managers to complete some reports which describe school activity. A school manager work and the work done by a secretary are difficult to separate; manager actions and secretary actions are complementary, having a mutual goal. In modern organization of school units, it is very important that, in the selection of personnel for the secretary, employers should take into consideration not only professional education, literacy knowledge, but also about certain qualities and skills of communication.

During communication process the following categories of communication can appear:

- the sender manifests solidarity, offers rewards and raises morale (status) of others;
- the sender manifests decrease of tension, he talks, laughs, jokes, expresses satisfaction;
- the sender expresses his agreement, accepts passively, obeys;
- the sender gives a suggestion, a direction, involving somebody's autonomy;
- the sender gives an orientation, a piece of information, repeats, clarifies and confirms;
- the sender demands an orientation, a piece of information, a confirmation;
- the sender demands an opinion, an evaluation, an analysis, expression of a feeling;
- the sender demands a suggestion, a direction, a possible action way;
- the sender manifest his disagreement, refuses passively, retains help;
- the sender negatively influences somebody else's status, but self-asserts.

Verbal behaviours represent one of the most important segments of human social activities. Human evolution, from the cultural point of view, was possible because people succeeded in speaking, listening, writing and reading. The main function of verbal communication is presented and made clear through its effects on other people, on other subjects. When we tell something to a subject, when we speak to somebody, we almost always expect that this conversation to lead or to convince the person to commit with us in this kind of conversation. In other words, we expect to perceive a reaction. It can often be considered that we are clearly advantaged by this kind of behaviour which becomes a way of communication, especially when we demand an object, information, or we request help in some action, or we participate in solving some problems. In other occasions, the subject transmits, asks, and requests something for a "social exchange": a little more attention or participation of some person during conversation. Even an uninteresting or expiring conversation is not meant to be without an answer because it becomes a way of communicating which determines the other person to look at us or eventually to answer us something.

Historically, it is known that, when seeing an animal, a person from a tribe could transmit the news to other tribe members, initially, by imitating the animal sounds; so, gradually, people obtained a vocal ability capable to describe animals, their number, their position in neighbourhood, as well as other details. Therefore, this infantile way of transmitting becomes an advantage form of communication. This type of communication supposed a growth of verbal transmission capacity and an increase of speaking complexity. Language, as a means of inter-human communication, should be learned. If a newborn who "aspires for

humanity” is transported somewhere, far away from the civilized world, and after a while returns to society, he will not be able to learn to speak, and he will try to communicate by non-articulated acoustical signals, or by uncontrolled gestures, that are not learnt, not received from the adult by action and imitation.

In this case, speaking mechanism from that brain cannot be used. In this material, we are not trying to clarify the problem of mutations during the long series of brain and speaking development, but we will mention that famous authors approached this subject in their action about human communication. Research papers written by Ekman (1980), Ekman & Friesen (1971, 1985) showed that, in fact, not all human communication is effectively transmitted through speaking or written words. Humans communicate their emotions and feelings by nuances in voice tonality, in facial expression, gesture and position.

Some research papers tend to confirm Darwin’s hypothesis according to which facial expressions of emotions are natively used. It is considered that a typical repertory exists for human species based on facial expressions with micro or macro movements. Members of some isolated tribes in New Guinea studied by Ekman and Friesen demonstrated that they have the capacity to recognize emotional expressions facially showed by westerners. These habitants do not have any problem in recognizing and production facial expressions such as sadness, disgust, joy and fear. Because they were using identical or similar expressions for situations in front of which they were not effectively exposed, Ekman and Friesen conclude that facial expressions are a part of behaviour types which are previously not learnt. People from other cultures are using different and various words to express particular concepts; elaboration of these words are not developing or increasing the amount of native answers, but they can be learned. Current detailed studies have not succeeded in determining whether other means of emotional communication (like tone of voice, hands movements etc) are learned, attained or partially native.

Inter-human communication is not simple since one cannot always know who receiver of the message is or to who gets to hear it. Taking into consideration that, in this way, confusion can easily appear, everyone, during lifetime, should tend towards a positive communication. This looks tiresome, but it is worthy. The better the internal communication is, the more successful its influence on the companion may be. As a final effect, it is really similar to operating on the computer. It gives me feedback and performs what I make it to, only if I strictly obey its rules.

Abstract

In the actual conditions of the globalization and extension of the markets throughout the world wide, the realization of the comparison between products and services, between economic entities, has become an indispensable instrument in the establishment of the real situation of the own firm comparing with that of the other firms and for the identification of the most appropriate practices of improvement of the existent situation. By using some modern management instruments, the firms try to increase their competitiveness in the actual business environment. Benchmarking comes to help the firms surpass the problems, to gain durable competitive advantages through the development of the strengths and by reducing the weaknesses. The paper proposes to emphasize the necessity of using benchmarking, the application methodology, the advantages and the disadvantages of the new process, as well as the concerned critics.

Keywords: Benchmarking, benchmark, the benchmarking application methodology, performance, the best practices, the advantages and the disadvantages of the benchmarking.

What does benchmarking mean? Why do we need it?

Benchmarking comes from geology, it has the meaning of reference point, which, situated upon a building is used as a reference point in order to determine the height and the position in the topographic prospecting. Nowadays, in business, it is used with the same purpose: *the choice of a reference point in order to assess.*

Benchmarking is a technique specific to the management and it is used by the commercial societies, the public institutions as an instrument of improving the quality and the performance. The process consists *in the detailed evaluation and analysis of the procedures and of the results of some economic entity considered as a pattern (a referential one) having as purpose the adoption of its good practices and the receiving of some results similar with those of the entities which already apply the benchmarking.* It is based on the research of the quantity indicators and qualitative analysis of the leader products. It has become a standard of evaluation for all the domains of activity, but especially for businesses.

This technique brings a progress to the classic and obtuse attitude of extrapolation of the future objectives comparing with the previous realizations marked with x%, according to our external information. The innovation consists in discovering the concurrence's performances and also of other societies and of their way of resulting, having as purpose taking the decisions necessary for reaching these results or even to exceed them. The continuous scan of the external environment helps the entity to a better anchorage in the competitive reality; an external view reduces significantly the risk of being taken by surprise.

In David T. Keans' vision, who is an employee of the Rank Xerox Company, benchmarking represents "a continuous process of measuring the products, the services and the practices of some company with the most powerful competitors or with those companies considered as being the leaders in a certain domain."

According to the definition of Robert Camp, also an employee of that firm, “benchmarking is the research of the industrial practices which lead towards superior performances.”

The American society Ameritech defines benchmarking as being: “the identification and the implementation of the best practices in order to obtain superior results regarding the satisfaction of the clients and the performances in businesses.”³¹

The evaluation within this process has as a starting point, defined “**benchmark**” the point of reference used as a comparison pattern for the present performance. An example of benchmark can be the competition, the clients’ expectations, the profit level, the sale figure, and other key indicators. Taking the way which leads towards the best practices is a good way to reduce the disordered actions which do not have a precise purpose.

Benchmarking is effective from the point of view of the cost and of the time, because the process involves more imitation and adaptation than pure invention, and the time and the money are saved. The partners of a benchmarking promote an efficient pattern, which reduces some efforts concerning the planning, the testing and the creation of prototypes.

The central idea of benchmarking can be easily summarized. You choose a society which executes the process better than you do, and then you copy what this one did. This is also the main source of critique brought to benchmarking, *meaning the copying from other sources. How can an organization be truly superior if it doesn’t invent in order to outrun the concurrence? It is a good question, but without wrangling, we can also say: how can an organization survive if it loses the contact with the external environment? In my opinion, it has to be found equilibrium between the adoption of “the best practices” and the knowledge of the external environment as to neither of these two to have to suffer. Anyway, the copying of other companies’ politics cannot be realized identically, they adapt to the reality within the company which applies the benchmarking.*

Of course, there have been critics brought to the new process, Philip Kotler mentioned in his book of reference, “The Principles of marketing”, citing the opinions of some specialists, that through benchmarking, the firms wouldn’t be so creative, being tempted only to imitate the best of them and this way it is created only an equality of these ones. Also, it would be given a too large importance to the competitors’ analysis, in the detriment of the clients’ analysis, which constitutes “the base engine of the business”. *In my opinion, these affirmations are not funded, because even if we try to copy the practices of other societies, these ones do not stop so that we could reach them, they progress searching day by day other development solutions, the concurrence examination being made in a tight connection with the clients’ needs.*

What does benchmarking presuppose? The application methodology.

For an organization, benchmarking consists in the following steps:

- To analyze in detail the own processes and approaches.
- To compare the processes, the practices and the results with different locations, with the best from, inside and outside the activity domain, being placed in the country or outside.
- To action in order to equalize or even to outrun the best.

Such a learning process involves the identification and the selection of the excellence points and criteria, upon which the entity aims to an improvement, a constructive exchange with the exterior, a good understanding of the best practices and the adaptation of these practices to the specific of the aimed organization (applying the standards and the objectives).

The benchmarking application methodology

A benchmarking process presupposes to go through the following stages which are distributed in five phases:

1. The identification of the subjects and of the benchmarking object
2. The selection of the benchmarking reference partners

³¹ Scurtu, V., Russu, C., Petrescu, I. (2006) Benchmarking. Teorie și aplicații, București, Editura Economică

3. The research process on the Internet
4. The analysis of the performances and the identification of the variance causes
5. The fixing of the performance levels
6. The communication of the analysis results
7. The establishment of the functional objectives (aims)
8. The development of an action plan
9. The identification of the benchmarking object
10. The readjustment of benchmarking

These steps reunite in the following phases:

- a) **The planning phase** consists in the preparation of the researches which must define what, who, and how:
 - What precisely must we research?
 - With whom must we realize the comparison?
 - How can we obtain the information?
- b) **The analysis phase** presupposes knowledge of the used methods and a rigorous evaluation of the advantages and weaknesses. The problems to which we must find an answer would be:
 - *Is the benchmarking partner the best in the domain?*
 - *If yes, why is that?*
 - *Which are the methods which he utilizes or which he intends to utilize?*
 - *How could these methods be adapted within the own organization?*

The answers to these questions will constitute the base for the establishment of the performance interval and of the direction of the future action: the maintenance of the achieved advantage.

- c) **The integration phase** is constituted in the process which allows the utilization of the analysis results for *the establishment of the operations objectives*. It is necessary to make an attentive planning, well-considered in order to incorporate the new methods achieved within the entity.
- d) **The development phase.** The results of the benchmarking must be emphasized within some applications which allow recurrently evaluations in order to establish the evolutions, the obtained progresses. Also, there will be taken into consideration measures of updating the process, because *the only constancy of the modern world seems to be the change*. This way, the entity must dispose of a very rigorous surveillance system of the concurrence in order to apply successfully the “best practices” in which there are elaborated the action plans, being measured the obtained process and it is in search of extension ways towards other domains.
- e) **The maturity phase** is reached when all the methods have been applied and when a progress has been obtained. Also, benchmarking must become an essential element of the management process within the economic entity.

The advantages and the disadvantages of the benchmarking

Benchmarking has multiple advantages, the experience Rank Xerox formulating the following benefits:

- Benchmarking brings the latest innovations and the inventions to manage the processes
- It constitutes an efficient instrument for team work
- It improves the knowledge of costs and performance of the products and services comparing to those of the concurrent companies
- It brings together all the divisions and helps creating a common front to keep up with the competition
- It emphasizes the importance of the personnel’s implication and in consequence it encourages the recognition of the individual and of the team merits.

The advantages mentioned above can be synthesized this way: team work, comprehensibility, flexibility, creativity, progress.

Team work: benchmarking cannot have success without the total implication of the project members. They create a common front, within the organization, offering a common aim to reach. Also, it includes the ideas and the concerns of those involved in the process. Along with good work on such a project comes recognition, meaning the reward offered for the effort made, both to individual and team level. This is achieved by setting goals, then meeting, or exceeding them.

Comprehensibility: Unlike some methods, benchmarking is easy to understand. This is due to the fact that benchmarking produces a direct comparison to another organization. After determining whom to follow, you study what they do, and emulate it. There is no misunderstanding of the overall goal of being the best.

Flexibility: Benchmarking is flexible and interdisciplinary, being used in almost any organization, public, private, or, non-profit. It is appropriate for a large multinational corporation or a local shop, from a federal agency to the government of a small village.

Identifying the best practice does not necessarily mean that the competitor has the best solution. This sort of out-of-the-box thinking can create new standards rather than emulating someone else's practices.

Creativity: Sometimes organizations must know where their goals are, but the path to meet them is not clear. Furthermore, even if another organization is perceived to be doing something the best, it does not mean it couldn't be done better. After clearly defining goals, however, it is easier to come up with innovative ways of getting there. It could also be created new ways of obtaining information or making partnerships, such as Remington, a shotgun shell manufacturer, getting information on how to make shinier shells from Maybelline's lip stick containers.

Evolution: Benchmarking develops with the consumer and doesn't require major costs. As things change in the world, so does who is the best. Because benchmarking involves constant reiteration, evaluating and changing, it changes as the market or consumer does. Although benchmarking is constantly in change, it isn't a big price tag up-front. All one needs are office supplies and a list of the best performers to get started.

To these benefits mentioned previously, unfortunately there is a series of disadvantages which cannot be neglected: it can require a large investment in time, labor, and capital. Costs for a large project can easily reach into the hundreds of thousands of euro. These can be minimized through careful, thoughtful, and deliberate planning.

The size of the benchmarking project: The size and scope of a benchmarking project is related directly to the cost. An easy way to minimize costs is to take on a stepwise approach which leads to a minimization of the amount of investment and risk taken concurrently.

Dividing Costs: Organizations can pool resources by taking joint benchmarking projects and dividing costs accordingly. This is more easily done in organizations that are not directly competing, such as government agencies. Various organizations have pooled their resources and knowledge into benchmarking groups with excellent results.

Consultants: Many consultant firms will also aid the organizations involved in a benchmarking project. These organizations have the technical knowledge and experience to more efficiently gather and interpret data. Careful background research of a consultant must be made to make this process more effective and it comes at a price.

The cost of the education and of travel: Benchmarking does require education and travel costs. Once a team is chosen, they often need to be educated on the methods of benchmarking. This is accomplished through workshops, seminars, meetings, and courses. Then, this information must be disseminated to others. When researching organizations, sometimes it is best to see the organization in action and meet with the team that performed and implemented the changes to gain first-hand knowledge of the processes involved.

Communication: One of the most important methods of keeping benchmarking costs low is effective communication. This involves knowing what you need and where your own deficiencies are and sharing information about yourself. Also, informing others inside of your organization of what has been learned through reports, analyses, etc. and its method of implementation involving flowcharts, matrices, schematics, etc. is critical. Clear communication also lets management know how the project is going and

its status, this reducing confusion and conflicts among management and the team and among team members themselves.

One of the biggest mistakes made by the organizations when they apply for the first time benchmarking is that they limit their activity of benchmarking only to their industry in which they develop their activity. Benchmarking within your industry is essential. However, you already have a pretty good idea how your industry performs so it's necessary that you reach outside and above your own industry into other industries that perform a similar process but may have to perform this process extremely well in order to succeed. The economic entities must learn how to defeat the concurrence by adapting some similar processes from a different industry. Customer surveys indicate long wait times for hotel rooms, especially for repeat Customers. Taking as an example the minimization of the hospital emergency room departments resulting in dramatically reduced check-in times, the hotel adopted measures meant to automatize the reservation of the rooms for the repeat customers, in order to efficientise their time. Also, netted less employees needed, automation for frequent hotel guests, and many more process improvements have been made.

Conclusions

As it can be extracted from the content of the paper, benchmarking obliges the entity to establish its purposes and objectives based on an external reality. *The clients* are not interested if the productivity of the product or the service has increased from one year to another. *They are affected by the quality, the cost and the delivery terms*, these features being primordial when choosing the products.

Benchmarking is an instrument of accomplishing the objectives of the competitive business. It is extremely powerful and efficient when it is used for accomplishing the adequate objectives, aligned to the firm's strategy. But it mustn't be regarded as a method that can replace the rest of the efforts for the realization of the quality or the rest of the management processes.

For a durable functioning, the firms must come with innovations and also to imitate. Benchmarking *increases the innovation* by demanding those who practice this method to constantly maintain under observation the external environment and to use the obtained information in the improvement of the process. The possible losses can be localized and adapted in time.

Benchmarking does not represent a substitute of the innovation; it is a source of ideas coming from the exterior of the entity. The success in business depends on the establishment and the accomplishment of the purposes and objectives.

IAPAB – ASEBUSS, Calea Griviței, nr.8-10, Sector 1, București, laviniar@asebuss.ro

Les préoccupations pour bien comprendre la complexité des organisations sont bien connues dans la théorie et la pratique du management. La motivation la plus fréquente pour toutes les recherches et les investigations faites a été fondée sur le besoin de savoir gérer les situations diverses en vue de maximiser la performance organisationnelle.

En ce qui nous concerne, pour enrichir les informations disponibles, nous voulons élargir, dans notre communication, les approches traditionnelles, focaliser l'attention sur la dimension psychologiques des organisations et présenter les mécanismes qui favorisent l'implication des salariés.

Mots clé: organisation, approche psycho-sociologique, management de l'implication, engagement des salariés, changement organisationnel.

1. L'organisation en tant que système culturel, symbolique et imaginaire.

Management et organisations sont des notions indissociables, puisque la première a pour rôle d'organiser et de contrôler de manière ordonnée le fonctionnement des secondes. Il est donc impossible de comprendre et de mettre en place un management efficace en ignorant les approches psychosociologiques des organisations. Pour cette raison, nous sommes partis de la vision proposée par Engène Enriquez qui, sur la base de plusieurs recherches – interventions, est arrivé à la conclusion que les organisations peuvent être envisagées comme des systèmes culturels, imaginaires et symboliques où se confrontent projets conscients et inconscients, désirs et phantasmes. Il est donc utile de retenir, les aspects suivants:

- *L'organisation, une culture.* En ce sens et en première analyse, l'organisation est d'abord une culture constituée par une structure de normes, de valeurs, de pratiques sociales dominantes, c'est-à-dire, au fond, *un mode d'appréhension du monde qui oriente la conduite de ses divers auteurs.* Les représentations sociales historiquement contextualisées sont à la fois intériorisées, largement admises bien que parfois floues.
- *L'organisation, une armature structurelle.* En seconde analyse, l'organisation est appréhendée comme une "armature structurelle" qui prend la forme d'une culture globalisante qui influence et qui stabilise les attitudes et les comportements humains en son sein. L'organisation est ainsi pensée comme un modèle de socialisation dont l'un des rôles majeurs est d'opérer une sélection parmi ses membres, d'exclure les moins conformes à l'idéal proposé et de valoriser les plus méritants. Ce système culturel est relativement cohérent, et assure la stabilité et la permanence de l'organisation. Il contribue à garantir une identité source de cohérence et de clarté tant sur le plan interne que sur un plan externe, notamment du point de vue des clients ou des usagers.
- *Un système symbolique.* En troisième analyse, une organisation est un système symbolique instituant des rites initiatiques, secrétant des mythes unificateurs, cristallisant des héros. Le symbolique façonne une mémoire collective dont l'objectif principal est de *sédimer l'action des membres de l'organisation, de leur servir de système de légitimation* en vue de donner du sens à leurs actions quotidiennes. Finalement, un tel système symbolique exerce sur les acteurs d'une organisation un véritable contrôle social tant sur le plan affectif que sur un plan plus intellectuel puisqu'un certain nombre de concepts sont largement intériorisés.
- *L'organisation, un système imaginaire.* L'organisation est aussi un système imaginaire. La production de l'imaginaire est indispensable au développement des systèmes culturels et

symboliques. On distingue deux formes d'imaginaire: l'imaginaire leurrant et l'imaginaire moteur :

- l'imaginaire leurrant vise à répondre aux besoins de sécurité mais aussi d'affirmation des acteurs.
- l'objet de l'organisation est de produire des statuts et des rôles sociaux structurant l'action des individus, permettant aussi de satisfaire leur volonté de puissance ou leurs demandes plus affectives. L'imaginaire moteur est également indispensable à toute vie organisationnelle dans le sens où il contribue à libérer l'imagination créatrice des sujets.

Il permet aux membres d'une organisation de s'évader de la quotidienneté et d'instaurer une nouvelle approche des rapports sociaux et de travail. D'une certaine manière, il garantit une forme de rêve permettant de s'affranchir de l'inertie organisationnelle et du conservatisme. Finalement, il existe une tension permanente entre l'imaginaire leurrant et l'imaginaire moteur. Le premier reste, cependant, dominant de façon générale et assure une conformité sociale et une stabilité organisationnelle. Le second, l'imaginaire moteur, est une source de désordre potentiel puisqu'il implique l'existence d'un espace de transactions fondée sur la liberté de la parole et les capacités réflexives des acteurs. Il se pose presque dans une certaine forme de défiance vis-à-vis du mode de management institué et des règles de fonctionnement structurant l'organisation.

La vision que nous avons présentée nous permet de percevoir l'organisation comme un organe vivant constamment en dynamique et dont le changement implique la mise en oeuvre des méthodes d'intervention, de conseil, et une action, structurante sur le mode de pensée et l'appareil psychique de ses membres. L'action organisée vise implicitement à provoquer chez les acteurs l'intériorisation du système de valeurs, la création d'un sentiment d'appartenance mais aussi la possibilité de susciter des émotions parfois excessives pouvant aller jusqu'à une admiration mêlée à la crainte, pour les supérieurs hiérarchiques.

Cette observation se trouve à la base d'une grille d'analyse organisationnelle proposée par E. Enriques et dans la quelle l'auteur nous invite à examiner les instances mythiques, sociale-historique, institutionnelle, structurelle, groupale, individuelle et plusionnelle:

L'instance mythique

Cela constitue le premier niveau d'analyse organisationnelle. La notion de mythe peut être définie comme une histoire idéalisée par les membres d'une organisation. Un mythe est un élément de socialisation de membres d'une communauté et fonctionne sur un double mode, affectif et conceptuel ou intellectuel. Sur le plan affectif, les mythes provoquent chez les membres d'une organisation de la fascination socialisatrice dans le sens où il constitue une source de cohésion sociale. Sur le plan conceptuel, le mythe est porteur d'idées mobilisatrices, de croyances qui donnent du sens à l'action quotidienne. Élément constitutif d'un groupe, les mythes rassemblent les acteurs et favorisent l'intériorisation du système de valeurs qu'ils véhiculent par les membres d'une organisation.

L'instance sociale – historique

Elle forme le deuxième niveau d'analyse proposé. Ce niveau d'analyse invite à prendre à considération, dans l'examen d'une structure organisationnelle, le contexte historique et l'état des rapports sociaux propres à la société toute entière. Le contexte historique est souvent le produit d'une idéologie dominante qu'il convient de décortiquer pour appréhender l'intelligibilité des processus sociaux expliquant certains comportements. En somme, les pratiques sociales dominantes résultent aussi des grandes tendances que l'on peut observer dans une société comme par exemple la tendance à l'individualisme et à la mise en compétition des individus.

L'instance institutionnelle

Elle constitue le troisième niveau de cette analyse. C'est à ce stade que se jouent les phénomènes de pouvoir qui viennent se cristalliser dans les institutions. Celles-ci sont envisagées en tant que modes de régulation et de contrôle des rapports sociaux. Elles expriment des *vérités* largement admises dans la société considérées comme indiscutables. Suivant cette logique, la loi, s'intériorise dans la vie quotidienne des individus et provoque des comportements de soumission à l'autorité légitimement admise. Les

institutions sont envisagées comme des formes politiques et psychiques provoquant des interdits mais aussi des possibilités d'ouverture et d'évolution. En ce sens, une institution est vivante, constituée souvent par des contradictions pouvant être interrogées même si elle cherche souvent à se défendre contre toute remise en cause. Au total, les institutions sont bien les produits d'une histoire garantissant ainsi une forme de stabilité et de permanence mais offrant toujours des possibilités de remise en cause par l'expression de conflits d'intérêts.

L'instance structurelle

Elle correspond au quatrième niveau d'analyse et fait référence, au sens strict, à la notion d'organisation. Tout en étant en compétition les unes par rapport aux autres, les organisations expriment les institutions qui les fondent. Le niveau organisationnel concrétise et incarnent l'esprit des institutions. Par exemple, si l'institution remet en cause le travail aliénant, les organisations vont s'efforcer de mettre en place un mode de gestion des ressources humaines fondé sur l'acquisition de connaissances et de compétences. Les organisations en tant que structures permettent de relever au moins six défis qui constituent des peurs plus ou moins admises dans une société moderne:

- premièrement, *l'angoisse de l'informe*, c'est-à-dire la peur des effets liés à la désorganisation: l'imprévu, le spontané, le poids de l'informel, etc. Une structure organisationnelle vise à réduire les incertitudes et leurs turbulences.
- en second lieu, *les pulsions de destruction* sont relativement maîtrisées par les organisations. Celles-ci visent à réguler ces pulsions de façon à éviter des comportements excessifs, voire déviants, des personnes en leur sein.
- troisièmement, *l'angoisse de l'inconnu* constitue aussi un défi à relever par les structure organisationnelles. Généralement, les dirigeants d'entreprise cherchent à contenir les incertitudes, à réduire les risques qui y sont associés et tentent d'élaborer des scénarii variés de façon à accroître la prévisibilité de l'avenir.
- le quatrième défi organisationnel à relever est *la peur des autres*. En effet, tout un chacun peut faire peser un danger potentiel sur la vie et la cohésion organisationnelle. Les phénomènes de rivalités, de conflits plus ou moins latents ou manifestes polluent toute structure organisationnelle. La clarification des fonctions et des responsabilités des uns et des autres s'inscrit pleinement dans cette volonté qu'ont les organisations modernes de prévenir les conflits entre des acteurs aux intérêts souvent divergents.
- le cinquième défi qui doit être maîtrisé par les organisation est *la liberté de parole*. L'expression de l'imaginaire des acteurs est souvent l'objet de suspicion dans la mesure où celui-ci introduit une part de rêve, de démesure et de déviance pouvant risquer de détourner certains individus de la raison d'être de la structure.
- enfin, *la peur de la pensée* et plus précisément de la créativité constitue une sixième angoisse à contenir dans la vie organisationnelle. Fondées sur la ritualisation et la normalisation des comportements souvent sous la forme de routines, les organisations s'efforcent d'encourager et de valoriser la conformité sociale et cherchent, tout au plus, à canaliser l'énergie créatrice des personnes.

L'instance groupale

Elle désigne la cinquième niveau de cette analyse de l'organisation. L'importance de la dimension groupale au travail à particulièrement été mise en évidence par les recherches de Elton Mayo. À partir de ses contributions, d'autres points de vue ont été affirmés. Enriquez signalait que, investi d'une mission, chaque membre d'un groupe va idéaliser la production collective tout en se trouvant confronté à un conflit entre la *reconnaissance du désir et le désir de la reconnaissance*.

La reconnaissance du désir caractérise la volonté de chaque membre d'un groupe de réaliser ses désirs personnels, de se distinguer, d'acquérir de prestige ou, tout au moins, de faire prendre en compte par les autres ses propres désirs. En même temps, il cherche à être reconnu et valoriser par les autres, il exprime ainsi un désir de reconnaissance. Un tel conflit conduit, suivant l'auteur, les groupes à évoluer dans deux directions différentes: la masse ou bien la différenciation. Dans *le cas de la masse*, le désir de reconnaissance s'impose puisque le groupe n'accepte pas une trop grande diversité de comportements, va

gommer les éléments distinctifs et va tendre vers homogénéisation des conduites ainsi que vers sa propre autonomisation dépassant la rationalité de chacun des membres.

Dans *le cas de la différenciation*, c'est la reconnaissance du désir qui prédomine. La variété des désirs est largement admise et même encouragée par les membres du groupe. Ce dernier accepte les conflits en son sein puisqu'ils sont envisagés comme un des modes de régulation possible. Le risque est que le groupe se recentre sur les conflits à surmonter tout en oubliant le projet commun qu'il poursuivait initialement. En définitive, le rôle des groupes est appréhendé dans cette grille d'analyse comme fondamental.

En se référant à K. Lewin et sa théorie du champ, on peut considérer que le groupe est un lieu privilégié du changement. Il en est potentiellement porteur. Toute organisation est inévitablement structurée autour de groupes de travail. Généralement, les notions de coopération, d'entraide et d'équipe sont mises en avant comme des sources de performances. En même temps, la théorie analytique de E. Enriqué nous invite à considérer le groupe comme *le lieu de tous les dangers* dans la mesure où il constitue un refuge socialisant pour chacun de ses membres. Finalement, le groupe est une instance permettant de conquérir une identité, une autonomie au sein d'une organisation tout en pouvant aussi, potentiellement, permettre à ses membres de développer des conduites de changements radicaux pouvant aller jusqu'à la remise en cause manifeste du système organisationnel à part entière.

L'instance individuelle

Elle désigne le sixième niveau de la grille d'analyse proposée et tient à réintroduire le sujet (qui est différent de l'individu) souvent oublié par les théories sociologiques dans l'analyse organisationnelle.

L'analyse des organisations montre qu'elles ont toujours, plus ou moins, montré une certaine méfiance à l'égard de sujets trop autonomes. La tendance managériale actuelle vise davantage à intégrer des individus hétéronomes que des sujets autonomes. Les premiers adoptent une identité collective dont les fondements se trouvent dans le narcissisme individuel et organisationnel.

L'instance pulsionnelle

Il s'agit du septième et dernier niveau de l'analyse. À la différence des précédentes, celle-ci a un statut particulier puisqu'elle est transversale aux autres niveaux d'analyse. Le concept de pulsion en psychanalyse fait référence à un processus dynamique source de motricité. Suivant la théorie de Freud, l'existence de pulsions est liée à la nature de l'espèce humaine et l'on peut même l'élargir à l'espèce animale. Enriqué reprend la typologie de Freud en distinguant dans l'analyse des organisations *la pulsion de vie* de *la pulsion de mort*.

La pulsion de vie désigne favorise la création d'unités entre les individus, elle est source de cohésion et de lien social. Elle peut pousser une personne à développer des relations partenariales de coopération dans le travail ou encore à nouer des amitiés.

La pulsion de mort envisagée dans une logique de destruction, tend à conduire à la réduction des tensions au niveau zéro. Pour autant, Enriqué montre que les pulsions de mort n'ont pas que des effets négatifs. En effet, la mort peut favoriser la régénérescence d'une organisation si celle-ci est capable de provoquer chez ses membres des comportements réflexifs susceptibles de favoriser l'émergence de nouvelles représentations dont la dynamique peut favoriser le changement organisationnel.

Cette vision sur l'organisation suggère une examination plus complexe, compte tenu des niveaux que nous avons présentés et permet, en final, l'enrichissement des conclusions qui peuvent servir comme base de la décision managériale.

Le management de l'implication

Les approches psychosociologiques des organisations ont permis la réflexion au sujet de *l'implication* des salariés. De manière générale, les chercheurs définissent l'implication (traduction française du concept anglo-saxon *commitment*) comme la relation entre une personne et son organisation. Les travaux issus de la recherche en sciences sociales indiquent qu'il existe de très nombreuses acceptions données au concept d'implication. En France, Maurice Thévenet est probablement aujourd'hui l'un des chercheurs les plus productifs sur le domaine. Thévenet analyse l'implication sous l'angle du management des organisations et prend en compte dans ses travaux la personne *dans son individualité et sa liberté* ainsi que l'entreprise avec sa culture. L'auteur insiste sur l'idée que l'implication peut donner aux personnes le sentiment de réaliser

quelque chose tout en se réalisant individuellement. L'implication renvoie donc à la réalisation de soi, l'estime de soi et la fierté.

L'implication organisationnelle peut être appréhendée à partir de trois grandes dimensions identifiées dans des travaux de recherche: *la dimension affective* (l'attachement de la personne à son organisation); *la dimension calculée* (qui fait référence au calcul rationnel d'un salarié anticipant les coûts éventuels de son départ de l'organisation); *la dimension normative* (qui désigne les obligations ressenties par une personne vis-à-vis de son organisation). Pour evidencier que le concept d'implication est multidimensionnel il faut insister sur deux aspects:

a) *Les composantes et les causes de l'implication.* À travers son analyse des composantes de l'implication organisationnelle, C. Louche identifie, dans une méta-analyse de la littérature sur le sujet, quatre grands items pour repérer l'implication:

- en premier lieu, il suggère de chercher à appréhender *les intérêts de vie*, c'est-à-dire le niveau de considération accordée par une personne à son travail du point de vue de son importance par rapport à la famille, à son niveau global de satisfaction, à ses réalisations et à ce que pense que la personne représente dans la société.
- en second lieu, il convient d'analyser *l'importance de la performance pour l'évaluation de soi*. Il s'agit ici de chercher à mesurer la manière dont une personne évalue l'importance de ses performances perçues par rapport à son niveau de satisfaction globale et, plus généralement même, à son bien être.
- en troisième lieu, Louche suggère d'intégrer dans l'analyse *la consistance avec le soi*. Cela revient à s'interroger sur la cohérence entre le potentiel de l'individu et ses réalisations concrètes ainsi que, sa capacité à développer au mieux ses capacités dans le cadre de son travail.
- enfin, il convient d'appréhender *la participation active* à la prise de décision tant sur le plan du contenu du travail de la personne que sur les décisions prises par le supérieur hiérarchique de celle-ci la concernant directement ou indirectement.

Au total, la recherche en psychologie sociale s'intéresse précisément à des variables personnelles (estime de soi, éthique) qu'à des variables situationnelles telles que la participation active ainsi que le contenu et l'intérêt du travail.

Sur le plan du management. Thévenet insiste sur la nécessité d'une adéquation entre les objectifs et les valeurs de l'organisation et de la personne. Dans cette optique, la personne va adhérer aux valeurs et au projet de l'organisation ce qui peut se traduire par son investissement dans le travail traduisant ainsi une volonté d'agir.

Enfin, l'implication peut inclure aussi un attachement affectif (l'amour de son organisation) qui conduit à une loyauté professionnelle source de fidélisation de la personne à moyen et long terme.

Dans sa théorie de l'implication, M. Thévenet identifie *cinq grandes causes de l'implication* des personnes en situation professionnelle:

- *l'environnement du travail* (relations interpersonnelles dans l'équipe, relations avec l'encadrement, lieu géographique d'exercice du travail),
- *les produits de l'organisation* (activité de l'entreprise, portefeuille de produits),
- *l'entreprise ou l'organisation au sens large* (politique générale, culture et projet, valeurs dominantes),
- *le métier* (attachement à sa profession, sentiment d'appartenance à un milieu professionnel) et, enfin,
- *la valeur travail* (centralité de travail, respect du travail, éthique personnelle par rapport à l'activité).

En résumé, l'implication en situation de travail représente la manière dont une personne place son travail compte tenu de ses autres intérêts de vie, s'identifie au travail, s'engage psychologiquement et physiquement, appréhende son niveau de performance comme essentiel pour s'auto évaluer et participe intensément aux relations et aux réalisations dans les situations de travail.

b) *Les différentes formes d'implication.* L'analyse de l'implication relève plusieurs formes d'implication:

- *l'implication dans les valeurs au travail* (la performance au travail démontre la valeur personnelle des personnes);
- *l'implication dans l'emploi occupé* qui désigne l'attachement d'une personne à son poste de travail ou à son emploi au sein d'une organisation. Il se manifeste à la fois par une volonté de valorisation des activités de travail réalisées dans l'emploi mais aussi par un fort sentiment d'appartenance à la profession;
- *l'implication dans la carrière* que l'on peut rapprocher de la théorie de la motivation. Suivant cette logique d'action, la personne a besoin de mesurer une progression professionnelle dans l'organisation par la progression dans sa carrière. L'activité professionnelle est alors envisagée comme un moyen privilégié de développement personnel et d'accomplissement de soi;
- *l'implication dans l'organisation*, probablement la forme d'implication la plus large. Elle désigne le degré d'adhésion aux valeurs, aux objectifs et au projet de l'organisation, compte tenu de sa culture, et se concrétise par une prédisposition personnelle à démultiplier des efforts pour contribuer à la performance organisationnelle.
- *l'implication dans le syndicat*. En tant qu'institution représentative du personnel qui vise la défense de ses intérêts., le syndicat peut être perçu par une personne comme un moyen tangible d'agir dans l'organisation pour préserver l'emploi, les conditions de travail, les rémunérations et lutter contre les politiques de licenciements économiques.

Finalement, malgré la diversité des approches de l'implication et la complexité du concept, la distinction entre implication au travail et implication organisationnelle est, peut être, la plus opérationnelle pour le management des ressources humaines.

Tous les débats sur l'implication arrivent aux questions suivantes:

- Peut-on manager l'implication ?
- Est-ce véritablement pertinent d'envisager un management de l'implication des personnes ?

Les travaux de Thévenet apportent des éclairages sans doute provisoires à ces questions qui se posent, tant sur le plan théorique qu'au niveau opérationnel. La thèse de Thévenet consiste à dire que c'est *un rêve que de pouvoir créer l'implication*. En ce sens, il développe l'idée qu'il est impossible d'impliquer des personnes. Finalement, l'implication est une décision personnelle même si les recherches indiquent que les organisations peuvent s'efforcer de réunir les conditions favorables à l'implication des personnes. Il y a, quelques interventions possibles pour favoriser l'implication de salariés:

- en premier lieu, *la cohérence de la politique générale* de l'entreprise et de son projet organisationnel avec les actions stratégiques et opérationnelles mises en œuvre.
- en second lieu, *la réciprocité*, c'est-à-dire l'échange social qui s'opère entre l'entreprise et ses salariés. En d'autres termes, les salariés doivent avoir un sentiment d'équité résultant de leurs contributions, à savoir de leurs efforts, confrontés aux rétributions (rémunérations, reconnaissance sociale, statut et qualification) qu'ils perçoivent en échange.
- enfin, la troisième condition est constituée par *l'appropriation* qui désigne le niveau de reconnaissance de soi des salariés dans les valeurs et les objectifs de leur organisation. Ces dernières années, le développement des politiques de ressources humaines visant l'essor d'une épargne salariale va dans le sens d'une plus grande appropriation et d'un sentiment d'appartenance accru.

En résumé, c'est probablement par le développement de la cohérence, de la réciprocité et de l'appropriation que les organisations susciteront davantage d'implication dans les années à venir. Cependant, la théorie de l'engagement actuellement émergente semble constituer une alternative potentiellement intéressante à l'implication des personnes.

L'engagement part d'une idée assez simple: *l'homme est rationalisant*. Dans cette perspective, il va adapter ses idées pour les mettre en conformité avec ses actions. L'action va ainsi précéder la rationalisation des opinions d'une personne qui va chercher à donner un sens positif à ses décisions.

Il est bien de retenir que l'engagement est le produit de conditions situationnelles à la différence de l'implication qui repose sur des variables personnelles. L'engagement dépend donc bien de conditions externes à la personne que l'on peut dissocier en deux catégories:

- en premier lieu, la taille de l'acte qui correspond à sa visibilité et après,
- son importance pour la personne que l'on pourra apprécier en termes de coût.

Ou total, l'apport de la théorie de l'engagement au management est de montrer que la créativité et surtout, la mise en oeuvre d'idées nouvelles débutent par des actes, c'est à dire des mises en situations plutôt que par des discours.

Abstract

The academic environment, through its activities and through its role in the society consists into a method of cultural answer to the social and professional elites need. Between the academic environment and society exists an interdependence relation, meaning that the well-functioning of the activity from the university level influence the society good development? The universities can transform in researching laboratories for the business environment (surroundings), with the condition of existing reciprocal opening and will.

Key words: knowledge management, cultural/intellectual capital, professional training

Knowledge – university – organization

An important domain for each organization which functions into a concurential market is represented by the knowledge management, whose base is represented through ideas, information, information kept and used inside the organization. Knowledge management includes on the one side, the sources of knowledge represented by the employees accretions and on the other side, the knowledge flux and the methods through the knowledge is used on the organization activities'. The strategies of the knowledge management imply communicating connections between people and information in order to work with well-informed experiences.

Cognition (according to Scarborough and Carter, 2000) is formed as a result of a collective labour experience and it is shared by the group members or by a certain community.

Knowledge consists in information used on an active manner (Armstrong 2003) and the information has certain meanings. (Drucker 1988)

Blake (1998) claimed that the knowledge management purpose is to have a good grip on the collective specialist knowledge of the company and to share it anywhere it can succeed into a great success.

Trussler (1988) endorsed that „in the following period, in many companies, the organizing and efficiently usage capacity will represent an important source of competitive benefit source”.

Mecklenburg and others (1999) claimed that „knowledge management allow companies to capture, apply and tune value from their employees experts creativity and competence”

The practical problems connected to the organization human resources supply, developing and compensation, employees value recognition, organizational learning and knowledge management , all can be found on **the cultural capital theory**. **The cultural capital** „consists in knowledge accretions and flux that a company dispose (Armstrong, 2003).

The elements of the cultural capital, according to Youndt (2000):

- Human capital: company employees knowledge's, abilities and skills;
- Social capital: knowledge's accretions and flux ones which issues from the relations' networks from the interior and the exterior of the organization;
- The managerial capital – knowledge emerged effectively in possession of the organization or institutionalized “baggage” of knowledge emerged in the possession of one organization, stocked in data base, textbooks, etc.

The human capital is the one who stock the knowledge which can amplify through the interaction with the social capital (clients, provision, and competitors) leading straight to the organizational capital or organization science. The value in organization is created by the human capital through knowledge, abilities, skills, but the organization efficiency is assured by the people knowledge, the interaction manner with the social, compounds that lead to the organizational capital appearance.

According to Armstrong opinion, taking to account the organization point of view, the intellectual capital theory, we can ask the following questions: 1. Which are the skills that the organization has in its possession? 2. What kinds of skills are necessary now and in the future? 3. How can we develop and maintain these kinds of skills? 4. What can we do in order to create a culture and an environment where can live peacefully not only individual learning, but also the organizational one, so as our employees and our necessities should be satisfied? 5. What can we do so the wordless and precisely knowledge created in our organization should be kept, registered and judiciously used?

The academic environment, through its activities and through its role in the society consists into a method of cultural answer to the social and professional elites need. Between the academic environment and society exists an interdependence relation, meaning that the well-functioning of the activity from the university level influence the society good development?

Schelling, the philosopher, claimed that **the university** should train only science people, researchers and under no circumstances professionals, because its goal is to rise the conscience latency, making reference only to the pure science. If we take into account the fact that the whole nations culture is influenced not only by pure ideas, but also by social reality, the Schelling conception can't be consider absolute. The university from our days has a complex goal: next to the scientific research and creation of the science that form its existence, the university intent to form the student spiritual personality and training for a job. It is said that the exaggeration of the direction of realizing the students professional training often contributed to the university study level descent. On the other side, it must be accentuated the fact that economy critical status determined the young in draft towards the university seeing that the university title conferee several chances to obtain a certain position into a company.

Lately seems that more and more universities train more professionals than scientists. Of course, the savants are having a serious and continue training, only in the individual office.

The student spiritual personality formation implies the advice to a see over the moment impressions, to understand the sense of the notions and to integrate inside their spectrum.

Dimitrie Gusti sustained that the **university**, thought at the beginning as a religious institution, then as an instrument of political power and today only as a professional training institution, is actually a social institution with a deeply value. It consists of „a sum of things, wills and facts, more precisely a structural relations system: outside, the university connection to the state and society, and inside, the academics material and cultural life, the student's relation with the university authority and in the end, the teachers – student's bounds.”

The professional training is defined by the specialty literature, as a training process where the participants achieve practical and theoretical knowledge necessary the activities course. It can't be measured through the graduation degrees number or obtained certificates, although they have their importance too, respectively the results obtained and its role in the society.

The professional training goals are: achievement the capacity to solve certain issues related to the activity field; certain actions execution; good communication inside and outside the organization; the capacity to bind certain changes to the labour location inside the company.

The professional evolution represents a complex training process that has as target the acquirement of the useful knowledge, taking to account the actual and the future status of the person.

The impact of Bologna Declaration over the higher education system professional training level and curricula

The European process has become an increasingly concrete and relevant reality for the European Union and its citizens. The academic world has an important role in this process through the necessity of building upon and strengthening intellectual, cultural, scientific and technologic dimensions of the new Europe. Only a Europe of Knowledge is capable of giving the necessary competences to face the challenges of the new millennium.

European higher education institutions have launched into a construction process of the European field of higher education, which has as aim the educational European system competitively increasing.

An important compound of the Bologna process refers to the higher education organization on studying cycle's system and is connected to the learning process quality increasing necessity and also to the creation of a more bounded relation between higher education and research, between higher education and economic dimension.

The common bases of the higher European education are fundamentals, according to the Bologna process, on two main cycles that separate higher education on different levels, known as Bachelor and Master, in order to increase a compelling environment, common to the national and international graduations.

The qualification levels are specialized according to the results of the formation process and the specific and general competences. **The competences** are those attributes (knowledge, attitudes, skills, and responsibilities) which outline the level that a person is capable to apply and obtain performances. They illustrate the training, appropriateness and responsibility level that a person can assume. Competences refer how to know, to understand, to action, to know theoretically speaking, to understand this knowledge in order to put them in practice on a special social context.

The curriculum, through its organization and structure, develops special and general competences, starting from the academic objectives materialized into *specializations* and from the labour market requests materialized in *qualifications*.

By creating this European framework it is envisaged the each national frame qualification harmonization, assignation of transparent and comparable qualifications. The European general framework of qualifications must be understood as an agreement regarding a common architecture and structure, where different national qualifications might be easily identified. The qualification framework has as main goal to simplify the process of establish precise objectives in order to carry through the curriculum elaborating process. The description of each qualification obtained by the student through individuals programs should provide the base for the disciplines content and further for the individual educational programs.

In this moment, the improvement of the conceptual approach used on qualifications description, represents a priority for Romania. Expressing and measuring study programs methods are the references standards, the level indicators, time, credits number, qualifications, the results of the competences and learning process. The curriculum expression in results provides precision to the learning process and leads to a curriculum centred on the student profile.

The reorganization of the qualification framework will improve the useful information towards students delivering process and will sustain the students to know the methods through they can complete their competences by appealing to the other national or international programs compatible with those whom they are already registered. The special competences description helps the student to obtain them by getting through the educational offer.

On working out for the curricula, the issue should start from the actual Romanian legislation on higher educational domain, from the European rules and Bologna process recommendations concerning higher education in the next decade, from the professional standards of the renewed and enriched professional domains based on the existing studies and documents, from the university experience regarding de professional training programs.

The modern curriculum, adequate to a knowledge society is characterized through the following features:

- Learning and results placement in the centre of the educational activity;
- Using the participative strategies on the educational process, in order to form the special competences;
- A flexible learning offer adequate to the professional career;
- Organizing the contents of the learning process by considering the final goal of the university training through its future use;
- Efficient mixture of the academic culture with the functional one, specific to each specialization;
- Conformation of the higher education content to the requests solicited by local community and civil society.

The specific organism which has the mission to promote the partnerships between the higher education institutions and economical-social environment, is The National Agency for Qualifications in Higher Education and Partnership with the Economic and Social Environment – ACPART, which turned in 2005, based on GD no.1357 from the The National Agency from Partnership between Universities and the Economic and Social Environment (APART).

In order to achieve its missions, the ACPART main objectives as a national authority for qualifications in higher education are:

- elaborate, implement and update the national framework for higher education qualifications which involves development, recognition and certification of qualifications based on the competences acquired by beneficiaries of the higher education system;
- analyse compatibility of the specialisations curricula in the fundamental areas of higher education with national qualifications framework standards;

National Qualifications Framework for Higher Education (NQFHE) is structured on three levels, each level having its own set of indicators/ general descriptions of a level expressed in terms of knowledge, skills and competences. Together with the workshops on study domains, NQFHE will elaborate the definitions to the corresponding qualifications.

There is a working team called “Consultative Committee for the Qualifications from the Higher Education System” made of qualifications experts, representants of different study domains and universities, and also social partners.

ACPART nowadays is preparing a key terms glossary, in order to propose to the decision factors and qualifications framework users, a common nomenclature. Its goal is to create a National Qualifications Register for Higher Education (NQRHE), considered the essential feature of the diplomas recognition and validation process, offered by the Romanian higher education institutions. It also elaborated a coherent 2006-2009 strategy which includes an operative actions plan regarding qualifications issue.

Conclusions:

- the necessity to restructure the specializations according to the economic, social and scientific progress;
- the necessity to correlate the specializations with the qualifications , taking to account the labour market requests, study program period and study cycle (bachelor, master, doctorate);
- the necessity to establish the specific and general competences framework which each student of a private study domain should be capable to practice;
- The necessity to project the curricula so it contains not only the specific and general competences, but also a developing and evolution strategy together with the incorporation of the specialty and community practices.

The business environment – academic environment relation nowadays

In order to offer a view as more as close to the reality of the business environment – academic environment relation, it was applied one of the qualitative research method – the focus group through the capacity of the “Constantin Brâncoveanu Pitești “University teachers.

The focus-group objectives, with semi-structured questions are:

- to identify the university man perception regarding the university role in the economic space;
- To evaluate the actual coordinates of the business environment – academic environment relation.

The focus-group with the academic area was organized on 5th of March, 2008 on “Constantin Brâncoveanu Pitești “University, with the participation of the 10 teachers .

The present article is restoring the main directions of the discussions and presents the main conclusion of the study: the universities can transform in researching laboratories for the business environment (surroundings), with the condition of existing reciprocal opening and will.

From the discussion focused on the relationship practice – research, the academic environment – business environment we can detach the following conclusions:

The mission of the academic environment is appreciated by the majority of the participants being not only that of forming people specialized and capable to incorporate easily in the labour market; only 2 subjects recognized the necessity and the importance of the activity of scientific researching.

The majority of the subjects had accentuate the fact that through the researching activity the academic environment must contribute to the business environment improvement; the economic agent, the organization should benefit of the results of the implementation of the specialist's ideas from the academic environment.

There are deep discrepancies between the academic environment and business environment in the way that, most of the times, there aren't common points in the developed activities in part.

The academic environment can offer to the business environment – the possibility of ubiquity in the real context of the market – capitalization the information and the data obtained from the companies. It cannot influence the business environment because of the stiffness which the didactic staff could identify with the occasion of the activities of accumulating material during the doctor's degree studies. Generally, business environment accepts influences from the exterior.

The appreciation of the representative of the business environment was univocal in what concerning the indispensable necessity that each didactic staff should have certain format of collaborating with the economic agents in order to streamline the didactic and researching activity through the direct connection of the economic environment's problem and to have the possibility to identify researching ideas which can execute directly the economic environment; the didactic staff who had a direct experience with the business environment through the activity evolved before the activity from the university – can be now considered to be isolated from the practice, they feel that they lost the connection with the practice. Some of the participant didactic staff had accentuated the fact that they feel a complex of inferiority determined by the lack of practical experience.

Other subjects consider that it would be benefic if in the University will function a researching department with a strategy of coherent search.

The appreciation that the didactic staff from the economic universities can realize, in principal, activity of applied researching - had been univocal; only one subject declares that could be a combination of applicative researchments with the fundamental one, but the applicative one has a significant balance.

Another general appreciation was that it is hard collaborating with the business environment which is not always disposed - especially with the companies which are not in the multi national category – to allocate financial resources for the analysis. The majority of the economic agents from Pitesti are less preoccupied of the developing of their scientific activities, using a methodology which results from the scientific research. It is very difficult to organize a field research because of the reticence in giving information inside the enterprise and because of the exaggerated bureaucracy promoted with the achievement of slowing down the movement of the researching activity.

The economic agents are organizing the forming continuous activity - preparing their own trainers or appealing to consulting companies and not to universities – whose role is considered only regarding the masters which are developing.

One of the subjects considers the business environment being unable to develop a partnership with the academic environment, cognition that was sustained by other participants, too. Many times, the university image is created only through the graduates training level who intend to apply for different jobs in certain companies. Some of the teachers experience's presents to the discussion showed that not always the top of the graduates are also good practiciens, because of the individual features, but also of the non-existence of a clear bound between university's specializations and labour market qualifications.

The nowadays benefits of the research – practice relation are more presumptively. The academic environment doesn't take advantages from the business environment existence; there is no good communication between the two parts unless the well-prepared specialists supply part. The partnerships will take effect only when the business environment will be aware of its importance and role.

We can state that there is a relation between “Constantin Brâncoveanu” University and business environment, but this is not a solid one, because the economic agents consider that an intrusion into their

intern environment (educational staff might invade their privacy) and some features that must be secret might be identified.

The relationship practice – research – is different seen from the didactic staff in rapport with the business environment cooperation experience, with the training obtained from the Master degrees:

- the research activity is an expensive activity for the didactic staff who must pay conference attending taxes and publicity taxes as a result of the researching which, sometimes, overdraw the own financial possibilities ;
- the research based on the projects is toilsome because of the excessive bureaucracy; there were described many uncomfortable experiences regarding the steps of the projects;
- some of the didactic staff are making research by passion, others are not attracted by this activity and consider that they don't have ideas and cannot involve in projects;
- The necessity idea of running research activity on small groups taking to account the individual skills and specializations it is unanimity accepted.

The conclusion regarding of what it should be done in order to improve the relation practice– research might be materialized under the following aspects:

- there is possible a cooperation with the voluntary economic agents, educational staff and students, and for this, the business people associations should be sensitized;
- project ideas based on the experience and certain results obtained on your own or from the activities with the students which can succeed in some companies; it is preferred to start the interaction with the economic agents who are opened to the partnerships idea ;
- the relation academic environment – business environment should be intermediate through students project's; we can determine the student to realize projects by using the information from the economic agents; we must help the students to promote their new ideas in order to promote their specialist image – a possible future employee;
- we must determine the students to interact with the business environment through common activities organized with the economic agents, through well-prepared practice stages, monitorized, by putting accent on the student personal evolution;
- we can identify the companies having problems and propose them to research projects voluntary and then materialized into contracts;
- we can attract in the research activity also the economic environment representants , because it was stated that where the managers followed doctor master degree's, the opening to the academic environment was larger;
- we can attract specialists into the educational activities, on certain themes, for a better understanding of the opportunities offered by the academic environment; some kind of successfully experiences existed;
- The research possibility should be valued at the maximum level through the master students that rise from the business environment.

The focus-group results with the academic environment will be completed with the results of the business environment one.

Abstract

By its own role, interface between the internal and the external environment of the company, the marketing function needs highly trained human resources, capable to sustain the activities that must be ventured in order to achieve the strategic objectives allocated and to offer to the top management, in real time and in accuracy conditions, with the support of a performant information system, the data needed in order to update the strategy, at this firm function level being concentrated the most important part of the feed back mechanism.

Also, owing to its special character, the labour relations must be developed on trust, a higher value having, compared to the formal, written contract, the so called psychological one, this being the base for realising the dynamic equilibrium between employee desires (how is he appreciated, his expectations, his possibilities to prove his competence, involvement, workplace stability, etc.) and the company's requests (loyalty, responsibility, commitment, professionalism).

Key-words: human resources, marketing, conflict, negotiation

I. The human resources policy for marketing function

As all company's functions, the marketing one needs, maybe the most, a special resource: **human beings**. This is the reason why approaching this subject involves some particularities, because having results in such activity on the entire cycle of obtaining, retaining, motivating and developing the human resources who are supposed to occupy the workplaces designed for the marketing function it will be necessary **to define a professional profile** focused on the human qualities necessary to manage the conflicts and to undertake negotiation activities.

By its own role, interface between the internal and the external environment of the company, the marketing function needs highly trained human resources, capable to sustain the activities that must be ventured in order to achieve the strategic objectives allocated, and to offer to the top management, in real time and in accuracy conditions, with the support of an adequate information system, the data needed in order to update the strategy, at this firm function level being concentrated the most important part of the feed back mechanism.

Thus, here the **people** became the most important "**assets**", they must be treated as **critical investments**, having a strategic character. This feature, doubled by their adaptability, potential and values system, identifies every generation, being directly correlated with the results of the activities they are involved in, and, consequently, establishing the premises on which the company's competitive advantage will be built.

Recruiting the personnel who will occupy the posts into the marketing function must be realised according to the companies' **strategic objectives**, internal and external **environment** conditions and correlated to the **organisational culture** particularities, in order to obtain performance, into the oilfield industry being met, from this point of view, a higher frequency of Ivancevich-Glueck and Fisher models, that sustain the development of competitive products/services and which pay attention inclusive to the uncountable efficiency, aspect related to the intangible assets.

In the same time, when conceiving the human resources strategy it is preferred, for the marketing function, a **strategy focused on people**, because entering on new markets, maintaining the market share or, generally speaking, the economic success are fundamentally related to the quality of the company's human potential.

In the new context, generated by the implementation of the Lisbon Strategy into the European economy, to the investment character of the already mentioned strategy, it must be added a formative one, in order to facilitate the development of the best organisational frame for starting the continuous learning process at every employee level, for each of them being necessary to assure the conditions for going through the stages of: socialising, specialising, development and valuing, thus to develop the know-how transfer system.

In the human resources activity it is, first of all, necessary to take account of the *people characteristics*, who present individual particularities, have different attitudes and behaviours, own approaches and tasks to fulfil.

The marketing involves *good motivation* for the human resources, who occupy its workplaces, on both sides of it: intrinsic and extrinsic, the link between effort and performance having to be correctly realised, the marketing personnel assumed commitment (attachment and loyalty) being an essential criteria for realising the strategic objectives.

At this function level, owing to its special character, the labour relations must be developed on *trust*, a higher value having, compared to the formal, written contract, the so called psychological one, this being the base for realising the *dynamic equilibrium* between employee desires (how is he appreciated, his expectations, his possibilities to prove his competence, involvement, workplace stability, etc.) and the company's requests (loyalty, responsibility, commitment, professionalism).

Taking account of the direct contact with the external environment and the need of capacity to permanently receive and release new complex knowledge, the personnel involved in realising marketing tasks needs to be *systematically trained* as a consequence of the continuous learning process at the entire organisation level, the recruitment of human resource being recommended to be done according to this criteria when we are talking about marketing departments/divisions.

In the personnel strategies conceived in order to select future employees for marketing it can be applied all three known types: "the suitable man" approach, adaptation at the employee skills and the flexible approach, designed to develop a competitive organisation.

Oil companies, by definition, are large, and because of it, most of them use the first type and, as a modern tendency, it must be emphasized the fact that it is paid attention to *train new young managers* (aspect characteristic for the flexible type personnel strategy), in order to replace, step by step, the expensive workforce represented by ex-pats.

In the same time, because of the dynamism involved by the marketing activity, the personnel who fulfil tasks of this nature must be accordingly motivated and rewarded, because firm results are tightly correlated with this factor, a direct link between rewards (basic salary, bonuses, flexibility, recognition) and performance management having already scientifically proved.

The presented situation can be synthetically presented as it follows:

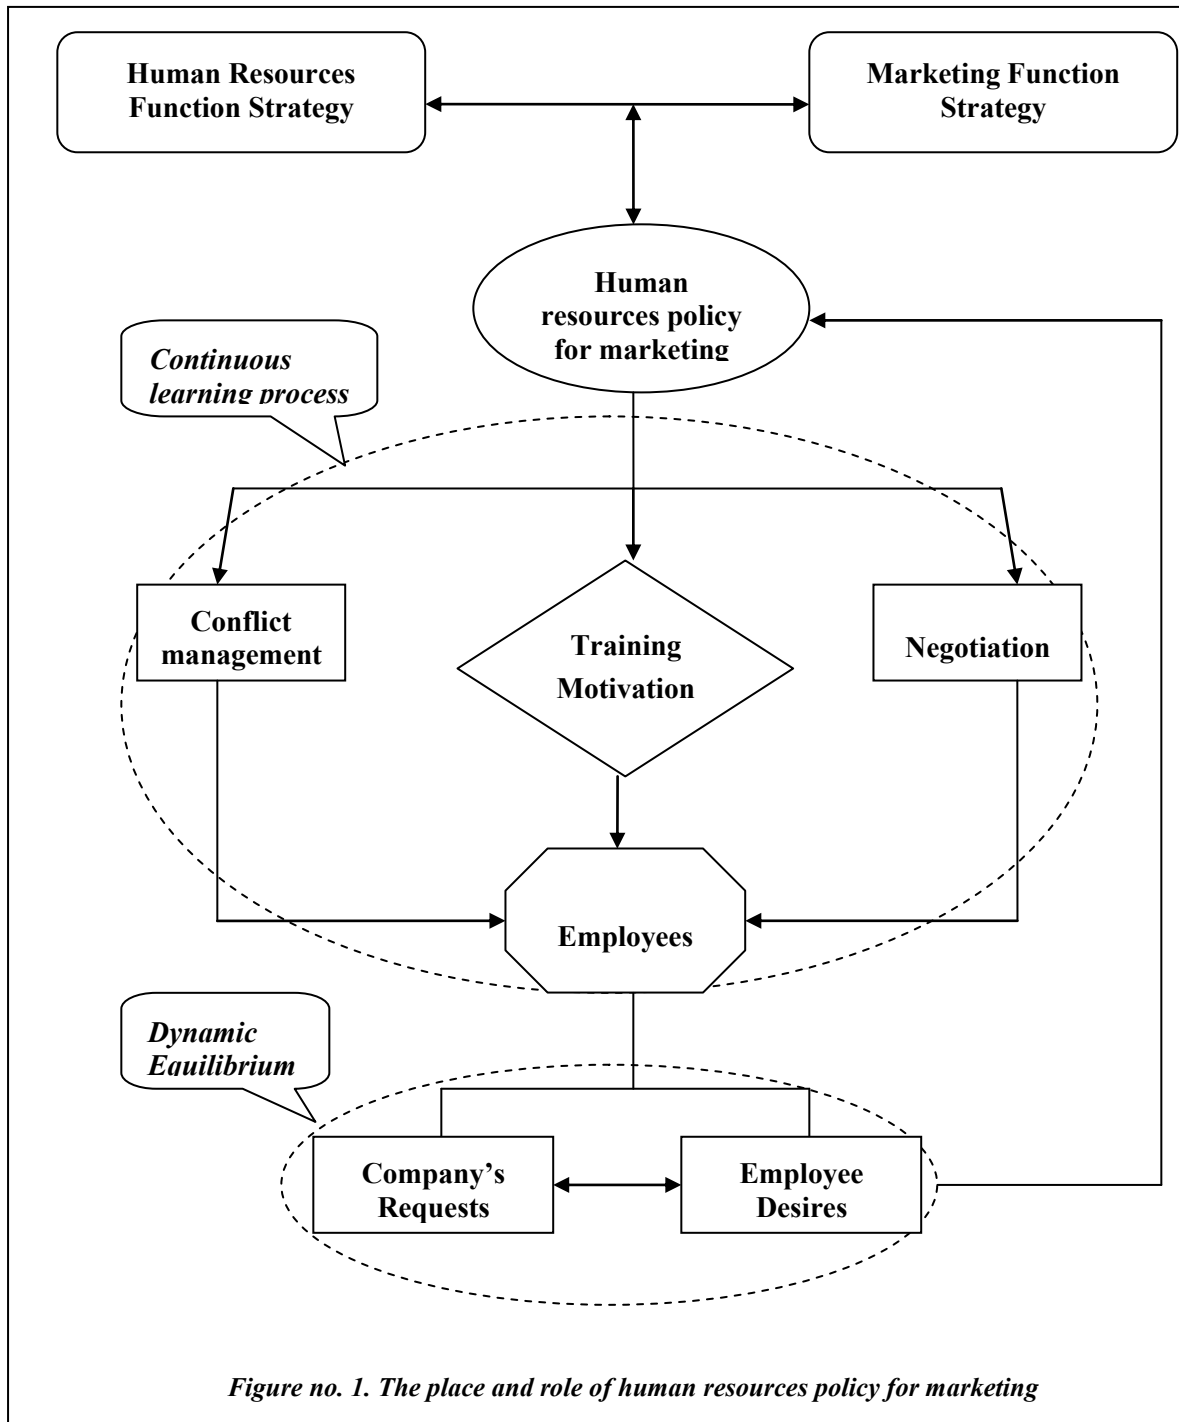

Figure no. 1. The place and role of human resources policy for marketing

II. Conflict management – a challenge for companies

The conflict, result of the progress and change, is *inevitable* at the companies' level, appears where inter-human connections are and involves communication. It starts from intrapersonal phase, than it became obvious at the interpersonal level, going further at certain forms for a group or appears at inter-groups relations.

From the presented features it is obvious the fact that, at the marketing function level, differently from all other functions, the conflict is present with a **double nature**: internal and external. Internal, because it appears and develops among the own employees and interdepartmental and external because through marketing it is sustained the largest part of the relationships with the external environment.

Managing efficiently the conflicts is a priority of companies' strategies because the negative effects can be higher when such situations go deepen. Some of the most **often met causes** are: the frustrations, the aggressiveness, different objectives and values, envy and, sometimes, cultural differences. In the same time, it is considered that *maintaining a certain level of conflict represents a sign of well organising*, because it stimulates the competition and the performance.

In order to **exemplify** the theoretical terms presented, we bring into attention the training which PETROM SA offered to some categories of employees responsible into the marketing function by special training in the conflict management.

Thus, in 2007, in partnership with BRAINOVATE SRL Bucharest, there have been presented to the employees advanced terms in this field, emphasizing the way in which the conflict could be efficiently solved. Analysing this study, it results that, in order to make an easier understanding, the conflict is pragmatically structured in **constructive** and **destructive**, the main differences being represented of the fact that the first shape is based on **dialog**, while the second one on **dispute**.

Among the **main causes** of the conflict there can be found out: unsuitable communication, lack of resources, different personalities and leadership problems. Conflict approach can be done, according to the involved parts, through: *domination, capitulation, negotiation, postponement, and collaboration*. In the same time, there are also shortly presented types of personality involved in the conflict, grouped as follows: *introverted and extraverted, sensitive and intuitive, rationalist and emotionalist, judger and receptive*.

The **main stages** in solving the conflict are:

- establishing the problem;
- presenting reasons;
- conceiving and evaluating the alternatives;
- solving and agreement.

The solving strategy is based on **certain tactics**, which have been proved **efficient**: reframing, paraphrasing, openness, minimising, sustaining the needs, discussing at the first person, and feeling recognition.

In the same time, the **inefficient tactics** in solving this are: blaming, attacking, sarcasm, negation, redirecting, minimising, fixation, suppressing, projecting and sounding.

For the cases when the conflicts get worse, its positive solving can be done in two ways: by **mediation** or by **arbitration**. The mediation is useful when the emotions and the relationships appear, being met at inter-human level, while arbitration is mostly used at corporative level and involves a final result, imperative and irrevocable from the legal or contractual point of view.

III. Negotiation – the conflicts solving path

From the already presented aspects it can be observed the fact that the most important way in which the conflicts can be solved is **the negotiation**, process characterised by an uncertainty climate in which the negotiator aptitudes (analyse capacity, planning, empathy, interactivity and communication) are vital and every marketing employee need them.

This is necessary because of the fact that when working in marketing, each of them is involved in many negotiation situations, reason for which they must to be prepared to make mutual concessions, to offer alternatives to understand the sources of the met conflicts and deal with the situation in a manner which maintain a winning position.

From this point of view, it worth to be noticed that PETROM SA trained a part of its personnel for understanding the **four basic principles of Harvard Concept**, more precisely:

- separating people from the problem;
- focusing on objectives, not on positions;

- creating mutual advantageous alternatives;
- using objective criteria for evaluating the negotiation results.

In the same time, the company's management training program included the introduction of **BATNA** (Best Alternative to Negotiated Agreement) specific terms, also known under Plan B name, alternative or retreating scenario, which main scope is to develop the negotiator confidence and to create a feasible alternative for the negotiation process.

During the negotiation process, a key role is played by the **value motivation system**, defined as a central concept designed for achieving the self management and relationship management abilities, depending on genetic influence and early experiences.

Into a study from 2005 of Personal Strengths Publishing Inc. (USA), also presented to PETROM SA employees in 2006, there have been structured **seven types of motivational systems**, as it follows: *altruist* (based on looking for the others welfare), *directive* (focused on fulfilling the tasks in order to achieve the objectives), *analytical* (careful to planning), *flexible* (emphasising the group welfare and the feeling of belonging to it), *assertive-protective* (obtaining the other welfare by realising the objectives), *correct-competitive* (pay attention to fair competition) and *cautious-offering support* (preoccupied to obtain self and others autonomy by respecting the rules).

In the same year, 2006 and in the already mentioned company, in cooperation with the BPP Professional Education firm, the human resource from marketing departments has been trained in order to clearly identify, according to the relationship and substance preoccupation, five **negotiating styles**: *compromise* (the conflict is decreased by successive concessions), *cooperation* (the problems are systematically approached in order to obtain an agreement), *accommodation* (the attention is focused on building the relation, despite the result), *retreat* (accept what is offered) and *defeat* (take as much as he can, ignoring the relationship). Their correct usage means to establish the partner **needs**, these ones being structured in three types: *emotional*, *rational* and *political*.

The negotiation process is based on **influence** (feature that involves effects by verbal and non-verbal communication, related to the subconscious) and **persuasiveness** (characteristic for the rational, conscious part).

When **leading the negotiation**, it must be established from the beginning if the situation is one of "feelings" type (based on influencing abilities as *reflection* – the capacity to listen the subliminal message sent by the other person, not necessary what he says, and *assertiveness* – understood as sustaining the own needs and expectations into a unyielding, not aggressive manner) or "facts" type, which involves skills of asking efficiently and suggesting responses.

The negotiation is sustained by "**dealing with objections**" **techniques**, among the most used being *curiosity*, *inoculation* (anticipating the partner complaints and mention them before he can be able to do that), *justification*, "*understood, felt, found*" (based on example, expressed as the favourable experience of other person who accepted your offer).

IV. Conclusions

From the presented aspects it can be observed the importance paid by the large oil companies to the human resources integrated in the workplaces from the marketing function, offering them *special training from the conflict management and negotiation point of view*.

Thus, it became evident the fact that, in order to resist to the competition, the *marketing knowledge must be completed with terms from human resources and psychology area*, being proved once more its multidisciplinary character.

Taking account of the discussed things, we can appreciate that **a profile of the marketing employee** implies **two main dimensions**: one of the **natural abilities**, among which that of *excellent negotiator* must to excel, and one of the **continuous professional training**, which has to be doubled with *advanced knowledge of conflict management*, these aspects being necessary to be first of all considered when the personnel from this function is recruited.

Abstract

In management process, we appreciate that decision represents the engine for any economic-social activity, who's effect can be felt in present or on longer period of time and sometimes it reflects even in career of person which had adopted.

Key words: decision, management, objectives;

The efforts of system management members in direction to achieve some high economical performances could be materialized only in measure to which they succeeded to elaborate and implement decisions substantiated on scientifically grounds.

To this moment, the informationally affairs medium is more intricately, due to increasing number of important informations volume for affairs proceedings, to number of informationally resources and the number of technologies used for access and dates keeping.

The restricted character of human, material or intelligence resources from economy, implies a huge and continued responsibility for managers in order to fulfill the organisation's goals regarding the best ways to allot and use this resources. It can be say that all management activity is formed by a decisions chain.

The social-economic medium's complexity and mobility make necessary the decisional skills in order to form and develop in future, due the fact that organisational management and it's evolution is related to decision's quality. In working author's opinion „Military management organisation”, the major role of decision consists in connection achievement between ideas and practice, making the link between the notional and grounded bases of option, over the activity or action in real proceeding.

For a long period of time, the management was considered a real art, gift, faculty hold by learning from attempts and errors. An individually styles variety, often based on creation, human thinking, intuition and experience were used in solving this type of problems, all this issues against quantities methods and scientific landings/approaches.

The affairs complexity and theirs's environment for proceeding highly increased in the last decades. Exist some major causes which determined this increase of complexity: - the possible solutions number is too high; the hardness to forecast the consequences for long term period due to increasing incertitude degree, the errors effects in taking decisions could be disastrous thanks to operations complexity and chain reaction, which an error could cause in different sectors to microeconomic and higheconomic levels.

Thus, the **decision** could be defined like a rational process to choose one solution, one certain action ligne from a number of possibilities, in order to get a safe berth to a result. From decision concept, could be depicted at least these following **elements**:

- Is regarded like a rational choosing process, specifically to humans;
- Is finding again all the management functions;
- Represents the final file in order to vouch for objective settlement or the objectives assumed by manager;
- Economic units integration into environmental medium depends on decision's quality;
- The action is named decision only if this is appropriate to one choosing situation;

- It is a legal instrument/act of attracting, combining and allotting of different resources in production process;
- It is a legal instrument/act to join the interests of economic unit's components;

In a large sense, decision represents the human's capacity, with certain responsibilities, to take resolutions in issues regarding their's competence/jurisdiction sphere. No matter the hierarchical level, it's content and quality, decision has a complex/intricate character, being a reaction of decision man to "signals" received from the conducted system.

In this manner, the decision is generally bequeath/tied by management, due the fact that it is not a product of contemporary economic life. The fact that imposed lately, their new quality element in management was to use, in the elaboration process of one large scientific device, throughout the empiric forms widely spread in the past had been replaced by the scientific ratiocination- based on deeply phenom analysis, the analysis of factors complex who conditioned a process, an operation, or an economic phenom and thus their's results – elaborate more action alternatives, attaching to every one their predictable consequences, also defining the optimisation or rationalization criterions.

Elaborate and adoptat process of decision represents a complex, dynamic process, which assume to step the following *phases*: identify and recognize the problem, settlement of objectives and decisional criterions, establishment of alternatives or decisional variants, choosing the best alternative, decision implement, control and finally, result's valuation.

Ensuring to managers the possibility to combine the available resources and to conduct the economic processes, the decision represents the major instrument to achieve the objectives taken upon the economic unit.. In economic units, inside a decisional frame, the objectives could be achieved on many ways. The existence of these issues impose the managers to have high competence, both regarding the elaboration of decisional variants and in valuation of their application.

The variants which allow to achieve the same objective are different through: the level and structure of allotted production factors; the level of work productivity; the obtained results; etc, causing the same time some measure consequences through the considered economic indicators level.

In order to vouch for elaborate of good decisional variants and fair valuation of every one, the decision persons must to prove a high degree of competencies, so the results obtained from application of one variant in practice, the real consequences not to be different by the advanced items only in agreed degrees. As much the difference between the real results and the advanced results is higher, so is imposed that in a shorter term to initiate correction decisions.

This one imposed only when in order to adopt the initiate one, were not taken into account the inside or outside system's factors or appeared other factors, to which were not available informations from decisional process start, which could be recognised through the ensemble's stages and phases covered in preparation, adoption, application and valuation of management decision's consequences.

The decisional problems solving with consequences over economic and social results of economic units assume major human and material efforts from managers. These efforts are valuate through the positive effects registred in unit economy..

Thanks to this reason I appreciate that, the activities commmand in a logic phases evolution is very important in order to obtain some economic performances forecasted by the economic unit's manager.

The activities grouping togheter on stages and afterwards on phases in decisionally process, it has not a theoretical pure character, this materialised and consolidated in economic practice from units.

The activities systematization on stages assume a selection and then a grouping on different phases, in a logical evolution that can't proceed otherwise. Such an example, the working's quality specific to second phase of decisional process depends on the way to command the activities and their quality specific to the first stage of decisional process, and choosing the variant with best profit, can't be done if previous settlement of indicators system or unit valuation parameters didn't proceed and, of course the establishment of decisional variants. Proceeding of decisional process assume also a competence activity from manager's side, measured by it's heterogeneous structure.

The decisional process structure is influence by a large number of *factors*, such as : the decisionally problem type; the real conditions to developp the decisional process; the knowledge degree of certain events apperance; qualities and manager's experience, etc.

The proceeding of one decisional process and elaborating one scientific decisions, decreases the risk to appear some consequences with important deviations versus the initial valuation and decreases the sphere of unknowledge.

The decision's quality adopt by managers can be appreciate through the amplitude of results obtained by practice materialize of this and the initiate valuation level. The economic units develop all the activity under the influence of some events. With low nature and frequency, which won't become entirely decisional problems, some being imposed situation with a certain manner to solve. In order to allow an event to become a "decisional problem" must to fulfill the basic condition "of having the possibility to obtain same result on many ways" with different characteristics.

In economic units the appearance of decisional problems is engender at least by two *situations*:

- a) In situation that the disorder factors create a lack of balance between the operational undersystem and the functional system with negative consequences in objectives achievement and it impose the restore of system functioning to settled parameters.
- b) In situation that exists balance between the two undersystems regarding the proposed objectives achievement, but the manager desires to obtain higher performances.

Diversity and complexity of decisional problems which follow to be solved by managers from economic units impose a systematization accordingly to some elements and criterions. The criterions are various, having a common element, thus "to order and alleviate the decision's person work.". In order to ensure the proceeding in practice of these demands is necessary that the decision taken person to dispose a large amount of specific informations for every decision and a certain time framework from identify the decision problem until to adopt decision necessity.

The most important *criteria*s and elements which follow to be taken into account to decision grouping are: the coverage sphere, the hierarchical level of decision taken person, the nature of problems which follow to be solve, substantiation level, the possibility to know the appearance of some events, the decision taken persons number etc. On decision plann, these elements translate in a vaste number of variables and impose conditions, also consist in increasing of interlinks between these.

When appears a problem is necessary to analyse all solving variants of this. For each variant are analysed the strong and faible points, the allotted resources, the necessary time, the risks. Choosing a variant from many possible options after combination of above mentioned factors, means to take an decision.

This represents in fact a process consisting in changing the reality, also changing of natural, financial and human resources of economic unit, of rationally choosing between variants. Decision must to be adequate to the performance, economy, acceptance criterions. In order to elaborate decision must to take into account: the action, a single measurable result; a time framework, also the maximum investment in order to reach /achieve the goal.

From mining industry point of view, the global practice of mining proved that an appropriate substantiation of decisions in using the mineral wealth can't be based on the other factors different by the important criterions, with the possibility to identify and to measurement only when the approach from economic perspective of mining activities is circumscribed under vaste technological peculiarities.

In mining branch, the valuation process of some mineral resource supposes gathering, manufacturing and appropriate rendition for a lot of informations, in order to illustrate the issues regarding, first, the quality and quantities of provisions and the condition to keep these resources inside the earth. In fact, the achievement phases of some mining project are constituted in materialized decisions, substantiated on some documentation basis which include the important informations, regarding the ore knowledge until the respective moment. As a conclusion, the decision, basic composition of decision system, is an essential element of management, being their specific utterance instrument. In stock, the quality level of organization manifests through the elaborated and applied decisions.

In terms of globalization and intensification of technology and information transfer, the assurance of a economic competitiveness corresponding level represent a major concern for the organizations. Their efforts concentrate on different parts of the activity, one of the most important is the intensification of investments projects. Classic investments projects orientated on solving precise problems on short and medium term pass now in the sphere of complex preoccupation, with a systematic view towards everything which assumes the substantiation, accomplishment and the exploitation in a strong connection with the environment. Even if the social responsible investments are a new economic concept, it constitutes one of the elements with a significant impact for the organizations competitiveness. The present working presents some aspects regarding the way in which the involvement in social responsibility investments project could assure the growth of the competitiveness related to the actual context of the social and economic development.

Key words: competitiveness, investments, social responsibility

The economic systems, even if situated on different positions and apparently independent, constitute component parts of a macro system which works and it is governed by common and complex principles, related to the development at demographic, political, administrative level or to the sustainable development requires. Even if the main actors of the macroeconomic system have a decisive role in the principles and directions establishment, the last period has proved the fact that certain states, according to some competitor advantages, real or potential, can determine changes and can generate conflicts with major consequences. In this context, the economic growth and implicit the competitiveness have passed from the relative independence sphere to the one of interdependence linked with the actual stage and the development perspectives.

In the globalization context, the economic growth is strictly related to the competitiveness level of the main activity domains from the social-economic environment. If at the beginning the competitiveness was especially a concept of theoretic concept, with the mission to point out certain aspects or independent parts of the developed activities, the practice has proved that the competitiveness became one of the most important factors of the economic development, of the attractiveness in the investments projects field or of the built of some classifications at macroeconomic level.

The major preoccupation at national and European level were concentrated around a reference document, elaborated in the year 2000 „The strategy of economic and structural reform from Lisbon”, recently submitted to some revisions in the years 2004 and 2007. The respective documents establish as reference objectives that until 2010, the European Union becomes the most competitive and dynamic economy based on knowledge, capable to assure the sustainable economic growth, more jobs and a more intense social unity.³² Beside the performances evaluation of the 15 members (in 2004), the Lisbon diary attracts the attention over the performances of the candidate countries to adhere to the European Union with the goal of

³² Lisbon European Council 23 and 24 march 2000: Presidency Conclusions, The European Union's Lisbon Strategy (<http://www.etuc.org/a/652>)

reducing the economic and social development dissimilitude's between these and the states members EU, through the engendering of a additional gross intern profit growth of 15-20% until the year 2015.³³

The European integration brought the national economic systems in front of some challenges and major opportunities determined by the corresponding growth rhythm, by the available investments founds in different activity domains, by the principles of the sustainable development.

The position occupied by Romania in the classification regarding the economic competitiveness made evident disadvantageous positions for our country, both in the pre adhering period and the post adhering one. According to the top in 2006, realised by the World Economic Forum, among the 125 developed and emergent, Romania is situated on the 68 position from the economic competitively point of view, in descent with one position comparing with 2005 year.³⁴ Behind Romania it was Bulgaria, which has descended from the 61 position to 72, the Moldavia Republic, which has ascended 3 places, to the 86 positions, and in the top of the classification is was Switzerland, meanwhile the United States of America, and the leader from 2005, descended on the 6th position. From the competitiveness perspective, the Romanian economy was estimated through the global index of competitiveness, taking in account many criterions, among those the infrastructure state, institutions, macro economy, health, primary and superior education, market efficiency, innovation. By comparison with the states which adhered in May 2004 at the European Union, Romania is situated on the last positions at all the mentioned criterions. At the corruption chapter, favouritism in the governmental decisions, the respecting of the laws and contracts – made oblivious in the pillar of the institutes qualities – we are situated on the 87 position. In the same time, at the infrastructure area, the situation is even more drastic, which means we are on the last position among the states which adhered at 1st of January 2007, the position in the classification was 77.³⁵ From the macroeconomic point of view, Romania, in the documents, occupies again an unhonoring place, 97, only Hungary being after it. Similarly situations are being remarked in relation with the technological contribution, Romania (position 49), but before Poland (51), but again on the 76 position at the competition.

Published speciality reports, The Global Competitiveness Index 2007-2008, place Romania on the 74 position with a score of 3,97 among 131 analyzed states. The occupied place makes obvious an inferior position towards the previous years, important aspect in comparison with the macroeconomic policy and strategy adopted at country level; from the offered dates it seems that they didn't reach the entire proposed objectives.

The confirmation comes from the fact that Romania is at the end not just in the competitiveness classification, but also in the top of the investments at one inhabitant, statistic at which leaders were Estonia, Hungary and Czech Republic. As long as there were less economic environment difficulties and the public institutes were stronger, more foreign investments came to solve the competitiveness problem. Even if the total volume of the direct foreign investments was a significant at the country level too, their effect regarding the economic growth, the competitiveness and sustainability it wasn't as big as it was expected to be.

The causes for this situation are complex and they are related to the wide sphere of involved factors, from beneficiaries to financiers, public authorities, organizations of profile, etc. Among the identified problems, we can mention the incoherent substantiation of the necessity, the utility and the feasibility of the investments projects, the instability of the economic environment and of the legislature on medium and long term, the allocation and the use of the investments stocks to solve the current problems, without a preceding strategy, authorities incapacity to manage efficiently a batch of programs and projects financed by the European Union and by the international business environment or the allocation of the investments stocks, especially the public ones, relied on some requests and criterions sometimes subjective. It is obvious the fact that the presented situations can't be carried just a strong involvement of all the actors,

³⁴ World Economic Forum Classification is realised based on available economic dates, but also on a sounding opinion realised by a batch of partners research institutes and business organizations

³⁵ World Development Report 2007 - Development and the Next Generation, ©2006 The International Bank for Reconstruction and Development / The World Bank

which has to generate a major change regarding everything related to the strategy and the policy at micro and macroeconomic level.

The actual context of economic development made evident the fact that the economic systems that had taken into consideration the social side of the investment process had an important growth due to the tough national and international competition. Countries like Switzerland, Sweden or Denmark, in which the economic strategies are mainly oriented on the social side, are in the top position regarding the international classification.³⁶ Aspects like the necessity of regularization, the compensation of the labour grade of occupation, life quality improvement, ranging to different kind of plans of standards and principles of developed nations, pollution reduction or the ecologic rehabilitation, represent the main factors which influence the process of obtaining and use the investments funds.

More and more organizations and private institutions take into consideration the social, ecologic and ethic factors when they have to take the decision regarding the investment. Lately, the management of many SME began to understand the importance that the ethic standards and social responsibility play in the project, in order to have a long life and to strengthen the position on the unique market.

At the international level, in the documentation specific to investments began exist clearly requirements regarding the opportunity, the ecologic utility, because this aspects are well evaluated, in concordance with statistics about the actual situation and the development objectives. More and more financial institutes put strict ecologic requirements that need to be satisfied by a project in order to be accepted.

Because of the varied type of problems, an issue that occurred and affects a big part of the community, the local public authority see they obligated to take position and involve themselves in the projects that have a major impact on a specific region. Investments with a public character, oriented on community services, based on the alignment to standards, characterized by varied effects, social, cultural, regional effects and less economic effects. This type of investments objectives is minion to bigger strategies, for a regional community, and as a result their effect will have a diffuse character related to the community level.

The appearance of the social in the investments process lead to a new concept, which is: social responsible investments. For the first time this concept appeared in the 1950-1960, when in the economy of the United States of America appeared the first concerns about the integration of social principles in the investments projects. The concept was developed at a higher level, and outside the USA, after the 1995.

According to the study named „Voice of the Leaders Survey”, the company’s reputation is one of the main factors that lead to the business success. The results of the study show that 60 % of the interviewed think that a good reputation help to the market capitalization of the companies in 40% of the cases.³⁷ Many other studies show that for the costumers the company reputation and the trust that they can have in the company is very important, indeed. They are willing to pay extra for their honesty and the commitment to their promises. The companies, as well, are aware of the business benefits that can be gained if the costumers have a big interest regarding the companies’ reputation.

A good reputation it’s also very important for the continuous performance of the company. The social responsible companies, those who respect some ethic standards are able to attract more capital and they can get loans at smaller cost. This is, also, one of the arguments that lead to the growth of social investments all over the world. According to the social organization „Social Investment Forum" (Washington)", in 2005 more than \$2 trillions of capital, from the administrative portfolio in USA, where social investments, which is a growth of 80 % comparing with 1997 – a remarkable achievement, taking into consideration the economic decline from that period.³⁸

A study made in Europe shows similar trends related to social investments in the last years. The opinion poll „CSR Project on Managing and Communicating CSR for Value" realized through the European funds managers, financial analysts and the responsible for the good relationships with the investors show that a percentage of 50 % from the investors see the social and environment consideration as main futures of the investment decision in the next couple of years. The non-financial risks are regarded more and more, as

³⁶ World Economic Forum - The Global Competitiveness Report 2007 – 2008 (<http://www.gcr.weforum.org/>)

³⁸ Social Investment Forum - 2005 Report on Socially Responsible Investing Trends in the United States, 10-YEAR REVIEW, Industry Research Program, January 24, 2006.

being important aspects of a investment process, less than 50 % of the interviewers said that professionals investors have already realized the importance of this aspects for the corporate rule, risk management, and costumers relations. In other words, for the social responsible companies, in the financial management the reputation has a important place, being very important for the company and for the clients, as well. ³⁹

An interesting role in this working is played by the motivation that lead to social responsible investment decisions. A study made in 2004, relates the main reason that were used : 86 % respect for human rights, 85 % a proper environment for business; 85 % respect for the environment, 76 % clients relation quality, 73 % working condition and ambiance and 68 % politics for employers satisfaction. ⁴⁰ The identified motivations have the purpose to point out organizations preoccupation, first of all for the social climate, human resources, stakeholders and the environment.

The big companies can have a big role in the process of improving trade practice on a big market, by creating and stimulating a general atmosphere of responsibility in business and by promoting standards and international agreements, but the small companies might play an important role to in the development of the local communities where they activate. The involvement of the economic systems and of the organizations in social responsible investments projects is justified and governed by the positive outcome towards competitiveness and the factors that generate it. By the following we must take into consideration all the interests of the co-interested groups ranging from stakeholders, employees, business partners, suppliers, clients, creditors, distributors, to consumers and community and building a strategy of social involvement, a strategy that would integrate the strategy of the organization on a medium and long notice, because the programs of social responsibility can not be conceived separately, besides one vision which integrates them in the management and marketing company objectives.

In order to adopt the social responsibilities practices toward the national plan of investments projects is needed to implement some international principles and practices. One of these sets of principles is the one promoted by The International Finance Corporation (part of the World Bank group) under the name The Principles of the Equator.⁴¹ In this context, the finance of the complex investments projects (power stations, transportation infrastructure, environment and telecommunication) of which values is over 10 millions dollars it is conditioned by the accomplishment of some requests and strict conditions regarding the potential impact and the social and environmental risks associated. ⁴² Through the assumption of these principles it is pursued the avoidance of the negative effects which the financed projects can have on different ecologic systems or communities, or, in case these effects are unavoidable, their reduction or/and compensation, in a corresponding way. The extension and the adhesion to these principles in the organizations practice at national level in the investments projects substantiation, brings significant benefits for the economic growth and competitiveness. The ethic code, standards and principles of social responsibility defining which the organizations apply in the investments projects assure a supplement of institutional transparency for the developed actions with benefits on the level of informing towards the rights and the obligations which the company has towards the groups interested for the project.

Another factor which favours the economic competitiveness is related to the periodical publishing of reports through which the company presents the way in which they respect the assumed obligations through the investments project, unto the environment and the society. In fact, these constitute guarantees of the involvement and bring a supplement of image for the stakeholders, financiers, customers, business partners, authorities.

The experience of the companies developed in the social responsibility investments programs pointed out the fact that for the markets and the organizations at different development levels, it can not be applied an universal model for the current activity in the social responsibility spirit. From this perspective we

³⁹ Department of Trade and Industry (2002), Corporate Culture - CSR Project on Managing and Communicating CSR for Value, DTI, London.

⁴⁰ The European Survey on Socially Responsible Investment and the Financial Community, 2004

⁴¹ The Principles of Equator reffer to the way in which one project finance has to take in consideration the aspects related to the social responsibility practices. At thede adhered over 50 banks which have more than 80% form the finance of the biggest projects from the entire world.(<http://www.equator-principles.com/principles.shtml>)

⁴² The "Equator Principles" - A financial industry benchmark for determining, assessing and managing social & environmental risk in project financing, July 2006.

appreciate as being useful the realization and the development of some activities for the civil society development, especially, making sensitive the customers regarding a responsible production, to promote taking responsibility by the organizations, these representing a long term engagement and relevant for the national context and the regional one, in particular.

In the same time, the way in which the companies social responsibility it is perceived stimulates, influences the dialogue and the partnership between the local and central public authorities, the private sector and the civil society, with implications onto the impact for the current and investments activities organization. The direct consequence of the implication in social responsibility investments generates the some contradictions between the economic and social interests of a project. In case between the two perspectives of the projects exist significant difference related to the resources, to the substantiation and realizing way, it can constitute a factor of major risk. We appreciate that in this kind of situations, the project manager has the essential role and he has to identify the common pints of the two directions and to promote them, and on the other side to harmonize the differences with the goal of reaching the project objectives at the organization and society level.

To draw a conclusion we can say that the transfer from a classic investments policy, orientated on the temporary organization difficulties, to a strategic policy of responsible investments, three- dimensional orientated: organization, environment, society, doesn't constitute an easy step. More the organization and its action environment understand and act more rapidly in the wanted way, more the main goal, competitiveness growth will be easier to be accomplished.

ORGANIZATION'S COMPETITIVE ADVANTAGES RELATED TO SOCIETAL KNOWLEDGE MANAGEMENT

Doval Elena

Spiru Haret University, Faculty of Management Brasov, address: 1, L.C.Babes, bl.5, sc.B, ap.8, 500435 Brasov, e-mail: doval.elena@yahoo.com, tel. 0723 593225

***Abstract:** In the knowledge-based society, the corporations and the global and international companies are involving more and more in developing environmentally sustainable products and production processes, as a consequence of the new industrial system that generates individual, organizational and societal knowledge. Some general aspects regarding knowledge, knowledge management and knowledge societal management are presented in the paper. The main issues of the societal knowledge management are based on several organizations' competitive advantages that are nowadays fundamental: intellectual capital creation, the life cycle management, the integration of societal requirements into business strategies and the knowledge work force development. The fourth strategic capabilities discussed in the paper bring benefits to individuals, organizations and society into the societal knowledge system.*

***Key words:** knowledge, knowledge management, societal knowledge management, competitive advantage, societal knowledge system.*

Introduction

The management focus has suffered transformation along time. If early on the management observed the work and later it included the role of information, recently a new shift occurred by including knowledge concept. The understanding of organizational performance is not related only on know-how and expertise influencing the quality of processes and products or services, but on existence and use of knowledge. "However, the knowledge focus has tended to be on the individual and not on systematic considerations of broader work processes or knowledge mechanisms within organizations. There has been little focus on invisible work, particularly on how workers think and utilize knowledge when performing tasks" (Wiig, 2000).

The literature offers valuable ideas and theories regarding the integration of cognitive sciences, knowledge understanding and knowledge use in the business functions and demanding markets, and many writers became viable references, such as: Brown and Duguid (2000), Damasio (1994, 1999), Halpern (1989), Nonaka and Takeuchi (1995), Klein (1998), Schön (1983), Wiig (1993), also cited in Wiig (2000). But, gradually and systematically the organizations started to create and leverage the intellectual capital into business and public management. Integrated in this theory is the information technology (IT), which is used extensively to support knowledge management, although "many information management tools are marketed as being 'knowledge management' tools, which they arguably are not, because knowledge is distinctly different from information and that knowledge management and information management is not the same" (Wiig, 2000).

The broad field of knowledge management introduces new options, capabilities, and practices to assist organizations to great advantage. It becomes a new responsibility to manage knowledge to strengthen private organizations and public service effectiveness and improve the society they serve. Nevertheless, the knowledge management goals are to improve the effectiveness and sustained viability of any enterprise – be it a commercial corporation, a part of society, a country, or a single individual. In this respect the knowledge management must be fully aligned to the enterprise's central objectives to create competitive advantages.

Knowledge and knowledge management

Knowledge is understanding gained through experience, observation or study (Barquin, 2006). Knowledge has different forms, such as:

- Explicit knowledge: books, papers, databases, videos etc.
- Implicit knowledge: in people's mind and could be explained
- Tacit knowledge: in people's mind and difficult to be explained.

These forms of knowledge could be encountered in any organization, but the managers may not be fully aware of the importance of balancing them in designing the organization strategies to compete on the market. As Lewit (1991) points out "the most precious knowledge can neither be taught nor passed on".

Some important basic characteristics of knowledge are underlined by Fuchs (2004):

- Knowledge is a manifestation of information in the human-social realm. Knowledge doesn't exist in nature as such; it is a human and cultural product.
- Knowledge exists both in the human brain and in social structures and artefacts. It has subjective and objective aspects that are mutually connected. Subjective and objective knowledge is constituted in social practices of active, knowledgeable human beings; knowledge is related to human practice.
- Objective knowledge is stored in structures and enables time-space distancing of social relationships. It reduces the complexity of social systems; foundations of human existence don't have to be re-produced permanently due to this storage-function. Objective knowledge is a supra-individual structural entity, but is based on human agency, it is medium and outcome of social actions, it constrains and enables human practices.
- Individually acquired knowledge can be put to use efficiently by entering a social co-ordination and co-operation process. Synergetic advantages that can't be achieved on an individual basis can be gained by such a co-ordination of knowledge. Emergent knowledge and qualities show up and are due to the synergies produced by the co-operating efforts of knowledgeable actors. Intelligent organizations are based on the effective use and management of emergent knowledge.
- Knowledge is a social, common, public good that has a historical character. Knowledge production is a social process, in order to produce new knowledge one must refer to prior knowledge produced by others. Frequently knowledge production has a highly networked and co-operative character. Knowledge is a self-expanding resource, but can only be artificially transformed into a scarce resource (e.g. by Intellectual Property Rights).

Other relevant characteristics also underlined by the author are: knowledge must be permanently enhanced and updated, it is intrinsically coupled to not knowing, it has relevance for a system and it is constituted within and part of human experiences, it is a non-substantial good that is generally not used up by its manifold usage, it expands during its usage, it can be compressed, it can replace other economic resources and the costs of reproducing knowledge are generally very low and are further diminished by technological innovations and progress.

A brief analyze of the knowledge shows a picture of too much data, too many sources, too many formats, too many tools and too little integration. In our days the knowledge is amplifying faster than could be imagined. It is complex and it has an unmanageable volume. For example, the total new information issued in 2003 is equivalent to half a million new libraries and the amount doubled in 3 years (Barquin, 2006). The framework of actual and future amount of knowledge makes the organizations to compete more toughly with uncertain results. The solution is knowledge management. According to Barquin the knowledge management has to be focused on:

- Identify or nurture communities of practice;

- Pay attention to customer knowledge;
- Automate content and document management;
- Identify and disseminate best practices whenever possible;
- Deliver knowledge through Enterprise Portals;
- Change culture to reward sharing/collaboration;
- Utilize story telling to capture share of attention;
- Implement data warehousing environments, enterprise-level integration, and business intelligence solutions;
- Provide leadership to accomplish objectives.

Knowledge management is concerned with the entire process of discovery and creation of knowledge, dissemination of knowledge, and the utilization of knowledge. Knowledge management is a set of tools and processes, used by knowledge workers in an architected environment, created through an enterprise initiative, to obtain maximum returns from its data, information, intelligence and knowledge. Knowledge management is the process through which an enterprise uses its collective intelligence to accomplish its strategic objectives (Barquin, 2006).

Given the importance of knowledge in virtually all areas of daily and commercial life, two knowledge-related aspects are vital for organization's viability and success at any level: knowledge assets (to be applied or exploited) must be nurtured, preserved, and used to the largest extent possible by both individuals and organizations and knowledge-related processes (to create, build, compile, organize, transform, transfer, pool, apply, and safeguard knowledge) must be carefully and explicitly managed in all affected areas.

Societal knowledge management

Innovation and intellectual capital supported by IT lead to a broader involvement of the society into knowledge management and to the integration of knowledge management into societal needs. The solution is "knowledge environments to get the right knowledge to the right person at the right time" (Barquin, 2006).

Societal management is focused on satisfying the needs of society as a whole, generating favorable relations between the organizations and communities. "Societal knowledge management is the innovation enabler by providing the driving intellectual capital resources" (Wiig, 2004). But, "knowledge management is the view that globalization makes it a necessary activity to maintain or improve competitive stance. This has produced a societal and enterprise knowledge management "*movement*". This movement is based on the belief that 21st Century globalization has led to the 'Knowledge Era' where the fundamental competitive factor is intellectual capital when effectively utilized and applicable. The emphasis is not only on competition but on the endurance of quality of life, basic personal values, and broad global, societal, and enterprise responsibilities and values. This facet focuses on strategies, policies, and allocation of resources to build required intellectual capital on short term and long-term. It covers concepts as different as initiation of quick training programs to fill important societal knowledge gaps and creation of long-term intellectual capital capabilities by improving preschool education of children or building research and technology infrastructure" (Wiig, 2002).

Societal knowledge management acts in a societal knowledge system (fig.1) that allow the society to prosper, the organizations to wor

k smarter and individuals to increase their quality of life.

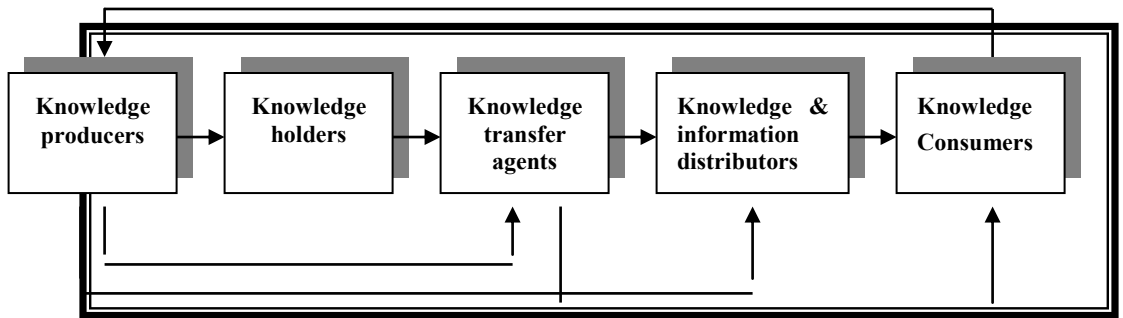

Fig. 1 Societal knowledge management system (adapted from Wiig, 2000)

This system “operates as a living organism with multiple goals, resources, information exchanges, flows of many kinds, and self regulating mechanisms. Unfortunately, some, such as the market mechanisms may too often be inefficient. The knowledge system changes and adapts to economic and social demands and it therefore is important to maintain the vision and overview for overall system and how it might operate in the modern, competitive society” (Wiig, 2000).

The main actors that behave into the societal knowledge chain are (adapted from Wiig, 2000): producers, holders, transfer agents, distributors and consumers, as for example:

- Knowledge producers such as: independent innovators, research institutes and companies’ research departments, universities;
- Knowledge holders: knowledge bases, experts, industries, public agencies, libraries;
- Knowledge transfer agents: primary and secondary schools, universities, professional firms, professional communities, individual professionals;
- Knowledge distributors: libraries (books), special publications, network (internet), media;
- Knowledge consumers: business, public organizations, specialized services organizations, public at large.

Societies consist of entities whose behaviors are determined by personal knowledge or intellectual capital embedded in systems, procedures, technologies, and computer-based systems.

The main societal knowledge management objectives are (Wiig, 2000, 2004):

- A stable, just, orderly, and secure society. This includes preparing citizens, organizations, and public agencies to be effective policy partners – to create sound public opinions – to engage in public debates and policy formation – to participate in processes to conceptualize, plan, decide, and implement public actions – to observe society policies – and to provide support for the administration;
- Acceptable level of quality of life, particularly through building, maintaining, and leveraging commercial and public intellectual capital;
- A prosperous society by developing its citizens to become competent knowledge workers and its institutions to be competitive;

- Strengthen societal functions and effectiveness towards implementing societal goals – e.g., public service agencies, law enforcement etc.;
- Provide infrastructure and general knowledge-related capabilities to make industry and commerce globally competitive;
- Increase citizens' capabilities to improve their lives, build knowledgeable workforce, and participate in societal functions;
- New challenges in societal knowledge system.

Organization's competitive advantages in societal knowledge system

The latest theories about competitive advantages focus on creating organizational strategic resources and capabilities. In the 'knowledge era', and more specifically, in the societal knowledge system the organizations need to take into consideration the creation of new capabilities, among four of them could be considered as fundamental: intellectual capital creation, the life cycle management, the integration of societal requirements into business strategies and the knowledge work force development (fig.2).

Intellectual capital creation

The shift from physical and financial capital to intellectual capital as an intangible strategic asset represents probably the core new competitive advantage creation. Intellectual capital is used to denote all aspects of personal tacit and explicit knowledge as well as structural intellectual capital, be it explicit, embedded in technology, or in other forms (Wiig, 2000). Knowledge acquired by intellectual capital is not able to be managed without IT and the new technology faster implementation.

The life cycle management

The life cycle management includes the entire life cycle of the product or service, across the entire extended value stream, from the extraction of raw materials right through to the management of its residue at the end of its productive life. To organize all activities and manage resources on the entire life cycle of the product or service is a real competitive advantage, considering cost reduction, increased productivity, environment protection issues and favorable market image creation.

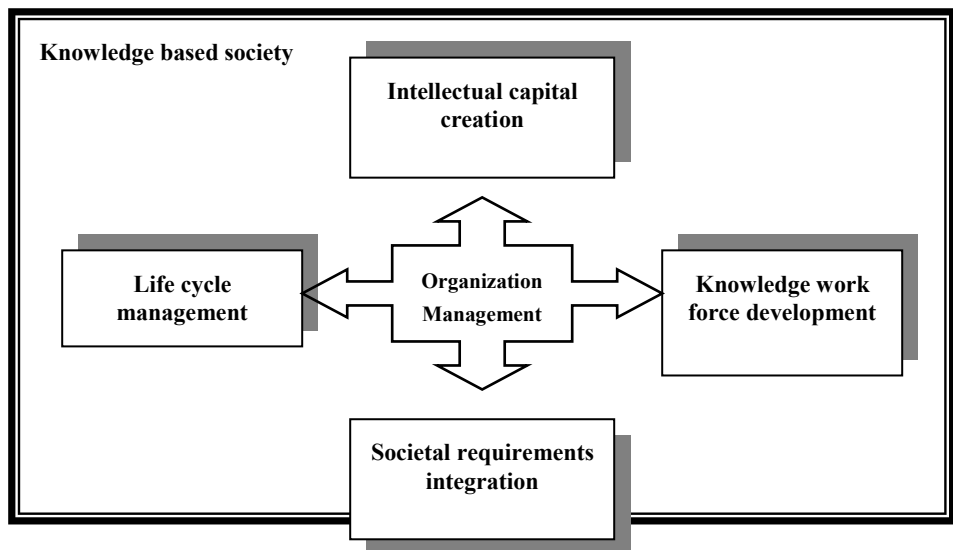

Fig. 2 Organization's competitive advantages in the societal knowledge system

The integration of societal requirements into business strategies

The societal requirements integration into strategies (including products and processes) is related to organization's capabilities and management competences to find priorities, to restructure appropriate knowledge and to understand and apply the best practices, usually based on common sense.

The knowledge the work force development

From the work force perspective knowledge is "a complex set of dynamic skills, know-how etc, that is constantly changing at the level of individuals". In this respect, Barquin (2006) relates that: knowledge-workers spend 15%-35% of their time searching for information, 50% are successful in finding what they want and they spend more time recreating existing information than producing new info. But, societies depend upon the capability of their work forces. An uneducated or unmotivated work force obliges the society to rely on natural resources to be successful, and even that is questionable. In today's global economy where intellectual capital determines competitiveness, a major objective is to develop and maintain the ability of its citizens to perform skilled and knowledge-intensive tasks. From the societal knowledge perspective, the organization needs to play an active role also in this area. To be effective, its role must be based on clear and flexible visions of what should be achieved, which societal results should obtain, and how it should be done (Wiig, 2000).

Some benefits of the organization's competitive advantages extended to community and individuals adapted to societal knowledge system are presented in the table 1.

The societal knowledge system implies organization flexibility that it resonates with broader, societal and political values and purposes. The organizations and people culture need to change towards the understanding of the convergence between economic rationality, technological revolution and environment protection. However, the organizations need to redefine themselves in terms of knowledge use for the increasing of competences in order to ensure the individual performance, commitment and creativity. It has to be made a distinction between the rhetoric and the reality, having in view the meaning and value. The rhetoric becomes real and real in its consequences. The societal knowledge management redefines organizations, its employees, its customers and communities because its resonance with and dependence on wider societal conceptions of the market and values is explained, developed and justified. The new reality legitimizes a humanistic, soft and knowledge-based strategic management in all organizations.

Table 1

Competitive advantages adapted to societal knowledge system	Major benefits for:		
	Individuals	Organization	Society
<i>Intellectual capital creation</i>	Knowledge-intensive skills performing	Increase in global competitiveness	Spread capabilities
<i>The life cycle management</i>	Potential professional areas for success	Improved performance and competitiveness	Consistently high quality and reliable public decisions and actions
<i>The integration of societal requirements into business strategies</i>	Satisfying employment requirements for greater competitiveness	Effective market actions that address real societal needs	Setting societal priorities that reflect a society with greater public acceptability
<i>Knowledge work force development</i>	Low unemployment and improved quality of life	Greater personnel retention and knowledge-building	Satisfying employment requirements for greater competitiveness

Conclusions

In the modern society the applications of knowledge management practices supported by IT based tools, have become important to pursue societal goals with success. Societal knowledge management have started to implement approaches to achieve well-defined objectives and this trend is accelerating as experience is gained and new insights of valuable applications of knowledge management are shared. That means that knowledge management is a potential for new practices in designing strategies and creating competitive advantages based on knowledge incorporation in societal system. Every organization, governmental or local institution and even individuals need to focus on clear goals seeking for (Wiig, 2004): making the target society more effective as a world citizen and global competitor; supporting continued pursuit of a balanced society and increasing effectiveness of constituents to improve their quality of life.

The knowledge management provides increased participation of more capable work force, increased participation by knowledgeable citizenry and improved social and economic environments.

In this context the organizations need to create and sustain new competitive advantages that could leverage societal needs and integrate them into the societal knowledge management system.

INCREASE OF THE COMPETITIVENESS OF THE SMALL AND MEDIUM-SIZE ENTERPRISES BY MEANS OF THE BEST STRATEGIES OF DEVELOPMENT OF ECONOMIC ACTIVITY

Dumitriu Nicoleta Adelina

Romanian – American University, 1B EXPOZITIEI Blvd., Sector 1, Bucharest, e-mail: ade_kws@yahoo.com, Phone: 0723.64.19.14; 0765.715.234

In the first part of the work, there are presented general notions on the small and medium-sized enterprises, what they signify currently and how they classify, from the point of view of the number of staff employed and annual turnover expressed in euro. It follows the presentation of the criteria, characteristics and advantages obtained, elements of vulnerability and factors determining the success or failure of the small and medium-sized enterprises. In the second part, there are shortly presented the proper strategies that may be adopted and necessity of their adoption by the small and medium-sized enterprises.

The targeted objectives are to understand the necessity of development of the small and medium-sized enterprises for the national economy, knowing the optimal strategies to be adopted by the small and medium-sized enterprises, possibility to adopt strategies of innovation by the small and medium-sized enterprises, development of the small and medium-sized enterprises by adopting some redevelopment strategies.

Key words: Competitiveness, innovation, strategies, specialization, diversification

Short presentation of the small and medium-sized enterprises

Generally, when speaking about small and medium-sized enterprises, we speak about economic entities whose classification in the first instance is made depending on the number of employees, turnover, size of the invested capital, size of the profit, size of the assets. In Romania, the delimitation of small and medium-sized enterprises depending on the number of the employees was made as it follows¹:

- a) Micro-enterprises – have up to 9 employees and achieve a net annual turnover or hold total assets up to Euro 2 million, the equivalent in lei;
- b) small enterprises – have between 10 and 49 employees and achieve a net annual turnover or hold total assets up to Euro 10 million, the equivalent in lei;
- c) Medium-size enterprises – have between 50 and 249 employees and achieve a net annual turnover up to Euro 50 million, the equivalent in lei or hold total assets not exceeding the equivalent in lei of Euro 43 million;

According to the sole patterns of E.U. , the legal and statistic definition of SME is as follows²:

SME	Staff number / annual turnover / total annual balance sheet		
	(employees)	(euro)	(euro)
Micro-enterprises 1 - 9		< 2 million	< 2 million
Small enterprise 10 - 49	< 10 million		< 10 million
Medium-sized enterprise 50 - 249	< 50 million		< 43 million

In order to set-up small and medium-sized enterprises, we have to consider certain criteria³ of appraisal:

- the economic criteria is a decisive criteria;
- the technical and technological criteria is a conditional criteria;
- the territorial or zonal criteria is a favoring criteria;
- the criteria of utilities is a criteria of functionality;
- the social criteria is an impact criteria.

All these criteria together with the experience, tradition, strategy or strategies adopted, management policy, etc. lead to the annual setting-up of an increasing number of small and medium-sized enterprises.

The small enterprises that are set-up must fulfill certain qualitative characteristics such as independent management (the manager is usually the company's owner), the capital ensured by one or several persons named associates and that become the owners of the enterprise from a geographic point of view, the area is local, even if the sales market is more extended, the company is small compared to other competitors in that field.

The significant advantages of the small and medium-sized enterprises are the high degree of adaptability to the market demands, the high capacity of innovation determined by competition and competitors, the simplified organizational structure that leads to a low cost and accurate circulation of information and decisions, existence of a direct system of information, a better management of the human resources, creation of new jobs, and not lastly a balanced territorial arrangement.

Still, the small and medium-sized enterprises show also elements of vulnerability as they have available a small capital, insufficient commercial means, technical and technological difficulties in order to cope with the competition in the high-technology sectors, impossibility of making some systematic investments and quite reduced protection of the employees.

Still, the small and medium-sized enterprises show also elements of vulnerability as they have available a small capital, insufficient commercial means, technical and technological difficulties in order to cope with the competition in the high-technology sectors, impossibility of making some systematic investments and quite reduced protection of the employees.

In time, it has been ascertained that a series of factors determines the success or failure of the small and medium-sized enterprises. These factors target on one hand, the enterprise and the entrepreneur on the other side. The factors targeting the enterprise can be its own or drawn financial resources, staff resources that means both the number and their quality, the system resources, that is the degree of complexity of the informational systems, of planning and control and business resources, meaning the customers basis, market share, relationships with the suppliers, production and distribution processes. The factors regarding the entrepreneur are the operational abilities used in order to accomplish some activities such as marketing, production, dismantling, objectives and degree of convergence between the individual objectives and the objectives of the enterprise, managerial abilities of the entrepreneur and strategic abilities of the enterprise for identifying strengths and weaknesses of the company to implement the best methods and techniques and to accomplish the proposed objectives. Besides the accurate evaluation of all these factors and their impact, it must be also required the careful analysis of the evolution of costs, analysis of available resources, forecasts of the sales, cash flow and necessary capital.

Necessity of adopting proper strategies by small and medium-sized enterprises

Objectives:

1. Understanding the necessities of development of small and medium-sized enterprises for the national economy.
2. Knowing the optimal strategies to adopt by small and medium-sized enterprises.
3. Possibility of adopting innovation strategies by small and medium-sized enterprises.
4. Development of small and medium-sized enterprises by adopting redevelopment strategies.

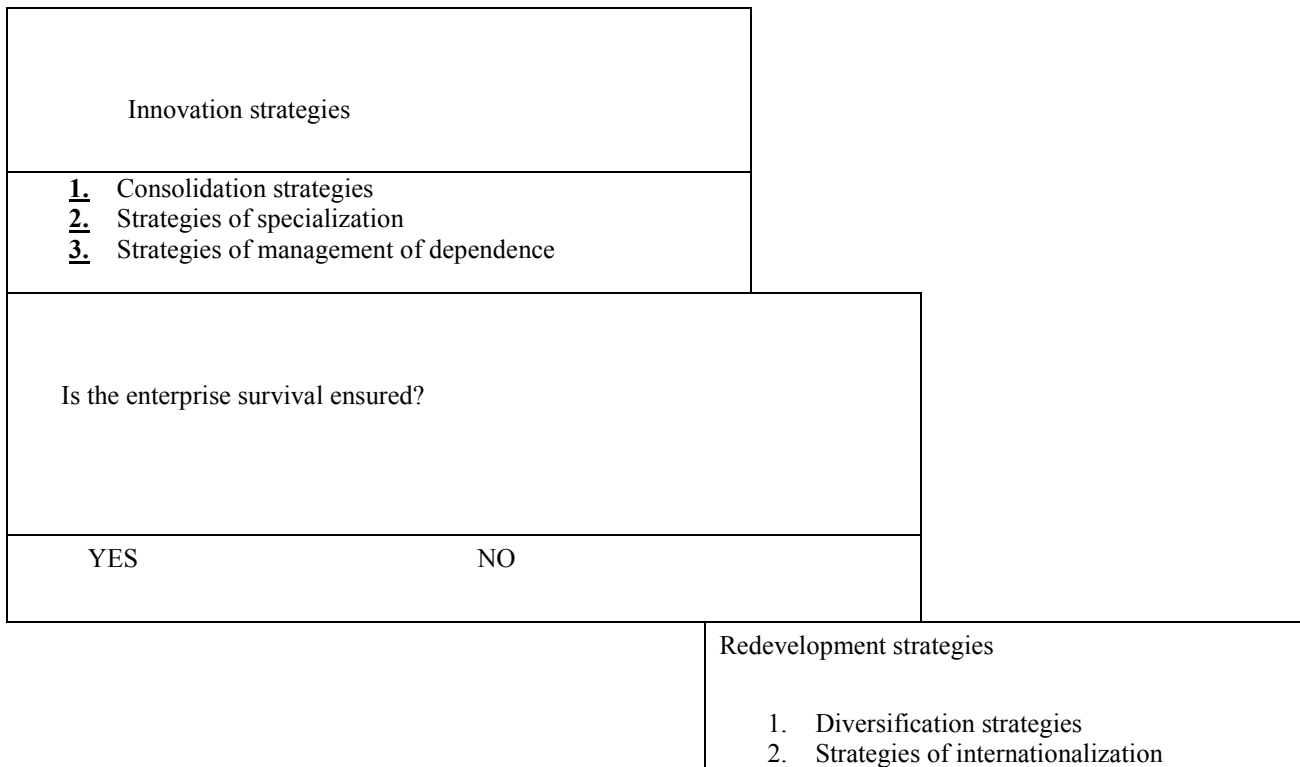

In the conditions of a market economy, the small and medium-sized enterprises play an important role in satisfying the consumers' requirements. Ensuring their development under conditions of a competing economy requires adopting a proper strategy according to the current particularities and future development perspectives.

According to the experience of competitive small and medium-sized enterprises, the adoption of proper strategies must follow-up the maximization of chances of survival on market on the conditions of their functioning within some national economy in which the competition situates on the first plan.

In the scheme below, a sequential classification of the most important strategies is presented, that can be adopted by the small and medium-sized enterprises in order to be able to maintain their presence on the market under conditions of productivity.

According to this scheme, small and medium-sized enterprises must adopt first of all, innovation strategies that can ensure for them a long-term survival potential. As a result of functioning of these enterprises, under the conditions of their being subject to the action of some factors of vulnerability, in order to ameliorate their actions, the enterprises can adopt the so-called strategies of consolidation of the activity by adopting some strategies of specialization or management of dependence.

Sequential classification of the strategies that can be adopted by small and medium-sized enterprises.

Under the conditions in which it is estimated that the factors of vulnerability remain a permanent threatening for the enterprise activity, the so-called strategies of redevelopment of the activity can be adopted that can create strategies of diversification and internationalization.

Ensuring the durability of the small and medium-sized enterprises requires adopting some innovation strategies. Although not all small and medium-sized enterprises use and develop inventions in their activity, the real life emphasize that they have an important contribution in drawing out innovations and their use in the productive process. More than a half of the great innovations of the 20th century are elaborated by independent inventors and small enterprises. In the current and future conditions, in the sectors in the maturity stage or within the sectors affected by economic crisis, the innovation, especially the technological one, follows the improvement of the production processes and is made particularly by the contribution of the small and medium-sized enterprises.

The elaboration and implementation of the technological inventions develop the technological environment and can stand at the basis of some innovation strategies. By using innovations, the small and medium-sized enterprises can implement strategies of strengthening or consolidation, by ensuring herewith a diminution or sustainable suppression of the factors of vulnerability. The possible strengthening strategies

can be materialized by the adoption of specialization strategies and in the strategies of management of dependence.

The specialization strategies that can be adopted by a small or medium-sized enterprise require the focus of these enterprises on a certain professional vocation, concretized by the production of goods or supply of services that cannot be executed under the economic conditions by large enterprises.

In order to avoid direct confrontation with the large enterprises, these strategies of specialization must allow the positioning of these enterprises on certain markets that do not draw by or do not interest the large enterprises from an economic point of view. These interstices of market must be well served, thus constituting a solid strategic basis, avoiding in this way to serve in worst conditions by large enterprises.

Adopting such strategies of specialization, small or medium-sized enterprises can take when necessary a vertical integration of their activity, superspecializing themselves in the respective field of activity, by using specific proceedings of activity that constitute its "strategic basis". By vertical integration, small or medium-sized enterprises can occupy a monopole position in the field of the said profession, that can be competed by other enterprises.

The adaptation of some specialization strategies by small or medium-sized enterprises must take into account certain limits and specific constraints. The practical life proves that generally as the market is more reduced, as much its economic potential is quicker reached by other enterprises. A narrower specialization strategy increases the global risk of the enterprise, by obliging the enterprise under the conditions of increasing this risk, to adopt strategies of redevelopment of the activity. Also, it must be mentioned actually that a narrow specialization strategy may lead to the increase of the number of vulnerability factors such as for instance the reduction of the number of clients.

The adoption of a strategy of management of dependence may constitute another form of strengthening and consolidation of the activity of a small or medium-sized enterprise. A small or medium-sized enterprise can be completely independent from a legal and financial point of view, but the economically dependent on a large enterprise or a group of enterprises.

The dependence phenomenon reached to a certain state of generalization once with the creation of some strong financial groups on different complex technological directions that made that certain small or medium-sized enterprise become dependent on such large enterprises, either by executing certain stages of the technological process for them, or by executing certain parts or sub-assemblies necessary for the delivery of the end products by them.

It must be specified that the dependence is not synonymous with the vulnerability or with the state of economic weakness of the enterprise. For a good management of the dependence in case that it is adopted such a strategy, the small or medium-sized enterprise can use different ways. A first way regarding a good management of the dependence consists in the activity make itself indispensable. Thus, a dependant enterprise can impose as a privileged supplier by becoming irreplaceable, thus ensuring dynamism and competitiveness. The dependent enterprise thus becomes an economic partner for a large enterprise, contributing to increasing its efficacy.

The small or medium-sized enterprise, dependent on one or several large enterprises during several years, benefiting of the economic advantages that result therefrom, may do investments also in other fields, thus increasing the degree of autonomy.

In the latest while there are established alliances between large enterprises and small or medium-sized enterprises as concern the development of certain activities. The large enterprises grant help to small or medium-sized enterprises consisting in transfer of technology, fabrication of certain products, making available the commercial network for the export activity, temporary delegation of certain persons. For the accomplishment of large international projects, there are established new relations of collaboration between the groups of global enterprises and some small or medium-sized enterprises.

As a result of a good management of dependence, both the small or medium-sized enterprises and the larger enterprises or groups obtain economic advantages.

If the action of the factors of vulnerability cannot be avoided, the small or medium-sized enterprise may adopt strategies of redevelopment of the activity by implementing strategies of diversification and when possible, strategies of internationalization.

The diversification strategy represents that type of strategy that consists in increasing the number of businesses, products, works, services, essentially different from the businesses developed currently. ! The

diversification strategies can be realized under two forms, such as concentric diversification and conglomerated diversification.²

The diversification as strategy of the small or medium-sized enterprises must be adopted with maximum attention in order to not enter activities that cannot be carried out productively with the existing or future means. In adopting a diversification strategy, it is necessary to consider the tendency of refocusing of the enterprises, even the large ones, on those activities which they can perform the best, taking into account the existing resources and abilities and competences available.

By adopting this type of strategy, the specialization will not be confounded with the diversification. The diversification assumes an extension of the professional vocation or adoption of a new professional vocation by the enterprise, assumes other abilities, competences and technologies resources that in most of the cases cannot be provided. Contrary to diversification, the specialization assumes a deepening of the professional existing vocation in a certain field of activity, by adopting technological resources, abilities and exiting competences to carry out the new dimensions of activity required by the specialization.

In order to adopt a diversification strategy by a small or medium-sized enterprise, it is necessary to be made a profound analysis of the possibilities to be implemented productively, by resorting to a successive filter of the ideas of diversification, by considering the existing possibilities and the need to develop efficiently the new activities.

The diversification of the activity needs to be made in stages, passing from a stage to another being made only after that a new stage was appropriated and the necessary resources were ensured. The adoption of a strategy of diversification assumes taking into consideration its implications on the modality of organization of the enterprise and on the style of management, emphasizing the delegation of the tasks, by organizing the production units, such as "responsibility centers" or "costs centers" in enterprises that adopts diversification, by imposing a systematic control from the superior management on the developed activities.

The internationalization strategy can be adopted by small or medium-sized enterprises for the redevelopment on a larger plan of activities. This type of strategy represents a natural prolongation of adoption by the enterprise of an accentuated specialization in a certain field of activity. The adoption of this type of strategy is made on basis of fighting down a certain type of obstacles and constraints according to different stages of development of the enterprise and with the degree of motivation of the management staff and development of this type of strategy.

The international engagement of small or medium-sized enterprises implies the use of the possible forms according to the existing conditions or that may be created, such as indirect export or implants of branches abroad. For the successful adoption of a strategy of internationalization of small or medium-sized enterprises, it is recommended to take into consideration certain requirements. Among them, we can mention those that recommend that the development of international activities be made depending on the existing means, that in this action, the risks be limited, to obtain an external support, to systematically control the efforts and results obtained by internationalization and to develop these activities of international development on the basis of a well thought plan.

¹si² – Constantin Barbulescu-Sistemele strategice ale intreprinderii, pag 214-215. (Strategic systems of the enterprise, pages 214-215)

The development of the internationalization actions in accordance with the existing means represents a basic requirement. Passing to more complex forms of internationalization requires the use of means which the enterprise must have available. The sub-supply of some parts or sub-assemblies to a large international enterprise may constitute an international form of activity at the beginning, following that in time, the enterprise starts on international activities on its account.

In order to limit the risk to carry out international activities, the enterprise has to endow with an efficient system of information and to appeal to specialized institutions in supplying the information necessary to be able to perceive the global risk of the enterprise in starting on international activities.

In order to carry out successfully international activities, the enterprise has to benefit of a certain time of support according to the planned activities, collaborating with the economic units from the targeted

countries for internationalization, the small or medium-sized enterprises being able to benefit on the basis of these collaboration of the commercial network of the large enterprises.

The successful development of some international activities requires adopting a superior organization of the control on these activities, by adopting some proper control procedures or by carrying out a periodical audit of them and inclusion of the international development in a well thought plan in which the international plan has to be conceived as a strategic option along with the activities developed by the enterprise.

The international development of a small or medium-sized enterprise has to be provided in a plan for them, the main stages of the planning process being shown below.

Setting objectives and rules

Analysis of the limits of strengths and weaknesses of the enterprise

Forecasting the limits of strengths and weaknesses of the enterprise

Isolation of the strategic problems of the enterprises and taking into consideration the possible opinions

Implementation and control

In conclusion, under the conditions of a market economy, the small or medium-sized enterprises play an important role for the satisfaction of the consumers' requirements. For increasing the chances of survival and continuous development, they can adopt innovation strategies, strategies of specialization and management of dependence and in case that it is not ensured the survival, there can be implemented some redevelopment strategies, among which the strategies of diversification and strategies of internationalization.

In current and future conditions, in the sectors in stage of maturity, or in the sectors affected by the economic crisis, the innovation and particularly the technological innovation is made by small or medium-sized enterprises. By using innovations, small or medium-sized enterprises can implement strategies of consolidating their activity, ensuring thereby the diminution and sustainable suppression of their vulnerability. For strengthening their activity, these enterprises can use strategies of specialization or management of their dependence to large enterprises.

The strategies have to be adopted generally on the basis of a plan, with well-defined stage.

Université „Constantin Brâncoveanu” de Pitești, Faculté de Finances - Comptabilité Pitești, Calea Bascovului nr. 2A, Pitești, județul Argeș, Email george_sene@yahoo.com, Tél. 0721236051

Realisé au projet de recherche intitulé „Le développement du recherche académique interdisciplinaire pour la montée de la compétitivité des universités roumaines au niveau international”

Providing a high quality education represents a priority for any higher institute. quality teaching and learning contribute to the student's evolution, to society's welfare and to the preservation and improvement of the environment. An educational institution must function in such a way as to satisfy the public trust by the quality of its activity and facilitate the affirmation of education as one of the public goods.

Mots clé (la qualité des services éducationnels, le management de la qualité, le système de management de la qualité, la garantie de la qualité, l'évaluation de la qualité des services éducationnels).

1. La garantie de la qualité dans le domaine universitaire de notre pays

L'enseignement supérieur joue un rôle important dans la formation des futurs spécialistes et dans la réalisation d'une conduite orientée vers la qualité, comme "élément vital pour la réalisation d'une économie prospère" (Joseph M. Juran)*. Assurer la qualité de l'acte éducationnel représente au moment actuel une nécessité et une obligation de chaque établissement d'enseignement supérieur.

Les préoccupations concernant la garantie de la qualité dans l'enseignement supérieur à niveau européen ont été mises en évidence vers la moitié des années 1990, quand est apparue la nécessité de créer l'aire européenne de l'enseignement supérieur. Ainsi, le concept de qualité dans l'enseignement universitaire a fait l'objet de certains documents importants, tels: *Déclaration de Sorbonne de 1998; Déclaration de Bologne de 1999; Réunion de Prague de 2001; Réunion de Berlin de 2003; Réunion de Bergen de 2005*. Le cadre législatif existant dans notre pays établit les conditions qui permettront le développement d'une culture de la qualité de l'éducation et la protection du bénéficiaire d'éducation.

Les établissements d'enseignement supérieur doivent respecter une série de standards européens, à savoir: la politique et les procédures pour garantir la qualité; approuver, monitoriser et évaluer de manière régulière les programmes d'études et les diplômes; l'évaluation des étudiants; garantir la qualité du personnel didactique; les ressources d'apprendre offertes aux étudiants; les bases de données et les informations intérieures; information publique.

2. Aspects concernant le management de la qualité dans le cadre de l'Université „Constantin Brâncoveanu” de Pitești

Le management de la qualité représente l'ensemble des activités coordonnées par l'intermédiaire desquelles on oriente et on contrôle l'université en ce qui concerne la qualité*.

* Joseph M. Juran est né en Roumanie en 1904 et il a été élevé aux États-Unis. Entre 1954-1960 il a été le consultant des entreprises japonaises pour la qualité. Le concept japonais de qualité, qui a connu un succès mondial par l'intermédiaire des maisons telles Hitachi, Fujitsu, Honda, est une symbiose des idées de Deming, Juran et Peter Drucker.

* Règlement concernant la garantie de la qualité des services éducationnels et de recherche scientifique, l'Université „Constantin Brâncoveanu” de Pitești

L'Université „Constantin Brâncoveanu” de Pitești est un établissement d'enseignement et de recherche, fondée en 1991 et accréditée institutionnellement par la Loi no. 242/23 avril 2002. Elle est une personne juridique de droit privé et d'utilité publique, partie du système national d'enseignement (ECTS), ce qui la rattache à l'aire européenne d'enseignement supérieur.

La responsabilité publique. L'université déroule son activité conformément aux lois roumaines et à la Carte de l'Université, elle a des pratiques d'audit intérieur concernant les principaux domaines d'activité, en poursuivant le respect des engagements assumés en conditions de transparence publique. L'audit intérieur est réalisé de manière périodique au niveau institutionnel et de services en ce qui concerne les domaines: financière-comptable, de l'intégrité académique, de l'enseignement, de l'évaluation et de la recherche. **L'intégrité académique** est contrôlée par l'intermédiaire d'un Code d'éthique universitaire, qui a été approuvé dans le Sénat de l'Université, qui garantit la protection des valeurs de la liberté académique, de l'autonomie universitaire et de l'intégrité éthique, en disposant des pratiques et des mécanismes claires de mise en œuvre.

Le système de garantir la qualité des services éducationnels adopté par l'Université a comme but: *fournir une meilleure corrélation des services éducationnels et de recherche scientifique aux exigences des clients et des autres parties intéressées; l'amélioration permanente de la qualité des services éducationnels et de ceux de recherche scientifique; le développement d'une culture de la qualité et garantir une protection réelle des intérêts des clients et des autres parties intéressées par les services offerts par l'Université; la définition et l'implémentation d'un système d'évaluation intérieure de la qualité des processus didactiques et de recherche scientifique et d'évaluation extérieure; la mobilisation des responsabilités des membres de la communauté de l'Université en ce qui concerne la façon d'utiliser les ressources financières; la facilité de la reconnaissance mutuelle au niveau européen des certificats, des diplômes et des titres universitaires.*

Dans le cadre de l'Université „Constantin Brâncoveanu” de Pitești, la qualité des services éducationnels est assurée par: le planing des activités de prestation des services éducationnels; la monitorisation des processus didactiques et de recherche scientifique; l'évaluation intérieure des résultats des processus didactiques et de recherche scientifique; l'évaluation extérieure des résultats des processus didactiques et de recherche scientifique; l'amélioration continue des services éducationnels et de recherche scientifique offerts par l'Université. Dans le cadre de l'Université, le système de garantie de la qualité concerne les domaines suivants:

a) La capacité institutionnelle de l'Université concernant la garantie de la qualité. La mission et les objectifs de l'Université sont actualisés par le **Projet stratégique et les projets opérationnels** annuels, en parfaite concordance avec le cadre national et européen des qualifications professionnelles. Dans ce sens, l'Université forme et perfectionne des spécialistes de haute qualification, elle promeut l'esprit de la libre pensée, critique, elle initie des activités de recherche scientifique à son compte et en collaboration avec des institutions similaires du pays et de l'étranger ou avec le milieu d'affaires, elle cultive et transmet les valeurs de la culture et de la civilisation universelle.

L'Université „Constantin Brâncoveanu” déploie son activité à présent dans les villes de Pitești, Rm. Vâlcea et de Brăila, par six facultés et 23 spécialisations, comptant plus de 7000 étudiants. L'offre éducationnelle de l'Université s'est diversifiée par l'organisation, à partir de l'année universitaire 2002-2003, des programmes d'études universitaires de mastère et de ceux postuniversitaires, dans toutes les trois villes, dans des domaines tels le Management et le Marketing. À partir de l'année universitaire 2008-2009, l'offre éducationnelle se diversifiera, le nombre des spécialisations pour le domaine de mastère se levant à huit.

L'activité académique est organisée en quatre **chaires**: la Chaire Management – Marketing, la Chaire Finances-Banques-Comptabilité, la Chaire Sciences Technico-Économiques, la Chaire Sciences Juridiques et de la Communication. Les **activités de recherche scientifique, pédagogie et méthodique** sont, elles aussi, à l'attention de l'Université, pour instruire les futurs diplômés de sorte que ceux-ci deviennent des cadres didactiques dans l'enseignement préuniversitaire et universitaire.

Structures administratives et territoriales. Dans le cadre de l'Université on met en œuvre de manière rigoureuse le management de la qualité, dans une conception participative, en stimulant la créativité et le travail en équipe. On emploie des méthodes scientifiques de diriger, telles la méthodes de la direction par objectives, par projets et par innovation. L'Université a opté pour la structure hiérarchique-fonctionnelle, dans une conception flexible, qui permet, au cas d'apparition des problèmes particuliers, qu'on mette en œuvre les méthodes de la direction par comités ou matricéale. La structure comprend 12 directions et services. La direction de l'Université est réalisée par le Bureau du Sénat, à savoir le recteur, qui jouit du

support de trois prorecteurs. Le choix des organes de direction se réalise conformément à la loi et sur la base d'un Règlement d'élections approuvé par le Sénat. L'élection des représentants des étudiants dans les Conseils des Facultés et Sénat est prévue clairement dans la Carte Universitaire et permet l'accès démocratique, transparent et non discriminatoire des étudiants conformément à leur droit de représenter et d'être représentés.

La relation entre l'activité d'enseignement-apprentissage et celle de recherche scientifique.

L'université a créé une stratégie à long terme et des objectifs à terme moyen et court qui concerne les projets et les résultats attendus de la recherche, tout comme les ressources de réalisation, composante du projet stratégique de l'Université. Il y a déjà une culture de la recherche, un code d'éthique et des préoccupations pour valorifier les résultats de la recherche. On élabore chaque année un Rapport concernant l'activité de recherche. Tous les cadres didactiques titulaires font une activité de recherche, fondée sur des grants ou dans le cadre du projet intérieur de recherche. En 2007-2008, dans l'Université „Constantin Brâncoveanu” il y a en déroulement 2 projet de recherche scientifique („La stratégie post-adération du ville Pitesti”, „Le développement du recherche academique interdisciplinaire pour la montée de la competitivite des universités roumaines au niveau international”), 1 grant CNCISIS, 1 programme „Bourse doctorale” (BD) et 1 contracts financés par des agents économiques.

Les résultats de la recherche sont mise en valeur par l'organisation d'un symposium scientifique annuel, avec participation internationale, et des symposiums ou des tables rondes thématiques périodiques. Dans le cadre du Symposium annuel de 2007 ont été communiquées 118 ouvrages scientifiques. Les ouvrages ont été choisis et publiés dans un volume du symposium, quoté ISBN (978-973-7732-58-3), publié à la Maison d'Édition „Indépendance Économique”. Cette maison d'édition est reconnue par CNCISIS et elle publie les ouvrages scientifiques et les manuels universitaires, ayant compte ISBN, appréciées et premiées à les expositions nationales avec le titre „La meilleure livre universitaire”. Chaque année, les cadres didactiques participent aux symposiums des autres universités du pays, tout comme à d'autres conférences et workshops nationaux et internationaux. Les résultats de l'activité de recherche sont utilisés pour la modernisation des supports de cours, et le développement de la base matérielle pour le processus didactique. Les étudiants ont accès à une partie de la base matérielle pour la recherche, effectuant des ouvrages scientifiques dans le cadre des cercles scientifiques estudiantins, sous la direction des cadres didactiques ou finalisant leurs mémoires de licence ou de dissertation.

La base matérielle. Le management de qualité et la valorification de bonne foi des ressources financières se sont matérialisés par la réalisation, pour la première fois dans le pays et dans l'enseignement supérieur, de trois sièges dans les trois villes, en tant qu'établissements d'enseignement et de recherche, mis en utilisation en 1997. Dans les trois complexes de l'Université il y a des bâtiments destinés à l'enseignement et à la recherche scientifique (trois Aula Magna; 25 amphithéâtres; un Master Centre à Pitești, inauguré en 2006, qui comprend des salles de conférence, une bibliothèque ayant une capacité de 400 places, club, café et restaurant; 80 salles de séminaires; 10 laboratoires d'informatique; 4 laboratoires de processon-édition; 6 laboratoires de langues étrangères; 4 laboratoires de mercéologie-technologie; 5 laboratoires multimédia; deux autres bibliothèques et six salles de lecture; 3 salons de livre; une résidence estudiantine d'élite; une salle sportive et un terrain avec nocturne. Les salles de cours et de séminaire et les laboratoires disposent des facilités nécessaires au déroulement du processus didactique (vidéoprojecteur, ordinateurs, imprimantes, rétroprojecteur et d'autres matériels didactiques, logiciels et bases de données spécifiques aux disciplines d'étude).

Les ressources humaines. Le corps didactique de l'Université, caractérisé par professionnalisme et compétence professionnelle, comprend 215 cadres didactiques, dont 149 en CDI (70%) și 66 collaborateurs (30%). La structure du personnel didactique, hiérarchiquement, est la suivante : professeurs (11%), maîtres de conférences (25%), lecteurs (37%), assistants (22%) și préparateurs (5%). La stratégie concernant les ressources humaines établit la soutènement des jeune salaries par des programmes d'études de mastère et doctorat, payées par l'Université et publiés à la Maison d'Édition „Indépendance Économique”.

Étudiants. Les derniers trois ans, l'admission à la faculté a été fondée sur le *concours de dossiers*, le critère principal étant les compétences et les performances antérieures du candidat, sans mettre en œuvre aucun critère discriminatoire. La méthodologie de l'organisation du concours d'admission est en concordance avec la législation nationale, étant mise à jour chaque année et soumise à l'approbation du Sénat. Le marketing universitaire promut les informations sur l'admission par l'intermédiaire de la page web de l'Université www.univcb.ro, la presse locale, la participation à des foires et expositions de

spécialité, des visites aux lycées et de la publicité directe adressée aux candidats potentiels. L'Université offre aux candidats des informations concernant : l'offre éducative, les compétences acquises, les facilités du campus universitaire ; le nombre des places ; la période d'inscription, les papiers nécessaires et la taxe afférente. L'admission et la scolarisation des étudiants étrangers sont effectuées conformément à la législation en vigueur, par le Service de Relations Internationales.

La promovabilité des étudiants enregistrée dans la session d'hiver de l'année universitaire 2007-2008 a dépassé 70% pour chaque année d'étude, étant de 80% pour la I-ère année, 75 % II-ème année, 76 % III-ème année, 77% IV-ème année. Par sièges, la promovabilité a été de 74% à Pitești et Rm. Vâlcea et de 78% à Brăila. Au niveau d'Université, la moyenne de promovabilité a été de 77%. La promovabilité à l'examen de licence et de dissertation dans les derniers 3 ans a été, en moyenne, de plus de 98%.

b) L'efficacité éducative. Le programme d'étude contient: les objectifs de formation et les compétences spécifiques pour les spécialisations respectives; des plans d'enseignements, avec les disciplines ordonnées successivement sur toute la période d'étude. Dans le cadre de l'Université on a fait des efforts pour le perfectionnement du processus didactique en ce qui concerne son côté pratique, en améliorant la qualité des cours et des séminaires. Des éléments d'innovation ont représenté l'introduction des disciplines semestrielles et d'enseignement avec de fréquence réduite. On a conclu des conventions bilatérales avec des universités européennes de prestige pour effectuer des stages de perfectionnement tant les cadres didactiques que les étudiants, par des programmes de type Erasmus-Socrates.

Par l'intermédiaire des activités didactiques, théoriques et pratiques déroulées dans le cadre de l'université, on envisage que, par l'acquisition des connaissances, des compétences et des habiletés nécessaires, ceux qui obtiennent la licence soient capables de: trouver un emploi; développer une affaire propre; poursuivre leurs études universitaires; réaliser l'apprentissage permanent; faire une activité de recherche. Au niveau de l'Université déploie son activité un **Centre de conseil et information en carrière**, ayant pour objectif de soutenir les étudiants dans le développement de la carrière professionnelle. Un nombre significatif de diplômés ayant obtenu la licence sont admis aux études universitaires de maîtrise.

Les cadres didactiques ont une **stratégie d'enseigner** avec d'objectifs précis et ils publient les objectifs du cours, le programme et la bibliographie sous une forme accessible. On se sert des ressources des technologies nouvelles (mél, la page personnelle de web pour la thématique, la bibliographie, les ressources et le dialogue avec les étudiants) et des méthodes auxiliaires modernes d'enseigner (rétroprojecteur, vidéoprojecteur). La relation entre étudiant et professeur est une relation de partenariat, où chacun s'assume la responsabilité d'accomplir les résultats de l'apprentissage. Les titulaires de discipline ont un horaire de consultations, affiché au panneau de chaque faculté. Pour chaque année d'études et pour chaque groupe d'étudiants on désigne un **mentor**, cadre didactique dans le cadre de la faculté respective.

c) Le système de management de la qualité. Dans le cadre de l'Université „Constantin Brâncoveanu” fonctionne **La Commission d'Évaluation et de Garantie de la Qualité**, composée de représentants de la communauté académique et de représentants d'autres parties intéressées par les services offerts par l'Université, à savoir: le prorecteur qui répond de l'activité didactique, en tant que coordinateur, quatre représentants du corps professoral de l'Université, un représentant des étudiants les plus performants, un représentant des meilleurs diplômés, deux représentants de ceux qui ont embauché les diplômés de notre Université.

Au niveau de l'Université ont été créées des procédures et des instruments qui soutiennent l'optimisation des décisions concernant la projection, l'organisation et le déroulement des programmes d'étude, ayant pour objectif l'harmonisation avec le marché du travail, le respect des lois nationales, tout comme la convergence aux pratiques correctes et les exigences concernant la garantie de la qualité de l'espace européen de l'enseignement supérieur. Les diplômes offerts aux étudiants de la faculté sont en parfait accord avec les qualifications universitaires réglementées à niveau national par le Cadre National des Qualifications. La délivrance des diplômes d'étude et de la feuille matricule est fait conformément à la législation en vigueur.

L'évaluation des étudiants se réalise sur la base de certains critères, stipulés dans le **Règlement concernant l'activité didactique**, approuvé par le Sénat. **La garantie de la qualité des cadres didactiques** est un objectif stratégique de la direction de l'université et des facultés, et l'évaluation des cadres didactiques est réalisée par les procédés suivants: pour les postes à pourvoir par concours (professeurs, maîtres de conférence, chefs de mémoires) il y a des grilles de notation qui comprennent l'ensemble des activités; l'évaluation des cadres didactiques par les étudiants; l'autoévaluation.

En conclusion, en ce qui concerne le management de la qualité, l'Université doit prêter une attention particulière aux aspects suivants:

- le développement des relations internes et internationales concernant la recherche scientifique;
- l'implication du personnel didactique et de recherche dans des projets et plate-formes à niveau national et international;
- la réalisation des contacts plus poussés entre les cadres didactiques et les étudiants;
- l'intensification des contacts avec le milieu économique, surtout avec les recruteurs de profil;
- l'implication plus marquée des étudiants dans l'amélioration des cours;
- l'amélioration des procédures concernant l'évaluation annuelle du personnel didactique;
- la préoccupation de réaliser les indices de performance dans la garantie de la qualité de l'offre éducative conformément aux standards nationaux et européens;
- la préoccupation permanente d'assurer l'instruction pratique adéquate des étudiants ;
- la poursuite du processus de promouvoir le personnel didactique;
- l'investissement dans le déroulement des activités de consultance et extension dans le domaine économique pour la zone d'influence de l'université;
- l'accréditation nationale et internationale de certaines plate-formes et laboratoires de recherche.

On doit remarquer que toutes ces activités qui visent le soutien de la qualité représentent, pour une université, un effort majeur, tant du point de vue des ressources financières allouées, que, surtout, du point de vue des ressources humaines investies dans ce genre d'activité. Il faut mener des activités en vue de culturaliser la communauté académique dans l'esprit de la qualité.

CERTAINS ASPECTS REGARDANT L'EFFICACITÉ DE L'ACTIVITÉ DANS L'ADMINISTRATION PUBLIQUE

Giurescu Daniela

Université de Craiova, Faculté de Droit et de Sciences Administratives, 13 A.I. Cuza, 200585, Craiova
danagiurescu@yahoo.com, 0724 641634

Le management de la fonction publique et des fonctionnaires publiques est un ensemble de processus en changement continu, en fonction des mutations dans le système administratif interne et international. L'étape de la réalisation de l'analyse-diagnostique de la situation existante au niveau du management de la fonction publique est nécessaire pour la formulation d'une stratégie cohérente concernant le management de la fonction publique et des fonctionnaires publiques. Dans la vision des États Membres de l'Union Européenne on promeut l'idée de la réalisation d'un nouveau type d'administration qui soit mis au service du citoyen. Dans une autre perspective, il est normal que la formation continue et le perfectionnement du personnel dans l'administration publique représente aussi bien les priorités des gouvernements qu'une coalition fondamentale pour la réalisation d'un acte d'administration efficient.

Fonction publique, formation professionnelle, management des ressources humaines

La vision stratégique du management de la fonction publique et des fonctionnaires publiques tient compte d'un horizon de temps de 8-10 ans, en offrant une image d'ensemble sur le rôle que celui-ci aura dans le cadre du système de l'administration publique. La vision stratégique sur le management de la fonction publique et des fonctionnaires publiques est influencée par des facteurs internes et externes et se concrétise dans la présente stratégie qui s'adapte dans le temps, en fonction des mutations intervenues.

L'élaboration d'une stratégie du management de la fonction publique et des fonctionnaires publiques est nécessaire pour:

- l'établissement de la direction d'évolution du management de la fonction publique et des fonctionnaires publiques à terme moyen, dans le contexte de la réforme dans l'administration publique;
- la concrétisation du but du management de la fonction publique et des fonctionnaires publiques;
- l'amélioration du cadre institutionnel et légal de la fonction publique et de son management;
- l'efficietisation de l'activité des institutions et des autorités publiques, par l'adoption et l'application des décisions dans un cadre organisé, par le rapport permanent aux priorités établies dans l'administration publique;
- le développement d'une culture organisationnelle orientée vers des performances et la valorisation d'un personnel compétent, à une attitude positive envers le changement et au désir de se rapporter à un système de valeurs viable.

Les principes fondamentaux du management de la fonction publique et des fonctionnaires publiques sont représentés par:

- le principe de la stabilité de la fonction publique : en ce qui concerne ce principe il y a un consensus sur la nécessité de l'assurance du respect de ce principe en vue de la construction d'une carrière durable dans la fonction publique, au-dessous de la délimitation plus claire du palier à partir duquel les prérogatives de pouvoir publique se confondent à celles d'un mandat politique;
- le principe de la dépolitisation de la fonction publique: en ce sens s'impose principalement la dimension pratique de ce problème, la proposition étant celle de renforcer le rôle actif des commissions de discipline dans le cadre des institutions et des autorités publiques dans la monitorisation et la sanction des cas d'ingérence politique dans l'administration (un exemple

concret étant celui de la monitorisation - à l'avenir - du nombre des fonctionnaires impliqués dans les campagnes électorales, en vue de l'adoption des mesures de sanction afférentes);

- le principe de la création et du développement d'un corps de fonctionnaires publics de carrière, professionnel, honnête, stable, impartial et neutre du point de vue politique;
- le principe de l'assurance prompte et efficiente, délivrée de préjugés, de corruption, d'abus de pouvoir et de pressions politiques de toutes les activités effectuées par les fonctionnaires publics;
- le principe « du traitement égal », par l'application en manière non-discriminatoire de certains critères de sélection et de promotion objective et clairement définie conformément auxquels tous les candidats à l'entrée et à la promotion dans le corps des fonctionnaires publics aient des chances égales;
- le principe de la sélection des fonctionnaires publics exclusivement selon le critère de la compétence;
- le principe de la transparence dans le management de la fonction publique par la mise à la disposition de tous ceux intéressés des informations regardant la manière de déroulement des concours ou des examens pour l'occupation des fonctions publiques ou des autres documents administratives qui peuvent être faites publiques;
- le principe de l'évaluation objective des fonctionnaires publics en fonction du niveau des performances professionnelles individuelles, par la comparaison des résultats effectifs aux objectifs individuels établis;
- le principe de la motivation générale différenciée des fonctionnaires publics en fonction du degré de réalisation des objectifs individuels;
- le principe de la promotion d'une politique de développement adéquate de la carrière en concordance avec la nature de l'activité déroulée, de même qu'avec les besoins et les possibilités individuelles et organisationnelles;
- le principe de la confidentialité par la garantie de la protection des données personnelles regardant les fonctionnaires publics et les changements intervenus dans leur carrière
- le principe de respect envers le citoyen;
- le principe de la délégation;
- le principe de l'orientation de l'intérêt envers les résultats en termes d'efficience, efficacité et qualité des services. L'efficience et l'efficacité s'améliorent lorsque l'implication des fonctionnaires publics devient plus prégnante, lorsque les responsabilités sont transférées aux niveaux inférieurs de l'administration, en même temps que l'établissement du système de responsabilités, à chaque niveau;
- le principe de la déconcentration et de la décentralisation de sorte que les décisions prises soient proches des citoyens ou du problème auquel elles se réfèrent;
- le principe de la séparation des fonctions politiques de celles administratives.

1. Le management des ressources humaines: l'approche stratégique

Dans l'esprit des principes fondamentaux analysés ci-dessus la nécessité d'une approche stratégique du management des ressources humaines s'impose; celui-ci vise principalement l'amélioration des procédures de recrutement, évaluation, contrôle et promotion en fonction publique, les mécanismes de motivation des fonctionnaires publics, de même que la formation professionnelle continue dans la carrière des fonctionnaires publics.

En ce qui concerne *le recrutement*, celui-ci doit suivre des directions comme:

- la création de certains mécanismes spécialisés de recrutement, administrés éventuellement par les Centres Régionaux de Formation Continue en Administration Publique Locale ou sous la forme d'un service externalisé;
- le recrutement doit entrer dans les attributions du directeur/responsable de ressources humaines, qui garde une liaison permanente avec des centre de ressource, de sorte que le

Centre Régional/le service respectif fournisse constamment des informations aux institutions publiques qui organisent des concours sur l'offre de personnel qualifié existante à un moment donné pour une certaine spécialisation;

- l'identification par le directeur de l'institution des spécialisations déficitaires et la création de facilités salariales pour l'attraction et la sauvegarde dans le système de personnes qualifiées dans ces spécialisations;
- l'institution d'un système de tests nationaux avec des critères minimaux pour ceux qui veulent devenir des fonctionnaires publiques, avec des demandes différentes en fonction de la catégorie de fonctionnaire publique pour laquelle on organise le concours (par exemple, pour les fonctionnaires publiques en fonctions de direction, il devrait y avoir des tests qui surprennent le profil psychologique, les habilités managerielles de la personne etc.);
- la création et l'application de critères uniformes pour l'organisation des concours au niveau local/régional;
- l'organisation des concours unitaires pour des fonctions similaires au niveau régional (2-3 départements);
- un système de tests qui doivent être passés par les personnes mandatées par l'Agence Nationale des Fonctionnaires Publiques pour représenter l'Agence dans le cadre des commissions de concours pour éviter la répliation de la médiocrité dans le système (par exemple, un évaluateur qui ne connaît pas une langue étrangère, ne pourra automatiquement pas tester le candidat dans ce domaine);
- la réalisation d'une analyse institutionnelle complexe au niveau de chaque autorité et institution publique, avec l'adoption de l'organigramme au nécessaire de personnel, l'allocation d'attributions claires de postes.

En ce qui concerne *l'évaluation*, celle-ci doit suivre des recommandations telles que:

- l'adoption des critères d'évaluation à chaque type de fonction/ au spécifique de l'activité déroulée;
- la création des prémisses légales qui permettent l'externalisation des services d'évaluation par les entreprises spécialisées, avec l'avis de l'Agence Nationale des Fonctionnaires Publiques;
- l'extension du projet-pilote d'évaluation des postes, dans lequel des représentants de l'ANFP instruisent les compartiments de ressources humaines dans la réalisation de ce type d'évaluation, après laquelle la procédure puisse être appliquée périodiquement.

En ce qui concerne *le contrôle*, l'application des règles suivantes s'impose:

- la monitorisation plus efficiente de l'application des prévisions de la Loi no 7/2004 concernant le Code de Conduite des fonctionnaires publiques;
- le renforcement du rôle actif des commissions de discipline dans le processus de combat/sanction des cas de déviation des normes qui règlementent aujourd'hui l'exercice des prérogatives dans la fonction publique;
- l'organisation des commissions de discipline au niveau départemental pour éviter le risque des liaisons interpersonnelles qui affecterait la procédure, dans le cas des petites communautés.

La promotion/ l'efficientisation de l'activité des institutions publiques doit viser:

- la réévaluation du système de promotion dans la fonction publique de sorte que le critère de promotion dans la fonction publique de sorte que le critère de base soit la compétence et non pas l'ancienneté dans la fonction;
- la création des mécanismes de promotion naturellement, concomitante à la fin d'études universitaires de longue durée, postuniversitaires etc. (aujourd'hui on ne peut plus opérer une transformation de poste, mais on passe à une catégorie supérieure dans la limite de la vacation de certains postes);
- l'institution des indicateurs de performance par institution.

En ce qui concerne la motivation des ressources humaines impliquées dans le processus d'administration publique, on recommande ce qui suit:

- les incompatibilités de la fonction publique, non doublées par une motivation salariale proportionnelle rendent cette fonction publique non attractive, spécialement pour les jeunes;
- dans la limite des fonds alloués, le directeur de l'institution doit avoir plus de flexibilité dans l'établissement des priorités- en incluant ici un système de motivation distinct pour les spécialisations déficitaires (en administration, une spécialisation déficitaire est celle des informaticiens);
- la création d'un système plus permissif de distribution des prix/primes salariales au niveau de l'administration publique locale d'attirer et administrer des fonds, simultanément à la transparence des mécanismes et des critères de distribution de ces primes.

La formation professionnelle et la formation continue doivent être basées sur:

- la réalisation d'une évaluation préliminaire des besoins de formation professionnelle des fonctionnaires publics, dans le but de l'harmonisation de l'offre des cours (de l'Institut National d'Administration, des Centres Régionaux) avec la demande de formation existante au niveau de l'administration publique centrale et locale;
- la réduction des coûts de formation par l'institution d'un système d'heures de formation par fonctionnaire et non pas des journées de formation;
- la popularisation et l'emploi des méthodes de fonctionnement de type e-learning à large échelle;
- l'institution d'un système objectif et unitaire de sélection des fonctionnaires publics qui vont bénéficier de cours de formation professionnelle, -un système basé sur les résultats des évaluations préliminaires de formation dans le cadre de l'institution;
- la libéralisation des services de training et l'encouragement de ce marché (dans le cas où ces services sont prestés par des ASBL accréditées, on doit prendre en compte l'allocation de fonds gouvernementaux pour la formation des fonctionnaires publics par l'intermédiaire des fournisseurs de training);
- l'approche différenciée de la notion de formation des fonctionnaires publics:
 - formation initiale - conditions pour l'entrée dans le système (inscription aux concours)
 - la formation continue - le perfectionnement obligatoire tout au long de la carrière.

2. Tendances actuelles dans le management des ressources humaines

En Roumanie, la réforme de l'administration publique doit être dirigée vers la réforme de la fonction publique, vers la décentralisation et vers la réforme gouvernementale.

Dans la perspective de la fonction publique, dont les attributs sont représentés par le professionnalisme et la non-politisation, la formation est une condition fondamentale. Pour cela on a besoin de l'implication et de la collaboration de toutes les institutions aux attributions dans le domaine, une grande partie avec de l'expérience dans la formation des ressources humaines pour l'administration publique.

Tenant compte du fait qu'à l'heure actuelle 82% des fonctionnaires publics ressentent le besoin de participer aux cours de perfectionnement, 34% des fonctionnaires ont participé à ce genre de cours, une fois ou plusieurs fois, la restructuration des stratégies dans la sphère de l'administration publique et la restructuration du rapport entre le milieu universitaire et l'administration s'imposent.

Ainsi, le perfectionnement du fonctionnaire public doit-il constituer une priorité, une fois que le fonctionnaire devient lui-aussi conscient du fait qu'il est au service du citoyen et qu'il a un rôle immense dans le processus d'intégration européenne, respectivement celui de mettre en pratique, d'une manière efficace, l'entier cadre législatif créé.

La réforme législative dans le domaine de l'administration publique, en général, et dans la décentralisation des services publics, spécialement, impose la création et la consolidation d'un corps de fonctionnaires publics, professionnel, neutre du point de vue politique et compatible avec les structures existantes dans les pays membres de l'Union Européenne.

Ainsi, par la stratégie de développement de la fonction publique on veut aboutir à:

- l'amélioration des systèmes de perfectionnement professionnel des fonctionnaires publiques;
- la création d'un corps de fonctionnaires professionnels;
- l'augmentation de la mobilité des fonctionnaires publiques dans le cadre de la fonction publique.

Les principaux facteurs qui influencent la formation pour l'intégration européenne des fonctionnaires publiques, se réfèrent aux éléments suivants, dans l'opinion des spécialistes dans le domaine: la législation, mentalité et éducation, modalités de perfectionnement, la qualité des ressources humaines, la collaboration entre les spécialistes dans le domaine et les praticiens, l'amélioration de la communication horizontale et verticale.

Dans l'opinion de spécialistes il y a encore l'idée qu'on doit agir en plusieurs directions pour l'augmentation du niveau qualitatif du fonctionnaire publique, c'est-à-dire:

- Mettre l'accent sur la formation et le perfectionnement du fonctionnaire publique et tout ça en accord avec les exigences de l'UE, mais dans des circonstances concrètes, spécifiques à la Roumanie.
- La réalisation des formes de formation professionnelle et de spécialisation qui aident le fonctionnaire publique et le déterminent à assimiler de nouvelles connaissances professionnelles, spécifiques à l'administration et non pas dernièrement à le rendre conscient qu'il est au service du citoyen. Le résultat des formations et des perfectionnements professionnels devra se réfléchir dans l'augmentation des compétences des fonctionnaires publiques et de l'efficacité de l'activité du personnel dans l'administration. La formation professionnelle des fonctionnaires publiques doit être planifiée, organisée et fondée, puisque dans l'administration publique il y un personnel à des spécialisations différentes. C'est pour cela que dans l'opinion des spécialistes, la formation et l'augmentation de la créativité, de l'originalité, de la capacité d'adopter de différentes décisions d'organisation et fonctionnement des autorités ou des institutions publiques constituent des aspects forts importants, en ce qui concerne tout le personnel de ce secteur de l'économie. Au même temps, on ne doit pas minimaliser la capacité et la qualité des formateurs impliqués dans le processus de formation, parce que ceux-ci sont mis devant des praticiens, comme les fonctionnaires publiques.
- Une autre direction d'augmentation du niveau qualitatif du fonctionnaire publique est constituée par la croissance de la motivation du fonctionnaire publique par un système de récompenses attractif et stimulateur, étant donné le fait que la motivation, du point de vue managerial, constitue la base de l'entraînement du personnel dans le but de l'accomplissement des objectifs proposés au niveau organisationnel.
- La conception d'un mécanisme et des procédures simples d'évaluation de l'activité du fonctionnaire publique, facteur important de l'augmentation de l'efficacité du travail. L'évaluation des performances professionnelles individuelles est une activité manageriale à nombreuses implications individuelles, mais aussi organisationnelles. Dans l'administration publique on doit avoir des systèmes efficaces d'évaluation des performances professionnelles, en tant que partie intrinsèque et importante du système de management, en général, et du système de management des ressources humaines, en particulier.
- La conscientisation par le fonctionnaire publique de la mission de l'intégration européenne. Après 1990, quand les responsabilités des autorités locales ont augmenté, dans le secteur publique on a transféré des spécialistes d'autres domaines d'activité, totalement différentes de ce secteur. Ainsi, pour l'adaptation de ceux-ci aux demandes du nouveau secteur d'activité a-t-elle été et est-elle nécessaire pour la réalisation d'une évaluation plus exacte des besoins de formation et de perfectionnement du personnel des autorités locales. Analysant les principales directions à suivre en ce qui concerne le recrutement, l'évaluation, le contrôle, la promotion, la motivation et la formation professionnelle, on peut conclure sur la nécessité d'une autonomie plus large de l'administration locale; au fur et à mesure on doit aboutir à la décentralisation des attributions en ce qui concerne le management de la fonction publique par l'administration publique locale par:

- la création des prévisions-cadre, flexibles, qui respectent une règle générale, amis qui permettent l'adaptation aux exigences spécifiques des institutions;
- le renforcement du rôle du département de ressources humaines dans le cadre des institutions publiques, en même temps que la définition claire des attributions du coordinateur de ce département;
- la débureaucratization des procédures (telles que le transfert ou le déménagement d'un compartiment à autre) dans le sens de l'élimination du caractère obligatoire de l'avis de l'Agence Nationale des Fonctionnaires Publiques.

THE PROGRESS AND STRUCTURE OF THE INTERNAL AND PUBLIC AUDIT IN ROMANIA

Ghita Emil

Universitatea „Spiru Haret” - Centrul Universitar Craiova, Facultatea de Management Financiar Contabil, Str. Brazda lui Novac, nr. 4, ghitaemil@yahoo.com, 0744614536

Stanculescu Mircea

Universitatea „Spiru Haret” - Centrul Universitar Craiova, Facultatea de Management Financiar Contabil, Str. Brazda lui Novac, nr. 4, 0752553638

Since 1999, Romania has seriously got involved in the System of Internal and public Financial Control. Together with experts of the European Community, we obviously started this process with the elaboration of a strategic document - Policy Paper - finalized in October 2001, by means of which it was set out the architecture of the coming system of internal audit within the public sector.

This new conception is based on the managerial responsibility and liability on an efficient management of the budgetary funds, especially of the European ones. Thus, it is supposed to be adopted the management modern principles, the control systems based on risks assessment, the concise and complete regulations and proceedings, in order to perform the activities and implicitly, an efficient position of internal audit.

Key-words: internal and public audit, internal control, internal control system, managerial control, the Ministry of Public Finances the Central Unity for Internal and Public Audit Harmonisation, the Central Unity for Management and Financial Control Systems Harmonisation, internal audit function.

Present Studies of Implementation the Internal Audit Function

The reformation of the public financial control in Romania supposed the passage from a control system mainly performed by external entities based of inspections and replies to notifications to a control system for each public entity separately, qualified to limit the risks effects the institutions faces on their way to reach the objectives.

The implementation of the action plan of the new system supposed a gradual process:

- elaboration of a normative and procedural frame for internal audit performance (2002);
- institutional structuring, respectively reorganisation of old internal control structures (2003);
- professional training based on elementary formation which covered all the personnel that is working at present in the internal audit domain (2003-2004);
- consolidation of the internal audit activity (2005-present day).

At present, we may assert that in Romania it was created the institutional frame for performing the activity of internal audit in all the central and public institutions as well as in most of the territorial structures. For the local and public administration the process is not finalized yet, there is a segment of territorial and administrative unities, respectively those that make circulate an annual budget of 100,000 to 2,000,000,000 euro, where, because of both the territorial extent and of the limited financial risks, the position of internal audit evolves sporadically. To this effect, there were identified some more solutions to lead to the implementation of the position of internal audit for this segment, as well.

In the context of the general principles for first-class practice, control is associated to a wider meaning, thus being viewed as a managerial position and not as a simple verification operation.

The entities optimum functionality based on an integrated frame of internal control imposes the existence of a control environment correspondent to these which should promote the ethnical values, accept the standards of first-class practice and set out the responsibilities in the spirit of the strategies and policies approved by the higher level management.

At present, the managers have understood that it is their responsibility to organize their own internal control system within the entities they ran as well as the fact that the responsibility was entirely transferred to them and this is the reason why they have to get involved in a structuring of maximum efficiency.

The role played by the Ministry of Public Finances and the one played by the Court of Accounts are to assess if the internal control system implemented by the management department works and if it is competent to prevent or to put an end to potential uneconomical uses of funds and to identify the eventual leaks in the funds administration they manage.

Under the given circumstances, the managerial structure will have to "invent" control activities which will allow them to master the risks that may appear and constantly evolve in order to control their effects.

For these reasons, the managers have to build up their own "flexible system for internal control" which can be easily reduced or developed in certain sectors or departments within the public entities and, thus keeping under control the risks evolution and the limit of their consequences.

The definite implementation of the new System for public and internal financial control was accomplished by creating within the Ministry of Public Finances the Central Unity for Internal and Public Audit Harmonisation - C.U.I.P.A.H., in 2003 and the Central Unity for Management and Financial Control Systems Harmonisation -C.U.M.F.C.S.H., in 2005.

The main purpose for the creation of the C.U.M.F.C.S.H. was to help the general management to define and structure its own internal control system.

To this effect, in 2005, the Ministry of Public Finances issued The Internal Control Code⁴³ which comprehends the *Managerial/internal control standards in public entities for the development of the managerial control systems* and consists of dispositions concerning the management obligations and responsibilities in all public institutions of which we mention:

- the managers of the public institutions will dispose measures necessary in the elaboration and development process concerning the managerial control systems, based on international control standards, inclusively on proceedings in written form for each activity separately;
- the managerial structure have the obligation to identify the risks and to perform actions for keeping the risks at an acceptable level;
- for the potential needs of execution of different punctual inspections or control actions, the managers may form their own commissions or, if it is imposed, control departments that may work permanently or certain periods of time, in order to solve the disorders or irregularities encountered within the entity.

The internal control standards represent an important contribution in making public the general principles for first-class practice in the domain, on the basis of which the entities may set out structures of applicability for the internal control and financial managing systems.

Beside the *general norms for internal audit activity performance* there were elaborated, separately, some norms of *management consultancy* by means of which the internal audit comes to support it, identifying and deeply discovering the internal systems operating process so necessary to the basic management whose responsibility is to implement these systems. *The internal audit must be looked at together with the management and internal control system within the public entities.*

Within the public system the internal auditors have a major responsibility towards mass-media and public opinion, while in the private sector, they respond only on clients needs. Thus, if the internal control structures notice any infringement of the normative frame, funds embezzlement, or even frauds, the public opinion may ask if, within this entity, the *position of internal audit* does exist and is applicable in accordance with the principles of the corporatist ruling.

Conclusions

- The executives of public entities must get involved effectively in the structuring of the management and internal control system by means of collaboration with the basic management structures responsible for the assessment of its efficiency in the internal control

⁴³ MPFO no.946/2005 on the Internal Control Code, covering the management/internal control standards for public entities and for the development of the managerial control system, Of. M. no.675 of 28 Inly 2005.

organization and with the internal auditors. The association between the components will represent the value added to the managerial decisions and a guarantee of the fact that the settled targets will be reached maybe quite at performance parameters.

- The development of the system for the professional training of the internal auditors is necessary in the nearer future, as well due to the fact that we must pass over the phase of regular audit and accept the audit and performance systems which require a totally different training, especially in order to deeply master the domain of auditing.
- Concerning the relation with the managerial structure and the guarantee of an independent and objective activity, the major preoccupation for the audit is the systematic updating of the internal audit regulations, document that states the method used in carrying out the internal audit position within the entities.
- Bearing in mind the current status of internal audit implementation, we consider that Romania has set out on the right way and comes to support the creation of an efficient internal audit at the public entities levels, according to the first-class practice of the European Union.
- In the context of a recognized internal audit activity, we may assert that at present, we are in a consolidation phase concerning the internal audit. As a proof for this stand the conclusive results registered from the added value achievements and the improvement of the activities performed within the public entities, but also the awareness of the meaning of management generally of its importance and necessity, for reasons of joining the European structures.

REMARKS ON THE IMPORTANCE AND NECESSITY FOR PUBLIC ENTITIES TO ASSOCIATE IN ORDER TO PERFORM EFFICIENT ACTIVITIES OF INTERNAL AUDIT

Ghita Emil

Universitatea „Spiru Haret” - Centrul Universitar Craiova, Facultatea de Management Financiar Contabil, Str. Brazda lui Novac, nr. 4, ghitaemil@yahoo.com, 0744614536

In Romania, due to territorial extend of the audited entities, we deal with a great number of isolated departments for internal audit, consisting of 1 to 2 auditors.

The international audit standards recommend that the number of internal auditors should cover at least the minimum of activities performed by the departments for internal audit. Related to this matter, the first-class international practice recommends that their number should be of three internal auditors at least.

The internal auditors of these departments consisting of 1 to 2 individuals encounter particular problems concerning the documentation, standards acquiring or implementation.

Key-words: internal and public audit, obligatory procedures of internal audit, risk analysis, realizing the function of internal audit through association (employment or office), chief employment or office for internal public audit, the Ministry of Public Finances the Central Unity for Internal and Public Audit Harmonisation (CUIPAH).

The analysis of organizing and functioning of compartments for internal audit in public institution

Apart from the subjective issues mentioned above, the internal auditors of these departments face also objective issues on the sense that they are not able to insure the accomplishment of some compulsory proceedings within an audit action, such as:

- activity of supervising the method used for internal audit tasks, respectively use of all proceedings, assessment of risk analysis, test examination during the on-site intervention, quality of remarks and recommendations, of internal audit reports, supervision of recommendations implementation;
- ensuring a program for quality development and improvement concerning the internal auditors' work.

The situation mentioned above is encountered both in local and public establishments which are chief credit rulers (city halls) and in other central public institutions (agencies, offices, authorities and others) which are not subordinated or they are not under the coordination or authority of other public organizations, but which make circulate annual budgets of 100,000 to 2,000,000 Euro, consecutively, in 3 - year's time and which, according to the Law no.672/2002 on public and internal audit, they are obliged to found departments for internal audit.

To analyze this matter, the Central Unity for Internal and Public Audit Harmonization - C.U.I.P.A.H. set forth *the assessment report for the current status of internal audit organization in small-sized central and local public entities subordinated to another entity*, discussed by the Comitty for Internal and Public Audit - CIPA, in December 2004.

The conclusion of the assessment report was that within the public and local entities, which make circulate an annual budget, the equivalent of 400,000 euro in Romanian currency, it is difficult to make available the position of internal audit by own forces, the reasons being the following:

- reduced amount of allotted funds;

- limited domain for auditing;
- lack of trained personnel;
- management misunderstanding the part that the internal audit plays.

All these objective limits make it necessary to find out some more flexible methods for making available the position of internal audit within these small-sized public entities and to dissolve the departments consisting of 1 to 2 internal auditors, isolated and spread on territory, founding some effective and operational structures.

The assessment report analyzed the possibility that the internal audit structures, within the territorial General Directorate of Public Finance, should generally perform the audit in small-sized public institutions, chief credit rulers which make circulate an annual budget of 100,000 euro, taking into account that in this case there are only 67 public entities in the entire country.

Meanwhile, the assessment report considered also the possibility of increasing the limit for small-sized public entities from 100,000 to 2.000,000 euro whose regular audit should be performed by the Ministry of Public Finance, as well. In this case, the number of small-sized public entities grows from 67 to 735, meaning that the Ministry of Public Finance can not provide it, not even in the farthest future. All these lead to the conclusion that it is necessary to find out a solution of partnership among these small-sized public entities and together may perform the position of internal audit, in accordance with the International Standards provisions.

To this effect, we recommend *to perform the position of internal audit in association, respectively by creating common structures of internal audit providing the position of audit for more entities with compatible activity domains.*

This method could be used in small-sized public entities, especially those which make circulate an annual budget of 100,001 to 2,000,000 euro, its equivalent in Romanian currency.

In these cases, the association is going to build up on geographical criterion, on main means of communication by joining the entities of the larger villages, cities or towns. Generally, it is recommended that by association to be founded departments of minimum 3 internal auditors in order to provide a complete covering, but it is considered that a structure of 5 to 7 individuals working full-time would be more efficient for the internal audit activity in order to be sorted out on performance criteria.

The executives of public and local institutions, which wish to associate for organizing, operating and performing the internal audit, will keep in view, at least for the start, the following aspects:

- grouping up the public institutions on size criteria in order to create the associations;
- setting up the rights and obligations of the associating institutions executives concerning the conception and provision of headquarters, furniture articles, computers etc., for the internal audit departments;
- selection and working frame for internal audit organizing structure with an executive personnel in order to comply with the law conditions related to professional training, integrity and required objectivity;
- provision of juridical assistance on termination of association contracts, of conditions of executive activity development within the internal audit department;
- effectuation of supervision and control proceedings for norms implementations by the territorial General Directorate of Public Finance

Depending on the amount of activities, as well as on the number of public institutions that form the association, the organizing structure that is under construction –department or office - will include the executive position - departmental manager or head clerk - as well as a suitable number of executives, internal auditors, respecting the legal provisions of the Statute of municipal officers.

The internal audit departments or offices of the associated entities perform internal audit team - work and the resulted reports are presented to inform on and to be approved by the executives of the respective public institutions.

Dependant on the way the activity of the association internal audit department or office goes, the contractual parties could as well anticipate other necessary rules, proceedings and activities, on the basis of the

amendments and completions to be set out and mutually agreed on in the document attached to the initial contract of association.

The internal audit department or office of the local and public institutions association subordinates to the executives of the local component institutions, and for the operational management of the internal audit department is empowered, having the mutual consent of the executives of the local and public associated institutions, the executive of the local and public institution where the internal audit department performs its activity. If the internal audit structures operate within a different headquarters it is essential to be set out an operational executive system for them.

The manager of the internal audit department or office, by the obligation stated by the local and public associated institutions, does not have to get involved in the elaboration of the proceedings for internal control within the local and public associated institutions. Also, the manager is appointed/dismissed by the competent executive of the local institutions, having the approval of the C.U.I.P.A.H.

The internal audit applies to all the activities performed within the local and public associated institutions concerning the foundation and use of the public funds, as well as the administration of the public inheritance, aiming at implementing, according to the law, the internal audit which examines the actions took on the financial effects on the basis of the public funds or inheritance in order to respect the assembly of principles, procedural and methodological regulations which are applicable to them.

Every three years at least, but not restricted to this, within every local and public associated institution, the internal audit department or office of the association audits the following :

- a) the budgetary and legal engagements from where derive directly or indirectly the payment obligations, inclusively the social funds;
- b) the payments took upon by budgetary and legal engagements, inclusively the social funds;
- c) the sale, mortgage, cession or rent of the goods from the private sector of the state or of the territorial and administrative unities;
- d) the cession or rent of the goods from the private sector of the state or of the territorial and administrative unities
- e) the public funds collection, respectively the method used for authorizing and setting up the debt security, as well as for the facilities offered on their cashing;
- f) the budgetary credits allocation;
- g) the accounting system and its liability; the system of taking decisions;
- h) executive and control systems, as well as the risks associated to such systems;
- i) data processing systems.

The territorial structures of the M.P.F., delegated by the C.U.I.P.A.H., will supervise the implementation of these principles performing together with the executives of the local and public associated institutions periodical analyses on the way the internal audit departments or offices organize and carry out the internal audit tasks stated in the activity programme.

The internal audit departments or offices, on the basis of the statutory tasks, periodically report to the executives of the local and public institutions, as well as to the internal audit structures within the territorial General Directorate of Public Finances and within the one in Bucharest, the accomplishment of the legal tasks and the method of implementation, in time and respecting the general norms concerning the performance of the activities of the scheduled internal audit tasks.

The territorial General Directorates of Public Finances and those from Bucharest periodically inform the Territorial Councils of Public Administration on the methods used for organizing, operating and performing internal audit activities within the local and public associated institutions.

The territorial General Directorates of Public Finances and those from Bucharest present to the C.U.I.P.A.H. annual reports on internal audit structure, operation and performance within the public associated institutions.

The C.U.I.P.A.H. annually brings up to the executives of the Ministry of Public Finances the Report on the internal audit activities performed by association with the public associated institutions.

Conclusions

We consider that the suggestion to perform the association of the small-sized internal audit departments is possible and it will have an influence in complying more strictly with the provisions of the international standards and with the first-class practice recognized in the domain.

The manager of the internal audit department or office within the associated public institutions is responsible for organizing and performing the internal audit activity, ensuring, according to the law, the execution of the following tasks;

- a) elaborates and passes on to be approved by the executives of the associated public institutions the methodological norms of internal audit, norms that are put forward to the C.U.I.P.A.H. to give its notice;
- b) elaborates and passes on the internal audit planning to be approved by the executives of the associated public institutions;
- c) carries out the internal audit assignments aiming at the assessment of the financial management and control system within the associated public institutions, paying attention that these comply with the legal, right, economical, efficient and effective norms and presenting to the executives the respective reports;
- d) informs the C.U.I.P.A.H. on the recommendations unimplemented by the executives of the local and public associated institutions, as well as on their consequences;
- e) periodically reports to the public associated institutions the remarks, conclusions and recommendations resulted from the internal audit activity;
- f) elaborates the annual report on the internal audit activities;
- g) in case it is identified any disorder or possible prejudice, he immediately reports it to the executives of the public associated institutions.

Factually making the association represents a structuring issue which will serve all the public institutions involved in association and will have an influence on the performance of some audit tasks in accordance with the norms of each institution and under the conditions of providing corresponding independence and objectivity as the internal auditors concern.

Also, after association, the costs will lessen due to a higher quality and a greater efficiency of the internal audit activity that may direct to reach some elements of performance.

VIRTUAL WORKPLACE AND TELECOMMUTING: CHALLENGES THAT REDEFINE THE CONCEPT OF WORK AND WORKPLACE

Gorski Hortensia

Romanian-German University of Sibiu, Economic and Computer Science Faculty, Calea Dumbavii Street, no. 28-32, Sibiu, Romania, tenzig11@yahoo.com, Phone: 0744 475361

Abstract: Virtual organizations that perform the activity in the virtual workplace (cyberspace) will play a more and more important role within the global economy. Telecommuting (teleworking) is a concept strongly related to cybecorporation and cyberspace. In order to determine: (a) the usage level of telecommuting according to the field of activity and the size of the organization; (b) the reasons that determine the organizations to appeal to telecommuting; and (c) the teleworker profile, I carried out a survey based on a sample of 150 managers from all types of organizations: commerce, production, services. The survey highlights the fact that only a reduced number of organizations have started „ to make a move” related to teleworking. Some of the organizations do not understand the concept; others have heard about it but are still reluctant to it, while other organizations have not heard of this concept.

Key words: telecommuting, teleworker, information technology, cyberspace, cybrcorporation.

Introduction

Lately many organizations have undergone the process of reengineering: they modify their size; they decrease the number of hierarchic levels; they eliminate departments' barriers; they create teams on projects and products; they externalize activities; they organize virtual workplaces and encourage teleworking (from home or other locations outside the organization). All these changes obviously lead to a **fundamental rethinking of the manner in which organizations develop their activities**. Within this context, the virtual workplace and the telecommuting are the key elements that should be carefully considered by managers and organizations.

In the new age of **information technology (IT)**, of the Internet and e-commerce, the virtual organizations will play a more and more important role in global economy. The **virtual organization** or the **cybercorporation** is a business specially designed for virtual space. The **virtual workplace (cyberspace)** is a working space without walls and boundaries, created with the help of IT that allows the work to take place at any time of the day (24 from 24 hours), in any location and that connects people and information no matter of their location (Keohan, M).

The concepts of cyberspace and virtual workplace focus on using the **communication technology** – *fax, e-mail, voice mail, software for video conferences* – so that the employees can perform their tasks in a location different from the headquarters. **Telecommuting** or **teleworking** is a concept strongly related to cybercorporation and cyberspace. Telecommuting refers to the use of information and communication technology in order to achieve remote working activities (respectively to work in a place different from the central location). For telecommuters that place can be their own home, or the plane, a hotel room or even the customers' offices. Strongly related to teleworking and to the use of communication technology – with the goal of connecting different locations with the central location – has emerged the concept of telecommuter. By **telecommuter** or **teleworker** we understand a person that works for an organization and that performs this activity from home or from other satellite location – at least a part time of the working hours – and that is connected to the central location by means of communication technology (Langhoff, J).

Even if currently teleworking implies a multitude of styles and organization models, the most important ones are the **telecommunities** – satellite offices located at the teleworker's workplace and witch are connected to the central location through communication technology tools. Any organization and any telecommuter or teleworker that develops an activity that can be realized in such a pattern could be a part of this teleworking system. As mentioned above, teleworkers are individuals that work at their own home or in working telecentral or persons that frequently go to the customers' place. Consequently, due to the fact that individuals can work in a location different from the central one, being also able to send the results

of their work through communication technology, the telecommuting and the virtual workplace can offer **new professional opportunities** for each involved person.

In practice teleworkers can be classified in **two categories**: (a) Those that work outside the organization because the situation is required by work that they are performing (for example many sales agents must go to the customers' offices instead of waiting for customers' calls); (b) Those that can work in a remote location from the central one because the tasks' achievement do not depend on the place where they develop the activity.

Telecommuting is also related to the tele-cooperation facilities and it offers to the worldwide specialists the possibility to collaborate by means of IT. Telecommuting usually implies sales and marketing workers, advertising field workers, analysts, architects, design engineers, auditors, economists, jurists, programmers, software engineers and other jobs related to computers and communications.

As a result of the detailed analysis of all teleworking aspects and of the specialized materials research one can underline the **advantages** that telecommuting generate not only for the teleworkers but also for the organization (Ghilic-Micu, B., Stoica, M).

- **Advantages for teleworkers**: Better management of time and increased flexibility of working schedule; Productivity improvement due to the fact that they are not disturbed by colleagues or by superiors (however, we should mention the fact that also at home there can be a productivity reduction if the teleworkers do not manage their activities very well or if they are repeatedly interrupted by other persons or by other problems); Better focus on tasks to be performed; Reduction or even elimination of transportation costs; Reduction of time required for going to the office; Reduction of stress (in an office where many persons develop their activity, the stress level can be rather high).
- **Advantages for organizations**: Reduction of expenses involved by the necessity of using working spaces – rent, maintenance, insurances etc.; The judicious usage of offices' space, in the case when some employees work according to the traditional system, while others prefer the teleworking system; Diminishing utilities expenses – gas, electricity, water etc.; Reduction of the consumption of consumable materials; Decrease of salary expenses, as the teleworkers are paid for their task and not for their time spent at work; Possibility to have experts located in any part of the globe; Possibility to hire low cost but qualified labor force (recruiting the personnel can be done in geographic areas where the labor force is low cost and well trained); Increase of productivity and performances due to the fact that teleworkers can better focus on the results to be achieved; Reduction of the number of absentees', because the teleworkers work at home; Creation of jobs and employment opportunities in rural or disadvantaged areas.

In some organizations a part of the personnel can perform the activity off-site and be in permanent contact with the central location. Using *mobile phones, portable computers/laptops*, and *communication networks* the registered orders and other information of great interest can be sent to the central location and processed in due time. As a consequence, decisions process can be faster, based on updated and real time information. It is possible that the personnel working off-site at the customer, would have to spend more time away from the central location – sometimes weeks – and, as a result the need of offices and spaces is substantially reduced.

In the circumstances of globalization and sharp competition, the organizations are trying to offer products/services of a good quality at the lowest prices possible. Within this context they can use teleworkers – a qualified labor force, that involves low costs and who can provide increased flexibility for the organizations. Presently, the Internet allows the organizations to search, to find very quick, and to use workers from any place on the globe. We can notice more and more frequently that there is a **task transfer towards the geographic area with low cost labor force**. The telecommuting has a significant economical and social impact and it obviously influences **the international division of labour**, offering to the developing countries the possibility to improve, and to the organizations from these countries the chance to become more competitive on the global market.

The organizations that resort to this manner of work should have **performing hardware and software**, in order to realize information and documents remote transmissions. The success of virtual workplace and of teleworking greatly depends on the organizations' ability to manage their businesses electronically, respectively to use **e-commerce** and the facilities offered by **Electronic Data Interchange (EDI)**. However, we should consider the fact that the infrastructure is a vital element and, in this context, the involved countries and organizations must greatly **invest in the infrastructure**, and this implies high costs. Moreover, the informational system should base on computers.

Market Research Regarding Teleworking

In Romania the first forms of teleworking emerged in 1995. At the beginning there were „pseudo activities” of teleworking in which the impact of IT was rather low. Out of the teleworkers’ group we could mention the sales agents that used to perform their work off-site, the journalists that used to report from the scene location, the field workers etc. In the year 2000, more evolved forms of teleworking started to appear in Romania too. Presently, there are organizations that partially or totally use the teleworking system, mainly in commerce activities, web design, computerized programming, Database Management, Computer Aided Design, consultancy in the filed of information and communication technology.

In order to identify the level of telecommuting usage, a survey has been realized based on a questionnaire applied on a sample size of 150 managers from Sibiu County organizations.

Main objectives of the survey:

- Highlighting the usage level of telecommuting;
- Analyzing the usage level of telecommuting according to field activity and organization size;
- Determining the reasons that make the organizations not to appeal to telecommuting;
- Determining the teleworker profile.

Usage of telecommuting option

From the analyzed results we can conclude that most organizations (74,7%) do not employ „telecommuting” (figure 1).

Figure 1 Organizations’ option regarding the telecommuting

Moreover, it is quite interesting to underline the usage level of this working method with regard to the organizations that resort to it. Subsequently, it was necessary to calculate the weighted average (mean) for the 38 organizations that resort to telecommuting. The results (minimum, maximum and average) are presented in table 1.

Table 1 Telecommuting Usage Level

	N	Minimum	Maximum	Mean / Average
Usage of telecommuting	38	5	70	27,34

After processing the data we can conclude that from the organizations resorting to telecommuting, the lowest usage percentage is 5%, the highest is 70%, and the mean is of a rather low value (27,34%). To conclude, the hypothesis mentioned before research (*Organizations resort very little to telecommuting*) has been confirmed.

For more details there is an *analysis according to the field of activity* and an *analysis according to the organization scale*. The results are graphically represented in figure 2.

Figure 2 *The usage of telecommuting – classification according to the field of activity and to the size*

From this combined analysis we can highlight that the highest weight of the organizations resorting to telecommuting are in the field of commerce (47,4,9%), followed by services (39,5%). In opposition, the industry field includes just 13,2% organizations that use this facility.

As we can notice in the above mentioned figure, the combined analysis emphasizes that the highest weight of the organizations employing telecommuting are registered within the medium organizations (39,5%), followed by big organizations (34,2%). On the third and fourth place there are the small organizations (21,1%) and micro enterprises (5,3%). The possibility to implement a teleworking system obviously depends on the financial resources and on the organization endowment with computers, communication equipments and specialized computer software. Taking into consideration all these premises, the micro enterprises and the small organizations can slightly afford to resort to telecommuting. On the contrary, the medium organizations are on the top place with regard to this aspect. An interesting conclusion refers to the fact that the big organizations do not appeal so much to telecommuting as the medium ones tend to do, even if they usually dispose of the necessary resources. The explanation could be that big organizations are probably more conservative than the medium ones, namely more connected to the traditional way of working, and thus more rigid.

The market research underlines also the most frequently mentioned **reasons** that determine the organizations not to use telecommuting: It requires an infrastructure that they do not dispose of; It does not fit to their activities; This option has not been considered yet; It is more difficult to control the employees etc.

Teleworkers Profile

Out of the data obtained via the market research, we can highlight the fact that within the organizations using telecommuting most of the teleworkers (60,5%) are employees that perform their activity off-site (for example at the customers' place); 31,6% are experts to whom the organizations occasionally appeal and only 7,9% are employees that permanently work at home (figure 3).

Figure 3 Teleworkers' profile

Location:

- 1 – Employees performing the activity off-site (customers' place)
- 2 – Experts to whom the organization appeal occasionally
- 3 – Employees that permanently work at home

To conclude, the hypothesis mentioned before the research (*Most of the teleworkers are employees that perform their activity off-site*) has been confirmed.

Conclusions

As mentioned at the beginning of this paper, the teleworking and the virtual workplace can offer a lot of advantages not only for individuals, but also for organizations. By using information and communication technology the individuals can work in a location different from the central one, being able to send the work results to the central location. In some organizations— especially in the commerce field – there is the necessity that a part of the personnel performs the activity away from the company and permanently keeps contact with the central location. In digital era, the mobile phones, portable devices (laptop, PDA etc.), and the communication networks can support not only the managers – so that decisions are made faster – but also the organizations – so that they become more flexible and more adaptive. These arguments can explain the survey conclusions namely that: (a) the commerce organizations make the most use of telecommuting, these being followed by the services field organizations; (b) the most frequent teleworkers are those that have to perform their activity off-site, (at the customers' place , this being the case of sales agents).

The organizations that appeal to telecommuting should take into consideration the necessity of highly relying on computers, communications and performing software and of using the facilities offered by Electronic Data Interchange – EDI. As a consequence, the possibility to implement telecommuting obviously depends on the financial resources and on the organization endowment with computers, communication equipments and specialized software. Taking into consideration all these premises, we can explain also the fact that the micro enterprises and the small organizations just slightly afford to use telecommuting, as many of them do not dispose of the necessary financial resources. Usually, the big companies have the necessary resources, but they are probably more conservative than the medium ones, being more connected to the traditional way of working, and thus more rigid.

We should admit that in Romania just a very reduced number of organizations have started „to make a move” related to teleworking, while some of them do not understand this term, others have heard about it but are reluctant, and others have never heard about this concept. Starting from the advantages offered by teleworking, we still hope that in the future teleworking will develop also in Romania according to the international tendency.

Another important aspect that should be mentioned is the fact that besides the infrastructure and financial facilities, the teleworking also implies other issues that relate to **mentality** and to **organizational culture**. Consequently, even if they have resources necessary for the telecommuting implementation, the organizations must carefully **analyze if they are ready for this challenge**. The organizations should take into consideration the fact that this new type of work can develop only if there is an adequate mentality and if managers have an attitude prone to telecommuting. The managers used with permanently checking the way in which the employees divide their working time, the managers that enjoy seeing the employees „stuck” in their chair and working in their offices during the eight hours of work, the managers that like to permanently control their subordinate employees will probably face difficulties in accepting the telecommuting system.

MANAGERS' TRAINING AS PROMOTORS AND USERS OF MODERN INFORMATION SYSTEMS

Gorski Hortensia

Romanian-German University of Sibiu, Economic and Computer Science Faculty, Calea Dumbravii Street, no. 28-32, Sibiu, Romania, tenzig11@yahoo.com, Phone: 0744 475361

Abstract: In the Information Age managers have to face complex and radical changes, many of those being related to the new information technology (IT) proliferation. The ability to transform the information technology in a threat or an opportunity, in a challenge or an impediment, greatly depends on the managers' professional training in the field of IT. In order to find out the usage level of the tools provided by IT and to point out the managers' attitude towards these, a survey was realized. By analyzing the results we can notice that the marks obtained by managers for the knowledge in the computer science field are rather unsatisfactory. Taking into consideration the fact that in the new age the information technology will be available in all industries and in all activities, enterprises should focus more on training the users – managers and employees.

Key words: information technology, informatics, information system, manager, training

General aspects regarding the training of managers in information technology field

The managers of information age have no other choice but face complex and radical changes. Many of these are related – directly or indirectly, more or less – to the new information technology proliferation. The spectacular development of information technology can be both a threat as well as an opportunity; it can be a challenge or an impediment for managers and their organizations. The ability to transform the information technology in a threat or opportunity, in a challenge or impediment depends greatly on managers training in IT field.

This paper focuses on several aspects related to the managers training as users of information systems and information technology and it is based not only on the market research results, but also on my experience as IT consultant and authorized trainer for developing, implementing and using modern information systems, based on the information and communication technology..

In the context of the challenges emerging from the information technology, we should understand and admit the fact that the success or failure of an information system greatly depends on the **managers' training** not only as final users, but also as supporters of modern information systems. Within this context, the organizations must focus on the adequate IT training of managers, realized by various *methods* and *adapted to the basic education and to the types of applications they are supposed to be aware of currently and in the future.*

Managers and employees can appeal for training to various **methods**: outsourcing – respectively courses, seminars, laboratories taught by experts and organized within the enterprise (on-site of the enterprise requiring this training) as well as off-site (at the enterprise providing training services); specialized training realized by the enterprises' own experts; e-learning; Computer Assisted Training – interactive training manuals which combine practice and seminars with Computer Assisted Training; HELP components of the software; interactive television, multimedia systems etc.

Maybe one of the most adequate training methods is to appeal on a well-known training company with experience in this field. Why? In such a company the trainers are not endowed only with hardware and software knowledge, but also with important **pedagogic abilities**. Are the pedagogic abilities important? Obviously! An expert, no matter of his training and experience in the informatics field, will not be able to completely pass on the information if he lacks pedagogic skills, respectively if he does not know how information and knowledge should be transmitted or how to make the trainees „to feel” the informatics. It is well known that some people have informatics “in their blood”, while others must be very well guided and stimulated in order to understand it and accept it. As a consequence, the person who transmits informatics knowledge – hardware or software – must be a good pedagogue and psychologist – „able to be in the trainee's shoes”. Only in this manner, the process of transmitting knowledge as well as the process of acquiring knowledge will end successfully.

Specific aspects related to the managers' training in informatics in Romanian enterprises, as resulted from the market research

As previously mentioned, within the context of the challenges emerging in the information age, the success and failure of an information system and of the organizational performances greatly depends on the managers' training in informatics field, as they should be supporters and catalysts of the changes generated by IT.

In order to find out the usage level of the IT tools and to highlight the managers' attitude towards the IT challenges, a selective survey was realized by way of a questionnaire directly administered by managers. The survey was realized on a sample size of 150 managers coming from enterprises (commerce, services, production) that develop their activity in the Sibiu County. In order to realize a successful survey I focused on: respecting a certain level of data representation; getting stable and reliable results; using efficiently the resources respectively ensuring a good ratio between the value of obtained information and the involved costs (financial and time).

Main goals of the survey:

- Highlighting the managers' opinion regarding the role of IT within the organizational change.
- Identifying managers' opinion regarding the advantages generated by IT.
- Identifying the influencing factors considered by managers when purchasing a Computer Based Information System or its components.
- Awareness of the managers' position towards Internet.
- Identifying the managers' knowledge in the field of informatics.

Out of the goals related to the survey just one makes the object of the present paper, namely: "Identifying the managers' knowledge in the field of informatics." (respectively the mark that managers consider to deserve for their level of knowledge regarding each type of informatics system). In order to reach this goal, the focus was on different application systems software: *Office Automation; Graphics Applications; Transaction Processing Systems – TPS; DataBase and Database Management Systems; Enterprise Resource Planning – ERP; Programming*. For each system one was supposed to determine the following: usage level; average of the marks given by managers and for more details the assessment of knowledge acquired on age categories.

From the results obtained after the processing of the data collected from the questionnaires I have chosen to be presented in this paper a synthesis referring to the marks given by managers and grouped on application category and on age category (figure 1).

Figure 1 Marks given by managers – classification according to Application System Software and age category

Office Automation. As presented in figure 1, the highest mark was obtained by managers who are below 25 years old (9,40). Next, the average marks tend to decrease with the advanced age (9,10 for the age category 26-35 years old; 8,50 for age category 36-45 years old and 8,10 for age category 46-45 years old). Unfortunately, managers who are over 56 years old can be found on the last place (6,20), at a rather big distance (approximately two points) as the second last place. The applications referring to Office work Automation are *easy to learn and use*. Many of them (for example Microsoft Office: Word, Excel) *can be found also in Romanian version* (inclusively Help components) and consequently each manager and employee has the opportunity to acquire them by self-teaching. In the last 8-10 years, the applications of this type *can be studied generally at all universities, no matter of the specialized field* (especially Word Processing). Moreover, on the market there are many specialized enterprises that offer, at reasonable prices, *trainings* in the field of Word Processing and Spreadsheets. Any manager of the 21st century should be able to edit a word document with inserted images, to make various computerized calculations, to create different graphics, to make a Power Point presentation, and to draw up his own work scenarios etc. These could be the explanations related to a large scale knowledge regarding these applications. However, we should emphasize the fact that the managers over 56 years are still living in the past as they only got the average mark of 6,20. The explanation could be that most of these managers did not study informatics in school and more than that, many of them are not prone to invest time and energy for computer science training.

Graphics Application. As we can notice, the highest average mark was obtained by the managers who are under 25 years old (8,90), closely followed by those belonging to the age category 26-35 years old (8,70). Next, the marks tend to decrease with advanced age (7,90 for age category 36-45 years old and 6,70 for age category of 46-55 years old). As this aspect is concerned, the managers over 56 years are still on the last position, the mark being unsatisfactory, even very close to the test passing level (5,30). The explanation for these results could be that the young managers had to *use graphic applications even from school years* because that was required by their projects, so that they acquired abilities in this field of graphic application.

Transaction Processing Systems – TPS. In the field of TPS (salary, inventory and accounting application, customers and suppliers management, production, marketing, sales etc.) the managers belonging to the age groups of 26-35 and 36-45 years old are the best trained ones (average 7,70), followed by those who are

under 25 years old (7,60). The last positions are occupied by the persons belonging to the age category of 46-55 years old (6,30), respectively who are over 56 years old (5,00). The explanation for this lower mark obtained by the young questioned managers (under 25 year) could be that usually these programs are not the object of high education courses. The ability to use these programs is acquired in time, as the person applies them for his work or as the person takes part in training stages led by the enterprises that develop and supply these applications. The argument for the lower marks obtained for the managers over 56 years old could be the fact that the automation and the development of these programs emerged when the respective managers found them selves at a certain age so that many of them are not willing to learn how to use them.

DataBase and DataBase Management Systems. As we can notice, the data base system is best handled by the managers who are under 25 years old (average 8,50), closely followed by those of the age category 26-35 years old (8,30). The knowledge level of data base decreases with the managers' advanced age. Thus, the average of 6,50 was obtained for the age category 36-45 years old; average 6,10 for those of the age category 46-55 years old and again the lowest average (5,20) for the managers over 56 years old. As resulted from another survey realized with the goal of determining the usage level of informatics tools related to DataBase Management Systems and Data Mining, the enterprise frequently use DataBases. The managers that graduated an economic or technical university have studied „DataBase” during high education years. Moreover, in the present there are a lot of specialized enterprises on the market, which offer professional training in this field. Thus, we can explain the fact that a rather high percentage of the questioned managers claim that they know how to work with these tools. Nevertheless, the average mark is rather low (6,92). This aspect can be justified by the fact that DataBase Management Systems are taught in universities generally in the first two years, so that if they are not used in the meantime, they could be largely forgotten. The same thing is going on with the managers who attended various trainings, but then never really used the respective applications.

Enterprise Resource Planning – ERP. It is obvious that the average of individual marks given by managers for their knowledge in the field of ERP are very low, namely 5,60. ERP Systems have recently emerged and their development involves considerable financial resources. Due to the total high costs – also caused by the development, implementation and usage of these systems – very few organizations can afford to purchase them even if their usage generates many advantages. As we can notice, in this field the best trained managers are those belonging to the age groups 26-35 and 36-45 years old (6,20). These are followed by young managers under 25 years old (average 6,10). The managers belonging to the age group of 46-55 years old got 5,00 while the managers over 56 years old got only a average mark below the test passing one (4,50). The initial learning of ERP Systems has been available in universities for several years and unfortunately only in few universities (those who have signed agreements with developer enterprises in order to use – freely or with low expenses – the educational licence). After graduating, if the companies they work for do not have such an information system, the young employees are not able to acquire the usage ability anymore, as there are no professional enterprises to offer trainings in this field. The training is offered only by the enterprises that develop such systems, especially for the organizations that purchase these systems. As a consequence, the managers of the enterprises that do not use such systems are hardly to know these systems (maybe only if they previously worked in an enterprise that had such a system or if they had the chance to study them at the university). Thus, the little knowledge in this field can be explained.

Computers Programming. As we can notice, that in the field of programming abilities the best trained managers are those below 25 years old (average 7,60), closely followed by the age category 26-35 years old (7,40). The other age groups have very low average marks. However, managers from the age category 36-45 years old obtained the average mark of passing the test (5,10). Still, the managers from the age category 46-55 years old and those over 56 years old got average marks below the test passing one (4,90 respectively 4,20). The explanation could be similar to that given in the case of the other types of applications, namely that most managers belonging to this category are not willing to invest time and energy in computer programming training. Probably, the managers that graduated computer science faculties acquired the programming abilities due to *analyst-programmer trainings* or due to *self-teaching*. It is true that lately, the economic and technical faculties have focused on *programming concepts*, but the course lasts only one semester and generally consists of basic notions which cannot be a real basis for those interested in programming, if not subsequently developed. These are also the reasons for which such a low

percentage of managers have programming knowledge and the cause of the low average mark obtained by managers (5,84). The young managers are an exception as their knowledge acquired at the university is still available and not forgotten. An interesting aspect, underlined by the discussions with the managers, is that most of them consider there is no use „in wasting” their time studying programming notions as the market has specialized enterprises which offer performing application. However, this point of view should be reconsidered as all the enterprises belonging to economic developed countries focus on the development, even by the computing end-users, of the more simple programs – self-sourcing. The new programming environments (respectively Fourth Generation Languages – 4thGL) are radically different from the old generations as they are easy to learn and use even by the persons without professional experience.

As we can notice, the usage level for all types of computer applications is dominated by the highest average marks obtained by the interviewee below 25 years old (8,02), these being followed by the persons from the age category 26-32 years old (7,90). This average decreases as the age increases, namely: 6,98 for the age category 36-45 years and 6,22 for age group 46-55 years old. The least trained managers belong to the group over 56 years and they got only the average mark 5,07.

Conclusions

The research points out the fact that, in general, as the informatics knowledge is concerned the results are rather unsatisfactory – the general average mark being 6,84. The general conclusion is that young generations are better trained in the informatics field. This conclusion can be explained by the fact that the young managers had a greater chance to study and acquire informatics knowledge at university and high school. Moreover, the experience acquired as an IT consultant gives me the opportunity to state that the younger persons are more willing to acquire knowledge in this field, while the older persons are more reluctant in investing time and energy towards this direction. However, these statements cannot be turned into general ones and as a proof, the research emphasis that there are older managers who have informatics knowledge.

In Romania many managers claim that they **do not have the necessary time** for a specialized training in computer field, as there are **other problems more stressful and critical** than „wasting time” in studying informatics. For many of them these not even are real reasons. A lot of older managers are afraid not only of getting close to the computer, but also to attend specialized trainings. Why? Because they are afraid to face new technologies, they are afraid of not being able to acquire knowledge and so „to be taken as fool” by lecturers and colleagues. Obviously there is no general statement regarding this aspect and we have to admit that there are managers very well trained in computer science field, experience that they acquired by attending specialized trainings or by self-teaching – as autodidact.

The problems related to managers and employees’ training, the acceptance or rejection of the IT challenges, and in general the success or failure of the informatics system greatly depends on the **organizational culture**. The implementation of Communication and Information Technology and the changes within information system can lead to **formal and informal transformations in the entire organization**. The formal changes can influence the department boundaries and the relations between managers and subordinates. The informal standards can affect the work and social relations among employees, the work standards and their statute. Consequently, those who develop informatics systems must permanently collaborate with future users in order to find out their requests or needs and their possible reaction to changes. Any informatics system, no matter how performing or not, will turn up to be a failure if is not supported by the management and if is avoided, rejected and/or sabotaged by users.

To conclude, taking into consideration the fact that in the new age the information technology will be available in all fields of activity, ideally would be that the enterprises should focus more on an adequate training – realized by different methods – for the users of modern Computer based Information Systems. The managers training, as well as of the employees training must be adjusted to their basic education but also to the types of applications they should be able to handle in the present and in the future. Moreover, any enterprise that intends to have a success regarding the implementation of new information technology should firstly have a **pro-informatics organizational and managerial culture**. The organization should have managers and employees who support the computer based information systems not only formally, but also out of their belief and intention to really want the informatics become part of their work and life.

LE MANAGEMENT DE LA PROGRAMMATION DE LA PRODUCTION AUX LIGNES TECHNOLOGIQUES POLYVALENTES (MULTIOBJET)

Gradinaru Doruleț

L' Université de Pitești, La Faculté de Sciences Économiques, 0752458187, gradinaru_dorulet@yahoo.com

Extrait: La projection des lignes en flux multiobjet doit assurer des conditions adéquates de manière que, dans leur exploitation, elle puissent réaliser plusieurs produits ou pièces avec de moindres pertes de temps et avec des dépenses aussi réduites que possible concernant les opérations de règlement nécessaires au passage d'un produit à l'autre. En fonction des caractéristiques constructives des outillages et des produits programmés à être exécutés, les lignes en flux multiobjet peuvent être exécutées en deux variantes, c'est-à-dire: des lignes en flux multiobjet avec outillage principal et produit représentatif et des lignes en flux monoobjet sans outillage principal et sans produit représentatif. Les éléments nécessaires à l'organisation des lignes en flux multiobjet sont les mêmes que pour les lignes en flux monoobjet, qui sont calculées de la façon mentionnée ainsi de suite.

Mots clé: ligne technologique polyvalente en flux continu et cadence imposée, fonds de temps mensuel disponible de la ligne polyvalente, rythme de fabrication, normatif de programmation, équation des dépenses de production, méthodes des trajectoires hamiltoniennes.

Dans les entreprises industrielles avec une importante production en série il y a la possibilité de l'exécution sur ligne de fabrication en flux de plusieurs types de produits différents qui ont pourtant la même gamme d'opérations. De telles lignes permettent, par conséquent, le façonnage en lots alternatifs de plusieurs types de produits avec la même gamme d'opérations, d'où le nom de lignes polyvalentes.

L'organisation de telles lignes polyvalentes en flux continu et de cadence imposée (où le passage de la fabrication d'un type de produit à un autre ne nécessite pas le règlement des outillages) est conditionnée par l'observation des conditions:

(1.1)

$$\sum_{i=A}^N \tau_i \cdot P_{pi} = F_{d \max}$$

$$\frac{t_K^A}{\tau_A} = \frac{t_K^B}{\tau_B} = \dots = \frac{t_K^N}{\tau_N} = M_K$$

(1.2)

où: τ_i représente la cadence de travail spécifique de chaque type de produit;

P_{pi} – le programme de production de chaque type de produit i ;

$F_{d \max}$ – le fonds maximal de temps possible de la ligne technologique;

$t_K^A, t_K^B, \dots, t_K^N$ – la durée de l'opération K ($K=1, 2, \dots, n$) pour les produits A, B, \dots, N ;

n – le numéro des opérations à exécuter;

M_K – le numéro des lieux de travail de chaque opération K ;

$A..N$ – la nomenclature des produits étant exécutés sur la ligne polyvalente.

Dans le cas des lignes polyvalentes en flux continu et cadence libre, des celles en flux discontinu, les conditions d'organisation de la projection des lignes sont les suivantes :

$$\sum_{i=A}^N \left(\tau_i \cdot P_{pi} + \frac{P_{pi}}{L_i} \cdot tt_{ij} \right) \leq F_{d \max}$$

(1.3)

$$\max\left(\frac{t_K^A}{\tau_A}; \frac{t_K^B}{\tau_B}; \dots; \frac{t_K^N}{\tau_N}\right) \leq M_K \quad (1.4)$$

où: P_{pi} représente le programme de production de chaque type de produit i ;

tt_{ij} – le temps de passage du lot des produits i au lot des produits j .

Tel comme on a précisé ci-dessus, le rythme de fabrication représente un normatif de programmation important qui doit être déterminé aussi dans le cas de la ligne technologique polyvalente. Dans cette situation, la cadence de travail de la ligne technologique exprime l'intervalle de temps qui s'écoule entre l'exécution de deux types de produits consécutifs; par conséquent, la notion de cadence de travail spécifique à chaque type de produit apparaissait.

Le calcul de la cadence de travail spécifique à chaque type de produit, quelle que soit la forme de mouvement des produits en cours d'élaboration, impose la réalisation de la succession d'opérations suivantes:

- le calcul du fonds de temps mensuel disponible de la ligne polyvalente (F_{dl}), car le programme de production de la ligne contient, pour chaque type de produit, la charge de production pour un mois :

$$F_{dl} = 60 \cdot D_S \cdot N_S \cdot N_{zl} \cdot (1 - k) \quad (1.5)$$

- la répartition du fonds de temps mensuel disponible de la ligne pour chaque type de produit, proportionnellement au volume de main-d'oeuvre nécessaire à l'exécution des tâches du programme de production :

$$F_{dli} = F_{dl} \cdot \frac{P_{pi} \cdot T_i}{\sum_{i=1}^n P_{pi} \cdot T_i} \quad (1.6)$$

où: F_{dli} représente le fonds de temp mensuel disponible de la ligne réparti pour l'exécution du produit de type i ;

P_{pi} – le programme mensuel de production de type i ;

T_i – la durée d'exécution, pour toutes les opérations technologiques, d'un produit de type i ;

n – le nombre des produits qui sont exécutés sur la ligne technologique polyvalente.

La cadence de travail spécifique du produit de type i (τ_i), dans le cas du mouvement individuel des produits en cours d'élaboration, est déterminée conformément à la relation :

$$\tau_i = \frac{F_{dli}}{P_{pi}} \quad (1.7)$$

Le rythme de fabrication de la ligne indique le nombre des produits de type i que la ligne technologique doit exécuter dans l'unité de temps. Ce rythme de fabrication, exprimé sous la forme de la production horaire (P_{hi}), s'établit conformément en rapport:

$$P_{hi} = \frac{60}{\tau_i} \quad (1.8)$$

La cadence de travail spécifique au produit de type i , dans le cas du mouvement des produits dans l'élaboration en lots de transport, exprime l'intervalle de temps qui s'écoule entre l'exécution des deux lots de transport consécutifs de produits de type i et elle est déterminée d'après le rapport:

$$\tau_{li} = \frac{F_{dli}}{P_{Pi}} \cdot l_i \quad (1.9)$$

où: l_i représente le volume du lot de transport du produit de type i .

Le rythme de fabrication de la ligne dans ce cas, exprimé sous la forme de la production horaire, est calculé de la façon suivante:

$$P_{hli} = \frac{60}{\tau_{li}} \quad (1.10)$$

Les normatifs de programmation des lignes technologiques polyvalentes impliquent non seulement la détermination du rythme de fabrication ayant comme fondement la cadence de travail, mais aussi la détermination du volume des lots de fabrication, partant dans ce but de la nécessité de l'égalisation de la fréquence de lancement de tous les produits élaborés sur la ligne technologique. Dans le cas contraire, donc de quelques fréquences différentes, les travaux de programmation, le lancement et la poursuite seraient beaucoup plus alourdis.

Pour la détermination du volume optimale des lots de fabrication, on part de l'équation des dépenses de production pour l'exécution de tous les produits qui s'exécutent sur la ligne polyvalente. Ces dépenses se divisent en deux catégories:

- dépenses indépendantes du volume du lot de fabrication (y_1) qui sont égales avec:

$$y_1 = \sum_{i=1}^n P_{Pi} (cm_i + cp_i) \quad (1.11)$$

où: P_{Pi} – le programme de production mensuel du produit i ;

cm_i – dépenses matérielles directes pour le produit i ;

cp_i – le coût de l'élaboration d'un objet du lot des produits i ,

exclusivement les dépenses de préparation-achèvement et d'immobilisation des moyens circulants;

n – le nombre des produits qui se fabriquent sur la ligne polyvalente.

- les dépenses dépendant du volume du lot (y_2), qui incluent les dépenses de préparation-achèvement et celles liées à l'immobilisation des moyens circulants, établis conformément à la relation suivante:

$$y_2 = \sum_{i=1}^n \frac{P_{Pi}}{L_i} \cdot b_i + \sum_{i=1}^n \left[L_i \cdot \left(cm_i + \frac{cp_i}{2} \right) + b_i \right] \cdot \varepsilon \quad (1.12)$$

où: L_i représente la quantité du lot de fabrication du produit i ;

b_i – les dépenses de préparation-achèvement pour le lot des produits i

ε – l'intérêt mensuel payé pour le recouvrement des besoins de moyens circulants immobilisés.

Tenant compte des deux catégories de dépenses, l'équation des dépenses de production pour l'exécution de tous les produits sera :

$$Y = \sum_{i=1}^n P_{Pi} \cdot (cm_i + cp_i) + \sum_{i=1}^n \frac{P_{Pi}}{L_i} \cdot b_i + \sum_{i=1}^n \left[L_i \cdot \left(cm_i + \frac{cp_i}{2} \right) + b_i \right] \cdot \varepsilon \quad (1.13)$$

Ayant en vue le fait que le nombre des lots (nl_i) est déterminé à l'aide de la relation :

$$nl_i = \frac{P_{P_i}}{L_i} \quad (1.14)$$

alors la relation (1.13)

$$(1.15)$$

Finalement la fonction Y s'écrit :

$$Y = \sum_{i=1}^n Y = \sum_{i=1}^n P_{P_i} \cdot (cm_i + cp_i) + nl \cdot \sum_{i=1}^n b_i + \sum_{i=1}^n \frac{P_{P_i}}{nl_i} \cdot \left(cm_i + \frac{cp_i}{2} \right) \cdot \varepsilon + \sum_{i=1}^n b_i \cdot \varepsilon \quad (1.16)$$

Le minimum de la fonction Y s'obtient lorsque la dérivée en rapport avec nl est nulle, c'est-à-dire: $\frac{\partial Y}{\partial nl} = 0$

$\frac{\partial Y}{\partial nl}$

$$\frac{\partial Y}{\partial nl} = \sum_{i=1}^n b_i - \frac{1}{nl^2} \cdot \sum_{i=1}^n P_{P_i} \cdot \left(cm_i + \frac{cp_i}{2} \right) \cdot \varepsilon = 0 \quad (1.17)$$

d'où le nomb

$$nl_{opt} = \sqrt{\frac{\sum_{i=1}^n P_{P_i} \cdot \left(cm_i + \frac{cp_i}{2} \right) \cdot \varepsilon}{\sum_{i=1}^n b_i}} \quad (1.18)$$

Dans ces conditions, la quantité optimale du lot de fabrication pour un type de produit est:

$$L_{opt_i} = \frac{P_{P_i}}{nl_{opt}} \quad (1.19)$$

et la périodicité du lancement des lots, elle est la même pour tout type de produit, sera :

$$R_{opt} = \frac{N_{zl}}{nl_{opt}} \quad (1.20)$$

où N_{zl} représente le nombre des journées de travail du mois respectif.

Quel que soit la méthode de détermination du volume optimale des lots de chaque produit qui s'élabore sur la ligne polyvalente, pour l'élaboration des graphiques de programmation il est nécessaire qu'on établit le plus raisonnable ordre de lancement en fabrication des lots des différents types de produits, ayant comme critère la minimisation des pertes de temps dans le fonctionnement de la ligne.

Pour l'établissement de la succession optimale du lancement des lots on peut utiliser la méthode des „trajectoires hamiltoniennes”.

Tenant compte du fait que sur ligne technologique polyvalente on exécute les produits $P_1, P_2, \dots, P_i, P_j, \dots, P_n$, l'établissement des successions optimales du lancement des lots en fabrication par cette méthode a comme point de départ la connaissance des dépenses de passage du produit P_i , au produit P_j et vice-versa. De telles dépenses de passage peuvent être transposées dans la matrice ci-dessous:

Le produit	Dépenses de passage						
	c_{11}	c_{12}	...	c_{1i}	c_{1j}	...	c_{1n}
P_2	c_{21}	c_{22}	...	c_{2i}	c_{2j}	...	c_{2n}
.
P_i	c_{i1}	c_{i2}	...	c_{ii}	c_{ij}	...	c_{in}
P_j	c_{j1}	c_{j2}	...	c_{ji}	c_{jj}	...	c_{jn}
.
P_n	c_{n1}	c_{n2}	...	c_{ni}	c_{nj}	...	c_{nn}

où c_{ij} représente les dépenses de passage du produit P_i au produit P_j , et c_{ji} les dépenses de passage du produit P_j au produit P_i .

À la matrice des dépenses de passage C on associe une matrice booléenne (B), dont les éléments sont déterminés d'après les règles suivantes:

- si $c_{ij} < c_{ji}$, on écrit la chiffre 1 dans la case ij et 0 dans la case symétrique ji ;
- si $c_{ij} > c_{ji}$, on écrit la chiffre 0 dans la case ij et 1 dans la case symétrique ji ;
- si $c_{ij} = c_{ji}$, on décide arbitrairement si écrire 1 dans la case ij ou ji et 0 dans la case symétrique.

La matrice booléenne obtenue ainsi est élevée à des puissances successives jusqu'au moment où deux puissances consécutives donnent deux matrices identiques, c'est-à-dire:

$$B^h = B^{h+1} \tag{1.21}$$

Dans la dernière matrice on supprime la ligne ou les lignes contenant seulement des éléments égaux à 1 et la colonne ou les colonnes afférentes. À l'occasion de chaque suppression on obtient le produit où les produits d'une certaine classe d'équivalence (qui est lancée dans la fabrication à un moment donné). Si on a supprimé, par exemple, dans la première étape, les lignes afférentes aux produits P_1 et P_2 , cela veut dire que les deux produits font partie de la première classe, devant être lancées en fabrication avant les autres. L'opération de suppression continue jusqu'au moment où on a supprimé les dernières lignes et colonnes de la matrice et on a établi la dernière classe d'équivalence.

Ayant comme fondement ces classes d'équivalence on construit un graphe où sont représentées d'abord les pointes afférentes à la première classe d'équivalence, puis les pointes de la deuxième classe d'équivalence et ainsi de suite jusqu'à la représentation de la dernière classe d'équivalence. Sur ce graphique on lit les trajectoires hamiltoniennes partant des pointes de la première classe d'équivalence jusqu'aux pointes de la dernière classe, tenant compte du fait que chaque classe d'équivalence constitue un graphe fort connexe et ayant aussi en vue les liaisons entre les classes.

À l'ensemble des m trajectoires hamiltoniennes possibles $d_{H1}, d_{H2}, \dots, d_{Hm}$, représentant autant des variantes de succession des n produits, on associe les dépenses de passage de la matrice initiale, sommant les dépenses de passage en chacune de ces variantes on obtient la dépense totale de passage de chaque succession. L'ordre optimal de lancement en fabrication des produits $P_1, P_2, \dots, P_i, P_j, \dots, P_n$ est donné par la variante de succession (la trajectoire hamiltonienne) dont la dépense totale de passage est minimale, c'est-à-dire:

$$S_{opt} = \min \{C_{S1}, C_{S2}, \dots, C_{Sm}\} \tag{1.22}$$

où: C_s représente les dépenses totales de passage de la succession s ; m – le nombre des variantes de succession.

L'OPTIMISATION ÉCONOMIQUE DU VOLUME DU LOT DE FABRICATION DANS LE MANAGEMENT DE LA PRODUCTION EN SÉRIE

Gradinaru Doruleț

L' Université de Pitești, La Faculté de Sciences Économiques, 0752458187, gradinaru_dorulet@yahoo.com

Extrait: Le dimensionnement optimal des lots de fabrication d'après le critère économique implique l'établissement de leur quantité dans les conditions du coût unitaire minimal. Dans le modèle d'optimisation présenté on distingue seulement les facteurs ayant un rôle important dans l'évolution des coûts, ce modèle soulignant les principales corrélations entre ces facteurs..

Mots clé: Lot de fabrication, Dépenses de préparation-achèvement de la fabrication, Dépenses avec l'immobilisation des moyens circulants, la transposition en lots de la production, le Coefficient des travaux de préparation-achèvement).

Le lot de fabrication – notion, facteurs qui influencent son volume

Le lot de fabrication représente la quantité des produits identiques (demi-produits, pièces, sous-ensembles, ensembles etc.) lancés simultanément en fabrication, qui s'élaborent dans les mêmes lieux de travail et qui consomment un seul temps de préparation-achèvement.

Une place essentielle dans la désignation de la catégorie de lot de fabrication est occupée par le temps de préparation –achèvement. Cette catégorie de temps génère une série de dépenses de préparation-achèvement de la fabrication, dont la quantification est strictement nécessaire pour la détermination du lot de fabrication.

L'importance et le rôle de la détermination du volume des lots de fabrication résident, essentiellement, dans les aspects suivants:

- en fonction du volume du lot de fabrication on établit tous les autres paramètres du management de l'activité de production, tel que: la durée du cycle de fabrication, le volume moyen des stocks de production inachevée dans les sections et intersections, la durée de la période de répétition des lots de fabrication;
- le volume des lots conditionne le degré d'usage des capacités de production, la vitesse de rotation des moyens circulants et l'efficacité de leur usage;
- le travail basé sur des lots représente une nécessité objective pour la production en série, déterminée par le devancement du rythme de consommation ou de livraison par le temps de fabrication, par l'observation du principe du parallélisme en exécution et les exigences de l'efficacité économique. La transposition en lots permet, aussi, l'assurance des bénéficiaires en mode rythmique et continu avec les produits sollicités; la transposition en lots de la production est possible dans les conditions des trois types de production. De cette façon, dans le cas de la production individuelle, la transposition en lots apparaît tenant compte du fait qu'un seul produit contient plusieurs repères identiques ou des repères identiques qui s'utilisent pour des produits différentes, et, dans le cas de la production en série majeure, la transposition en lots est déterminée par le nombre relativement grand de sortiments qui se fabriquent en grandes quantités. Mais la production en série moyenne constitue le domaine typique de la transposition en lots de la fabrication, dans les conditions de la production des sortiments divers en quantités relativement importantes.

Le lot optimal dans le cas des produits parcourant plusieurs stages d'élaboration

Dans la détermination du volume optimal des lots de fabrication on peut utiliser plusieurs critères, parmi lesquels: le critère économique, le critère technico-économique, le critère disponible ou – dans les conditions où l'usage d'un des critères antérieures ne conduit pas aux effets économiques suffisamment favorables pour l'entreprise – on peut recourir aux critères présenté de suite.

Le dimensionnement des lots de fabrication d'après le critère économique consiste en l'établissement de leur volume optimal, qui conduit à un coût unitaire minimal. Dans le modèle d'optimisation du volume du lot on souligne seulement les facteurs ayant un rôle important dans l'évolution des coûts, ce modèle marquant les principales corrélations entre ces facteurs.

D'après ce critère, on considère que les facteurs suivants agissent sur le volume des lots:

- les dépenses de préparation-achèvement de la fabrication;
- les dépenses avec l'immobilisation des moyens circulants;
- le programme de production.

a) Les dépenses de préparation-achèvement de la fabrication (b)

Ces dépenses ont le caractère et l'influence des dépenses conventionnellement constantes, leur poursuite étant réalisée par la corrélation avec le volume de la production.

Les dépenses de préparation-achèvement de la fabrication par unité de produit (y) sont exprimées de la façon suivante:

$$y = \frac{b}{L} \quad (1.1)$$

où: L représente le volume du lot de fabrication.

Graphiquement, l'évolution des dépenses de préparation-achèvement de la fabrication par l'unité de produit a lieu d'après une hyperbole équilatérale (fig. 1.1).

Fig. 1.1 L'évolution des dépenses de préparation –achèvement unitaires

b) Les dépenses avec l'immobilisation des moyens circulants

La période d'immobilisation des moyens circulants génère des dépenses spécifiques agissant comme pertes pour le processus de production .

Les dépenses avec l'immobilisation des moyens circulants sont directement proportionnelles avec le volume du lot de fabrication, tel comme on peut observer dans la fig. 1.2.

Pertes de l'immobilisation d'une unité de produit

Fig. 1.2 L'évolution des dépenses avec 'immobilisation des moyens circulants

Dans la figure ci-dessus, a représente le coefficient angulaire de la droite des pertes.

La perte de l'immobilisation d'un lot de production sera:

$$u = V \cdot T \cdot \varepsilon \quad (1.2)$$

où: V – représente la valeur des moyens circulants immobilisés;

T – la durée moyenne des immobilisations (heures, jours, etc);

ε – la perte résultant de l'immobilisation d'une unité monétaire pour une période de 1 an.

La valeur V se détermine de la façon suivante:

$$V = L \left(c + \frac{c_p}{2} \right) + b \quad (1.3)$$

où: c – représente le coût d'une unité de produit jusqu'à l'entrée en fabrication;

c_p – le coût de l'élaboration (salaires directs plus des dépenses indirectes, exclusivement les dépenses de préparation-achèvement de la fabrication).

La valeur T se détermine d'après la relation:

$$T = \frac{L}{N} \quad (1.4)$$

Selon ces calculs préliminaires, concernant les dépenses de préparation-achèvement de la fabrication et les pertes résultant de l'immobilisation des moyens circulants, on peut apprécier que pour l'obtention d'une unité de produit on réalise les dépenses suivantes :

$$Y = C_m + S + r + \frac{b}{L} + \frac{\left[L \left(c + \frac{c_p}{2} \right) + b \right] \cdot \varepsilon}{N} \quad (1.5)$$

où: C_m représente la dépense avec la matière première / produit;

S – le salaire par unité de produit;

r – des dépenses de régie unitaire.

En dérivant la fonction Y , qui quantifie le coût d'une unité de produit selon le volume du lot L , et égalant le coût à zéro, on obtient la valeur minimale des dépenses de production :

$$\frac{\partial Y}{\partial L} = -\frac{b}{L^2} + \frac{\left(c + \frac{c_p}{2} \right) \cdot \varepsilon \cdot N}{N^2} \quad (1.6)$$

ou

d'où résulte le volume optimal du lot de fabrication L_{opt} ,:

$$L_{opt} = \sqrt{\frac{b \cdot N}{\left(c + \frac{c_p}{2}\right) \cdot \varepsilon}} \quad (1.7)$$

Le lot optimal dans le cas des produits qui parcourent un seul stage d'usinage

La principale caractéristique de la fabrication dans certains maillons de production, tel que les ateliers de pressage, d'usinage mécanique, etc, équipés avec des outillages automatiques ou semi-automatiques, est constituée par l'exécution d'un nomenclateur relativement ample de produits, avec une envergure réduite et un volume faible de l'usinage. De tels produits sont exécutés entièrement dans un seul lieu de travail, outillage ou installation.

Pour ces produits l'analyse de la structure des durées d'exécution souligne un poids important du temps nécessaire à l'exécution des travaux de préparation - achèvement. Pour cette raison, la minimisation du nombre de réglages des outillages, des installations et implicitement la réduction de la durée des travaux de préparation-achèvement doit représenter le facteur principal dans la détermination du volume des lots de fabrication.

Une méthode de calcul du volume des lots de fabrication, pour le cas de la production où le quote-part de la durée des travaux de préparation-achèvement détient un poids significatif dans la durée d'usinage d'un produit, est celle qui a comme fondement „le coefficient des travaux de préparation-achèvement”.

Pour un certain produit, le coefficient des travaux de préparation-achèvement exprime le rapport entre la durée des travaux de préparation-achèvement et la durée totale d'exécution du lot de fabrication, de la manière suivante:

$$kp\hat{i} = \frac{tp\hat{i}}{tp\hat{i} + L \cdot t}, \quad (1.8)$$

où:

$kp\hat{i}$ - représente le coefficient des travaux de préparation-achèvement;

$tp\hat{i}$ – la durée des travaux de préparation-achèvement d'un lot de produits

L – le volume du lot de fabrication;

t – la durée d'exécution proprement-dite d'un produit.

La relation (1.8) nous permet d'observer que le volume optimal du lot de fabrication pour un certain produit, en utilisant le coefficient des travaux de préparation-achèvement, peut être déterminé comme il suit:

(1.9)

où

$$L_{opt_i} - \text{représ} \quad L_{opt_i} = \frac{(1 - kp\hat{i}) \cdot tp\hat{i}_i}{kp\hat{i} \cdot t_i}, \quad \text{pour le produit } i;$$

$tp\hat{i}_i$ - la durée des travaux de préparation-achèvement d'un lot de produits i ;

t_i - la durée d'exécution proprement-dite d'un produit i .

Les données concernant $tp\hat{i}_i$ et t_i sont prévues dans la fiche technologique du produit, document se trouvant dans l'évidence de chaque agent économique.

En analysant la relation (1.9) on peut observer, d'un côté, l'existence d'un cercle vicieux dans la détermination des valeurs $Lopt_i$ et kpi , et de l'autre côté, le principal problème du dimensionnement du volume des lots de fabrication, duquel dépend la qualité des calculs d'optimisation, est constitué par la méthode de fondement du coefficient des travaux de préparation-achèvement.

L'élimination du cercle vicieux dans la détermination des valeurs $Lopt_i$ et kpi est possible – affirment la majorité des chercheurs – si on procède au calcul du coefficient des travaux de préparation-achèvement par ateliers ou sections de production, en utilisant les données statistiques concernant la fabrication d'une période précédente. Dans ce sens, le coefficient des travaux de préparation-achèvement peut être calculé d'après le rapport:

$$kpi = \frac{\sum_{i=1}^n tp\hat{i}ef_i}{\sum_{i=1}^n tp\hat{i}ef_i + \overline{Lef} \sum_{i=1}^n tef_i}, \quad (1.10)$$

où:

$i = \overline{1, n}$ représente le nomenclateur des produits exécutés dans l'atelier ou dans la section dans une période précédente ;

$tp\hat{i}ef_i$ – la durée effective des travaux de préparation-achèvement d'un lot de produits i ;

tef_i – la durée effective d'exécution proprement-dite d'un produit i ;

\overline{Lef} – le volume moyen effectif d'un lot de fabrication.

Le volume moyen effectif du lot de fabrication se détermine à l'aide de la relation:

$$\overline{Lef} = \frac{\sum_{i=1}^n Lef_i}{n}, \quad (1.11)$$

où: Lef_i représente le volume effectif du lot de fabrication du produit i .

Le coefficient des travaux de préparation-achèvement, établi à l'aide de la relation (1.10), reflète seulement la situation effective de la production, ce qui peut conduire à une déformation des calculs d'optimisation. C'est pour cela que, dans les calculs d'optimisation du volume des lots de fabrication on recommande l'utilisation d'un coefficient kpi , établi par la relation (1.10), seulement pour des valeurs moindres de 0,03 ou du moins égales avec 0,03. Dans les calculs d'optimisation du volume des lots de fabrication on peut adopter en tant que normatif un coefficient $kpi < 0,03$, car il résulte que la modification de la valeur du coefficient kpi dans l'intervalle $0,01 \div 0,03$ ne conduit pas à des modifications importantes en ce qui concerne le volume des lots de fabrication.

Si la valeur du coefficient des travaux de préparation-achèvement, résultée de l'application de la relation (1.10), est supérieure à 0,03, la rigueur des calculs d'optimisation du volume des lots de fabrication est influencée par le juste fondement du coefficient kpi .

Pour ces conditions de fabrication on doit apporter certaines corrections de calcul dans le choix du coefficient kpi , come valeur normée. En essence, les opérations de correction consistent en la réalisation des calculs suivants :

- on détermine, pour chaque atelier ou section de production, le rapport r .

$$r = \frac{\sum_{i=1}^n tef_i}{\sum_{i=1}^n tp\hat{i}ef_i}, \quad (1.12)$$

- on introduit le rapport r dans la relation (1.10), cas où kpi est égal avec:

$$kpi = \frac{1}{1 + r \cdot \overline{Lef}} \quad (1.13)$$

- on calcule la dérivée de la relation (1.13) en rapport avec Lef , pour établir la rapidité de la modification du coefficient des travaux de préparation-achèvement selon la variation du volume du lot de fabrication:

$$kpi' = \frac{r}{(1 + r \cdot \overline{Lef})^2} \quad (1.14)$$

- on choisit la valeur optimale du coefficient des travaux de préparation-achèvement kpi^* selon le critère du minimum de la rapidité de la modification de la relation kpi' :

$$kpi^* = \min \left[-\frac{r}{(1 + r \cdot \overline{Lef})^2} \right] \quad (1.15)$$

- le coefficient kpi^* , résultat de l'interprétation de l'exigence formulée dans la relation (1.15), est utilisé pour la détermination du volume optimal des lots de fabrication, conformément à la relation (1.9).

$$Lopt_i = \frac{(1 - |kpi^*|) \cdot tp\hat{i}_i}{|kpi^*| \cdot t_i} \quad (1.16)$$

LE MANAGEMENT DE TYPE KAIZEN

Gradinaru Puiu

L'Université de Pitești, La Faculté de Sciences Économiques, 0745902875, gradinarupuiu@yahoo.com

Extrait:Le concept Kaizen désigne le perfectionnement continu du management et des activités de l'organisation qui impliquent l' employé , et inclue les exécutants mais aussi les managers . Kaizen représente une pratique managériale courante et constitue qui tente à définir la mentalité Japonnaise.

Motes clé:Le management visuel , le management est orienté vers la réingénierie des affaires, 5s, juste dans le temps (J.I.T) en maintenant une productivité totale (T.P.M),kanban teian .

Kaizen – Une Philosophie De Vie Qui S'adresse Aux Plus Bons Et Á Celles S'usposaient Être Les Meilleurs

Le modèle Japonnais de conduite á démontré le fait que,le progrès se fait petit á petit mais rapidement , et apporte des victories sûres ,de longue durée. La méthode Kaizen,,implémentée aussi en Roumanie, apporte du satisfaction et beaucoup d'argents de poche;

Kaizen est un concept d'origine japonnaise, qui en essence justifie l' amélioration continue .

Le terme provient du boudisme ,où ce terme signifie«rénovelle le Coeur et fait-le de plus en plus bon».Dans les armatiaux,pour «Kaizen cela signifie:`` avancer a petits pas,mais rapides``.La méthode s'étend de plus en plus dans le management .

A présent Kaizen s'étudie en dehors même du territoire japonnais , dans de grandes instituts des ÉTATS UNIS ,du Canada,de l'Europe de l'ouest et est considérée comme une voie entre deux (2) sortes de conduites traditionnelles: Le management de la qualité ,est orienté en conformité avec le standard préétabli,,et le management orienté vers la réingénierie des affaires ,basé par un changement majeur du processus, ou même dans la structure de l'organisation..

Le management orienté vers la réingénération des affaires nécessite une grande consommation des ressources pour la réalisation d'un changement d'un BOND type, mais á la fin le succès n'est pas au rendez-vous .

Dans l'abordation du type kaizen ,on met l'accent sur la fluence du processus d'amélioration et de l'efficiantisation .La seconde importante difference est que, pour Kaizen ,la responsabilité des processus et la qualité des produits sont stictement propre á la compagnie et á ses spécialistes .

Dans cet esprit d'innovation ,plus ou moins fiable ,les travailleurs ,les masteurs, les ingénieurs ,et les managers sont impliqués.

La méthode Kaizen a été implimentée aussi á J.T.I Roumanie.Le processus a débuté dan les années 1999 en impliquant premièrement le management de top niveau mais aussi le management moins de la compagnie.La partie introductif du système a nécessité une préparation de 6 mois,dans ce temps on a fait l'armonisation avec les pratiques du management de type J.T.I. Roumanie:le système I.S.O.,le cercle de la qualité ,les programmes de suggestion etc.Au début on a employé les instruments:5S et le management visuel-qui ont eu une grande force sur les emplyés,parce que,par ces méthodes,les employés ont vu et ont compris des aspects élémentaires de conduite,dans leur activité quotidienne.

5.S. –représente une série d' étapes qui a la forme des concepts liés á l'organisation du lieu de travail et le déploiement de l'activité:

1. La classiffication=la séparation des lieux utiles de ceux inutiles;
2. L'ordonation=l'arrangement des choses essentielles,pour pouvoir les retrouver et les employer plus facilement.
3. Le nétoieiment=mentenir les appareils et le lieu de travail propres,(identifier les causes et l'inspection individuel continue)

4. La standardisation= des méthodes entières /de procédures a éviter l'apparition dans le future des problèmes de type S1,S2,S3, identifiés et solutionnés.
5. L'autodiscipline= le respect en permanence des règles établies (les étapes S1,S2,S3,qui doivent devenir une routine)

Le manager de la compagnie J.T.I. Roumanie,réconnaît qu'il a été une provocation entre communiquer et faire impliquer réellement les ouvriers et non formellement dans ce processus.On a établi que chacun doit accomplir des objectifs bien définits, avec des indicateurs de performance et d'évaluation faites au cours de l'année.La meilleure modalité d'attirer les employés est celle d'afficher des choses plus intéressantes, pour eux,ou ils contribuent ,pour aussi voir comment s'impliquent ils.Petit a petit,les gens ont accepté le jeu, non seulement parce qu'ils ant été enseignés et soutenus par des causultants et la totalité du management de la compagnie, mais aussi, parce qu'ils ant participé à la prise des décisions; on a tenu compte de leur point de vue,on a appliqué leurs suggestions et ils sont récompensés individuellement par leurs efforts fournies.

Après ça,l'introduction des systèmes J.I.T.(juste dans le temps)ou T.P.M (maintenance totale de la productivité) a été qu'une question de temps.Les mentalités étaient dépassées.Les gens sont devenus plus réceptifs à l'amélioration continue.Les sondages d'opinion effectués ont démontré une augmentation réelle de la satisfaction des employés a tous les niveaux de l'organisation.Différemment en 1999,il y a une baisse de 50%, mais la productivité a augmenté de 4%. ,pour pouvoir atteindre cette performances le processus est soutenu en permanence.Chaque année on fait 3-4 révisions suivant le model de deployment de l'activité et on fait des pronostiques dans le plan de l'amélioration .

Les Médicaments Kaizen Pour L'Amélioration De Ses Performances

7W.-la réduction des dépenses avec les7 pertes

5S.-La maintenance d'un environnement de travail propre et plaisant,mais aussi la maintenance d'un climat de travail stimulant;

V.M.-L'amélioration interne de la communication dans la compagnie,l'amélioration et la motivation des employés en reconnaissant leurs mérites.

J.I.T.-L'élimination des stoques et la réduction de la production /la prestation du travail;

T.P.M.-L'amélioration et la disponibilité de la technologie ,pour la réduction des heures de défection ,les réparations ,etc;

Knaban-La manifestation par des marquages des matérielles ou du processus pour l'amélioration de leurs qualités;

Teian-Une système d'amélioration continue d'organisation basé sur l'application des suggestions des employés;

J.I.T - La réponse rapide aux commandes

Toyota est bien connue par la qualité et la fiabilité de ses véhicules.La compagnie a reçue le prix du journal américain ``Forbes``pour l'année2002 comme la compagnie qui a le management le plus grand au monde et avec la meilleure qualité de sa production.Ça, parce que Toyota a développé pendant des décénies le système de production J.T.I.(juste dans le temps),système qui a permis la réduction de la durée de répondre aux commandes faites par des clients,de 3 semaines (la durée initial)à 2 jours!On a fait ça dans des conditions d'amélioration continue, la fiabilité des véhicules et l'augmentantion du période de la garantie.des véhicules a 3 ans .

T.P.M. - Moins de défection

Pour les efforts d'implementations du type T.P.M,réalsés dans les companies japonaise Waseda , est spécialisées dans la production des composants mécaniques et réduit le temps total des interruptions occidentales des équipements de dix mille minutes à 30 minutes ,et a réalisé au moins un taux de 1.5 million de dollard en 6 mois.

Teian- Tout opinion est importante

Aux ÉTATS UNIS,et en Europe ,on emploie les même méthodes mais basés en principe „une bonne idée pour un bon bonus!,, .L'étude comparative a ces méthodes ,a été réalisée en 1999,par l'association Américaine pour le système de suggestions et d'association japonnaise des ressources humaines ,a montré qu'un échantion de 555 compagnies de différents pays , le nombre total de suggestion enrégistré aux États unis étaient de 996 mille ,au moment ou au japon , on utilisait la méthode kaizen-Tein, cela dépassait 60 millions . Aux ÉTATS UNIS, la bénéfice realiee en appliquant 100 suggestions était de 22.800\$,mais au japon ce chiffre dépassait de 365.000\$.

Le Management D'efficient Se Construit Du Jour Au Jour Et D'employé En Employé

Pour qu'un style de management ait des résultats dans le temps,il est important que tous les ouvriés de la compagnie soient impliqués dans le processus de la production continue. Mais il est plus important que les managers de top soient les premiers a s'impliquer ,parce qu'ils sont, ceux qui influencent la plus grande partie de la compagnie.

La majorité des managers de top pensent que l'action s'arrête uniquement dans leur bureau,mais cette pensée est fausse. Les manager doivent toujours être au terrain ,, ,d'après le professeur Masaaki Imai, Fondateur de l'institute Kaizen.Le professeur disait que les managers d'efficiencient devraient visiter en permanence le centre où les locaux de la production,le lieu de vente mais également vérifier les données fournies dans l'ordinateur.

En parlant de la philosophie Kaizenne,Masaaki Imai dit que cette philosophie consiste l'application de quelques principes conduisant l'amélioration graduelle du management de la compagnie mais avec l'implication des employés ,de bas niveau jusqu'au top management. Mais cela se fait par des observations ponctuelles du lieu de production ,c'est là ou se trouve la base des affaires ou des données mais on peut aussi remédier les petites erreurs .

D'habitude ,on pourrait adopter après 6 mois voir un an les résultants du principe Kaizen.Par exemple, il ya des compagnies qui ont réduit de 30% leur prix de vente après 6 mois et ont augmenté leur productivité a 100%. A la différence d'autres philosophies du management qui ont tendance a détruire les principes d'administration antérieures, Kaizen ne se propose pas a créer des révolutions dans le processus de conduite qui tente à se construire à côté de ceux qui existaient déjà , et s'améliorent du jour au jour.

L'abordation de la méthode Kaizen suppose être la continuation des performances du passé , l'amélioration graduelle de ces résultats de durée ,différemment des changements qui proviennent des résultats rapides,qui devient éphémères en longue terme

En Roumanie,,jusqu'à present,il y a plus de 15 compagnies qui ont adopté la philosophie du management de type Kaizen.

Parmis ces compangies il y a des compagnies qui travaillent dans le domaine de l'automobile, dans le domaine bancaire,où des compagnies qui offrent des services de projection ,de l'architecture ou du marketing,mais aussi des departments publiques dans les conseilles nationaux d'état..

Cet intérêt pourrait être expliqué par le fait que le management de type Kaizen suppose faire des efforts d'amelioration de la production , la plus part des employés de la compagnie ,le progrès se voient et se mentient dans le temps.

Le spécte est large,il y a des compagnies multinationales qui ont développé ce type dans les pays où ils ont des sites de travail.Ils sont venus en Roumanie non-seulement pour profiter du fait que la Roumanie est un pays low-cost,mais aussi ils profitent du management intelligent dès ressources humaines de tous les types .Mais aussi il y a des compagnies Roumaines avec un managerRoumain intégrant,qui ont développé des affaires à un haut niveau ,spécialement dans le domaine de la production à l'aide de la philosophie de type Kaizen.

LE STRESS PROFESSIONNEL DANS LES SECTIONS DE PRODUCTION

Gradinaru Puiu

L'Université de Pitești, La Faculté de Sciences Économiques,

0745902875, gradinarudoru@yahoo.com

Extrait: La préoccupation pour le stress au lieu de travail est relativement nouvelle pour les Compagnies Roumaines que dans celles de l'Occident. En voyant les résultats, un sur trois employés de UE (40 millions de personnes) est soumis au stress au lieu de travail. A cause de cela, on perd chaque année 1 million de jours de travail. Aproximativement la moitié des employés manquent le travail à cause de la perte d'intérêt. On peut expliquer ça parce que les compagnies imposent des conditions de travail très dures ce qui conduisent à un haut niveau de stress, on constate aussi le taux croissant d'absentéisme au lieu de travail.

Les problèmes créés par le stress dans les conditions industrielles et les grandes dépenses pour maintenir la santé, imposent aux chercheurs du monde entier, l'élaboration des méthodes de combattre les facteurs qui sont des "inducteurs" de stress.

Motes clé: inducteur de stress, le management des changements organisationnelles, réducteur de stress, ergonomie.

LE MANAGEMENT DE STRESS DANS UN MILIEU DE TRAVAIL

L'intérêt augmenté dans l'élaboration et à la réalisation des programmes de management de stress au lieu du travail, pourrait être expliqué comme suit:

1. les employeurs ont commencé à se rendre compte du fait que, le stress au lieu de travail représente un problème majeur, non seulement pour le système de la santé publique mais aussi pour, la production industrielle qui demande la formation d'un fond spécial de dépense.
2. L'augmentation du niveau de compréhension, du mécanisme d'action du stress et ses interactions avec les différentes analyses des maladies, en incluant le dérèglement somatique de l'organisme de l'ouvrier.
3. Dans une mesure considérable on perfectionne la méthodologie d'identification et de l'appréciation du stress au lieu de travail .
4. On élabore les processus de réalisation et de légalisation des méthodes, qui permettent la diminution de la manifestation du stress au lieu de travail.
5. On obtient des témoignages que les programmes de formation qui entrent dans le domaine du management du stress au lieu de travail, influencent d'une manière rapide la situation financière de la corporation, et augmentent le degrés de satisfaction des employés pour le travail fournie.

On doit mentionner que, l'opinion de la majorité des chercheurs et des pratiquants, se réduit de plus en plus au fait que la plus importante tâche de nos jours c'est "la production". Pour résoudre ce problème on emploie le système d'appréciation du stress professionnel, qui tient compte de quelques niveaux de manifestation de stress dans la société.

Chacun d'entre eux a un type de stress ou des "inducteurs" d'état de stress, pour chaque type d'inducteur on propose quelques types d'interventions des "réducteurs".

Groupés dans des catégories formelles et informelles, ils permettent la détermination du volume nécessaire aux mesures de contrôle personnelles ou organisationnelles par rapport avec les potentielles réactions d'adaptation.

LE MANAGEMENT DES CHANGEMENTS ORGANISATIONNELS

Il faut préciser qu'on a élaboré une série de mesures d'élaboration consultatives en ce qui concerne la diminution des niveaux d'évolution des situations de stress dans le rang des employés .

Les consultations prévoient l'emploi des méthodes d'identification "des inducteurs" du stress au lieu de travail (une tâche trop grande, des situations de conflit imprévues), des méthodes ergonomiques au lieu de travail qui prévoient la diminution de l'influence ou l'exclusion totale des inducteurs qui identifient le stress. L'avantage de cette approche permet la découverte des sources de stress au lieu de travail. Dans le même temps, les managers sentent le déconfort, parce qu'une telle méthodologie peut amener des changements dans les opérations traditionnelles, avec la modification du système déjà utilisé dans le domaine de la production.

Comme règle, quelques actions faites dans la direction de l'augmentation du niveau de stress au lieu de travail conduisent aux changements organisationnels pour améliorer les conditions de travail. Ces changements prévoient:

- l'établissement de la tâche pour l'employé en conformité avec ses capacités et ses ressources;
- la perfection de l'ergonomie au lieu de travail, permet l'assurance de la stimulation et la facilitation de démontrer les capacités;
- la détermination du rôle de l'employé dans le processus du travail, et l'établissement de ses responsabilités;
- la possibilité de l'ouvrier de participer aux réunions et à la prise de décisions
- l'amélioration de la communication, en excluant la méfiance
- assurer le soutien pour résoudre les rapports sociaux entre collègues
- l'organisation des cours de réqualification, compatibles avec les possibilités et avec la responsabilité de l'employé.

Même les efforts faits pour améliorer les conditions de travail, ne peuvent pas exclure le stress en totalité. À cause de cela, la méthode la plus efficace est considérée comme une approche combinée.

LE MANAGEMENT COMBINÉ POUR PRÉVENIR LE STRESS AU LIEU DE TRAVAIL

À présent, il manque le management standard, qui doit montrer la manière de prévenir l'état de stress au lieu de travail. L'élaboration d'un tel programme et la prise des décisions correspondantes, sont influencés par quelques facteurs: les dimensions et la complexité de l'organisation, l'accès aux ressources et spécialement l'unicité du problème de stress. Comme règle on mentionne la suprasollicitation de l'employé, le manque de communication et de la flexibilité. Même s'il y a des difficultés dans l'élaboration des mesures universelles sur le stress au lieu de travail, on peut résoudre ça avec un paquet qui doit inclure des principes sur la conduite. Un tel paquet suppose l'emploi d'un programme de management pour combattre le stress, comme suit:

La première étape: Identifier le problème.

À cette étape on étudie les limites des situations de stress et, on analyse aussi, les sources du stress. Dans le même temps, on étudie les dimensions de l'organisation et l'accès aux ressources de travail. Dans les petites compagnies, on discute de ce problème du stress (des discussions entre les managers de la compagnie et les représentants des employés) pour prendre des informations sur les facteurs qui provoquent le stress. Dans des organisations ce type de débat pourrait être utilisé pour apporter des informations sur les conditions qui provoquent le stress.

N'importe quelle méthode employée, l'information doit inclure les caractéristiques de tours de travail, des dates sur le niveau du stress, que les ouvriers confrontent; l'état de leur santé et le degré de satisfaction de travail fourni. Le guide d'orientation des spécialistes dans le domaine du management est constitué par les conditions suivantes de travail, que l'apparition du stress emporte :

- la nature de la tâche de travail (l'enceinte, une courte pause, le prolongement des heures supplémentaire de travail, l'agitation et la routine dans l'abordation des problèmes ont pour conséquence l'insuffisance du temps pour trouver la solution ce qui n'est pas nécessaire au professionnalisme de l'employé.
- le style de management (manque de liberté de l'ouvrier à la prise de décision. le manque de communication dans le processus d'organisation du travail)

- les relations entre ouvriers (l'environnement social défavorable, le manque de soutien, le manque de compréhension)
- le facteur de travail (des conflits et l'indétermination (des conflits, manque de détermination pour la résolution de leurs problèmes de travail, un haut niveau de responsabilité)
- le problème de la carrière (des conditions dangereuses de travail, l'aide d'avancement dans leurs carrières)
- -les conditions dans l'environnement de travail (des conditions physiques défavorables et dangereuses, ainsi que l'agglomération dans l'entreprise, la pollution de l'air).

Les résultats issus des enquêtes et des observations doivent être analysés avec la formation de la réponse (dans cette compagnie il y a des problèmes de stress au lieu de travail, quelle est le degré d'inclusion à ce problème dans des différentes sections de travail).

La deuxième étape: la réalisation des interventions

Après la découverte du stress au lieu de travail, il faut essayer d'étudier son champ d'action. Cette étape élabore des stratégies d'intervention pour prévenir les conditions du stress dans les petites entreprises. La discussion sur l'identification de problème de stress peut conduire l'idée de liquidation de stress et la prévoyance de son développement.

Dans les grandes entreprises le management de stress peut être formel parce qu'ici il pourrait apparaître la nécessité dans l'élaboration des recommandations basées sur l'analyse effectuée des données de la première étape du management et l'obtention d'une consultation faite par des experts externes.

En dehors de cela, il pourrait apparaître une telle situation: l'un des inducteurs de stress, par exemple l'état de tension dans l'environnement de travail se développe dans tous les compagnies, alors, dans ce cas, il est nécessaire d'avoir une large information.

Si un tel facteur est dépisté dans une subdivision séparée, il faut prendre une décision concrète sur la révision du processus de travail. Si l'état de stress est observé, l'intervention se fait sous forme de modification organisationnelle du lieu de travail, pour accorder l'aide psychologique nécessaire.

Il n'est pas nécessaire de prendre beaucoup de temps pour effectuer une série d'interventions, ainsi que, la réalisation des mesures peut être effectuée rapidement. En ce qui concerne ce type d'intervention on peut aussi rapporter le perfectionnement des méthodes de communication, effectuer des formations.

La troisième étape: L'interprétation des résultats des interventions

Une telle appréciation n'est pas nécessaire pour établir l'effet des résultats obtenus à la réalisation du programme de management du stress et pour la détermination des lieux inévitables,

Pour effectuer cette analyse, on doit établir un temps limite pour la recherche des lieux du travail et de l'enquête des employés parce qu'il y a des interventions qui prévoient d'effectuer des modifications organisationnelles différentes, la recherche doit avoir un caractère de courte ou de longue durée.

L'appréciation des résultats de courte durée peut être effectuée par trimestre ce qui assurera la dépistation du premier effet à la réalisation du programme de prévention du stress et donnera la possibilité d'effectuer la correction des mesures suivantes sur le management du stress.

Si on tient compte du fait que des types d'interventions ont un effet insignifiantes (les études de longue durée effectuées à chaque année) nous permettent d'établir l'efficacité réelle des programmes de prévoyance et l'exclusion du stress au lieu du travail.

Dans ce cas, les recherches doivent être focalisées sur la communication et sur l'analyse des informations similaires.

Les deux (2) premières étapes du programme de management du stress dans ce plan on doit mentionner le fait que les employés se sont soumis à la mission de prévoyance à l'action du stress: ils sont les premiers à observer les effets de l'intervention.

La détermination des dépenses au niveau de la compagnie peut être utilisée pour renforcer l'intérêt des employés sur le travail et sur le maintien de leur santé. Ceci démontre que le stress au lieu du travail occupe petit à petit le droit d'appeler le syndrome du XXI siècle.

On suppose que ce problème va aussi continuer dans les entreprises Roumaine .Pour accorder l'attention au problème du stress au lieu de travail, on peut considerer,de justifier et opportuner.Il reste a anticiper la processus de résolution du problème et la fixation du temps raisonable au niveau du seuil et l'effet négatif commençant avec l'introduction des situations de stress ,nécessiteront l'emploie des différents méthodes de management ,leurs descriptions a ètè donnée ci dessus.Les interrogations seront a l'ordre du jours pour les manageurs autohtons de haut niveaux :<que faire?>Partialement cette réponse est représentée ci dèssus . Une autre question traditionnelle pour la Roumanie est *qui est coupable?*qui pourra être mise au cas où la mesure préventive ne sera pas prise.,les hopitaux seront pleins d'ouvriers affectés du stress .

THE ROLE AND IMPORTANCE OF MANAGERIAL GAMES IN IMPROVING THE COMPANY'S MANAGEMENT

Grosu Oana

George Bacovia University, Accountancy and Administration Informatics, Pictor Aman street, nr. 96, Bacău, 600164, Email oanaifr@yahoo.com, 0740796674

Managerial games were created in order to test the abilities, the decision capacity and the degree of reaction under risk conditions of those who took part in such activities. By means of these simulations the managers or the managerial teams subject to test, get in touch with a real working environment, based on all the data, reports and working situations of two or more firms situated on competitive positions. After learning the rules of the game, each participant has to put into practice all the strategies he knows in order to place the firm he manages on the first place of the managerial top.

Key words (strategy, simulation, knowledge)

The transition to the market economy, as well as the changes at the macroeconomic level, generated by Romania's accession to the European Union have led to certain transformations of the competitive environment and, implicitly to the adaptation of the organizational management to the new requirements. Thus, most of the Romanian organizations, in order to meet the external and internal market demands, either adopted a series of international managerial strategies, reported to the internal economic environment and activity profile, or they chose an internal reorganization and the change of management, style and vision.

The creation and development of international organizations for different market shares in Romania have influenced the competitive environment emphasizing thus the need to elaborate a global economic strategy that should envisage a mission adapted to the future type of economy, a clear definition of the fundamental economic objectives leading to a balance of the macroeconomic indicators' evolution, GDP, productivity, inflation rate, budgetary deficit, unemployment rate, technological development as well as a constant economic-fiscal policy that should ensure internal resources, borrowed or brought, necessary for the development.

The emphasized international tendency of globalization has led to the change of vision and to the reorientation of internal resources of national and international firms, a stronger emphasis being on the development and improvement of the human resource, transforming thus knowledge in competitive advantage, being supported at the same time by technological progress and innovation. Organizations functioning on the competitive market and coming with their own strategy, either for a new market share, for the promotion of a new product or a price policy eventually tend to overlap which leads to the long-term reorientation of set managerial objectives.

At present, in order to be an honest competitor on the market you need to be strongly balanced, know and correctly assess the micro and macro evolution of the environment where you develop your activity and to have all financial resources necessary to meet your objectives.

Managerial simulation is a procedure that allows, on the one hand, the testing, assessment and manipulation of a real system, without a direct action on it and, on the other hand it has a great number of models describing the existent relations between the system components offering the possibility to change parameters and study the effects produced on data. The most important characteristic of simulation is the time compression so that the manager can observe in a short period of time the long-term effect of the taken decisions. The managerial simulation is used only for typical managerial situations that are produced repeatedly, being a model created out of the implied variables that reproduce the decisional mechanism afferent to the respective situation.

For the elaboration of a managerial game one should start from the delimitation of the typical decisional situation, stage realized by the collection and analysis of all the necessary information, the identification and evaluation of the implied variables, which can be managerial, economic, technical, necessary for the

setting of the decisional model afferent to the managerial situation, the decisive role being the elaboration and testing of the information programs that allow the operationalization of the chosen model.

The efforts for the projection and use of managerial games had as a purpose the training and specialization of managers of different field of activity. The larger the applicability area of managerial games is, fusing with other fields of present interest, the greater the managers' performance will be. I consider that it is absolutely necessary that any manager who wants to develop his activity in accordance with demands of the competitive market, being flexible to the changes of the business environment, to improve his knowledge, skills level, testing by means of the managerial simulation the possibility of meeting the set objectives.

The advantages of simulation or managerial games can be synthesized as follows:

The development of managerial and professional skills and knowledge

- a) **The consolidation of training** – tendency accomplished by the fact that, within simulations, participants have to apply theoretical knowledge previously acquired.
- b) **The development of some integrated functional perspectives** – this objective is strongly connected with the first one and represents a transition to the applied of the theoretical concepts on the functional organization.
- c) **The improvement of the decision capacity** - the period from information to the decision-taking is for simulations longer than in real life. Therefore, the participants will carefully analyze the typical situations they are placed in, knowing in the future similar situations how to act. Trying the simulation of the real environment, the games introduce a random element, characteristic for daily life, element that the competitors should take into account when taking their decision.

Improving the professional and managerial behavioral skills

This objective was introduced by the tradition of social sciences and had a great impact on the managerial training. The solving of the following problems is viewed: the fact that most individuals are aware of their image in the eyes of the others and do not notice the social-psychological and not intellectual character of the skills which are necessary for team work.

The motivation of participants and team work

The satisfactions resulted from this process are generally psychological. In many cases the specifications for well-known games are not of the type “it is viewed for the participants to learn X, but it is rather viewed for the participants to feel good working together.

The tendencies that can be mentioned regarding the simulations development within the present context are generally the consequence of the learning methods evolution, of the new educations. We mention some of the main defiance of the surrounding environment at the beginning of the third millennium:

- the transition from penury to the richness of supply ;
- the increase of the market role in the economic development of companies and national economies;
- the acceleration of technological changes;
- the general growth of productivity.

Approaching the problem of the real environment evolution closer to the economic model, there can be noticed the exponential increase of the number of variables explaining the phenomena that appear

Taking into account these tendencies, simulations, as a training method, are more and more used in academic environments, registering some tendencies in their development:

- the emphasis of the realist character
- the extension of computer games;
- the proliferation of interactive, complex, participative simulations

- The diversification of the game range depending on the target-participants. ⁴⁴

Within this sustainable development, we will retain as an important element the transition to computer games and its consequences. In an internet article, Fox McManus⁴⁵ from Texas describes two major advantages of the use of internet in the training programme:

- in this environment the advantages of all communication channels can be combined (writing, sound, video) and resources can be shared between different users;
- The immense stocking activity can lead to the creation of large information resources. Internet is by far that greatest information basis, easily accessible and usable for different purposes.

Managerial games are those products requiring the participants to face situations where they have to apply different management functions. According to the definition given by Henry Fayol the management process is an exercise of the functions of “prevision, planning, organization, command, coordination, and control”. The framework created by this definition is a large one

The framework created by the definition is a large one, the category of computer games comprising a diversity of games. Company games can be seen as a subclass of management games; the restriction being imposed here refers to the environment. Company games are games in which participants practice management functions, but within a simulated company. This supposes the contact with an informational material typical to that a company’s management has access to, depending on its hierarchical level. The games for the companies with Anglo-Saxon accounting systems deal with balance sheets and profit and loss accounts. The decisions specific to this type of game have a high quantitative character, related to elements such as: price, quality, advertisement, distribution.

Historically speaking, company games have been used as didactic tool before the boom in the PC industry. In 1965, in the American universities there was circulating a totally manual simulation called The Small Business Management Exercise. Within this type of simulation the participants took decisions for the company’s management and the manager decided what happened according to some charts and some simple arithmetical correlations. In the specialists’ opinion, the game accomplished successfully its mission: that of showing the participants what real management meant.⁴⁶ The practicing of this game was not at hand for anybody but it supposed a previous reading of the game instruction book, an economically-oriented thinking and some preliminary adaptation rounds. One of the strengths of this game is transparency. The manager can justify his decisions by commentaries like “There has been a disparity between your product’s quality and the required price. In this situation, the benefits of publicity are reduced as you do not promote a credible product.”⁴⁷

A game similar to that described previously and that is still used within the Academy of Economic Studies of Bucharest is CORAV (mini game of a company’s activities correlation). CORAV is a market game where the participants, 3-6 enterprises compete on two generic markets: internal and external. The elements of the game refer only to the processes of the exporting products, not taking into account the production for the internal market.

Computer company games are nowadays used as didactic tools. Their development is due the modern technology, to the spread of PCs and to their important role in the current processes in any field of activity. Any computer game is based on numbers and rules, which represent the basis of the electronic computer; as a result, problems have to be formulated specifically in order to be programmed. The essence of any computer simulation is the mathematical model; in the case of company games we will approach the mathematic-economic model as way of transposing the economic realities in programmable mathematic equations. Most of the times, in order to accurately present the economic reality, the complexity of models is so high that participants cannot completely comprehend all viewed relations. As a result, company games face a certain resistance from the public to whom they address.

⁴⁴ Nicolescu, Ovidiu, Radu Ioan,- SIMACO - Cartea jucătorului – Editura Economică, București, 2007

⁴⁵ <http://ccwf.cc.utexas.edu/~mciTianus/wbi.html>

⁴⁶ Elgood, Chris – Computer – Controlled Business Simulations – Training Officer Magazine, martie 1998, vol.34, nr. 2;

⁴⁷ Elgood, Chris – Handbook of Management Games and Simulations, 6th Edition, ed Gower Publishing Limited, UK, 1998, p.21.

The main reasons of resistance are:

- their tendency to bring forward quantitative elements on accounting and which seem sterile to the participants;
- their complexity makes the learning process they facilitate not very transparent to the participants; many times there are involved decisional variables whose causal connection is not easy to foresee;
- the results generated by the computer for the support of participants make them no longer concerned with additional checking.
- the equipments are either not always available, or not easy to handle.

Alternative uses of a company computer game can be:

- the use for the team development;
- the use for the introduction and familiarization of certain technologies;
- the use connected to prestige, that is the people faced with a complex simulation, not to solve it but to show that they are considered able of this attempt;
- the use related to insecurity conditions;
- the use associated to the acknowledgement of future possibilities.

After a research process in the business simulations field on the internet, there has been determined that there are two major types of offers in this field, the first offering simulations on demand, dedicated soft and the latter under the form of prefabricated.

Those offering simulations on demand are generally managerial consultancy firms whose services have in view the staff training with the modern management principles. Given the diversity of domains, of the necessary knowledge, of the objectives to meet by means of the created soft, the consultants go to the subject's company in order to investigate the situation. The projected programs are tailored on what already exists in the company according to the direction of evolution. In the case of prefabricated there are games already created and destined for universities.

Computer company general systems are used in economic universities. Management faculties are their main beneficiaries as the declared objective generally aims an introduction in the field and a familiarization with the main decisional variables and the correlations between them. Companies' employees requiring training have already gone beyond the global vision and prefer a more specialized training.

In Romania, the well-known universities rarely use managerial simulations. The management is interested in purchasing this type of products, but the supply is reduced. The games should imply more the use of computers as an analysis tool and even of the internet. Only this way there can be realized simulations between geographically distributed teams, similar to the competitions between universities.

As they need to specialize their staff Romanian companies appeal most of the times to the foreign consultants concerned with the conception of simulations from an economic point of view, so that they can meet the set objectives. As a consequence, the development of simulations can be a good opportunity on the Romanian market. They address mainly to the academic environment and aim the acquirement of basic knowledge on the market influencing means.

Among the internationally and nationally representative managerial games there are "SIMACO", "Prelem XXI 2003", "S.S.A.F.", "S.P.A.F." and "The Simulation of the distribution chain management". At present there isn't any simulation of the financial organization management, this economic field being somehow avoided because of the complexity of the developed activity, of the restrictions imposed by the access to information and to the continuous changes in the competition field. Therefore, the more inviting to approach and to simulate the managerial process of these organizations is, the more expanding they are.

THE NEED FOR HIGH QUALIFIED LABOR FORCE IN THE PRIVATE FIRMS FROM ORADEA

Hatos Adrian

Universitatea din Oradea, Facultatea de Științe Socio-Umane, ahatos@gmail.com

Chipea Floare

Universitatea din Oradea, Facultatea de Științe Socio-Umane, fchipea@gmail.com

This article presents the results of a survey conducted with randomly sampled representatives from 660 firms from Bihor, aimed at supporting the academic institutions to develop their educational programs as to address the educational needs for the private sector. The study presents in the first section the structure of the human resources of private firms from Bihor County and a prognosis of the need for higher education qualifications from the following period. In the second section we assess the quality of the human resources provided by University of Oradea.

Keywords: labor market, prognosis, training needs analysis, quality, educational services planning

Introduction

The Romanian higher education institutions are increasingly forced to take into account the needs from the labor market when planning the educational services. We can talk about the devalorization of the certifications, due both to their inflation and also to their decrease utility compared to the competencies and abilities needed at working places in the knowledge society. On the other hand, the European employment policy, as part of its social policy, imposes the correlation of educational offer to the signals from the labor market (Prisăcaru, 2004). University of Oradea has to face these pressures, and our article addresses these needs by achieving three objectives which can help at planning a complete educational offer:

- description of the structure of human resources of private firms from Bihor County,
- prognosis of the need of higher education qualifications for a the near future,
- evaluation of the quality of human resources provided by University of Oradea for the private sector employers.

Data and method

The findings of this study have as basis data from a survey conducted in March – May 2008, on a random sample of firms form Bihor County. The sample consisted of 489 firms from Oradea, 142 firms from other towns in the County and 29 firms from the rural areas. The survey is part of the project: “Careers. Guidance, mediation and professional training center for young people from Bihor County”, nr. nr. PHARE 2005/017-553.04.02.01.01.601, in which University of Oradea, Faculty of Social Science is partner.

The sample

Comparing the two sets of data one can notice an overrepresentation of firms from the commercial sector, distortion which is counterbalanced partly by the under-representation of service firms. Added to the sampling biases, the differences can be also explained by the errors in the identification of the correct main domain of activity or to some changes in this domain from the one officially registered. The data correction by domain of activity, by simple mathematical reduction of firms with commercial activity, show that all the sampling biases can be reduced to overrepresentation of firms with commercial activity.

Table 1. the sample structure on domain of activity

	Number in the sample	Percentage in the sample	Percentage in Bihor County	Ponderated percentage
commerce	392	64,9	43,9	47,8

services	99	16,4	25,2	24,1
constructions	32	5,3	7,1	7,8
another domain	30	5,0		7,3
light industry	22	3,6	6,9	5,4
transport	16	2,6	8,3	3,9
heavy industry	6	1,0	3,5	1,5
agriculture	5	0,8	2,7	1,2
agro-industrial	2	0,3	2,4	0,5
Total	604	100	100	

Structure of human resources in private business from Bihor County

The structure of labor market and local economy can not be judged only on the basis of frequency of organizations declaring a certain type of activity, knowing that the firms from industrial domain are generally larger than the ones in commerce. Large firms, with more employees, even if are less in number, occupy important segments of labor force. Our data show that, indeed, the majority of firms in the heavy industry have over 30 employees, while those in commerce have less than 10.

Table 2. Firms from Bihor County on domain of activity and number employees

	less than 10 employees	between 10-49 employees	between 50-249 employees	over 250 employees
agriculture	60,0	20,0	20,0	,0
constructions	40,6	40,6	18,8	,0
heavy industry	,0	16,7	83,3	,0
light industry	13,6	27,3	45,5	13,6
transport	33,3	26,7	26,7	13,3
commerce	74,0	20,8	3,4	1,8
services	64,3	25,5	6,1	4,1
agro-industry	50,0	50,0	,0	,0
other	55,2	31,0	6,9	6,9

The interesting results are those regarding the profile of human resources of private enterprises from Bihor County. One can note that, depending on the weight of the four levels of education considered (see figure 1), we can identify certain particularities. Thus, firms from light industry have over 50% of the employees non-qualified, while those in heavy industry have a significant percentage of higher educated personnel, and those from agro-industrial sector employ an important number of professional school graduates.

Figure 1. The profile of human resources of Bihor firms

People who graduated high-school and vocational schools are the ones that participate the most at different training courses. This situation can be explained by several aspects: they are the best represented category (at least high-school graduates); accreditations obtained do not guarantee the vocational training required; they are employed for long term, the investment in human capital being thus profitable.

The prognosis of need of higher educated personnel

The majority of firm representatives consider that they will increase the number of employees in the future years, which prove also some amount of optimism regarding the local business sector. The most needed are the high school graduates, followed by those graduating vocational schools and those from higher educational programs. From this last group, the economists and engineers will be most wanted.

Figure 2. Prognoses regarding the number of personnel

Table 3. Highly educated specialists needed by the firms from Bihor County

	N
Engineers	205
Law counselors	27
Economists	274
Doctors	7
Computer specialists	38
sociologists, social workers	10
Psychologists	2
Public officers	56
other	41

Our data prove the fact that, at least on behalf of the private sector, the need of university degrees will be still very high, even increasing. Given the needs from the public sector and from the non-governmental sector we record a strong demand. University of Oradea has to be prepared to answer this demand.

Regarding the recruitment tools and mechanisms, personal connections are still the most efficient technique for identification and acquisition of a working place – generally valid situation (see Granovetter. 1995). In order to maximize the orientation chances on the labor market, students have to be put in contact with the economic sector since their student hood (through practical training in the field, volunteering and the forms of social participation, internships).

The evaluation of University of Oradea graduates

From the firms in our sample, 266 have as employees' graduates from University of Oradea. The mean number of them is of 6.7. The majority (86%) consider the professional training of these employees as good or very good. It is worrisome though that at the question where they had to identify the weak competencies of their employees which graduated University of Oradea they list technical and field related competencies.

Figure 3. Which are the competencies that your employees who graduated University of Oradea lack? (%)

This critical judgment regarding the competencies and abilities regarding their field impose a re-evaluation of the contents of educational programs in the direction of their harmonization with the technical and applied needs of contemporary professions.

Limits

Our research has a few limits that can not be ignored. Thus the validity of our conclusions is affected by the lack of comparative data – regional or longitudinal. Consequently, in the presentation of our data we can not talk about trends or about the situation of human resources from our County in an area of regional comparisons. On the other hand, the lack of data from public sector and those regarding NGOs make the image we have on the labor market and possible tends to be only partial.

Conclusions

Regarding the evolution of labor market and their effects on planning of the educational offer from University of Oradea can be focused on at least three aspects:

- the optimism of business sector which forecast a higher demand of labor force,
- the demand in higher qualified labor force will be still very important, with an advantage for engineers and economists (on behalf of private sector),

- there is a concrete need for evaluation and reorganization of educational programs on behalf of University of Oradea.

THE CONFIGURATION OF THE ROMANIAN CONCEPTS ENTREPRENEUR AND MANAGER IN FRONT OF THE EUROPEANIZATION

Holban (Oncioiu) Ionica

Alexandru Ioan Cuza University Iasi and ASE Bucharest, Constanta, str. Brizei, nr. 5A, bl. FB7A, ap. 1, Tel. 0744 – 322911, Email nelly@cta.ro

Summary

In the context of the new type of economy, as a result of the European integration and of the striking necessity to increase the adjustment's capacity of the Romanian enterprises to the exigencies of the social-economical environment, one of the problems which must be solved is, without doubt, the transition from the model of the good manager, executor of the received tasks from the superior hierarchical levels and directed especially to the administration of the current problems- widely, product of the totalitarian system- to the model of the dynamic and prospective manager, with capacity to observe and to anticipate the changes, to plan the actions which must be undertaken to realize them or to come across them, but also to stimulate and to activate the others members of the organization with power of decision..

Key words: entrepreneur, manager, european integration.

Taking into consideration the behavior in the existent business practices on the unique European market, the entrepreneur is different in many aspects from the manager. We can say that all the entrepreneurs are managers, meaning that they should control their own business, but not all the managers are also entrepreneurs. This happens because the big companies became very structured, with strict rules, necessary to control some entities of such dimension. The little companies have not these problems.

A business of success represents the transformation of the work, of the imagination, of the risk and of the entrepreneur's capital in profit. Firstly, the businesses are formed in our imagination and then, these are transposed in the real world, which is more complex, and presupposes the projection of all the factors in order to realize the business's profitableness.

If a manager is responsible only for an aspect related to a specific function, the entrepreneur is responsible for the entire business.

The entrepreneur differs from the manager also from the point of view of the behavior in all the activity's spheres of the business. He has the exploitation tendency of the existent opportunities in his business' environment, without being constrained by the resources availability.

To be entrepreneur supposes a distinct prevision sense, a certain attitude regarding the carried up activity and also the unique responsibilities.

As far as the *strategic orientation* is concerned, it is a business dimension which tackles the factors which leads to the company's strategy elaboration. This orientation is determined by the opportunity's fructification manner, and it should be assumed by the Romanian managers.

The entrepreneur has the exploitation tendency of the existent opportunities in his business' environment, without being constrained by the resources' availability.

Even he recognizes the necessity of opportunities' fructification; firstly, the manager focuses on the utilization manner of the available resources and those he can control.

This dimension points out one of the main characteristic of the entrepreneur- the creativity, innovator spirit.

Consequently, the Romanian manager will be efficient when he has a strategic vision regarding the phenomena and the processes which develop inside and outside the company and he is preoccupied by its future, manifests a great receptivity in front of the new and interest for the authentic, professional and moral values, he has the realistic evaluation capacity of the situation in which the company is, but he has also the capacity to stimulate the employees' confidence and their attachment for the company.

In other words, the manager is efficient when he proves a strategic vocation and an enterprising spirit, based on initiative, competitiveness and risk's accepting, but also on information, intuition and talent.

To be a good strategist, a company manager has to stimulate himself to develop his talents and to improve his abilities in the following directions:

- the thought's originality, expressed by the capacity to interpret the external world's evolution;
- sensibility, to realize the collaborators, consummators' expectations;
- the capacity of selection, respectively to memorize the most important events, the "key" opportunities and the main dangers;
- the capacity to adapt to change, respectively to think in a constructive manner, using the transformation and anticipating the situations' modification that can supervene;
- concentration and perseverance to achieve a purpose, improving the vision on a long period.

Certainly, the reunion of all these qualities depends on the personality and the characteristics of the manager, but firstly on his professionalism level, on his availability to acquire new knowledge and managerial abilities, to develop a strategic thinking, all these representing demands and exigencies very important to which the managers has to answer to assure a realistic perspective orientation of the companies and an efficient administration of their activity.

I also consider that in situations of incertitude and rapid mutations of the business environment from Romania, is impossible to surprise everything (technological breaches, the new competitors' entrances, the clients' pressures, state' interventions etc.) through formal analysis techniques, and the strategic "rationality" is not sufficient. To this is attached the difficulty to come on the unique European market.

It has to be duplicated, so it has been shown by the experience of the countries members of the EU, by the managers' intuition and creativeness, by their imagination and vision regarding the evolution of a phenomenon or of another and of the company that they administrate.

These qualities represent the binder that maintains the organization cohesion, helps it to formulate itself and to implement coherent strategies, to increase its flexibility and to adept successfully to change.

Another element that differentiates the entrepreneur by the manager is the opportunity's fructification, its exploitation degree.

The entrepreneur wants to profit rapidly of the appeared opportunity, on a short period of time, in a manner almost revolutionary. For this, it is considered that the entrepreneurs may assume exaggerate risks.

The manager engages himself in opportunities, on a long period of time, in a rhythm slower, progressive, but which can seem stationary.

The resources engagement distinguishes the two subjects of the economical activity. The entrepreneur engages himself in a multi-stage process of using the resources, with a reduced implication degree to each stage. They try to maximize the produced value, through the minimization of the resources volume implied, certainly, with the price to assume a bigger risk. The managers focus on the uni-stage utilization of the resources, with a great implication degree and only after a detailed evaluation.

Another factor which produces differences between the entrepreneurs and managers makes reference to the resources' control. The entrepreneur is the adept of the habitudes, talent and others' ideas use. He tries to use these resources in a proper manner.

In exchange, the manager wants to own the property and the resources' control or to employ the personnel necessary to realize the tasks. Firstly, he is interested in the efficient utilization of the resources that he possesses. With respect to the management structure, between the Romanian entrepreneurs and managers and those from EU, exist important differences.

The entrepreneur wants to know directly each domain of the business. The fact that he rents the necessary resources and he doesn't use the own employees, determines the development of an informal management structure.

On the other hand, the manager considers the management relations more formal, defining the specific rights and obligations assigned by the tasks' delegation.

This arises directly from the use of the resources and of the own employees. Some authors tried to make the distinction between entrepreneurs and managers, suggesting that it is impossible that a good entrepreneur to be also a good manager.

The entrepreneur is seen as an egocentric person, and, consequently, inefficient to manage. Nevertheless, although the managerial tasks are very different from those entrepreneurial, the managerial talent is essential.

The reward system is a new factor through which the entrepreneur differs from the manager. The entrepreneur focuses especially on the value creation and realization. Those who invested money in the business' setting up, they will want to recuperate them as quick as possible. As a result of the conception based on the value creation, the entrepreneurial companies tend to substantiate on performances the reward system- there, where the performance is closely connected to the value. The manager focuses less on the value maximization and distribution.

He takes into consideration, when he takes decisions, especially the protection of his position and the job's security. Firstly, the reward system is based on the individual responsibilities and on the performances referring to the objectives' realization, regarding the short-time profits. The rewards have the mission to stimulate the increase of the responsibility levels.

With the XX century, the entrepreneur became a synonym or at least associated with the free enterprise and capitalism. He is recognized as being an agent of the changing. The entrepreneur is a creative person, with innovator ideas of business, which contribute to the enterprise's increase and profitability.

The entrepreneurs are also those who are not necessary inventors or innovators, but persons who initiate a business, taking risks that normally, others don't take the liberty, with the object to realize the profit.

Some authors affirmed that the entrepreneurs are some adventurers, taking into the consideration the fact that they assume some risks that others wouldn't. For this reason, the risk is an important element in the entrepreneurial process.

Nevertheless, I think that the existent perception is wrong, because the majority of the entrepreneurs prepares and plans their actions. So, the entrepreneur doesn't search deliberately the risk and doesn't assume it inefficiently, but he doesn't have restraints when it is about risks that can be avoided. According to the economist Peter Drucker, the persons who need certitude, is less probable to be good entrepreneurs.

In all the entrepreneurial activities the decisions must to be taken for a purpose, and the essence of any decision is the incertitude. Conformable to the mentioned author, I consider that the incertitude, the doubt, the lack of persuasion lead to managerial failures and block the way towards excellence.

The incertitude and the doubt are the greatest enemies of the failures. The lack of persuasion presupposes the lack of a motivation, powerfully anchored in the belief to succeed in the prompt realization, at time and qualitative of the activities, objectives, and the appliance of new methodologies in the products' realization.

The Romanian entrepreneur can not manifest the necessary will to assure himself the success, only having the firm conviction that he will be successful in what he enterprises, always advances in the direction of his beliefs. He will realize only what he thinks he is capable to do.

There exists an extraordinary power in the conviction that you can realize what you proposed. Who has the bigger self confidence is released by the incertitude of his situation, even if this is insecure and it eliminates any incertitude for the future.

In other words, who is protected by his belief releases many of his fears and cares which can defeat those who don't have a sufficient belief in what they could realize. He can use freely his qualities, using them completely, at their entire value. Nobody can use entirely his qualities, when he lets him being surrounded by the troubles, incertitude, fear or hesitation.

Relating to the situation of the Romanian entrepreneurs, at the present, especially in the context of the European integration, I consider that they should learn that in a Market economy there is not only profit, but profit and loss, there is not only gain, but risk and gain, you should have a company's strategy, and to be entrepreneur supposes art, economical knowledge, intuition and style adequately to the circumstances of the ambient environment of the business. Therefore, the Romanian entrepreneur should have knowledge from each activity domain to built a successful activity, but in my opinion, for a business to be successful it should begin with the identification of the combination mode of the production's factors available: to identify the goods and services request and offer, to introduce the business on the respective market in function of the economical arguments, to calculate the breakeven, the managerial productiveness of the production's factors.

The decision to put in application a business in a Romanian economy anchored to the European integration's requests has to be taken with the entire comprehension of the implied risks and to find the solutions how to remove them. This thing relates the Romanian entrepreneur's intuition and flair.

In conclusion, the enterprise contains also a part of management. But the enterprise and the management aren't synonyms.

The enterprise presupposes a specific management, with its own concepts, purposes and methods.

The enterprise is based on the risk's administration, and not on its minimization, on the orientation towards opportunities, and not towards resources, on action, and not on the analysis, on an informal structure, flexible of management, and not on a formal one.

These characteristics derive from the specific features of the entrepreneur.

“SUPPLY CHAIN MANAGEMENT OR ADAPTIVE BUSINESS NETWORK? – COORDINATION VERSUS COLLABORATION”

Ilieş Liviu

Babeş Bolyai University, Faculty of Economics and Business Administration, 58-60 Teodor Mihali Street, Cluj-Napoca, Romania, liviu.ilies@econ.ubbcluj.ro, 0264-41.86.52/3/4/5

Abstract: You are not the only company capable to create value for your clients. For making valuable products, for performing high standard services, one company is no longer enough in this new informational era, in this new needs era. Better business performing means now to satisfy more complex needs quicker than ever. Could one company face this challenge alone? Is there another way?

Collaboration may be the answer. Maybe the most well-known term when it comes to collaboration between companies is Supply Chain.

Why Supply Chain, why Supply Chain Management (SCM)?

This article presents the answers to these questions, but also presents different approaches regarding SCM: the logistics approach regarding supply chain management, the strategic approach, the new entrepreneurial approach, supply chain as a win-win game. New paradigms regarding collaboration appeared regarding business collaboration: Adaptive Business Network (ABN). Do these new concepts imply the dead of SCM? Or are they only a new wave in SCM terminology and business orientation?

Our conclusion is that these new approach is a normal change in business: businesses are made by people and people don't like to be conducted (managed). The old-fashioned SCM was based on a coordinator versus several obedients relation. It is absolutely normal to dream at freedom and to be not very efficient while you have to play after somebody else rules. ABN is in the other side of human relations and also business relations – it insists on partnering. Everybody is a part of a chain which has as its main goal customer satisfaction, has the right to make proposals, to negotiate, and to be a winner.

Of course, ABN appearance does not involve SCM disappearance, but change in how some chains are managed, in how some chains function. We shall see for the future if an organization with several brains is more successful.

Keywords: Supply Chain Management, Adaptive Business Network, Collaboration

Introduction

The goal of this article is to bring these new concepts into the light, making a short comparison with SCM.

The first part of this paper contains details regarding SCM, SCM well-known paradigms, SCM less known paradigms.

The second part is a presentation for a new business concept: Adaptive Business Network (ABN), making connections with the old paradigm, SCM.

Supply Chain Management

Supply Chain Management definitions and paradigms

The Council of Supply Chain Management Professionals (CSCMP) is the most well-known organization regarding Supply Chain Management. CSCMP was originally founded as the National Council of Physical Distribution Management (NCPDM) in January 1963. In 1985, recognizing the growing field of logistics, the association's focus broadened as it changed its name to the Council of

Logistics Management (CLM). It stayed that way until 2004 when CLM's Executive Committee voted to become CSCMP, effective in 2005⁴⁸.

CSCMP's definition for Supply Chain Management is the next one: Supply chain management encompasses the planning and management of all activities involved in sourcing and procurement, conversion, and all logistics management activities. Importantly, it also includes coordination and collaboration with channel partners, which can be suppliers, intermediaries, third party service providers, and customers. In essence, supply chain management integrates supply and demand management within and across companies.

Bowersox, Closs and Cooper's definition: Supply chain (sometimes called the value chain or demand chain) management consists of firms collaborating to leverage strategic positioning and to improve operating efficiency. For each firm involved, the supply chain relationship reflects strategic choice. A supply chain strategy is a channel arrangement based on acknowledged dependency and relationship management. Supply chain operations require managerial processes that span across functional areas within individual firms and link trading partners and customers across organizational boundaries [**Bowersox, Closs and Cooper: 2002: 5**].

Frazzelle defines the Supply Chain as the network of facilities (warehouses, factories, terminals, ports, stores, and homes), vehicles (trucks, trains, planes, and ocean vessels), and *logistics information systems* (LIS) connected by an enterprise's supplier's suppliers and its customer's customers. Logistics is what happens in the supply chain. Logistics activities (customer response, inventory management, supply, transportation, and warehousing) connect and activate the objects in the supply chain. To borrow a sports analogy, logistics is the game played in the supply chain arena – Frazzelle says [Frazzelle: 2002: 8].

The GSCF (Global Supply Chain Forum) defines supply chain management as "the integration of key business processes from end user through original suppliers that provides products, services, and information that add value for customers and other stakeholders"⁴⁹. There are now here presented four different definitions. CSCMP considers Supply Chain Management as the management of procurement, conversion and logistics activities (planning), but also the coordination of the channel partners. Bowersox and his colleagues underline the relational character of the channel partners. Frazzelle comes and says that logistics is the game played in a supply chain arena. The final definition spreads out the area of the Supply Chain Management and identifies the subject of the Supply Chain Management as all the key business processes which add value for the stakeholders (including here the customers too). Now that we have met the paradox, there is a chance to make some improvements. But this paradox exists already for several years. We can say that these are not paradoxes, but paradigms.

⁴⁸ Their history from www.cscmp.org, page accessed at 15.05.2007.

⁴⁹ Considering their site: <http://www.fisher.osu.edu/centers/scm/research-publications/scm>, accessed at 15.05.2007.

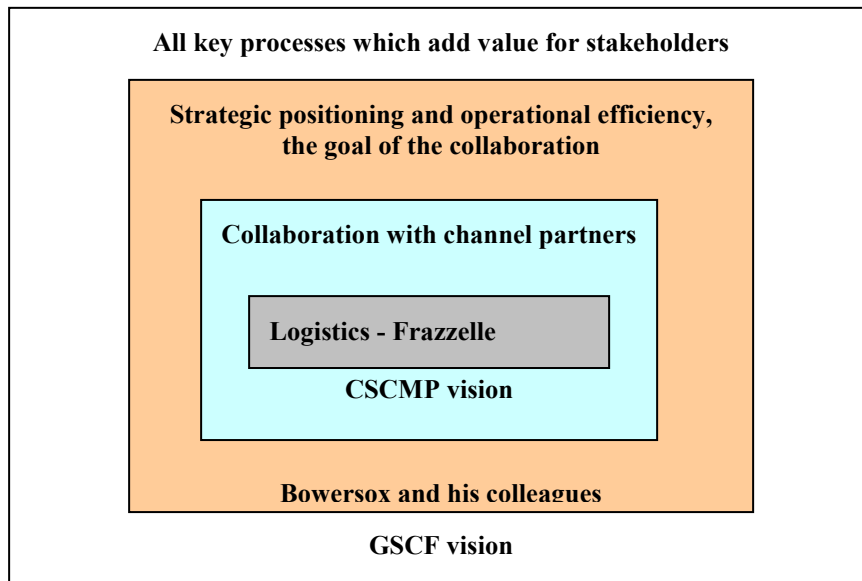

Figure 1: Four paradigms regarding Supply Chain Management

We cannot say that there are bad or good paradigms, but the lenses that you use to see the world will tell you the problems, the solutions for these problems. But a paradigm is as lenses are. Frazzelle tries to solve logistics problems saying that these are Supply Chain Management problems, CSCMP will focus also on collaboration problems, Bowersox will solve also strategic problems related to the Supply Chain, while GSCF will try to improve the performance of the Supply Chain processes, comprising logistics, collaboration, strategies, but thinking at all stakeholders affected by these processes.

Describing the history of the Supply Chain Management, Delfmann and Albers [Delfmann&Albers: 2001] identified several paradigms for this notion, but also identified the main goals and objectives of the Supply Chain Management.

They identify four Supply Chain Management paradigms, some of them similar to the previous paradigms remembered before in this this paper:

1. **The functional chain awareness school** (Houlihan's definition from 1988): "Supply Chain Management covers the flow of goods from supplier through manufacturer and distributor to the end user";
2. **The linkage / logistics school** (Turner's definition: "SCM is a technique that looks at all the links in the chain from raw material suppliers through various level of manufacturing to warehousing and distribution to the final customer.");
3. **The information school** (Johannsson's definition: "SCM requires all participant of the supply chain to be properly informed. With SCM, the linkage and information flows between various members of the supply chain are critical to overall performance";
4. **The integration / process school** (Lambert's definition): "The integration of business processes across the supply chain is what we are calling SCM".

While the first paradigm makes the link with the Porter value chain, the second focuses on logistics activities inside supply chain, the third focuses on information transfer between channel participants, while integration is the subject of the fourth paradigm.

Why supply chains? Why Supply Chain Management?

Oliver and Weber [Delfmann & Albers : 2001 : 11, Woxenius: 1998: 58] introduced the idea of Supply-Chain-Management. They motivate this evolution [Delfmann & Albers : 2001 :8, accordingly to Oliver, K., Webber, M., *Supply-chain management: logistics catches up with strategy in: Logistics. The strategic issues*, Christopher, Martin, Chapman&Hall, Londra, 1992, pag. 63-75]: "What were hitherto considered

„mere’ logistics problems have now emerged as much more significant issues of strategic management... We needed a new perspective and, following from it, a new approach: Supply Chain Management.”

Considering this motivation, we can say that Supply Chain Management can never be considered as the management of the logistics of the supply chain. The new paradigm which occurred after logistics integration has a strategic feature with no doubt. Of course, the opinions may vary, as we saw for example Frazzelle considers only logistics to be the game played in the supply chain.

Why Supply Chain Management?

We can say that we see things thinking at the benefits one thing could bring to us. Because there is a chance to improve logistics performance more than this was made through logistics integration at firms level, because there is a chance to improve the chain participants’ performances through information sharing more than it was possible at firms level or just because collaboration at processes level means possible better performance for each company.

Delfmann and Albers also identify the main advantage that Supply Chain Management could bring to a chain, to a value chain, if we take into account the Porter’s paradigm.

Bowersox and his colleagues focuses on the logistical main advantage of a supply chain approach [**Bowersox, Closs and Cooper: 2002: 5**]. They say that the six-sigma errors level is present for actual businesses. Perfect timing at the perfect location, the right in good state product for the right quantity is no longer an impossible logistics dream. It is no longer a dream, it is the usual customer expectation, and it is a standard, even with lower costs. This is what they call the “supply chain revolution”.

1.3. New Supply Chain Management paradigms

1.3.1. SCM as an innovation

A very interesting paradigm regarding SCM is to see it as an innovation. Saad and his collaborators [**Saad, Jones&James: 2002: 173-183**] realize a very interesting analysis of the evolution of SCM through construction firms.

SCM can be seen as an example of “evolutionary and cumulative innovation, which is often described as emanating from internal programmes aimed at improving overall effectiveness”. The focus is now not only limited to increasing the internal efficiency of organizations but has been broadened to include methods of reducing waste and adding value across the entire supply chain. “It is seen as a set of practices aimed at managing and coordinating the whole supply chain from raw material suppliers to end customers and which develop greater synergy through collaboration along the whole supply chain”.

1.3.2. SCM as a win-win relation

With no doubt the game theory is a well-known tool related also to economy and it has proved it’s applicability during time. This SCM paradigm could be interpreted as a more „hard” view regarding business relations.

Jorn-Henrik Thun debates the potential of cooperative game theory for SCM, giving a mathematical approach to SCM results. The game theory can be used to evaluate each firm’s performance and each process’ results inside a supply chain.

This approach was build-up thinking at the SCOR model (Supply Chain Operations Reference Model) developed by Supply-Chain Council – SCC. The model is a way to see supply-chains, rather than an optimization tool [Stadler and Kigler: 2005: 41].

We will present here only the general processes:

Figure 2: General processes identified using SCOR [Stadler and Kilger: 2005: 42, Poirier and Walker: 2005: 14, Bolstorff and Rosenbaum: 2003: 5].

Plan covers processes to balance resource capacities with demand requirements and the communication of plans across the supply chain. **Source** covers the identification and selection of suppliers, measurement of supplier performance as well as scheduling of their deliveries, receiving of products and processes to authorize payments. In the scope of **make** are processes that transform material, intermediates and products into their next state, meeting planned and current demand. **Deliver** covers processes like order reception, reservation of inventories, generating quotations, consolidation of orders, load building and generation of shipping documents and invoicing. In the scope of **return** are processes for returning defective or excess supply chain products.

2. Adaptive Business Network (ABN)

Business strategy has reached a turning point in which two opposing forces must be reconciled. At one end of the spectrum is the need for stable, efficient processes in a company. At the opposite end is the need for instant adaptation to rapidly changing business conditions. Efficiency without adaptability means solving yesterday's business challenges at the lowest possible cost, and adaptability without efficiency allows for quick reactions, but inflates cost structure.

The concept of the adaptive business network developed over several years as the effect of the Internet on the structure of the manufacturing industry came into focus. The concept, which offers chances for change at logistical activities level, marketing level, strategic management level, was first formally identified by Claus Heinrich in his book, *Adapt or Die: Transforming Your SupplyChain into an Adaptive Business Network* (John Wiley & Sons, Inc., 2003).

Heinrich's definition for ABN is the next one: an adaptive business network is an integrated, flexible network of companies focused on a customer need that responds in real time to changes in the state of the network. The adaptive business network involves a three-phase process that is executed repeatedly at all levels of every business including planning and execution, which are the foundations of efficiency; sensing and responding, which enable adaptability; and learning. The Smart-and-Fresh model Heinrich [Heinrich: 2003: 33-45] presents to bring into our attention the ABN concept is an example which suggests that not only technology is the new trend, but the adaptive character.

There are practically two SCM models: a linear model and the ABN model.

Figure 3: SCM linear model

Figure 4: SCM ABN model

The main advantages that ABN brings are: communication efficiency, collaborative relationships between channel partners, instantaneous communication, and minimized bullwhip effect.

3. Conclusions

There are several ways to make business better. One alternative is collaboration and the most used term to denote collaboration relations between companies is Supply Chain Management. This new born business field has not yet finished its evolution.

In previous decades SCM was recognized as a coordinator game, a great company which builds up a chain which is going to satisfy clients.

That is no more sufficient. Companies want also independence as people do: collaborate but don't forget who you are! This is maybe the slogan which Adaptive Business Network incorporates.

THE LINK BETWEEN ORGANIZATIONAL CULTURE AND CORPORATE PERFORMANCE – AN OVERVIEW

Liviu Ilieș

Babeș Bolyai University, Faculty of Economics and Business Administration, 58-60 Teodor Mihali Street, Cluj-Napoca, Romania, liviu.ilies@econ.ubbcluj.ro, 0264-41.86.52/3/4/5

Corina Gavrea

The object of this paper is to examine organizational culture and organizational performance through an analysis of the existent culture models and the empirical studies conducted to examine the corporate culture and organizational performance link. Even though a wide literature has focused on this relationship, the link between these two variables remains unclear because of the mixing results of the empirical studies.

Key words: organizational culture, organizational performance, competitive advantage.

Introduction

The term *culture* refers to a relatively stable set of beliefs, values and behaviors commonly held by a society, being derived from social anthropology as a framework for understanding “primitive” societies (Kotter and Heskett, 1992). The term *organizational culture* was used for the first time in the academic literature by Pettigrew in 1979 in the journal “Administrative Science Quarterly”. Organizational culture was used to explain the economic successes of Japanese firms over American firms by motivating workers who were committed to a common set of core values, beliefs and assumptions (Denison, 1984). One of the most important reasons that explain the interest in organizational culture is the assumption that certain organizational cultures lead to an increase in organizational financial performance. According to Peters and Waterman (1982) successful organizations possess certain cultural traits of excellence. Ouchi (1981) showed a positive relationship between organizational culture and productivity.

Even though the literature on organizational culture and its relationship with corporate performance is rich and diverse, there are only a few empirical studies that actually examined the nature of this relationship. For this reason, this article will examine, based on existent empirical research, the link between culture and performance.

Conceptualizations of organizational culture

Lim (1995) suggested that the conceptualizations of organizational culture exist along a continuum which has two extremes: the process oriented and the classification approaches.

The process/qualitative approaches to organizational culture

This approach is usually represented by Schein’s model (1990) who describes organizational culture as a pattern of basic assumptions invented, discovered, or developed by a given group as it learns to cope with its problems of external adaptation and internal integration, and that has worked well enough to be considered valid, and therefore, is to be taught to new members as the correct way to perceive, think and feel in relation to those problems. In Schein’s opinion, culture has three levels:

- behaviors and artifacts, which is the most clear level of culture consisting of the physical and social environment of an organization;
- values, which is less visible than the previous level of culture, being composed of those elements that provide the underlying meanings by which the patterns of behaviors may be deciphered;
- basic assumptions, which represent an unconscious level of culture being the most difficult to relearn and change.

According to Sackman (1991), the qualitative approaches may have limitations in testing hypotheses and building theory because of the large number of case studies that have to be completed in order to draw some general principles from such approaches. Because qualitative approaches are time and money consuming, the classification approaches were proved to be more useful in the study of organizational culture.

The classification/quantitative approaches to organizational culture

According to the classification approach, organizational cultures correspond to a range of ideal types that can be reflected by two or more variables. One of the best known studies based on this approach belongs to Hofstede (1980) who used data gathered from IBM employees from over 40 countries. The author identified four dimensions of organizational culture: power distance, uncertainty avoidance, individualism/collectivism and masculinity/femininity. Later, Hofstede (1998:238) defined organizational culture as a concept that has the following features:

- “holistic (describing a whole which is more than the sum of its parts);
- historically determined (reflecting the history of the organization);
- related to the things anthropologists study (like rituals and symbols);
- socially constructed (created and preserved by the group of people who together form the organization);
- soft, and;
- difficult to change”.

Compared to the qualitative approach, the quantitative approach generates a number of quantitative methods that can be used to measure the corporate culture. There were many questionnaires developed based on the classification approach that have the advantage compared to the qualitative approach of covering large samples at lower cost. (Sackman, 1991)

Organizational culture: assumptions

From the literature on organizational culture we can identify a number of assumptions about organizational culture. We will present and discuss four of the most important assumptions found in literature:

1. The first assumption refers to the process of organizational culture change, more specifically even though culture may be resistant to change, they are to some extent flexible and manageable (Scott et al., 2003). According to Ogbonna and Harris (2002) who analyzed the existent literature on culture change, the process of organizational culture change can be influenced and a number of contemporary organizational culture researchers are adopting this perspective.
2. The second assumption relates business performance with distinct cultures of organizations.
3. The third assumption refers to the possibility of identifying particular cultural attributes that facilitate or inhibit good performance, thus helping managers in designing appropriate strategies for cultural change.
4. The fourth assumption states that the benefits resulted from change will outweigh any negative or undesirable consequences. (Scott et al., 2003).

Organizational culture and sustained competitive advantage

As mentioned previously, the interest in organizational culture can be explained by the assumption that certain organizational cultures lead to an increase in corporate financial performance. This assumption is founded on the perceived role of culture in generating competitive advantage (Scholz, 1987). According to Krefting and Frost (1985) organizational culture may create competitive advantage if the boundaries of the organization are designed in a manner which facilitates individual interactions and if the scope of information processes is limited to appropriate levels. Theorists also argue that the values that are widely shared and strongly held enable managers to predict employee reactions to certain strategic options and in this way minimizing the scope for undesired consequences (Ogbonna and Harris, 2000)

In 1986, Barney specified three conditions that have to be met in order for a company's culture to achieve sustained competitive advantage. First, the culture has to be valuable, which means that it must allow the company to behave in a manner that will lead to higher profits, lower costs and other results that improve the financial performance of the firm. Second, the culture has to be rare, which means that it must have distinctive characteristics that differentiate the firm from the cultures of a large number of other firms from the same industry. Third, a culture must be imperfectly imitable, which means that even if potential imitators can understand valuable and rare organizational cultures, it still may not be possible to imitate those cultures.

The impact of organizational culture on corporate performance

The literature on organizational culture is rich and diverse. Much of its richness is founded on the claim that culture is linked to organizational performance. Even though there are some theorists that questioned the culture-performance link, sufficient evidence exists to suggest that organizational culture is associated with organizational performance. (Ogbonna and Harris, 2000)

One of the earliest quantitative studies on the culture-performance link was conducted by Denison (1984) who used data from 34 American firms over a five year period. The author examined characteristics of organizational culture in these firms and tracked their performance over time. To measure performance the author used data on returns on investment and sales. For organizational performance responses on a one time survey regarding the perceptions of work organization and participation in decision making were gathered. Although, the author found that organizational culture is correlated with financial performance, some of his measurement indicators differ in the strength of the relationship between culture and performance. Decision making and work design were associated with long term financial performance while supervisory leadership was associated with short term financial performance. Even though it has encouraging results, this study is not without limitations. The most important criticisms refer to the use of employee perceptions which suggest that the study had obtained a measure of organizational climate rather than a measure of organizational culture (Lim, 1995).

Rousseau (1990) tried in his study to overcome some of the limitations in measuring organizational culture. He gathered data from 32 voluntary service organizations using as a performance measure the amount of money raised from a recently completed fund-raising campaign and the Organizational Culture Inventory promoted by Cooke and Lafferty (1983) to measure organizational culture. The results of this study showed no significant positive correlations between performance and culture.

One of the most extensive studies on the culture-performance link was conducted by Kotter and Heskett (1992). They used data gathered from 207 firms over a five year period. In this study they used various measures of culture and long term economic performance data. Their initial objective was to examine the relationship between *strong* cultures and long term performance. Even though they found only a minor correlation between strong culture and long term performance, subsequent investigations showed that firms with cultures suited to their market environment have better performance than those that are less fitted to their environment.

Marcoulides and Heck (1993) analyzed the relationship between organizational culture and performance using data collected from 26 organizations. The authors proposed a model in which organizational culture was measured using several latent variables (organizational structure, organizational values, task organization, climate, and individual values and beliefs) and organizational performance was measured using capital, market and financial indicators. The results of this study showed that all of the latent variables used to measure organizational culture had some effect on performance with workers attitudes and task organization activities being the most significant variables.

More recently, Ogbonna and Harris analyzed the relationship between organizational culture and performance by including the leadership style as a third variable in the model. They used a sample of 1000 units from the Financial Analysis Made easy database of registered British companies. To measure performance they used variables such as: customer satisfaction, sales growth, market share, competitive advantage and sales volume. For organizational culture they used measures such as: competitive culture, innovative culture, bureaucratic culture and community culture. The results showed that all four measures of organizational culture were associated in some way with corporate performance. More specifically, innovative and competitive cultures had a direct effect on performance and accounted for approximately 25 percent of the variance in organizational performance. Both competitive and innovative cultures were

externally oriented in line with the assumption that organizational culture must be adaptable to external environment for a sustained competitive advantage. The bureaucratic and community cultures, which were internally oriented, were not directly related to performance.

This study was extended in 2002 when the authors analyzed the link between market orientation, organizational culture, strategic human resource management and organizational performance. The authors used the same measures as in the previous study for organizational culture and performance. As in the previous study, competitive and innovative cultures were found to have a significant effect on performance while community and bureaucratic cultures were not related to performance.

Concluding remarks

In this paper we examined and reviewed some of the research concentrated on the link between organizational culture and corporate performance. Even though we presented a wide variety of studies, the results are mixed or inconclusive.

First of all it is assumed that organizational culture is directly related to performance but the study conducted by Ogbinna and Harris (2000, 2002) shows the opposite: the only variable that had a purely direct effect on performance was innovative culture while the competitive culture had both a direct and indirect effect. Moreover measures of bureaucratic and community culture had a purely indirect effect on performance. Also, except for a few studies (Marcoulides and Heck, 1993; Ogbinna and Harris 2000, 2002), all the other studies that examined the culture-performance link failed to discuss the influence of other variables such as organizational structure or leadership. For this reason the future investigations of this relationship have to take into consideration and remove the effect of other factors (Scott et al., 2003).

***Abstract.** Immaterial value of contemporary organizations is on continuing growing, but these, approach in a new manner the aspects about their performances and timelines of development, they are intensifying the investments into the human capital, the organizational capital, respective into relational structure of the company. On the same time, the instruments of the financial reporting and traditional management are not able to quantize the investment's efficiency into the intellectual capital of company. This essay, had not it base a vast study about the measure methods of the intangible's contributions at the company's value, show a calculation model of contribution of human capital at grow of knowledge value based company's.*

***Key-words:** knowledge management, human capital, intangible assets*

Started by 90's, an increasing number of the research institutes and companies especially from North Europe began to put seriously the problem about measure, estimate and expressing of the investment's efficiency on intangible assets. These efforts went to suggest many theories about these on the last years and were creating measure methods witch tend on time to apply like some report standards. This was happened when the important of intangibles assets for the company's success was significant grow, and the traditional economical and managerial concepts were not adequately. To recent economical and managerial studies based on the elaborated of some instruments witch to facilitate a better understanding and representation of intangibles.

The principal part about the measuring system is that is not possible to measure intangibles with a scientifically precision. Without the proper instruments must to use the traditional methods based on financial reports, indexes, which to cause the appearance of these intangibles assets.

The principal questions witch looking for answer on the measurement of intangibles assets had like to end to discover the prices (costs) or timeliness for the value creating, and these are hiding into the traditional account How much is the employ's substitution ? What is the value of learning lessons when the interaction of company's employees with costumers happens? What is the post timelines of the value creating when improper management systems of the knowledge exist?

The models used now by the companies were precede some testings on the identification intangibles direction like on '60s and '70s HRA model (Human Resource Accounting) by Flamholtz, the model named "value added statement" (the declaration about added value) elaborated and used of some companies from Great Britain in '70s, These models have not got an impact about companies activity and on time they disappeared. For the new provocations, the scientist of this phenomenon give an important attention to the concept of the intellectual capital (IC) and the adopting of instruments for the classification and identification of the new determinants of value. So, were many different methodologies of expression and measure of the intellectual capital like „Value Platform” by Dow Chemical, „Intangible Assets Monitor” from Celemi, „Value Scheme” from Skandia etc. These models support that idea – the components of the Intellectual Capital can be assemble in three groups: human capital, organizational capital and the capital generated by the relations with customers, the end will be that to maximize the company's value operated about those three elements.

The essay show the partials results of a vast study about the models of calculation witch can be use to determine the investment's efficiency on the intangible actives so, those results about of investment on the human capital. The models are the representations of systems which can be study without the systems can

be touch physical, social and economical. The well-known models are linear programming, dynamic programming, stochastic programming, models of queue phenomenon, Markov chain. The modelations especially the analytical modelation, making about the simplification of reality, is the event's renditions. The managerial reports on the models are too risky. So, when the models are applying for some managerial decisions, is necessary that the models to be validate artificial, before their application. However, it is necessary to estimate the risk. The ability of making models are an increasing number thanks to the development of the operational investigations which put to the managers' disposition all kind of models like a prefab form and a technique of calculation more performant for testing the models' validity and solve.

By all these progresses, the managerial activity is on the high intensity thanks to the complications which progressing on time: the natural resources are reducing; the population of the Earth is a growth and the pretentious are an increasing an all life's categories. Therefore, the management registering the trend of decrease of the direct experiments on the systems and must to strengthen the creating and using methodology of models like an appreciation means of new strategies designed to control the consequences of real uncertainties.

For the model of calculations we started by the identification and expressions of exist which the model will follow to estimate them. About the descriptions of measuring methods of intangibles resulted from the international experiences, the most conclusive expressions of a company's value (wrote in calculations by Y expressions like that:

- the differences between the of the capitalizations market value, at the stock-exchange, and the nominal value of shares from book;
- the ratios between the intangibles assets generated by the intellectual capital and wages cost;
- the difference between discounted cash-flow achieved at the end of the year and that projected at the begin of the year.

This model was elaborate for a company at the stock exchange and chose, like an expressions form of management's value of the company, the differences between capitalizations market value of company and equity value. Company's value, so the Y objective functions, depend on the variables wrote by x. These variables were choosing after Intangible Assets Monitor (IAM) by Sveiby in 1997, and there are three classes of intangible assets:

- the ability of the company's employees (OPF);
- the relations with market and customer (RPC);
- the structure and functions of organizations (SFO).

This systematize is convenient because it as not infringe to classical systematize of the managerial process on functions of the company, which the three classes are into these relations:

- Research & Development - SFO, CPF;
- Productions - SFO;
- Commercial - RPC;
- Human resources - CPF;
- Accounting & Financial - RPC, CPF.

After Sveiby's Monitor, each of three classes where are systematize the intangible assets, have four type of index which expressing the generated of the value for the company and than:

- indexes of grow;
- indexes of turnover and renewal;
- indexes of efficiency;
- indexes of stability.

These are the principal aspects that the stock exchange brokers when they estimated the share's quotations. So, into a simple expression of the Y functions by x variables, must to exist an index for each category of indexes belong to the four categories and this each class of intangibles, which are into those three categories (CPF, RPC and SFO). All, we talk about the 12 x variables. Limited the number of x

independent variables at 12 indexes, has a simplifications character, but it is not compulsory. Can be adopt anytime variables of 32 which are on IAM. Can be replace some indexes on the list by others or can be add others, which are into IAM.

After these results, the Y objective functions expressing causal connections of x variables. It is true, into Y are the effects of many causes like quality effects of the sell produces, effects of the employee's educations standard, effects of the employee's average age, effects of personnel age in company, effects of specialist proportions, effects of employee's turnover. Therefore, the Y objective functions must to organize information about the factors that generated the value about the management strategies. The terms of these functions proper of n variables, are responsible of the Y result, can be specify about the strategically correlations. Must be correlated much than two variables, will be talking about multiple correlations, with linear functions. On the descriptions of indexes which will be into the x crown of independent variables, resulted than these indexes expressing the achievement strategies of same managerial objectives into the purposed limits, means that more suitable model to assure the optimize of management's components with intangibles assets is the model of linear programming (LP). This will be constituted of Y objective functions like that:

$$Y = \theta_0 + \sum_j \theta_j X_j \quad (j = \overline{1, n})$$

(1)

it must be maximize:

$$\max(Y - \theta_0) = \sum_j \theta_j X_j \quad (j = \overline{1, n}) \quad (2)$$

into a restrictions system:

$$\min X_j \leq X_j \leq \max X_j, \quad (j = \overline{1, n}) \quad (3)$$

and nonnegative restrictions:

$$X_j \geq 0 \quad (4)$$

Into these relations, θ_0 is the slope, θ_j is coefficient of dependence variables and X_j is level of strategically indexes.

Like indexes, which are into the company's human capital, were choose and calculating the next:

- **Rookie ratio:** $RR_t = (N_2 / N) \times 100$, into: N_2 – employee's $t < 2$ year; N – total employees;
- **Employee's age in firm:** $\bar{T} = (\sum N_T \times T) / \sum N_T$, into: N_T – employee's age $t > 2$; $\sum N_T$ – total employee's;
- **Turnover ratio:** $g_t = (N_v - N_p) \times 100 / N_T$, into: N_v – employee's entry in year t, N_p – employee's live in year t, N_T – total employee's year t;
- **Stability ratio year t:** $g_{st} = (100 - g_t)$
- **Professionals experiences of specialist in year t:**
 $NEP_t = (\sum N_{Tt} \times T_t) / \sum N_T$, into: N_{Tt} – specialist with t year in firm in t year; $\sum_T N_T$ – total specialist in firm in t year;
- **Specialist with superior education:** $SGSt = S3 \times 100 / (S1 + S2 + S3)$, into: $S1$ – primarily education employees; $S2$ – secondary education employees; $S3$ – tertiary education employees;
- **Ratio of employees who frequent concluding programs:** $PP_t = N_{pp} / \bar{N}$, into: N_{pp} – employees who frequent concluding programs in year t; \bar{N} – average employees;

- **Added value per employees:** $VAA_t = (P_t - C_m) / \bar{N}$, into: P_t – value of production in year t , C_m – material cost I year t , \bar{N} – average employees in year t .
- **Satisfaction degree of employees:** $GS_t = \sum n_i x_i / \sum n_i \leq 5$, in care: i – satisfaction degree, $i = 1, 2, 3, 4, 5$ (5 higher satisfaction degree); n_i – number of employees which declare a degree of satisfaction i ;
- **Turnover of specialist:** $RSP_t = N_p \times 100 / N_a$, into: N_p – experts leave in year t ; N_a – experts come in year t ;

The restriction:

$$5\% \leq RSP_t \leq 20\% \text{ and at firsts IT, } 5\% \leq RSP_t \leq 10\%$$

- **Average age:** $VA_t = \sum n_v \times V / \sum n_v$, in care: n_v – number of employees age v ; V – age in year.

The number of indexes can be alternate at a company to another. If they had calculation many indexes, the correlations degree will be higher, and the model that have them, will be closer of the reality. A great number of indexes as independent variables complicated the model.

The system of restrictions will have a size directly proportional by the number of variables. To work with a big model is not advisable because: 1) it cannot afford a middling analysis; 2) it cannot be manipulated easily. Therefore, in this case we are interesting about the modelation technology and the restrictions system can have 8 – 10 independent variables with 2 – 3 variables for each variables class (external, internal, competence) and each valences category (grow, renewal, efficiency, stability). For the model's simplifications, were choose nine indexes by 2 – 3 classes (external, internal, competence) and each category of valences (grow, renewal, efficiency, stability). Were elaborating the combinations of these indexes and was determining investment effect into these, about the company value.

Combinations of indexes into are the indexes that have an importance for our problem are:

- I. The growth of incomes (%)
 - Incomes/Administrative personnel (%)
 - Professional experience average (years)
- II. The costumer's index of satisfaction (note)
 - R&D expenses in incomes (%)
 - Professional experiences average (years)
- III. The costumer's index of satisfaction (note)
 - Returns on administrative personnel (%)
 - Professional experiences average (years)

On these conditions, the model must to have a system of three restrictions which to define the positions of variables into the 3 levels of existences (external structure, organization, people). For to observe the possibilities and needs of the company's three manifestation level, is necessary that into the model PL (1) – (2) to introduce on the restrictions (3) other restrictions about the resources and market, restrictions like that:

$$\sum_j A_{rj} x_j \leq B_r, \quad \left[\begin{array}{c} j = \overline{1, n} \\ j = \overline{1, R} \end{array} \right] \quad (5)$$

Into A_{rj} are the R set restrictions coefficients about the specific consumptions of r resource per unit of measure where are expressing x_j indexes, and B_r are free terms of the restrictions, represented the available resources.

After the calculations, the influence of these indexes, combinations about the evolution of company's value look like that:

Nr. combination	I	II	III
Y prevision (mil.)	403.572,12	256.093,16	447.329,26
Y optimized (mil.)	1.948.256,25	1.943.158,18	486.356,54
ΔY	1.544.684,13	1.687.065,02	39.027,27
X_1	15%	4	4
X_2	2.713,20	4%	10%
X_3	30	30	30
Corrective factor	37.666,93	35.994,82	35.706,16
ΔY_{\min}	1.507.017,20	1.651.120,20	3.321,11
ΔY_{\max}	1.582.351,06	1.723.009,84	74.733,44
ϵ_{\min}	10,81	219,87	0,47
ϵ_{\max}	11,35	229,44	10,67
Allocate resource (mil.)	139.410	7.509,52	7.005
Efficiency	13,98	258,76	69,43

After the result, the only variable which it growth go to growth of the company's value is **Professional experiences**. The growth of other variables value influenced negative the company's value and the growth of investment in research & development or into the costumer's indexes of satisfaction because they are big consumers of financial resources. The result of „shadow-prices, after solved dual problem of LP, they go to conclusion that must be reduce the investments which bring about customers satisfactions into research & development, because the customer's unsatisfaction for a long time give company a negative image and produced a diminution of company's value on time. Renunciation at investments can go to decline of company's competitive position on market and that can be a diminution of company's value for a long time.

LP gives the moment solutions and it doesn't observed the dynamics of phenomena for a long time, when the observations number (like a years numbers take on calculations) is too small.

The conclusion is that kept to a minimum level of investments on the consumer variables of resources with a minimum investment on the growth of employees ability is the best solutions for the company.

DISTINCTIVE ASPECTS OF THE SERVICES STRATEGY

Isac Florin Lucian

Universitatea Aurel Vlaicu din Arad, Facultatea de Științe Economice, Bd.Revoluției nr.77 0040-257-283010 e-mail:rectorat@uav.ro

Abstract ; Services have certain peculiarities (immateriality, unstorable, heterogeneity) which distinguish them from the material goods. Due to these peculiarities, the strategies adopted by the service firms have distinctive features, mainly with the aim of creating a competitive advantage.

Key words: strategy, services, competitive advantage.

Strategy implies the way in which the organization actions in order to fulfill its aim. It represents a set of rules which develops the aims which are triggered by this aim.

Etiologically, the word strategy comes from Greek, where **stratos** means army and **agos-I** lead⁵⁰. In Larousse dictionary, the term strategy appears as:

- the art of coordinating the action of military, political and moral forces implied in leading a war or in preparing the defense of a nation. Strategy is the competence of the government and of the high commandment of the military forces;
- the art of coordinating actions and of managing them in order to fulfill an aim; election and political strategy.

The strategy of services provides the conceptual framework which enables the managers to identify the opportunities in order to offer values to their clients⁵¹ and to offer that certain value in profit or in the limits of a budget. The role of operational managers in services is (from this point of view) to help creating and delivering this value through the contribution to the thinking of the strategy and through the developing of the operations, resources, people and processes, all with the aim of assuring the future success of the organization.

For the implementation of the strategy of services, the organization has to appeal to a multitude of abilities, starting with a visionary thinking at the higher levels of leadership, continuing with the interpretation of the policy strategy at the management level and ending with the implication of the service process at the level of the first line of the employees. Researches in the domain of developing strategies reveal that the strategies have a rather evolutionist character than a revolution one⁵². Quinn sustains that in spite of the fact that in formulating the strategy are included refined analyze techniques, the real strategy develops as a combination of inner decisions with outer events which form a shared agreement as regarding the strategy to be followed. Taking into consideration the actual requirements of the economy of services, we appreciate that the contact staff in the service firms play a decisive part in development of strategy. Most of the time, they have information, in advance, about the clients' preference, about the way in which the clients' tastes change. This stuff have the difficult task to "live" the strategy.

Just like the other business, those in the area of services have to develop strategies in order to prevent the occurrence of "fragmented"⁵³ activities and decisions. In marketing terms, a strategy is often seen through

⁵⁰ Ioan Petrișor-Managementul strategic al organizațiilor. Politica generală a firmei, Ed. Marineasa, Timșoara, 2001, p.46.

⁵³ C.H.Lovelock- Product Plus, McGraw Hill, New York, 1994; P.M.Senge- The Fifth Discipline, Century Business, London, 1993

the politics of the organization used in order to obtain an advantage upon its competitors⁵⁴. Some firms may not want to obtain this advantage, seeing their own part as one of maintaining their own position in the market. Other organizations operate in non competitive situations and want to make sure they are able to adapt to permanently changing conditions. Therefore, ***the strategy of services is defined as the totality of plans and politics through which a service organization aims at fulfilling its goals.***

A strategy plan will render profitable different aspect of the organization and will assure there is a mutual support between them and that they are directed by the points indicated by the leading forces of change. There are five critical elements in a strategy: creating the aims of the company, understanding the environment, developing a suitable concept about services, identifying the proper aims for measuring performance, developing a suitable operation⁵⁵.

- ***Corporation aims:*** they provide the necessary aims and the goals of the strategy. If we consider strategy as a set of plans or politics designed to fulfill certain aims, there must be a declaration of these aims too. These aims offer, partially, the necessary motivation of change, and they establish the dimension and the speed of change as well. Such a declaration is an important step in making the change public, and the employees will know what the expectations of the firm will be in what regards themselves.
- ***The environment:*** each service organization operates in a certain context and that context has to be understood in order to assess not only the opportunities which can be exploited, but also the probable answers of the other organizations and the clients' reactions to change.
- ***The concept of service:*** it identifies the chosen nature of the business – the imagined service that the organization wants to create. The concept of service helps the organization to focus upon ***the value*** it can offer to the client.
- ***Performance aims:*** they offer the means through which a strategy is changed into an operational language, establishing the priorities for these operations. Together with the concept of service, they specify the tasks for the implied operations.
- ***The operations:*** the operations (the people, the structures, the systems of measuring performance, the supplying chains) – have to be developed in order to implement the strategy.

Strategy is an iterative process. The key components, the aims, the context, the concept of service, the performance criteria, the operations have to be ordered for the delivery of the services and the fulfilling of the strategic objectives. This requires a constant checking of all the elements that participate in the fulfilling of the aims. More than that, the organizations have to answer the two major forces which govern their way of functioning: the inner and outer contexts. Therefore, strategies require a continuous assessing even when some corrections are needed to be done.

Strategies can be intentioned, formal and planned; in turn, they can be developed from an intentioned strategy which was not fulfilled or can be generated by a formal planning process⁵⁶. The planning of an intentioned strategy is heading towards a “top down” approach starting with the declaration of the aims of the firm or with assessing of the context and the market opportunities. The emerging strategies tend to be “bottom-up”, starting with an idea about a certain service concept or about new operational capabilities. Both approaches can be used in the service organization⁵⁷.

The Competitive Services and Advantages

Many organizations, both in the field of production, and in the sphere of services, admit they can obtain sustainable and significant profit, through the improvement of services they provide. Services, as well as their performance, can become true competitive “weapons”.

⁵⁷ R.A.Burgelman, A.S. Grove-, „Strategic dissonance”, California Management Review, iarna 1996, p.8-28.

For the manufacturing organizations or for those product oriented, services can be important means of differentiating, especially in the case when they operate in the markets where there is a slight difference of the product or where the development of the product is slow, difficult and expensive. The nature of available services and the way in which the services are performed, can offer the ways towards competitive success.

The companies service oriented admit they often need to perform high levels service for their clients. The ever growing competition, the decreasing amount of sales and the increasing amount of importance the clients give to services represent a pressure for the service organizations and they imply an rethinking and improving of the level of offered services. The effect of quality service is very important for the increasing loyalty of the clients and the gaining of new clients and of the financial position of the organization, as well. In the organizations that compete through costs, services have a key part in assuring deliveries on time and low operational costs.

Certain service organizations compete with the results of the delivery activity, others with experience, others are able to compete with both dimensions. There is a great number of positions which the service organization can adopt when they compare themselves with the competition. This analysis can be applied for the non profit organizations or for those in the public domain, as well, because they are engaged in a certain competition form for the resources. The five positions that have been identified are:

- **failure** : the results of the organization are under the specifications of the industry and the service to the client is of an unsatisfactory quality. The traditional services which failed in capturing the tendencies of the market are in this position.
- **self-content**: in these organizations the result of the services is excellent, but the way in which the clients are dealt with is unsatisfactory. Sometimes the professional services enter this category, being considered by the clients as being full of arrogance. Medical services enter the same category.
- **maintaining the client for a short time**: the loyalty of the customer can be developed by good services. If the total result of the service goes under the established standard , the users will tolerate this situation only for a short period of time. If the experience with the service is excellent , the emotional costs of changing the users' preference are high so, they might even give up that service.
- **average**: is the position of many “business to consumer” have. In many of these traditional domains in the sphere of services there is often a number of competitors that lead their business in the same way. A good example is the domain of financial users in Britain, with many players, but few possibilities to differentiate their offer.
- **“of world class”**: are the organizations universally recognized as being the best in what they do.

Many organizations will discover that they can position their wide variety of services in different points. Some of them will be of the “world class”, others will fail. The most important fact is to make a clear cut distinction among them because they demand different strategies.

In order to understand how services can be used to create a competitive advantage it is necessary to understand what the consumer considers as being important . In this way we can speak of a “**perceived user value, PUV**”⁵⁸. This represents the criteria that the client appreciates as important and will have in mind when assessing an organization and its services. PUV For a chain of supermarkets may include the range of goods, the stock availability, the store location.

1.2. The understanding of the competitive context of services

Generally speaking, the service firms compete in a difficult economic context. There are several reasons for this difficulty:

- **Rather low entrance barriers**: the innovations in the sphere of services are not licensed , and more often , services are not intensive in the capital. Under these circumstances , innovations

⁵⁸ C.Bowman- Strategy in Practice, Prentice Hall, Harlow, 1998.

are easily copied by the competitors. Nevertheless, there are other types of entrance barriers, as for example, the location of a resort hotel on the most attractive beach on an island(e.g. the location of Club Med on the Moorea island in The French Polynesia).

- ***The smallest opportunities for the scale economies:*** We have to remember that ,because of the simultaneity production- consumption in the sphere of services, either the client has to go to the place of their performance or the performer of services has to go to the client's place. The necessity of these shifting delimitate the market area, determining low deliveries. The services firms ,working in the franchisee can make some savings by dividing the publicity and the acquisition costs; in other cases electronic communication can replaces the physical shifting.
- ***Irregular fluctuations of sales:*** the service demand varies according to the moment of the day (sometimes seasonal), with issues at random.
- ***No advantage from the point of view of dimension in the relations with the buyers or suppliers:*** the reduced dimension of many service firms creates a disadvantage in the negotiations with the important suppliers and purchasers.
- ***The substitution of products:*** the innovations in products can substitute services (e.g. the pregnancy test which can be done even at home). The service firms do not have to passively watch what the competitive firms do, on the contrary, they have to anticipate the possible innovation of products which ay render services out of fashion.
- ***Clients' loyalty:*** stable firms that use personalized services create a loyal base of clients which becomes an entrance barrier for the new services.
- ***Output barriers:*** small service firms can go on operating in spite of their low profits. For example, a private firm can establish as main aim, hiring the members of the family in spite of maximizing the profit. Other service firms, such as the antiquity shops or the scuba diving shops have a romantic attraction or a hobby interest which offer the owners enough satisfaction for their work to compensate the low financial results.

If we analyze any other private domain in the sphere of services, we notice that there are firms which have surmounted these competitive difficulties and have prospered. For example, McDonald's has won a dominant position in the fast food industry by overcoming most of the preceding difficulties. The new comers on the market have to develop a strategy of services that should appeal to the important competitive features of that industry. There are three generic strategies which have proved to be of success in offering competitive advantage.

Competitive Service Strategies

The well known American strategy specialist Michael Porter⁵⁹ states that there are three generic competitive strategies: general cost leadership, differentiation and concentration.

General cost leadership

A similar strategy needs efficient scale facilities, firm costs, control from the upper levels, and often, innovative technologies. Having a low cost position provides a certain protection against competition because most of the efficient competitors will be the first to suffer the pressure of competition. The implementation of the low cost strategy needs major capital investments in equipment, an aggressive policy of prices and initial losses determined by building the market share. A leadership strategy based upon costs may sometimes change an industry, fact proved by the success of firms like McDonald's, Wal-Mart or Federal Express. More than that, service firms may obtain low costs using a variety of methods:

- ***Looking for low cost clients:*** it costs less to serve certain clients than others, and the first will be privileged in the politics of the service providers. For example, United Services Automobile Association (USAA) occupies a dominant position among the car insurers because they have as clients only military staff and their families. This group implies low

⁵⁹ Michael E. Porter- „Generic Competitive Strategies”, in Competitive Strategies, New York, Free Press,1980.

costs because its members are characterized by nomadic behavior, are willing to do business on the phone, email or online and are used in operating like this.

- **Service standardization:** routine professional services at a low cost are expected (e.g. the preparation of the personal tax)
- **Diminishing the elements connected with the staff involved in the service delivery:** it's a high risk strategy, that may be accepted by the consumer only if his comfort is increased.
- **Diminishing the network costs:** the service firms that need network in order unite the suppliers and the consumers. Electricity utilities that have important fix costs on the transmission lines provide the best example.
- **Cutting out the operations in services:** many services, such as passenger transportation or the barber shops are by their nature online because they can be performed only in the presence of the client. In services in which the client doesn't need to be present, the service transaction can be cut out. For example, American Airlines has one of the 800 centers of booking tickets located in the Caribbean. So, we can say that the cut services function on the rules of a factory, economy being made by strengthening, low cost locations and the absence of the client in the system.

Differentiation

The essence of the differentiation strategy is based on the creation of a service seen as being unique. It can appear in different forms: brand image, technology, features, services for the client, the network of dealers. A differentiation strategy does not ignore costs, its main aim being to create the clients loyalty. Differentiation with the aim of improving the service is obtained at a cost that the target consumer is willing to pay. Some approaches of differentiation are:

- **Making the intangible tangible:** by their nature, services are intangible and do not leave the consumer any memory about the purchase. Admitting the need of reminding the clients of their holiday, many hotels offer complementary toilet articles with the name of the hotel written on them.
- **A certain personalization offered to the standard services:** service firms provide certain personalized impulses which can generate a low cost relation between the firm and its clients. For example, an employee of a hotel that is capable of addressing the client by name can get a favorable impression that might determine the client to come back to the same hotel. Beauty parlors have added many personalized features (personal stylist, atmosphere music, relaxing environment) in order to distinguish themselves from the classic ones.
- **Diminishing the perceived risk:** the lack of information regarding the purchase of the service, generates a feeling of taking risks for many clients. The lack of knowledge or trust in services will determine the search for certain suppliers that will have the necessary time to explain the work in that domain.
- **Increased attention to the qualification of the staff:** the investments in developing and instructing the staff that determines a increase of the quality services represent a competitive advantage, hard to be imitated. The leading firms in their industry are recognized to be, among their competitors for the quality of their training programs. In certain cases, these firms have initiated training centers that have college statute (McDonald's Hamburger University of Oak Brook, Illinois, close to Chicago).
- **Quality control:** providing a consistent level of quality in services in many locations and using a harmless working system is an important challenge. The firms have dealt with this problem in different ways including the training of the staff, explicit procedures, technology, direct supervision, the colleagues' pressure.

Concentration

The concentration strategy is built round the idea of serving very well a certain target market by approaching to consumers' specific needs. The market share may be a certain group of customers (e.g. USAA and the military community), a service or a geographic region. The concentration strategy is based

on the premises that the firm can supply a narrow market share more efficiently and more proficiently than any other firms that try to supply a much larger market. Therefore, that firm obtains competitive advantage on its share of market by satisfying the specific needs of the consumer and by applying lower costs due to the specialization.

METHODS OF ASSESSING THE QUALITY IN SERVICES

Isac Florin Lucian

Universitatea Aurel Vlaicu din Arad, Facultatea de Științe Economice, Bd.Revoluției nr.77 0040-257-283010 e-mail:rectorat@uav.ro

Abstract: The present study presents the main methods which may help the manager of the service firm to investigate the level of the services which the firm performs. The utility of these methods should be taken into consideration even by the Romanian firms, especially because this branch of economy is in full development.

Key words: management, quality, services.

1.1. The GAP model used in expressing the quality of services

The objectives of the management of services are not considered as being fulfilled only by fulfilling the clients' expectation as regarding the services performed by the firm. The increasing of the quality in services is not only a main aim in the management of services, but it also represents the strategic premises for the development of the firm. The scientific research has developed several models for the assessment of the quality in services. The GAP model elaborated by Parasuraman (1985) has enjoyed special appreciation.

The Gap model represents a general framework for appreciating the quality of the services from the point of view of the clients and of the firm as well. It was developed with the help of the interviews with focus groups of customers and discussions between the experts and the service of errors in banking, credit cards, insurance, brokers, and goods repairing. Therefore, there appeared differences (GAP) between the clients' perception of the quality of the services and intention of the firm. As a result the following discrepancies have been established:

GAP1-the discrepancy between the clients' real expectations and the clients' expectations perceived by the management of the firm;

GAP2-the discrepancy between the clients' expectations perceived by the firm and their representation in the quality specifications of services;

GAP3-the discrepancy between the quality specifications of services and the performed services;

GAP4-the discrepancy between the quality of the performed services and the firm's communication concerning the performed services;

GAP5-the discrepancy between the clients' expectations regarding the services and their perception of the services performed.

The GAP model is based upon the duality in the domain of the performer of services and the client.

GAP1 reveals the deficiency that the firms have incorrect representations of the importance of the quality characteristics in its appreciation by the clients. The possible causes of this deficiency are connected with the little attention paid to the market studies or the complete lack of such studies. The discrepancy may also be generated by an unsatisfactory communication between the staff that comes in direct contact with the clients and the management ("from bottom upwards" communication) or by a great number of hierarchy levels.

Example:

The analysis of the clients' expectations from a hotel specialized in organizing congresses concerning the brackets of the organized seminars revealed the following results: the management of the hotel started from the premises that the participants to the seminary expect firstly a coffee break, secondly fruit and cakes break, thirdly a nice display on the table, and fourthly, flowery displays. The clients' survey revealed different expectations and a different order. The participants to the seminary expected first of all a coffee break, then another coffee break, thirdly, proper toilets, and fourthly, the possibility of using the phone.

GAP2 expresses the discrepancy in applying the clients' expectations in concrete quality specifications (for example, in standards for services). This deficiency is more often determined by the following factors:

- - the hesitating attitude of the management regarding the improvement of the quality in services;
- - unclear aims as regarding the quality of services;
- - the incorrect usage of the instruments and techniques for the standardization of the performed services.

Example: following the example for GAP1, GAP2 appears if the employees of the same hotel gets the order to set on the tables fruit and cakes instead of coffee, for the breaks, not taking into consideration the participants' preference for the second coffee (the quality standard expressed as type and succession of services wasn't obeyed).

GAP3 reflects the situation in which the stuff that comes into contact with the clients doesn't perform the services at the level expected by the management of the firm. Among the factors that determine such a situation we can mention:

- unsatisfactory qualified stuff;
- unsuitable criteria for verification and control for fulfilling the tasks;
- deficiencies in group-working;
- The conflict of roles, or the misunderstanding of the roles by the stuff implied in services.

Example: The rent car firm AVIS established as compulsory standard the answer within an hour to any requests of renting from any client. If an employee, with specific attributions, answered in a few days to a request, we could speak about a discrepancy between the quality specification and the performed service.

GAP4 appears when the client's perception upon the quality of the service is influenced in such a way (by exaggerated promises in the advertisements or by the omission of information) that there appears a discrepancy between the service performed and the service promised. The causes are generated either by an unsuitable horizontal communication (for example between the marketing and the distribution divisions) or by the firm's tendency to unfairly advertise the quality of its services.

Example: We can speak about GAP4 when bank promises, through the communication means, the consideration of the clients' needs, while at the level of the consulting services offered these needs are not wholly taken into account.

GAP5 reflects the major deficiency of the model, being greatly determined by the other four deficiencies. According to Parasuraman (1985, p46.) the difference between the expected services and the ones performed, can be reduced by mineralizing the other four categories of discrepancies, obtaining thus, the key for a good service. The client requesting the services makes a certain perception concerning the quality of the services offered by the firm, perception which is conditioned by each situation. This perception may correspond identically with his expectations or it may be above or under his expectations. The last two situations are very important when discussing the quality of services.

Example: Excessive offers in the restaurant of a hotel, daily fresh fruit in the hotel room, a delivery one week in advance, the long queuing at the cash desks, an unfriendly representative of the firm.

The number of discrepancies (GAP) represents the steps which have to be taken in the design of a new process of services (market exploration, design, conformation, communication, client's satisfaction). As a result of the GAP study, there have been identified the ten dimensions of the quality which are used by the clients.

1.2. The SERVQUAL Model- basis of the quality services measurement

The ten dimensions of the quality of services identified by Parasuraman (1985) in the GAP model could be concentrated, due to some analyses processes, into five dimensions of the quality. On the basis of these results, the so called concept SERVQUAL appeared and it now represents an important part in the process of measuring the quality of services in many firms. The five dimensions of the SERVQUAL concept are:⁶⁰

- the acceptability of tangible („tangibles”);

⁶⁰ M.Bruhn-Orientarea spre client: temelia afacerii de success,Ed. Economica, Bucuresti,2001,p82-83.

- trust , sincerity(“reliability”);
- competence, certitude(“assurance”);
- empathy(“empathy”);

These dimensions have been measured on a double scale with 22 items as can be seen below:

INSTRUCTIONS: This survey investigates your opinion concerning the service_____. Please show the measure in which you consider that the firm which offers the services _____ has the characteristics depicted in each of the statements. If you firmly agree that the firm should have that certain feature, circle 7. If you want to show your disagreement with that feature, circle 1. If your feelings are not very strong, circle a number from the middle of the scale. There is not a right or a wrong answer, we want you to circle a number which best reflects your own expectations as regarding the offer of the firm.

Services_____:

E1: The firm should have modern equipment.

E2: The physical facilities should be visually attractive.

E3: The employees should wear neat clothes.

E4: The aspiration of the physical conditions should be in accordance with the type of offered service.

E5: When these firms promise to perform something in an established period of time, do they have to keep their promises?

E6: When the clients have a problem, the firms should be understanding and reassuring.

E7: These firms should be reliable.

E8: They should perform their services within the promised time.

E9: They have to accurately keep their documents.

E10: We shouldn't expect the firms to communicate the clients the exact moment of performing the service.

E11: Clients should not expect prompt services from the employees.

E12: The employees should not always be ready to help the clients.

E13: It is not a problem if the employees are too busy to answer immediately to the requests of the customer.

E14: The clients should be able to trust the employees.

E15: The clients should feel safe during their transaction with the employees of the firm.

E16: The employees should be polite.

E17: The employees should be well assisted by their firm in order to do their duty well.

E18: We shouldn't expect the firm to pay special attention to each client.

E19: We shouldn't expect the firm employees to pay special attention to each client.

E20: It is unrealistic to expect the employees to know the clients' needs.

E21: It is unrealistic to expect the firm to be preoccupied by the most important interests of the client.

E22: We shouldn't expect the firm to have a convenient schedule for the clients.

INSTRUCTIONS

The next set of statements is connected with your feelings towards XYZ. For each of the next statements show the measure in which you believe that XYZ has the characteristic described in the statement. Circle number 7 if you strongly agree that XYZ has the characteristic, and circle number 1 if you strongly disagree. You can circle any number from the middle of the scale in order to show the intensity of your feelings. There are no correct or wrong answers, we want you to circle the number which best reflects your perception of the XYZ.

P1: XYZ benefits by modern equipment.

P2: The physical facilities of XYZ are visually attractive.

P3: The employees wear neat clothes.

- P4: The physical facilities are in accordance with the type of service offered.
- P5: When XYZ promises a service in a certain period of time, it should keep its promises.
- P6: When the clients meet a problem, XYZ is understanding and reassuring.
- P7: XYZ is reliable.
- P8: XYZ should perform its services within the promised time limit.
- P9: XYZ should keep its documents accurately.
- P10: XYZ shouldn't communicate the clients the exact time of performing the service.
- P11: It is not realistic for the clients to demand prompt services from the employees of the XYZ.
- P12: The employees of the XYZ shouldn't always be ready to help the clients.
- P13: The employees of the XYZ are too busy to answer immediately to the requests of the clients.
- P14: You may trust the employees of the XYZ.
- P15: You feel safe during your transactions with the XYZ.
- P16: The employees of XYZ are polite.
- P17: The employees have the right support from the XYZ in order to do their task well.
- P18: XYZ does not pay you any individual attention.
- P19: The employees of XYZ do not pay you any individual attention.
- P20: It is not realistic to expect the employees to know the clients' needs.
- P21: It is not realistic to expect these firms to be concerned with the most important interests of the clients.

Source: J.Fitzsimmons, M.Fitzsimmons, *op.cit.* 2005,p.132-133.

The double scale used in the SERVQUAL model is used, in the first part, to emphasize the ideal situations (the desired profile), and in the second part, to emphasize the real situations (the real profile). Both scales are based on seven steps of appreciation, from 1 – total disagreement to 7- total agreement. From the difference between the desired situation and the real situation, for each item, there is a value between -6 and +6, the quality of the service increasing with the resulted value. The middle separates the high quality services from the low quality ones.

In spite of the empiric foundation and of the adequate method of measuring the service quality, this is criticized for the validity of its measurement of the quality in services. The double scale demands the clients' capacity of assessment. It was also noticed an exaggeration of the values in the domain of the desirable.

The GAP model and the SREVQUAL method offered the premises which were taken by the management in order to improve the quality of services and the orientation towards the clients of the service providing firms. These refer mainly to the management of the staff, inner and outer communication, the applying of the market studies, redesigning of the organizational structures, using informatics and controlling systems.

Example:

In order to obtain the optimization of the quality of services in the branches of the detail commerce firm MIGROS in Switzerland, in 1995 a working group was made for the Welcome project with the responsibility of elaborating a tool for the quality in services. The group whose components were people with leadership responsibilities in MIGROS, clients and consultants in the problems of the firms assumed the task of offering all the branches MIGROS help in the improvement of the daily activity services. The result of the project was the suggestion of a broad concept of the services which was applied after 1996. A model of the firm from the point of view of the services was the starting point of the concept. The MIGROS model was presented to all the sale points and to the employees, and they generated certain effective measures in the domain of services.

1.3. The“Walk-through”audit

The delivery of a service has to be done in accordance with the expectations of the clients from the beginning to the end of the experiment. Because the client is a participant in the process, his impressions

the quality of services are influenced by several observations. An environmental audit can be a proactive management instrument for the systematic assessment of the clients' image regarding the performed services. A 'walk-through' audit (WtA) is a study based upon the client in order to discover the areas which need improvement.

Fitzsimmons and Maurer⁶¹ developed such an audit for the restaurants. It consisted of 42 questions which investigated the experience of serving dinner in the restaurant. The investigation starts from the parking area, entering into the restaurant and following the way in which the client is welcomed, the way in which he is waiting for a free table, the way in which he sits at the table, orders and receives drinks and food, and eventually receives the bill and pays it. The questions included two categories of variable terms:

- maintenance items;
- "person to person" services;
- waiting;
- placement of the table and of the seats;
- atmosphere;
- the display of food;
- the display of the bill;
- suggestive promotion and sales;
- tips;

In this way, the whole experience of the client is followed from the beginning to the end. WtA is usually based on the details of the process of service delivery in an effort of discovering the items upon which we can action for an improvement.

The first step in designing such an audit is the preparation of the graphs which include the interactions which the consumer has with the system. The following example refers to the way in which parts of the WtA are used by the Art and Drawing Museum in Helsinki. The questionnaire was divided into five major sections connected with the process of the delivery of services (tickets, information, experience, facilities, and satisfaction). Within each section there are several statements regarding the observation that a client would make. The statements should be formulated rather as declarative sentences than questions. In order to catch the clients perceptions, we used a Likert scale with five points (1= total disagreement...5= total agreement). As WtA illustrates, other questions have been included, being of great interest for the management (for example, "where have you heard about the event?" in order to mark the efficiency of advertising). It is also useful to let the last part for "comments" which can offer useful opinions of the consumers which haven't been anticipated by the questions already asked. In order to avoid excessive questioning, WtA has to be limited, as length, to two full pages.

WtA can be administrated in several ways (via email, phone interview or personal), but the most efficient method is the one administrated directly to the person immediately after the experience regarding a certain service. Rewarding the consumer with a gift certificate or a next free visit will increase significantly the degree of participation.

WtA is an opportunity of assessing an experience with a certain service from the clients' point of view. Tangibility in a service implies providing the consumer certain suggestions, verbal, environmental, sensorial, that can define the service for the client and that can encourage the repetition of the visit.

WtA can also be an instrument for the diagnosis in management with the aim of assessing the distance of perception between consumers and managers of the delivery services. The clients visit a certain place less frequently than the managers and, however, they are more sensitive to the subtle changes (old wall painting or old carpets) than the managers. The quality of the service for the client can be diminished and become more difficult to be understood both by the clients and by the managers.

In order to test this application of WtA, the same audit used at the Helsinki museum, which has been done for the clients, was also done for the managers and employees. There could be traced differences in the perception of services by the managers, clients and employees. Some of the differences are not surprising

⁶¹ J.A.Fitzsimmons, G.B.Maurer- Walk-Through Audit to Improve Restaurant Performance, Cornell HRA Quarterly, februarie 1991, p.95-99.

(as for example “There was enough information about the objects”, because the employees were familiar with the exhibits). Other differences suggest possible improvements, as follows: “It is very easy to get further information from the employees” or “The employees that help you behave in a friendly manner”. It is interesting to mention the points in which there are differences in perception from the point of view of the managers and the employees, as for example “The explanations concerning the objects were clear” or “There is the possibility of interacting with the exhibits”. In both cases, the employees agreed in a greater extent with the statements than the clients, the managers occupying the last position.

Abstract: The present paper dwells on the evolution of employment during the period 2006-2007 within the SME-s and on te perspectives of the year 2008 in order to measure the intentions of the employers regarding the increase or the diminution of the number of employees.

Key words: employment, entreprise, jobs.

In Romania, in 2007, compared to the year 2006, the SME-s increased their number of employees in average with 3,73 persons / company, fact that represents an average increase of the number of personnel/company with 16,58 % , thus demonstrating that the sector of small and medium enterprises contributes decisively to the creation of new workplaces.

More than 3 /4 of the companies (79,53%) hired less than 5 employees, 8,92 % of the enterprises employed between 6 - 10 persons, 6,30% of the enterprises hired between 11- 20 persons and only 5,25% of the SME-s hired over 20 persons (figure no. 1).

Figure no. 1: The Employment Situation within the SME-s

Should we take into consideration the SME-s in point of the duration of their performed activity, we will notice mainly that the companies activating on the market for about 10 - 15 years hold the most important average of new employees (5,04 %) and the enterprises with less than 5 years of existence recorded the most important percentage increase for newly hired persons (19,88%) (table no. 1).

Crt. no.	Indicator	The SME's duration of existence			
		under 5 years	5 – 10 years	10 – 15 years	Over 15 years
	The average number of newly hired persons	3,30	3,30	5,04	4,02
	The increase percentage of the average number of employees	19,88 %	15,70 %	16,10 %	10,32 %

Table no. 1: The evolution of employments and of the average number of employees according to the SME-s duration of existence

By grouping the companies on regions of development, we can notice that the SME-s located in the North-Western area hold the most important number of newly hired persons (9,67%), while the enterprises within the Central area record the most important percentage increase concerning the number of employees (22,41%). The companies located in the South-Western area register the smallest average number of new employees as well as the smallest personnel increase percentage (8,38%).

Crt. nr.	Indicator	The SME-s duration of existence							
		Nord East	South East	South	South West	West	North West	Center	Bucharest
1.	The average number of newly employed persons	6,96	2,61	2,35	1,21	5,38	9,67	1,78	4,34
2.	The increase percentage of the average number of employees	15,51%	18,02%	17,03%	8,38%	16,53%	21,30%	22,41%	16,47%

Tabel no. 2: The evolution of employments and of the average number of employees within the SME-s, according to the development areas

According to a study performed by ManPower Romania, regarding the manpower perspectives, it comes out that the employers within all the eight analyzed regions have positive employment intentions. The results of this study demonstrate the fact that the net employment provision for the second trimester of the year 2008 reaches a level of + 36%. Thus, 43% of the Romanian employers intend to augment their work force during the following trimester. On the other hand, only 7% of the employers expect a reduction of the employment activity. Concurrently, a segment of 49% of the employers do not anticipate any change. The employers from the North-western area are the most optimistic regarding the 2nd trimester of the year 2008 with a significant Net Employment Prevision⁶², of +42%. The employers within the North-eastern and West regions are the less optimistic, recording nevertheless an important Net Employment Provision of +21%.

⁶² The parameter „Net Employment Prevision" (PNA) can be obtained by means of the difference between the percentage of employers anticipating an increase of the total number of employments and the percentage of employers estimating an employments reduction within their location, during the following trimester.

Fig. no.2: Comparisons between development regions

According to the chart hereinabove (Fig. no. 2) the employers from the capital, center, North-west, South and South-east anticipate a considerable evolution during the 2nd semester of the year 2008 whilst the Net Employment Prevision of 21% is identical to the one reported by the employers from the western region and corresponds to one of the lamest previsions for the sectors of activity studied during this trimester.

The analysis of SME-s according to their fields of activity emphasizes the following important aspects:

- considering the average number of newly employed persons, the constructions and industrial companies detach considerably from the SME-s from the other fields, with averages of 7,59 and 5,16 new employees per company. These evolutions are determined by the particular development of the activities in the field of constructions and by the slight revival of the industrial sector;
- regarding the increase percentage of the average number of employees, the service companies occupy the first position (19,98%), and the tourism companies the last (14,57%).

Crt. no.	Indicator	SME-s on sectors of activity					
		Industry	Constructions	Trade	Tourism	Transports	Services
1.	The average number of newly employed personnel	5,16	7,59	2,30	4,43	3,40	2,78
2.	The increase percentage of the average number of employees	16,04%	17,92%	15,11%	14,57%	16,55%	19,98%

Table no. 3: The evolution of employments and of the average number of employees according to the SME-s activity field

The comparisons between the sectors of activity (Fig. no.3) for the year 2008 the 2nd semester indicate that the employers from the labor market have great expectations regarding the employment activity, positive previsions being reported on all the ten sectors of activity.

Fig. no. 3: Comparisons between sectors of activity

The companies with the strongest intentions of employment come from the industries where the deficit is the most acute. The constructions field leads by far this top, with a net employment prevision of 54% for the next three months, in the conditions in which the deficit within the sector is estimated by ARACO to approximately 80-100.000 persons at present. The same problem of personal recruiting also occurs, at present, in the retail (the employment prevision is of 41% for this sector), in the hotelier industry (46%) or in the extractive industry (49%). The employers from the financial-banking or consultancy field have also serious employment intentions (38%). The public institutions anticipate, as well, a positive dynamic of employments within the following trimester - approximately 20%.

In this context, the National Council of Small and Medium Sized Private Enterprises from Romania performed a research on a sample of 234 SME-s having as purpose to evaluate the existing deficit on the work force market. A first investigated aspect referred to the percentage of the SME-s confronted with a deficit of work force. The result emphasized the fact that most of the investigated companies (Fig. no. 4) – 70,94% - confront with such a deficit and, at present, the deficit is, on an average, of 17 persons/company, but it will increase by the year to come to 29 persons/company.

Fig. no. 4: The situation of the companies confronted with a work force deficit

The undertakers were questioned regarding the professions (jobs) indicating the highest deficit. Most of the companies indicated: skilled workers in the field of constructions, lathe operators, fitters, instalatori, carpenters, welders, electricians, motor vehicles dyers, mechanics, motor vehicle tinkers, millers, mechanic

fitters, skilled workers in agriculture, drivers, security agents, rodent control agents, salesmen, chemist operators, architects, electronic engineers, designing engineers, metallurgic engineers etc.

As a conclusion, the proposals solicited by the undertakers for the improvement of the situation on the Romanian work force market aimed at :

- the reduction of the fiscality applied on the work force;
- the support of the Arts and Trades Schools program;
- the elimination of social welfare for the skilled persons receiving a job through AJOFM, according to their qualification;
- the organization of vocational schools for craftsmen;
- the organization of regional workplaces grants ;
- the granting of facilities to the companies organizing trainings and qualification/requalification courses with their own funds;
- the stimulation of the Romanians working abroad for their return to the country;
- the granting of facilities to the companies employing students and young people;
- the reappraisal of the Labor Code which is unbalanced, by granting more rights to the employees and more obligations to the employers;
- the facilitation for the employment of work force from the Republic of Moldavia;
- more permissive conditions for the granting of work permits or of sojourn visas.

MODALITÉS POUR APPRÉCIER LES PERFORMANCES ÉCONOMIQUES ET FINANCIÈRES D'UNE ENTREPRISE

Lăcătuș Viorel Dorin

„Babes – Bolyai” University, Cluj Napoca, Faculty of Economics and Business Administration , Teodor Mihali Street no. 58-60, Viorel_lacatus@yahoo.com

La performance n'est pas seulement un chiffre: elle peut prendre toutes les formes informationnelles si elle répond à ces deux fonctions –la conduite d'action et l'évaluation de résultats.Les performances techniques et technologiques mettent en valeur le progrès qui se développe sans cesse et marque la capacité d'une entreprise à réaliser des biens et des services concurrentiels. Les indicateurs financiers ne permettent d'apprécier que partiellement les performances d' une entreprise; le diagnostic des performances vise les problèmes stratégiques, organisationnels, sociaux , technico-économiques, commerciaux ainsi que financiers.L'appréciation de l'efficacité d'une entreprise, de ses performances, ont un contenu plus vaste; le diagnostic financier n'en est qu'une composante.

Mots clé: la typologie de la performance, indicateurs financiers, la rentabilité, le profit légitime,

Introduction

Pour bien comprendre ce que signifie la performance en général, économique- financière en particulier, il est important de rappeler quelques considérations qu'on trouve dans la littérature spécialisée .

Par exemple, dans le ‘ Dictionnaire fiduciaire . Organisation et gestion ‘ on trouve des souscriptions qu'on peut utiliser dans la configuration de compréhension .Le mot ‘performance’ provient du mot ‘ performare’ (latin) et ‘to perform’ (anglais).L'invocation de ces mots permet de relever le sens de performance dans le contrôle de gestion , appliquée à l'analyse économique-financière .

Le sens de ce mot – ‘ performare’ – dans le dictionnaire mentionné, peut être interprété par : ‘donner entièrement la forme de choses ‘, ou par - s'agissant de ‘ to perform’ : accomplir, réaliser une tâche régulièrement, systématiquement, ou accomplir certaines choses demandant une certaine habilité et aptitude. Dans une optique relativement similaire, on peut expliquer la notion de « performance » par la réalisation d'activités correspondant à des objectifs recherchés, ce qui pourraient être traduits en dernier lieu par « rendement » (du point de vue des auteurs).

Il est important de bien faire la distinction entre notion de performance et notion de résultat. La performance, soulignent les auteurs, représente un concept relatif à des objectifs et à des normes, tandis que le résultat est une notion absolue.

Selon nous, cet essai d'explication du sens de la notion de performance n'est pas adaptable à tous les domaines de compréhension.

1. Démarche dans la théorie de la performance économique-financière

1.1 La typologie de la performance

Afin d'évaluer la fonction du système économique et social comme un tout, qu'il s'agisse d'un micro-système, c'est-à-dire une entreprise, ou d'un macro-système (une économie nationale), ou de la composante d'un système, il nous paraît important de former une typologie établie sur la base de certains critères (il ne s'agit bien sûr pas d'une typologie exhaustive). Ainsi, nous relevons les groupes de performance suivants :

a) Du point de vue de l'échelle de formation et manifestation des performances :

- échelon micro-économique
- échelon mézo-économique
- échelon macro-économique

b) Du point de vue du contenu des performances :

- performances technico-technologiques
- performances économiques
- performances technico-économiques
- performances financières
- performances économique-financières
- performances économiques et sociales

Il est souvent fait mention des performances financières dans la littérature spécialisée. E. Cohen, sous la formule « l'analyse financière des performances », précise que les plus importantes sont les suivantes :

Le profit

L'excédent brut d'exploitation

L'excédent de trésorerie

Le cash-flow

Parmi celles-ci, on pourrait inclure la liquidité générale (bien entendu, dans le contexte de l'enregistrement de certaines valeurs du coefficient) la liquidité immédiate, la corrélation fond de roulement net-actif circulant (proche du type « ciseaux »), le dividende per actions, la valeur de l'action, etc.

Après quoi on remarque que, dans la typologie des performances, sont mises à part les performances économique-financières. A notre avis, un tel groupe réalise une fonction informationnelle cognitive de réel intérêt pour diagnostiquer et évaluer l'activité d'une entreprise.

Selon nous, la rentabilité ou la profitabilité avec tous les indicateurs absolus et relatifs, entrent correctement dans la catégorie des performances économique-financières. Ou, comme on le sait déjà, toute la littérature spécialisée l'inclut dans le cadre de la situation financière.

Il est certain que la rentabilité, dans les conditions légitimes de sa formation, reflète la consommation et l'efficacité des facteurs de la production, par essence le travail et le capital, ce qui signifie qu'elle apparaît au premier plan comme indicateur « déterminé » économique.

Parmi les fonctions ultérieures interviennent le potentiel financier, mis en évidence par les capacités d'autofinancement, de rémunération des capitaux, de satisfaction des obligations vis-à-vis du macro-système suivant pour assurer le mode général des activités.

Le problème se pose également en ce qui concerne la rotation des actifs circulants d'exploitation. Selon nous, cet indicateur est inclus dans la catégorie des performances économique-financières dans lesquelles l'économique est de fait un déterminant complexe du processus de formation des stocks à la consommation physique des différentes ressources matérielles. Dans ce cas, la rotation des activités entre en corrélation avec le volume des sources financières plus grand ou plus petit tenant compte de l'accélération ou du ralentissement de la rotation.

L'appréciation d'ensemble des performances d'une entreprise ne peut faire abstraction des performances économiques et sociales. Le comportement des agents économiques manifeste de sérieuses carences concernant les performances économiques et sociales, surtout du fait de l'action de prestigieuses organisations internationales qui les influencent. Or, la santé de la population, la protection de l'environnement, le développement durable suppose des contraintes plus rigoureuses que les contraintes économiques.

Dans le fond, le présent et l'avenir des communautés humaines devrait faire abstraction des frontières entre les pays, or rien ne peut véritablement contrer l'initiative et le développement libres.

c) Du point de vue des manifestation en les limites des fonctions managériales

Le spectre des performances peut être analysé entre les limites des fonctions du management. La prévision se fonde sur un ensemble de valeurs du passé et du présent réalisé par l'entreprise, qui s'inclut dans la combinaison des déterminations futures pour situer leur dynamique en zone des performances attendues comparatives avec leurs concurrentes.

L'organisation représente une zone remarquable dans l'assurance des prémices des formes de performances économique-financières de l'entreprise .

Leur domaine comprend toutes les fonctions du système et évidemment, à leur niveau, il les rend plus efficaces, concourt aux sorties spécifiques analytiques et synthétiques qu'on peut situer à la cote de performance.

Dans le même ordre d'idée, la coordination comme une composante managériale, par un processus synchrone des actions et la surveillance de l'activité facilite la fonction entière et obtient un lien effet-performance.

1.2. Le rôle et la place des indicateurs dans la caractérisation des états de performance

L'obtention de valeurs dépend de la croissance du revenu ; celle-ci se réalise alors quand les produits ou les services de l'entreprise sont préférées à ceux offerts par la concurrence. La stagnation du revenu attire implicitement une dépréciation de la valeur et la régression de l'entreprise.

La stimulation de la croissance du revenu a besoin d'indicateurs économique-financiers, indicateurs devant être utilisés non comme un moyen mais comme un but. L'usage des indicateurs économique-financiers pour mesurer les succès d'une entreprise est, de fait, une modalité reflétant les performances économique-financières.

Philippe Lorino, in « Méthodes et pratiques de la performance. Le pilotage par les processus et les compétences », affirme que les indicateurs de mesure des performances offrent des informations qui doivent aider un acteur individuel ou, en termes plus généraux, un acteur collectif, à conduire des actions visant à atteindre son objectif ou à permettre l'évaluation d'un résultat.

La performance n'est pas une mesure objective, l'attribut d'un phénomène mesuré indépendant de l'observateur, mais est construite par des acteurs en relation avec le type d'activité menée et des objectifs proposés. La performance n'est pas seulement un chiffre, elle peut prendre toutes les formes informationnelles si elle correspond à ces deux fonctions – conduite d'actions et évaluation de résultats.

Les indicateurs financiers sont indiscutablement et absolument nécessaires pour apprécier les performances d'une entreprise, mais il faut prendre en considération un certain nombre de limites. En premier lieu, les indicateurs financiers ne permettent qu'une appréciation partielle des performances d'une entreprise, le diagnostic des performances vise les problèmes stratégiques, organisationnels, sociaux, technico-économiques, commerciaux et financiers. L'appréciation de l'efficacité d'une entreprise, de ses performances, a un contenu beaucoup plus vaste ; le diagnostic financier n'en est qu'une composante.

En second lieu, le fait que l'analyse financière aborde les critères monétaires d'appréciation des performances, revient à négliger certains aspects de l'activité qui ne peuvent avoir une transposition monétaire.

Par ailleurs, l'analyse financière permet la formation d'images d'ensemble sur la base des résultats sans permettre une bonne connaissance des activités internes d'une entreprise. Les indicateurs abordés d'analyse financière permettent une appréciation globale de l'activité d'une entreprise. Or, pour mieux préciser les performances économique-financières, il est besoin d'une perception analytique des résultats, et de stabiliser la contribution de chaque facteur à part dans les réalisations de l'entreprise, ce qui ne peut se faire que par un diagnostic global de l'activité d'une entreprise.

L'analyse financière permet de mesurer et d'apprécier d'un point de vue strictement financier les résultats présents qui ont de fait un caractère partiel ; pour apprécier les performances économique-financières, il faut se soumettre par nécessité à l'utilisation d'un système d'indicateur qui exprime également l'orientation stratégique de l'entreprise, qui caractérise ses relations internes et externes, l'efficacité des activités, la capacité d'adaptation de l'entreprise face à la demande du marché, etc.

De plus, les performances reflétées par l'analyse financière sont la résultante des activités menées dans le passé une caractéristique d'une entreprise à un moment donné ; elles ne permettent ni d'apprécier la capacité d'une entreprise à réaliser un profit stable, ni d'appréciation sur la durabilité d'une activité.

Les performances économique-financières d'une entreprises sont mises en relief par un diagnostic global qui a pour objectif de mettre en évidence dans quelle mesure se réalise les objectifs majeurs d'activité : assurance de viabilité et croissance des valeurs d'une entreprise.

1.3 La rentabilité dans le système de performances

« Peut-être qu'aucune autre notion ou concept n'est utilisé dans les discussions économiques avec une variété aussi stupéfiante de sens distincts que le profit. »

Frank Kniglet

Le profit représente l'une des zones fondamentales du revenu formé dans l'économie de marché. Dans l'acceptation la plus large, le profit représente le gain ou l'avantage réalisé en espèce grâce à une activité économique.

Aucune activité entreprise par un agent économique ne peut se développer si elle ne réalise un avantage en espèce, si elle ne récupère les dépenses ni n'obtient un excédent de revenu.

Comme résultante des actions économiques, vues comme le décalage entre les revenus et les dépenses, on considère que le profit d'une entreprise peut avoir deux composantes : le profit légitime (légal) et le profit illégitime (illégal).

légitime

Revenu – Dépenses = profit [

illégitime

Le profit légitime représente la différence entre les revenus et les dépenses constitués légalement comme fond et modalité de calcul (sous-entendu dans ce contexte le coté social –moral des actions qui entrent fréquemment sous l'incidence de la tentation de déviance). Il apparaît comme un surplus monétaire dégagé du respect des normes légales et peut être différent du profit normal (respectivement au niveau moyen du profit obtenu dans la branche ou dans le secteur d'activité).

Comme composante du profit légitime sont considérés également les revenus provenant de la volonté d'éviter les risques qui, avec une probabilité plus ou moins forte, accompagnent l'activité économique d'une entreprise.

Les gains de ceux qui ont assumé les risques de l'activité économique, indifférents de dimension, s'inscrivent dans le cadre de l'acceptation de profit légitime. Bien entendu, l'action économique suppose également l'échec de celui dont le coût est supporté par l'entrepreneur.

Le profit illégitime, ou le revenu non-gagné, est défini comme la somme que s'approprie le possesseur de ces facteurs de production sans avoir apporté la moindre contribution dans l'obtention de résultats, sans l'avoir mérité, n'ayant rendu aucun service dans l'activité économique.

A titre d'exemple, **le profit légitime peut être :**

- La pratique de prix de vente très élevés (comme une spéculation sur une demande supérieure à l'offre),
- Les gains supplémentaires dus à l'inflation,
- L'économie sur les dépenses pour la protection de l'environnement,
- Les gains obtenus par des frais moindres et positions de marché favorables

Les effets directs ou indirects d'efficacité marginale sur le profit sont indiscutables. Un management dynamique et de qualité, l'assurance d'une réduction des dépenses, l'amélioration de la qualité, l'augmentation de la productivité sont les causes d'un profit supplémentaire assuré.

Dans la littérature spécialisée on trouve souvent la notion de profit admis ; c'est le cas de l'institutionnalisation de mesures de profit qui se stabilisent, pas tant en fonction de facteurs économiques que de décisions étatiques visant à assurer plus ou moins un certain niveau de profit sur les secteurs, les sous-secteurs.

Par la centralisation des revenus et des dépenses d'une entreprise, le décalage entre le total des revenus prouvés et les frais correspondants (exclusivement l'impôt sur le profit) s'exprime le contenu du profit brut (ou profit comptable). L'ajustement du profit brut avec l'impôt sur le profit constitue le profit net.

Laissant à part toute ces essais de définition du profit, comme notion purement théorique, on constate que celui-ci se trouve fortement impliqué dans la psychologie humaine : « le profit est le résultat d'action de force ou de pouvoir , où l'entrepreneur - ou le propriétaire - d'une unité économique entend parvenir, sur les marchés, par sa production, à créer une situation en mesure de renforcer son caractère ». Jean MARCHAL.

Conclusions

Parmi toute cette spéculation, ces avis, ces opinions, pour les entrepreneurs, dont le but est d'obtenir les résultats les meilleurs dans les domaines économiques, financiers, patrimoniaux et sociaux pour lui assurer stabilité et prospérité sur le marché, seule la version législative officielle présente de l'importance.

Le profit se définit ainsi comme la raison d'être d'une entreprise, se destinant à contribuer à la constitution du budget de l'état, à la création de nouveaux emplois, au fonctionnement des activités nécessaires à l'existence d'un pays.

A l'opposé, quand l'entreprise affiche des résultats qui reflètent, après une longue période d'activité, son incapacité à produire des bénéfices, elle risque de se soumettre à la procédure de faillite, d'élimination par le phénomène de concurrence.

Cette situation est de fait le résultat d'une situation dans laquelle l'agent économique, par manque de moyens nécessaires, se met dans l'impossibilité de poursuivre son existence en tant que « productrice de valeur » sur le marché.

FONDEMENTS DES DECISIONS FINANCIERES AYANT POUR BUT DE REALISER UN MANAGEMENT PREVENTIF

Lăcătuș Viorel Dorin

„Babes – Bolyai” University, Cluj Napoca, Faculty of Economics and Business Administration , Teodor Mihali Street no. 58-60, Viorel_lacatus@ yahoo.com, Telephone: 0264-418.654

Dans les conditions actuelles, nombreuses sont les entreprises en situation de crise sans que le management de celles-ci ne parvienne à contrôler ces situations. La mondialisation du marché, la pression exercée par la concurrence, le besoin continu d'efficacité des activités avec la baisse des prix, la dynamique de croissance du milieu économique contemporain suppose un perfectionnement continu du processus de planification, contrôle et conduite en vue de réaliser du profit. En complément des fonctions classiques financières-comptables, on parle de plus en plus du concept de controlling stratégique comme modalité pour aborder une affaire, dans une perspective financière, mais aussi dans le processus d'affaire, dans leurs interdépendances ayant pour but l'identification des événements ayant un impact significatif sur les affaires avant que celles-ci ne deviennent information comptable.

Mots clé: management préventif, controlling stratégique, instruments du controlling, le contrôle par les budgets

Introduction

Dans les conditions actuelles, nombreuses sont les entreprises en crise dont le management ne parvient pas à contrôler la situation.

Celles-ci sont décrites comme événements irréparables, du genre: perte d'un client ou d'un fournisseur stratégique, fournisseur qui menace d'arrêter les livraisons, expiration

d'un crédit de financement, etc.

Aujourd'hui, on parle de plus en plus d'une entreprise - dans le nouveau contexte économique - dans une philosophie de contrôles et de prévisions, avec l'idée que celles-ci puissent faire face aux problèmes confrontés: le niveau élevé de l'incertitude, la mauvaise préparation de la force de travail, la dévalorisation du travail, la dégradation de l'environnement et des relations humaines, l'augmentation de l'immoralité des engagés, mais encore d'autres aspects de nature politique, économique, sociale et culturelle.

La mondialisation, la pression de la concurrence, le besoin continu d'efficacité avec la baisse des prix, la dynamique de croissance du milieu économique contemporain, supposent un perfectionnement continu du processus de planification, contrôle et conduite de l'entreprise.

1. 1 De la fonction financière et comptable au controlling stratégique

Information comptable réelle, opérante et complexe, il représente le support des décisions économiques et financières nécessaires aux managers dans le processus de conduite des activités d'une société. L'organisation et la conduite de la comptabilité est une obligation des personnes juridiques dans le cadre de l'économie de marché, et représente un instrument de connaissance économique-financière.

La fonction financière-comptable, son **rôle classique** de mise en évidence de l'utilisation des ressources financières, d'attraction de nouvelles ressources, de planification à court terme, de contrôle périodique et de coordination, dont le but est d'assurer la possibilité de corriger les déviations sur le processus économique, s'est montré insuffisant pour fournir des informations nécessaires aux fondements des décisions managériales.

En complément des fonctions classiques financières comptables, dans le contexte de l'économie du savoir, on parle de plus en plus du concept de controlling stratégique.

Le controlling stratégique est considéré, selon les spécialistes, comme une modalité pour aborder une affaire, dans une perspective financière, mais aussi dans le processus d'affaire, dans leurs interdépendances, dans la recherche-développement et l'innovation, et dans le développement et le

perfectionnement des ressources humaines ayant pour objectif l'identification des événements ayant un impact significatif sur les affaires avant que celles-ci ne deviennent information comptable.

Selon nous, par le controlling, est comprise la sous-fonction déléguable au management, par laquelle sont assurées et analysées des informations relevant des différents niveaux de décision.

Cette fonction présente le développement des affaires et indique le grade de réalisation des objectifs stabilisés par l'intermédiaire de la planification, analyse et interprétation des informations soutenues de l'existence d'un système de rapport adapté aux spécificités de l'entreprise.

Lorsque l'on a découvert les secteurs problématiques du business, on les analyse afin les éviter dans l'avenir, tout en s'assurant des capacités d'adaptabilité de l'entreprise face à la concurrence.

Le controlling stratégique synthétise l'identification des risques et facteurs de risques, avec pour objectif d'assurer l'existence à long terme de l'entreprise.

La fonction financier-comptable dans son exercice classique, ce que nous appelons le controlling opératif, est utilisé spécialement pour la croissance de la rentabilité économique avec une bonne liquidité et indépendance financière dans l'entreprise.

1.2 Les instruments propres aux activités de controlling

Les objectifs étant stabilisés, on procède au contrôle et au calcul des variations du niveau réalisé par rapport avec ceux planifiés. Les déviations doivent être évaluées en temps utile, tandis que le management de l'entreprise peut être mené dans la durée.

Parmi **les instruments spécifiques du controlling opératif** sont: analyse ABC, méthodes empiriques de pronostic, projets linéaires et analyses de trend, méthodes mathématiques et statistiques de détermination des déviations absolues et relatives, détermination et présentation graphiques des résultats, le calcul de niveau de rentabilité.

Le controlling stratégique vise à déterminer les chances et les facteurs de risque dans l'entreprise le développement des potentiels de succès, la surveillance du milieu externe et la définition de stratégies d'entreprise.

Parmi **les instruments propres aux activités de controlling stratégique**, relevons: analyse de la concurrence, analyse de porte-feuille, méthode BBC, analyse du cycle de vie du produit, diagnostic organisationnel, balance de la scorecard, target costing, analyse SWOT (évaluation des points forts et des points faibles), analyse du coût du capital engagé, technique de scénarios, autres.

On rencontre l'activité de controlling dans différents segments du domaine économique, comme le marketing, le management des ressources humaines, et davantage encore sous forme de controlling financier sur les investissements, les recettes, les dépenses, et sous forme de controlling des activités de trésorerie.

En particulier dans le domaine industriel d'activités de production ou de recherche/développement, nous rencontrons des préoccupations par rapport au controlling des projets.

Dans le management des projets, **le rôle du controlling** est de:

- planifier les résultats et l'évolution du projet
- délimiter le projet en phase d'exécution
- surveiller les déviations du plan
- déterminer les dépenses de projet et assurer l'enregistrement correct de celles-ci dans le cadre de la comptabilité financière
- déterminer les niveaux de réalisation du projet et déterminer les revenus.

Le controlling vous assure l'enregistrement du résultat escompté dans le projet respectif, en tant que partie intégrante des résultats et des performances de l'entreprise.

La nécessité de connaître en permanence la situation d'une firme, la transparence aux différents niveaux de décision et de secteurs, de déterminer des objectifs clairs, quantifiables, de planifier l'unités économique et la décision, d'analyser et d'interpréter les différents indicateurs économiques, ont déterminé l'augmentation du rôle et de l'importance des activités de controlling dans une entreprise moderne.

Le controller, personne responsable de ces fonctions, peut être comparé à un consultant interne sur les problèmes économique-financiers, **la nature de ses activités supposant**:

- connaissance solide de nature financière-comptable
- raisonnement analytique, dynamisme
- capacité de communication et de collaboration avec les différents départements de la firme et avec les stakeholders externes
- capacité de simplification des phénomènes complexes
- capacité à identifier et gérer les risques et opportunités
- savoir-faire dans l'utilisation des programmes de gestion des informations
- vision dans le temps, capacité d'anticipation

Dans son travail au jour le jour, le contrôleur ne doit pas oublier de:

- assurer le maintien de l'accès à l'information
- initier et entretenir les différents systèmes et applications utilisés dans l'activité de controlling
- coordonner les sous-objectifs, les tactiques, les actions.

La qualité et l'efficacité du controlling dépend de la disponibilité des ressources nécessaires, de la qualification du personnel, et bien sûr de l'équipement matériel et des techniques de calcul.

D'après nous, seule une combinaison saine des activités de controlling opérationnel, des types d'activités spécifiques de la fonction financière – comptable dans l'acceptation classique, avec les activités modernes de controlling stratégique vont conduire au succès de durée de l'entreprise et exercer dans les conditions d'efficacité du management préventif dans l'activité économique-financière de l'entreprise.

En conclusion, le controlling est une nécessité du management moderne imposée par la dynamique du milieu économique contemporain, par la réactivité nécessaire à la prise de décision, du besoin d'optimiser les activités, de réduire les coûts, de développer une stratégie claire, dans l'alternance des actions, dans les scénarios et dans les besoins d'anticipation des phénomènes économiques.

La qualité et l'efficacité de ceux-ci dépend de la disponibilité des ressources nécessaires, de la qualification du personnel et bien sûr enfin, de la dotation en appareils et techniques de calcul.

1.3 le budget et le contrôle par les budgets –instruments de planification et contrôle préventif des entreprises.

La technique budgétaire, comme composante du processus de planification organisationnelle suppose la mise en ordre des informations à court terme dans un budget général, qui une fois stabilisé suppose des activités continues d'analyse comparative régulée, les résultats effectifs étant mis en relation avec ceux budgétisés, les déviations enregistrées influencent le cycle budgétaire suivant.

L'analyse des déviations a comme principal but d'assurer la possibilité de correction en temps réel sur le parcours du processus économique.

Dans de nombreuses entreprises de Roumanie, privées ou mixtes, mais aussi du marché allemand, le budget, une fois fait, reste encore un document passif.

L'activité de finance doit porter l'empreinte des exigences budgétaires, des restrictions quantitatives et qualitatives spécifiques aux disciplines financières.

L'activité de budget est un processus complexe qui commence avec la phase de préparation du budget, suivie de la mise en budget proprement dite puis de la règle du budget stabilisé.

La préparation du processus de mise en budget est importante, aussi l'application correcte et conséquente des principes budgétaires suppose une réorganisation du service financier.

Par ailleurs, le service financier doit disposer d'un système d'informations opérationnel, bien doté en techniques de calcul et bureautique moderne, pour oeuvrer en temps réel, pour fournir des informations financières qui recouvrent les événements techniques, économiques, sociaux, écologiques du quotidien de la firme.

Concrètement, la budgétisation des activités économiques est faite par la transformation des activités de consommation et de production, et des fluctuations des fonds dans les informations financières puis dans les décisions incorporables dans la maquette du budget.

Les déviations des indicateurs projetés ou attendus se transforment en implications financières. La recherche de fond en mode opératif suit. A partir de là, on adopte et on réalise les budgets intermédiaires.

Ces budgets peuvent être consacrés à des investissements, à des moyens circulants, à la recherche scientifique, à des actions sociales, etc.

Le budget des recettes et dépenses constitue un instrument de contrôle des dépenses et des recettes en comparaison des prévisions avec les réalisations.

Précisons que celles-ci jouent un rôle important du fait que pour la majorité des gens, le contrôle des activités économiques par le budget, a le sens d'activités coercitives et, en partie, inutiles. Il provoque états émotifs et discomfort.

Toutefois, le management suppose activités de surveillance, contrôles qualité, sanctions et récupération des pertes, ainsi que des récompenses pour la réduction du gaspillage, dépistage des déviations et augmentation de la qualité, ayant quelques unes des attributions du management en relation avec les activités de contrôle.

L'absence de contrôle provoque, dans la majorité des cas, du gaspillage, une baisse de la qualité, la perte de segments du marché, la hausse des dépenses. Se pose également le problème de l'existence et de l'exercice du contrôle par le budget.

Dans la réponse du service financier, chute le mécanisme entier d'obtention de valeurs et de dimensionnement exact de celle-ci pour être reconnue par le marché. Le financier est, comme il se doit, un ingénieur des valeurs, tandis que le service financier est un laboratoire de vérification et de gestion des valeurs qui sont obtenues par l'entreprise.

Si ce laboratoire détecte des signaux alarmants, la parole du financier doit être écoutée, et l'activité économique doit être corrigée dans le sens voulu et en fonction des exigences du budget.

La meilleure forme de contrôle par le budget est représentée par le dépistage et l'analyse des différences entre les résultats prévisionnels et ceux réellement obtenus. Dans la littérature de spécialité, il s'agit des écarts suivants:

1. Ecart global sur les coûts

- par rapport aux éléments du coût
- par rapport au coût unitaire

2. Ecart global sur les résultats

- des quantités vendues
- par rapport aux prix de vente
- par rapport à la structure des ventes

Un autre domaine clef du contrôle par le budget a pour objet la situation de la trésorerie de l'entreprise sur le parcours de l'exécution du budget de trésorerie. Ce phénomène financier-monétaire représente le pouls de la firme, et doit être vérifié, si possible, chaque jour.

Dans les conditions de blocage financier dans lequel se trouvent de nombreuses entreprises de Roumanie, le contrôle par le budget de trésorerie doit viser tout particulièrement l'évolution de revenus des clients et leur effet sur les liquidités de la firme.

En mode concret, ce contrôle est suivi:

a) évolution des créances totales face au chiffre d'affaire journalier

par le rapport (r) $r = \text{créance totale} / \text{CA journalier} = n \text{ de jours}$

b) évolution du solde du compte Clients, comme différence entre le volume des factures émises et le volume des revenus prévisionnels et réalisés.

Les décalages constatés sur le mois sont des éléments de débat et peuvent constituer le point de départ pour adopter des mesures de correction des activités économiques et financiers de la firme en cause.

Nous pouvons en conclure que le contrôle budgétaire et l'analyse des déviations avec les rapports d'analyse, les rapports prévisionnels comparatives constituent les instruments de base dans l'exercice d'un management stratégique-préventif moderne.

1.4 Stabilisation d'un moyen efficace de contrôle financier préventif.

Le management préventif dans l'activité économique-financière a à la base un set de standards stabilisés.

L'objectif principal du **contrôle financier préventif** est constitué de l'élaboration et de la publication de rapports financiers corrects et complets, la protection de l'intégrité du patrimoine de l'entreprise et l'évaluation de l'efficacité opérationnelle.

Le management général est responsable de la stabilité de ces normes et du maintien d'un système de prévention et contrôle basé sur le principe d'efficacité économique de type coût-bénéfice.

1.5 Application et justification du contrôle dans le management préventif

Le contrôle est considéré comme l'un des instruments de gestion et prévention des risques les plus efficaces.

Deux types majeurs de contrôle sont discutés dans la littérature spécialisée

- **le contrôle préventif**, considéré comme prépondérant dans l'activité de contrôle de l'organisation, doit permettre de prévenir un événement indésirable dans le cadre ou en relation avec l'activité de l'organisation.
- Par exemple, la réglementation de l'approbation des acquisitions dans l'entreprise est une mesure de contrôle et de prévention du risque.
- **le contrôle d'après les faits** aide à identifier les événements déjà enregistrés, en offrant la possibilité d'interventions de correction et l'obtention d'informations de référence pour le suivi ultérieur.

Conclusions

Dans la pratique, il a été démontré que seule une combinaison pertinente de l'utilisation de ces deux types de contrôle peut permettre d'atteindre et réaliser les objectifs recherchés dans la meilleure proportion.

Analyse de l'**efficacité** du contrôle:

- Le degré dans lequel la mesure de contrôle proposée se rapporte au risque prépondérant identifié.
- La nécessité de mesures de contrôle supplémentaires (dans le cas où le risque identifié est considéré comme élevé).
- La combinaison de mesures préventives et détectives.
- L'implication du management ou d'une personne indépendante non exposée au risque.
- La favorabilité du milieu de l'entreprise et le mode par lequel il peut affecter l'activité de contrôle.
- Mesure dans laquelle le personnel impliqué dans l'activité de contrôle possède les connaissances, les aptitudes et l'attitude nécessaire.
- Composantes clés du processus de contrôle dans le mode d'attribution des responsabilités.

La **justification** des actions du contrôle se démontre par:

Impact de l'événement en cas d'absence de mesure de contrôle

Les coûts des activités de contrôle vont être devancés par les bénéfices de réduction des risques.

La matrice de contrôle, instrument utilisé dans la monitorisation et la gestion des risques:

- identification du processus clé des entreprises,
- décomposition de celles-ci dans les activités critiques du point de vue des risques
- identification et localisation des risques majeurs,
- classification de ceux-ci en fonction de leur impact potentiel sur l'entreprise.

ASPECTS REGARDING THE APPROACH OF THE PROBLEMS OF THE EMPLOYEES AND OF THE PROBLEM-EMPLOYEES

Lukacs Edit

„Dunărea de Jos” University of Galați, Faculty of Economic Sciences, Nicolae Bălcescu Street, No. 59-61, 800001 Galați, Telephone: +40236460467, E-mail address: elukacs@ugal.ro

The procustian approach of the job's design is widely spread in actual society too. Several researches in European countries regarding working conditions, employees' satisfaction and work stress marked the fact that there are many stressful jobs. The most serious consequence of work – stress is the lack of balance between private and professional life. Western organizations offer various support instruments to their employees in order to improve the balance between work and private life. There are employees who have difficult demeanour due to stress and exhaustion. The approach of problem-employees demands great skill and ability.

Key-words: bed of Procut, working conditions, balance between work and life, support company politics, problem-employees

1. Bed of Procut and working conditions

The idiom „Bed of Procut” is relatively widely spread not only in literary discourse but in the current one also. We met it either in the greek mythology or as the title of a famous novel of Camil Petrescu or because it is frequently used as a metaphor, to reflect various inadjustment situations or situations in which people are treated with force and brutality.

For those cases, less likely, when the reader does not recall the story, here is an abstract:

Procut was a robber in Atica, who invented an artifice to scrounge money from the tired and rather unlucky travellers who came by his house. He offered them hospitality; afterwards the guests either paid for their consumption or had to sleep in one of his beds. If the guests accepted the idea of sleeping in his beds, Procut mentioned in addition that the guest had to fit exactly to the bed. After being served with plenty of food and beverage the guest was shown the bedroom where there were two beds: one of them was very short and the other one very long but no unlucky guest matched the size of bed to sleep in. If the overdone amount of money requested by Procut would not be paid, he would force his victims to lay on one of his beds: the tall guests on the short bed whom he chopped their legs which were longer than the size of the bed; the short ones on the long bed whose bodies he stretched so as to fit the bed.

Since the connection of man with the environment became complex, this type of Procustian approach of environment design was widely spread. In metaphorical terms the people's arms were “stretched” so as to reach the unaccessible command organs/parts and the perceptual abilities were highly strung in order to see or hear the signals which can not really be seen or heard. At the other extremity of the Procustian scale, the legs were often “chopped” in order to match tight jobs and the cognitive capacities have been reduced so as to handle monotone tasks (1).

In our days we can often consider a Procustian approach regarding the match of man with the working environment also. There are plenty of researches which emphasize the fact that in our contemporary society the ergonomic design of working places is not taken into consideration.

The inquiries of the Foundation for Improvement of Life and Work Conditions, starting with the year 2001, provide compared data concerning working conditions, satisfaction degree of people, balance between private and professional life, which express not only the manner European people work and live but also the way they think.

The answers of almost 30.000 employees from 31 European countries highlight the fact that work is no longer a priority in European people's lives. They place health above anything and family on second place (2).

Our country presents the most concerning results. Most Romanian people work in unfavorable environment conditions (far too hot or too cold or pollution) and in tiresome or great physical effort demanding locuses. Work causes for over 42% of the questioned Romanian employed people backaches and excessive fatigue. Only 10% of the Romanian employed people declare themselves very content with their working place.

In a recent article of the "Financial week" there is the assertion that development appears to be the worst enemy of the employee. Although it is meant to ease labour, the new technology overbalances the employee's life who feels more and more threatened by the automation of operations. There are many qualifications who practically vanished due to implementation of sophisticated working systems but there are also new ones which emerged so that active population must permanently be "up and doing" in order to adjust to new things on the way (3).

An analysis made by the European Agency for Safety and Health at Work points out that the changes which occurred at the level of conceiving, organising and administrating work lead to serious abasement of mental and physical health of active persons. Jukka Takala, manager of EU-OSHA, pays attention to the fact that nowadays stress is the second most reported health problem and it affects 22% of European Union employees. Researches suggest that between 50% and 60% of all wasted working days are related to stress. In 2002 the annual economic cost of working stress in EU 15 was calculated to reach 20.000 million euros.

2. Balance between professional and family life

The most serious consequence of job stress is the lack of balance between private and professional life. Researches of EU-OSHA emphasises the fact that 40% of European Union employees who have prolonged working schedule are discontent with the relation between professional and family life.

Although spending prolonged working hours is being considered by managers as a manner to press employees to make efforts so as to show the requested efficacy, overtime work does not mean performance. Social sciences specialists assert that an the work of an employee who works overtime is not as performant on the long run as the work of an employee who uses his normal working time under similar conditions (4). An employee is more productive if there is a balance between his private and professional life. The balance is due to the span (how long?) and the quality (how?) of his working time and outside it. When the employee spends too much time at work and/or when being at work he is concerned about personal problems or related to family then he is dealing with an imbalance issue. The same imbalance appears when the employee thinks about work problems in his spare time or when he is with his family.

Offering the employees the necessary instruments to reach an appropriate balance is a concern of organizations. The balance between work and life improves the maintenance degree of employees in the organization and leads to the growth of their initiative and engagement and to reduction of stress as well.

3. Employee support company politics

The organizations of the future will have to carefully approach the employees' worries for their families and their personal lives if these organizations want to be leaders in their activity domain and train talented employed labor force. People need and deserve support from their managers.

At the moment the European employers deal with a deficit of 25 million employees; this a problem which will grow in all countries of the continent and in Romania, within ten years the labor force deficit will increase by about 15%", asserted Arvin Mishra, partner Human Capital of Ernst & Young (5). According to Arvin Mishra the talent crisis registered in Europe, the greatest worldwide, due to population's aging increases the pressure on the companies in order to attract and maintain talents.

The firms which invest in development and maintenance of talents have a rate of return on Investment 22% bigger than the competitors and the companies that treat the HR department as a business associate benefit from competitive advantage; these are only two of the topics discussed upon within the HR Forum 2008 event, organised by the Money Express magazine.

In developed countries the employers have identified various support instruments to balance professional and family lives of their employees. Here are few examples mentioned:

- The company Hewlett-Packard adopted flexible work schedules since 1972 which are being perceived according to researches as one of the most appreciated advantages
- According to Lewis E. Platt's assertions, president and manager of HP, the company also accepted a more pliable leave of absence policy. „Today the employees can obtain a leave of absence for any reason. If the employee reached a certain point in his life when he just wants to rest a little he can do it”(6).
- The American public relations firm Fleishman Hillard offers the employees a pause of six weeks after having worked for four-seven years inside the company.
- The banking group HSBC ensures baby nurseries for the employees' children and the investment bank Goldman Sachs offers financial assistance to the employees who adopt a child as well as a 5 days paid vacation for family emergencies.
- The oil group Royal Dutch Shell ensures consultancy services for stressed employees and the communications British firm Text 100 allows the employees to miss work two days a year because they are tired (7).
- In the American company IT Sun Microsystems the employees can work at home, in case fulfilling the tasks does not depend on actually being at the office; this system facilitates the attraction of talents from several regions of the world.

The concept of balance between work and life is not very much spread in Romanian companies. There are still companies which adopt benefit systems which help employees to improve the balance between professional and family life or which attempt to reduce the effects of professional effort. Dacia Groupe Renault is also part of this category which offers a series of benefits to the employees: offering help and subsidizing home-work transportation and canteen or subsidizing rest and treatment tickets (8).

Employers are obliged to approach the issue of stress at work according to the frame-directive 89/391/CEE referring to health and security in EU. This directive and the necessary legislation of the European Union countries emphasise that working stress is related to the legal aspect of health and security at work. They ascertain that stress ought to be approached in the same systematic and logical manner as other health and security issues by applying the risk managing model and especially emphasising the preventive measures.

4. Approaching problem-employees

The difficult demeanours of some persons or of the so-called problem-employees are easily recognisable in companies due to the emotional reactions they develop. According to experts from the point of view of the antisocial demeanour really difficult people are rare, in return anyone can have a difficult demeanour at one time (9).

Generally speaking the difficult demeanours of some of the employees can consist of objective causes such as assignment of tasks which exceed their abilities or, on the contrary, of too few tasks, lack of variety of work, setting vague objectives for the employee, unexpected working hours, uncertainty of the job or constant and continuous pressure (10). The difficult demeanour is often direct consequence of stress and exhaustion.

There are also times when difficult demeanour is based on personality features such as hypersensitivity, negative thinking, low self - respect or aggression.

Regardless of what the causes of difficult demeanour are, the approach of problem-employees is a challenge for the managers. While most of them may be tempted to dismiss these employees researches have indicated that the best alternative is to learn how to behave with that person. Dismissal is not always a solution as recruiting and training new persons is expensive (11). On the other hand the presence in a work group of an aggressive, arrogant, insubordinate, finical, hypersensitive and unproductive employee is difficult to bear. It is even worse when he has alcohol problems.

In organizations various types of problem-employees are to be met and they are often named with humour: „little genius”, „pathologic blabber”, „chronic complainant”, „the informer”, „the absent-minded”, „the bad-tempered” and so on.

The choice of the right demeanour for the approach of the employee will be made according to the type of demeanour.

4.1. Understanding the hypersensitive

No one likes to be criticised but most people can accept constructive critiques. However some persons feel any kind of critiques. Every time there are vague critique hints made related to their activity they become defensive and start accusing people that they are picking holes in them. The hypersensitive employee's fear to be criticised leads to great precaution in all his activities. In order not to risk by making the smallest mistake he checks and double checks anything he does. Consequently he doesn't succeed to finish his tasks on time. The hypersensitive employee may have low self-respect and therefore needs encouragement. Approaching him takes plenty diplomacy and pleasantness. Every time his activity is being analysed one should start by praising the good aspects of the accomplished activities and then make suggestions of how he can improve the unsatisfactory zones (12).

4.2. Tempering tantrums

There are employees who lose their temper occasionally and scream and yell at their colleagues and even at their bosses. They calm down rapidly but their demeanour affects the work of the entire team and some time has to pass until everything returns to normal.

Here are some suggestions of how to treat a person who has tantrums:

- After he has calmed down you should have a human to human discussion with the person. Emphasise you understand that it is not always easy for anyone to control one's temper but these tantrums are not to be accepted at work.
- If he has another tantrum send him out of the room until he calms down. Tell him that the next tantrum will lead to disciplinary actions.
- Recommend him to think about the old saying: „count up to ten before opening the mouth”.
- If you have an employee assistance program suggest the member to set a meeting with one of the program's advisors.

4.3. „Got you” game

Almost in every organisation there is an employee whose greatest pleasure is to catch the others making a mistake. The persons who play this game try to display their superiority. Because they usually do not have original ideas or constructive suggestions they find it satisfactory to discover others' mistakes, especially their boss's. They try to make them feel embarrassed and uncomfortable. The most adequate approach is by ignoring their observations or the answer by making a joke and smiling: “thank you for drawing the attention before something bad would happen”.

4.4. Denying negativity

Nothing goes right for the negatory employee. He always has a reason why an activity or a program can not be realized. Negatory persons cause more problems to the organisation. They oppose to every change just because they like to oppose. No argument ever helps. They often do whatever they can to sabotage a situation so that the new method wouldn't work and they could then say: „I told you so”.

Negatory persons have a negative impact on the team's morale. As a rotten apple can affect a whole barrel, so can a negatory person spoil the entire team's morale.

When new ideas are being brought forward to negatory persons it is good to ask them to express their objections outloud and then assure them that their observations are being appreciated.

Negativism is often based on personality factors which are formed since a long time and which exceed the abilities of any manager to solve the problem. In this case professional help is required.

4.5. The informer

The informer type problem-employee can be very good in his domain, can have multiple qualities, but has the greatest flaw: a bad character. He is disgusting by providing information about his colleagues to his boss: „X is late again”, „Y is talking to her friend on the phone again”. Such a man can manipulate the

relations among the employees of a company for his own benefit. He is the same man who will leave to another company for a greater income and will expose all the secrets of the previous company.

Although it doesn't hurt a manager to know everything inside a company and always be informed about it, such an employee could be dangerous for the company.

5. Conclusions

The results of the researches made by the European Agency for Safety and Health at Work (EU-OSHA) and also the ones of the Foundation for the improvement of live and working conditions draw the attention on the fact that working stress is one of the greatest challenges that Europe deals with in terms of working security health. Stress is placed second mostly reported health problems and it affects 22% of European Union employees.

The most serious consequence of working stress is the lack of balance between employee's private and professional life.

The difficult demeanours of some of the employees are often caused by stress and exhaustion. Under stress conditions calm people can turn into nervous and aggressive people.

Working stress can be prevented and the measures for its adjustment can be very effective from the point of view of costs.

Some of the measures for preventing working stress would be the next ones: testing work resistance during the hiring selection, clear definition of tasks and responsibilities, offering enough time to the employees for the fulfilment of tasks, adapting workload to the capacity and resources of each employee, offering opportunities to socially interact and others.

LA VISION MANAGERIALE CONCERNANT LA CONCEPTION DES INDICATEURS SPECIFIQUES AU CONTROLE DE PERFORMANCE DANS LE DOMAINE DES PRODUCTEURS DE CONFECTIONS TEXTILES EN ROUMANIE

Olaru Adriana

alexcapatina@yahoo.fr

The organisational performance is determined by the way in which companies try to adapt to the new „game's rules” imposed by the information era; the control system of the performing companies must be focalized on the implementation of the Balanced Scorecards that are developed in the context of the insufficiency of financial indicators within the processes referring to the performance measurement. Our paper emphasizes the results of a research that we made in view to determine the principles concerning the vision of Romanian managers from textile producers on performance control management; after the analyze process of the information gathered from the research, we outline the strategic orientation adopted by the organizations that influences their performances, the manners in which is projected the system of performance indicators and how are applied the benchmarking techniques and the most important indicators exploited in performance control process on the four dimensions of the balanced Scorecard.

Keywords: vision, performance, Balanced Scorecard, organisational culture

1. Eléments méthodologiques de la mise en oeuvre de la recherche

La recherche concernant le niveau d'application du management du contrôle de performance dans le domaine des producteurs de confections en Roumanie a suivi la création d'une base d'informations ayant un caractère général sur la manière dans laquelle les compagnies qui agissent dans ce secteur ont projeté et implémenté des systèmes des indicateurs pour quantifier les performances organisationnelles.

La définition des objectives de la recherche a envisagé l'évolution spécifique du domaine investigué, en plan conceptuel et opérationnel, auprès un échantillon représentatif des compagnies impliquées dans la production de confections textiles de Roumanie.

Le questionnaire utilisé comme support de la recherche est formé par des questions semi-ouverts qui visent tant des aspects concernant la projection du système des indicateurs associés au contrôle de la performance que des aspects concernant les implications de l'analyse de ses indicateurs sur les stratégies de développement de ces entreprises.

Dans la construction de l'échantillon, nous avons sélectionné 40 compagnies qui agissent dans le domaine des confections textiles qui ont un degré de notoriété élevé ; les managers de ces compagnies ont accepté de répondre aux questions, confirmant la conception de leurs stratégies d'affaires sur l'analyse des systèmes des indicateurs associés au contrôle de la performance.

2. L'analyse et l'interprétation des résultats obtenus

En ce qui concerne les actions possibles d'augmentation de la force compétitive implémentée au cadre des stratégies d'affaires des compagnies investiguées (figure no. 1), on remarque le fait que leurs managers focalisent les efforts d'abord sur les processus de rentabilisation de la gestion des coûts (50%), ce qui dénote une préoccupation permanente pour trouver des solutions concrètes de réduction des coûts au niveau de tous les départements ; en même temps, nous considérons que cette approche implique aussi des risques qui peuvent affecter les standards de performance.

L'assurance du contrôle périodique des indicateurs de performance à travers les tableaux de bord équilibrés (Balanced Scorecard) occupe la deuxième place conforme aux réponses des managers interviewés (28%), mettant en évidence le double rôle du tableau de bord équilibré :

- *instrument informationnel*, ce qui permet à chaque responsable d'une unité de gestion de disposer des indicateurs spécifiques, sur lesquels il peut effectuer des comparaisons entre les résultats réels et les objectifs établis, réagissant en conséquence à son niveau de compétence ;
- instrument prévisionnel, puisqu'il compare en permanence les réalisations avec les prévisions en vue de déterminer la réaction des managers.

Le développement des compétences des employés présente une importance moyenne pour atteindre les standards de performance, fait relevé par le poids des réponses reçus de la part des managers (15%) ; à notre avis, il faut imposer aux salariés des standards de performances mesurables à la suite de leur participation aux programmes de formation et développement des compétences. Ces cibles doivent être soumises à une analyse intermédiaire au moins une fois par trimestre.

Figure no. 1 - Les actions qui assurent la hausse de la force compétitive des entreprises analysées

L'externalisation de certaines activités vers des entreprises spécialisées, appréciée comme un facteur d'augmentation de la compétitivité par 10% des managers des compagnies productrices des confections textiles, présuppose l'utilisation stratégique des ressources externes pour le développement de certaines activités qui pourraient être réalisées avec les forces propres. Les entreprises pourront hausser leur niveau de performance sélectionnant les fournisseurs qui ont l'habileté d'offrir des services complexes d'externalisation, pour les activités qui ne font pas l'objet principal de la compagnie.

Le poids très réduite des réponses concernant le rôle du reengineering dans les activités de production et vente dans la hausse de la force compétitive d'une organisation (5%) met en évidence la notoriété assez basse de ce concept et de ses avantages au sein des entreprises analysées, dans les conditions où la majorité des problèmes liés au développement peuvent être solutionnés par la re-modélisation de la culture managériale à travers les opérations de reengineering.

A la question concernant **les implications des cultures organisationnelles sur les modalités qui définissent les prémisses de l'implémentation d'un système de contrôle de la performance**, la majorité des managers ont placé sur la première place le développement des relations constructives entre les organisations et leurs « stakeholders » en vue de mettre en œuvre une culture orientée vers la performance

(52%), suivi par la mesure et l'évaluation de la performance en concordance avec les standards et les objectifs établis, en vue d'offrir aux managers et aux employés le feedback de leurs activités (30%) et la création d'un cadre pour la mise en place d'un système d'objectifs, exprimés par standards de performance (18%). (figure no. 2)

Figure no. 2 - Modalités qui définissent les prémisses de l'implémentation d'un système de contrôle de la performance

Dans l'opinion des managers interviewés, la projection des tableaux de bord équilibrés n'est pas influencée par les composantes des cultures organisationnelles ; nous ne partageons pas cet idée parce que, à notre avis, la performance organisationnelle représente une valeur culturelle qui impose la projection des tableaux de bord équilibrés en vue d'évaluer le degré d'accomplissement des critères de performance.

La culture organisationnelle orientée vers la performance s'appuie sur les interactions répétitives entre les quatre perspectives d'un tableau de bord équilibré (la perspective des clients, financière, du développement organisationnel et des processus internes), la mise en commun des croyances et valeurs partagées par les employés, même s'il y a des facteurs fortes qui la particularise, comme : le style de management et implicitement la manière de la prise des décisions, le niveau de formalisme, la structure d'organisation, qui peuvent influencer les comportements des employés en vue de l'accomplissement des objectives.

Un aspect qui a déterminé l'intérêt accru des chercheurs et praticiens dans le domaine du management de la performance concerne la réalisation de la fonction de contrôle à travers la culture organisationnelle. Celui-ci est un contrôle qui peut être considéré de nature idéologique, orienté tant vers la raison que les émotions des employés. Le contrôle culturel agit sur plusieurs niveaux, qui varient de ceux cognitives, aspects éthiques (normes, valeurs, idéologies) vers ceux esthétiques et émotionnelles (honneur, loyauté, dévouement). La culture organisationnelle peut être considérée l'un des principaux moyens qui vise la création d'une discipline sociale dans l'organisation et assure l'accomplissement des indicateurs de performance.

Dans le moment où les managers des entreprises textiles **approuvent un système de contrôle de performance**, ils accordent la plus grande importance à la manière de stimulation des employés de tous les niveaux hiérarchiques pour atteindre les standards de performance (45%). La projection et l'implémentation d'un système informatique de management des performances a obtenu un poids de 28% du total des réponses à cette question, tandis que la mise en place des plans réalistes de performances individuels et les facteurs critiques qui assurent le succès des stratégies d'affaires ont enregistré 15%, respectivement 12% des options de managers. (figure no. 3)

Figure no. 3 - Le degré d'importance accordé lorsque les managers approuvent un système du contrôle de performance

L'évaluation et le mode de récompense des employés doivent être considérés des processus d'analyse qui offrent aux salariés le feedback nécessaire à la réalisation de la performance. Les managers doivent toujours récompenser les performances de pointe et expliquer le plus claire possible le concept de « performances à haut niveau ».

De même, nous considérons qu'un management performant, adapté aux demandes actuelles du marché, suppose l'adoption d'un système informatique complexe qui assure la cohérence informationnelle, technologique et d'infrastructure ; l'implémentation d'un système informatique de management des performances contribue à l'amélioration de l'activité d'une organisation par l'accroissement de la productivité, une utilisation efficiente des ressources matérielles et humaines, la connaissance opérative et détaillée des revenus et coûts. Toutefois, les rapports fournis par ces systèmes informatiques permettent l'adaptation rapide à l'environnement d'affaires, ce qui conduit à une compétitivité accrue des compagnies.

La mission principale d'un manager est de faciliter la performance individuelle, de créer les conditions nécessaires à l'accomplissement des indicateurs de performance. On considère que la performance individuelle et le rendement collectif dirigent vers l'ouverture des nouvelles opportunités de développement.

En vue d'assurer l'efficacité du système de contrôle des performances, il faut envisager, dès le moment de sa conception, une approche séquentielle des objectives, puisqu'on considère que dans une première étape le contrôle de la position stratégique de l'entreprise dans son environnement d'affaires s'impose, suivi par la communication de la position stratégique de l'organisation auprès ses « stakeholders », la conception du système des indicateurs de performance et finalement la confirmation des priorités pour atteindre les critères de performance.

Plus de la moitié des managers des entreprises incluses dans l'échantillon de la recherche (52%) partagent l'opinion que **l'indice général de performance** se réalise sur la base des objectives d'amélioration des performances par rapport à la propre performance enregistrée dans une période antérieure, tandis que 23% des répondants considèrent que cet indicateur est déterminé sur la base des objectives d'amélioration de la performance par rapport aux concurrents (à travers les techniques de benchmarking). Il existe aussi d'autres opinions conforme auxquelles l'indice général de performance est représenté par un set d'indicateurs qui assurent une vision unitaire du top management, adaptée au besoins de pilotage organisationnel (15%) et favorisent la participation du personnel à travers une responsabilité accrue et en même temps stimule les employés en vue d'atteindre les objectifs mesurables (10%). (figure no. 4)

Figure no. 4 – Modalités d'approche de l'indice général de performance

L'objectif suprême d'une organisation est de performer constamment en vue de se développer. On remarque le fait que la majorité des organisations incluses dans le processus de la recherche ont une approche en ce qui concerne l'indice général de performance rapportée à sa valeur dans une période antérieure, fait qui nous détermine d'affirmer que la vision managériale se focalise surtout sur les processus internes.

Les performances organisationnelles doivent être corrélées avec celles de chaque employé. Si les performances organisationnelles s'expriment d'habitude par les indicateurs financiers, celles individuelles sont en général influencées par les comportements, attitudes ou l'accomplissement des objectifs individuels.

Les indices généraux de performances diffèrent d'un niveau hiérarchique à l'autre, d'un département à l'autre. Les similitudes apparaissent dans la zone des valeurs individuelles/valeurs spécifiques à l'entreprise et aussi dans la zone de certains comportements/qualités spécifiques. Pour chaque position il faut établir exactement les valeurs personnelles et professionnelles qui font la différence : la capacité de travailler individuellement ou en équipe, la capacité de conduire une équipe et de tolérer l'autorité, l'accomplissement des objectifs pré-établis ou indices professionnels.

L'importance de l'organisation des sessions d'évaluation des performances doit être mis en lumière, puisqu'elle a un impact majeur sur la motivation individuelle et aide les employés d'appréhender quels sont les points forts et quels aspects doivent être améliorés.

Balanced Scorecard est un moyen utilisé pour transposer avec succès la stratégie dans la pratique à travers le suivi des indicateurs de performance financiers et non financiers. Ceux-ci sont définis en vue d'établir les cibles et mesurer la performance au niveau de tous les compartiments d'une organisation.

Le principe de projection du tableau de bord équilibré (Balanced Scorecard) auquel adhère la majorité des managers interviewés (43%) relève l'optimisation des indicateurs de performance afférents à ses quatre perspectives (financière, clients, processus internes et développement organisationnelle), ainsi que les améliorations apportées dans certains processus d'affaires n'aient pas lieu au détriment de la détérioration des autres ; 35% des managers des compagnies textiles incluses dans la recherche considèrent que le principe de la projection d'un Balanced Scorecard est constitué par les relations de dépendance entre les indicateurs associées à ses quatre dimensions, qui facilitent la détermination de l'indice général de performance, tandis que 12% des managers croient que la projection du Balanced Scorecard suppose, premièrement, l'association dans un seul rapport managérial des éléments nombreux, apparemment sans interdépendances entre eux, d'un plan d'affaire orienté vers l'obtention de la performance ; 10% des

réponses à cette question envisagent les relations qui apparaissent entre la projection du Balanced Scorecard et l'assurance du cadre pour l'élimination des situations qui mettent en évidence des ressources inefficaces qui participeront à la réalisation des indicateurs de performance. (figure no. 5)

Figure no. 5 – Principes de projection du Balanced Scorecard

A notre avis, le tableau de bord équilibré (Balanced Scorecard) ne doit pas être perçu comme un facteur de remplacement pour la stratégie et la vision d'une entreprise, mais il est un instrument qui aide à leur formulation et réalisation, permettant un équilibre entre les objectifs financiers et ceux non financiers, engendrés par la perspective des clients, processus internes et appréhension et développement organisationnel. Après les résultats obtenus suite à la recherche, le processus d'optimisation des indicateurs de performance associés à ces quatre perspectives du Balanced Scorecard s'appuie sur un équilibre qui doit être assuré au niveau du chaque département, et le système informatique doit fournir des rapports qui mettent en évidence les relations de dépendance entre les indicateurs associés aux dimensions du tableau de bord, tandis que les situations d'allocation inefficace des ressources qui participent à la réalisation des indicateurs de performance doivent être envisagées par les logiciels de type Project Management.

Balanced Scorecard est fondée sur une approche pondérée entre quatre perspectives et a comme but le transfert du poids de la gestion financière à court terme sur la vision managériale à moyen et long terme, basée sur les stratégies innovatrices orientées vers la satisfaction totale des attentes et exigences des clients. L'objectif de cette méthode est d'orienter la stratégie vers les indicateurs qui décrivent le futur de la compagnie.

Les quatre perspectives impliquent la capacité des managers de fournir des réponses aux questions suivantes :

- **Perspective financière** (Comment nous sommes perçus par les stakeholders ?)
- **Perspective clients** (Comment nous sommes perçus par les clients ?)
- **Perspective processus internes** (Dans quels processus est ce que nous devons exceller pour avoir succès ?)
- **Perspective Développement et Innovation** (Comment est ce que nous soutenons notre capacité d'adaptation et comment pourront améliorer nos performances ?)

Parmi les quatre perspectives du tableau de bord équilibré, les managers des compagnies analysées accordent l'importance la plus grande à la perspective financière (40%), suivi par la perspective clients

(35%), la perspective des processus internes (18%) et la perspective développement et innovation (7%). (figure no. 6)

Figure no. 6 – Le degré d'importance accordé aux quatre perspectives du tableau de bord équilibré

Même si la plupart des réponses reçus mettent en évidence le placement de la perspective financière sur la première position, qui apparemment prouverait une orientation prédominante de ces organisations vers les résultats financiers, nous considérons que toute stratégie doit prouver que les relations de type cause - effet dans le tableau de bord équilibré peuvent être identifiées à partir des résultats financiers, à travers la perspective clients et processus internes et finalement vers la perspective développement et innovation. Lorsqu'une stratégie est élaborée, Balanced Scorecard doit être complétée par une série d'indicateurs cible qui représentent les niveaux de performances désirables dans le futur. La construction de ces quatre dimensions suppose d'accorder priorité aux activités et projets qui contribueront à l'accomplissement des cibles ; en vue de vérifier la faisabilité et la commensurabilité des cibles, il faut avoir le savoir faire dans le domaine du contrôle de performance.

3. Conclusions

Nous apprécions le fait que **Balanced Scorecard** analyse la stratégie d'affaire à travers toutes les perspectives possibles et permet la division des objectifs stratégiques en actions individuels jusqu'au dernier niveau opérationnel. L'avantage le plus important de cet instrument est représenté par les relations directes entre les objectifs stratégiques à long terme et les actions à court terme. La majorité des systèmes de contrôle et de management des organisations sont conçus autour les indicateurs et cibles financières, mettant l'accent dans une proportion réduite sur les objectifs stratégiques à long terme, engendrant une approche différenciée entre l'élaboration de la stratégie et sa implémentation.

Les managers qui utilisent le modèle Balanced Scorecard ne se focalisent pas seulement sur les indicateurs financiers à court terme en vue d'évaluer les performances de l'entreprise. Le tableau de bord équilibré permet l'utilisation de quatre **processus**, qui contribuent à la corrélation entre les objectifs à long terme et les actions à court terme. Ces processus sont : **la traduction de la vision, la communication et relation, la planification de l'affaire, le feedback et apprentissage organisationnel.**

☉ **La traduction de la vision** est le processus qui aide les managers d'atteindre le consensus dans leur organisation en ce qui concerne la vision et la stratégie organisationnelle. Pour que les employés agissent conforme aux déclarations présentées dans la vision et stratégie, celles-ci doivent être exprimées par un set intégré d'objectifs et mesures, agréées par tous les directeurs exécutifs, qui décrivent les facteurs du performance à long terme.

☉ Le deuxième processus, **la communication et la relation**, permet aux managers de communiquer la stratégie en amont et aval des échelles de la pyramide organisationnelle et de la lier par les objectifs individuels et les objectifs départementaux. Traditionnellement, les départements sont évalués conforme

aux performances financières. Balanced Scorecard offre aux managers l'opportunité que tous les niveaux organisationnels comprennent la stratégie à long terme.

☉ Le troisième processus, **la planification de l'affaire**, implique la possibilité des compagnies d'intégrer les plans financiers avec les plans d'affaires. La majorité des organisations implémentent des programmes de changements, chacune avec ses managers et consultants de projet, concourant pour le temps, l'énergie et les ressources des directeurs exécutifs, situation qui conduit fréquemment aux problèmes liés aux résultats. Lorsque les managers planifient des objectifs ambitieux pour Balanced Scorecard comme une manière d'allocation des ressources et établissement des priorités, ils peuvent comprendre et coordonner les initiatives qui aboutissent aux stratégies à long terme.

☉ **Le feedback et l'apprentissage**, le quatrième processus du Balanced Scorecard, offre à une entreprise la possibilité d'apprentissage stratégique. L'existence du feedback et l'évaluation des processus sur lesquels se focalise la vision de l'organisation, ses départements et ses employés assurent l'accomplissement du système des indicateurs spécifiques au contrôle de la performance.

EDUCATION SERVICES QUALITY – A MUST FOR A COMPETITIVE EDUCATIONAL SYSTEM AT A EUROPEAN LEVEL

Olaru Silvia

Spiru Haret” University, Faculty of Marketing and International Business , Splaiul Independenței, nr. 313, Bucharest, Sector 6 , 0040 21 3169793, olarudelia@yahoo.com

Considering the present economic development, human resources represent the essential element of competition, at both national and international level. In the global competition of the IT economy, quality and human resources ingenuity are the main factors that differentiate countries.

Taking into consideration Alfred Marshall’s statement: “the most valuable of all capital is that invested in human beings”, we consider the quality of human resources in general and that of education in particular to be a key factor for general economic growth.

Key words: human resources, quality, education, quality management

Introduction

Specialists say that there is a very close relation between the technological progress and the investment in education influencing all areas of life: economy, society, politics, and culture. Although the most wide spread idea about quality is that it’s expensive, researches have shown that this idea is false. The quality of education is a desired social objective, and its contribution to general efficiency of economy is determinant.

Seen as a corporate culture model, total quality management has the purpose of orienting all its activities and processes towards the client and of optimizing them, so that they bring him long term benefits. The customers of the education services are both the people who benefit from them and their family but also the society as a whole.

The deficiencies of educational institutions’ management come from the orientation towards solving and diminishing quality problems as they arise rather than increasing the quality of processes and activities that generate these problems, the duality of organizational structures in the educational system and the tendency of self isolation of the personnel and functional subdivisions, the faulty analyses and institutional quality management measurement processes and often solving quality issues after a “late modernization” model.

1. Human Resources – A Key Factor for Economic and Social Development

Considering the present global economic development, the human resources represent the essential element of competition, at both corporate and national level. In the global competition of the IT economy, quality and human resources ingenuity are the main factors that differentiate countries.

People represent the main source of any economy on its way to modernization. The human resources that are educated, healthy, with a high physical and intellectual potential, able to be educated during the whole cycle of life and that adapt themselves to the economic changes, are essential for an economic growth model based on competitiveness, efficiency and quality.

Based on the existence of “living organizations”, managers have reached the conclusion that human resources represent the soul of those organizations (Mathis, R.L., Nica, P.C., Rusu, 1997).

Economic growth depends directly on work productivity. Higher capital investments and technological modernization, although necessary, are not sufficient to obtain these productivity improvements. This is why the improvement of human resources quality is necessary as an inherent condition that in the end implies the structural increase and optimization of public and private investments in key domains of human development, first of all in education and health.

The quality of human resources represents a sum of properties and characteristics of the human resources of an organization. The books written on this subject, refer to quality sometimes as “utility”, “capability to utilize”, or “conformity with the requirements” (S.Ciurea, N. Dragulanescu, 1995). Each of these

expressions represents aspects of quality that require further explanations because here we refer to human resources quality.

Although there have been a lot of discussions about better utilizing the human resources, usually, in reality, the whole potential of personnel from one division is not fully utilized. Thus the necessity of relating the exigency of issued standards with organizational realities regarding: (C. Rusu, M. Voicu, 2001):

Supporting and developing the organization's personnel competences (the efficiency of professional development system of the personnel and of promoting procedures, including the system for choosing all levels managers; the awareness and acceptance degree of the personnel for the criteria employed to evaluate performance.

In order to increase the workforce and corporate adaptability, the following will be supported: assurance, development and maintenance of workforce in order to achieve the companies' high criteria regarding the workforce competences, requirements that are essential in order to be competitive in the transforming process of economic and technological conditions required by the development of knowledge based society.

Adapting the professional competences of own personnel to the company's development needs will support the increase of productivity and the quality of work. All these, together with better work conditions, will lead to a healthy and secure workplace, especially in activity domains and divisions with a high risk and will determine a substantial decrease of accidents as the workplace and of professional diseases, as well as promoting an active aging process (prolonged active life and reduced phenomenon of anticipated retirement).

For continuous improvement of knowledge and managerial competences on all levels, entrepreneurial development will be supported. Implementing programs for entrepreneurial development will lead to ensuring entrepreneurial creativity, improving the manager's and the entrepreneur's capacity to manage their business and to adapt to the exigencies demanded by competitiveness and technological changes.

In order to make the changes in economic and social life faster, it's necessary to have a human resources policy that ensures high quality personnel. In a world characterized by globalization and internationalization of businesses, you can't obtain performance without competent human resources, which means that personnel activities go to a next level concerning promoting total quality management (TQM) and related to that concerning the strategic importance for organizations.

The development of human resources in education has as objective the diversification of initial and continuous education offers and of career opportunities for teaching staff and other human resources from the education and initial learning system. The competences gained during this education and learning programs will ensure, first of all, the acquisition and development of rewritten competences in the European Framework for Teachers' Qualifications.

The actions taken into consideration for this, view the human resources from education, both as participants to lifetime study and as disseminators of knowledge. This domain contributes to the development of human capital stock in education capable to offer quality education focused on individual personal and professional development needs of students, to decreasing the early school abandonment phenomenon and to increasing of education attractiveness.

Also, taken into consideration the fact that orientation and counseling services of human resources in education are not developed enough, nor have operational specific instruments to define professional and career plans for this category of human resources, actions from this domain will be linked with specific measures of career development growth opportunities for human resources in education.

The main actions taken into consideration are:

- Developing continuous education offers for teaching staff and human resources in education (including "on the job training");
- Developing initial education offers for teaching staff and human resources in education (for example, master's programs for teaching staff);
- Developing continuous and initial education offers for new professions in education; research;
- Developing the supplier services and instruments network;
- Ensuring the access to quality services;

- Career opportunities and career development services for human resources in education.

Developing and modernizing initial and continuous education offers have as objective the increase of the educational offers' appeal, the increase of quality and education value for the workforce market. The investment in human capital must be understood as an investment that sums up the investments in education. The investment in human resources includes the total expenses for increasing physical and intellectual aptitudes of people. The investment in human resources approach, like investments in physical capital, can be made through the cost-benefit, cost-efficiency and actualization analysis.

Among the factors that influence the investment in human capital are: *the economic general situation, the length and stability of the income flow, income differences, direct and indirect costs, ability revenue, human capital investment rate of return, the marginal income of it*, etc. Investments in human potential, seen as key investments in an economy, should be focused so that they coincide also with workforce occupation politics at national level. It should also be taken into consideration that an efficient regional and activity sector management of investments in human capital can lead to a better national economic development.

The perception of changes that took place in the structure of human resources and the effects caused by them on investments in human capital evolved along with the restriction of activities in some domains. Thus, the appearance of unemployment and the effects of it on some socio-professional categories led to rapid changes mainly in the structure of work demand and generated significant mutations in the human capital investments' structure.

The most important part of human capital is, as we have already shown, education and implicitly, the level of knowledge. In order to highlight the efficiency of investments in education we have to analyze both the costs and the benefits of the investing process.

The costs refer to the funds allocated for acquiring land but also buildings meant for education purposes. The private benefits resulting from the investment in education are clear: increased incomes, decreased risk of unemployment, therefore the increase of the degree of insertion on the workforce market. Social benefits strengthen the social cohesion, the increase of productivity and the certainty of economic growth, the decrease of social costs by preventing social exclusion, etc.

Taking into consideration the fact that individual investment into a person is made on a long term basis, not only in school but also at the workplace, the investment responsibility is not only of the employee but also of the employer, because the production process is the subject of permanent adaptation to the new techniques and technologies that appear on the market.

An OECD study shows that "participating at an additional year of secondary education amplifies the economic growth by as much as 5% and further, with 2.5% on a long term". Also, an additional school year raises the level of individual salary by approximately 6.5%. Evidence has also shown that, unemployment rate decreases along with the superior education levels, thus reducing the social costs that are involved. In conclusion we can say that the employment rate increases together with the education level reached by a person.

Education must help solve some of the problems that the contemporary society deals with. For this, internal coherence of education systems and society must be improved, but also ensuring a certain stability and continuity of these that will ensure long term efficiency.

If investments in tangible resources have as output the creation and development of physical (technical) capital, investments in the growth, education and training of human resources generate that which we call human capital.

We can say that a better quality of work contributes to the growth of employment, productivity and social cohesion. Benefiting of a higher and higher reward for qualification, the polarization between those with high volume and those with low volume of knowledge *affect the economic and social cohesion*. The access to education paid by the employer is often limited for those who already have a high qualification and so some groups are blocked in the inferior part of the workforce market.

An important desideratum is the development of education and training throughout the entire life, so that the changes and reorganizations in the economy don't produce negative effects for the social cohesion. One of the most important conclusions of recent research in education is that investment in educating and training people is both a *growth factor*, especially in the present times characterized by fast technological changes, and a fundamental instrument in *supporting social integration*. This fact was also confirmed by

the analysis of the PISA study results, which show that some countries with the highest medium achievements have, also, the lowest levels of differences between individuals and schools; in other words, the improvement of quality does not imply restricting the opportunities, on the contrary.

Education and high qualification education are considered an instrument of reducing differences between highly and lowly developed regions, by providing human resources necessary to the economic and social development. Choosing *the regional or local level of the training degree* as one of the six fundamental pillars of permanent education strategies in Europe and the movement for Learning Cities and Regions show how important these have become for hiring workforce and for local and regional development.

The question here is: should education be seen as a public asset exclusively? It is said that a stable, democratic society can't exist if the majority of its citizens don't dispose of a minimum level of civic culture. The idea is that the education a child benefits from brings benefits not only to his parents or to himself, but also to the other members of the society. "The education of my child contributes to other people's welfare by promoting a stable and democratic society" (M. Friedman).

Other people from the society benefit also from the fact that a parent pays for the education of his children. But it's difficult to identify all the beneficiaries and to demand payment from them. As a conclusion, we are dealing with a vicinity effect. Governmental intervention would be necessary on one hand in order to impose that every child receives a minimum level of education, and on the other hand to pay for this education in the case they don't afford.

Regarding the Romanian education system, we can see that it faces structural issues and especially the rural education system which deals with major difficulties regarding investments in physical infrastructure, qualified teaching staff, limited access to professional education and to continuous education programs for the rural population.

The special interest for investing in human capital in general and educational in particular is reflected also by the constant concern of OECD to support economic growth through programs of educational capital growth. International comparative studies for OECD countries show that at individual level, investment rate of profit in education is higher for higher education graduates than for secondary education graduates.

2. Quality of Education Services – a Must of the Present Times

In Romania, as well as in other European countries, the quality of education has become a very interesting domain considering in the first place the national differences as compared to developed countries and the necessity of obtaining results integrated in the European context. For this, compatible politics and procedures for ensuring the quality of teaching and higher education have began to be promoted, in order to increase the global competitiveness of higher European education and to facilitate mutual acknowledgement of each other's diplomas and university degrees.

Taking into consideration the desired outcome, any higher education institution is responsible to develop a quality culture, meaning to develop politics, techniques and practices that are applied consistently and thoroughly documented in order to obtain those results / performances that obey the desired objectives.

Among the institutional standards of ensuring the quality in a university are: the existence of specific mechanisms of approval, surveillance and evaluation of study programs and diplomas, the evaluation of students according to public criteria and procedures consistently applied, the compulsory fact of ensuring sufficient, competent and qualified teaching staff to manage teaching and study, the learning resources offered to the students to be appropriate and specific for each learning program, institutions to have data systems and information that measure the quality.

The quality of education services is a desired social objective, and its contribution to the general growth of efficiency of economy is critical. Although the most widespread idea about quality is that it's expensive, research have shown that this idea is false.

Ensuring the quality in education refers to elaborating reference standards, norms and performance indicators in the national education system taking into consideration the following aspects:

- The quality of the national education system;
- The quality of suppliers, education unit and institution representative.
- The quality of teaching and education process of the students is proven by the learning results, by applying development methodologies of the curriculum, teaching and learning methods, evaluating the examinations and certifications.

Concerns regarding ensuring the academic quality exist also in the extra-European and global space. For example, UNESCO and OECD, taking into consideration the transnational, cross-border education, are involved by elaborating and adopting “guidelines” regarding the quality of the services offered by transnational institutions. The issue is that of applying the same quality rigorous demands not only to national institutions, but also the transnational ones.

Among the motivational factors that determine higher education institutions to be concerned with the quality issue are:

- Orientation towards performance and increasing competitiveness of universities on the education services market and of graduates on the workforce market;
- The increase of expenses for education processes and for research and development;
- The acknowledgement on the European market of the qualifications (titles and diplomas) offered by the institutions in the country;
- Developing a corporate culture of quality, total involvement of the personnel for obtaining performances;
- Increasing the responsibility for the quality of university services.

In order to offer a common set of references to all universities and to facilitate the inter-university comparison regarding the institutional management and to evaluate the quality externally, the following was proposed by Law:

- Reference standards;
- Clues concerning domains where this applies;
- The necessity of working with performance indicators.

Conclusions

Ensuring the quality and quality management in education and initial education is an area that mainly needs developing and implementing systems and procedures of internal evaluation, management and the guarantee of quality for the education activities and initial and continuous education, as well as professional managerial activities for the suppliers of education and for the initial and continuous education.

The focus is mainly on the institution’s activity and on the suppliers of education and knowledge from the formal education system. The main activities focused on are: creating and developing guarantee systems and quality management in education and training; developing professional training programs for educational management and for quality management; developing mechanisms to monitor the graduates’ entrance on the workforce market in order to adjust the education offer according to the evolutions from the workforce market; creating and developing guarantee mechanisms and quality management in education in the non-formal and informal education contexts.

The quality of education in the Romanian education system focuses on outputs as per the European context revealing opportunities offered by the European society of knowledge. Pupils, students and teachers must be aware of the necessity of proper studies that can be efficiently used in the entire Europe.

Considering that quality education means continuous improvement of performances and considering the rhythm of social changes, education institutions must have as objective the continuous development of human resources.

Cette étude présente brièvement la manière dont les managers gèrent les relations de travail, tout en insistant sur les stratégies et les styles de management utilisés, en passant par les facteurs d'influence. Une partie de cette étude est réservée à l'explication du déclin des relations collectives de travail, qui se développent sans syndicats dans diverses organisations de certains états de l'Union Européenne.

Mots-clés : relations de travail, syndicat, stratégies, styles de management

Considérations générales

M. Armstrong, spécialiste de la pratique des relations collectives de travail, définit la notion de « relation de travail » comme le rapport entre les employeurs et les employés. Ces rapports peuvent être formels (tels que les contrats de travail, les accords de procédure) ou bien ils peuvent être informels, tel le contrat psychologique. Ce dernier exprime, selon M. Armstrong, certaines suppositions ou attentes liées à ce que les employeurs ou les employés désirent effectivement offrir. Dans une entreprise, un contrat psychologique équilibré est nécessaire pour avoir une relation ininterrompue et harmonieuse entre l'employeur et l'employé. La transgression de ce contrat est la preuve que les deux parties ne partagent plus le même système de valeurs et d'objectifs.

Selon cet auteur, le point primordial dans la relation de travail est l'obligation assumée par l'employé d'offrir à l'employeur effort et aptitudes contre un salaire ou une rétribution. Les employeurs autant que les employés continuent d'avoir certains droits et obligations légales implicites. D'une part, l'employeur est obligé de payer les salaires, de mettre à la disposition des employés des conditions de travail qui correspondent à leur niveau de qualification, de faire preuve de bonne foi dans les rapport avec les employés et de ne pas compromettre la confiance qui caractérise la relation de travail. D'autre part, les obligations de l'employé tournent autour des mots-clés suivants : conformité, compétence, honnêteté et loyauté.

Les dimensions de la relation de travail sont présentées par S. Kessler et R. Undy (figure 1). Ainsi, la relation de travail peut avoir une dimension individuelle si elle fait référence aux contrats et aux attentes des individus, ou une dimension collective, si elle renvoie aux relations entre la direction de l'entreprise et les syndicats, les associations des employés ou les membres des organismes consultatifs communs, telles les commissions paritaires des usines.

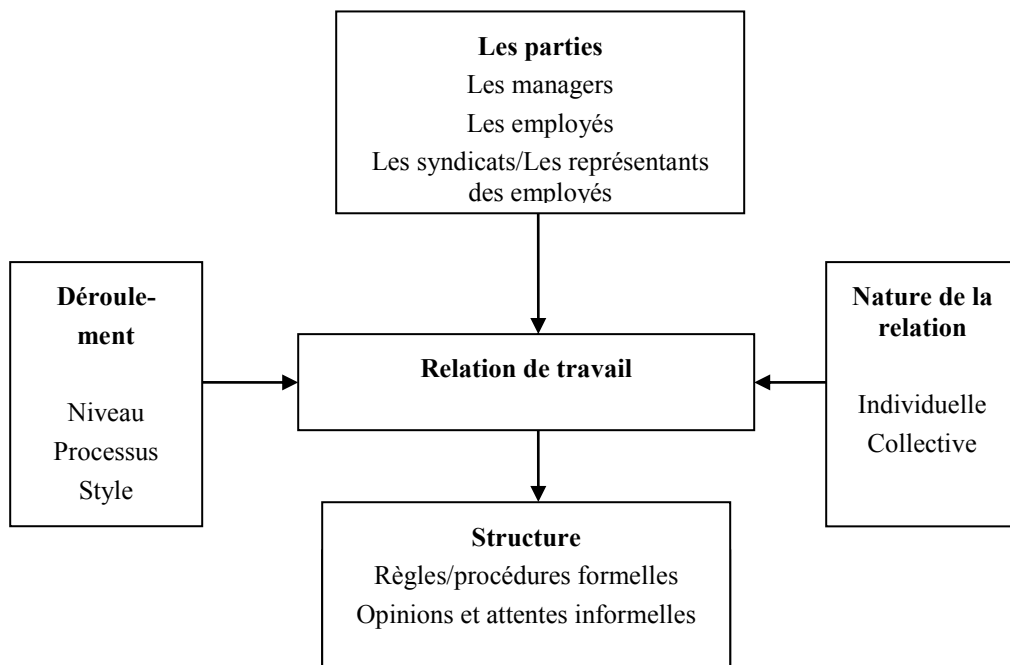

Figure 1. Dimensions de la relation de travail

(source : S. Kessell et R. Undy, The New Employment Relationship : Examining the psychological contract, Institute of Personnel and Development, London, 1996)

Par ailleurs, dans la relation de travail, il est très important de souligner le rôle de l'employeur. En effet, c'est lui qui détient généralement le pouvoir de dicter les termes du contrat, si ces derniers n'ont pas été fermement établis par négociation collective. Les employés individuels ont rarement la possibilité de modifier les termes contractuels imposés par les employeurs, excepté les cas où ils sont fortement recherchés sur le marché du travail. Le déroulement de la relation de travail est influencé par des processus comme la communication ou la consultation, ainsi que par le style managérial qui caractérise une entreprise ou qui est adopté par certains managers individuellement.

Stratégies concernant les relations avec les employés

Les stratégies concernant les relations avec les employés portent sur ce qu'une entreprise se propose de réaliser ou de changer dans la manière dont elle gère les rapports avec les employés et les syndicats. Les relations entre l'employeur et l'employé ont depuis toujours représenté une source potentielle de conflit. Dans cette perspective, Friedman (1977) parle de deux types de stratégies utilisées par les managers pour exercer l'autorité : l'autonomie responsable et le contrôle direct.

- **L'autonomie responsable** mobilise la capacité de travail tout en accordant aux employés la possibilité de contrôler eux-mêmes leur activité pour un meilleur profit de l'entreprise. Ainsi, les managers accordent aux employés un certain statut, de l'autorité et de la responsabilité, tout en cherchant à les rendre fidèles et à les déterminer à adopter les objectifs de l'entreprise.

Le contrôle direct est basé sur la surveillance de très près de l'employé. Il s'agit d'un régime sévère de discipline caractérisé par des menaces liées à la diminution du salaire, voire au licenciement. On a aussi tendance à réduire la responsabilité individuelle des employés. Tel que le montre Morgan (1977), le contrôle direct voit dans l'entreprise et les employés un mécanisme. C'est un régime actuellement considéré comme révolu, peu intéressant pour l'employé, qui se rend compte qu'une meilleure productivité serait possible si on utilisait la stratégie de l'autonomie de la responsabilité ou de la délégation (voir La Théorie Y de McGregor, 1960)

Par ailleurs, l'approche de Walton (1985), qui porte sur les stratégies managériales mutuelles (où les employés et les employeurs partagent les objectifs de l'entreprise ainsi que le but de les atteindre), a été

plus appréciée que le contrôle direct, qui risque de compromettre la performance économique et le développement humain.

De leur côté, Blyton et Turnbull (1998) affirment que certaines stratégies peuvent être adoptées pour divers employés retrouvés dans des situations particulières. En revanche, il y a des employés qui peuvent faire l'objet de stratégies contradictoires. Tel est le cas des compagnies japonaises qui déploient leur activité en Europe. En effet, on impose à l'employé une discipline individuelle stricte et on l'encourage à la fois à une forte implication personnelle. Ces stratégies de contrôle dans les relations de travail témoignent sur la manière dont les managers comprennent agir pour le bénéfice de l'entreprise.

Au XXI siècle, l'économie des pays développés est basée sur des métiers qui prônent les connaissances et non pas le travail physique. Plus les employés sont instruits, plus leur rapport avec les managers tourne à leur avantage. On arrive ainsi à la stratégie de l'autonomie de la responsabilité. Par exemple, il est nécessaire qu'un employé comprenne que certaines décisions relatives au travail sont basées sur la notion de l'exercice du pouvoir en commun. Elles ne doivent donc pas être considérées comme imposées sans consultation préalable.

Styles de management dans les relations de travail

Le style de management reflète les manières dont les managers exercent leurs attributions dans la réalisation des fonctions du processus de management, ainsi que leur attitude envers les employés. Le style de management traduit la manière dont l'employeur pense et agit dans les relations de travail. J. Purcell et Gray (1986) ont défini les styles de management comme la manière préférée de travailler avec les employés ou les collectivités. J. Purcell et K. Sisson ont même identifié cinq typologies, en divisant les styles de management dans les relations de travail selon les différents managers :

- Les traditionalistes exploitent les employés, en les considérant comme de simples travailleurs, des facteurs de productions qui forment un mécanisme. On limite l'implication de l'employé et on s'érige contre les syndicats. C'est le meilleur exemple de contrôle direct, motivé uniquement par les coûts réduits. L'employeur paye moins, investit moins dans la formation des employés et dans l'amélioration des conditions de travail. Cela arrive le plus souvent dans l'hôtellerie et dans le textile. Dundon (1999) parle dans cette perspective d'une usine de moteurs du Nord-Est de la Grande Bretagne qui a arrêté le paiement des salaires et a licencié un employé ayant perdu deux doigts lors d'un accident de travail.
- Les paternalistes sophistiqués sont considérés de bon employeurs qui prennent soin des employés de manière paternelle. Ils ne reconnaissent pas les syndicats. En revanche, la formation, l'implication et l'engagement des employés constituent les stratégies de ce type de managers. Ce style est rencontré dans la haute technologie et dans la recherche. Par exemple, Marks & Specer est la compagnie qui a pratiqué ce qu'on appelle aujourd'hui le management des ressources humaines. (MRH), Hewelt-Packard.
- Les sophistiqués modernes (les constitutionnalistes) reconnaissent les syndicats. Ils ont une visée plurielle sur les relations de travail et, pour résoudre les conflits, ils font appel à des accords collectifs formels. Ce style est rencontré dans l'ingénierie et dans la production, à l'exemple de Ford.
- Les sophistiqués modernes (les consultatifs) reconnaissent aux syndicats le droit de s'impliquer dans l'administration des relations de travail. La négociation est considérée comme un problème commun à résoudre et les stratégies de management prennent en compte l'implication des employés. On les rencontre dans les compagnies où les coûts qui concernent les employés sont relativement bas par rapport aux coûts d'ensemble, à l'exemple de Dupont.
- Les modernistes standard reconnaissent les syndicats, bien que de manière bivalente. Il n'y a pas de stratégie concernant les relations de travail. S'il existe un conflit de travail, on intervient ad hoc, de manière pragmatique. Ce style existe depuis longtemps dans les multinationales développées par des acquisitions ou par la diversification, dans le domaine de l'ingénierie et de l'industrie lourde, comme British Aerospace, Lucas.

Par ailleurs, on constate dans une étude récente (Marinaş Cristian, sous la direction de A. Manolescu, "Le Management comparé des ressources humaines" 2006, p.270) qu'il existe dans les organisations roumaines actuelles surtout deux styles de management impliquant la manifestation de l'autorité sous différentes formes.

Ainsi, certains employeurs adoptent le style familial de management centré sur des éléments tels que la richesse et les propres intérêts, sur le profit, sur la possibilité de risquer pour le développement de l'entreprise. Dans d'autres entreprises, c'est le style managérial allemand qui prédomine où les employeurs accordent des responsabilités aux employés. Enfin, les auteurs de cette étude considèrent que les managers de Roumanie adoptent majoritairement le style français, car l'autoritarisme constitue un problème de pouvoir personnel et une solution à la fois face aux activités quotidiennes de l'entreprise. Le droit d'organiser et de contrôler vient de la position hiérarchique de l'employeur.

L'administration des relations de travail dans les entreprises européennes

Un aspect essentiel visant l'« option stratégique » dans le management des relations de travail est lié à la reconnaissance des syndicats pour la détermination collective des termes et des conditions d'embauche. Un élément important dans ce processus porte sur la décision du degré de reconnaissance accordé par la direction au syndicat. En effet, le manager dispose de deux options : une reconnaissance partielle (procédurale), où les droits de reconnaissance sont limités aux problèmes liés aux mesures disciplinaires, et une reconnaissance totale, où les syndicats participent en tant que partenaires égaux aux négociations avec la direction de l'entreprise pour déterminer les termes et les conditions contractuels.

Au fil du temps, le dialogue social a représenté la principale forme de communication entre les partenaires sociaux. Au cours des deux dernières décennies, dans l'Union Européenne de nouvelles formes d'action ont été adoptées afin d'anticiper et de répondre aux défis de la globalisation. On a ainsi identifié de nouvelles stratégies pour favoriser la justice sociale et la compétitivité économique.

L'Union Européenne a identifié dans les partenaires sociaux de nouveaux piliers de stabilité et de développement. La législation accorde une place primordiale aux négociations collectives à tous les niveaux. L'Allemagne, Le Danemark, Les Pays Bas, la Grèce sont des pays où les négociations ont lieu au niveau des branches d'activités professionnelles. Pour pouvoir participer aux négociations, le syndicat doit être représenté dans plusieurs institutions.

En Grande Bretagne, l'explosion syndicale a lieu dans les années 1979 lorsque le nombre des membres syndicaux atteint le sommet de 13,2 millions de personnes, vu la demande importante de travail de l'époque. Le déclin des syndicats est enregistré à partir des années 1990. En 1995, on décompte 8,2 millions de membres syndicaux pour 256 syndicats, et en 1998 on arrive à 7,5 millions de membres. Ce déclin a mené à ce que les négociations collectives au niveau des PME ne soient pas institutionnalisées.

L'enquête de 1998 (Cully) portant sur les relations de travail entre les employés, réalisée sur un échantillon de 3000 entreprises, constate que :

- dans 47% des entreprises il n'y a aucun membre syndical, alors qu'en 1990 ce chiffre était de 36%
- dans 2% des entreprises tous les employés sont des membres de syndicat, en baisse par rapport à 1990 lorsque ce chiffre était de 7%
- 70% des employeurs ont été d'accord avec le syntagme : « Ici on n'opère aucun changement sans un débat préalable avec les employés »

A présent, en Grande Bretagne, la position des syndicats est plutôt consultative et défensive. Les syndicats cherchent à protéger ses membres contre le licenciement abusif et luttent contre la modification des contrats et des accords de travail. Il existe pourtant des branches de l'économie britannique, tels les transports, où les syndicats disposent d'un grand pouvoir de négociation grâce à l'importance du service qu'ils rendent à la société. Par ailleurs, en France, les négociations collectives ont toujours favorisé l'adoption de solutions menant à la diminution des conflits de travail. En Belgique, les accords sociaux représentent un compromis entre les syndicats et les patronats qui reconnaissent le droit du syndicat d'être le seul représentant des ouvriers dans et en dehors de l'entreprise.

Parallèlement, en Espagne, les représentants des salariés ont des compétences importantes liées à la surveillance et au contrôle de l'activité de travail. En Italie, le dialogue social est limité à l'information des syndicats. Dans le secteur privé, la participation des salariés au dialogue est limitée.

Dans des pays tels que la Roumanie, la République Tchèque, la Slovaquie, la Slovénie, l'Estonie et l'Hongrie, le processus de globalisation est en pleine expansion, les syndicats ayant perdu l'opportunité d'exercer la moindre pression sur les compagnies internationales. On y constate aussi la diminution du

nombre de membres syndicaux. En Hongrie, par exemple, la législation du travail permet la réalisation de contrats collectifs. Mais, comme les PME représentent la moitié de la main d'œuvre, la probabilité de développement des relations collectives de travail est assez basse. Dans ce pays, les conditions de travail sont imposées par l'employeur par un accord individuel avec l'employé. En Lettonie et l'Estonie, 80% des employés ne font pas l'objet d'un contrat collectif de travail.

La législation actuelle de la Roumanie est alignée aux acquis communautaires. En ce qui concerne le dialogue social, le cadre juridique existant institutionnalise le dialogue social tripartite à tous les niveaux de l'économie nationale, tout en favorisant le fondement du dialogue social bipartite. Le dialogue social tripartite a lieu au niveau des structures suivantes : le Conseil Economique et Social, le dialogue social tripartite sectoriel, le dialogue social territorial.

Par ailleurs, la négociation et la conclusion des accords sociaux au niveau national représentent une forme particulière de partenariat social. Parmi les résultats remarquables enregistrés dans ce domaine, on signale l'élaboration et la promotion en commun de nombreux projets de loi et d'actes normatifs ayant un impact social particulier, tels : le Code du travail, la Loi des patronats, la Loi des syndicats, la Loi relative à la stimulation de l'embauche et à la protection sociale des chômeurs. On signale ici le rôle du partenariat dans la diminution considérable des conflits de travail au cours des dernières années, ainsi que la disparition des mouvements syndicaux revendicatifs au niveau national, les revendications s'étant limitées à des problèmes sectoriels et locaux. Selon le Bulletin Statistique trimestriel, dans le domaine du travail et de la sécurité sociale, le nombre total de conflits d'intérêts en 2006 est de 95, en baisse par rapport à 2003 lorsqu'on enregistrait 121 conflits.

Le dialogue social bipartite (syndicats, patronats) a une place importante dans le processus de négociation et de conclusion des contrats collectifs de travail, ainsi que dans la résolution des conflits collectifs de travail réglementée par la Loi n° 168/1999.

En guise de conclusion, on souligne que les perspectives du développement du dialogue social bipartite, basées sur l'augmentation des capacités des partenaires sociaux, vont mener à une implication soutenue de ces partenaires dans la résolution des problèmes économiques et sociaux, ainsi qu'à la création de nouvelles formes de partenariat nécessaires pour assurer un climat favorable à la stabilité sociale en Roumanie.

Les facteurs d'influence sur le choix des stratégies et du style managériaux

La Nature de la législation. Dans tous les pays de l'UE, l'administration des relations de travail est fortement influencée par la nature de la législation favorisant une plus grande uniformité dans la réglementation de la législation du travail en Europe. En Allemagne, il y a des réglementations formelles relatives à la participation des employés. En France, il existe des systèmes performants de réglementation pour la qualification dans le domaine de l'industrie. Les accords collectifs sont implémentés de manière légale dans beaucoup de pays européens, sauf la Grande Bretagne. Le système volontaire qui existe dans ce pays, où les employés et les employeurs choisissent librement la manière d'administrer les relations de travail, suppose une gamme variée de styles de management adoptés.

Les caractéristiques de l'entreprise. On fait référence ici à la taille de l'entreprise. En effet, plus une entreprise est grande, plus il y a des procédures formelles dans les relations de travail.

Le droit de propriété sur une entreprise. Le manager, propriétaire d'une petite entreprise, voit dans le syndicat un intrus. Une étude de 1998 relève le fait que 39 % des entreprises ayant entre 25 et 49 employés reconnaissent les syndicats, alors que dans le cas des entreprises de plus de 500 employés, les syndicats sont reconnus à hauteur de 78%. Par ailleurs, 11% des ces entreprises acceptent la rémunération des salariés par négociation collective, alors que pour les entreprises de plus de 500 employés la négociation collective des salaires est acceptée à hauteur de 43%. Enfin, 26% des ces entreprises enregistrent des employés impliqués dans la résolution de problèmes de l'entreprise sans faire partie de l'équipe de direction. En revanche, dans les entreprises de plus de 10.000 employés, ce rapport est de 47%. En Grande Bretagne, la même étude met en exergue le fait que le nombre d'employés du secteur public faisant partie des syndicats (95%) est double par rapport à celui du secteur privé (25%). Les styles managériaux du secteur public sont plus artificiels par rapport à ceux du secteur privé. Ceci est, d'une part, le résultat du déclin du secteur public en Europe, qui tend vers la privatisation totale. D'autre part, on constate une tendance dissimulée des employeurs publics à refuser les structures traditionnelles des relations de travail.

Puia Ramona Stefania

Academy of Economic Studies of Bucharest, Faculty of Management, ramonapuia@gmail.com

During the last sixteen years, Romania, like other south-eastern European countries, import managerial principle, methods and techniques from the western developed management systems. It is important to notice, that in this period, the managerial practices were influenced by the multinational companies. The recent managerial evolutions and the socio-economical, political, juridical and technological factors had directly consequences on the human development level in Romania.

Key words: human development index, Romania, GDP, adult literacy rate, gross enrolment ratio, life expectancy.

Introduction

Since January 2007, Romania became member of the European Union, but 74% of the urban population with higher education consider that Romania was not ready yet for the adhering process. The Romanian companies' managerial staffs also sustain this hypothesis, 75% of them considering that Romania doesn't have the necessary tools to face the European Union integration. A lot of Romanian companies consider the competition a threat, although they should understand it as a positive economic effect⁶³.

These are the main arguments to consider the necessity of an x-ray of the main managerial practices used in Romanian companies.

Human development indicator in Romania

According to the Human Development Global Report 2004⁶⁴, Romania was the 69th of the 177 countries that formed a hierarchical system based on the Human Development Indicator. The Human Development Index registered the value of 0.786 and so Romania was placed near the countries with a middle level of human development. The value of the Human Development Index is over the average registered by the Latin America (0.777), the Eastern Asia and the Pacific area (0.740) and the Arabian countries (0.651). Though, the Romanian indicator value is under the average registered in the Central and Eastern Europe (0.911). During the last four years, the Romanian Human Development Index registered a lasting growth in value, although the general tendency was under the growth rhythm of the region⁶⁵.

According to the Human Development Report 2007-2008⁶⁶, Romania is the 60 country in a total of 177 countries where data are collected and the Human Development Index is calculated. In 2005, the Human Development Index registered the value of 0.813 and so Romania was placed near the countries with a high level of human development. Generally, in Western and Central Africa there is a low rhythm of human growth (table 1). The countries with the highest rhythm of human development are the Northern Countries; three of them, Island, Norway and Sweden are in the first six places in the world. (Table 1).

	Country	HDI 2005	Level
High human development (HDI \geq 0,800)	Island	0,968	1
	Norway	0,968	2
	Australia	0,962	3
	Canada	0,961	4
	Ireland	0,959	5
	Sweden	0,956	6
	Switzerland	0,955	7
	Brunei	0,894	30
	Barbados	0,892	31
	Seychelles	0,843	50
	Oman	0,814	58
	Trinidad Tobago	0,814	59
	Romania	0,813	60
Medium human development (HDI 0,500 – 0,799)	Thailand	0,781	78
	China	0,777	81
	Egypt	0,708	112
	Uganda	0,502	155
Low human development (HDI \leq 0,500)	Senegal	0,499	156
	Rwanda	0,452	161
	Ivory Coast	0,432	166
	Sierra Leone	0,336	177

Table 1 The Human Development Index in different countries⁶⁷

The data from the Human Development Global Report shows that each component of the Human Development Index in Romania increased in value since 1995. (Table 2)

Indicators	Years		
	1995	2000 ⁶⁸	2005 ⁶⁹
GDP (USD per capita)	6,095	5,750	9,060
Adult literacy rate (%)	96,9	97,0	97,3

⁶⁷ *** Human Development Report 2007/2008 - Fighting climate change: Human solidarity in a divided world, Published for the United Nations Development Programme, New York, SUA, 2007, pag. 230-232

⁶⁸ *** Raportul Național al Dezvoltării Umane 2003-2005, www.undp.org, pag. 22;

⁶⁹ *** Human Development Report 2007/2008 - Country Fact Sheets – Romania;

Gross enrolment ratio (%)	61,6	66,5	76,8
Life expectancy (years)	69,4	70,5	71,9
Human Development Index (HDI)	0,759	0,767	0,813

Table 2. Romania's Human Development Index, 1995 - 2005

The educational issue registered some improvements (table 2), that showing the interest of the Government and of other organisations to invest in the human capital. The most important progresses were registered with the adult literacy rate, in comparison with the education index. During 1995 and 2005, the Gross Domestic Product continuously decreased, while the life expectancy index fluctuated. Beginning with 2000, at each of the two indicators levels (Gross Domestic Product and Life Expectancy Index) we can notice a continuous growth (Table 2). Between 2000 and 2005, Romania registered a sustainable economic development revealed by the evolution of the GDP per capita which registered a growth of 1.57 in 2005, in comparison with the year 2000.

During 1995-1999 was dominated by a series of economic difficulties that Romania dealt with in the process of transition to market economy. In that period the restructuring process reached a maximum especially because of the reorganisation of a large number of state enterprises and the decreasing of state budget subventions. Beginning with 2000, these measures brought positive effects that registered favourable economic evolutions.

Regarding the life expectancy, according to the data presented in the Human Development Report 2007-2008, Romania is the 76th country in a total of 177 countries. The biggest life expectancy index is registered by Japan with a record of 82.3 years and the smallest by Zambia (40.5 years). In Romania, the life expectancy is 75.6 years for women and 68.4 years for men.

Surprisingly, the highest adult literacy rate is registered by Georgia (100%) and the lowest in Burkina Faso (23.6%). In Australia there is the gross enrolment ratio (113%), while in Niger is the lowest value for this indicator (22.7%). The countries with the highest GDP per capita are Luxemburg (60.228 USD per capita), SUA (41890 USD per capita) and Norway (41420 USD per capita). The smallest value for GDP per capita is registered in Malawi (667 USD per capita).

In Bulgaria, the country that joined European Union in the same time with Romania, there is a higher index of human development than in Romania. In 2002, the Human Development Index was 0.796, also higher than the value registered in Romania 0.786 (Table 3). In comparison with other Central and Eastern Europe countries, Romania has a higher position than Turkey and Ukraine (Table 3). The annual rhythm of economic growth registered in Romania between 1990 and 2005 was of 1.6% per year, while in the same period in Bulgaria there was a lower rhythm of 1.5% per year. In countries like Croatia (2.6%), Czech (1.9%), Hungary (3.1%), the annual rhythm of economic growth was higher than the one registered in Romania in the same period of time.

In the Central and East Europe, Turkey registers the lowest value of the Human Development Index, but we can observe that, in the last seven years, Turkey reduced the deficit of human development and nowadays it is at the same level as Ukraine. In Hungary there is the highest value of the Human Development Index.

Country	HDI 1995	HDI 2002 ⁷⁰	HDI 2005 ⁷¹
Hungary	0,810	0,848	0,874
Croatia	0,798	0,830	0,850
Bulgaria	0,784	0,796	0,824
Romania	0,759	0,786	0,813
Russia	0,771	0,795	0,802
Ukraine	0,751	0,777	0,788
Turkey	0,713	0,751	0,775

Table 3. The Human Development Index in the Central and Eastern Europe countries

A comparative analyse of the Human Development Index values registered at the level of the Central and Eastern European countries reveals the direct relation between the economic performance of the country and the values of the Human Development Index.

There are also some indicators⁷² that can reveal the human development level registered in Romania:

- The women membership in politics that registered in 2002 the value of 9.3% of the whole number of parliamentary members. In 2007, this indicator registered the value of 10,7%.
- According the data from the Human Development Report 2007-2008, the percentage of women that occupy a management position in the central administration is 12.5%, comparative with Germany, the country that leads from this indicator point of view, 46.2% of the employees in public administration being women.
- In 2007 there was a high incidence of women in politics, 11.2% of deputies being women and 9.5% senators.
- 31% of the women are working as leaders and officers in public administration and social-economic departments.
- 56% of the women have intellectual and scientific job places.
- during 2002-2007, the share of the women's earning in the men's earnings was rising from 0,58% to 0,69%.

We must not analyse the Human Development Index as a pure mathematic index that incorporates in a single number the complex and dynamic realities of the human development. We must understand it in tight relation with the country capacity to develop a coherent future strategy.

Conclusions

The most important conclusion we can develop is that the Human Development Index is the expression of one country economic performance. Generally, the countries that developed their economies also increased their human development level. Certainly, this correlation is based on the purpose and the importance of

THE MAIN PARAMETERS AND LEVELS OF HUMAN RESOURCES AUDIT

Marin Costel

Academia De Studii Economice Bucuresti, Irmarin@ase.ro

Human resources audit is an expertise which is carried out periodically to the administration system of human resources, including monitoring and collecting information, their analysis and assessment on this basis of the efficiency the organization uses human resources with. The main goal is to improve the employees' performance and job satisfaction

The purpose of human resources audit is to emphasize the strengths and weaknesses in the nonprofit system of human resources and managing the possible issues and the auditor is the landmark in the correct and legal carrying out of the audit.

*The human resources audit domain is much more comprehensive than the mere personal activity control. Human resources audit requires **the study of the human resources system** within the organization on different hierarchical levels..*

Key words: parameters , levels, human, resources, audit

The main parameters and levels of human resources audit

The objective of Human resources audit is to check the compliance of the obligations by the firm but also the degree of adequacy of commands in order to ensure, for example, a continuous and effective development and the improvement of the individual's knowledge, a fact leading to the employer's profit, first and foremost.

Human resources audit could be seen from the technical and organizational point of view, socio-psychologically and economically.

From the **technical and organizational** point of view – human resources audit is a means of verifying the documentation and an indicators analysis, which demonstrates the efficiency of the activities in an organization.

In the western practice, human resources audit consists in the analysis of data and staff turnover indicators, the human resources attitude towards job and the degree of personnel satisfaction.

Socio-psychologically, human resources audit represents an assessment of work relationships in the company in order to outline the essential factors of motivation and to identify the resources of maximizing the activity of the firm from the subjective point of view of personnel.

The **economic side** of human resources audit consists of:

1. Establishing the competitiveness of the company in human resources area, which can be done by comparing the social and economical indicators of company activity to the work regulations mentioned in the laws or to the best results from other companies in the same line of business;
2. Settling the functioning effectiveness of the Human Resources Department, ascertaining the role it has in increasing the competitive power;
3. Establishing the economic effectiveness of audit itself by comparing the audit costs to the effects of auditing.

An efficient analysis is that which presents thorough and accurate information on personnel administration and development programs application results, as a strategic resource of the organization.

The main parameters of human resources audit as distributed on the personnel subsystem functions are presented in table 1.⁷³

⁷³ I.G Odegov, T.V. Niconova, *Auditul Personalului*, Editura „Examen”, Moscova, 2004.

The main parameters of human resources audit

The Functions of Human Resources Subsystem	The Content of Human Resources Audit
Formation of personnel policy in the organization	The assessment of the current situation of personnel policies, the degree of compliance to the development strategy of the firm; the evaluation of relationships among the personnel policy, the features of the organization and the internal conditions
Planning the human resources	The assessment of existing resources, targets and development prospects, future personnel request; analysis of planning plan and staff turnover planning analysis
Utilization of human resources	Degree of personnel occupation analysis; personnel stability analysis.
Recruitment and selection of human resources	Assessment of methods and procedures used in recruiting personnel; recruitment costs; recruitment efficiency in filling in the vacant positions; filling in possible positions in the future; efficiency of selection procedures.
Professional assessment of human resources	The analysis of methods used in the personnel assessment, their effectiveness; assessment of results and effects of the personnel evaluation process.
Human resources adaptation	Analysis of the methods used for personnel adaptation, their efficiency, identification and diagnose of issues which appeared in the adaptation process.
Human resources training	Analysis of targets and forms of training, their compliance to the purposes of the organization; study of the training program; assessment of personnel after completing training, the efficiency and results of the training program.
Professional career development of human resources	Analysis of development system of personnel in the organization; job analysis, analysis of the plan for personnel development, the efficiency of methods used.
Organization and progress of the working process	Analysis of work environment, security techniques; analysis of work standardization process; evaluation of work productivity; analysis of investments in this area and results.
Human resources' motivation and stimulation	Analysis of motivation forms, their relationship with personnel motivation; analysis of the level and structure of payment forms; assessment of compliance between the motivation forms and the targets of the organization.
Development of teamwork spirit	Diagnose of socio-psychological climate, assessment of the relationship strains between employees, hostility towards changes; organizational culture diagnose; the type of leadership practiced.

Human resources system requires analysis of human resources on three levels: **strategic, functional and medium**. Taking this into consideration, we could formulate **three levels of accomplishing the human resources audit**, namely⁷⁴

The Strategic Level

On the **strategic level**, the human resources audit is carried out from the point of view of the organization's strategy, which requires a checking of the integration of administration practice of human resources in strategic planning within the organization, and the relationship between the human resources department and the other departments, referring to the formation of utilization of human potential within the organization. The auditors study the organization strategy by interviewing staff, studying strategic plans, systemizing external and internal factors of the firm and establishing the dynamics of changes. The general strategy in the firm usually targets a most competitive position in the market. Staff searches and identifies means of occupying the best possible position in the market through the assessment of opportunities and threats in the environment and through the analysis of strengths and weaknesses within the firm.

Development of competitive skills of personnel can be done with:

- Clearance of flaws within the organization structure which hinders the growth of the work potential. In order to maintain an equilibrium in the organization it's essential to keep the quality of human resources, without whom the organization losses any chance of strengthening its position in the market and to eliminate further inauspicious events. This may be done through reorganization, elimination of structural subdivisions and removing the employees who can't integrate in the change strategy.
- Identification of the organization's unique features which represent the administration system of human resources in each organization. Even in the conditions of perfect agreement among the profile, structure and objectives of the organization there can't be similar human resources which compose these organizations and finalize these purposes in the same manner.

The features of the human resources in the firm and the utility level of every individual's possibilities anticipate all the results and all the competitive possibilities.

The study of strategy has a major impact on planning the personnel policies, motivation system, work relationships and other aspects in the human resources field.

The competitive strength in the work market is the organization's capacity to be chosen for a workplace, i.e. the sum of all the work conditions offered by the employer, which makes the difference between the organization and others within the same line of business.

Among the indicators which can be used in the assessment of the firm's situation there are:

- - The level of personnel satisfaction;
- - The level of personnel stability.

The study of the firm's global strategy influences the importance of the audit activity information.

The Functional Level

The functional level requires checking the effectiveness of functional departments' activity within the organization's human resources system.

On this level, the auditor is required answers to three questions:

- Do the results meet the established targets?
- Is it possible to have these results with the lowest costs?
- Is it possible to simplify and improve the personnel procedures?

The Medium Level

⁷⁴ Employment Practices – HR Audit Results, www.peoplehelpers.net.

The medium (management) level requires checking the accuracy of the middle-managers' application of personnel policy.

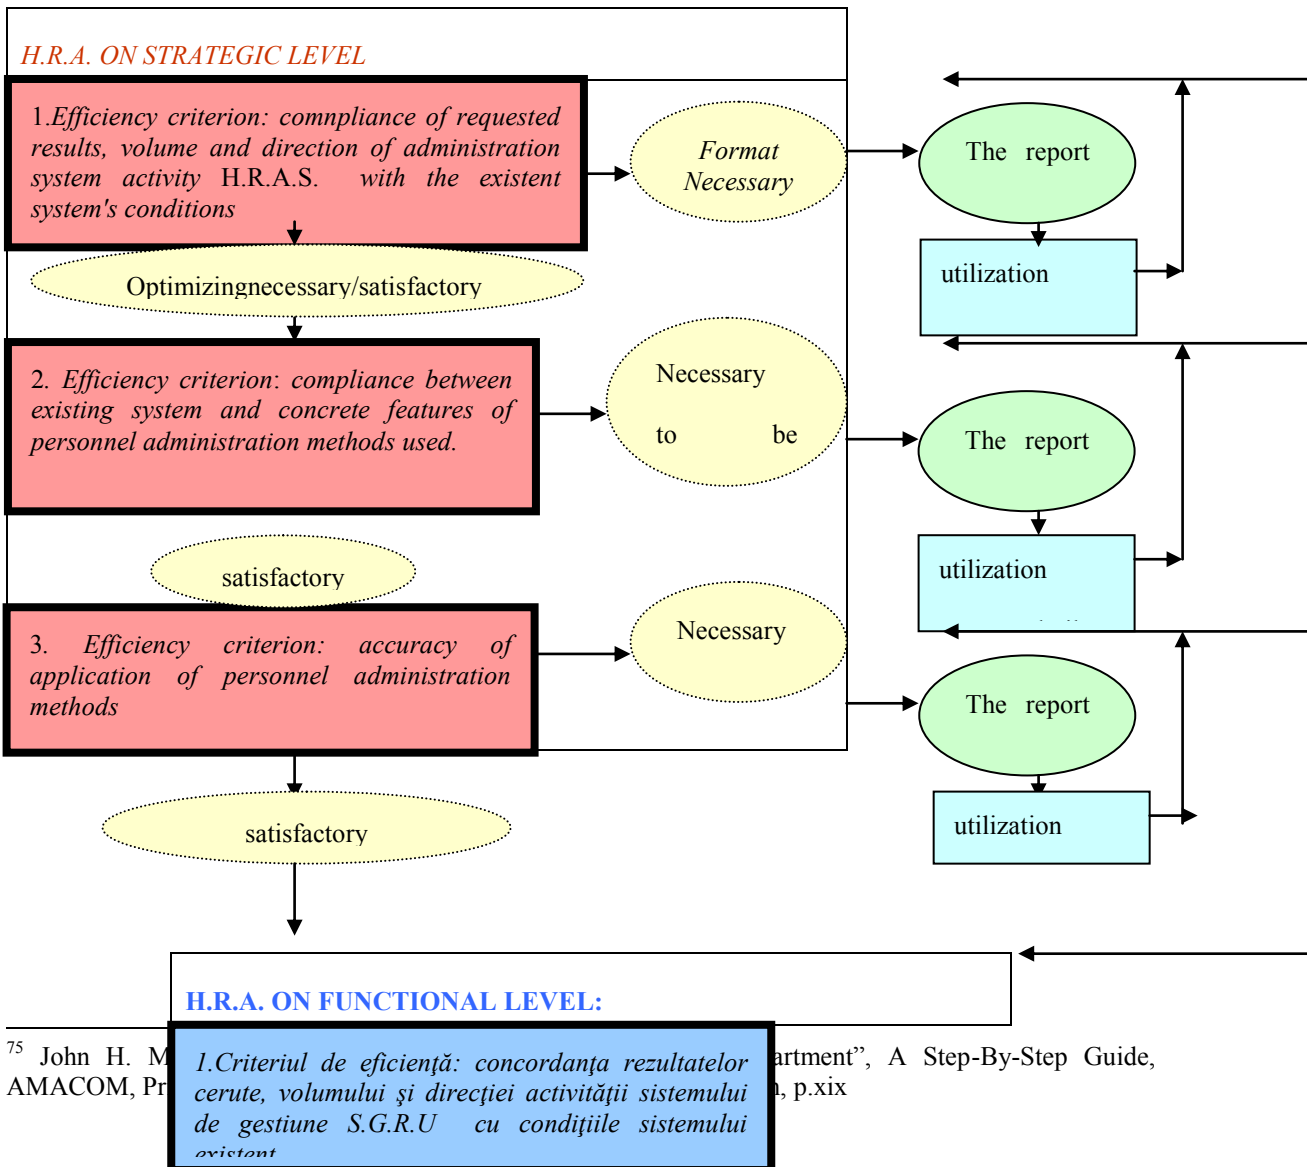

In this mission the auditor uses information from:

- Union representatives;
- Employees;
- Human resources administrations and departments;
- External resources (social organizations, shareholders, city services).

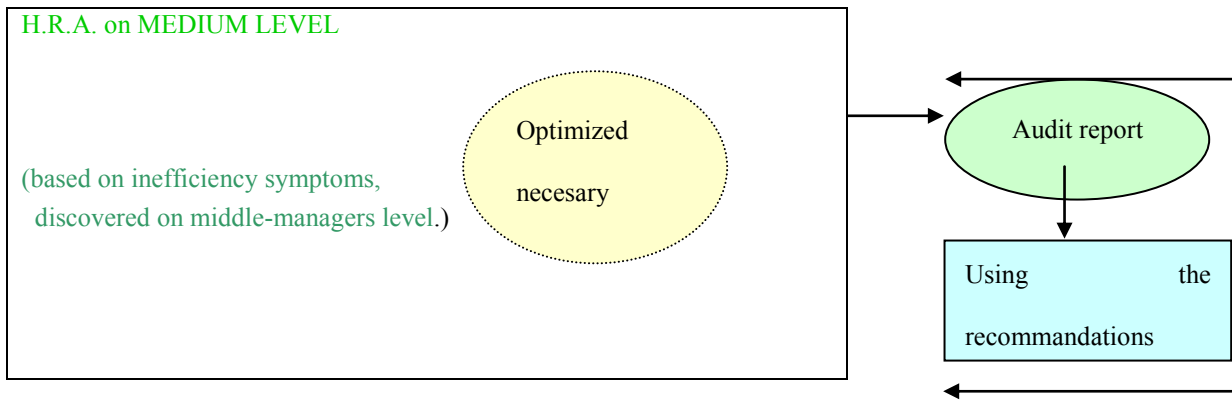

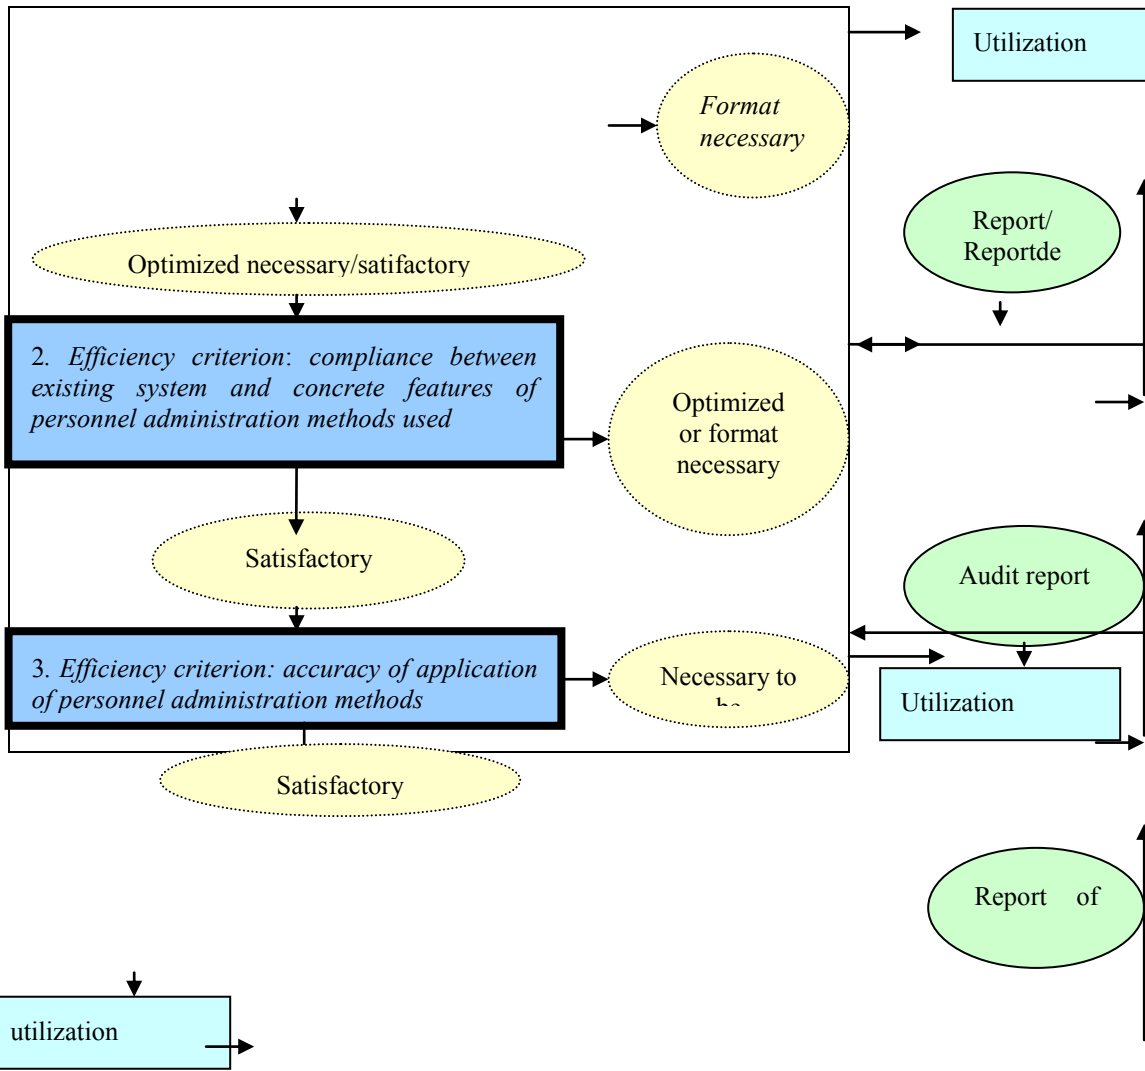

With the achievement of the audit procedures in this area, the middle-managers' esteem for the functional activity of human resources department rises. Also, human resources audit kindly appreciates line managers who take care of the firm's personnel policy. If the managers ignore or disrespect the laws at work, then the audit has to uncover these faults in order to take the necessary measures. It's very important to obey the laws as otherwise, for example in the case of disobeying the human rights, security techniques, rewards or work laws, the image of the firm is hit directly. Human resources audit can improve the image of the human resources department and its role in the company. An efficient human resources department achieves the company's targets but also the personnel's requirements.

Diagram no.1

Diagnose Operations Algorithm of H.R.A.⁷⁵

⁷⁵ John H. M. AMACOM, Pr... department", A Step-By-Step Guide, p.xix

In practice, an audit reaches every subject which is developed in human resources management if we are to consider the most appropriate approach – the holistic approach. Although we do not intend to diminish the importance of all the variables presented herein, we emphasize that in a human resources audit a system of

elements concerning on the one hand qualitative human resources ensurance and on the other hand their utilization is of an utmost importance.

The diversity of human resources audit and the work relationships within an organization enables the approach of this procedure as a complex process worthy of individual study

ETUDE DES CARACTERISTIQUES QUI DONNENT UN SENS AU TRAVAIL DES JEUNES ENSEIGNANTS

Mazilescu Crisanta-Alina

Université „Politehnica” de Timisoara, Departement de Formation Didactique, e-mail: alina.mazilescu@gmail.com, tel: 0722628355

In this article we study the characteristics which give a sense to the work and more exactly which give a sense to the work of the young teachers. The study has on the base the model of the characteristics of employment of Hackman and Oldham (1976) and uses the instrument JDI elaborated by both authors. The results are globally analyzed on the whole sample of the teachers, but also partial and comparative degree enters teachers' university and teachers of the secondary school.

Mots-clés: travail, caractéristiques du travail, sens du travail, profession enseignant

INTRODUCTION

Le travail occupe une place importante dans notre vie, même si on ne pense pas à toutes les bénéfices qu'il nous apporte. On travaille pour s'assurer la subsistance, pour se faire plaisir ou bien on le fait pour mettre en valeur ses compétences ? Quels sont les besoins qui nous poussent à dédier une grande partie de notre vie à un emploi ? Quelle place le travail occupe-t-il dans nos vies ? Voilà quelques aspects qui, au fil du temps, ont été au cœur des préoccupations de nombreux spécialistes du domaine du travail.

Les théories construites développent, chacune pour sa part, une perspective différente du travail et de son rôle dans notre vie : le travail comme une gratification instinctuelle, le travail comme un droit ou comme une nécessité économique ou le travail comme un instrument d'épanouissement personnel.

Nos travaux s'appuient sur les caractéristiques qui donnent un sens au travail et, plus précisément, sur ces caractéristiques-là qui donnent un sens au travail des jeunes enseignants. Cette perspective de cohérence s'inscrit dans le cadre théorique de l'ajustement au travail et de l'ajustement personne - travail.

Des modèles théoriques qui visent les caractéristiques d'un travail stimulant ou motivant

Le travail peut être défini comme une activité qui a un but (Brief et Nord, 1990) ou un ensemble d'activités coordonnées visant à produire quelque chose d'utile (Shepherdson, 1984) ou une activité utile, déterminée par un but défini au-delà du plaisir engendré par son exécution (Fryer et Payne, 1984).

Si l'on prend en considération plusieurs points de vue, on peut définir le sens du travail comme :

- la signification que le sujet assigne au travail (Morse et Weiss, 1955)
- l'orientation vers le travail (Super et Sverko, 1995)
- un effet de cohérence entre les caractéristiques qu'un sujet cherche dans son travail et celles qu'il perçoit dans le travail qu'il accomplit (Morin, 1993).

Deux modèles sont représentatives pour cette approche : le modèle sociotechnique proposé par Trist (1978) et le modèle des caractéristiques de l'emploi de Hackman et Oldham (1976).

Le modèle sociotechnique

Eric Trist a développé son modèle à partir de l'idée que l'insatisfaction des travailleurs des mines est due à la mauvaise organisation du travail plutôt qu'au montant de leurs salaires.

En ce sens, il a montré que l'organisation du travail de façon à correspondre aux motivations intrinsèques et extrinsèques des employés améliore la performance organisationnelle.

Trist a trouvé six aspects intrinsèques du travail (la variété et le défi, l'apprentissage continu, une marge discrétionnaire et l'autonomie, la reconnaissance et le support, une contribution sociale qui fait du sens, un avenir désirable) et six aspects extrinsèques (le salaire, l'assurance de l'emploi, les facilités, la sécurité, la santé, la justice et l'équité des procédures) qui peuvent affecter l'engagement au travail.

Le modèle des caractéristiques d'emploi

Le modèle de Hackman et Oldham a développé l'idée que les caractéristiques de l'emploi peuvent influencer (parmi quelques états psychologiques) la motivation, la satisfaction et la productivité des travailleurs.

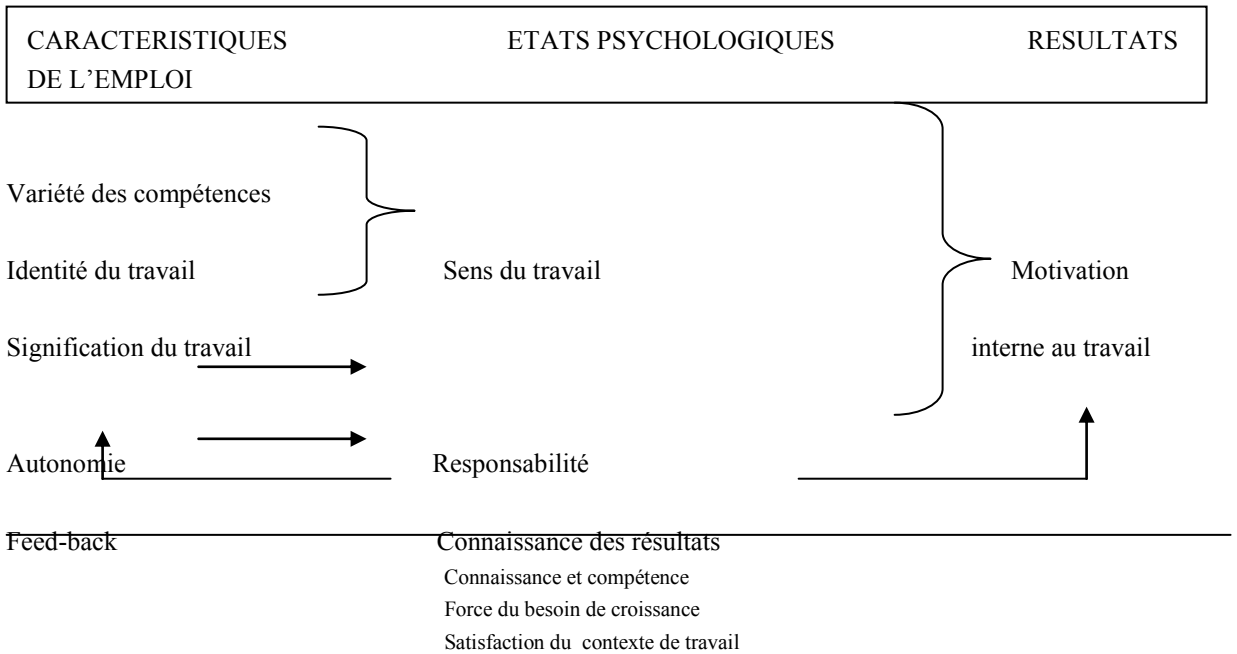

Fig – Modèle des caractéristiques de l'emploi de Hackman et Oldham (1980)

Le modèle de Hackman et Oldham décrit cinq caractéristiques de l'emploi d'où découlent trois états psychologiques:

- *la variété des tâches* – le degré dont un travail implique une variété de tâches qui exigent une variété de compétences ;
- *l'identité de la tâche* – le degré dont un travail permet d'assurer une tâche du début à la fin, avec un résultat tangible, identifiable ; *la signification de la tâche* - le degré dont un travail a un impact considérable sur le bien-être ou le travail d'autrui, à l'intérieur de l'organisation ou au lieu de travail ;
- *l'autonomie* – le degré d'indépendance et de liberté qu'a quelqu'un pour planifier ses activités et pour choisir la façon d'accomplir sa tâche ;
- *le feedback*.- le degré dont l'accomplissement des tâches est lié à l'information que l'individu obtient directement sur sa performance.

Parmi les cinq caractéristiques du modèle, trois semblent contribuer à donner du sens au travail: la variété des compétences, l'identité du travail et la signification du travail.

Le sens du travail, le sens des responsabilités et la connaissance des résultats de sa performance sont les états psychologiques qui peuvent influencer la motivation et la satisfaction au lieu de travail.

La liaison entre les caractéristiques d'un emploi, les états psychologiques et la motivation au travail seraient modérés par la force du besoin d'épanouissement personnel, par les connaissances et les compétences d'une personne et par la satisfaction de son contexte de travail.

Notre étude a le but d'identifier les caractéristiques d'emploi des jeunes enseignants et leur potentiel de motivation. En même temps, nous sommes intéressée par les différences existant entre les caractéristiques de l'emploi des assistants universitaires et des enseignants au lycée.

2. Méthode

2.1. Les sujets

Les sujets qui ont constitué l'échantillon de notre étude font partie de quatre facultés d'une université technique roumaine (de Timisoara) et de six lycées de la région du Banat. Trente d'entre eux sont des assistants universitaires, qui assurent des travaux dirigés - 16 femmes et 14 hommes (de 24 à 33 ans) - et 30 sont des jeunes enseignants au lycée (dans les trois premières années de carrière didactique).

2.2. La procédure

Nous avons fondé notre étude sur J.D.S (Job Diagnostic Survey) élaboré par Hackman et Oldham à partir de leur modèle des caractéristiques de l'emploi. Ils se sont proposé de mesurer la perception des travailleurs sur leurs postes par rapport à chaque dimension de leur modèle. JDS a 15 items et est utilisé pour mesurer cinq dimensions. Les trois premières caractéristiques (suivant leur modèle) donnent un sens au travail, alors que les deux suivantes décrivent un emploi stimulant. Les cinq caractéristiques sont présentées ci-dessous:

- la variété des tâches V.A. (3 items)
- l'identité de la tâche I.S. (3 items)
- la signification de la tâche S.S. (3 items)
- l'autonomie (3 items) A
- le feed-back (3 items) Fb.

2.3. Le mode d'analyse des réponses

Sur une échelle de sept degrés, on demande au sujet de choisir une réponse pour chacun des 15 items. A partir des résultats obtenus (score de 1 à 7), on peut établir la mesure globale de l'enrichissement du travail, appelés score potentiel de motivation MPS.

Le score de MPS s'obtient en faisant la moyenne des scores des trois premières caractéristiques, qui va être multiplié avec le score de l'autonomie et avec le score de feed-back.

$$\text{MPS} = [(\text{V.A.} + \text{I.S.} + \text{S.S.}) / 3] \times \text{A} \times \text{Fb}$$

3. Résultats

Les moyennes des caractéristiques au JDI varient (comme on voit dans le tableau 1) du 4,42 pour l'identité du travail au 5,57 pour la variété du travail.

Caractéristiques de l'emploi	Min	Max	Moyenne	Dev Std.
Variété des tâches	2,00	7,00	5,57	,96
Identité de la tâche	1,00	7,00	4,42	1,51
Signification de la tâche	2,60	7,00	4,82	1,22
Autonomie	3,00	7,00	5,38	1,11
Feedback	3,30	7,00	5,39	1,00
Valid N (listwise)				

Tableau 1- Statistique descriptive globale pour les 60 sujets enseignants

Dans ce tableau, on voit que les trois premières positions, par ordre hiérarchique, ont des valeurs très proches. Il s'agit de: « Variété des tâches », « Feedback » et « Autonomie ». La dernière place est occupée par l'« Identité de la tâche ».

Le tableau 2 présente les moyennes des caractéristiques de l'emploi en fonction des deux catégories d'enseignants poursuivies : assistants universitaires et enseignants au lycée.

Statistique comparative	Descriptive	Moyenne Univ	Dev.Std Univ	Moyenne PreUniv	Dev.Std. PreUniv
Variété des tâches		5,83	,84	5,32	1,03
Identité de la tâche		4,31	1,43	4,53	1,59
Signification de la tâche		4,91	1,12	4,73	1,33
Autonomie		5,53	1,13	5,23	1,09
Feedback		5,55	1,06	5,24	,93

Tableau 2 - Statistique Descriptive comparative enseignement supérieur et lycée

3.1. Analyses globales

Sur un échantillon total de 60 jeunes enseignants, la caractéristique « Variété des tâches » occupe la première position, étant donc la plus valorisée et avec le potentiel de motivation le plus élevé.

Le travail d'enseignant implique une variété de tâches qui exigent une variété de compétences. Ce résultat se trouve justifié par le fait que le travail d'enseignant nécessite des compétences dans la classe étudiants/élèves, des compétences de travail dans l'établissement scolaire et des compétences au niveau du système d'éducation. Au niveau de la classe d'élèves, l'enseignant doit être doté d'une compétence scientifique, d'une compétence pédagogique et d'une compétence psychosociale.

Très proches de la « Variété des tâches » sont les caractéristiques « Autonomie » et « Feed-back », ce qui signifie que les enseignants jouissent de liberté dans l'accomplissement de leurs tâches et ont le moyen d'obtenir des informations sur la réussite ou sur l'échec de leurs tâches.

L'« Identité de la tâche » est la caractéristique avec le potentiel de motivation le plus bas et cela peut être expliqué par le fait que les résultats du processus d'éducation et d'instruction ne sont pas tangibles immédiatement et visent la contribution de plusieurs personnes durant plusieurs années .

3.2. Analyse comparatifs assistants universitaires - enseignants au lycée

L'analyse des deux échantillons n'indique pas de différences significatives.

4. Conclusion

Les caractéristiques de l'emploi du modèle de Hackman et Oldham viennent de préciser l'importance du sens que l'on attribue à notre travail, ce qui peut stimuler la motivation, la croissance du sentiment de puissance, l'équilibre psychologique et la croissance de la loyauté.

LA SATISFACTION PROFESSIONNELLE ET LES CARACTERISTIQUES DE L'EMPLOI DES ENSEIGNANTS ROUMAINS

Mazilescu Crisanta-Alina

Université „Politehnica de Timisoara, Departement de Formation Didactique, e-mail: alina.mazilescu@gmail.com

The places of depart of my study aim of at one quote, the report that the young people with university studies are attracted by the professional offers of countries Westerner and they leave in these countries, and the other one quoted than there is a general indifference, in our country, on the phenomen of " migration of brains ".

Having on the base this perception of the social reality, my research centres on the analysis of the problems connected to the motivation and to the professional university satisfaction of the assistants professors.

The echatillon of the subjects which participated has this research consisted of 30 young teachers.

For studied the relation enters the potential motivator of work and the professional satisfaction (with all its constituents) were used the following ones instruments: J.D.S (Job Diagnosis Survey) JDI (Job Descriptive Index) and JIG (Job in General) The resultats of this recherche has just put the bases of a program of reconfiguration of employment of the teachers of universities, by valuing the information on their motivation and their professional satisfaction.

Words-clé: job satisfaction, job characteristics, motivation

La satisfaction professionnelle est devenue l'un des sujets les plus importants et les plus recherchés dans le domaine de la psychologie organisationnelle. Le besoin de faire un travail efficient a contribué au développement de l'appréciation du facteur humain dans les organisations et, par conséquent, à l'accroissement de l'intérêt pour la satisfaction du travail.

Notre recherche s'appuie sur le modèle des caractéristiques de l'emploi de Hackman et Oldham (1976), mais fait référence aussi à d'autres modèles théoriques sur la motivation et la satisfaction du travail. En voici trois des plus représentatifs :

Le modèle des caractéristiques de l'emploi

Hackman et Oldham ont identifié cinq caractéristiques de l'emploi qui peuvent influencer la motivation, la satisfaction et la productivité des travailleurs :

- *la variété des tâches* – le degré dont un travail implique une variété de tâches ; *l'identité de la tâche* – le degré dont un travail permet d'accomplir une tâche du début à la fin ; *la signification de la tâche* - le degré dont un travail a un impact considérable sur le bien-être ou le travail d'autrui ;
- *l'autonomie* – le degré d'indépendance et de liberté ;
- *le feed-back*.- le degré dont l'accomplissement des tâches est lié à l'information que l'individu obtient directement sur sa performance.

Le modèle sociotechnique

Eric Trist a trouvé plusieurs aspects intrinsèques et extrinsèques du travail qui peuvent influencer la motivation au travail. Parmi les aspects intrinsèques on peut énumérer : la variété et le défi, l'apprentissage continu, une marge discrétionnaire et l'autonomie, la reconnaissance et le support, une contribution sociale qui fait du sens, un avenir désirable. Les aspects extrinsèques établis par Trist sont les suivants: le salaire, l'assurance de l'emploi, les facilités, la sécurité, la santé, la justice et l'équité des procédures.

Le model de Morin et Dassa (Les caractéristiques d'un travail qui a du sens)

Morin et Dassa ont conçu un modèle général des composantes principales décrivant un travail qui a du sens : l'utilité du travail, la rectitude morale, l'apprentissage et le développement professionnel, l'autonomie ou l'exercice de son pouvoir et la qualité des relations professionnelles.

Les recherches visant le modèle de Hackman et Oldham (1976) fondent l'hypothèse d'une relation entre les caractéristiques d'un emploi et les résultats d'un travail. Kim, Price, Mueller et Watson (1996), Pearson et Chong (1997) ont montré l'existence d'une relation entre les caractéristiques d'un emploi et la satisfaction du travail, mais la relation causale n'est pas totalement clarifiée. On considère qu'il y a une relation indirecte (médiante) entre les deux aspects mentionnés.

En ce qui concerne les conditions extrinsèques d'un emploi, les études montrent que le salaire est un bon indicateur de l'implication au travail (Buchko, 1997) et de l'intention de quitter un emploi (Lum, Kervin, Clark, Reid et Sirola, 1998).

La satisfaction du travail et l'effort déposé peuvent être des indicateurs du stress occupationnel, de la performance professionnelle et de la tendance de quitter une organisation (Jamal, 1990 et Cooper, 1996).

Les études mentionnées, relatives aux antécédents et aux conséquences de la motivation au travail et de l'implication de celle-ci au niveau individuel et organisationnel, mettent en évidence l'actualité de la problématique étudiée dans le champ des recherches scientifiques.

Les objectifs de notre recherche visent à :

- identifier les dimensions extrinsèques qui influencent la satisfaction du travail des assistants universitaires ;
- identifier les caractéristiques de l'emploi liées à la satisfaction du travail.

METHODOLOGIE

L'échantillon des sujets qui ont participé à cette recherche a été composé de 30 jeunes enseignants, qui assurent des travaux dirigés dans une école polytechnique de Timisoara: 16 femmes et 14 hommes (de 24 à 33 ans).

Pour étudier la relation entre le potentiel motivateur d'un poste et la satisfaction professionnelle (avec toutes ses composantes) ont été utilisés les instruments suivants:

J.D.S (Job Diagnostic Survey)

Cette échelle a été élaborée par Hackman et Oldham qui se sont proposé de mesurer la perception des travailleurs sur leurs postes par rapport à chaque dimension de celui-ci. JDS a 15 items et est utilisé pour mesurer cinq dimensions: la variété des tâches, l'identité de la tâche, la signification de la tâche, l'autonomie, le feed-back.

Le score de MPS s'obtient en faisant la moyenne des scores des trois premières caractéristiques qui va être multiplié avec le score de l'autonomie et avec le score du feed-back.

JDI (Job Descriptive Index) et JIG (Job in General)

JDI est un instrument élaboré par P.C. Smith, Kendall et Hulin (1969) qui ont mesuré la satisfaction du travail suivant cinq aspects : le travail, la relation avec le chef, le salaire, la possibilité de promouvoir et la relation avec les collègues. En 1985 a été ajoutée une nouvelle échelle nommée JIG qui fait référence à l'emploi, en général. JDI est composé de 72 items et JIG a 18 items. Le JDI et JIG ont été adaptés à la population roumaine en 1994 par H.Pitariu.

Résultats

Pour déterminer le niveau de satisfaction du travail pour le groupe de 30 assistants universitaires, on calcule la moyenne et l'écart-type pour la dimension « Travail » de l'échelle JDI. Le niveau de satisfaction est opérationnalisé comme il suit : le score maximal à chaque échelle de JDI est 54 ; la moitié (27) est prise comme le point de raccourci pour indiquer la satisfaction basale du travail. Tous les scores inférieurs à 27 sont considérés comme représentant l'« insatisfaction du travail » alors que tous les scores excédant 27 sont considérés comme indiquant une « satisfaction du travail ». De plus, chaque moitié de la gamme est dédoublée pour donner une indication sommaire du niveau de satisfaction ou d'insatisfaction.

Selon cette procédure, on considère un score de 13.5 ou moins comme indiquant une "forte insatisfaction", tandis qu'un score situé au-dessus de 13.5, mais au-dessous de 27, représente une " insatisfaction modérée".

De l'autre côté de la médiane, les nombres jusqu'à 40.5 représentent la "satisfaction modérée", tandis que ceux au-dessus de 40.5 indiquent la "satisfaction forte."

Dimension JDI /JIG	N	Minimum	Maximum	Moyenne	Ecart-type
travail	30	6,00	52,00	39,80	11,18
rémunération	30	,00	30,00	7,86	6,70
promotions	30	6,00	54,00	36,83	15,59
chef	30	10,00	52,00	37,16	12,01
collègue	30	9,00	51,00	33,93	12,44
emploi en général	30	13,00	54,00	41,06	10,02

Le score moyen de 39,80 pour la dimension « Travail » du JDI indique que les assistants universitaires sont "modérément satisfaits" de leur travail alors que le score 41,06 pour la moyenne de la dimension « Emploi en général » indique que les assistants universitaires sont "fortement satisfaits" de leur emploi.

La rémunération est la dimension avec la moyenne la plus basse (7,86), valeur qui nous indique une "forte insatisfaction" en ce qui concerne le salaire des jeunes enseignants.

Dimension JDI	France (n=36)			Alaska (n=39)			Norvège (n=57)			Pays de Galles (n=51)			Roumanie (n=30)		
	Moyenne	E.t	R	Moyenne	E.t	R	Moyenne	E.t	R	Moyenne	E.t	R	Moyenne	E.t	R
travail	38.47	9.40	2	36.85	8.05	4	31.54	7.30	3	31.65	9.07	3	39,80	11,18	1
rémunération	21.55	14.67	4	38.56	11.43	3	14.60	10.20	4	10.27	0.25	4	7,86	6,70	5
promotions	15.72	13.94	5	14.13	13.35	5	10.74	6.77	5	5.92	6.97	5	36,83	15,59	3
chef	36.88	13.30	3	39.92	14.91	2	42.16	9.10	2	35.73	3.91	2	37,16	12,01	2
collègues	42.19	12.32	1	42.95	8.92	1	44.28	6.77	1	38.65	1.94	1	33,93	12,44	4

Tableau

En ce qui concerne les caractéristiques de l'emploi, la statistique descriptive se présente comme dans le tableau suivant :

	N	Minimum	Maximum	Moyenne	Ecart-type
Variété des tâches	30	4,00	7,00	5,8387	,84095
Identité de la tâche	30	1,00	7,00	4,3100	1,43703

Signification de la tâche	30	2,60	7,00	4,9100	1,12230
Autonomie	30	3,00	7,00	5,5367	1,13881
Feedback	30	3,30	7,00	5,5533	1,06147

Comme on voit dans ce tableau, la caractéristique avec le potentiel de motivation le plus élevé est la variété des tâches, alors que le potentiel de motivation le plus bas est donné par l'identité de la tâche.

Par rapport aux corrélations qui cherchent à identifier les relations entre les dimensions de l'emploi (aussi MPS) et la satisfaction professionnelle, les résultats se présentent comme il suit:

corrélations	Travail	Emploi en général
MPS	$r = .445$ $p=0.05$	$r = .422$ $p=0.05$

corrélations	Travail
autonomie	$r = .524$ $p=0.01$

Au premier regard, on peut observer qu'une seule caractéristique de l'emploi du modèle de Hackman et Oldham, l'autonomie, est en relation avec la satisfaction du travail. Cela met en question la validation empirique de ce modèle. Mais, en même temps, on voit que le score potentiel de motivation MPS est corrélé avec la satisfaction donnée par le travail et avec la satisfaction de l'emploi en général. Sur ce point de vue, le modèle de Hackman et Oldham sur le MPS est valable.

En ce qui concerne les corrélations entre les dimensions de JDI et JIG, on voit que la satisfaction du travail est fortement corrélée avec la satisfaction de l'emploi en général, mais aussi avec la satisfaction donnée par les relations avec le chef et les collègues.

corrélations	Satisfaction donnée par l'emploi en général	Satisfaction donnée par la relation avec le chef	Satisfaction donnée par la relation avec les collègues
Satisfaction du travail	$r = .859$ $p=0.01$	$r = .775$ $p=0.01$	$r = .392$ $p=0.05$

Conclusions

Cette recherche sur 30 enseignants, assurant des travaux pratiques, nous indique un haut niveau de satisfaction de l'emploi en général parmi les sujets examinés, avec quelques inassouvissements dans les secteurs particuliers du travail. Les découvertes suggèrent qu'ils ne sont pas satisfaits par le salaire.

Par rapport à des enseignants d'autres pays, on voit une différence au niveau de la satisfaction donnée par les relations avec les collègues. Alors que les étrangers valorisent les relations avec les collègues (dimension qui occupe la première place dans la hiérarchie), les enseignants roumains mettent ces relations en base de la hiérarchie, juste avant la rémunération.

La caractéristique de l'emploi qui donne un sens au travail des enseignants est la variété des tâches, mais on trouve aussi deux autres caractéristiques qui sont importantes pour leur emploi: l'autonomie et le feedback.

This paper intend to present a personal opinion regarding the evolution of the labor force within the organization in Romania, namely the business firm, mostly affected by this phenomenon: the labor force migration. Having a human resources management, adequate to this new tendency in Romania: emigration and immigration may be an alternative solution to this tendency. Romania and the entire Europe face the migration of both qualified and unqualified labor force on the background of the demographic factor.

REL: J10G

Exodus, migration, the emigrants' absorption

The national publications of the last years have approached the demographic problem faced by our country and Europe, emphasizing some statistic data:

‘The number of the old people over 80 will increase by 180% the following 45 years’. In 2050, the experts estimate that the Romanian men will live, on average, 10 years longer, and the women 7 years longer. Simultaneously, in most of the European countries, the population will decrease. The specialists predict that one of the most dramatic decreases will be registered in Romania: in the present level of the birth rate is maintained, there will be less than 16 million inhabitants in 2050.

‘A third of the Europeans are over 60 years old’. For the last 60 years, the number of Europeans over 60 years has increased. On the contrary, there is a significant decrease of the number of births in the entire Europe. Between 1950 and 1955 there were over 12 million births a year while between 2000 and 2005 there were only 7.3 million. Consequently, until 2050, about a third of the European population will be over 60 years old. The number of those over 80 years old is expected to increase by about 180%, accordingly to **the UNO statistics**. The demographic changes are different from one country to another. In countries like Germany, Spain and Italy dramatic decreases of the population are expected, while in France and Great Britain will have more inhabitants until 2050. For our country, the experts in demography have more possible scenarios regarding the evolution of the population in the next 45 years. All depends on how the birth rate will increase, and also on what the level of mortality, of **internal and external migration** will be. After **1992, migration**, the natural decrease of population also intervened, completed by the parallel growth of the general mortality. Since 2003 birth rate has started to grow slightly, according to the specialists’ opinions. The straightening of birth rate will diminish the demographic decline, but this is impossible to stop. The specialists estimate that in Romania the retirement age should be extended, while **the young people should be encouraged to stay in the country**.

The national and international press stated that the European Union as well has been facing the same genre of demographic problems. In 2003, the natural growth of population was only 0.04% per year and all the new member states, except Malta and Cyprus, faced a decrease of population. Although many aspects regarding the demographic changes are exclusively the matter of the Union members, the European Commission has launched a brainstorming campaign at the community level by publishing the **Green Card**. This is meant to find some solutions, including through the Lisbon Strategy, whose target is **the creation of more and of a better quality jobs**. Nevertheless, in sectors such as family, health, education, **migration**, or the free circulation of persons, there are certain social policies which, in the experts’ opinion, must be clarified and improved. **Immigration**, another matter brought into discussion in the Commission’s report, may bring **temporary improvements**, but on a long term **it may generate major problems on the working market**, in the social insurance and tax systems. Although the European Union

is planning to maintain the **national characteristics** of the member states, it is very important for each of these to have **flexible policies** regarding the social insurance system, **the equivalence of studies and qualifications for the immigrants**.

On the background of such phenomena, Romania as well is facing the **illegal immigration**. It is estimated that in 2005, 1700 foreign citizens were discovered trying to trespass the border, either to stay in Romania or to transit the Romanian territory. Thus, 1300 tried to enter illegally in Romania and 400 tried to leave the national territory, according to the **report of the Ministry of Administration and Internal Affairs**.

On the background of the Romanian population's emigration in the European space, an **alternative solution** for the companies in Romania is the **use of the foreign labor force** on our territory.

Presently, about 100 000 Romanians are working in constructions abroad. One of the solutions may be the use of the foreign labor force on the territory of our country. The members of the **Constructors' Social House** suggested a few possible solutions for the maintenance of control and the regulation of the flows of foreign workers in constructions working in Romania. One of these would be a tight collaboration between the organizations in the field of constructions and the **Labor Force Migration Office** for the contingency of the flows of migrant workers in Romania. At the same time, the development of partnerships and the closing of bilateral agreements between the Romanian unions and those in the countries where the foreign workers come from, on the existing models, represent a positive point regarding the mentioned matter. Other points would be the joining in unions of the foreigners working in constructions in Romania, the development of partnerships, the closing of bilateral agreements between the Romanian private employment organizations and those from the origin countries of the foreign workers. These are a part of the solutions suggested as alternatives to the exodus of the Romanian qualified and unqualified labor force.

The members of the Constructors' Social House noticed **the poor qualification of workers** in our country. The statistics show that: 'among the workers legally employed in the field in constructions in Romania, about 7% are not qualified, and many of the qualified ones are old. The young people do not choose this field any more because it is poorly paid and the working conditions on the local sites are far from appropriate', explained the vice president. According to a study of the National Research Institute in the field of Work and Social Protection, in the sector of constructions, more than 70% of the questioned employees have never attended an instruction form during the whole period of their activity.

Taking into consideration the above mentioned data, the change and management of this process within the business firm in Romania is essential.

Using the **immigrant labor force** in the context of the **Romanian organizational culture**, the **performance management**, the **carrier management** are some of the **suggested alternatives** in the future PhD thesis 'Research in the Degree of Preparation of the Organizations in Romania regarding the Maintaining of the Qualified and Unqualified Labor Force in the Context of the European Union's Extension', on the background of the salary discrepancies decrease between Romania and the other European countries. Taking into account the possibility that in the future the local firms could use immigrant labor force, they should adapt the working style.

The employee should be encouraged to orientate him/herself and conduct his own carrier plan. The immediate result of this aspect is the development of the employees' responsibility in an organization and the improvement of their performance. The usage of some adequate methods of evaluating the employees' performance represents the guarantee that the organizations' employees reach 'the desired destination', meaning the desire point of their carrier.

On the grounds of powerful **changes in the organizational and cultural environment** there will be many organizations unprepared to deal with these. **Alwin Toffler** suggests three elements that should be taken into consideration in order to diminish the effects of the future's shock: the employees must learn 'how to study', 'how to chose', 'how to correlate'. All these elements should be correlated in a **carrier management program including the executive level employee**.

Having answers to questions such as 'Do you know your subordinates? Do you know their wishes and aspirations?' can make the difference among organizations. As Aristotle stated, 'the man is nothing in himself/herself but an infinite chance, but he/she is infinitely responsible for this chance', we people, are directly responsible for the chances that may occur to us. Having a performance and carrier management

implemented within the organization is the method through which the managing staff ensures that they have employees prepared 'to exploit all chances' within a well-designed organizational culture.

Plato stated 'Get to know yourself and you will get to know the Gods and the entire Universe'. I consider that the two processes: **the performance management and the carrier management** are a **method** through which an organization can know its employees in order to keep them in its own firm. The better the organization understands the importance of the processes and it applies them, the more it becomes aware of the benefits it may get from their correct implementation. An approach of the connection between the performance management and the carrier is necessary in the context in which, at the level of the performing employee, one can not talk about a carrier, even less about a performance management.

People make the difference among the companies. But how many companies know what motivates their people, which are the explanation for their employees' behavior, which are the reasons for not leaving the company, except for the material aspect?

I consider the approach of the two processes in an organization, in the context of the salary discrepancy diminishing between Romania and the European Union, to be the first step in the communication process between the management. Being asked to what extend the communicative people are superior to the introvert ones, Aristotle answered 'To the same extend that the living are superior to the dead!' From the perspective of the historical evolution, the European Space started to take shape in the 7th and 8th centuries. In time, the European continent has become a public space, then a European Union, and today, one can even talk about a great European State. Why state?

Because the objectives, the measures applied until now, as well as the projects of the European Union prove that this is no longer an economic community, as it used to be at the beginning of its creation but a community of values, rights and obligations.

The European Union has taken over many of the traditional state's protection functions offering better guarantees than those given by the traditional state. If, in the latter's case, legitimacy was assured by its national character in the European Union's case, legitimacy is given by the very political will manifested by the countries which adhered to the Union. The Amsterdam Treaty (signed in 1997 and enforced in 1999) adds to the provisions of the previous one, the common administration of 17 fields, among which, the field of the human resources and of the jobs.

Some of the important objectives of the European Union are tightening the relationships among the European peoples and creating a climate of peace and unity, **obtaining the economic-social progress through a common action**, by creating a common and cohesive internal market. In this context, the organizations must organize themselves in such a way so that it permits the employees to evolve in an **international competitive environment** where competence should be a central factor in developing a carrier. Also, as Vinturache Mihai said in the "Systems management of the safety ecological in the industry" paper, employers are required to assess risks and take practical measures to protect the safety and health of their workers, keep accident records, provide information and training, consult employees and co-operate and co-ordinate measures with contractors, in integrated human resources management.

The human resources management will be the one that makes the difference: a management oriented towards the development of the execution employee, the assurance of an environment proper to the development of certain competences but also the **opportunity of their application** in an **organizational culture** centered on the needs of all employees, being either at the supervising or the execution level. If in the past the performing employee used to be seen as a simple instrument based on which the organization would increase its profit, today, in the context of the European Union integration, I consider that at this level it is no longer possible without a performance and carrier management. The framework offered by the organization should be a stimulating one, where the performing employee might have a feeling of belonging and perceive the business as his/her own. This is possible on the background of his/her identification with the organization. The specialists of the organization have the mission of identifying to what extent the employees feel the company's mission and values, what carrier means to them within the organization, which are their needs of development over short and long term.

The conception of a stimulating training program, adapted to the competences identified by the organization's specialists, may influence one employee's decision of leaving the organization.

These are only a few elements that might influence the decision of the best performing employees and not only, to remain within the Romanian firm in the favor of those in the European space which offer such perspectives to their employees.

Knowing the strategies applied by other companies in the European Union with respect to the human resources management can help the Romanian companies set their strategies in human resources so that they could make the difference in keeping the best employees within the organization, including standardizations of their procedures. „Systematization and standardization of the work does not always guarantee the success. One of the usual managerial problems is to identify the cause why the work is not done properly, is low quality, in spite of an efficient organization” as Malina Cordos said in „The motivation in quality management people based” paper.

Each organization has its own life, a certain organizational zeal, a certain rhythm where the employees find their place (identify themselves with the organization) or search other ways of fulfilling themselves as people. As Septimia Chelcea states, ‘The organizational zeal can be obvious or, on the contrary, barely noticeable’ within an organization.

The organizational zeal is defined as “The will of the organization’s members to act in order to reach the set purposes”. There is a set of factors that can influence the organizational zeal and depending on which an organization is differentiated from another, for instance the applied managerial style. The closer the managers get to their employees, set tangible objectives for them, explain why these have to be achieved and what the importance of their accomplishment is, the more the employees will chose the organization on a long term in order to remain within it and their performance will be as expected. How they can be achieved (in what ways, with what techniques and procedures) is up to the employees.

The more the employees prove their interest, the bigger the organizational zeal will be, the less the danger will be for the organization to lose the best employees in the favor of the other companies in the European Union.

CULTURE AND CORRUPTION

Mihuț Ioan

Faculty of Economics Cluj-Napoca, "Dimitrie Cantemir" Christian University Bucharest

ioanmihuti@gmail.com

National culture and the organization's management are interdependent systems of values, which generate human performances that can reach levels of excellence. But, in certain crises situations, generated and supported by turbulent economic frames, by the transition from one economic system to another, the cultures specific to the organizations' management become vulnerable. In such conditions, when an economic system is chaotically dismantled, as it happened to the communist one, "an organized anarchy" appears, a system which is good for some individuals and interest groups that assimilates rapidly the deficiencies specific to a "marginal culture".

Our study is trying to underline some characteristics of the Romanian managerial culture, specific to the transition period from real socialism to capitalism and pre-adhesion to the EU.

Keywords: *national culture, management and organizational culture, managerial style, corruption.*

In the research and interpretation work, out of the sociological perspectives of the cultural phenomenon, the great Romanian sociologist Dimitrie Gusti notices three approaches of culture: *objective culture*, seen as a system of cultural goods that form the style of an era, *institutional culture* which includes the state, the church, the customs, the economic organizations and *personal culture*, that is the attitude of persons concerning the work of culture – the living report between persons and cultural values⁷⁶.

If the above mentioned values and institutions become representative and specific for a nation, created based on the unity of language, territory and economic and social life, then we can talk about *national culture*.

Taking into consideration the fact that the values, norms and principles (rules) promoted by the national culture system can be found reproduced in the valuable and behavioural variables within the organizations or at the persons who lead them, their cultural fundamentals belong to the system. Still, from the point of view of the content dimensions between managerial culture and the organizational one there are notable differences. For instance, while managerial culture notices aspects of the behaviour of those who have managerial functions within the organization, organizational culture reflects the active life of all its members. Thus, both categories of culture interact, being complementary parts of general management. From our analyses and reflections result significant differences between cultures: national, managerial and organizational. Even if each organization has its own cultural identity (managerial and organizational) which comes from the values and norms of the national culture, in the real economy this is disseminated in different results, sometimes with good effects, other times with an immoral effect.

The bad behavioural deviations (including facts of corruption) in the organizations, but also the chances to correct them have their sources in the national cultural legacy as well as in the managerial culture (thinking and acting of the organizational or governmental management). The remedies are always possible, even for the drastically diminution of the corruption phenomenon, when within all the articulations of the managerial structures the factors of performing managerial culture are promoted, factors which create a system of values and sustainable believes, defining competitiveness as the supreme value of the way of thinking and acting. Managerial competence, the force of example of ethical behaviour and the intransigency in fulfilling and applying the laws are independent forces, which represent ways to answer in a viable way, when they manifest in convergence, to all the financial "engineering": evasions, fake auctions, stealing through "tick" firms, compensatory exchanges of properties, illegal reimbursements of VAT, bribery, unclean commissions as well as many other "tricks" specific to a kleptocratic management. These vices of managerial nature belong to the *personal culture* mentioned by Dimitrie Gusti "as a living report between persons and cultural values."

⁷⁶ Dimitrie Gusti (1965), Pagini alese, București: Editura Științifică, p. 252.

Managerial culture acts as a mechanism for equilibrating some values that are endogen and hexogen to the organization, being strongly oriented towards the accomplishment of the objective assumed by the organization. For the managers who are concerned with a good “leadership”, ethical approaches become more and more important, because the traditional theories of structure and process that have been intensively applied in the XXth century have left the human communities outside analyses and strategic decision. We are underlining this phenomenon taking into account the fundamental purposes of managerial culture that needs to support the organization’s *mission, strategy and objectives*. Thus, M. Godet defines managerial culture from the perspective of its focus on three poles of activity: *anticipation, action and motivation*.⁷⁷ Anticipation defines the future changes; action takes into account the implementation of strategic changes, while motivation refers to the mobilization of all the actors involved in the changing process.

Organizational culture is a discussed concept, loaded with multiple significances, the phenomenon bringing into the attention of the organizational management the importance of human resource and the need to innovate (including socially) in order to promote positive changes. Launched at the beginning of the '80s in the United States, organizational “culture” has known a rapid expansion, representing today the theoretical nucleus of a new school in the management science: the school of cultural management. Since then, the management literature has started to spread the fact that an organization’s excellence is given by the common ways through which its members have learned to study, sense and act.

The managers’ ability to obtain extraordinary contributions from a great number of people is transformed in the ability to create a sense of a treasured purpose. The firms with weaker performances tend to have cultures which focus on internal policies, instead of the customer and on figures instead of people, as two American authors stated when searching for organizational excellence⁷⁸.

Thus, it results the pragmatic significances of *organizational culture* which aim a few elements such as: behavioural rules, the norms which develop within the organization, the dominant values adopted by the organization regarding the offer (products, services), the philosophy which leads the organization’s policy concerning the business partners (stakeholders), the rules established for its efficient functioning, the spirit and the climate which characterizes the organization in its internal and external environment (the market, society), respectively the relations with the natural environment.

Corruption at the Romanians is the result of the immoral activity of some persons and groups (personal and group managerial culture), usually in minority, but which obtain a no worthy attention, having the possibility of using some manoeuvre means at the border of legality of illegality, that favour the idea that they act in all the articulations of the power structures. It is true that greed, the desire for immediate enrichment and on every way, including the criminal one, gathers the persons and the groups interested in the sudden change of their wealth fare by avoiding the moral principles or the legislation. We call these types of the transition’s alliances towards capitalism, created out of reasons of excessive enrichment and moral depravation, coalitions of cleptocratic management⁷⁹.

The „original” Romanian transition towards the market economy has proved that the corruption acts have continuity at the Romanians, their proliferation and amplification, after 1989, being reflected by the increase in time of the Index of the perception of Perception (IPC), for 1997-2001 (see Fig.1). In this case, the perception of the level of corruption has been appreciated for 91 countries by analysts from the Göttingen University, by consulting the businessmen, the economic analysts of risk and the public opinion.

⁷⁷ M. Godet, *Prospective et Planification Strategique*, Economica, 1985, apud L. Marian (2001), *Strategii manageriale de firmă*, Tg. Mureș: Editura Universității „Petru Maior”, p. 20-21.

⁷⁸ T. Peters, R. Waterman (1982), *In Search of Excellence*, New York: Harper & Row Pb., p. 9-17.

⁷⁹ Mișuț, I., *Euromanagement*, (2002), Ed. Economică, București, p. 252

Fig.1. The index of the perception of corruption for Romania, 1997-2001

The index of the perception of corruption (IPC): IPC=0 – maximum corruption; IPC=10 – minimum corruption

The elaborated histogram is of course subjective, being an empiric image of the corruption in Romania seen by the foreigners. In reality, the corruption facts can be bigger or smaller than the situational perception. It is important to admit that after 1989 we, the Romanians, perceive from one year to another the increase of corruption and not its decrease, even if small fluctuations might appear (as it results from the histogram, corruption in 1989 seemed to be smaller than in 1998). The present tendency of intensification for the “corruption power” for Romania is expressed by the continuous decrease towards “zero” (maximum corruption) of the perception index, from 3,4 in 1997 to 2,8 in 2001. Appropriately, the phenomenon called “the burden of corruption” has increased from 6,6 to 7,2 points. According to the same source, for 2001 the perception index of corruption in countries appreciated as “clean”, such as Denmark or Finland, has come close to 10 points. It has to be noticed that the two Northern countries placed on the 1st and 2nd spot regarding “cleanness” are members of the European Union, and on the last places, 90 and 91, there is Nigeria and Bangladesh. In this top, Romania is placed on the 69th spot, next to Venezuela, with a visible tendency of unfavourable evolution of the index for the perception of corruption.

Fig. 2 continues to analyse the IPC’s evolution until 2006, the year before Romania’s integration into the EU. As it can be seen, the differences are significant between the average IPC level in the EU and the IPC for Romania, a difference which is maintained relatively constant, 3.5 points. The index of the perception of corruption in the analysed period is below the average of the years ’97-2000 (see Fig.1). It thus becomes obvious that the low rhythm for the implementation of reforms and anti-corruption activities in the Romanian society did not give the expected results. The causes which maintain the corrupted climate are numerous, they need to be identified and discouraged by the synergy of the society’s moral forces.

Fig. 2 The evolution of the corruption index in Romania in comparison with the average indexes in the EU, 2001-2006

In a study regarding the mentalities within Central and Eastern Europe, the Austrian Institute Fessel+GFK for the market research configures for each nation in transition certain predominant features, on two bipolar axes: disillusion - hope and passivity ambition. Fig.3 presents the map of the Romanian transition mentality towards modern capitalism. The relative equilibrium can be noticed, of 15%, in the area of disillusion between *winner*s (animated by ambition) and *nostalgic* (passives), as well as a significant difference of 6% in the area of hope between the *new-comers* (ambitious) and *traditionalists* (anchored in passivity and sceptical to change), in the favour of the last. In reality, the managerial structures (including the governmental ones) have been dominated by the category of "nostalgic" who, being in power, have participated to the "great kleptocratic distribution", by "commissions", being the first beneficiaries of the fraud privatizations. As a reward for party "loyalty", of big boss etc. the promotion of incompetence has been used for the managerial functions. Thus, if during communism the phrase "specialist and politics man" has been used, in the democracy of transition towards capitalism, within the public institutions and enterprises have remained only the political men, because "the specialists" have privatized.

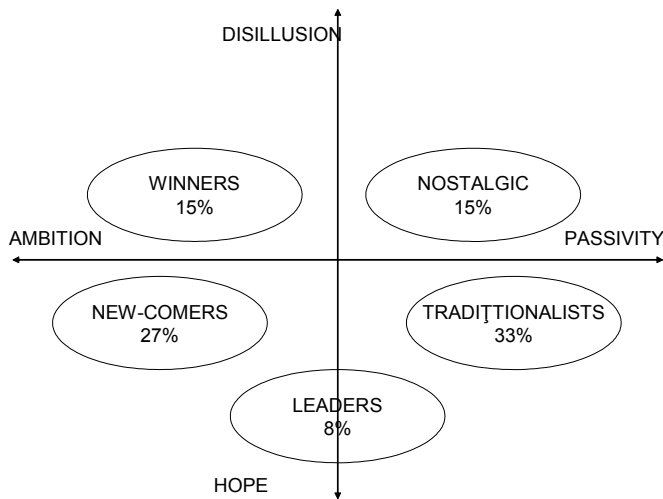

Fig. 3. The map of the Romanian mentalities in the transition towards capitalism

Source: Data from: A. Roșca (1996), "The Romanian oscillate between tradition and the desire to change", *Capital*, nr. 47, p. 39.

It becomes obvious that in the kleptocratic organizational culture, in order to dominate, subordinate, share the advantages etc. Incompetent leaders are promoted, which creates a functional environment for „Peter’s principle”. All the transition managers who made restructurings and reform only by suppressing the jobs and by sending the employees away have reached their level of incompetence. According to the criteria and values of the organizational culture where the ethic behaviour is at great price, the incompetents should have been dismissed.

The gates of the kleptocratic robbery and organized theft will be closed only if there will be actions on the causes which maintain the corrupted climate. Among these we mention: *the bureaucracy of the relation with the foreign investors and citizens* (action for the diminution of state bureaucracy are required), *privatizations with envelope offers* (privatizations should be transparent), *the lack of the codes of ethic behaviour for the dignitaries, managers, firms etc.* (the elaboration of ethics codes is required), *immunity for dignitaries* (this wall should be eliminated), *anti-corruption laws that are confusing and permissive regarding the assets, conflict of interests and others* (an anti-corruption package of laws should be elaborated, identical to the one in the EU, which will insure the independence of justice), *political clientele and local mafia* (a strong advertising is required and exemplary sanctions), *“the barriers” of managerial incompetence* (a strict promotion of professionalism and competence in management is required), *poverty* (viable strategies for eliminating poverty).

Conclusions

Romania’s integration in the EU and the globalization of the processes of knowledge will have a positive impact on cultures: *national, managerial or organizational* making more efficient the convergent actions for the elimination of immoral behaviours and economic criminality, specific to the kleptocratic managerial approaches.

The Romanians are not corrupted, only those who temporarily were or still are at power and take advantage of the immoral usage of their managerial function for purposes of personal or group enrichment. The corruptible and corrupted managers abuse their public power in order to obtain private benefits.

In order to be able to eliminate efficiently the corruption at the Romanian managers, it is needed to have a synergetic action of the *political forces, economic, juridical ones*, as well as *the church’s and the civil society’s*. As long as the corruption acts remain hidden and profitable, the action for eliminating in synergy will remain a future desiderate.

Romania had started a dramatic process of restructuring of the entire society and institutional organization, on the rough road between a dictatorial communist regime to a European democracy. One of the most important domains in which in the last 18 years major changes were realised through a multitude of changes, modernising, restructuring, splitting or merging actions, during a desperate try to create an efficient system of the public services. The entire structure of the existing operators must be redesigned in the near future, development of these institutions that will work in the future on the basis of performance indicators, defined by the National Authority of Public Services.

Key words: Regional Operator, investments, management redesigning, EU funding

Assessment of the existing situation:

Even since 1990, Romania had started a dramatic process of restructuring, starting from political, administrative, legislative and social point of view of the entire society, on the rough road between a dictatorial communist regime to a European democracy.

One of the most important domains in which in the last 18 years major changes were realised through a multitude of changes, modernising, restructuring, splitting or merging, during a desperate try to create an efficient system was the public utilities system.

As we already know, a **Public service** can be defined as an activity of a general interest performed by a public or private institution or company, which is established by a competent organisation like a central or a local administrating institution with the purpose of satisfying one or more requests of the members of the community.

It is a common understanding that services of general interest are constantly developing and will definitely continue to develop.

The present paperwork intends to be an objective analysis of the situation and more, of the necessity of realigning the public services management for water and sanitation in the existing context, after the integration of Romania into the European Union.

We can positively identify as major priorities the statements of Romania signed under the frame Treaty of adhering to the European Union, respectively the general Procedures of administrating community funds between 2007 – 2013, as is stated in the EC rule No. 1083/2006 which establish the general provisions regarding the European Fund of Regional Development, European Social Fund and Cohesion Fund.

In the purpose of being quite eloquent, we would like to detail bellow few of some defining figures of the water and sanitation services in Romania, as follows:

- Only 65% of the population benefits of water supply insured from a public din network, Romania being in the middle of the scale within the average countries of Europe.
- Romania is categorised as a relatively poor country in the countries with water resources, having only 2660 cum/inh/year, in comparison with an average of 4000 cum/inh/year in Europe.

- 79% from the wastewater are discharged not treated or just not enough treated in the emissaries.
- Only 52% of the Romanians benefits of both water and sanitation.

Considering the Frame water Directive 2000/60/EC, from the point of public services for water and wastewater, we can identify the following major requests for improvement of the above mentioned services:

Art 9: - The necessity for implementing of the principle of recovering the costs and of stimulative prices till year 2010.

Member States take into account the principle of recovering the costs for water services including the costs for resources and environment, considering the economic analysis in accordance with Annex III and the principle "polluter pays";

- Member States should insure till 2010 "a policy of prices that can ensure adequate for all the users, and also for rationale utilisation of the water resources";

- The Member states should insure: a good contribution of the different water users divided in industry, population, agriculture in order to ensure the recovery of the costs of water utilisation.

In accordance with the report elaborated by the National Institute of Public Health, Romania is ranked in the middle of the European coverage, considering that only 65% of the world population benefits of drinking water supply from a public network.

In Europe, population is connected to the water supply distribution in a proportion of about 96% -100% in the urban area and about 87% in the rural area, in accordance with the Health Organisation of the World named "Global Water Supply and Sanitation Assessment 2000". In the last 25 years in Romania was reached an increase of 29% for the users of public water networks, representing now more than 65% of the population of the country, in the conditions were during the same period of time major changes were registered comparing the report between urban and rural population.

In the statistics, the resident population within about 256 urban localities is supplied with potable water around 86% inhabitants, figures showing that only in about 55 urban localities population is 100% connected to the public network for water supply, representing no more than 21,5% of the total population of Romania.

In accordance with the "**White Paper on services of general interest**" released by the "Commission of the European Communities" in 2004, regarding public services, we can withdraw some of the main objectives for these categories of services:

- The need to ensure the provision of high-quality and affordable services of general interest to all citizens and enterprises in the European Union.
- Services of general interest remain essential for ensuring social and territorial cohesion and for the competitiveness of the European economy
- citizens and businesses rightly expect to have access to affordable high-quality services of general interest throughout the European Union
- Access is an essential component of European citizenship and necessary in order to allow them to fully enjoy their fundamental rights.

Purpose: A SHARED RESPONSIBILITY OF A PUBLIC AUTHORITY IN THE UNION

„In the Union, services of general interest remain essential for ensuring social and territorial cohesion and for the competitiveness of the European economy. Citizens and businesses rightly expect to have access to affordable high-quality services of general interest throughout the European Union. For the citizens of the Union, this access is an essential component of European citizenship and necessary in order to allow them to fully enjoy their fundamental rights. For enterprises, the availability of high-quality services of general interest is an indispensable prerequisite for a competitive business environment.”

The provision of high quality, accessible and affordable services of general interest meeting the needs of consumers and enterprises is therefore an important element contributing to reach the strategic goal of the Union "to become the most competitive and dynamic knowledge-based economy in the world capable of sustainable economic growth with more and better jobs and greater social cohesion".

Actions for creating the new institutional structures

Implementing of regional investment programmes financed through The Environment Operational Sectorial Programme answer to an entire series of requirements derived from the existing situation of water and sanitation services, most important of these being detailed bellow:

The requirements of the water and sanitation services in the most costly from Romania's obligations under the Adhering Treaty.

Drinking water supplied in the centralised system in mostly of a poor quality, under standards. In many areas sanitation does not exist. Water supply public services are in the most occasions not effective, especially because of the big number of small operators, which doesn't have the financial capacity sustaining investment in infrastructure.

Legislation that rules the functioning of the water and wastewater services is in accordance with the aquis comunitaire, but there are also several requirements that should be realised for full conformation, especially the ones regarding the implementation of the legislation for cases of small and average communities. In accordance with Adhering Treaty, Romania obtained the following deadlines for wastewater and sanitation services alignment till 2015 for 263 agglomerations having more than 10.000 inhabitants and till 2018 for 2.346 agglomerations having between 2.000 and 10.000 inhabitants and for drinking water services until 2015.

In order to comply with requirements, priority for financing regional investment projects for optimising investment and operational costs will be accorded.

Based on an long term investments programme, the utility services will be assured at quality requirements and acceptable tariffs. As we stated before, the investments needs should be prioritised, for assuring the engagements of Romanian authorities in order to comply in the first round with urban agglomerations.

General scheme for recommended institutional organisations for obtaining financing under the programme it is shown bellow.

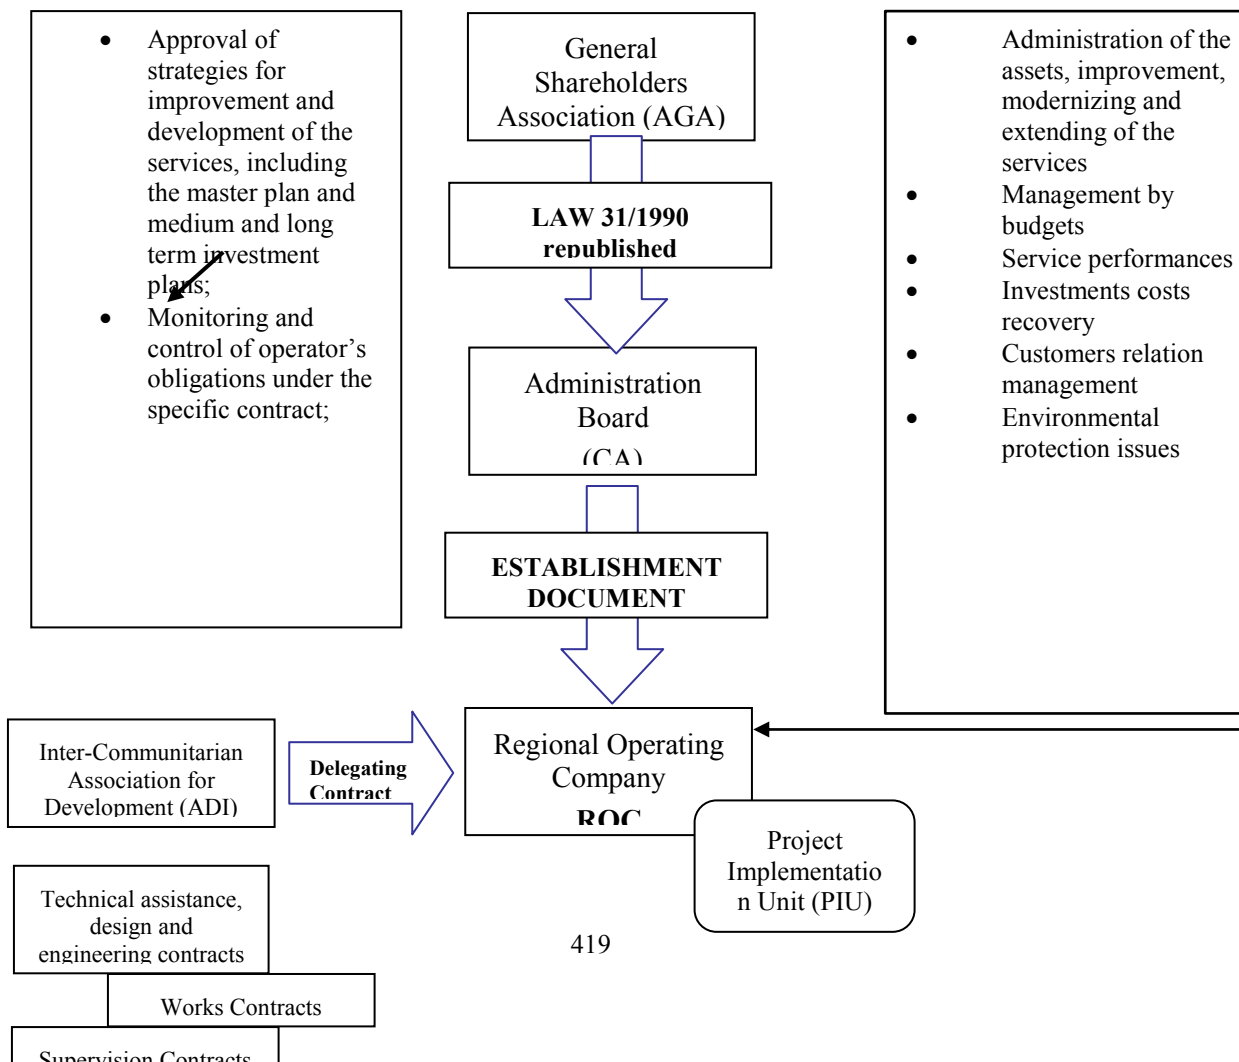

Fig. 1. General scheme for recommended institutional organisations for obtaining financing

Managerial redesigning of the existing public services operators in future in the new ROC's

The entire structure of the existing operators must be redesigned in the near future, development of these institutions that will work in the future on the basis of performance indicators, defined by the National Authority of Public Services. This development is compulsory in the context of obtaining funds for investment projects, therefore the next steps to be performed are to be accomplished from the managerial and organisational points of view.

There were identified the main development directions described as follows:

- Implementing of a DECENTRALISED MANAGEMENT SYSTEM OF THE TYPE OF MANAGERIAL RESPONSIBILITY, in which the organisation of the operator is redesign on so called "operating cost centres grouped on precise criteria: geographic area; volume of the necessary investments for reaching relevant European standards; administrative capacity; number of inhabitants, etc.
- Applying the basis of Projects Management, functionally and not only as an efficient management technique of investment projects. This will facilitate in the future the implementation of such organisational structures like the PIUs. (Project Implementation Units)
- Applying of the internal benchmarking evaluating method for evaluation of the performances of the internal structures of the ROC (cost, administrative of performance centres).
- Promoting of the principles of corporative governing concerning the protection of the shareholders, harmonisation of the interest of the stakeholders, social responsibility for the customer etc.
- Establishment of some commercial societies with under the "coat" of the ROC, specialised on the operational and maintenance.
- Also, the management of the new created ROC should consider the externalisation of one of these activities for effectiveness.

Abstract:

This paper draws a parallel between the organizational management of some academic institutions of fine arts in Romania and Germany comparing their organizing and functioning mode, taking into account the cultural, political, social and economical differences and also considering the fact that both countries are part of the same Europe.

Key words: management, organization, art, education

Starting with the definition of the comparative management, we notice its functional characteristics within different cultures, but the most frequently studied ones are the management conceptions in the USA and Japan, due to the fairly high competition between their industries.

If we study the European management we realise that the cultural, economical and social contexts specific to the European lifestyle lay at its foundation.

From a cultural point of view we could speak about comparative management within some fine arts institutions from two European countries that are different considering their economic and social position: Romania and Germany.

1.The organising and functioning mode of the Faculty of Visual Arts in Oradea, Romania

Oradea has imposed itself as an old traditional and cultural centre of an area with cultural-spiritual interferences, as a cosmopolitan, multiethnic and multi-confessional town.

The Faculty of Fine Arts was born out of the desire of the artistic community in Oradea and out of the awareness that there are professionalists (fine artists and theorists) that can live up to the pretensions of this kind of action, under the guidance of the University of Oradea. This desire coincides with the quality of our region as an area characterized by its mobility, economical power and ability to absorb the artistic products and services.

Bihor county is a confluence area of the western and eastern culture, where one can find the remains of the great European movements: Romanticism, Gothic, Renaissance, Baroque, Secession and also the Romanian customs inspired from Byzantine culture that have successively left their mark both upon wall and wooden architecture and also upon religious painting.

We can also mention the tradition of the academic education of Oradea by the foundation of the Royal Academy of Law and Philosophy in 1780, that was followed by the current University with its remarkable fame.

The cultural relationship of the town, the existence of a functional system of cultural institutions, as well as the premise of further developing the Faculty of Fine Arts in the Renaissance Princely Palace (16th and 17th century) within the Fortress of Oradea- historical monument - all represent further reasons to

financially support this faculty of our town. This space of about 25.000 m², of which 12.000 m² are meant by the municipal authority to house the Faculty of Visual Arts is an extremely suitable one for carrying out the process of artistic education.

Organizational Framework.

The Faculty of Visual Arts within the University of Oradea was founded according to the Government Ordinance no.3622/1995 and has been functioning from the university year of 1995-1996. It currently has the following structure:

1. The Department of Fine Arts with the following specializations:
 - The Pedagogy of Fine Arts
 - Sculpture
 - Painting
2. The Department of Decorative Arts with the following specializations:
 - Industrial Design
 - Textile (tapestry, prints, fashion)
 - Restoration-Conservation
 - Ceramics, Glasswork, Metal
3. The Department of Theoretical Subjects:
 - History and Theory of Art.

Part of the tuition fees are financed from the state budget and the rest are paid by the students.

Organizational Framework of the Faculty.

The organizational management of the faculty is provided by a managerial team made up of the dean, prodean, the heads of the departments and scientific secretary.

The judicial structure.

The Faculty of Visual Arts functions as a state institution endowed with judicial personality.

The educational system is applied gradually from the first years with teaching fundamental subjects and continuing with the expansion of the professional experience in the second and third years. There is a well-balanced ratio between the speciality subjects and the theoretical ones so as to assure both the formation of the artistic language and the conceptual development of the ability to make theoretical statements.

The quality of the artistic education is according to the criteria and standards of the academic evaluation and accrediting stipulated by the law (teaching staff, educational content, facilities, research activity, institutional, administrative and managerial structures according to the law) being compatible to the European system in accordance with the "Bologna Declaration" (1999).

The Faculty of Visual Arts is part of the University of Oradea and it functions as an academic institution proceeding from University's Carta, The Education Law, The Status of the teaching staff and the Organizing and functioning regulations of the Romanian educational institutions.

The artistic didactic instruction is carried out at the level of the modern principles and methodologies and it is open to permanent renewals. The credit transfer system allows the students' mobility and an increased flexibility of their own study routes. This organizing system required the students' responsibility when choosing the didactic routes, it gives them the possibility to freely acquire a multidisciplinary knowledge.

The students are equal partners in the mutual attempt to form qualified specialists. The students' opinion, either individual or expressed by their representatives and authorized by democratic processes or polls done with validated methodologies, represent a method of self-control, assessment and improvement of the academic activity.

The activity of the students is materialized by organizing personal and group exhibitions, fashion shows, artistic camps and so on.

The professional managerial goal

5. The complex formation of the future specialists-artists in the fine arts field.
4. The formation of its own staff from the student community of Oradea by means of counselling and professional orientation, by educational management, by sociology of education, by intercultural education and so on.
5. Developing some competitive research programmes.
6. Benefiting by financing some projects-contracts or other sources gained according to the law: own incomes, subsidies, donations, sponsorships and taxes from judicial or physical people according to the paragraph 53 from the Education Law. The incomes from the above mentioned sources are managed and used entirely at the faculty level (chairs, specializations).
7. Benefits, compensations, comisions and granting financial compensations (up to 20%) according to the decision made by the Senate of the University, to those teaching staff that sign contracts with the market.

2. Academie fur kunst&creative Lebensgestaltung Lage – The Academy of Art și Creative Design of Lage, Germany

General Context

Germany is one of the biggest economical powers of Europe and an important part within the European Union. The German people are well-known for their readiness and punctuality. From a cultural point of view, the German artistic management is different from the Romanian one, Romania being a young democratic, eastern European and former socialist country in comparison with Germany – a capitalist, western European country.

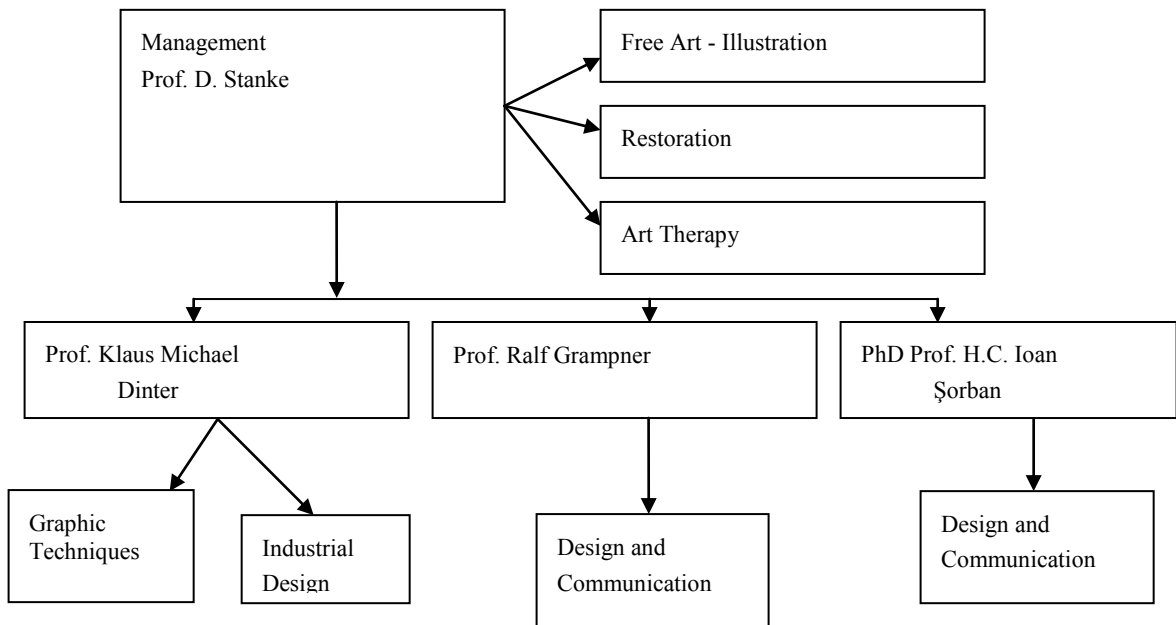

A peculiarity of the German educational system is represented by the implication of the companies through training programmes. This implies financial investments for training the employees. Thus, they spend four hours a week studying in a company and a day and a half in a theoretical school. In this way, the companies ensure qualified labour and the graduates definitely have a work place.

This characteristic of the German system regarding the involvement of the companies in the professional training leads to a superior quality of the products and services that are internationally renowned.

The German managers lay emphasis on the quality and costs decrease as well as on the link between the structure and culture of the organization with the market requirements.

Organizational structure

The Academy of Art and Creative Design of Lage – AKL, is an institution with judicial personality and an entirely private capital. It was founded 30 years ago by a remarkable personality of the artistic world, that is PhD Prof.H.C. Doris Stanke. Her activity as a teacher of illustrations, restoration, sculpture, free arts and art therapy is well-known beyond the borders of her region.

The management of the Academy is mainly dealt with by Doris Stanke in collaboration with the heads of the departments and it follows two directions:

1. practice (one year)
2. study (two years).

All these are based on the compatibility with the European educational system – Bologna. In order to pass the entrance examination in the first year at the academy, one can attend a practice year.

The structure of the hours in the curriculum:

1. Practice : 1 year – 25 hours/week – 100 hours/month
2. Study : 3 years – 32 hours/week – 128 hours/month

As for the artistic management, it comprises the total of the theoretical and material structures that are the basis of the applied artistic creation as artistic consumer goods, this being a promotion and success method for the fine artist and market operators.

Art therapy at AKL is based on humanistic sciences in accordance with scientific, artistic, psychological and interdisciplinary methods and knowledge. By means of colour, form, line and background, the art therapy can touch the innermost soul of a persona and help him to live a life without any problems and almost without any medication. AKL does not impose the use of a certain art concept, it pursues the application of manual methods used by the Ancient masters in order to achieve a large range of forms which, after having been freely applied using different art movements, they would produce works of art.

The study of the art therapy is recommended to the art students who have a talent for pedagogy, psychology, to the medicine students and to the teaching staff, nurses, caretakers of the elderly, and kindergarten educators.

The person who laid the foundations of art therapy in Germany is Rudolf Steiner.

Doris Stanke starts with the division of man in three parts: head- bust – abdomen and she presents this concept in the following table:

Therapy Artistic form	Figure The division in three parts	Physical Body Phyziology	Soul Characteristics	Spirit Consciousness
Drawing	Head	Nerves	Thinking	To be awake

Painting	Bust	Alert life	Feeling	Dreaming state
Moulding	Abdomen	Metabolism	Will	Sleeping

Tiring work, the life style of the modern society, the lack of fantasy in the environment, the haste, the noise all these lead to a sickening stress that can be compensated by sociability, sport, relaxation or hobbies. In this respect, each country is characterized by a specific tendency, i.e the southern countries suffer less from stress and more from depression.

3. Conclusions

The two analyzed systems of organizational management are closely connected, interdependent with the cultural background of each of the two countries.

As for the managerial approach there are differences between the two countries, even though the starting point is similar. The Romanian state interferes more in the organizational system, as the faculty is a state institution while the German state barely does. But both institutions proceed from the European artistic education system, according to the "Bologna Declaration". The cultural differences led to the foundation of art therapy in Germany, while in our country this does not function, even though its benefits are huge.

In the young democratic eastern European countries, art therapy is more than necessary, as it does not appeal to the state politics, but to the person. Therefore politics must show interest in it for the mutual benefit in what concerns balance and health. We think that art therapy can be applied to each country regardless of its culture, socio-political background and economical structure.

When losing the sense of reality and personality, art therapy can be seen as a way to regain stability and normality, bringing its contribution to increasing the life quality.

There are differences regarding the managerial practice, when making decisions (in Germany the staff is involved in the process while in Romania this happens in a smaller degree), human resources etc.

For the continuous improvement of the artistic management of our faculty, we have organised experience exchanges, with well organised visiting programmes at AKL in order to implement an educational artistic management in accordance with the standards of the European Union and to train compatible and functional professionals on the artistic market in a liberal society, an artistic market that would encompass all the methods and means that secure the material and spiritual existence of the artist.

LE NOUVEAU CONTRAT PSYCHOLOGIQUE : UN DÉFI POUR LES PROFESSIONNELS ROUMAINES EN RESSOURCES HUMAINES

Muresanu Doina

Docteur en gestion internationale, ASE Bucuresti, Étudiante au doctorat en administration des affaires, Spécialisation ressources humaines- management, École des Sciences de la Gestion, Université du Québec à Montréal (UQAM), Canada, Chaire de gestion des compétences, Pavillon des sciences de la gestion, local R-2915 315, rue Sainte-Catherine Est, Montréal, Qc, Canada H2X 3X2, Téléphone : 001.514.482.7295, e-mail : muresanu.doina@courrier.uqam.ca, doina_muresanu@hotmail.com

La multiplication des recherches sur le contrat psychologique est apparue comme un résultat des changements subis par les relations de travail où on assiste à des processus de restructuration des entreprises, de licenciement et de prolifération du travail temporaire sur le marque de la globalisation économique et de la nécessité de repenser la gestion des ressources humaines à la lumière de son approche stratégique (Morrison et Robinson, 1997). Qui plus est, on admet qu'un changement de paradigme se déroule de la sécurité de l'emploi vers l'employabilité. (Guerrero 2005). Dans ce contexte, le contrat psychologique qui facilite l'analyse de la relation d'emploi à partir des perceptions individuelles concernant les obligations qui existent entre l'employé et l'employeur (Rousseau 1989), fournit les moyens d'une meilleure compréhension des attitudes et des comportements au travail dans le but d'améliorer la mobilisation et la fidélisation des employés roumains dans le contexte du marché de travail européen.

Mots clé : contrat psychologique, brèche, violation, conséquences sur les attitudes et sur le comportement

Abstract :

The multiplication of research concerning the psychological contract has appeared as a result of the changes undergone by the work relations where we witness a process of enterprise restructuring, dismissal and uncontrolled proliferation of temporary work taking into account the economical globalization and the necessity to rethink the human resource management from its strategic approach. Moreover, we admit that there is a paradigm change, from employment security to employability. In this context, the psychological contract which eases the analysis of the work relation starting from the individual perceptions concerning the existent obligations between the employee and the employer provides the means for a better understanding of the attitudes and behaviors with the purpose to improve the commitment and the loyalty of Romanian workers within the European work market.

Key words: psychological contract, breach, violation, consequences on the attitudes and behaviour.

Nous nous proposons dans cette communication scientifique d'analyser quelques unes des facettes du nouveau contrat psychologique qui aideront les professionnels des ressources humaines à mieux comprendre l'utilité de ce concept pour développer une stratégie RH en harmonie avec la stratégie globale de l'entreprise. A cet égard, nous présenterons d'abord la notion de contrat psychologique dans ses acceptions initiales et actuelles tout en essayant de distinguer leurs points convergents et divergents. Par la suite, nous nous proposons de cerner les fondements et les caractéristiques définitoires du contrat psychologique. Cependant, nous montrerons les conséquences de la brèche et de la violation du contrat psychologique. La partie finale de notre travail essaiera de présenter l'importance d'une meilleure compréhension du nouveau contrat psychologique pour les praticiens RH qui sont confrontés avec des défis importants après l'entrée de la Roumanie en l'Union Européenne.

La notion de contrat psychologique

La littérature sur le contrat psychologique suggère que ce concept représente une extension des écritures des philosophes du dix-huitième et dix-neuvième siècles sur le contrat social, des ouvrages dont les origines portent les traits des anciens philosophes Grecs. Ainsi, dans cette approche, le contrat social inclut une composante « naturelle ». En ce sens, l'adhésion de l'individu à une forme organisée de la société, et une partie de « soumission » qui réclame l'action de l'état en tant que garant de la sécurité et de la protection des citoyens à l'échange de leur part de payer les impôts, de respecter les lois et de partager le risque de la défense en cas de différentes menace (Roehling 1997). Morrison et Robinson (1997) reprennent l'idée de contrat social comme « suppositions, croyances et normes concernant un comportement approprié dans une unité sociale particulière »⁸⁰ (p. 246) pour expliquer le processus d'interprétation de la brèche soutenant que les parties prenantes du contrat psychologique changent non seulement des promesses concernant l'échange des biens et de services, mais elles s'engagent implicitement à réaliser cet échange réciproque en respectant l'ensemble des valeurs, des croyances et des normes spécifique à un contrat social donné. En s'inspirant des idées de Clark & Waddell, (1985), Morrison et Robinson (1997) ajoutent que des différents contextes sont gouvernés par des contrats sociaux différents et qu'un comportement jugé comme acceptable dans un contexte, pourrait être considéré comme intolérable dans d'autres contextes.

Les racines de la théorie du contrat psychologique dans la littérature de la gestion s'appuient sur la théorie de l'équilibre de Barnard (1938) et sur le modèle de récompense - contribution élaborée par March & Simon (1958). La théorie de l'équilibre de Bernard (1938) met en lumière une perspective d'échange entre les organisations et leurs membres dans le sens où chaque employé reçoit des récompenses pour lesquelles il apporte des contributions. (Roehling 1997). March & Simon (1958) mènent plus loin la théorie de l'équilibre pour s'intéresser à la nature des échanges qui influencent la décision des employés de s'impliquer dans les organisations. Cependant, ils sont les premiers qui parlent de termes implicites et explicites du contrat d'emploi (Roehling 1997).

Le terme de Contrat Psychologique du travail a été créé par Argyris (1960) pour décrire la relation entre les ouvriers et leur contremaître dans une usine. Il a observé qu'un niveau satisfaisant des salaires et la garantie d'emploi contribuaient à l'augmentation de la production.

« Puisque le contremaître réalise que le système tendra à atteindre une production optimale sous un leadership passif, et puisque les employés partagent ce point de vue, on peut faire l'hypothèse qu'une relation particulière se développe entre les employés et le contremaître, relation qui peut être qualifiée de 'contrat psychologique au travail' » (Argyris, 1960, p.97)⁸¹.

Quelques années plus tard, Levinson (1962) a mis de côté le terme « travail » dans le concept d'Argyris (1960), pour mettre en évidence les obligations des entreprises en ce qui concerne le bien-être émotionnel de ses employés. Il emploie le terme d'« attentes mutuelles » pour décrire le contrat psychologique entre l'individu et l'organisation mais dont les parties peuvent ne pas être parfaitement conscientes (Guerrero, 2004b). Tel que décrit dans le livre « Psychological men » (1976), Levinson affirme l'existence des besoins psychologiques au travail. La motivation individuelle est équivalente avec le fonctionnement de la personnalité individuelle. En plus, les gens ont des impulsions (nécessités) de base : développement / construction ; affection / amour ; destruction / agression. Ces impulsions agissent simultanément et inconsciemment et c'est l'ego qui intègre ces forces d'une manière cohérente (Meckler, Drake, Levinson, H., 2003).

Schein (1965) quant à lui, met l'accent sur l'importance d'une adéquation entre les attentes et les contributions de chaque partie et sur l'interaction entre les deux parties impliquées dans le contrat psychologique (Coyle-Shapiro, 2005).

« La notion de contrat psychologique suppose que l'individu a une série d'attentes envers l'organisation et que l'organisation a une série d'attentes envers lui...De telles attentes ne sont écrites dans aucun contrat formel entre l'employé et l'organisation, mais elles agissent pourtant comme de puissants déterminants du comportement » Schein, 1965, p.11

⁸⁰ Notre traduction.

⁸¹ Les définitions du contrat psychologique d'Argyris, Schein et Rousseau et la citation de Blau ont été reprises de Coyle-Shapiro (2005), p. 22,23 et 27.

Bref, selon Coyle-Shapiro (2005), les principales différences parmi les conceptualisations initiales du contrat psychologique représentent (i) le passage d'une vision de l'échange qui se réfère aux avantages tangibles vers une perspective plus large qui contient des éléments tangibles et intangibles ; (ii) la perspective de la définition du CP changée du niveau de group envers la relation individu- organisation ; (iii) la préoccupation pour l'interaction entre les deux parties de l'échange ; et (iiii) la relation entre ces parties vue comme une relation de dépendance (parent enfant) (Meckler, Drake, Levinson, H., 2003).

Avec Rousseau (1989) la perspective change devenant plus « étroite », vu que jusqu'à ce moment-là le contrat psychologique faisait référence à l'idée d'attentes, de croyances, d'obligations, de perceptions ou encore de relations (Guerrero, 2004b). Rousseau (1989) considère que le Contrat Psychologique est une « perception » subjective et différente d'un employé à l'autre qu'une promesse a été faite et que la compensation qui suit cette promesse va déterminer des obligations réciproques.

Le contrat psychologique représente « la croyance d'un individu relative aux termes et aux conditions d'un accord d'échange réciproque entre cette personne cible et une autre partie. Les questions clés ont trait ici à la croyance qu'une promesse a été faite et une compensation offerte en échange, liant les parties à un ensemble d'obligations réciproques » Rousseau 1989, p.123.

Ainsi, on assiste à un déplacement de l'analyse du niveau relationnel à celui individuel, plus spécifiquement, au niveau des croyances subjectives individuelles. Cependant, l'accent est mis sur la notion d'obligations basées sur des promesses perçues, notion distincte de celle d'attentes qui a caractérisé les travaux précédents. Dans cette logique, les attentes font référence seulement à ce que l'employé attend de recevoir de la part de son employeur, tandis que le contrat psychologique est relié aux *attentes mutuelles* perçues (souligné par l'auteur) qui sont spécifiques à la relation employé-employeur (Robinson et Rousseau 1994). Rousseau (1989) ajoute que les promesses elles-mêmes ne constituent pas un contrat. Par contre, le contrat psychologique engage en égale mesure les promesses et les contributions changées pour telles promesses. Les contributions comme travail dédié, l'acceptation du perfectionnement ou du transfert peuvent être offerts en échange pour des promesses implicites ou déclarées concernant le salaire, la promotion, le développement ou la carrière (Robinson et Rousseau 1994).

Dans sa critique à Levinson, Rousseau (2003) considère qu'il ne prend pas en considération le rôle du schéma dans le CP comme source de stabilité, adaptation et résistance au changement. L'accent mis sur l'individualisme égoïste et l'omission du processus relationnel sont des points faibles de la conceptualisation de Levinson. En revanche, Rousseau (2003) propose la conceptualisation du contrat psychologique comme modèle mental de la relation d'emploi. Le rôle joué par le schéma dans la formation du CP nous fait croire que les managers et les employés qui partagent un schéma commun ont d'avantage la chance d'avoir une compréhension mutuelle des obligations discrètes de l'un à l'autre et d'être d'accord en ce qui concerne leurs interprétations des informations, d'actions et d'événements. Rousseau (2003) propose une vue en termes de « nous » de la relation d'emploi. En même temps, elle est en désaccord avec la relation de dépendance décrite par Levinson (2003) proposant un partage du pouvoir au sein d'une organisation.

Selon Rousseau (1989), le contrat psychologique n'est pas synonyme du contrat implicite (en anglais « implied contrat »), car leur niveau d'analyse est différent. Le contrat psychologique se situe au niveau individuel et à cause de son caractère subjectif. Pour que le contrat psychologique existe, les parties, soit l'employeur et l'employé, ne doivent pas s'entendre sur ses termes. D'autre part, le contrat implicite représente une obligation mutuelle qui existe au niveau relationnel (par exemple, dyadique, interorganisationnel) et il est le résultat d'un consensus social concernant la nature de l'obligation. Rousseau (1989) considère que le contrat implicite représente un modèle des obligations issues des interactions entre les individus et l'organisation qui devient une composante de la structure sociale dont la relation est sortie. Ainsi, le contrat implicite peut être évalué par les « observateurs » de la relation, c'est-à-dire les tiers, le public, tandis que le contrat psychologique n'existe que dans les yeux de l'employé. D'ailleurs, selon Guerrero (2004 b), la vision « contractuelle » de la relation d'emploi est très anglo-saxonne étant soumise à la logique « client – fournisseur », spécifique aux entreprises américaines. Dans le même sens, Rousseau (1989) emploie la typologie de Miles et Snow (1980) pour départager les stratégies d'emploi selon la culture organisationnelle en deux catégories : « faire » et « acheter ». En tant qu'acheteur, les organisations payent le prix du marché pour obtenir des individus avec des habiletés spécifiques rapidement utilisables. Ce n'est pas le cas pour la stratégie « faire » qui implique

l'investissement en employés en termes de formation, de socialisation et de développement d'une relation à long terme entre l'employeur et ses employés.

La théorie de l'échange social comme fondement de la théorie du contrat psychologique

La théorie de l'échange social s'appuie sur les travaux de Blau (1964). Selon lui, on connaît deux types d'échanges : l'échange économique et l'échange social. L'échange de type économique a comme base le contrat formel qui est explicite et plus spécifique. En conséquence il peut être mesuré, quantifié, donc, il peut être négocié. En plus, au niveau temporel, il agit à court terme parce qu'il n'a pas besoin de temps pour se consolider. Par contre, l'échange social englobe « des faveurs qui créent des obligations futures diffuses, non précisément spécifiées, et dont la nature de la contrepartie ne peut être négociée mais doit être laissée à la discrétion de son auteur » (Blau, 1964 p.93). Pour éclairer davantage la notion d'échange social, Blau (1964) continue en affirmant qu'on ne peut pas parler d'échange social dans des situations limite comme celle de donner d'argent sur la menace ou celle de faire des dons pour satisfaire l'orgueil propre. Blau (1964) considère l'échange social comme détenteur des éléments avec une valeur intrinsèque ce que le distingue de l'échange économique. En même temps, il n'est pas entièrement désintéressé (comme l'amour profond) à cause de l'attente du retour de la faveur de la part de son receveur. Bref, l'échange social est « un cas intermédiaire entre le pure calcul de l'avantage et la pure expression de l'amour » Blau, 1964, p.112⁸².

D'autre part, étant donné que les obligations impliquées dans l'échange social sont diffuses, non explicites et elles n'ont pas de valeur métrique. La relation entre les deux parties prenantes a besoin du temps pour se consolider. Par conséquent, puisque l'échange social comporte des obligations moins explicites, c'est la confiance qui joue un rôle de base dans ce processus. Comme la confiance, l'affectivité et le soutien offerts pas les organisations ont aussi besoin d'une orientation à long terme pour que la relation soit satisfaisante pour toutes les parties impliquées (Blau 1964). La confiance est présente dès le début de la relation, chaque partie ayant besoin de la confiance que l'autre partie retournera ce qu'elle a reçu. Cette action de réciprocité fait aussi la distinction entre l'échange social et l'échange économique. La confiance joue un rôle aussi important pour le contrat psychologique car elle intervient dès le début de la relation entre l'employé et son employeur (Robinson, 1996). Ainsi, selon Robinson (1996), l'existence de la confiance *à priori* va modifier la perception de l'employé concernant l'apparition ultérieure de la brèche dans son contrat psychologique. L'employé est, dans ce cas, susceptible d'être plus tolérant envers son employeur en interprétant la brèche comme un événement non intentionné, dû à l'erreur ou en dehors de la responsabilité de son employeur. Cependant, elle ajoute que la confiance soit tout aussi importante durant l'entier processus du contrat psychologique en jouant le rôle de médiateur de la relation entre la brèche et ses conséquences.

Shore et Barksdale (1998) utilisent la théorie de l'échange social pour définir un modèle de la relation d'échange entre l'employé et l'employeur. Ainsi, ils partent de l'approche de Blau (1964), selon laquelle un équilibre dans la relation d'échange est attendu tandis qu'un accomplissement déséquilibré des obligations pourrait engendrer des conséquences négatives sur cette relation. Dans ce sens, Shore et Barksdale (1998) ont démontré que la plupart des relations d'emploi sont équilibrées mais il peut exister des individus qui perçoivent la relation avec leur employeur comme étant déséquilibrée. Plus spécifiquement, ils ont examiné le modèle général de l'échange en termes d'équilibre et de niveau d'obligation. Leur approche est basée sur la délimitation d'une typologie composée de quatre type d'échange dont deux sont équilibrées à de niveau différents des obligations soit (i) mutuel obligations élevées (anglais « mutual high obligations ») et (ii) la relation mutuelle baissé en obligations (anglais « mutual low obligations relationship »). Les autres deux catégorie d'échange dévoilent une relation déséquilibrée soit au niveau de l'employé qui aurait plus d'obligations que l'employeur, c'est-à-dire (iii) la relation employé supra-obligation (anglais « employee over-obligation relationship »), soit au niveau de l'employeur dont les obligations sont perçues comme supérieures à celles de l'employé ; (iv) la relation employé sous-obligation (anglais « employee under-obligation »). En s'appuyant sur cette logique, l'étude de Shore et Barksdale (1998) démontre que les catégories équilibrées de l'échange livrent des conséquences plus positives pour l'organisation que les catégories manquant d'équilibre et aussi qu'un

⁸² Notre traduction.

niveau élevé d'obligation pour l'employé conduit à des attitudes et à un comportement qui soient en accord avec les objectifs de l'organisation. Au contraire, un niveau d'obligations plus élevé pour l'employeur démobilise l'employé car il voit l'employeur dans la position de ne pas avoir accompli et respecté sa part de la relation d'échange. En conséquence, les employés sous-obligés envers l'employeur sont plus susceptibles de montrer des niveaux baissés de la perception du support organisationnel et d'engagement affectif et par la suite d'avoir le niveau le plus élevé d'intention de quitter l'organisation.

Au coeur de la théorie des échanges sociaux se trouve la **norme de réciprocité** (Goldner 1960) selon laquelle « (i) les gens doivent aider ceux qui les ont aidé et (ii) les gens ne doivent pas faire tort à ceux qui les ont aidés ». Selon Goldner (1960), on distingue deux types de réciprocités : la *réciprocité hétéromorphique* et la *réciprocité homéomorphique*. Dans le cas de la réciprocité hétéromorphique, la valeur du contenu de l'échange est perçue comme équivalente même si la forme du contenu est différente tandis que la réciprocité homéomorphique présuppose un contenu de l'échange parfaitement égal (Coyle-Shapiro et Parzefall 2005).

La littérature sur le contrat psychologique a gardé la distinction entre l'échange économique et l'échange social pour identifier le contrat psychologique de type transactionnel et relationnel. Le contrat transactionnel englobe des éléments de nature économique plus tangibles et reste invariable au cours du temps. Par contre, le contrat psychologique de type relationnel contient une forte dimension affective appuyée sur la confiance et la loyauté entre l'employé et l'employeur (Guerrero, 2004b). Dans la même veine, Morrison et Robinson (1997) affirment que la violation du contrat psychologique est susceptible d'être plus profonde dans le cas d'un contrat relationnel parce qu'il n'est pas caractérisé par un comportement opportuniste ou égoïste est le seuil de détection de la brèche et plus élevé tandis que la vigilance de l'employé est plus baissée. Cependant, selon Coyle-Shapiro et Parzefall (2005), ce type de contrat est dynamique et, vu qu'il englobe des éléments tangibles et intangibles, pourrait être doté d'une certaine ambiguïté.

La typologie d'échange social versus les types de CP

Même si les chercheurs ne font pas l'unanimité par rapport à la typologie du contrat psychologique ou à son importance pour les recherches du domaine (Coyle-Shapiro et Parzefall (2005), les dernières années ont révélé un renouvellement de l'intérêt concernant le rôle de la typologie de contrat psychologique pour expliquer le comportement organisationnel.

En s'appuyant sur les travaux de McNeil (1985), Rousseau (1995) propose quatre types de contrat psychologique, positionnés sur un continuum allant de l'instabilité vers stabilité (Tableau 1). Le contrat le moins stable est celui de type transitionnel caractérisé par une relation d'échange non stable, des attentes ambiguës concernant la performance et une stratégie de la part de l'entreprise plutôt réactive que proactive. Par contre, le contrat de type relationnel livre la plus grande stabilité dans la relation d'emploi car il a comme fondements la confiance mutuelle et la loyauté de même qu'une relation de type « ouverte » (open-ended) (Rousseau, 2000). Lester, Kickul et Bergmann (2007) considèrent qu'il n'y a pas aucune contradiction entre le caractère stable et celui ouvert du contrat psychologique relationnel. Le caractère ouvert est opposé, selon eux, à la situation dite « statique », dans laquelle la relation d'emploi reste inchangée dans le temps. Par contre, une relation stable offre l'opportunité pour les parties de communiquer leurs préférences et leurs attentes dans une relation évolutive et continue. Le contrat relationnel englobe une forte partie « affective » d'où son rôle important dans l'explication de plusieurs comportements dus à la réaction émotionnelle qui suit l'apparition de la brèche ou de la violation (Morrison et Robinson, 1997 ; Raja, Johns et Ntalianis, 2004 ; Ho, Weingart et Rousseau, 2004).

Dans le milieu du « continuum de la stabilité », Rousseau (1995, 2000), place le contrat transactionnel et le contrat de type « balancé ». Le contrat de type transactionnel englobe des arrangements d'emploi à court terme ou d'une durée limitée, basés premièrement sur un échange de type économique. Par contre, le niveau de la performance attendue est clairement spécifié, ce qui confère un bas niveau de l'ambiguïté pour les deux parties impliquées dans la relation d'emploi. Dans le même sens, Flynn (2005), parle de l'échange de type « négocié » dans lequel les deux parties engrenées dans une relation d'échange établissent de manière négociée le contenu et les termes de cet échange. Cependant, le contrat psychologique de type balancé ou équilibré (balanced) (Rousseau, 1995), contient des arrangements d'emploi dynamiques et ouverts, conditionnés à la fois de succès économique de la compagnie et des opportunités de développement de carrière livrées aux employés. Vu son caractère dynamique et sa capacité de constituer

un cadre d'apprentissage et de développement autant pour les employés que pour l'organisation, certains chercheurs ont nommé ce type de contrat psychologique « contrat de développement » (Guerrero, 2004 b).

Au-delà de ces différences d'opinions, la distinction générale entre des contrats psychologiques de type transactionnel et relationnel aide les chercheurs à expliquer les raisons pour lesquelles des types différents d'obligations rompues ont des effets différents sur les comportements au travail. Ainsi, selon Morrison et Robinson (1997), la préoccupation concernant les résultats (outcomes) de la relation d'emploi semble à avoir un effet important dans le lien entre la brèche et la violation du contrat psychologique plutôt pour l'échange transactionnel que pour l'échange relationnel. Elles expliquent cette situation apparemment paradoxale par le fait que la relation transactionnelle suppose une réciprocité immédiate et directe tandis que dans un échange relationnel, les employés sont plus « tolérants » et s'ils perçoivent qu'ils ont été correctement traités, ils seront plus confiants qu'à long terme leurs contributions seront adéquatement récompensées. Par contre, selon les mêmes auteurs, l'expérience de la violation serait plus forte dans le cas du contrat relationnel, puisqu'il n'est pas caractérisé par un comportement opportuniste ou égoïste et que la détection d'une brèche engendrerait des sentiments de mécontentement plus profonds à cause de la violation des présupposées et des croyances qui gouverneraient ce type de relation d'emploi.

Les conséquences de la brèche et de la violation du contrat psychologique

Même si les chercheurs ne font pas unanimité quant au concept, au contenu ou aux instruments de mesure du contrat psychologique, ils s'accordent à reconnaître sa capacité de livrer des réponses pertinentes aux questions sur les nouvelles relations d'emploi. Cependant, la notoriété du contrat psychologique augmente au fil des années puisqu'il permet une meilleure compréhension des comportements et des attitudes au travail (Guerrero, 2005 ; Robinson et Morrison, 1997, 2000 ; Coyle –Shapiro, 2000).

Apparu comme un reflet du caractère idiosyncrasique de la relation d'emploi, le contrat psychologique offre l'explication de l'émergence de certaines attitudes et comportements au travail, suite à l'apparition de l'inadvertance entre ce qui a été promis et ce qui a été livré dans la relation entre l'employé et son employeur. Ce déséquilibre conduit parfois à l'apparition des phénomènes de brèche ou de rupture ou, d'autre part, à l'apparition de fortes réactions émotionnelles, caractéristiques de la violation du contrat psychologique.

Ainsi, selon Dulac (2005), les conséquences des brèches et violations du contrat psychologiques peuvent être analysées par rapport à leur impact sur les attitudes et sur les comportements au travail.

L'impact de la brèche et de la violation du contrat psychologique sur les attitudes au travail.

De nombreuses recherches se sont axées sur l'analyse de la brèche et de la satisfaction. Robinson et Rousseau ont démontré dans leur étude de 1994 que la perception de la brèche était reliée de manière négative à la satisfaction au travail. Dès lors, plusieurs recherches ont trouvé une relation négative entre la brèche du contrat psychologique, soit par rapport à la satisfaction dans la relation d'emploi (Robinson et Rousseau, 1994 ; Turnley et Feldman, 2000 ; Guzzo, Noonan et Elron, 1994) soit par rapport à la satisfaction générale dans la vie (Kickul et Lester, 2001).

Une autre composante de l'attitude au travail qui a suscité l'intérêt des chercheurs est représentée par l'engagement affectif des employés à l'égard de leur organisation. Plusieurs études ont démontré empiriquement un degré d'engagement envers l'organisation plus faible le moment où les employés percevaient l'apparition d'une brèche dans leur contrat psychologique (Coyle –Shapiro et Kessler, 1998 ; Coyle- Shapiro, 2000 ; Raja et al, 2004 ; Robinson et Rousseau, 1994). Par contre, Turnley, Bolino, Lester et Bloodgood (2004) ont trouvé une relation positive entre la perception de la brèche et l'engagement envers le syndicat.

L'intention de rester ou de quitter l'organisation a fait l'objet de plusieurs recherches car elle représente un signal important pour une organisation concernant sa préoccupation de mobiliser et de retenir ses employés. Maintes études dans ce domaine ont trouvé que la perception de la brèche prédit de manière significative l'intention des employés de rester ou de quitter l'organisation. (Robinson et Rousseau, 1994 ; Turnley et Feldman, 2000 ; Guzzo, Noonan et Elron , 1994).

Robinson et Rousseau (1994) ainsi que Robinson (1996) se sont concentrés sur l'analyse de l'impact de la brèche (i.e. non-accomplissement des obligations dans la relation d'emploi) sur la confiance dans la relation d'emploi. Leurs études ont démontré une diminution de la confiance vis-à-vis l'employeur le

moment où les employés ont perçu l'émergence d'une brèche dans leur contrat psychologique. Qui plus est, pour Robinson (1996) la confiance joue un rôle important autant que l'outcome (conséquence) de la brèche, ainsi qu'antécédent de son apparition.

Suite à sa recherche menée en 2000, Coyle-Shapiro a conclu qu'il y a un effet positif de l'accomplissement des promesses du contrat psychologique sur le support organisationnel perçu par l'employé. A son tour, Dulac (2005) cite d'autres études qui se sont intéressées à l'impact de l'accomplissement des obligations du contrat psychologique sur d'autres attitudes au travail comme le cynisme affectif et cognitif (Anderson, 1996 ; Robinson et Brown, 2004) ou la fatigue émotionnelle (Johnson et O'Leary-Kelly, 2003).

L'impact de la brèche et de la violation du contrat psychologique sur les comportements au travail.

Premièrement, l'étude de la brèche qui survient dans le contrat psychologique est importante parce qu'elle permet la compréhension de l'effet des promesses non tenues sur la performance au travail. Ainsi, Robinson (1996) met en évidence l'existence d'une relation négative entre l'apparition de la brèche et la performance reliée à la tâche, donc la performance intra-rôle. Lester et al. (2002) démontrent à leur tour, dans une évaluation faite par le superviseur direct, que la perception de la brèche conduit à une diminution de la performance au travail.

Par contre, peu de recherches sont destinées à l'étude du départ effectif de l'entreprise (i.e le taux de roulement ou le turnover). Turnley et Feldman (1999) ainsi que Guzzo, Noonan et Elron (1994) ont trouvé que le turnover est relié positivement et significativement à la brèche du contrat psychologique.

En ce qui concerne la performance extra-rôle (i.e. des comportements de citoyenneté organisationnelle), plusieurs études ont démontré l'impact négatif de la brèche sur la disponibilité des employés de s'engager dans ce type de comportement. Ainsi, Robinson et Morrison (1995) ont démontré empiriquement que les obligations non remplies prédisent de manière négative le comportement de vertu civique, une composante de la citoyenneté organisationnelle. Coyle-Shapiro et Kessler (2000) concluent à leur tour que les employés essaient de redresser la balance dans la relation d'emploi dans le moment où ils perçoivent que leur employeur n'a pas rempli sa part dans le processus d'échange. Cette situation déséquilibrée contribue à la diminution de la volonté des employés de suivre un comportement de citoyenneté organisationnelle.

Enfin, comme Kickul (2001) le souligne, d'autres comportements dits « déviants » peuvent se manifester auprès des employés quand une brèche survient. Ainsi, même si l'employé accomplit ses tâches intra-rôle, il peut s'engager dans des comportements opposés à ceux de citoyenneté organisationnelle comme le fait de parler excessivement avec ses collègues au lieu de travailler, critiquer en secret les actions de la compagnie ou prendre des longues pauses pour éviter le retour au travail. Dans le même esprit, Dulac (2005) rappelle les comportements de frustration, d'agression et de revanche mis en relief dans les travaux de Felson (1982) et Bies et Tripp (1998).

L'importance du contrat psychologique pour la pratique en ressources humaines

Les professionnels RH trouveraient dans la théorie du Contrat Psychologique quelques pistes de réflexion concernant l'amélioration des pratiques de la gestion des ressources humaines des entreprises. Guerrero (2004 b), en s'appuyant sur la typologie de Rousseau (1996) pour catégoriser les types de contrats psychologique, argue que l'une des raisons du succès du Contrat Psychologique est le fait qu'il offre des explications concernant la mobilité externe des employés. Ainsi, les contrats de type relationnel et de développement déterminent des comportements au travail les plus positifs, tandis que le contrat de type transactionnel a comme conséquence des comportements négatifs de la part des employés. Les recherches de Tsui et al. (1997) ont démontré que dans le cas du contrat psychologique de type relationnel les salariés ont un élevé niveau de confiance par rapport à leur employeur et une implication organisationnelle importante, ce que contribue à un moindre taux de *turnover* comparativement au contrat de type transactionnel où l'employé manifeste moins d'attachement à l'entreprise. Dans ce cas, l'implication de l'employé par rapport au group ou par rapport aux tâches « extra-roll » est faible, donc l'intention de départ est élevée est la mobilité externe l'est tout autant.

Un autre aspect qui explique la mobilité externe des employés est représenté par le degré de respect des promesses qui ont été faites dans la relation d'emploi. Quand l'employé perçoit qu'il y a un écart entre ce que lui a été promis et ce qu'il reçoit effectivement, il va avoir des sentiments qui vont du mécontentement

jusqu'à la frustration, à la trahison ou même à la colère, des sentiments associés à la violation du Contrat Psychologique. Dans ce sens, les chercheurs qui s'occupent du Contrat Psychologique mettent en garde les praticiens de la gestion, et surtout les professionnels RH sur le danger de promettre ce qu'ils sont mandatés d'offrir aux employés. Par exemple, la recherche de Morrison (1997) qui s'occupe principalement des diplômés MBA conclue que cette catégorie d'employés est plus susceptible de percevoir une brèche ou une rupture du Contrat Psychologique puisqu'elle est la plus recherchée catégorie d'employés par les recruteurs qui ont la tendance d'exagérer les côtés attirantes d'un emploi. Qui plus est, Guerrero (2004 b) recommande aux responsables RH de proposer une vision plus juste et plus « réelle » de l'entreprise et du futur poste pour éviter l'apparition du sentiment de la rupture du contrat psychologique et pour impliquer d'avantage l'employé dans la vie de l'organisation. D'autre côté, il peut apparaître dans la vie d'une organisation des situations dans lesquelles l'employeur ne peut remplir ses promesses suite à des conjonctures économiques défavorables. Selon Morrison et Robinson (2000), l'incongruence entre les promesses et la réalité peut être diminuée si l'agent organisationnel initie un processus de communication avec les employés visée par les changements dû au déclin organisationnel. Ainsi, selon les chercheuses, même si l'employé blâme l'entreprise à cause de la perception d'une brèche dans son contrat psychologique, le sentiment de violation pourrait être atténué lorsque l'employé perçoit qu'il a été traité avec justice, honnêteté et respect. Qui plus est, l'étude de Robinson (1996), révèle l'importance de la confiance comme antécédent et comme résultat de la brèche du Contrat Psychologique. Ainsi, les managers sont invités à se rendre compte que l'employé sera plus « tolérant » envers son employeur à qui il fait confiance, même s'il perçoit que, peut-être, les promesses attendues non pas été entièrement rencontrées.

Vu que le Contrat Psychologique évolue en temps, son influence sur les pratiques de la gestion intervient dans plusieurs étapes de la relation d'emploi (Guerrero, 2004b). Ainsi, tel que rappelé plus haut, dès la procédure de recrutement, les représentants de l'entreprise doivent faire attention aux promesses/obligations qui sont véhiculées par rapport à la future relation d'emploi.

Par la suite, dans la phase dite de « rencontre », l'employeur devrait ajuster ses pratiques envers les employés en essayant d'adapter les opportunités offertes au spécifique des attentes exprimées par les employés concernant, par exemple, l'avancement de leur carrière ou l'équilibre vie professionnelle- vie privée. Dans ce processus, l'entrevue périodique d'évaluation joue un rôle crucial (Guerrero, 2004b).

Ceci dit, on peut conclure que, peu importe le pays dont on parle, le respect des promesses qui ont été faites dans le contrat psychologique doit constituer une priorité pour tous les professionnels RH car cela représente une garantie des comportements et des attitudes positifs au travail, ce qui conduira à l'augmentation de la performance des ressources humaines et implicitement, de la performance organisationnelle dans son ensemble.

CRITICAL ANALYSIS OF THE SCRUM PROJECT MANAGEMENT METHODOLOGY

Năftănăilă Ionel

The Academy of Economic Studies Bucharest, Management Faculty, 6 Romana Square, Sector 1, Bucharest, Management Chair, E-mail: ionel@naftanaila.ro, Phone: +40751080037

Abstract: Considering the fast-paced changes in the economic and technological environment, the organizations are placed under increasing pressure for agility and efficiency. As a consequence, the traditional structures tend to be replaced by newer, flexible structures, adapted to various events occurring inside and outside companies. With regard to Information Technology in particular, the science of project management has become crucially important. The paper critically analyzes one of the most modern project management technologies in this field – SCRUM, by identifying its strengths and weaknesses from both a theoretical and a practical point of view. The paper is relevant from a scientific perspective because it can be considered as a starting point for researchers looking into project management methodologies; the paper is also relevant for practitioners, by presenting the main benefits and disadvantages of using SCRUM in Information Technology companies.

Keywords: SCRUM, Project Management, Software development, Information Technology, AGILE, Methodology, Iterative

Introduction

The importance of research

The scientific literature abounds of examples in which the success of projects drive the success of companies, or, the other way around, the failure of a project puts the company out of business (Charette, 2005), (Voas & Whittaker, 2002), (Jones, 1995). As a consequence, minimizing risk and approaching projects in a structured manner, become critical success factors. By using a proper methodology, the project managers increase the probability to deliver what the client wants, while accommodating the time and budget restrictions.

Therefore, research in Information Technology Project Management becomes increasingly important, any scientific work in this field having the potential to significantly improve the effectiveness and efficiency of the organizations of this field, with regard to the three basic restrictions: time, financial and scope.

Description of SCRUM

The SCRUM approach is used in the top companies in the field of software development, and has a significant success rate. Analysts of the field consider that SCRUM can be appropriate also for other types of software development companies, in order to benefit from using object oriented tools and techniques (Aberdeen Group, 1995).

The SCRUM approach (or methodology) is based on process management; these processes can be defined, or they can be considered as “black boxes” (Takeuchi & Nonaka, 1986). The name SCRUM comes from the English name of a formation of players in the rugby game – a tight formation in which the players are united in a specific position.

SCRUM represents an improvement of the iterative and incremental approaches, in order to deliver object-oriented software. The iterative methodologies have been initially discussed by Pittman (Pittman, 1993) and afterwards developed by Booch (Booch, 1995).

SCRUM is a management methodology, developed in order to improve and maintain an existing system or a production prototype. This methodology assumes the existence of a project and some source code sequences, which almost always exist in the object-oriented software development due to class libraries. SCRUM is not addressing to development efforts for completely new or legacy systems.

The releases in SCRUM are planned taking into consideration the following variables:

- User requests – what are the needed improvements for the current system
- Time pressure – which is the needed timeframe for obtaining a competitive advantage
- Competition – which are the predictable actions of the competition, and what is needed to prevent them most efficiently
- Quality – what is the needed quality considering the above
- Vision – what changes are needed in this phase in order to realize the desired system
- Resources – what human and financial resources are available.

These variables form the initial plan for an Information System improvement. However, these variables are also altered during the project, and a successful development methodology needs to consider these variables, along with their dynamic nature.

The main difference between the traditional methodologies (waterfall approach, spiral approach or iterative approach) and the empirical approaches (such as SCRUM) is that the latter assume that the analyze, design and development processed in the SPRINT phase are unpredictable. A control mechanism is needed to manage this unpredictability and to control risks.

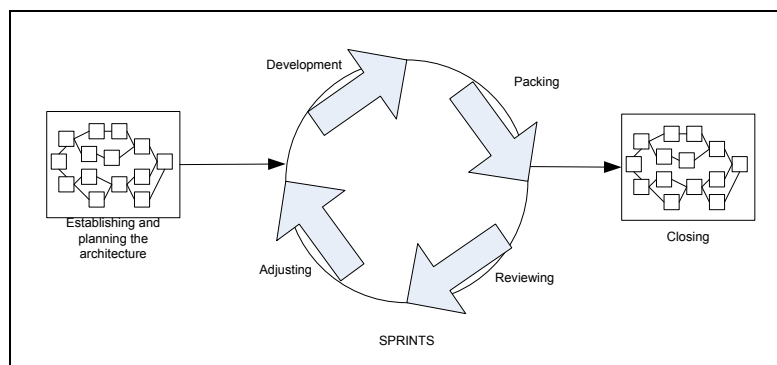

Figure 1 – SCRUM Methodology (Schwaber, 1996)

Some general features of the SCRUM methodology are:

The first and the last phase (planning and closing) consist of defined processes, where all the inputs, outputs and processes are well structured. The knowledge regarding these processes is explicit.

The SPRINT phase is an empirical process. Many of the processes in the SPRINT phase are non-identifiable or impossible to control; as a consequence, the SPRINT phase is treated as a black box which does not need external control. The control, including risk management, is placed on each iteration of the SPRINT, in order to avoid chaos and to maximize flexibility.

SPRINTS are non-linear and flexible. Where possible, explicit knowledge regarding the process is used; if not possible, trial and error methods are used.

The project is open to further development until the closing phase. The deliverable can be changed at any time during Planning and SPRINT phases. Thus, the project remains adaptable to the complexity of the environment, including the competitive pressure, time pressure, quality or financial pressures during these phases.

The deliverable of the project is determined based on the environment, during the project.

In the SCRUM terminology, a SPRINT is a set of development activities which are undertaken during a pre-determined timeframe, usually from one to four weeks. The interval depends on the complexity of the product, on the risk assessments and on the needed degree of skills and expertise. The speed and the intensity of a SPRINT are determined by its agreed duration. The risk is assessed continuously and permanently, and adequate measures are taken for each risk event. Each SPRINT involves one or more teams which perform the following:

Development: Defining the needed changes in order to implement the requests from the journals into packages, opening the packages, analyzing the field, designing, developing, deployment and testing, and also documenting the changes.

Packaging: closing the packages, creating an executable version of the changes and the way in which these fulfill the requests coming from journals. Reviewing: all the teams meet to present the evolution, to evaluate the evolution, to raise and solve problems and to add new entries to the journals. Adjusting: Consolidation of the information discussed in the reviewing meetings.

Each SPRINT is followed by a review, which has the following characteristics:

- The whole team along with the management is present and participates.
- The review may include the clients, the sales team, the marketing team, and others
- The review covers the functional, executable systems, which incorporate the objects associated to the respective team, and includes the changes made to implement the journal entries.
- The way in which the journal entries are implemented can be changed during these revisions
- The moment of the next revision is determined by the complexity and the registered progress. The SPRINTS usually have a duration of 30 days.

Critical analysis of the SCRUM methodology

Strengths of SCRUM

The traditional development methodologies are designed only to answer the unpredictable coming from the internal environment and from the development environment, at the beginning of an improvement cycle. The recent approaches, such as Boehm's spiral methodology (Boehm, Anchoring the Software Process, 1996) and its variations are still limited in their ability to answer to changes in requests once the project has been started.

The SCRUM methodology, on the other hand, is designed to be flexible all along the project life. It provides control mechanisms for planning a release, and then for managing the project's variables as it progresses. This allows organizations to modify the project and its deliverables at any time, delivering therefore the most appropriate release.

The SCRUM methodology frees the developers, so that these can focus on developing innovative solutions during the project, when the learning curve and changes in the environment are already taken into consideration.

Small developer teams can share tacit knowledge referring the development processes; also, the methodology provides a very good learning environment for all involved.

The object oriented technologies provide the basis for the SCRUM methodology. The objects, or the product's characteristics, offer a relatively discrete and easy to manage environment. Procedural code is usually not well-fitted for SCRUM, due to numerous and complex interfaces. SCRUM can be selectively applied to procedural systems, only when the interfaces between the various components of the software are relatively simple, and the product has a strong data orientation.

Team size in SCRUM

When SCRUM is the methodology used in the development process, one of the first aspects which needs to be decided is the size of the development team. The recommended size of a development team when using SCRUM is from one to 10 persons, and it is important that the size of the team does not exceed this number. This is particularly relevant because small teams tend to work more independent and more efficient than the teams involved in large projects (Rising & Janoff, 2000). In smaller projects, communication is usually easier, those involved being more up-to-date with the project's evolution. Also, organizing meetings with the client is easier, and the efficiency of those meetings is increased, because having a small number of members in the project team, each can interact with the client, as opposed to the situations in which the number of members in the project team is large, and they practically cannot interact with the client during the meetings.

However, usually it is not recommended that all the project team participates to the client meetings. Many times, some members of the project team are not directly interested by the information emerging from this interaction, and as a consequence they can be informed by their colleagues about the outcomes of the meeting.

When the project team is too large (larger than 10 persons) the difficulties in communicating and implementing changes are increasing, and sometimes these can overcome the benefits of using the SCRUM methodology (Nichols & Twidale, 2003). The disadvantage which can occur by using SCRUM is given by the following situation: sometimes, in order to reduce the size of the project team, the project is split on separate components, each of those being a SCRUM project (Mountain Goat Software, 2007). The coordination efforts in this case are very big, and also the communication difficulties between the managers involved (and in this situation they are at large numbers).

When using SCRUM, traditional roles in software development projects (programmer, designer, tester, and architect) are not used anymore. In this situation, all the members of the project team are involved in finding the solution to the problem at hand. By being involved, all the members of the project team consider that they have a contribution to each part of the project, and consequently a responsibility towards fulfilling client's demands (Mountain Goat Software, 2007).

Another potential problem which can occur when using SCRUM is, however, due to the lack of specialization between the team members. It is commonly observed that a programmer usually writes better code than a solution architect or a designer, and vice-versa, a solution architect will always have a broader point of view over the system than a programmer. The idea of a strong involvement is essentially a good one, though, and the small number of members in the SCRUM team fully contributes to this.

Daily SCRUM meetings

There are three questions that are addressed to the team members at the beginning of the daily project meeting. These questions are:

- What did you do yesterday?
- What will you do today?
- What obstacles do you anticipate?

By addressing these questions, the most important aspects of development will be covered each day. When these daily meeting exist, the team develops very well from the standpoint of human and professional relationships, and the involvement in the project is growing (Rising & Janoff, 2000). Also, the team members will see the progress of their colleagues, and will be more motivated to involve more and to do better their part of work for the project. There is however a possibility that the team members who repeatedly fail to fulfill their daily objectives to become less motivated, or to be exposed to a higher level of stress than the rest of the team.

Rising (Rising & Janoff, 2000), considers that sharing the problems with the team members will motivate the whole team to use the talent and creativity to solve the problems which occurred. These problems do not have to be solved during the meeting, as this will be time consuming. Those who can help solving the problem only have to state their availability during the meeting, and the problem will be solved later.

When there are daily meetings, the visibility over the progress of the project is highly improved. However, it is very important that the meetings' length to be maintained at a minimum, so that no time is wasted. The literature on the subject (Mountain Goat Software, 2007) recommend that the meetings do not exceed 15 minutes. If the meetings last too much, the tendency of the team members is to become un-interested, which can only damage the project instead of helping it.

Another positive fact related to the daily meetings is the fact that the tasks which will be done during a day are known by all the team members, and those who will have to bring their contribution to the respective tasks are warned since the beginning of the day.

SPRINTS

A typical SPRINT in the SCRUM projects lasts 1 to 4 weeks. After each SPRINT, the deliverable is presented, either internally or to the client.

However, experts recommend that a SPRINT should last approximately 30 days in SCRUM. Thirty days are enough for the whole team to understand various parts of the increment, such as design, development and testing. If the SPRINT is done in less than 30 days, it could become difficult that all the tasks to be accomplished. Considering the fact that SCRUM uses the product environment in each SPRINT, if the

SPRINTS are long, the technology can become obsolete, or the environment will change and the product will not fulfill its initial purpose (Control Chaos, 2007).

Another advantage of using SCRUM and the SPRINTS is the fact that once a SPRINT has been decided and started, there should be no more changes over the features which will be developed over the respective SPRINT. The team can have a meeting before the SPRINT starts, and there they can decide what are the activities that have to be done for a 30 days period (or for the length of the next SPRINT). By holding this meeting, a higher productivity from the team members is obtained, and re-work due to changes practically disappears.

There is, however, a trade-off which has to be done in certain situations. Many times, when the client cannot introduce any changes during a SPRINT, will do the change over the next SPRINT, case in which a large part of the work might be re-done. In this particular situation, altering an already started SPRINT is allowed.

SPRINTS are positive features of the SCRUM, as after each SPRINT the decision to continue or to stop the project is possible; this can be decided over some factors such as the market, the client's need for the product, etc. In a contract project, the client has an early chance to experiment the product, and therefore does not have to pay for something that in final could not fit its needs.

There is also a possibility that the product has to be changed during development, in order to better fit the client's needs. This can be done with SCRUM a lot earlier than with a traditional methodology, where the client has a single delivery of the final product.

The main advantage of the SPRINTS is given by the fact that the cost of change in project is significantly lowered (Highsmith & Cockburn, The Business of Innovation, 2001). By avoiding problems as early as possible in the process, a lot of time and money is saved in the project.

The client

In the SCRUM projects, the client represents a very important development factor. At the end of each SPRINT, the client will receive a deliverable, and will be able to see the incremental growing of the product. The client will also receive feed-back regarding the way the product works.

By using SCRUM, a good relationship with the client is usually developed, and his knowledge about the project increases in time. Also, the client gets used to the project and to the (inherent) differences between the way he wishes the product to look and work, and the way it will look and work at the final. It is very important that the client to wish to be capable to participate to all meetings regarding the product.

SCRUM is therefore a methodology developed to be flexible and easy to use, mainly through changes that occur during the development process. SCRUM's characteristics make it very suitable for software development projects, where requirements change rapidly or where they are unclear.

SCRUM's most important characteristic is given by the daily meetings, and the SPRINT review meetings; during these meetings the team along with the client decides what has to be done and what tasks will be accomplished. The SCRUM methodology is suitable to create multiple types of software, like in-house, under contract or for selling on a market, as long as the client has enough time to give consistent and timely feed-back.

Weaknesses of SCRUM

One potential weakness of SCRUM, highlighted in the literature (Highsmith & Cockburn, The Business of Innovation, 2001) is the fact that, when the project is developed for an external client, this has to be involved a lot in the project. The client has to be able and available to test the monthly (or periodical) releases or deliverables, and to suggest new or modified functionalities.

In the projects using SCRUM, the vision of the client highly influences development. Highsmith (Highsmith & Cockburn, The Business of Innovation, 2001) shows that if the client does not have a clear sense of the product's direction, the members of the development team will tend to behave in the same way, and the final product can be significantly different to what is expected. Therefore, one of the main weaknesses of SCRUM is precisely one of its strengths: client involvement in the development process.

Another potential weakness of SCRUM is given by the relatively long period in which the client (internal or external) cannot intervene in the project. Although in principle this is an advantage, there are situations

in software development when the client's intervention has to be done within a SPRINT; if the methodology cannot accommodate these interventions, the risk over the project is significant.

The small size of the project team can also be considered a weakness of SCRUM; the way in which this methodology approaches large projects with large teams is viable, but not very easy to be implemented.

SCRUM has another potential weakness: relatively low visibility over the project outside SPRINTS – in other words, it is very difficult to estimate how long a project will take or how much it will cost; in the project with external clients, where bidding is used to determine the contractor for projects, this can be a major hindrance in using SCRUM.

Conclusions

SCRUM represents a software development methodology, based on the iterative methodologies, part of the AGILE category. SCRUM is known by its ability to accommodate frequent changes (technological and from a requirements standpoint) which occur in the software development projects, and also by offering the possibility to quickly obtain results in projects. Its main feature is flexibility, and in the same time it offers mechanisms of controlling and improving the project's performance. Also, the SCRUM methodology, in the current context of the knowledge-based society, contributes to keeping tacit knowledge inside the organizations.

The methodology is very well fit for projects with small development teams (under 10 developers, but 4-5 developers is recommended). It is preferable that this methodology to be used for projects with internal client, or with highly available external client; the availability of the client directly influences the success of the project.

The methodology is used more and more in software development companies; recently it large software providers (such as Microsoft) started to support it, which shows the increasing importance as well as the recognition of this methodology's advantages.

Future research

One of the most important future research directions based on this paper is the identification of ways to overcome the few weaknesses of SCRUM. More specifically, it would be appropriate that variations of this methodology are developed, in order to allow it to be used in larger projects, with larger teams, and which would offer better and scientifically sound planning tools.

HOW TO ESTABLISH THE OBJECTIVES WITHIN A STRATEGIC SYSTEM

Neamțu Liviu

“Constantin Brâncuși” University, Faculty of Economics, Republicii, no 1, Tg-Jiu, Gorj County, Romania, e-mail: liviu.neamtu@utgjiu.ro, tel. 0726155187

Abstract: Managers should understand that the domains of establishing some objectives are different and therefore the diversity of objectives to which the concrete actions are reported, is big. From capital and active accounts, to competences and costs and up to technologies, know-how and production factors there will be numerous long term plans over which the managers should establish the targets and leadership formula. Their hierarchy and managing on more plans are aspects which are necessary for the organization success. Only in this way the values supporting the organization become phenomena which reinforce the system and can also uphold the rhythm of accommodation to the new realities of the market. Having the analyses hierarchy and the targets as a model, the managers should also choose the most well adapted ways to the own specific of the organization, considering that the objectives are part of its strategic system and does not represent an individual act with no connection to the concrete reality.

Keywords: objectives, domains, ranging, strategic system, system of values

1. The hierarchy of objectives

To accomplish accordingly the landmarks role of the actions course which the firm is to develop in keeping with the mission that it has assumed at expressing the objectives, it should take into account the following requests:

- to refer to a single object, to express a single reference element, only in this way being able to assure its clarity, precision, and to avoid the ambiguities;
- to be easily measurable, meaning to be formulated in quantitative terms;
- to express the results that should be obtained and not the activities or the actions that should be accomplished;
- to have precise achievement terms;
- to be realistic and workable.

Each organization has, depending on the profile in which is joined through its activity and on its own specific, some domains in which it establishes the strategic, functional and operational objectives. We identify seven domains like these at the level of a firm:

- The capacity and force of capital, the long-term organizational development expressed by the rate of growth year by year, the actions value, the situation of borrowed and own capital, level of investments, the capacity of self-investment, the income on action, level of dividends, financial balance, the coefficient of capital's efficacy, etc;
- The efficacy and situation of the organization on the market, domain in which the forms of expressing the objectives can consist in the market quote covered with its own services and products, the business amount, the level of production, the sales volume, the recess of available market, the volume and weight on activity areas and on business or product groups in the total amount of activities;
- The competitive and profitable activity, domain for which the objectives can be expressed as a profit, profit recess, income from investment, profit/sales report, etc, costs structure, the formation sources of profits, the volume of total profit etc;
- The profitableness and the product quality together with the innovation in which the expressing of objectives can be done in a value form or by the technical-economic parameters of the products which will be launched on the market;

- The efficiency of work within the compartments and performances and their managers preparation, domain in which is more difficult to identify the specific objectives, taking into consideration the particularities of the leadership work. The effort to identify some more suggestive forms of reflecting in objectives of managerial catering quality can lead to expressions considering the time given to meetings during the total time of managers' work, of the decisions taken in what concerns the major problems of the firm within a year, of the weight of the decisions delegated at the inferior levels in the total amount of the decisions taken at a certain level, of the speed reaction in taking major decisions, the minimal number of weeks in which managers participate annually at the managerial perfecting programs, the number of titles of professional and scientific consecration.
- Productivity itself is an objective which is expressed in different measure units – the number of pieces manufactured by a worker in a shift, the production reported to the number of employees, the production reported to the number of workers, number of pieces produced in the time unit, number of clients served in the time unit, as well as other different terms (the hours of absence from work program, the minimal number of weeks when each and every employee follows a professional improvement program);
- The rated capacities of resources. For each category of resources (human, financial, material, energetic) there are specific forms of expressing the objectives as it follows: 1) for human resources – the background of work time, the number of hours or days of without leaves, the hours of delays, the number of leavings from the firm, the number of hires etc, all reported to a certain time unit; 2) for the financial resources – the weight of its own capital in the total capital of the firm, the average volume of money flux, the grade of loans, the solvent patrimony, etc; 3) for the material resources – the capacity of production, the capacity of storing, the capacity of transport, the average specific consumption, the level of material expenses, the park of means of transport etc.; 4) for energetic resources – the average specific consumption, the energetic intensity, the total amount of energetic consumption, the level of energetic expenses etc.

It should be noticed that some of the strategic objectives refer to the relations of the firm with the environment and quantize its competitive position, outline the image they want to have in the perception of investors, clients, manufacturers, creditors, and rivals, public in general, and finally reflect its capabilities. Other objectives have an internal incidence and they mainly refer to the financial and economic performances that the firm proposes to realize.

By presenting the domains in which the organization establishes its objectives after the environment analysis and its own analysis on these domains, it certifies the fact that in the case of strategic objectives the orientation will be done in report with the analysis and prevision realized over the external environment, and in what concerns the operational objectives these will be established, mainly, in function of analyses and previsions over the market and internal environment.

Figure no. 1 The hierarchy of objectives at the organization level

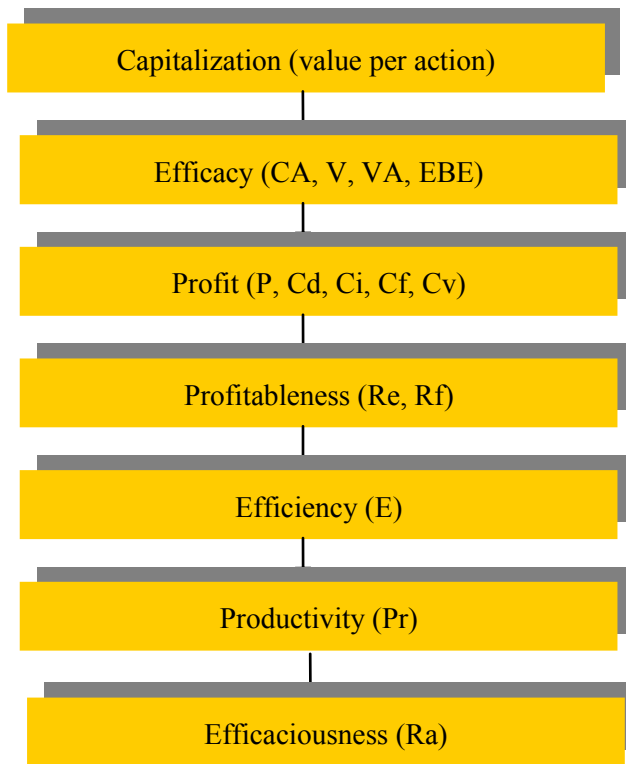

Figure no. 2 The domains hierarchy of establishing the objectives

The hierarchy of objectives is established from the level of the entire organization up to the individual level, when the objectives settled at a certain level determine those from the following level (fig. no. 1).

The hierarchy of the domains which establish the objectives can be realized from the biggest to the smallest domain (fig. no. 2). This way, the anterior domain will establish directions of action in what concerns the other subordinated domains.

The concept of strategic system makes the firm management to adopt a flexible and global approach before the systemic modifications. Realizing the effects against intuition of the homeostatic forces and of the risks of system disorder obliges the organization management to carefully understand the objectives of change and the strategy to reach them.

2. Establishing the objectives

The step of the high management of the organization which establishes its strategic objectives, from which derives the objectives presented above, is found under the incidence of some major factors which alters the chosen objectives. These factors refer to the situation of the organization's action environment, to its internal condition and to the value system the high management promotes.

The forces of action and the tendencies which manifest in the action environment of the organization influence the establishment of the objectives on numerous ways. The normative-legislative settlements concerning the fees and taxes system, the prevention from monopoly manifestations and the respect for the competition on market, the prevention from polluting the environment, the protection of consumers interests etc., could stumble the establishment of some objectives too ambitious in the domain of firm profitability. In the same way the trade union pressures act concerning salary increases, the reduction of work program, and the modification of spores given for special conditions of work etc. Clients want to buy products and services at prices and tariffs as low as possible and this request can be offered only by some of the market rivals. The producers who have quasi-monopolistic positions can impose prices and conditions for delivery which are burdensome for the firm, and thus affecting its production expenses etc.

The second determinant factor of the objectives establishment is the internal situation of the organization, its available resources and the distribution of the decisional prerogatives over the hierarchic lines. The well-organized activity, the adequacy of available resources for the activity development, the suitable organizational climate, the general preoccupation for the efficiency and the competitive growth are strong arguments for the settlement of some ambitious objectives and they are tiresome for the whole personal of the organization. The internal relations of power inside the organization – expressed through the reports between the high management and the managers and specialists from the strategic planning domain – condition, also, the magnitude of the objectives which are established.

Looking into the problem of establishing the objectives, we will consider that at the organization level they result from the collations of the power spheres involved in the orientation of the current activity and the future development of the organization as it follows:

- External coalitions of owners, producers, clients, trade unions, and public in general, who exercise over the firm some influences meaning norms of behavior of some constraints, effectuated controls, pressure campaigns, the presence of some members from outside the firm in its Administration Council;
- Internal coalitions of the high management members; of the other managers; of specialists in the strategic planning domain; of the members of different professions exercised within the firm; of the trade-unionists of the firm; of the execution staff.

The third determinant factor of the organization's objectives establishment is constituted by the value system promoted by its high management, in accordance with the base formation and the preparation of managers, their experience, the social-cultural environment from which they result and they belong to, the beliefs and information they get. The promoted value system manifests through a specific set of attitudes and behaviors of the high management components, which mark the way in which the organization objectives are established, its "personality", the image it outlines and sends inside it.

In the complex establishment of the objectives, the combinations are promoted in different proportions of the mentioned values. The combinations are translated into attitudinal and behavior manifestations of the organization managers involved in establishing the objectives, which affects the optic they are approached in and the level to which the respective objectives are settled. These manifestations refer to:

- The attitude adopted in solving the problems (combative, passive);

- The position to risk (to assume, to avoid);
- The position to “new”, to innovation (innovative, non-innovative);
- The preference for the dynamic environment or stable environment;
- The approach of problems (quantitative, qualitative);
- The manner of managing (autocratic, participative);
- The spirit of treating the people, the groups of people, firms, institutions, governmental organisms etc. (to confront, to collaborate);
- The vision concerning the organization role (exclusively to realize a profit, to have social responsibilities);
- The manner of taking the decisions (individually, collective).

The managers ply to one or another of the possible manifestations of each and every attitude and behavior said before, is strongly observed in the action of establishing the objectives and in the magnitude settled finally to them.

3. Conclusions over the objectives within the strategic systems

One of the conclusions can be seen at the mechanism of establishing the objectives, at the influence factors and at the ways through which these factors determine the managerial step consecrated to the problem, and is that the objectives adopted at the end represent a compromise between the managers' wishes and the need of satisfying the requests frequently divergent of interests keepers in the firm activity (property, clients, producers, creditors, State etc.)

The adopted objectives result from the numerous processes of “negotiations” in which managers try to establish objectives to satisfy objectives to satisfy, in a great majority, all the parts. The process of objectives establishment for the future activity is based on the past activity results and on the most recent objectives previously settled; the increases applied to the most recent past objectives to set out the future evolution should also result with the accord of the different groups of interests.

OBJECTIVES AND OPTIONS WITHIN A STRATEGIC PROCESS

Neamțu Liviu

“Constantin Brâncuși” University, Faculty of Economics, Republicii, no 1, Tg-Jiu, Gorj County, Romania , e-mail: liviu.neamtu@utgjiu.ro, tel. 0726155187

Abstract: Either is considered in a wide or limited meaning, the strategic system of a firm invites the strategist to pay attention to the complex relations among its components. It forces him to become explicit in what concerns the wanted and equilibrated arrangements which should be mentioned among the different parts of the system. The concept of strategic system distinguishes the importance the system architecture has and helps to understand the fact that the strategic innovation often consists in new forms of relations, in new arrangements between the constituent parts or in a new definition of its strategic domain which could take economical advantages undetected until then.

It should be understood that for building a strategic system, the management needs a clear vision of the way in which such a system should be formed and function, as well as a total engagement for its realization. The management from all levels is invited to make the proof of great responsibility in front of the decisions and interventions which could unbalance a performing system, and transforming it unwillingly in a self-destructive system.

Keywords: objectives, strategic process, strategic sequence, strategic levels, options

1. The strategic process and the formal background

The organizations management involves a multitude of situations in which realizing an analysis, the delimitation of some previsions, taking a decision and applying a strategic solution (implementation) is necessary. The strategic process represents actually a sum of identification (analysis), measuring (prevision/prognosis), selection (decision) and intervention (implementation) processes involved in a strategic chain just like a matrix.

Thus the decisions are involved in each and every strategic level within a completely integrated strategic system. At the same time the decision is found within each stage of a strategic level. The integrated process of strategic action, for a strategic level, proceeds accordingly to the following model:

Figure no. 1 – The integrated process of strategic action

Each component (sequence) from the strategic process chain, just like any type of human action, is realized at a different level of consciousness considering the situation (fig. no. 2). Thus it can unroll based on a concept, on some principles, on models or methods of work. The evolution of the formulation from the concept formulation to the formulation based on methods depends on the context of taking a decision and the specific.

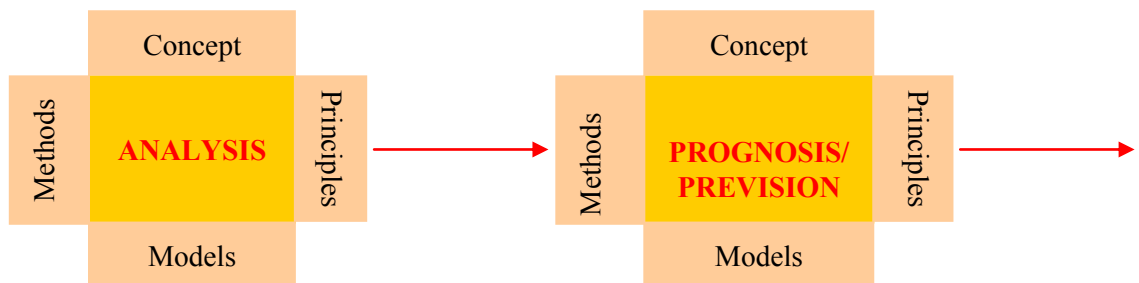

Figure no. 2 – The formalization grades of a strategic sequence

To exemplify we could analyze the component (sequence) decision from the chain of strategic process. Thus, in situations of an uncertain environment characterized by a great risk the decision is realized by using some specific methods, but which ask for a great volume of time and consumed resources. On the contrary, in the situation of a certain environment and well-known as forms of manifestation, the decision will be realized at a conceptual level through automatisms formed within a past experience. Realizing a decision by using principles represents the adaptation of some work concepts at new, concrete situations, considering a set of principles developed in the decisional practice from a business (activity) environment relatively stabile. Taking a decision accordingly to the application models is valiant in the context of a changing environment but in which some of its evolution stages could be identified.

On the other hand when we reach the level of strategic action there appears a necessity of conceptual formulation in the case of analysis processes, prevision, decision and implementation. Why is this thing imposed? Just because the spectrum which includes the phenomena and processes took into consideration is very big at the level of the superior management. Thus, in the case of top management, in the base of environment analysis, the previsions over the markets capacity and their structure are considered especially prognoses as general anticipation of the evolution directions of an environment and the decision and implementation are realized in a non-regulated formula at the level of concepts or principles. At the level of functional management which is often occupied with the market and firm politics, we deal with a strategic process which uses alternative formula (models) for analysis, prognosis/prevision, decision and implementation. The operational management is extremely, clearly and formally regulated and it relies on specific methods of work.

2. The situation of objectives within the strategic process

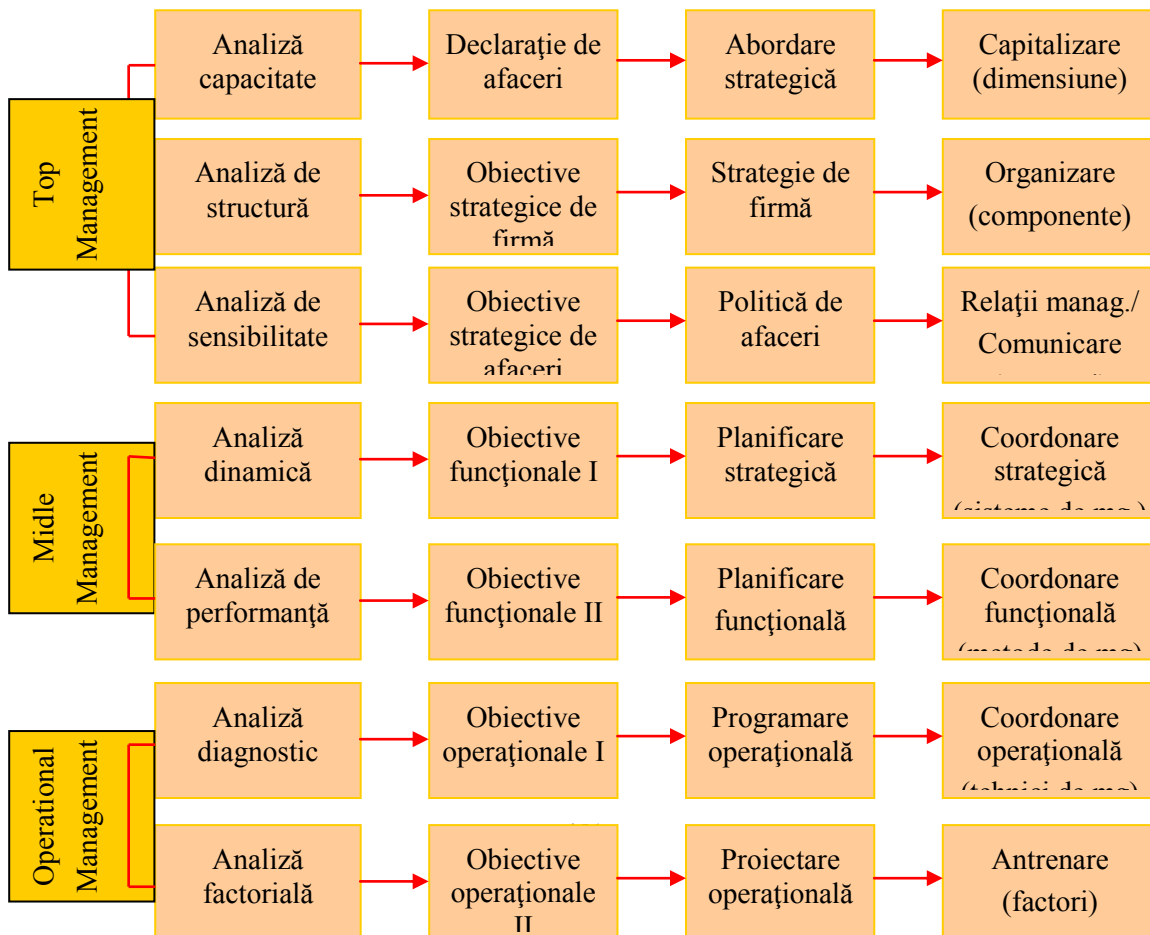

Comparatively, the classic models of the strategic management (Ansoff, Chandler, Thompson & Strickland) consider as being the stages of the strategic process the following: objectives, strategic options, actions, resources and terms. In the context of nowadays presentation we consider that the establishment of objectives represents a substantiation of prevision/prognosis, the strategic options represent the decisional

act, and the actions, terms and resources are a sum of the implementation of previously established decisions. There are two aspects which want to be distinguished through this study.

The first is oriented to enlighten the specific of the decisional system and the reports with the managerial decision. In this way we consider the managerial decision as being part of all the managerial systems as a succession of the decisional process presence in all the levels of the strategic system. So, the decision is found to be a fundamental base both for organizational system and relational, informational, methodological system. On the other hand, the decisional system could be assimilated as the assembly of the organizational (managerial) relations or of all the managing structures from the organization. A second aspect is that of the relation between prevision and objectives. This actually represents the essence of the discussed theme and is obviously the fact that the settlement of objectives is realized directly with the foreseeable level of the elements which are essential for the level of action taken into discussion. No matter if the prognosis or prevision over some phenomena or market characteristics is correct or not, all our expectations will be at a level directly connected to the predictable one.

For each strategic level another level of the economic and social system the organization takes part in, is approached, and therefore the specific indicators for each and every level of action is predictable. Thus these indicators, through their level of manifestation on the business/activity market will represent the objectives of economic or social type that the organization establishes itself (firm, institution). From another point of view, the objectives derive directly from the analysis realized over the markets, being characterized by a certain character of stability in time. Under the aspect of stability the capacity of a market and the dimensions of an organization modify at big intervals of time of approximately ten years minimum, and that makes the mission and declaration of business of an organization to be stabile over a long period of time. On the opposite, there are the operational objectives II which are very flexible on short term as the influence factors of market and the production factors are in a continual change, sometimes monthly or at even smaller intervals of time, and therefore it results their cyclic character. As a result of these changes the decision also suffers numerous changes having a repetitive character at an operational level and this determines the frequent usage of standard decisional models and methods in the current activity. Even the implementation implies a small number of actions and a reduced frequency of terms at the superior levels and a big number of actions with small intervals terms for the operational levels.

Description of those levels and sequences from strategic chain are presented on figure no. 3.

3. The formulation of objectives between option and strategic target

In formulating the objectives, there is, many times, a heterogeneous mixture of concrete targets to be reached in the strategic process and concrete options of reaching them. This weak delimitation of strategic, functional and operational targets toward the options of realization is due to the classic model of formulating an objective.

Theoretically, objectives are considered as being classified in two categories: economic and social. Personally, we consider that the both categories define more a concrete specific of options than of objectives, representing directions (options) of the organization business/ activities evolution. The objectives can not be only economical and of course not only social, having a complex prediction character of a specific aspect of the firm (dimensions, structure, dynamic etc.). On the other hand these don't aim concrete social or economic measures but they distinguish only aspects or levels to be reached through social and economic measures. This wrong classification of the objectives is due exactly to this incorrect identifying of strategic options with the objectives.

A more pertinent classification could be considered the one which structures the objectives in financial objectives and strategic objectives (Thomson & Strikland). This structure distinguishes much better the observation that the objectives should be better separated in report with the options of reaching them. Thus the objectives are targets of a quantification nature as results, efforts or combinations of these having an emphasized value-financial character. At the same time the strategic objectives are constituted as concrete options of reaching the results or the predictable/forecasted efforts.

For example the firm of sports equipment "Nike" established for the next period, the following sets of objectives:

Financial Objectives:

- Improve returns from each of our existing groups;
- Dispose of those parts of our business which cannot generate returns or do not fit with our business strategy;
- Achieve a 20% return on equity;
- Achieve net sales growth rate of 10% per year;
- Maintain average earnings per share growth rate of 15% per year;
- Maintain total debt to total capital at 40% or less;
- Pay out 25% to 35% of net income in dividends.

Strategic Objectives:

- Protect and improve Nike's position as the number one athletic brand in America;
- Build a strong momentum in growing fitness market;
- Intensify the company's efforts to develop products that women need and want;
- Explore the market for products specifically designed for the requirements of maturing Americans;
- Direct and manage the company's international business as it continues to develop;
- Continue the drive for increased margins through proper inventory and fewer, better product.

In report with the previous example the difference between **objectives** and **options** or better said between **target** and **intention**, is very well distinguished.

An objective should accomplish a very well regulated formulation after certain rules. No matter the action area of a firm, the objectives express themselves through three determinant elements:

- The indicator they refer to, for example, the physical volume of production or the effectuated service, the number of business, productivity, the market quote covered with the products and the services of the firm, the profit rate etc.;
- The scale or unit of measure in which the respective indicator is expressed; for example, for the mentioned indicators: the physical volume of production can be expressed in tones, litres, pieces, megawatts-hour, tone-kilometers, transports etc.; the number of business in lei, dollars, etc.; productivity in lei/employee-year, lei/worker-year, tone/hour, pieces/change etc.; the market quote in percents; the profit rate in percents etc.;

- The level on scale of the indicator, expressed quantized; for example for the illustrations of the indicators and scales presented; 500tones, 1,5millions litres etc.

The strategic options represent synthetic declarations concerning what the firm proposes to realize in a certain interval. So, the strategic options constitute the way through which the firm objectives, formulated in measurable terms, are “translated” in expected directions of action whose level conditions the objectives realization:

- It constitutes an essential premise of assuring a global orientation of business/activities/actions/operations under the aspect of an action unit to reach some results and preordained efforts through objectives (efficacy, profitableness, the efficiency of actions);
- It assures clear reference bench-marks for the decision factors within an organization to follow all the processes which carry on at the firm level. The options become, in these conditions, real constraints for the work processes, the behavior and the actions of the main involved factors;
- It guides the terms of execution in report with the level of importance of the established options;
- -It delimitates the necessary resources in accordance with the involved actions for each and every option.

Within the decisional normative model grounded on the global utility, the objectives are transposed as selection criteria of the decisional variant. This is the reason for which the objectives should be put in a hierarchy as importance and so, an importance coefficient could be allocated to them.

<i>Decision Criteria</i>	<i>Objective 1 (0,4)</i>	<i>Objective 2 (0,4)</i>	<i>Objective 3 (0,2)</i>
<i>Decision Variants</i>			
<i>Option 1</i>			
<i>Option 2</i>			
<i>Option 3</i>

In the last years, progress has been made at European level to develop and adopt a European Qualification Framework (EQF), a sort of Esperanto of qualification that allows an easy translation of all national qualification frameworks into one common language and that covers not only vocational training but also higher education. This will allow all European citizens to have their qualifications easily recognised when moving to another country.

A major aim of Bologna processes is to increase the mobility of students, The Diploma Supplement, the ECTS, Europass and the harmonization of the structure of higher education are several measures that can have a positive impact on students' mobility.

The current study aims at elaborating an in-depth analysis of the conditions for outgoing students from Romania within Erasmus activities as well as compliance with the criteria from the European quality charter for mobility 2000-2006. The study uses quantitative (on-line questionnaires) research methods.

1. LITERATURE REVIEW

In 2007 we celebrated both as the year of the 50th birthday of the Rome Treaty, a key milestone in European history, and of the 20th birthday of one of the most renowned European programmes: ERASMUS. The first European action programme in Higher Education, launched in 1976, was of an experimental nature. In the first three years of the 1980's, only 450 universities were involved in Joint Study programmes involving the mobility of an average of 1,000 students and 130 professors per year for the ten countries which were at that time members of the European Community. In 2007, with thirty-one participating countries, the estimated numbers of beneficiaries have skyrocketed to reach some 200,000 students and 30,000 university staff annually (The participating countries in 2007 were the 27 EU countries, the 3 EFTA countries (Norway, Island and Liechtenstein) and Turkey as a candidate country to join the EU).

We hope in 2037, when its 50th birthday will be celebrated, Erasmus and other Education and Training programmes such as Leonardo da Vinci, for vocational education and training, or Comenius, the European programme for schools, will all be considered as major milestones in European integration, as important as was Jean Monnet's European Coal and Steel Community initiative.

The history of European cooperation in Education and Training has not been a smooth one. Between 1976 and 1980, at the request of both Denmark and France the Education Council did not meet at all. As so often in European Union history, France played the role of "enfant terrible". Nevertheless, the Council resumed its works in June 1980, but this was accepted by Denmark on the sole condition that neither a decision nor a budgetary commitment would be taken. Taking into account the continuous support of the European Parliament, the Joint Study Programmes were still able to develop over the years with a – by today's standard - meagre budget of some 2 Million ECU in 1984. 1985 will be seen as the key turning point for the European Community to win the battle for having a significant role in Higher Education cooperation. As is not well known, the front runner was not ERASMUS but COMETT (1986-1989), the action

programme of the Community in Education and Training for Technology that focused on university-industry cooperation and in particular the trans-national placement of students in enterprise for their advanced training in new technologies.

Such a positive environment also benefited ERASMUS inasmuch as it would never have

The successful strategy followed for COMETT opened the road for the Commission to adopt on December 12 1985 a second audacious proposal for a new programme, the EuRopean Action Scheme for the Mobility of University Students (*ERASMUS*) covering the period 1987-1989 with a requested budget of 175 Million ECU, an average of nearly 60 Million ECU per year, 30 times more than the total budget earmarked in 1984 for the whole of European cooperation in Higher Education.

Teacher mobility in Erasmus is mainly geared at lecturing in another higher education institution or preparing mobility programmes (around 30,000 participating teachers) and working together on modernisation projects or networks (1,000) covering a wide variety of domains as diverse as musical heritage or the education and training of dentists in laser surgery. But the bulk of Erasmus investment is in student mobility.

With some 1.7 million students having benefited from an Erasmus mobility grant in the last twenty years, Erasmus is undoubtedly a major success. It is, however, not the leader of all European programmes in terms of mass impact. For instance, the RACE programme (Research on Advanced Communication in Europe), was at the origin of the GSM norm in mobile communication and the Europe Against cancer programme made a leading contribution to the fight against tobacco⁸³. Both of these programmes were launched in the same period as Erasmus and both are nowadays benefiting hundreds of millions of citizens in terms of ease of mobile communication or improved public health. The key reason for the popularity of Erasmus is that the vast majority of its beneficiaries have become living "ambassadors", fully satisfied with their first concrete European experience with 98% of them ready to recommend their friends to go for Erasmus mobility (ESN, 2007).

In 2007 Leonardo da Vinci cut its last ties with COMETT since student placements are from now on under the umbrella of Erasmus. Nevertheless, Leonardo da Vinci remains a mass mobility programme. Since 1986, slightly more than 600,000 trainees and trainers have benefited from a training mobility grant.

In 2007 some 15,000 trainers and 60,000 trainees should benefit from a Leonardo grant. Monitoring the quality of such mass mobility has been, as for Erasmus, a constant priority for the European Commission and its network of Leonardo da Vinci agencies.

All in all, the impact and the quality of Leonardo da Vinci individual mobility are high. The number of complaints received as well as the number of mobility organisers excluded from the Leonardo da Vinci programme is now very marginal indeed.

In parallel, progress has been made at European level to develop and adopt a European Qualification Framework (EQF), a sort of *Esperanto* of qualification that allows an easy translation of all national qualification frameworks into one common language and that covers not only vocational training but also higher education. This will allow all European citizens to have their qualifications easily recognised when moving to another country.

The Jean Monnet action was launched in 1990 to support the set up and the running of university courses on European integration worldwide. Nowadays, it is a full programme, integrated in the Lifelong Learning Programme. Although little known, Jean Monnet is successful in terms of impact and value for money.

Firstly, this programme supports, within the European Union, a number of Higher education and training institutions which attract mainly European students, researchers and trainees. In 2007, close to 1,200 students and researchers will thus be involved and more than 15,000 professionals:

- Slightly more than 500 Masters degrees are expected to be delivered by the College of Europe in Bruges and Natolin (420), by the Centre International de Formation Européenne in Nice (60) and by the European Institute of Public Administration in Maastricht (45) while some

⁸³ As for COMETT and ERASMUS, the choice of the legal base for the Commission proposals was based on an economic rationale and the use of article 100A of the Single Act that was requesting a qualified majority only. See my article "Following the US Example: How the European Community Went Into Public Health", in "Winning in the New Europe", Liam Fahey Editor, Prentice Hall, 1992.

700 students and researchers are registered in the European University Institute in Florence (620 in the doctoral and 100 in the post-doctoral programmes).

- The European Institute for Public Administration will offer this year short term training sessions on European matters for more than 10,000 staff from public or private organisations and the European Law Academy in Trier will provide training sessions for some 4,500 judges and lawyers.

Secondly, Jean Monnet also encourages the teaching of European integration in universities across Europe and the whole world by providing financial support to the so-called Jean Monnet chairs, Modules and Centres of excellence. In 2007, for a modest investment of 3.5 million €, some 250,000 students world wide will participate in Jean Monnet courses. This represents a cost-effectiveness ratio almost as exceptional as that of the eTwinning action in Comenius.

2. METHODOLOGY AND FINDINGS

A. Data from ERASMUS universities was gathered by means of questionnaires. Overall, answers from 31 universities were received from a total of 52 universities participating in 2006/2007.

B. Data from ERASMUS students was gathered by means of an online survey. The hyperlink to the online survey was provided to all participant universities in the programme, who have distributed it in turn amongst the students participating in the programme in the years of reference. Overall, 824 valid answers from 58 universities were received. This large sample provides a representative sample for analysis with low margins of error.

2.1. Description of research instruments

A. The questionnaire concerning the compliance with the criteria from the European Quality Charter for mobility 2000-2006 is structured into four section five section:

- *Information and guidance, learning plan, personalization*, includes data about the principles of the Charter (EUC – Erasmus University Charter), about the role and the responsibilities of the home and host institutions, about the training and education system from the host country
- *Quality Criteria, linguistic aspects*, refers to the preparation of the beneficiaries before their departure in mobility (preparation according to their specific needs, including linguistic, pedagogical, administrative, financial, legal, cultural aspects).
- *Logistical support, mentoring* includes data about the assistance and information ,about the travel arrangements, insurances, work or residence permit, the portability of government grants and loans, accommodation arrangements.
- *Recognition– Reintegration and Evaluation* includes data about the study or placement period as a part of a formal learning or training plan in order to facilitate beneficiary’s academic recognition. The experience acquired during the mobility must be evaluated both by participant and home institution in order to appreciate if the objectives from the “learning plan” have been reached.
- *Commitments and responsibilities* The responsibilities arising from these quality criteria must be agreed and, in particular, confirmed in writing by all sides -sending- hosting institutions and participants.

B. The questionnaire is structured into four sections, following the phases and the logic of the mobility process:

- *Identification* data include questions about the respondents themselves and other relevant items for the study: the home university; the home faculty; gender; the academic year for the ERASMUS study period; the host country.
- - *Motivation* includes data on the reasons for participating in the Erasmus exchanges and the importance of a scholarship for the participant’s future career.
- *Information* includes data about Erasmus students’ participation in other European Programmes, duration of Erasmus mobility, the selection process of participating students, sources of acquiring information on the programme.

- *Personal experience* – captures the mobility experience from the participating student’s perspective by studying a variety of aspects such as social (integration in the host university), administrative (grant payment, accommodation), the impact of the mobility programme on future personal career and personal evolution (professional performance and competencies), the most positive/negative aspects of the mobility.

2.2. Results

A. There is a schedule of student mobility organizational activities made public by the Community Programs Office on the university website, through posters, meetings with students and individual counseling. The principles of the Erasmus Charter have been promoted and respected in detail by all the actors involved in Erasmus mobility: partner institutions, students, National Agency and last but not least European Committee.

The selection of the students has respected the criteria of EUC and a list of specific criteria approved by the Senate Office and made public: the studies status, the linguistic abilities, motivation, recommendation and.

The Learning Agreement comprises disciplines and a number of credits that sum up to 30 credit points per semester or 60 credit points for a mobility period of one academic year. The strongly personalized „one to one” teaching imposes for the Learning Agreement to constitute part of the individual education program in the home institution. This program can be done only under the condition of a preliminary acceptance from the teacher and from the specialty department from the host institution and through an excellent communication between the Erasmus Offices and the students both before and after their acceptance for studies. As contractual base of the studies taken at the partner institution by the Erasmus student, the Learning Agreement is the fundamental instrument for the studies recognition of the student at his return from the stage. This instrument is signed and assumed by the dean of the faculty, by the Erasmus coordinator and by the applicant student.

The individual study makes the mobility organizing activity very complex.

Only three Romanian universities organize language courses but in the evaluation criteria as a part of the selection process, the candidate linguistic abilities are a very important.

The assurance of the grants for the mobility period is a principle of our university faculties. Generally, the Erasmus grants and the personal contribution of the student allowed them to have a good merge in the host cities. Useful information regarding the daily life costs have been most of the times offered by our former Erasmus students. The narrative reports written by our ex-students comprise useful information about daily life costs, ways to spending free time. All these information is transmitted to the students through individual counseling and consultancy activities organized by the Community Programs Office.

Different ways of monitoring have been used: email communication from the student to the Erasmus Office of the home institution, between the institution Erasmus coordinators, monitoring visits and monitoring through the professors taking a teaching to the host institution. On their return the students fill in a questionnaire of mobility evaluation and write a narrative report describing the experience they’ve had.

The study program comprised the Learning Agreement is part of the formal study program of the home university and is assumed and signed by both institutions. The changes proposed by the host institutions (generally not more than one-two disciplines) have been accepted by the home institution only as long as the required number of credits has been accomplished.

The recognition of credits obtained by the students during the Erasmus stage has been realized according to the EUC principles. Transcribing the received grades of the student in the official documents of the home university required extra documentation on the national grading systems and in making them compatible with the Romanian system. Sometimes, additional documents have been necessary concerning the artistic or research activity undertaken by the student (photos, press releases, concert/recital posters, etc.) for a optimum evaluation of his work. The transcription of credits and grades is made by the ECTS responsible person for each of the faculties.

On their return, the students go through a more or less difficult period of becoming again a part of their study year. A very important role in this process is held by the Erasmus Office members, the individual teachers and last but not least the year colleagues. The memories and the experience lived during the Erasmus stage become subject of both formal and informal inter-personal communication.

B. The Erasmus students appreciate to the highest extent the quality of the teaching process in the host university (62.67%), The percentage of the Erasmus students aiming at continuing post university studies in the host university or another university abroad is almost identical (61.55%), 58.72% of the respondents consider their mobility opened opportunities for new mobilities.

There are also a high percentage of those who declare they intend to develop a career abroad (48.22%) while 31.81% are not decided on this question.

The motivation of the students from different universities varies significantly, although some could be identified as most important:

- 89.06% the European experience;
- 64.93% the cultural aspect;
- 64.44% future career plan.

60.84% of the students consider that mobility is very important for their future career. Most of them (83.80%) would also find a second mobility as further improving their career perspectives.

41.88% of the students have the perception the selection process reveals to a high degree their potential to succeed as an Erasmus student.

Academic recognition of the studies abroad has been confirmed by 91.69% of the respondents, but there is still a high percentage (8.31%) whose answer was negative to this question.

The students mentioned cultural experience, personal development and improvement of foreign language skills as the most positive aspects of the mobility.

As the most negative aspects of the mobility they mentioned: financial difficulties (insufficient funding, mobility period too short, bureaucratic problems).

89.39% of the respondents consider the contact with a new culture as the major influence of their mobility in terms of personal development. The cultural aspect is also seen by respondents as having the most relevant impact on their future personal development (69.77%).

Conclusion :

When one looks at the whole picture, one can only be impressed by the results achieved with roughly 120,000 teachers and trainers and more than 500,000 students or trainees undertaking in 2007 a trans-national mobility, real or virtual. Also, worth noting, is that the "appetite" for trans-national mobility is very strong indeed. For example, in the first quarter of 2007, the PLOTEUS website providing information on education and training opportunities in Europe was visited 250,000 times and the Europass portals providing a portfolio of documents allowing a citizen to have his or her qualifications better recognised was visited 1,100,000 times. This is indeed a world away from the beginning of the 1980's. This is all the more important given that nowadays we do have a single market for goods and services and a single currency. But we do not yet have a true European labour market in which citizens can have their qualifications recognised in another country in which they would like to work. As economists well know, the first two markets –money and goods—cannot be sustainable in the long term in the absence of the third one. This is indeed one of the major challenges Europe has to cope with at the beginning of the 21st century.

A number of recent initiatives reflect that quality control in education is an important issue on the political agenda of the European Commission as well as in many European countries.

Within the Lisbon process, enhancing the quality and effectiveness of education and training systems in Europe is one of the three main goals to be achieved in the period up to 2010.

The accelerated globalization and technical changes determined, in France, starting with 1980, the adoption of new communitarian strategies focalized on: the development and the adaptation of the agriculture both in view to increase the added value of agricultural and the creation and improvement of the local agro-food channels, the application of agricultural practices that assure the environment protection and the improvement of the life quality in the rural space.

Keywords: local activities development, enterprises incubators, regional centers of technological transfer, patrimony economy poles, local productive systems, competitiveness poles, rural excellence poles, SME.

1. The evolution of the territorial development in France

In the last period, in France, the public policies, the political actors' discourses and the scientific papers emphasize the profound changes on the territorial policies. Thus, the territories are considered to be productive environments, ecosystems based on growth, able to involve the innovation, the change and finally the competitiveness.

In such a context, the small urban and rural territories had to focalize to projects concerning the tourism turning to account and local economy optimum. In order to achieve this goal, the local administration should apply innovation strategies.

The socio-economist and engineer Pierre Veltz, director of European High Studies for Amenities and Development Institute, reveals the fact that the Taylor approach from the 30's affected the geography, enterprises' organization and territorial development representations. Influenced by a weak concentration of the employees less or medium qualified and a rigorous division of tasks between management, product development and execution levels, this dominant model of mass production contributed to the uptake of an important number of SME's.

Starting with 1980, the internationalization and technical transformations remodeled the competition rules and conditions, which concern not only the costs but also criteria like quality and products' diversity. We observe the passage from hierarchical organization to the network organization. In this context, outsourcing projects for activities in more or less autonomous business units were implemented.

The main part of geographical, demographical and economical links between towns and their peripheries lost considerably from their importance. In the same time, the great towns followed network alliance strategies.

The rural space becomes a part of global economic space from France, often influencing the metropolis. Thus, the new arrangements encourage the synergic links between villages and towns.

In this approach, the territory is perceived like a social system, not only spatial, that can contribute to the competencies' increase by means of interactions and relationships. Pierre Veltz considers that the reinforcement of learning solidarity between SME's, SME's and other groups, private and public actors must represent a priority of territory arrangement, because in the new economical and technological context, the intelligence of resources combination makes the difference between territories that win and those that lose.

2. The evolution of the innovation concept

Innovation can be defined as a procedure that assures the application of an invention to the production of new goods and services, the improvement of the existent goods and services or the improvement of the way concerning their production or distribution, obtaining a competitive advantage or a social benefice.

The initial meaning of the innovation concept confined to the technological innovation, which had two components: product innovation and procedure innovation. **Technological innovation** was for a long period of time the single innovation form. We witness nowadays a considerable extension of this concept.

The first declension from the technological innovation concept is represented by the **social innovation**, in which it is considered that the intervention of a new product can solve a social problem.

The **tertiary innovation**, another innovation derivative, appears in the culture domain, tourism and services that we are interested especially in territorial development.

Starting with 1982, in France, the Economic and Social Council (ESC) launched a new discussion topic: "innovation and regional development", an opportunity to underline the link between innovation and territories. This occasion emphasized that the regional dimension is a favorable field for the innovation development and multiplication, because this initiative:

- represents a strength for companies, helping them to gain on markets, supply sources and offering a greater possibility to adapt themselves.
- allows the establishment of personal relationships between funds owners and the potential innovators.
- allows a better individual development.

ESC insists on the importance of the innovation; on the one hand, the concentration on the development of the activities' network and human capital, that make the progress possible to the regional level, and on the other hand, the importance of the regions responsibilities increase for their own economical and social development.

The essential factor of innovation is the cooperation of all the private and public actors from a territory, in which the role of local elected representatives owns the first place. If they dispose of an economic vision for their territory, as like the leadership capacity, they can involve the concurrent enterprises in an active collaboration, for example the launch of a local productive system.

Besides the creation of innovative approaches, the public policies must reply to companies'needs, especially SME's, spreading the existent and accessible innovations.

3. Preexistent national and regional policies

In France, the local economic development field was influenced by the intervention of different actors, like: Industry and Commerce Chambers, local communal communities, General Councils and Regional Councils.

Industry and Commerce Chambers are public institutions with administrative features, being coordinated by the SME's, Commerce and Handicraft and Liberal Professions Minister. They have two categories of missions: the creation and development of enterprises (the resources issue from dues) and the development of the industry and commerce (their services being paid by the users). They represent the companies' interests in front of the public powers, helping them in the process referring to urbanism documents processing, strategic planning from economical point of view or market research carrying out.

At the national level, the interests of the Industry and Commerce Chambers are represented by the Industry and Commerce Chambers French Association.

The **local communal communities**, in number of 2.300, are engaged in operations concerning inter-communal competences.

General Councils provide services, information, financial support and consultancy.

Regional Councils, arranged by the law from 13 august 2004, elaborate regional schemes concerning economical development and sustain the creation and the development of all types of enterprises: industrial, handicraft, commerce, services, etc. they facilitate the access of enterprises on the international markets, contribute to the technological development and innovation; in this process, a network of universities is involved, focalizing on channels dynamics and competitiveness poles. As well, the Regional Councils have the responsibility to define the needs concerning the professional training strategy, to subsidize training centers and social works and paramedical professions institutes. They finance in the same time permanent professional training for those that are looking for jobs, offering them remuneration during their training stage.

Besides these institutions, the local economic development profits by the **extra-public organizations**: development agencies, enterprises incubators, regional centers and platforms of technological transfer, patrimony economic poles, local productive systems, competitiveness poles and rural excellence poles.

The **development agencies** and expansion committees include the actors, which contribute to the economical development of the territory they manage. The originality of these agencies is due to their structure, being constituted by: consular chambers representatives, unions' representatives, syndicate employees, managers, professors, etc. This partnership, which allows the organization of experiences and different points of view confrontations, supports the innovation spirit and the permanent adjustment to the evolutions of the economical life. The main intervention domains of these agencies are: the enterprises' development, local collectivities consultancy, European actions, studies and communications. Development agencies, that are present especially in small towns, are federalized at the national level in the National Council of Regional Economies.

The incubators of innovative technological enterprises were created in 1999 at the initiative of the Research Minister. They sustain and support development projects for enterprises, based on technological innovation, by the means of competence centers, like universities and research laboratories. They also finance studies for companies' creation.

The regional centers of technological transfer and regional technological platforms

The regional centers of technological transfer have the task to expand advanced technologies in the economic network. These are competence centers to which companies can request consultancy when they search the competitiveness by using new techniques. They can also assure training services.

The regional technological platforms include competences of the research institutions and from other structures that can facilitate know-how and innovation. They assure technical services, consultancy and training.

The regional centers of technological transfer and regional technological platforms are sustained by the state and local collectivities, the personnel being motivated by the beneficiaries of their services.

The patrimony economy poles (PEP) are attached to a goal concerning the local economic development that must be built on a patrimonial resource represented by: classical monuments, industries, ethnography, landscapes and traditions. Starting from one of these patrimonial supports, interesting topics can be realized for the development projects. These projects will include the local economical life actors which work in tourism, economic and social activities.

The local productive systems (LPS) were launched by the French government in 1999. A local productive system is:

- a geographical concentration of enterprises, most frequently SME's;
- formed by strategic resources organized in a manner to build innovation centers interconnected with the enterprises network.

The political interest of the LPS is to make from territories and enterprises' cooperation an engine of the thematic economic development, which will be sustained by competitiveness poles or rural excellence poles.

The competitiveness poles gather in the same territory enterprises, training centers and research institutions, involved in common projects with innovative character and that dispose of the necessary

dimension for an international visibility. We can distinguish between poles centered on technological dimension in which the research-development predominates and poles oriented to the industrial perspective, with advantages determined by the productive network.

In all cases, the partnership, the innovation and the international visibility are the essential factors for the poles' recognition.

The rural excellence poles were launched by the French government in October 2005. Inspired from the policy of urban competitiveness poles, these are projects that facilitate the development of the rural territories, receiving a partial finance support from the part of the state. The rural excellence pole is a project concerning the economic development, being situated on a rural territory and based on a partnership between local collectivities and private companies.

4. The conception, application and evaluation of the territorial strategy – support for innovation processes

The conception of a development strategy in such a complex and uniform sector as innovation must emphasize the following stages:

First stage: The realization of an economical diagnosis of the territory

During this stage, there will be established the features of the local economic network, its evolution on long term in order to identify the development opportunities.

This stage requires the conception of a questionnaire formed by six questions:

1. There is an inter-communal policy in terms of local economy?

The goal of this question is to determine if there is at the communal level an economical development strategy.

2. What's the situation of the commune in what concerns the activities developed?

The deciders must argue the place of the village in the dynamics of the activities and occupations.

3. What is the dynamics of the local economic environment?

The local communities' representatives will analyze the activity sectors types presented on the communal territory and their evolution (agriculture, production, handicraft, services logistics, tourism), the evolution of the activities fields needs, determined on infrastructure terms as well as the interests concerning the geographical concentration of the activities in the sphere of competences poles or activities zones.

4. What is the dynamism of the commune from business perspective?

The goal of this question is to know the enterprises from the commune territory and its neighbor villages, in view to identify the needs, extensions or outsourcings and the risks for the businesses.

5. What are the existent training channels in the commune?

In this case, the deciders will analyze the organizations' needs and the training channels, both from commune and the neighbor villages, in order to identify the actual and future movements of the population that will affect the commune.

6. What are the lands or the available places for the enterprises arrangements?

There will be verified the activities zones covering rates, the availability of the lands and places for the arrangements of new enterprises, as well as for the assurance of a sufficient services level for enterprises.

Second stage: Building an efficient governance system

The governance doesn't limit on the involvement of the key actors to the most important decisions. First of all, it must assure a mobilization system on long term. From this point of view, benchmarking (the comparative evaluation of the performances by the means of synthetic indicators) and the change of good practices become the best instruments for the improvement of the innovation territorial framework.

Third stage: The application of the direct actions in the favor of innovation

After the identification of the strengths and weaknesses of the territory from the innovation point of view, targeted actions must be started and integrated in a global strategy, in order to consolidate the network of new, innovative enterprises and to create a favorable framework for innovative projects in the existent enterprises.

During this stage, venture capital funds become extremely important in the increase of the global attractiveness of the territory (infrastructure, public services, life quality, cultural domains, etc.).

In the new enterprises development phase, a special support must be accorded to the expertise of the structures and the implementation of certain projects.

Fourth stage: The evaluation of the results obtained

In France, the evaluation of the public policies was defined by a decree: “to evaluate a policy signifies to search if the juridical, administrative or financial means allow the realization of the expected effects from this policy as well as the achievement of the goals that were planned.” (Decree from 22.01.1990)

The evaluation of the public intervention in the favor of the innovation will be more efficient if it will operate in a partnership framework.

5. Conclusions

The entire attention of the public powers must be focalized on the so called “territorial engineering”. The communitarian national and international policies are conceived in France in a way in which they are able to struggle against the inequalities concerning the resources, competences, territorial development financing, creating specialized structures and resources.

The innovation is perceived when it covers a very complex topic, which refers to: the innovation within partnerships, the organizational innovation (by the channels expertise and the improvement of the marketing strategies) and the technological innovation within production and commercialization channels.

In '90s the topic of HRM and performance was popular not only among managers, but also among academics. There are many researches which point out the importance of human resources for building organizational competitive advantage. Starting from the most popular researches from the field, through this article, we want to point out the role and the importance of human resources department in order to ensure a level of performance necessary for a high competitiveness.

Keywords: human resources department, competence, performance.

Introduction

Should a company assigns HR manager some functions for the development of human resources, the selection criteria come from a different area and the respective candidate must be a good psychologist and prove excellent communication skills, vision and the capacity of handling conflicts.

In Romania, more and more companies understand the role of the human resources department within the development of the team. The perception of HR manager has also undergone some alterations. A good HR manager must keep the contact with the employees of the company and seize the feed-back transmitted by the employees in connection with the processes within the organization. In a certain extent, we may say that the HR manager is the bridge between the employees and the executive level of the company.

Even if in Romania there is no higher education institutions specialized on Human Resources, the number of HR managers well-trained is ever greater as this job has become a very professional one due to both procedures implemented in the multinational companies and to training courses organized abroad. Romania lacks specialists with a technical training.

However, the units of professional training do not provide sufficient personnel to the companies in the field. Technical training is in deficit in Romania, at the level of both vocational school and technical high school and at university level. In order to forestall this aspect the companies must give a higher importance to improving human factor through personalized training sessions organized for each employee.

The reasons for which the employees desert the companies are in tight relation with the competition between companies for the best professionals. During the last years the transfer of personnel between companies, for material benefits became a tendency for raising the salary level.

The roll and importance of Human Resources Department within the organization

American, European and Australian top managers accuse the lack of efficiency of human resources departments and that of training position in their companies for the lack of competent personnel, which do not allow them to attack the market leader position and affect even the critical functions inside the organizations.[1]

The lack of essential competences represents a problem of vital importance for the management of the companies. As the competition becomes ever tougher, the need to grow competent personnel especially for the critical positions should be on the top list of priorities of corporations. The lack of success of the companies in developing the labor force leads directly to a low level of competitiveness.

A study of Accenture, the international management and outsourcing services consulting company, which included over 250 of respondents in the United States of America, Europe and Australia, revealed the fact that only one of seven executives (14%) think that the general level of competences of labor force in the organization they represent is the most competitive at the level of the whole industry in which they carry on their activity. According to the study, these deficiencies may be considered, in a certain extent, a result of an insufficient human resources training and development.

Moreover, only one of five respondents declared that the vast majority of the employees do not understand the company's strategy and what must be done for it to be competitive on the market it occupies.

The executives also pointed out that critical positions such as sales, customer service, financial and strategic planning do not meet the right standards due to these reasons.

All these are manifest against the background of a deep and extremely spread lack of satisfaction regarding the human resources departments and training activity. Thus, only one of ten respondents stated they were satisfied with the activity of such divisions within their companies.

The lack of solid bounds with decision-making level in business, incapacity of assessing the human resources and training impact at the level of the entire activity, as well as the incapacity of educating competences and know-how among the personnel were the most frequent critics addressed to human resources departments. [2]

But one third of respondents declared that their organizations adapt their human resources policies and training activities according to each department needs, while more than four of ten mentioned that they do not assess the profitability of these activities at the level of the entire business.[3]

Almost half of the participants at this study (43%) mentioned that alluring talents is a difficult problem due to a more restrained basis of selection. At the same time, the study revealed, besides the inefficiency of HR policies, the lesser implication of managers who coordinate the various main functions in the organization in solving the personnel problems.

Even if the whole picture was not so gladdening, the research also identified a number of companies in which the three functions mentioned by the executives as being the most important run at the highest standards. Accenture representatives associated their performance with human resources policies and efficient training activities.

Among those practices which ensure success, the executives identified the formal measures which establish the impact the human resources development has on the main business functions, their adaptation to such functions as well as a strategic approach of human resources which should be regarded as an important business partner by the top management of the companies.

The ability of a company to develop labor force competences will make the difference on competition market. Some companies focus on one or two aspects of human capital management, such as internal communication but the best companies have an unbiased insight. Human Resources Department is the main source of yield.

The companies in our country have not understood by now the importance of HR department and frequently they forget that this department is responsible of the most important investment of a company: the people.

Any organization which wants to make a progress must realize the role the human resources department plays within a company. This department must be accepted as strategic partner in the running of the company. The respective department brings a direct contribution to the change of the company so that the company be in accordance with reality.

Just because their importance is not recognized accordingly, the human resources departments in our country prove to be less efficient than their foreign counterparts. A study made by Pricewaterhouse Coopers points out a very concerning aspect that in Romania organizations spend equal money as those in western countries for the needs of HR department but the results are not the same.[3]

According to the data of the poll, almost 0,4% of all costs of a company are allotted to HR department. This is double compared to central Europe companies. The study shows that such departments spend more money but their work is one sixth less productive than the rest of departments of the same company.

In addition, out of the data collected by PrincewaterhouseCoopers, one can see that there is a direct connection between the profit of a company and the work rendered by the human resources department. It is obvious that in a company in which the department is strong the profit is equally high.

The study was made according to the information provided by 60 companies of various fields of activity such as: IT, pharmaceutical, consumer's goods, industrial, financial, retail, automobile industries.

Unfortunately, the reality shows that in many Romanian companies the importance of human resources department is not recognized and especially by the work mates in other departments of the same company. Even if it is the 'right hand' of the managerial team, this department is the first one which gets under personnel cutting policy when it is about idling people.

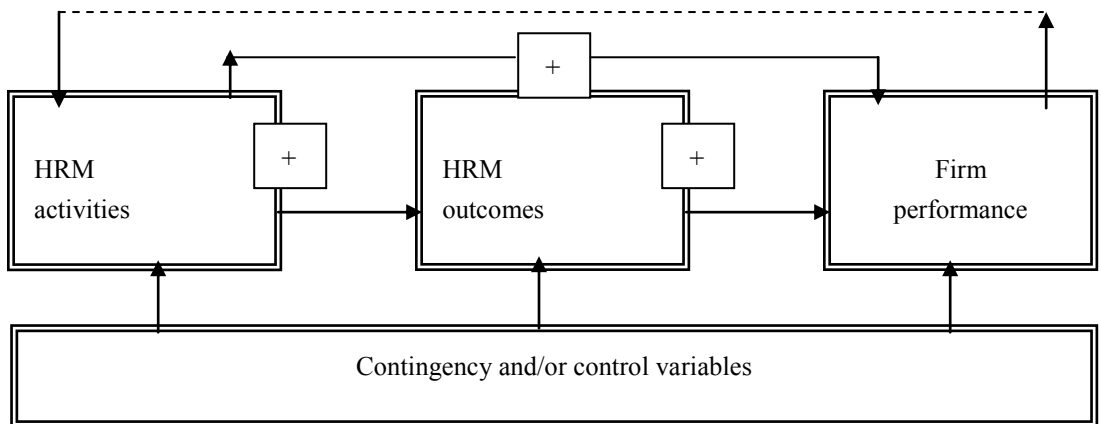

What is really worrying is that after so many years in which we had a lot of time to see how human resources activities are structured in foreign companies, Romanian companies go on with the idea that the development of a human resources department is not a necessity. That is why such departments are very rare in Romanian companies. It is no wonder that in a company with hundreds of employees there is only a personnel and salary department – which are mandatory by law - but no human resources department. The specialists say that no human resources department can exist without a HR manager.[4]

Academics as well as managers seem to give particular attention to critical success factors and sustained competitive advantage of an organization. That is why we have to point out the relationship between HRM and performance.

Many researchers developed conceptual models to explain the relationship between HRM and performance. In 1987, Guest developed a normative model, identifying four policy goals: integration, employee commitment, flexibility/adaptability, and quality. In his model these goals serve as human resource outcome; goals and policies together generate a range of organizational outcomes such as high job performance and low turnover.

Using the framework presented by Guest, Paauwe and Richardson (1997) summarized it, thus:

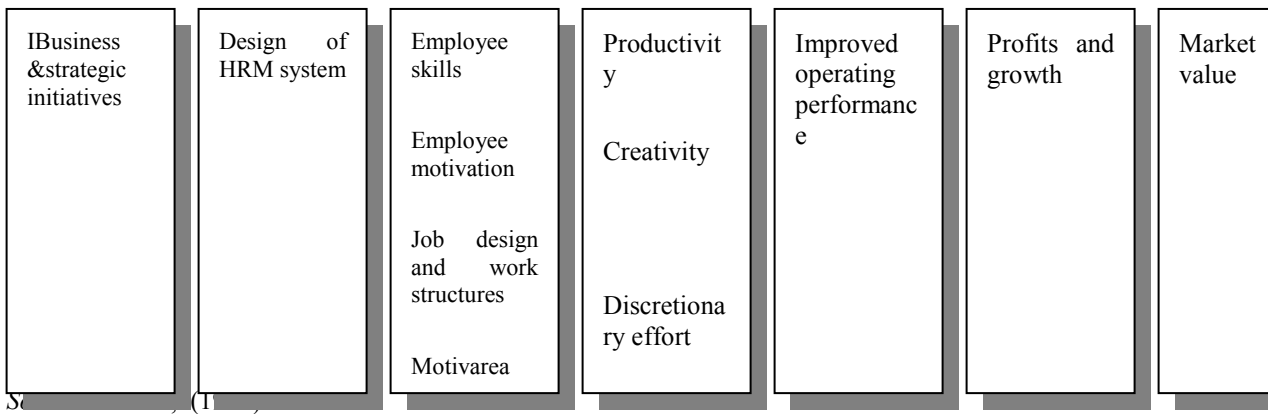

Fig.1. General overview of the linchage between HRM activities, outcomes, and performance.

Source: Paauwe si Richardson (1997)

Baker (1997) presents a conceptual model of HR- shareholders value relationship. In this model the authors assume that business and strategic initiatives affect the design of HRM systems. The HRM systems in their conceptual model affect: (1) employee skills, (2) employee motivation, (3) job design and work structure. These factors are presumed to have an impact on productivity, creativity, discretionary effort etc. this model contains seven "boxes" and, in effect, represent a chain of excellence. The final "box", and thus the ultimate outcome of this chain, represents the market value of the firm.

Fig. 2. A model of the HR-shareholders value relationship

Finally, the models of Baker (1997) and Guest (1997) both reveals a number of hidden assumptions, relevant for further research on the relationship between HRM and performance:

1. Vertical “fit” is a necessary condition for success, represented by the link between strategy and design of HRM systems or HRM practice.
 8. The relationship between HRM and performance is linear.
 9. There is a sequential link between HRM (design of HRM system’ or HRM practices’) and market value/financial performance. In other words, there is a chain of interrelated boxes.
 10. Financial performance, represented by profits, growth, and market value, is the final outcome of the transformation process and therefore is representative of organizational performance and subsequent success.

Conclusions:

Irrespective the strategy they choose, focus on the client, proficiency in services, costs lowering, grabbing opportunities or differentiation, the companies need employees proving new competences in information management, strategic thinking or empathic action.

Thus, everybody should understand the importance of HR department which has as main task to develop such competences for a better consolidation of the business strategy.

In order to be capable to provide analytic evaluations and to protect the informational patrimony of the company, the employees of human resources, marketing and strategic planning departments must have some knowledge and capabilities.

According to specialists, such skills are necessary especially for the transfer of data and information into a strategy of action leading to decision-making. Any company needs resources/capabilities in order to back up its strategies. Such resources can develop when within the company there is a clear internal policy, work instrument and an IT platform.

Thus 15 competences and 4 differentiation capabilities were identified. The 15 competences are divided in three categories: six concern the information management, five concern the strategic thinking and four the empathic action. Each of the 15 competences and four capabilities take a period of development in order to be directly applied. Generally, this period varies between three and twelve months according to the complexity of each competence.

While the managerial competences refer to perception and understanding of information coming from the environment (newspapers, television, street panels, internet, seminars, clients), the strategic thinking competences have the role of proposing the development of an information system belonging to the company, the appropriate sharing of common information for both the colleagues and the executive level, the replacement of reports by visual maps including all information in order to accomplish an action plan for protecting the informational patrimony of the company. Thus, according to the conclusions adopted as a result of understanding and synthesizing the information, more action strategies can be applied.

60%-80% of all information we need are within the organization, but one must know whom to ask and when to ask.

Regarding the emphatic action techniques, they stress the access to sub-consciousness of the collocutor so that the non-verbal language becomes a very important factor for both understanding the affective mood of the partner of discussion and for shaping it with the purpose of getting an efficient relation.

Empathic capabilities have as a purpose the development of behavior for achieving a better team work, transmitting more credible messages with a greater impact but also the possibility of better understanding the other person's inner personality.

Although within the majority of companies a very simple way of thinking based on labels, assumptions and stereotypes is dominating, leading in their turn to simple behavior patterns, the role of competences that a good human resources manager must have becomes ever more important for a better development of relations and internal policy.

HRM system design within the organization play an important part because according with the conceptual models presented in this article there is a strong relationship between HRM and performance factors. So, we can figure that human resources play an important part within the organization being an important source of competitive advantage. Concerning with this one of Coca-Cola managers said once: "if tomorrow will burn all Coca-Cola assets, we will build everything again because remains something very important: the brand and the employees who built Coca-Cola".

***Abstract.** This paper introduces interdisciplinary research as a key point on European Union's and Romania's research agenda. It identifies specific programmes that aim to reinforce this type of research in European context and itemizes the main barriers to interdisciplinary research projects. Considering team integration as the biggest challenge to interdisciplinary research, the paper suggests the use of **sociometric technique** as a good instrument in facilitating group cohesion. The sociometric technique allows managers of interdisciplinary projects to identify leaders and isolated disciplines/individuals in the team, to uncover asymmetry and to map chains of connections. The case study undertaken within the paper demonstrates the opportunity of such a technique in an interdisciplinary context.*

***Keywords:** research project, interdisciplinarity, team integration, sociometric technique*

1. Interdisciplinary research, an European Union priority

The EU experience

The Union has today set itself a new strategic goal for the next decade: to become the most competitive and dynamic knowledge-based economy in the world (...)
(Lisbon Strategy, 2000, European Council)

This quotation transcripts as simple as possible Europe's intention to boost economic growth in order to reduce disparities from the United States. The "knowledge triangle"- **research - education - innovation** - is a core factor in European efforts to meet the ambitious Lisbon goals. Numerous programmes, initiatives and support measures were carried out at European Union level in support of knowledge. The review of the Lisbon Strategy in 2005 reinforced the Barcelona target to allocate 3% of the GDP for research&development in the European Union. Most European states have already rallied behind that objective; however, the level of private investments is still seen as too ambitious. The Framework Programmes are the instruments through which the European Commission implements its scientific and technological research policy. Since their launch in 1984, the Framework Programmes have played a lead role in multidisciplinary research and cooperative activities in Europe and beyond. The **Seventh Framework Programme (FP7)** continues that task, its broad objective being grouped into four categories: Cooperation, Ideas, People and Capacities. For each type of objective, there is a specific programme corresponding to the main areas of European Union research policy. All specific programmes work together to promote and encourage the creation of European poles of (scientific) excellence.

The specific programme '**Ideas**' aims to reinforce excellence, dynamism and creativity in European research and improve the attractiveness of Europe for the best researchers in "**frontier research**". In terms of the document, "frontier research pursues questions irrespective of established disciplinary boundaries. It may well involve multi-, inter- or trans-disciplinary research that brings together researchers from different disciplinary backgrounds, with different theoretical and conceptual approaches, techniques, methodologies and instrumentation, perhaps even different goals and motivations". It should be noted that even if the European Research Council uses the single term "multidisciplinary research" instead of multi-, inter- or trans-disciplinary research, concepts are clearly distinct. To Romanian professor George Văideanu we should recognize the merit of distinguishing between related concepts, in a paper published under UNESCO in 1985: ■ Transdisciplinarity is a state of complete balance of influence between all relevant

participating disciplines at the highest possible level of coordination. ■ Interdisciplinary is somewhat weaker than transdisciplinarity in coordination or cross-communication. The balance of influence, however, of the respective disciplines, is upheld. The total impact of the quantitative and qualitative elements is not strong enough to establish a new discipline. ■ Cross-disciplinarity deviates from interdisciplinarity in both the qualitative and quantitative senses. One discipline dominates the others and is the one that establishes all important premises. ■ Pluri-disciplinarity is characterized by the fact that communication takes place between various disciplines, but the contact may be weaker or more sporadic than in cross-disciplinarity. ■ Multi-disciplinarity is the least developed form of interdisciplinarity. The communication between disciplines is reduced to a maximum. Projects are often complementary to each other. To conclude, „interdisciplinarity is a form of cooperation between disciplines to solve problems that can be solved only through the convergence and prudent combination of different points of views. It implies a certain amount of integration between different areas of knowledge and between different approaches and the development of a common language so as to enable conceptual and methodological exchanges to take place.” (G. Văideanu, 1985)

The Romanian case

The Romanian Research – Development – Innovation (RDI) system went across a very difficult period after 1989: the underinvestment and delayed restructuring only permitted a connection to the global trends in science and technology in isolated cases. However, the public funding of the Romanian RDI showed a radical changes starting with 2005, together with the first substantial increase in the GDP share assigned to that field. The CEEX Research of excellence program launched in 2005 by the National Authority for Scientific Research has contributed to direct public expenditures for research towards developing the Romanian Research Area. In the CEEX program, the priorities of the public R&D funding were those from FP7, and the projects focused on the creation of powerful consortia, the promotion of interdisciplinary research, the development of human resources, the international promotion of the Romanian RDI system, and the reinforcement of infrastructures for conformity evaluation and certification.

With the RDI strategy for the period 2007-2013, Romania intends to reach the European average for the basic indicators describing the structure and performance of the research, development and innovation system. The National Plan for Research, Development and Innovation takes into account the significance of fundamental research for knowledge development and the training of highly skilled human resources and emphasizes the excellence, the interdisciplinarity and the international visibility. Complex research in frontier areas and the participation to international excellence research networks are sustained through the programme **Ideas**. Even though for this programme there have been no specific priority domains established, and the emphasis is on participation in international networks of excellence research and on research at the boundary of knowledge, there are several basic research areas of special interest, with potential in Romania. And social sciences are concerned too.

2. Interdisciplinary research projects (IRP) - between rigour and „bricolage”

Interdisciplinary thinking is rapidly becoming an integral feature of research as a result of four powerful “drivers”: the inherent complexity of nature and society, the desire to explore problems and questions that are not confined to a single discipline, the need to solve societal problems, and the power of new technologies.
(Stehr N., Weingart P., 2000)

Research&Development projects can be defined, according to Romanian Research Law (324/2003) as „a way to accomplish the objective of a programme, in a specified period of time. It makes use of limited resources and asks for obedience to a clear set of rules”. By extension, an interdisciplinary research project (IRP) aims to accomplish a certain objective through the cooperation and integration of knowledge coming from different disciplines; it also makes use of planned resources and functions under a set of rules. The management of research projects aims to find the best way to allocate limited resources to the project’s main objective. The management’s task becomes more difficult in interdisciplinary projects. Working with people with different disciplinary backgrounds, in a disciplinary-oriented environment, gives the management a lot of challenges.

Although interdisciplinarity is somewhat weaker than transdisciplinarity in coordination or cross-communication, its level of complexity is also very high because an equilibrium between disciplines should be maintained on a continuous basis. On the other hand, any interdisciplinary project should find a common language that all participants should be able to use. The task of the manager of an interdisciplinary project is doubled by the obligation to create harmony between participants in the team. That's why specialists recommend **the identification of possible barriers** as the starting point in any interdisciplinary research project (Birnbaum M., Rossini F., Baldwin D., 1990). Traditional rivalry between disciplines is one of the most cited barriers to IRP: participants in interdisciplinary teams have, in most of the cases, a disciplinary affiliation, they tend to protect against possible „rivals”. This unilateral specialisation leads to the difficulty of finding a common language and to fear of unknown. More than that, usually participants are asked to make use of research methods of their co-workers. The difficulty rises especially where a quantitatively based discipline meets a „softer” discipline. That's why it is strongly recommended to surpass disciplinary attitudes.

There are also some institutional and cognitive constraints in doing interdisciplinary research (Heintz Ch., Origgi G., 2003). Institutions are often disciplinary organised, so they allocate their resources consequently. Incentive and rewards are usually based on disciplinary rather than interdisciplinary standards. Whether team members are drawn to a project by their inherent interest in the research problem or the availability of funding, their commitment will be enhanced by negotiating professional rewards in advance, if possible. More than that, many national research councils tend to have a structure based at least in part on long-established disciplines (such as physics, chemistry and mathematics) with discipline-based committees to determine the allocation of resources. Such a structure makes it harder for researchers who propose a multidisciplinary project to decide which committee they should aim their proposal at. In the same time, there are very few scientific journals/reviews focused on interdisciplinarity, so the dissemination of results can be also problematic.

But the most important challenge to IRP remains team integration.

One of the reasons why I think interdisciplinarity is always fighting an uphill struggle is because it is not only multi-vocal, it's not only less certain, but it has a softer feel about it. People who have a narrow disciplinary focus are able to say things they think with great confidence. What can interdisciplinary people say with great confidence?

(Amey M., Brown D., 2004)

All interdisciplinary teams depend on the willingness of individuals to subordinate their individual interest to a common objective. There are some certain ideal characteristics for personnel: flexibility, patience, a willingness to learn, tolerance of others and a willingness to venture into uncharted waters. **Just as there are not algorithms for interdisciplinary research, there are no prescriptions for building interdisciplinary teams** (Birnbaum M., Rossini F., Baldwin D., 1990). Experience suggests several lessons: familiarity with general systems theory has proven a benefit in some projects; research performance, in general, appears positively associated with research diversity in terms of professional activities, knowledge of several areas specialization, engagement in multiple projects and interdisciplinarity orientation. Nevertheless, increased intellectual diversity among team members relates to superior research to a point, then diminishes. Interdisciplinary skills include knowing what information to seek, participating effectively in collaborative work, acquiring a working knowledge of the language, concepts, information and analytical skills pertinent to the problem, collating the contributions of individual experts, knowing how to confirm or disconfirm the proposed solution.

From a disciplinary perspective, interdisciplinary results seem to lack scientific rigour. To surpass this barrier, Berry K și J. Kincheloe (2004) introduced the French term "bricolage" as the best descriptor for interdisciplinary research. In their opinion, much of what is promoted as "rigorous inquiry" is reductionistic and ultimately misleading. The authors present an alternative to such approaches to educational inquiry and construct a new conception of rigour, **“bricolage”**, that is culturally sensitive and socially transformative, and makes use of a variety of research tools and ways of seeing.

This paper considers all barriers to interdisciplinary research. It agrees with the idea that manager's first task in interdisciplinary research is to integrate the working team. So, the paper suggests the sociometric technique as a good instrument in facilitating team integration. It brings into study the case of interdisciplinary compatibilities within Constantin Brâncoveanu University. The results of such a study

lead to the assessment of each discipline's prestige and puts into light relational attractions and rejections between disciplines.

3. Research methodology and main results

This study aims to identify interdisciplinary compatibilities within Constantin Brâncoveanu University, a private educational institution based in Pitești, with branches in Rm. Vâlcea and Brăila. Scientific research at Constantin Brâncoveanu University is carried on through the Department of Scientific Research and through four Chairs: (1) Management – Marketing, (2) Accounting – Finances – Banks, (3) Technico-Economic Sciences, (4) Law and Communication Sciences. The study uses the **sociometric technique** to put into light the web of preferences, likes or dislikes within the big group of teaching staff. This technique allows a researcher to identify leaders and isolated individuals, to uncover asymmetry and reciprocity and to map chains of connections. Sociograms or “friendship charts” are graphic representations of social links within a group and result from the application of sociometric technique. They were first developed to analyze choices and preferences within a group of classmates/students, so the teacher can observe the social makeup of the class. I thought useful to use sociometric technique to analyze inter-disciplinary preferences in the university, in order to map the chains of connections between disciplines.

To conduct the study, I made an inventory of disciplines and of full-time teaching staff employed in the University. I came to the conclusion that, in order to include in the study more disciplines, I can make use of six teaching staff per each of the groups of disciplines identified previously: Management (MG), Marketing-Tourism (MK-T), International Relations (IR), Accounting (A), Finances (F), Merceology-Technology (M-T), Statistics-Mathematics (S-M), Law and Public Administration (L-PA), Journalism and Communication (J-C), Foreign Languages (FL). I asked the teaching staff to nominate, from a list, *three disciplines they think they may have compatibility (+) and three disciplines they think they have incompatibility (-) for an interdisciplinary research project*. I tabulated and placed the results in a **Sociomatrix**, then I calculated each discipline's total **Likes (T+)**, **Dislikes (T-)** and the **Sociometric status**. Last, I draw the **Sociogram** (*Appendix*).

It should be also noted that **51,6%** of the respondents have previously been part of an interdisciplinary team. Participants to the study were also asked to nominate the most important barriers to interdisciplinary research: **46,6%** considered *the time to integrate the team* as the biggest barrier to interdisciplinary research. For **43,3%** of the respondents, the difficulty to find *a common language* actions as an inhibitor to interdisciplinary research, while **26,6%** considered *the lack of interdisciplinary evaluators* as an important impediment. **25%** of the respondents think there is *a traditional rivalry between disciplines*. Other important barriers to interdisciplinary research can be: *universities are disciplinary-based* (**18,3%**), *the results of an interdisciplinary project can be hardly published and disseminated* (**16,6%**) and interdisciplinary research implies often *additional costs* (**8,3%**).

Results and conclusions

There are 5 groups of disciplines with positive scores (Likes) above the mean: Management (38+), Marketing-Tourism (30+), International Relations (21+), Finances (20+), Journalism-Communication (19+). The most Dislikes went to, decreasingly: Law-Public Administration (27-), Journalism-Communication (26-), Accounting (25-), Statistics-Mathematics (22-), Finances (22-), Merceology-Technology (19-). It is interesting to observe the case of two groups of disciplines: Journalism-Communication and Finances, which scored highly in both categories (Likes and Dislikes).

The **Status index (Isp)** indicates one discipline's prestige within the group, taking into account, in the same time, Likes and Dislikes. It is computed from the relation:

$$Isp = \frac{(T+) - (T-)}{N-1}$$

Isp = Status index

T(+) = Total Likes

T (-) = Total Dislikes

N = respondents

In this case, $N=60$ \longrightarrow $l=1$ = one group = 6 respondents \longrightarrow $N_l=54$

The status index permits the diffusion of scores around 5 categories:

1. **Star** - Management (Isp = 0.58)
2. **Popular** – Marketing-Tourism (Isp =0.39)
International Relations (Isp =0.26)
3. **Isolated** – Foreign Languages (Isp =-0.02)
Finances (Isp =-0.03)
4. **Ignored** – Journalism-Communication (Isp =-0.13)
Statistics-Informatics (Isp =-0.2)
5. **Rejected** -Law-Public Administration (Isp =-0.34),
Merceology-Technology (Isp =-0.32)
Accountability (-0.37)

On the **base** of the Staus Index, the **Sociogram** (See Appendix) is represented by 5 concentric circles, each of them representing a certain distance from the centre where the leader (star) is. The Sociogram helps graphically see not only each discipline's place in the space of group, but also the nature of relationships between disciplines. Looking at the Sociogram, one (the manager) can easily see how each discipline can be related to others.

■ *Management* is, undoubtedly, the leader of the group; it can base any research project because it has the best prestige among disciplines. Management, Marketing-Tourism and International Relations form a **clique** (the only one in the study), because all choose each other. As the Sociogram shows, this is the best solution for an interdisciplinary research team. To note that although Management has the most Likes within the group, *Marketing-Toursim* gained Likes from the big majority of respondents. So *Marketing-Tourism* can easily form interdisciplinary research teams with individuals from all the other chairs: *Journalism-Communication, Foreign Languages/ Statistics-Mathematics, Finances/ even Merceology-Technology*.

■ The sociogram shows also two **cliques in evolution**: Statistics-Mathematics, Finances, Accountability and Marketing-Tourism, Finances, International Relations. Even they come from different Chairs, they are attractive one to another.

■ The main **reciprocal rejections** are: Accountability with Journalism-Communication, Finances with Merceology-Technology, Law-Public Administration with Marketing-Tourism and Law-Public Administration with Statistics-Mathematics.

■ Law and Public Administration is, as the sociogram displays, the most difficult discipline to be integrated in an interdisciplinary research project, because there is no possibility to combine with 2 other disciplines in the same time.

■ Management and Accountability and Management and Statistics-Informatics are **incompatible pairs**: Management rejected the two, while the two chose Management.

There are also a lot of connections that can be seen in the sociogram. The sociometric technique used as previous can help managers of interdisciplinary research projects know better the members of their teams, their status within the group and the way they relate one to another. It can be a very useful technique for managers who have to set up an interdisciplinary team or for managers who try to enforce the team's cohesion.

Abstract. *European statistics on higher education place Romania among last places of all the countries that entered Bologna Process. The present paper presents the results of a study concerning the identification of causes that lead to the fact that Romanian higher education is mistrusted evinced a lot of deficiencies in the organization and functioning of work process within the universities. Although the study was more complex, here we present just the results which concern on the teaching – learning – evaluation process along with some proposals for rising the efficiency of it, sustaining the necessity of managerial competence rather than pedagogic of those who conduct educational processes at different levels, including the implementation of managerial principles in the activity of teachers that is so useful in actual development of educational activities with a group or class of students.*

Key-words: *higher education, teaching-learning-evaluation process, educational management*

According to present social – economic development environment, the quality situation in higher education becomes more and more obvious while universities are involved in competition on education services market. This fact has been acknowledged at the European level by start of Bologna Process that certifies the accord of signed countries to meet common effort to reestablish higher education and research on new bases generated by knowledgeable society.

Romania has adhered to Bologna Process since its beginning in 1999. However, even though some achievements cannot be denied, European statistics on higher education place Romania among last places of all the countries that entered this process. Statistics and national opinions are added to these, concerning higher education graduates accession on labor market that sustain the fact that Romanian higher education is not so proficient in the context of requirements of knowledgeable society principles and of pragmatic requirements of European Union.

Our study concerning the identification of causes that lead to the fact that Romanian higher education is mistrusted evinced a lot of deficiencies in the organization and functioning of work process within the universities. The present work is concerning on the teaching – learning – evaluation activity and the manner of its development and organization influences in a significant manner the level of social, economic and teaching efficiency that the educational managers reach.

The research study on teaching – learning – evaluation process developed in Romanian universities demonstrates that the main requirements that affect teachers and students work are the following:

- Time allocation;
- Setting of objectives;
- Evaluation activity.

In this paper, they have been approached from managerial and not didactic perspective, starting from the assimilation of teaching – learning – evaluation process to any other work process and in respect of its particularities.

Time allocation

Time is a fundamental resource for any human action and consequently for the activities developed in higher education institutions. However, just as with other economic activities, the observation that unlimited period of time that a working person has (student in this case) is not a sufficient condition to fulfill work tasks (in this case learning according to set objectives), other conditions being required as well; yet, lack of sufficient time to fulfill a task may annul benefic effects of other conditions created with the purpose to support work task fulfillment.

Relevant studies in this field demonstrate that allocation of insufficient time for learning for expected results may generate for the student, especially for the one that has to learn, anxiety mood, stress, weakness feelings that may induce study abandon, plain memorizing instead of fully understanding of concepts to be apprehended, exam pass may become the only goal of learning. Consequently, students may try to overcome the problem of lack of time by turning to methods that may push them away from a complete study. Thus, they may not properly comprehend the knowledge they were taught in the university and also their ability to think logically may be affected. All these facts lead to less trained graduates and professionally unsatisfied teachers that see their students fail to obtain the desired results. On macro level, this situation may lead to formal integration of higher education system into European requirements, and it shall maintain the image of mistrusted system that is not capable of having cooperation relationships with top universities in Europe. More than the image issue, the most serious consequence of wrong allocation of time to study is the transformation of superficial study practice into permanent habits of study. As long as “permanent education” is a set objective of European educational systems, to avoid the danger of permanent superficial study is a duty for any educational manager.

The problem of correspondence between time allocated to study and the expected results is not scientifically approached in Romanian universities. Setting of necessary time to study have to be done in realistic manner, so that any average student (it has been established that within student institution, approximately 70 % are of medium level, 15% are very good and 15% are weak) may reach the set objectives of learning. Although time necessary to study is influenced by a series of factors such as the level of motivation and students skills, the degree of difficulty of study concepts, some international statistics provide certain average values of time amount that different methods of studying require. Thus, every method implies individual study that is essential to profound learning. These statistic data may be reference elements to Romanian higher education system.

Setting of objectives

Highly connected to the allocation of time for study is the issue of setting and expression of learning objectives. Just as in any other social – economic activity process, the setting of objectives for teaching – learning process is important for its efficiency. The objectives, together with rewards and incentives have a powerful effect over behavior and actions of both students and teachers. Out of data made public by universities the conclusion is drawn that most of the time, the way of setting the objectives is unclear, confuse and meaningless. Implementation of the system of setting the objectives according to presented requirements and of the system of necessary time determination is an activity that takes time and yet, it is a project within the socio – economic organizations and, therefore, the managerial methodology to apply to this purpose is the one specific for *project management* that implies the existence of project manager and project team. As regards the stages of project development, they may be the following:

1. Measuring the capability coefficient of the faculty

It is specific to any faculty and it should be determined with the purpose of resources identification (material and human) that the faculty has got to sustain the teaching – learning process. Also, this is useful to establish the average level of the student of that faculty. Calculation of the coefficient is also useful to make the objectives real. The following indicators shall be used:

Indicator	Calculation manner	Value	Score	Importance coefficient
Student selectivity in the	Nr. of candidate students /	> 4	4	25%

entrance exam (I₁)	Nr. of enlisted students	3 – 3,99	3	
		2 – 2,99	2	
		1,5 – 1,99	1	
		< 1,5	0	
Entrance exam average score/ high school graduation exam / previous years (I₂)	\sum score / Total no. of students	> 9	4	25%
		8 - 9	3	
		7 - 8	2	
		6 - 7	1	
		< 6	0	
No. of students/ teacher (I₃)	No. of students/ teacher	17 - 19	4	20%
		19,1 - 21	3	
		21,1 - 23	2	
		23, 1 - 25	1	
		> 25	0	
No. of students/ internet computer (I₄)	Total no. of students/ no. of computers	< 7	4	5%
		7,1 – 10	3	
		10,1 - 13	2	
		13,1 - 16	1	
		> 16	0	
Existence of didactic spaces according to specific field (I₅)	Qualitative appreciation concerning the surface, nature and ambiance of spaces	The following terms shall be used: very good, good, satisfactory, bad, very bad	4 – very good; 0 – very bad	5 %
Providing libraries with books and magazines necessary to didactic activities (I₆)	Qualitative appreciation as concerns the book, diversity, modernity	The following terms shall be used: very good, good, satisfactory, bad, very bad	4 – very good; 0 – very bad	20%

Calculus indicators for the capability coefficient of the faculty

$$\text{Capability coefficient (C}_C\text{)} = 0,25 I_1 + 0,25 I_2 + 0,20I_3 + 0,05I_4 + 0,05I_5 + 0,20I_6$$

$0 \leq C_C \leq 4$, and it may be divided into three levels of significance:

1. $0 \leq C_C \leq 2$
2. $2,1 \leq C_C \leq 3$
3. $3,1 \leq C_C \leq 4$

2. Setting the objectives

Starting from final objectives of specialization, every teacher is to establish the objectives of its own teaching subject. This stage requires a meeting of all those who teach in the faculty, and according to managerial methods such as brainstorming or Philips 66, shall agree on the objectives of the disciplines so that they form a coherent frame. At the same time, we consider necessary that for every study objective the teacher needs to express the competence levels according to the following logic:

- Performance level P_1 – represents what the student **has to know**, a minimum amount of knowledge that any graduate shall have;
- Performance level P_2 – represents what the student **should know**;
- Performance level P_3 – represents what is **remarkable** for the student **to know**;

Thus it is created a matrix of competences / study objectives that may be used as instrument of formalized expression of objectives.

	Theoretic knowledge	Knowledge in practice	Nature of the concepts student may express	Communication ability	Learning ability
P1					
P2					
P3					

Matrix competence / study objectives

These competence levels shall be established in an absolute manner by teachers taking into consideration the existing standards at the national and European level without adapting them for a category of students.

3. Resource distribution by teachers according to competence levels and study objectives

Every teacher shall set the teaching - learning methods that are needed for the objectives and competence levels as well as the time required for direct meeting between student and teacher and for individual study also. At this stage teacher' resources (time, attitude, didactic material etc.) shall be distributed differently according to capability coefficient. An example in this respect may be such as:

The case: $0 \leq C_C \leq 2$: 80% of resources shall be allocated to the P_1 level, 15% to the P_2 level, 5% to the P_3 level.

The case of: $2,1 \leq C_C \leq 3$: 60% of resources shall be allocated to the P_1 level, 25% to the P_2 level, 15% to the P_3 level.

The case of: $3,1 \leq C_C \leq 4$: 40% of resources shall be allocated to the P_1 level, 35% to the P_2 level, 25% to the P_3 level.

4. Adjusting theoretic determinations according to actual situation

This requires, on one side, confrontation with time allocated by the other colleagues so that, per total it shall not overcome the established time by law that a student may allocate t studying that is 1.500 hours/year; and on the other side, there has to be set a manner in which students accept and comprehend the time allocated by the teachers.

5. Conversion of necessary amount of time in ECTS

Since the problem of time allocated to study is approached at the European level by means of study credits distribution, all these determinations shall be transformed in European common terms. Thus, each study course shall be allocated a number of study credits.

Evaluation activity

Rigorous organization of evaluation activity, which is connected to that of study objectives setting, represents the basic condition of an efficient teaching – learning process with all the advantages that come out of this. Thus, the studying individual defines what is important to him within the entire teaching – learning process, by means of the elements that he shall be evaluated with. So, for a student the course

study objectives are not those previously set y the teacher (they shall only have the role to appeal to the student to a certain study subject) but he shall express his objectives by what he has to know in order to pass the exam. Comparing the above with the work in any other organization, student evaluation is equivalent to worker’s wages and just as the worker shall work for what he is paid to do and not for the set objectives, the same shall the student study those things he is evaluated for. In other words, teachers and students have an opposite perspective on relationships that form within teaching – learning – evaluation process. Thus, in a way similar to managerial practice, unless there is a close relationship among foreknowledge – achievement – finalization between the objectives and student evaluation, then we can reach efficiency in educational management.

The results of this study in Romanian universities evinced a trend to use rapid forms of evaluation (quiz test or written examination) against forms of evaluation that allow the student to express freely, creatively such as oral examination or practical work evaluation. Also, in the absence of various methods of evaluation, this activity is not a regular one, but focuses mainly during evaluation period, that determines the student use the “leap” study. Such organization of evaluation cannot reach the efficiency of the study process, making it difficult for students and teachers work.

Studying specialized writings, we have elaborated, in the shape of a matrix, the existing correspondence between the objectives that have to be followed in the teaching – learning processes and the possibility of their verification that one of the most used method of student evaluation provide.

	Theoretic knowledge	Knowledge use	Applic.	Analysis	Synth esis	Evalu ation	Communica tion
Oral exam							
Written exam							
Paper work							
Quiz test							
Case study							
Public present of a work							
Project work							

Matrix of the examination forms – evaluated objectives

This study goal is to bring into attention of those interested a reality that many of European countries have already understood, that is the necessity of managerial competence rather than pedagogic of those who conduct educational processes at different levels, including the implementation of managerial principles in the activity of teachers that is so useful in actual development of educational activities with a group or class of students.

The knowledge-based economy, along with the impact of the information and communication technologies (ICT) in management of the organizations, presents a growing interest in strategic management literature. Nowadays, information and communication technologies are recognized as key tools in management processes, having a remarkable potential to contribute to sustained competitive advantage for businesses. However, some difficulties in using information and communication technologies and aligning them with strategic development could appear in case of small and medium enterprises (SMEs). The aim of this study is to reveal and analyse the key factors of implementing information and communication technologies in small and medium business within the sector of services. We examined how information and communication technologies could influence the organizational practices of SMEs within the sector of services. Based on the results of the study we offer some reflections on knowledge-based economy practices in SMEs management within the sector of services.

Key Words: information and communication technologies, small and medium enterprises, management, services, knowledge-based economy.

Introduction

This study investigates how the use of ICT could contribute to the success of small and medium enterprises (SMEs) within the sector of services. Within the knowledge-based economy, SMEs are facing both opportunities and challenges due to the information and communication technologies development. We consider that ICT should be used in small business management within the sector of services because ICT are key tools in management processes and could improve managerial practices. The study is based on evidence provided by articles and research reports. The research question was answered by analysing published sources and interpreting evidence. Another way of approaching this question could be collecting and analysing empirical data from the SMEs within the sector of services and comparing the results with the findings of this study.

Background

The rapid development within society of the use of information and communication technologies has meant a revolution in the way businesses work, as indeed it has changed the way in which very many people in Europe work. Information technology generally means the convergence of computers, hardware, software, telecommunications, Internet, electronics and the resulting technologies and it can be measured through the inventory of applications that organisations have (Ruiz-Mercader et al., 2006). Information and communication technology includes networks, computers, other data processing and transmitting equipment, and software (e-Business W@tch, 2006). Nowadays people need to have skills and competences to be able to use information and communication technologies. The development of the knowledge society is raising demand for the key competences in the personal, public and professional spheres. The way in which people access information and services is changing, as are the structure and make-up of societies. As a result, the way of doing business has to change, and for the SMEs within the sector of services this could be a real challenge.

The growing internationalisation of economies affects the world of work, with rapid and frequent change, the introduction of new technologies and new approaches to organizing companies. E-business represents

new ways of conducting business, where electronic networks of companies to a large extent make e-business an inter-organizational activity. The performance of the inter-organizational alliance and ability of the partners to create value in such networks would therefore depend on their relationship competency. With better knowledge of how to influence their business networks, SMEs could increase their influence and their outcome of such relationships (Eikebrokk T. R. and Olsen D. H., 2007). The application of ICT in business processes leads to e-business, defined by the e-Business W@tch (2006) in the broad sense, relating both to external and to company internal processes, considering that it includes external communication and transaction functions, but also ICT-supported flows of information within the company.

Role of SMEs within the new economy

The economic importance of SMEs within the sector of services is highly recognized at the European Union level. According to Eurostat (2008), in total, there were almost 19 million enterprises in the EU-27's non-financial business economy in 2004. Of these, 99.8 % were SMEs, the majority of which were micro enterprises (employing fewer than 10 persons). However, in order to have a significant impact on Europe's economy, SMEs need to grow bigger, meaning that they should increase employment, expand their variety of services, and enlarge their markets and earnings. Innovation is the most important driver of SMEs growth, because it could lead to new products and services or more efficient ways of delivering existing ones, through the introduction of new technology, know-how, additional staff with new skills, and access to new markets (European Commission, (a), 2008).

SMEs are very diverse, despite that all of them, by definition, employ less than 250 employees. SMEs could be dynamic, flexible and innovative companies, or traditional, family-based enterprises, embedded in local business environments. A small firm is not a scaled-down version of larger firms. Larger and smaller firms differ from each other in terms of their organizational structures, responses to the environment, managerial styles and, more importantly, the ways in which they compete with other firms (Man W. Y. T. et al., 2002). In many cases, the skills and experiences of an entrepreneur are not necessarily sufficient to grow the business to a much larger size. Further stages in the company's development require, amongst other things, new technologies and the know-how to implement them, new staff, with additional skills, access to new markets, and financial investments (European Commission, (a), 2008). In this respect, SMEs could use ICT in order to grow and to become more innovative. eBusiness, for example, eliminates the barrier of distance, allowing them to trade throughout Europe's vast Single Market - and indeed the world - without having to expand a physical network of offices and shops (European Commission, (b), 2008). Their size, however, means that many SMEs do not invest in ICT. Some reasons for this situation could be that SMEs face resource constraints on one hand, and are sceptical about ICT and eBusiness, finding many IT solutions still too expensive or untrustworthy, on the other hand.

The use of ICT in SMEs should be more encouraged and this could involve improving technical and managerial skills, making appropriate eBusiness solutions for SMEs available, addressing the high cost of ownership of ICT equipment (European Commission, (b), 2008). Public policy makers are important for stimulating programs for SMEs and they should initiate relevant actions in order to motivate SMEs associations to run programs to increase e-business competency in member organizations (Eikebrokk T. R. and Olsen D. H., 2007).

Benefits of adopting ICT in SMEs within the sector of services

SMEs within the sector of services should use ICT because it provides many benefits at different levels (Love P. et al., 2004): operational level, tactical level and strategic level. As the figures 1, 2 and 3 reveal, the use of ICT in SMEs within the sector of services could improve communication, ability to exchange data, teamwork, customer relations, visibility of services, market share, and competitive advantage etc. This statement is based on the fact that ICT allows companies to obtain, to process, to accumulate and to exchange information. Furthermore, in a knowledge management context, ICT can support transformation within and between tacit and explicit knowledge. Successful knowledge management initiatives could transform the small business innovation capacity into a sustainable higher performance (Ruiz-Mercader J. et al., 2006). Another benefit of adopting e-business could be the higher efficiency obtained in business transactions due to a fast and accurate processing of information. Web-enabled services increase the

competitiveness of SMEs because they change the relationship with customers by creating a stronger link between firms and its clients (Lal. K., 2005).

Using ICT in SMEs within the sector of services could also facilitate cooperation within the company and between the company and other firms. SMEs could use tools and Internet technologies such as business modelling tools, service development tools, discussion groups, training tools etc. As Lal K. (2005) stated, e-business has the potential to redefine the existing business infrastructure organisations and to re-evaluate the way in which they do business. It has capabilities in re-engineering business processes across the boundaries that have traditionally separated suppliers from their customers. Previously separated activities such as order processing, payments, and after sales services may be merged into a single process. As a result, the costs of creating, moving, processing, and managing documents are reduced.

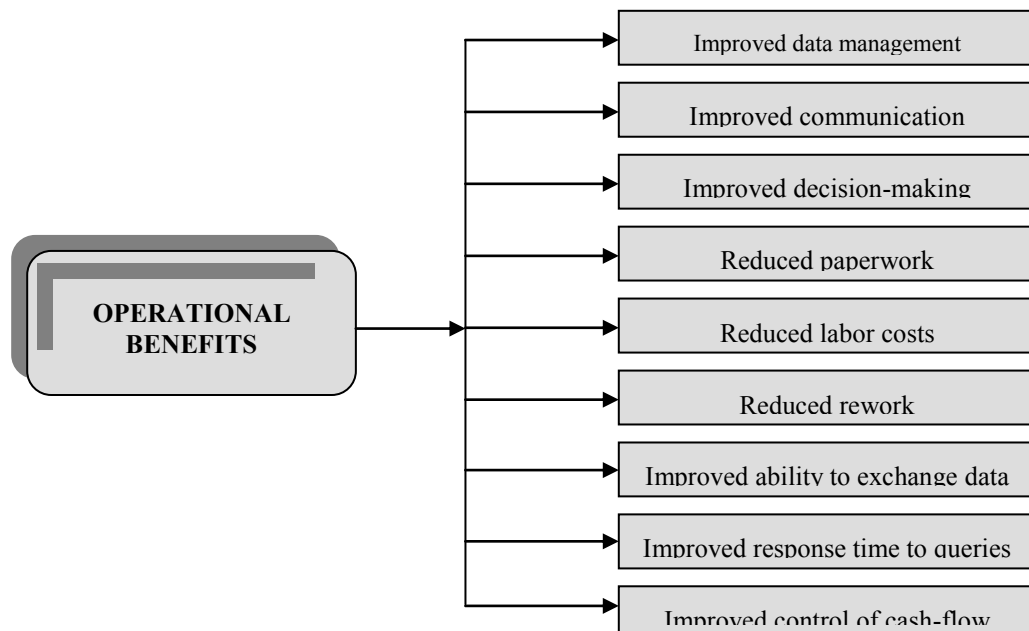

Figure 1 Operational benefits of ICT adoption by SMEs within the sector of services

Use of ICT in small and medium enterprises management within the sector of services could improve the competitive advantage and the performance of firms. The entrepreneur's demographic, psychological and behavioural characteristics, as well as his/her managerial skills and technical know-how are some of the factors that could influence the performance of a SME. The relationship is also affected by many characteristics of the services sector, environmental, firm-specific features and firm strategies. Competitiveness of a SME is revealed by the long-term performance of the company related to its competitors, which is the result of being competitive (Man W. Y. T. et al., 2002).

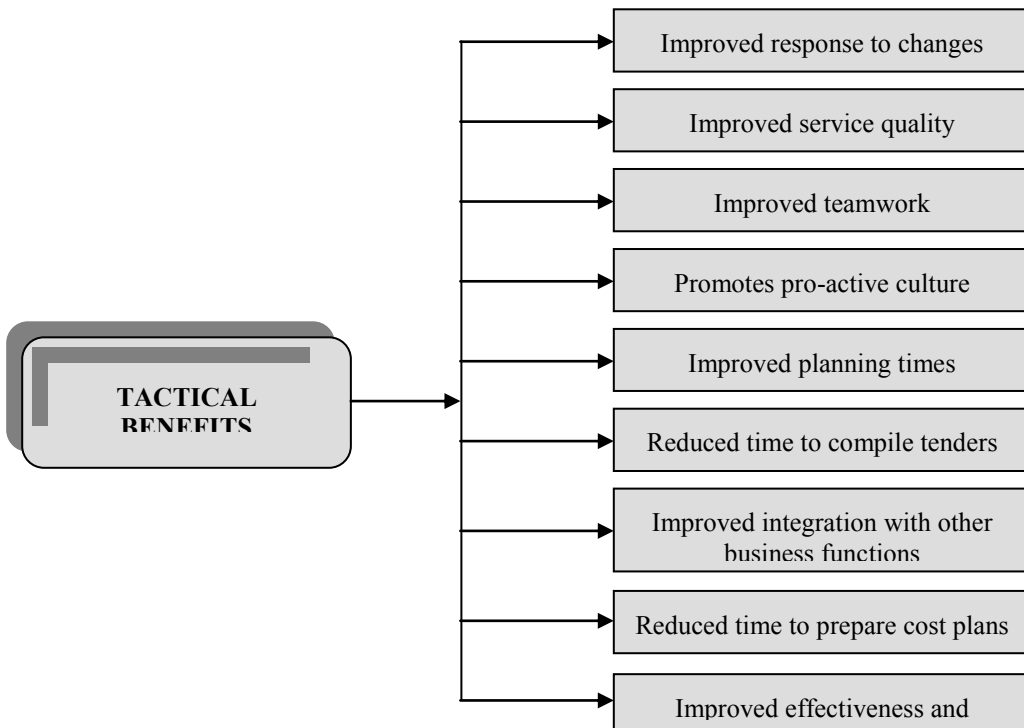

Figure 2 Tactical benefits of ICT adoption by SMEs within the sector of services

ICT technical skills are essential in ICT use and application, but they are not a source of competitive advantage, due to their availability and mobility. In order to obtain benefits from using ICT both ICT technical skills and managerial skills related to ICT are needed. Managerial skills involve management's ability to develop ICT applications to support and contribute to other business functions. Such skills could be real sources of sustainable competitive advantage because of their nature and development. Therefore, effective ICT capabilities could be reached through aligning or fitting ICT resources (particularly managerial skills) with each other and with other important organizational resources (Celuch K. et al., 2007).

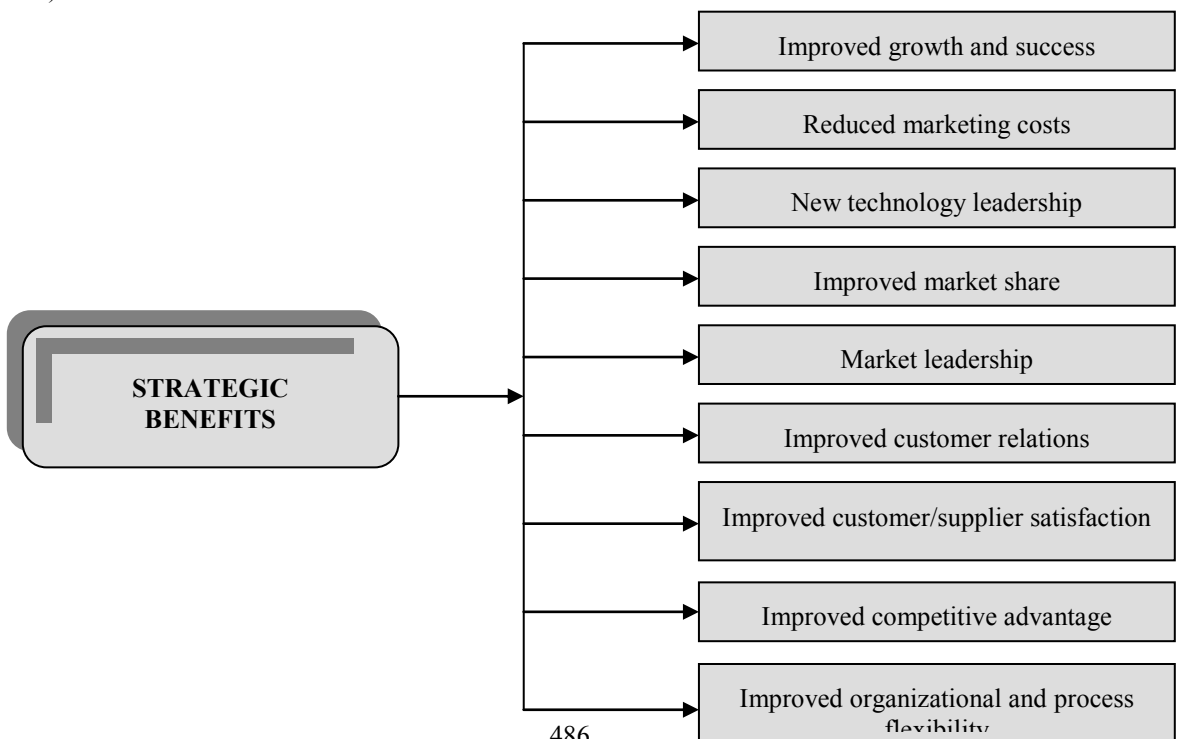

Figure 3 Strategic benefits of ICT adoption by SMEs within the sector of services

The competencies in ICT business process integration could be defined as their ability to integrate ICT and business knowledge to create and develop new business processes. Eikebrokk T. R. and Olsen D. H. (2007) have examined the competencies that affect e-business success in European SMEs and their empirical analysis identified three competencies associated with e-business success: e-business strategy, IT-business process integration, and systems and infrastructure. Competencies in strategic planning and IT management were not found to be significant predictors. E-business success in terms of efficiency, complementarities, lock-in and novelty were explained by competencies in e-business strategy, IT and business process integration, and systems and infrastructure. The results showed that the type and extent of competency in SMEs were important determinants for success.

The competitiveness of SMEs depends on the basic role of the owner/manager, intangible investment (intellectual capital), tangible investment in information and communication technology, and strategic capability, meaning the ability to be innovative and adaptive to change (Love P. E. D., Irani Z., 2004). Successful e-business initiatives and strategies depend on the mentalities of managers, their understanding of ICT, and the organisational implications of adopting ICT (Damaskopoulos P., Evgeniou T., 2003). The most fundamental challenge to SMEs may lie in changing the attitudes of an organization (Eikebrokk T. R., Olsen D. H., 2007). Managerial perceptions and commitment are critical factors for the successful implementation of ICT in SMEs within the sector of services (Damaskopoulos P., Evgeniou T., 2003). If the managers do not have positive perceptions and commitment to the pursuit of competitiveness and growth in the e-business environment than e-business strategies of SMEs could not be developed. However, awareness and commitment, though necessary, are not the only conditions that ensure ICT uptake and success of e-business initiatives. The successful implementation of e-business strategies depends on the capacity of SMEs to generate synergies between technology, organisational goals and strategies, and people's abilities and skills. Therefore, SMEs within the sector of services must understand how they can gain and add value through developing their ICT capability. Smaller firms often lack a coherent ICT investment strategy or the related skills, partly because most SMEs cannot afford to employ ICT practitioners, and for that reason ICT strategy and implementation critically depends on respective skills of the management (E-Business W@tch, 2006).

Success in e-business networks is heterogeneously distributed between partners, and success for the e-business relationship as a whole is different from success for each participant. As a result, related competencies could also differ (Eikebrokk T. R., Olsen D. H., 2007). The value of any communication technology is proportional to the square of the number of users of the system. Large companies have already recognised that they need to get their small business partners "on board" in order to reap the full benefits of e-business. Policy is also focusing on the integration of small firms in their "digital eco-systems" (E-Business W@tch, 2006). We could argue that SMEs within the sector of services could combine their services with those of other SMEs or large firms in order to achieve performance. As a result the market area could be expanded through the use of ICT and the customer satisfaction could be improved.

Costs of adopting ICT in SMEs within the sector of services

The use of ICT in small and medium businesses management within the sector of services implies different costs, and these costs are both direct and indirect (figure 5).

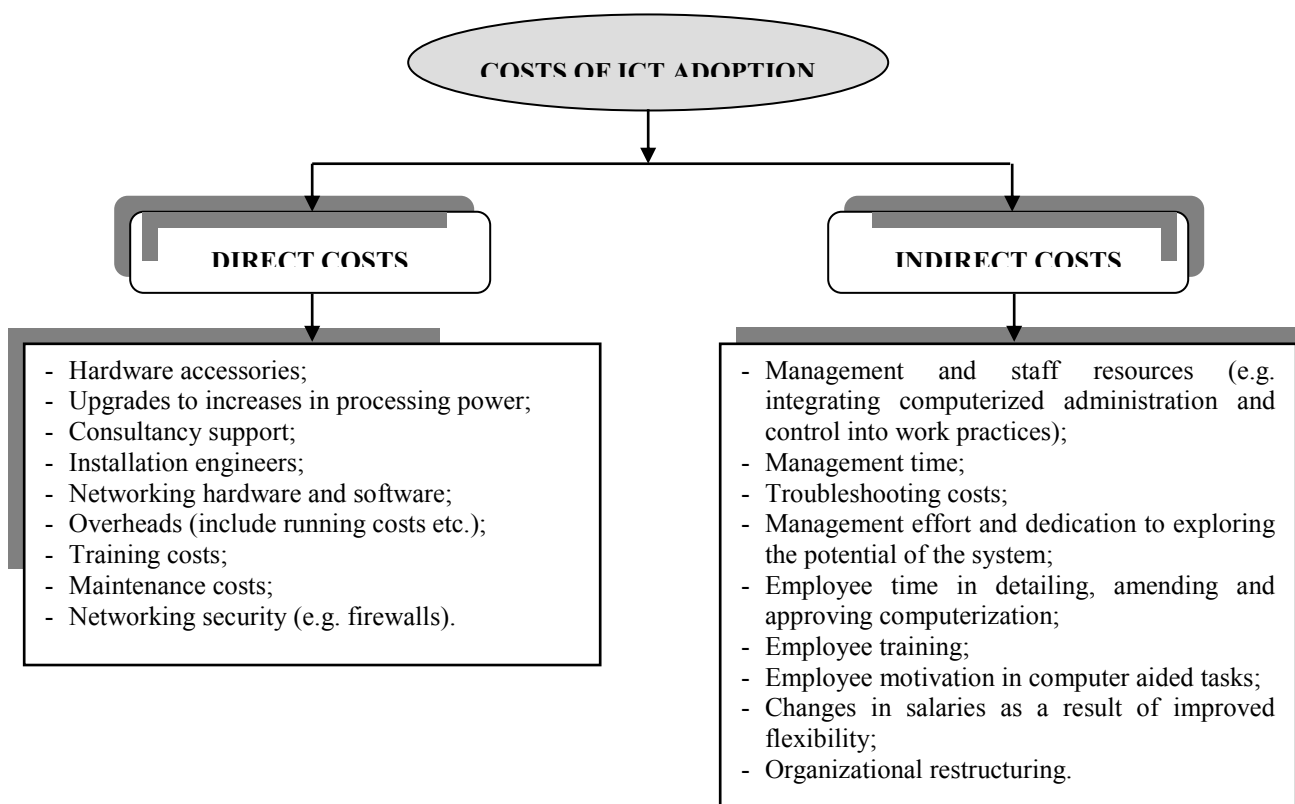

Figure 4 Costs of ICT adoption in SMEs within the sector of services

Direct costs of ICT adoption, such as the costs of hardware accessories, the costs of upgrades, training and consulting costs, maintenance costs, the costs of maintaining networking security are often underestimated. In fact, they might include unexpected additional hardware, installation and configuration costs.

The indirect costs are more significant than direct costs. Organisational costs can arise from the transformation from old to new work practices. At first, a temporary loss in productivity may be experienced. Additional organisational costs may be experienced once the basic functions of the system are in place. These are associated with management's attempts to capitalise on the wider potential of the system at the business and project level (Love P. E. D., Irani Z., 2004). The managers of the companies with extensive ICT infrastructures tend to reorganize their activity, but organisational restructuring is expensive, mainly when people are resistant to change. However, ICT companies are increasingly addressing the SME market by developing affordable, smaller-sized solutions, like ERP and CRM suits (E-Business W@tch, 2006). Moreover, current technological developments like Voice-over-IP telephony and mobile e-business solutions could help SMEs and could reduce the resistance to change, because they tend to become instruments within day-to-day life. This fact could lead to another indirect cost related to employees who have developed new skills requesting revised pay scales or leaving to go to competitors (Love P. E. D., Irani Z., 2004).

Management time could also be a significant indirect cost because time is spent leading, planning, and organising the integration of new systems into current work practices. The result of implementing newly adopted technologies may also force management to spend time revising, approving, and subsequently amending their ICT strategies. In addition, significant resources are used to investigate the potential of ICT and in experimenting with new information flows and modified reporting structures (Love P. E. D., Irani Z., 2004). However, electronic information tends to be today more accurate, timely and easily available (Lal. K., 2005) and therefore using ICT in small business management will reduce the operational costs.

Conclusions

The study reveals that ICT should be used more in SMEs within the sector of services. This conclusion is based on several premises: (1) within the knowledge-based economy, SMEs from the sector of services are facing both opportunities and challenges due to the information and communication technologies development; (2) ICT are today key tools in management processes; (3) ICT could improve managerial practices of SMEs within the sector of services; (4) SMEs could use ICT in order to grow and to become more innovative; (5) ICT provides many benefits for SMEs within the sector of services; (6) the costs of ICT adoption in SMEs within the sector of services have a good potential to decrease.

Our findings could give good reasons for intensifying the efforts of promoting the use of ICT in SMEs within the sector of services and attempting to change mentalities. SMEs within the sector of services should change their managerial practices by integrating ICT in their day-to-day activity. Otherwise, they will not be able to benefit from the opportunities that knowledge-based economy offers and moreover, they will face the risk to be eliminated from the services market.

Further research could focus on collecting and analysing empirical data from the SMEs within the sector of services, comparing the results with the findings of this study, and developing a model for the integration of ICT in SMEs management within the sector of services.

Honey is the sweet viscous substance elaborated by the honey bee from the nectar of floral plants. It is produced in almost every country of the world and is a very important energy food, used as an ingredient in hundreds of manufactured foods, mainly in cereal based products, for sweetness, flavor, color, caramelization and viscosity. An important role in establishing the authenticity, the origin and quality of honey is held by the microscopic analysis of pollen at the origin of each honey variety. There are several criteria that help identify pollen grains and therefore find the plant of origin: The exine structure and markings; The shape of pollen grains; The colour of pollen grains; The size of pollen grains; The density of pollen grains; The percentage of pollen grains specific to monofloral honey.

1.1. General aspects

Honey is a natural food product produced by honey bees (*Apis mellifera L*), which use "raw matter" provided by plants directly, and also, to a smaller extent, they use elements from other sources.

A basic raw matter collected from plants is flower or extra-flower nectar, to which some other elements can be added such as the excretions of insects (aphids and other plant-feeding insects), resulting in a product known as honeydew honey.

According to *Codex Alimentarius*, the nectar from flowers or from other sources is rich in sugars that bees process, enrich with the substance they produce and turn into specific products that they then store in wax combs as honey.

From the viewpoint of food safety and hygiene, honey is the natural food product extracted from honeycombs when they have been capped by honey bees at least $\frac{3}{4}$ of their surface, so as to prevent larvae, bee fragments, wax pieces or other impurities from entering (Balucea, 2002).

Honey must be sold by a name corresponding to the origin and type of honey, as follows:

- Honeycomb honey;
- Blended honey;
- Improved honey (pollen, propolis, royal jelly etc.);
- Crystallized honey.

1.2. The main types of honey and its food value

According to its source, honey can be classified in:

- monofloral honey- made from the nectar of a certain species of plant, such as acacia, lime trees, sunflower, rapeseed;
- polyfloral honey - derived from the nectar of several types of flowers or from a mixture of monofloral honey, for instance from fruit trees, acacia and lime trees, lime trees and sunflower;
- forest honey – from the sweet secretions found on other parts of plants, other than flowers, mixed with the nectar of forest flowers.

According to the processing technology, honey can be classified in:

- honeycomb honey;
- free-flow honey;
- honey obtained by extraction (Şindilar, 1998).

The high content in glucose and fructose, which are easily assimilated, confers the acacia honey excellent energy and nutritional values. As fructose is metabolized without needing insulin, honey is a product that is recommended for diabetics. Moreover, honey protects the digestive tract and favours the absorption of iron in the intestine.

Compared studies carried out at Sports College in Canada have recently confirmed the advantages of using acacia honey in athletes' diet, as compared to other energy food products. Thus, acacia honey has proven its superiority due to the high caloric power, perfect digestibility, pleasant taste and absolute tolerance.

In child food, honey has successfully replaced sugar substitutes. It has been proven that honey helps us assimilate calcium and magnesium, which are essential elements in bone structure formation. Some studies have signalled an anti-anaemic effect and an increase of haemoglobin in blood, an improvement of health in general, an increased appetite and increasing weight.

Due to its physical-chemical properties and due to its antibiotic principle, honey is highly antibacterial and cicatrising as it quickly eliminates suppuration and reduces cicatrization time (Marin, 1990).

1.3. Quality characteristics of acacia honey

Honey is a syrupy, transparent, light to dark yellow liquid, with pleasant taste and smell properties. Any similar product which has not been exclusively produced by honey bees or which comes from sources other than nectar or honeydew, despite the fact that honey bees metabolized the raw mater and deposited it in the wax comb cells cannot be called honey and is considered to be an adulterated food product (Diaconescu, 1995).

Honey must meet the organoleptic, physical-chemical and hygiene quality requirements in order to be ready for consumption (Banu, 2002).

The physical and chemical quality indicators, as well as microbiological and sensory indicators depend on many factors but especially on the geographical origin, the chemical composition, the extraction technology and the storing conditions.

Acacia honey has a series of specific sensory characteristics: no foam, no visible foreign particles, and colour from slightly colourless to light yellow, golden yellow, specific smell and taste, more or less distinguishable flavour, sweet taste, homogenous, viscous or crystallized consistency.

The main sensory characteristics that give the organoleptic quality of acacia honey are presented in table no. 2 (Bulancea 2002.)

Tab.1 Sensory characteristics of acacia honey

	Colour		Taste and smell	Consistency	
	1st Quality	2nd Quality		1st Quality	2nd Quality
Acacia honey	Almost colourless Light yellow Golden yellow	Dark yellow	pleasant, sweet, characteristic of acacia honey	Uniform: fluid or viscous, without signs of crystallization	

Tab.2. Physical, chemical and microscopic characteristics of acacia honey

	Acacia honey	
	Superior quality	1 st Quality
Water, % max.	20	20
Acidity, ml NaOH sol.1N/100g max.	4	4
Reducing sugar, expressed as invert sugar, %, min.	70	70
Easily hydrolysable sugar, expressed as sucrose, %, max	5	5
Diastasic index, min.	6.5	6.5
Ash, %, max.	0.5	0.5
Specific pollen grains, with reference to the total number of pollen grains examined, %, min.	30	25
Hydroxymethylfurfuraldehyde (HMF), mg / 100 g max.	1.5	1.5
Colour index, mm. , max.(Pfund scale)	max.12	max.18
Electrical conductivity, micro Siemens x10 ² , min	-	-
Water insoluble substances, max.	0.1	0.1
Falsifying agents (artificial invert sugar, industrial glucose or another starch hydrolysing substance, gelatine, gum, cereal flower or other starchy products, artificial colouring bodies, synthetic sweeteners etc.)	0	0

Tab.3. Microbiological indicators of acacia honey

Specification	NTM/g	No. yeast/g	Mould	Pathogen microflora
Normal honey	< 300	2-3	Absent	Absent
Honey preserved for a limited time	< 300	10 - 10 ³	Absent	Absent
Honey which is not good for consumption any more	> 300	10 ⁴	Present	Present

1.5. A case study on the authentication of honey by means of microscope examination

Acacia honey authentication assesses whether the physical-chemical and sensory parameters fall within the limits set by the current legislation. It also identifies if the product has been modified or adulterated, it helps reduce fraud and last but not least, it identifies authenticity.

After an organoleptic examination, physical and chemical analyses are carried out, which determine the content and structure of compound whose characteristics vary depending on the geographical area, such as amino-acids, flavour substances, mineral substances and so on. Some of the most recent technologies available for honey authentication are mass spectroscopy and nuclear magnetic resonance (NMR) that determine the content and value of stable isotope ratios (D, ¹³C, ¹⁸O and so on) and the value of isotopic ratios (D/H, C¹²/C¹³, O¹⁶/O¹⁸).

The microscopic examination of pollen also identifies the region where the honey was produced. However, notable results are only registered with plants which have a more restricted growing area (Bulancea, 2002).

The most numerous pollen grains in a sample are of importance but minor pollens are also important, as well as the combination and ratio of all grains (honey type).

Ten varieties of acacia honey samples sold by various companies were used for analysis.

Tab. 4 Acacia honey varieties used in the experiment

Cr. No.	Code	Commercial name	Stated quality	Producer

5	P ₅	Magic Honey Acacia	-	Flomir Prod SRL, 21 Dunării street, Tulcea
6	P ₆	Acacia honey Albina Carpatică	-	S.C. Albina Carpatică, 3 Lacului street, Braşov
7	P ₇	Acacia honey Gold Honey	-	Gold Honey Prod, packed by Apis Prod SRL, 1/21 A. Mureşan street, Blaj
8	P ₈	Acacia honey	-	Vita Naturalis, 2 Tomis street, Constanţa
9	P ₉	Acacia honey	-	S.C. Pastoral SRL
10	P ₁₀	Acacia honey	-	S.C. Apicola Georgescu SRL

A microscopic analysis of the acacia honey

By identifying and counting the microscopic components of honey sediments, of pollen and starch grains respectively, we are able to formulate conclusions related to the plant habitat where the honey bees produced the honey, and implicitly we can identify the geographical and botanical source of the honey.

The most certain indices are pollen grains. The most numerous pollen grains in a sample are of importance but minor pollens are also important, as well as the combination and ratio of all grains (honey type).

Depending on the climate, geographical, botanical and agricultural conditions in a region, sometimes in a small area, several types of honey are collected each presenting types with a microscopic image which can be characteristic enough to allow identifying the geographic origin of the honey.

Qualitative pollen analysis

An important role in establishing the authenticity, the origin and quality of honey is held by the microscopic analysis of pollen at the origin of each honey variety.

There are several criteria that help identify pollen grains and therefore find the plant of origin:

1. The exine structure and markings;
2. The shape of pollen grains;
3. The colour of pollen grains;
4. The size of pollen grains;
5. The density of pollen grains;

6. The percentage of pollen grains specific to monofloral honey.

The pollen grains obtained after the extraction of acacia honey were analyzed under the microscope. In general, honey contains pollen grains with specific morphology for each melliferous plant species. The pollen samples were photographed and used as an indicator in establishing honey sample authenticity.

Three types of pollen grains were identified in the analyzed samples, according to figure no. 1.

In profile (a), the exine examination showed that it was thin, had a compact structure and was sculptured in the shape of rain drops.

In profile (b), the exine showed a compact granulated structure and many pores.

In profile (c), the exine examination showed that it was thin, had a compact structure and was sculptured in the shape of glove fingers.

As noticed in figure 1, **the shape of pollen grains** identified in the acacia honey samples analyzed is:

1. Round as in profile (a);
2. Triangle as in profile (b);
3. Oval as in profile (c).

The colour of pollen grains in the acacia honey samples analyzed range from grey white in the case of profile (a), to grey yellow in the case of profile (b), and orange yellow in the case of profile (c).

Quantitative pollen analysis

Pollen density varies from one honey variety to another. Acacia honey is among the lowest density honeys. Pollen density is expressed as an average number of pollen grains on a microscopic field (the average of at least 30 fields examined their oculars and with the objective 40X) from the preparation with the sediment obtained after centrifugalizing a solution containing 10g of honey. The values of pollen density for the investigated samples are shown in table no. 5

Table 5. Pollen density

Cr. No.	Sample	Pollen density (average number of pollen grains/microscopic field)
1	P ₁	43
2	P ₂	53
3	P ₃	32
4	P ₄	37
5	P ₅	38

6	P ₆	44
7	P ₇	47
8	P ₈	48
9	P ₉	-
10	P ₁₀	-

The percentage of pollen grains specific in monofloral honey is determined by the separate counting of grains belonging to the acacia species and of grains belonging to other species on the same microscopic fields. The percentage of pollen grains from the dominant species was determined with the equation:

$$\%Gp = \frac{n_1}{n_t} 100$$

n₁ – number of pollen grains from the dominant species;

n_t – number of total pollen grains.

The results of counting pollen grains are shown in table no. 6.

Table 6. Determining the percentage of pollen grains from the dominant species

No. Cr.	Honey code	No. of pollen grains with profile (a)	No. of pollen grains with profile (b)	No. of pollen grains with profile (c)	Total number of pollen grains	% pollen grains from the dominant species
1	P ₁	27	1	1	29	93.10
2	P ₂	20	1	1	22	90.90
3	P ₃	28	2	1	31	90.32
4	P ₄	40	2	2	44	90.90
5	P ₅	26	1	1	28	92.85
6	P ₆	29	2	1	32	90.62
7	P ₇	25	1	1	27	92.59
8	P ₈	30	1	2	33	90.90
9	P ₉	-	-	-	-	-
10	P ₁₀	-	-	-	-	-

Conclusions:

Following the pollen grain content study, we concluded that:

- the highest percentage of pollen grains in the dominant species, profile (a) respectively, is present in sample P₁, and the lowest is present in sample P₃;
- samples P₁-P₈, are monofloral honeys as the pollen in the dominant species represents more than 90% of the total number of identified pollen grains;
- samples P₉ and P₁₀ do not contain natural honey because the pollen is missing and consequently, they cannot be called monofloral bee honey.
- samples P₉ and P₁₀ are not authentic because the physical and chemical indicators do not fall within the provisions of STAS 784/3 – 1989 and do not contain pollen and starch grains.

- samples P₁-P₈ are authentic because the percentage of pollen grains from the dominant species represent more than 90% from the total number of pollen grains identified and the percentage of starch grains is less than 10% of the number of identified microscopic formations.

THE USE OF MULTIFACTOR MATRIX FOR HUMAN RESOURCES MANAGEMENT ASSESSMENT

Popescu Alina Cornelia

S.C. LEONI WIRING SYSTEMS PITESTI S.R.L., STR. CALEA BUCUREȘTI BL. 25, SC. A, AP.3
octav_ali@yahoo.com, 0722514969

Summary: The multifactor matrix is often used in order to analyze and improve the general management system. This method is also successfully used in order to carry out the human resources management analysis. The present paper shows the way in which the multifactor matrix method may be used with a view to carrying out the human resources management, having as starting point the model supported by Shingo Konomoto⁸⁴. The case study was conducted at the Valeo Electrical Connective Systems company; the company carries out international activities and it was created based on French capital; the analysis performed focuses on two factors: strategic vitality and organizational vitality.

Keywords: Strategic Vitality, Organizational Vitality, Multifactor Matrix

Strategic vitality depends on the company's results. It points out the features corresponding to the company's long-term policy in the human resources field. Companies with a high strategic vitality in the human resources are those that undertake an active policy with respect to their employees. This human resources policy is based on concrete permanent concerns and actions that aim at recruiting, employing, motivating and improving the employees, consequently rendering them fit to carry out their activity according to a coordinate manner, in conformity with management objectives and with the organizational and hierarchical system, thus contributing to the improvement of the company's performances. In their turn, employees make efforts in order to duly execute their tasks.

Organizational vitality seen from the point of view of human resources points out whether employees have initiative and whether communication is adequately performed within the company. As far as companies with high organizational vitality are concerned, the employees thereof show initiative, the communication and information flows go in both ways, from top to bottom (hierarchically) and from bottom to top, while the decision-making system is decentralized. All these facts enable the respective companies to react in a flexible manner to conditions displayed by the internal and external environment.

The “**strategic vitality**” index is connected to the above-mentioned factor, resulting on the basis of the following subindexes:

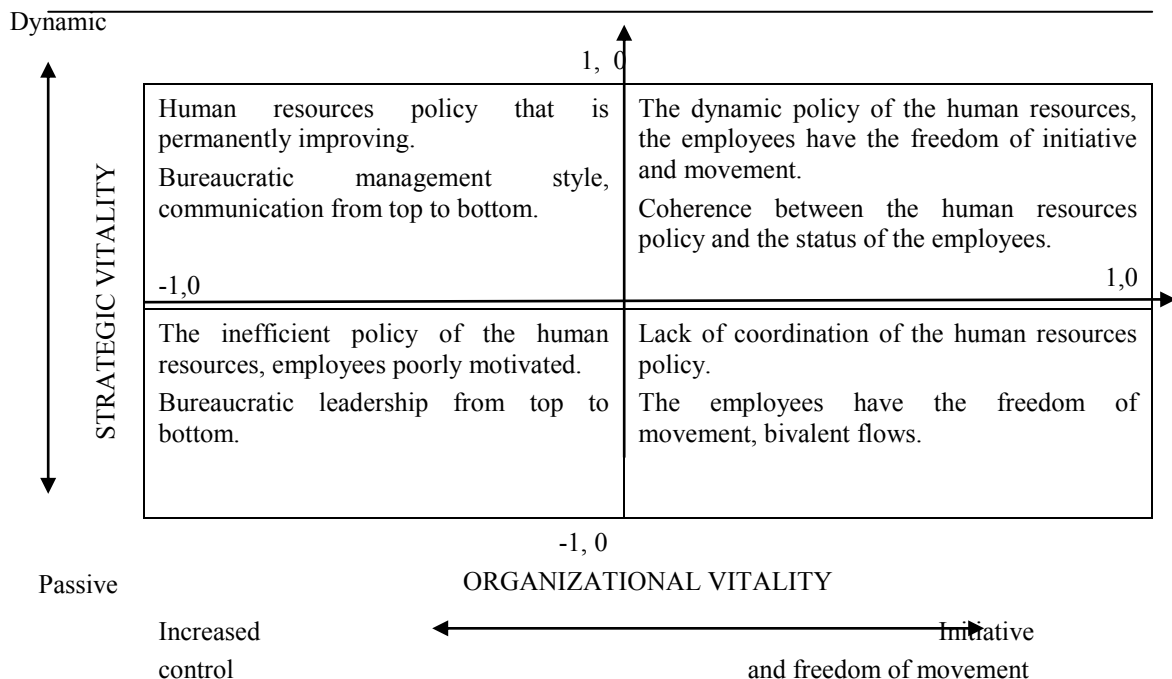

- Human resources recruitment and selection system;
- The degree of initiative of the employees;
- The range of the incentives / rewards used to motivate the employees;
- The employee training and improvement system;
- The skill levels range;
- The system of acknowledgement of professional performances and promotion possibilities;
- Establishment of relationships, respectively the need of affiliation;
- The general satisfaction of the employees;
- The staff fluctuation;
- The absenteeism rate.

The index “**organizational vitality**” is also connected to the above-mentioned factor, based on the following indexes:

⁸⁴ Shingo Konomoto, „Problems of Japanese Companies in East and Southeast Asia”, NRI Papers, No. 18 November 1, 2000, p.3

- The number of authority levels ;
- The degree of centralization of the decision-making process ;
- Leadership and relationships;
- Communication system used in the company;
- Promotion of the dialogue;
- Delegation of authority;
- Presentation of the company's objectives to all the employees;
- The level of formalization of the rules of discipline, of work tasks etc;
- Criteria of distribution of the organization's incomes;
- The degree of consideration, respect, shown by the management;

The two indexes are used to create a matrix with four fields, where there are emphasized four types of Human Resources management, as may be seen in Picture no.1.

The multifactor matrix of the human resources management types.

(Source: adaptation after Shingo Konomoto, "Problems of Japanese Companies in East and Southeast Asia", NRI Papers, No. 18 November 1, 2000, p.3)

In the right field of the picture, where both types of the company's vitality, as far as the human resources are concerned, have positive goals, the companies which have an optimal human resources management are placed. The companies which find themselves in this field have an increased dynamics of the human resources improvement, given by the insurance of number, structure and professional qualities on the best coordinates. The staff fluctuation, although relatively reduced, is compensated by corresponding employment, the structure of jobs is ensured by skilled persons, with a continuous improvement system. The employees have the freedom of movement, they are encouraged to take initiative, they are given decision-making powers according to the job description. The motivation system is well established, being based on precisely specified incentives in terms of type, number, value, granting cases, which confers it the feature of a transparent motivation system.

The companies from the upper left field have also a positive score for the strategic vitality, but the management style is bureaucratic, from top to bottom. However they find themselves in a good position to improve their performances.

The companies listed in the lower right field have a negative score of strategic vitality since human resources management has no coordination whatsoever. Human resources policy is not based on a constant interest in providing human resources, seen from a structural and qualitative point of view according to parameters necessary to a great performance. In the organization chart, vacancies or jobs held by underskilled staff may appear. Motivation and improvement are not part of a coherent and transparent system. The employee enthusiasm is low, time is wasted and efficiency is low. But these companies have a favorable score of organizational vitality, as a result of the fact that the employees benefit from quite a high freedom of movement, and the style of leadership - which is sometimes informal, and with little bureaucratic input, helps them state their point of view.

The companies listed in the lower left field suffer a double disadvantage. On the one hand, they undertake an inefficient policy of human resources, and on the other hand internal communication is faulty.

Assessment of current situation of Human Resources Management by means of multifactor matrix corresponding to Valeo Electrical Connective Systems S.R.L. company

A. Strategic vitality: situation analysis carried out by means of the following table:

Index	Specific weight (-1 → 1)	Level (1-10)	Score
1. Human resources recruitment and selection system	0.6	5	3
2. Degree of initiative corresponding to employees when certain changes of the company's activity are needed	0.8	7	5.6
3. Range of incentives / rewards used to motivate employees	0.2	9	1.8
4. Employee training and improving system (on the job training, job rotation, theoretical training etc)	0.6	10	6
5. Skill levels range (skill level required for the job)	0.2	2	0.4
6. System of acknowledgment of professional performances and of promotion possibilities (communication of feedback, performance assessment)	0.2	8	1.6
7. Establishment of relationships, the wish that the individual experiences to establish and develop friendship relationships with others	0.6	4	2.4
8. General satisfaction, the extent to which the employee is satisfied with the work carried out, both from the point of view of the organization and from the point of view of rewards he receives	0.2	6	1.2
9. Staff fluctuation	-0,2	3	-0.6
10. Absenteeism rate	-0.4	1	-0.4
General score (average value of index)	0.28	-	21

Strategic vitality of Valeo Electrical Connective Systems S.R.L. company in the field of human resources

Source: author's contribution

As may be seen in the previous table, the Valeo company has an average strategic vitality, amounting to a value of **0.28**, thus it is part of the dynamic strategic vitality area. **Specific weight** was identified following application of standard questionnaires to Valeo employees, and the assessment was carried out according to the multifactor matrix shown in picture that displays values ranging from -1 and 1.

The level establishes the importance of each index: 10 – great importance, 1 – little importance, and the score results following multiplication of the level of importance by the specific weight that results on the basis of analysis, leading to a final score of **21** out of 55.

B. Organizational vitality: situation analysis carried out by means of the following table:

Organizational vitality of Valeo Electrical Connetive Systems S.R.L. company in the field of Human Resources

Index	Specific weight (-1 \longrightarrow 1)	Level (1-10)	Score
1. Number of levels of authority (6 levels of authority, great distance from the power)	-0.4	4	-1.6
2. The degree of centralization of the decision-making process (highly centralized decision-making process)	-0.6	7	-4.2
3. Leadership and interpersonal relationships, satisfaction and dissatisfaction respectively regarding the social climate and work relationships	0.4	5	2
4. The communication system used within the company: hierarchical, at the same level of hierarchy, formal-informal, from top to bottom, from bottom to top)	0.4	9	3.6
5. Promotion of dialogue: formal and informal communication frequency between managers and operators (communication carried out on a daily basis, during 5-minute meetings, carried out on weekly, monthly and semestrial basis)	0.6	3	1.8
6. Delegation of authority: extension of delegation of authority in order to comprise the subordinate staff	0.4	6	2.4
7. Presentation of company's objectives to all employees: the capacity to set forth clear objectives for the subordinate staff in accordance with the company's objectives	0.4	10	4
8. Formal rule (Internal Rules and Regulations, Organization and Functioning Regulations, Work Instructions etc)	0.8	8	6.4
9. Criteria of distribution of organization's incomes	-0.4	1	-0.4
10. Degree of consideration, respect, shown by the management: the capacity to understand the problems and wishes of subordinate staff	0.2	2	0.4
General score (average value of index)	0.18		14.4

The organizational vitality analysis pointed out that Valeo company presents a positive value of **organizational vitality** amounting to **0.18**, thus it is part of the organizational vitality area characterized by

initiative and freedom of movement. **Specific weight and level of importance were identified** in the same way as in the case of strategic vitality.

Conclusions:

- as may be seen from the two tables, Valeo company corresponds to the upper right quadrant of the multifactorial matrix **(0.18,0.28)**.
- if with respect to certain indexes negative values resulted, the final scores, both for the strategic value and for the organizational value, yielded positive values. The final scores are used in order to carry out the human resources management assessment from a qualitative point of view.
- the management style of Valeo company tends to adopt a more bureaucratic feature, to the detriment of the freedom of movement, as may be seen from the assessment of the two indexes used to perform the organizational vitality analysis.

MULTICULTURAL LEADERSHIP

Popescu I. Doina

The Academy for Economic Studies, Management Faculty – Management Chair, Str. Sabinelor nr.106, Bl. 115, Ap.8, sector 5, București, e-mail: doinaipopescu@yahoo.com, mobil: +40 723 413411

The paper presents the necessity for a more profound understanding of the leader's relationship on a cultural and national stage, while considering several factors: globalising economies, internationalising businesses, the existence of work teams that contain people of various cultures. The personality, efforts and style of a leader can result or be in conflict with the working environment. Therefore, a leader belonging to a certain culture should adopt various attitudes and behaviours so as to generate a range of influences, adequate for achieving the organizations objectives. Leaders must know the culture, history and expectations of the working environment in order to develop a style of leadership suitable for each unique and complex context.

Keywords: Organizational culture, national culture, heterogeneous workforce, multicultural leadership.

A leader's relationship is not only an essential part of the management process, but also, it is an integrant part of the social and cultural structure of an organization. A good manager must support the forming of an organizational culture that comes to the employee's aid.

For example, Brown believes that: "An efficient leadership, a working organization or a development programme must have the same sensitivity and understanding toward culture at their core. A very good leader is not only aware of the main characteristics of an organization, he simultaneously knows how to act so as to shape and improve them."

Another important variable that influences the choice in leadership type is national culture. McGregor believes that the social, economic and political environments influence the leadership relation in the same degree it does the attitudes and needs of subordinates. Moreover, Tannenbaum and Schmidt identify the fact that the leaders system of values is a factor that influences his choice in style. Also, they underline the fact that the need for independence or tolerance is relevant variable in the choice of style. This factors range depending on the cultural context in which the leadership relationship manifests.

The behaviour of leaders or subordinates must not be considered a stereotype. There have already formed several myths regarding the German discipline, the English obstruction, the Italian indiscipline etc. Even so, there are motifs that point to the fact that cultural differences are relevant in understanding certain forms of leadership. A characteristic that can be used to classify organizations is the distance imposed by power. It would appear that this influences the limit to which subordinates accept inequality and which, consequently, influences the degree of power that leaders can exercise.

For this reason, it is to be expected that an autocrat style of leadership is characteristic to organizations from different countries, such as France, Spain, China, Iran, where the distance imposed by power is large. In contrast, there are countries like England, Italy, Holland, U.S.A., where the distance imposed is small and where a participating style of leadership is preferred. It should also be specified that whichever the preferred style is, a managers that operate in a certain country are obliged to respect the legal measures specific to that country. Within the European Union, all members, except Great Britain, have agreed to respect the content of the Social Carta from 1989 and that of the Maastricht Treaty of 1991. These agreements regard employees' rights to information, consultation and participation. It is quite possible that, for this reason, British managers have higher prerogatives in coordinating people at the workplace. In most part of the post-war period, under a statutory policy of common consultancy, German managers had to work with both workers' representatives in the executive board and with work committees. Lawrence, for example, described how personnel managers from West Germany where required to work with staff representatives in problems of employment, training and remuneration.

From the late past century, the rapid development of science and technique in companies from the developed countries almost astonish imagination. As a result, these companies have become dynamic organizations, industrial, with a high educational level and standards hard to imagine in the past. This

phenomenon is the beginning of a noticeable effect over most of the workforce utilized. Today, the majority of employees enjoy a high life standard and aspire to being much better educated and sophisticated than they have ever been. Consequently, an employee's potential has grown with self control and direction. In Maslow's terms, according to these changes in receptivity, most of the population in the U.S. and other developed countries now have a basic psychology and their needs for safety and security are better satisfied. Management cannot depend any longer on satisfying these needs – through salaries, stimulatory plans, encouragement, medical services and others – the main motivational factors that influence the industrial workforce. Today, the American society and that of other developed countries consider that their expectations regarding psychology and security will be naturally fulfilled. Actually, most people do not concern themselves with the issue of an everyday meal or with that of welfare. Their attention is currently oriented to other needs: people want to belong to a group, they want their capabilities to be recognised, and they desire respect and the opportunity to utilize their talents to the maximum. As William H. Haney used to say: "Therefore, the managerial practice should be subordinate to the actual level of receptivity; the purpose is to help a person adjust so that he may surpass his current state and thus requiring less and less external control and awarding him increasing self-control. And why would someone wish for something of this sort? Because through fulfilling these requirements he earns satisfaction from his work, specific to the level of self-realisation achieved, a level at which he is highly motivated."

American theorists tend to support participating management. This is also a conclusion of Geert Hofstede. He considered, that the American theories that discuss management cannot be applied outside the U.S.

Let's, for example, consider the idea that a manager allows his employees to participate in executive matters. This would be compatible with the American view over power in institutions and organizations, where authority is distributed unequally. On the other hand, there are countries like Germany, Sweden, Norway, and Israel where power has a more equal distribution. Examples of this kind can be located in the German codetermination and the management style of some Scandinavian countries. Ironically, even though these ideas were first presented by W. Edward Norton and other American theorists, they were ignored for many years. Several American companies tried implementing this sort of practises, like the Swedish participatory management and other successful methods applied in Japan, "the quality circles". The reality was that most of these attempts were doomed to fail from the begging; the blame falls mainly on the fact that American managers did not accept the idea of sharing power with their subordinates.

Hofstede concludes that managers cannot choose the leading style they desire. Moreover, they must try to understand the culture of the area, they must understand their subordinates and realise how the relation employer-employee should be shaped. The concept of multicultural leadership has been formulated along with the tendency of globalising economies, internationalising businesses and the birth of teams with people of various cultures and beliefs. As a result, in the age of global communications, employees from all compartments and from every hierarchical level can come in contact with colleagues and clients from all around the world. International business plans are important for the long-term success of many companies and that is why it is vital that the management establishes and sustains cordial relations regardless the cultures involved. Early and Singh (1995) underline the need for a more profound understanding of the management's relationship on a cultural and national stage. The personality, efforts and style of a leader may conflict with the environment within it manifests. A manager belonging to a certain culture should adopt attitudes and behaviours that generate a suitable influence for achieving satisfying results.

Mead defines the organizational culture as a series of learning experiences, a collection of beliefs, traditions and habits, shared by a group of people and learned one a time by all those that enter the organization. Geert Hofstede defines culture as a collective programme by which the organization functions and which differentiates the members of a group from those of another. Both researchers support the idea that any culture is learned and not inherited. If we believe this statement to be true then we must also accept that new cultural characteristics can be thought and that there are strategies which adopted allow a leader to overcome the difference in this area of expertise. Specialists have established a series of elements that form a cultural programme and these are:

- language (verbal or non-verbal);
- economy;
- religion;
- politics;

- social institutions, social classes, family structure;
- spiritual and morale values;
- attitudes;
- manners;
- habits;
- material objects;
- aesthetics;
- education.

Therefore, by knowing the values and behaviours of other cultural groups and by having a profound understanding of one's own values and beliefs, a leader can develop a capacity of integration. By gaining self-awareness and awareness of others a leader can choose those behavioural adjustments that increase his capacity of obtaining success by leading people belonging to different cultures.

Many researchers support the notion of cultural compatibility in the leadership style. For example, employees that hold leading position in areas such as India, Eastern Africa or Indonesia, are expected to adopt an autocratic style, with a clear distinction between leader and subordinate. Unlike them, managers from Austria or Finland adopt a participatory leading style. Only by knowing the general defining elements of a geographical and cultural area, relevant to the flow of global economy, can we understand and resolve the adaptation and communication issues that occur in management-staff relationships.

Enterprising managers from the new democracies seek methods to modernise the overfulfilled technobureaucrat management styles. According to reports, most new owners and investors in Central and Eastern Europe await the benefits of capitalism: a sure and noticeable profit, without having to experiment the declines provoked by losses and risks. Another group of businesspeople have belonged to the old nomenclature and are, therefore, loyal to a way of thinking that seeks gaining power and winnings rapidly and, frequently, unfair. As a result, Central-European management has been characterised as being "collective" and with a bureaucratic approach. The defining elements are: motivation through group unity, avoidance of personal conflicts, repetitive behaviour, aversion towards risks and the setting of objectives by a manager, without the agreement of employees, shareholders and clients. On this note, it becomes necessary that ex-communist countries adopt a management based on western values: individualism, innovative behaviour, opportunity detection and focusing on the client. Such values reflect pragmatism along with flexibility and show a realistic concern toward increasing productivity, autonomy, assuming responsibilities, long term strategies etc. For Est-European mentalities the main accusation is bureaucracy. Its hold, however, is lessened by a certain type of pragmatism that forms from the customised laws, of rules in general and, under a certain conditions, on the management's dependency for politics. Also, implementing West-European concepts has proven quite difficult because of the conflict between dependency, obedience, blocking ones own personality, characteristics of collective societies and the unbalancing of authority, autonomy, courage to face insecurity, a strong individualism, specific to pragmatic societies.

In Romania the main deficiency of leading act is the exaggerated concern of manager to keep this status instead of preoccupation for increase the turnover and for create a proper work environment. This generate an organizational culture based on control, motivation based on basic needs for safety and security, the absence of delegation and of teamwork.

The standards and performances imposed by American organization have even greater importance since they are achieved in the country with the most heterogenic ethnic groups. The differences and disputes are eliminated to form a stable ground of respect towards efficiency, cooperation, communication and profit. The United States has been tagged for its lack of cultural originality, the non-existence of a national portrait; the only stable symbols it holds are money, power, pragmatism and free-speech. Generally, American management constantly introduces innovative ideas through which they reduce costs, increase quality and market presence. Intense efforts are being made with the intent of improving client service, information technology and human resource management.

In the past decades, countries like Singapore, Hong Kong, Taiwan, South Korea, has shown remarkable progress. From a cultural point of view, the above mention states, along with the true Asian miracle – Japan, belong to Confucianism. Societies based on this philosophical system cherish intense effort,

temperance, perseverance, hierarchical order in educational and interpersonal relations. Beside the Confucian teachings, managerial practice has been influenced by Taoism and the papers of military strategists.

Though apparently, the East-Asian management resembles the American or West-European one, they differ on some levels: interpersonal relations, competition approach, cooperation and business strategy. As Fujisawa, one of the founders of the Honda corporation, pointed out: “the Japanese manager and the American one resembles about 95%, but differs in all the important aspects.” Asian economies that are expanding have shown how businesses can combine the respect for traditional values (hierarchy and social status) with the pragmatic flexibility of decision taking.

After research conducted in many national cultures, Bass identified seven factors that influence directly the efficiency of a leadership style:

- desired conscience (the desire to be aware of other people feelings);
- real conscience (effective understanding of others and of one’s self);
- obedience (to rules and authority);
- the favouring of adopting team decisions;
- preoccupation for inter-human relationships;
- collaboration in terms of equality.

Di Stefano and Lane concluded that globally efficient managers are those who have the capacity to:

- develop and use abilities of global strategy;
- respond successfully to changes and transformations;
- rule over cultural diversity;
- project and function in flexible organizational structures;
- work with others and in a team;
- communicate;
- learn and transfer their knowledge within the organization.

They maintain that these capacities grow unequally through-out a person’s entire life. Most scientists, however, are sceptical whether an efficient leadership, that crosses national and cultural borders, is a general concept. Consequently, because of the often reduced transferability of leading practices, managers are advised to search for themselves or take consultations in developing a style of leadership that is appropriate for each work context. A universal culture, one which has the same grounds and which could lead to a unique way of integration, would remain a utopia if it were to be understood from uniform culture’s point of view. This represents the image of a world where differences are accepted and appreciated. Cultural resemblances can become the foundation for stability, collaboration and mutual respect for new elements, elements that will, eventually, award a leader more options of how to approach problems.

Due to global demographic changes (especially on the North-American and West-European continent) and, also, because of the internationalization of businesses, structural differences between employees will continue to increase. In addition, managers will be forced to supervise socialising with greater attention and to intervene in order to obtain maximum benefits from the growingly diversified workforce employed.

Microsoft is one of the firms that puts a large price on diversity and has created a culture that reflects the value of difference among people. Microsoft’s management believes that the company’s evolution was possible because of an active diversity programme. The company’s philosophy is to make both clients and employees feel welcomed. A diversified personnel requires the implementing of training programmes regarding diversity and upgrading policies that involve benefits and which investigate any case of discrimination or harassment.

Orientation committees for diversity at Microsoft include representatives of African, Hispanic, Jewish, Asian, European etc. employee groups and are permanently widening with new representatives from other groups. The committee helps the company formulate its policies, identify problems and create an adequate working atmosphere.

Ortho Pharmaceutical initiated a programme for diversity “management” which supervises the process of cultural transition taking place within the organisation. Therefore, a “comrade” type system (or the “buddy system”) has been created at the Ore-Ida company. The comrade represents an English speaker that will help a new employee (whose native tongue is not English) with communication issues.

Through organizational understanding of culture and nationality, the process of socialising and diversity has become an important requirement toward achieving the company’s objectives. Competition, market and people have become such complex notions that the effective usage of every employees talents and aptitudes have come to form a valuable characteristic for the leaders of organization in present time.

Popescu Emilia

L'Université de Pitești, La Faculté Des Sciences Humaines, 40 Republice Blv.

Resumé : L'organisation reçoit, formule et résout les intérêts collectifs et se préoccupe de ceux personnels. Elle représente le laboratoire où est produite l'analyse, jusqu'à l'élément individuel et personnel du travail, et la synthèse, jusqu'au complexe social, humanitaire et universel des deux catégories d'intérêts humains sociaux et individuels.

Efficacite economique, organisation, sisteme

Ce n'est pas par hasard qu'on accorde un espace de plus en plus vaste aux études concernant la corrélation entre les intérêts et l'efficacité dans la littérature de spécialité. Malheureusement, ces études n'approchent pas dans une mesure suffisante la liaison et la manipulation entre le système d'intérêts et l'efficacité économique. De cette façon, les économistes insistent sur l'aspect économique des intérêts et s'engagent sur ce chemin dans l'étude de la corrélation qui existe entre les intérêts et l'efficacité. A leur tour, les psychologues, les psychosociologues ou les sociologues accentuent seulement le contenu psychologique, psychosocial des interdépendances tellement complexes et permanentes existant entre le système d'intérêts et l'efficacité économique. C'est pour cela qu'on essayera par la suite à relever quelques composants psychosocioéconomiques dans la corrélation entre le système d'intérêts et l'efficacité économique dans l'organisation. Quelques uns de ces composants sont présentés dans la figure 1.

Instrumentalement, le système des corrélations entre les intérêts et l'efficacité économique consistent en des moyens économiques et financiers, mais son fondement est social-psychologique, car il est motivé par les intérêts des hommes, par leur désir de hausser leur niveau de vie matériellement et culturellement.

Par une connexion judicieuse des intérêts collectifs avec ceux personnels on peut arriver à l'entraînement, sur des fondements psychosociaux, de l'entier personnel pour l'action d'accroissement de l'efficacité économique ayant des effets amples et significatifs pour l'organisation, pour son développement economico-social, aussi bien que pour les employés qui, par une adaptation psychique aux demandes imposées par les exigences résultées de la corrélation intérêts-efficacité, éliminent de leur activité la passivité et la routine et s'engagent dans l'effort général d'accroissement de l'efficacité économique, ce qui représente de nouvelles possibilités de gain pour eux et pour leurs familles. Il en résulte donc, que l'intérêt économique génère l'acte de prise de conscience du personnel en connexion avec ses besoins et son action afin de les satisfaire. L'acquisition par les hommes de la conscience de leurs intérêts fait des intérêts économiques un motif, un but et une impulsion de l'action, de l'activité afin de réaliser les intérêts respectifs.

Dans l'économie de marché, la décentralisation et l'autonomisation déterminent, joint à l'utilisation adéquate de la stimulation, une nouvelle attitude face au travail pour tous les niveaux d'administration et d'exécution, concrétisée dans l'intérêt pour le travail développé, dans l'attitude participative, active dans les collectifs de travail, dans le désir effectif d'assomption de quelques responsabilités accrues, dans le sens de la responsabilité pour les résultats obtenus.

Dans ce contexte, a lieu l'entremêlement rationnel et équitable des intérêts sociaux avec les intérêts individuels, la compréhension de l'intérêt comme motivation essentielle des activités et des relations humaines qui apparaissent et se développent dans le processus d'accroissement de l'efficacité économique, la prise de conscience des besoins individuels et d'accroissement de l'efficacité économique. Dans toute organisation, les résultats dans ce domaine dépendent du degré de compréhension et d'utilisation des

intérêts économiques, de ceux collectifs et individuels. Les principaux composants de l'intérêt collectif consistent en:

- la préoccupation d'assurer la main-d'oeuvre adéquate du point de vue quantitatif et qualitatif ;
- l'exercice du contrôle afin de réaliser la concordance entre le volume et la qualité du travail fourni par chaque ouvrier et le contenu du salaire ;
- l'assurance de la concordance entre la mesure des possibilités de consommation et la mesure du travail effectué par chaque employé.

A son tour, l'intérêt personnel est composé de deux traits essentiels :

- l'intérêt pour la consommation personnelle;
- l'intérêt pour la production, c'est à dire pour occuper la position la plus favorable et efficace dans la division sociale du travail.

Entre les deux aspects il y a la possibilité de l'existence, en fait, de la concordance avec des effets positifs sur l'entier processus général d'accroissement de l'efficacité économique, mais aussi du désaccord - situations où l'employé traite son intérêt de production, de travail, à travers le prisme de son intérêt de consommation, arrivant parfois à sacrifier son intérêt personnel de production en faveur de celui personnel de consommation.

En même temps, des contradictions apparaissent aussi entre les organisations, particulièrement dans le processus de l'échange d'activité, c'est-à-dire la violation des dispositions contractuelles, la contradiction entre le temps individuel de travail et le temps individuel des autres unités dans le processus de la formation des prix.

Étant données les conséquences négatives des contradictions antérieurement exposées, on considère en tant que principale nécessité la préoccupation pour l'intégration des activités personnelles ou relatives au groupe dans l'ensemble des activités de l'organisation. N'oublions pas qu'un chef de section ou de service qui est préoccupé seulement par le bon déroulement de l'activité de la section ou du service qu'il tient en administration, sans tenir compte de l'influence de cette activité sur d'autres sections ou services, sur l'activité générale de l'organisation, est considéré adéquat seulement en apparence et arrivera tôt ou tard à être empêché dans sa propre efficacité par le manque d'efficacité économique et sociale des autres.

La connaissance du mécanisme du système d'intérêts, des propres contradictions présente une importance particulière dans le processus d'accroissement de l'efficacité économique. Justement pour cette raison, dans l'élaboration de la ligne générale et des modalités d'entraînement à l'action d'accroissement de l'efficacité économique on doit tenir compte du système d'intérêts, on doit prévenir les désintérêts et la routine, on doit éduquer l'intérêt pour l'efficacité de toute activité dans la production de base ou auxiliaire, dans l'assurance technico-matérielle du processus de production ou dans l'écoulement des produits pour l'intérieur ou pour l'export.

Pour obtenir des réalisations plus importantes, l'intéressement du personnel doit former l'objet des efforts systématiques de l'organisation. Une telle préoccupation est fondée sur l'expérience des organisations et sur les confirmations psychosociologiques économiques, qui mettent en évidence le fait qu'un réel intéressement peut avoir en tant que résultat l'obtention d'une augmentation de l'efficacité économique sans investissements ou avec les moindres investissements. Les principaux éléments de caractérisation de l'intéressement, comme mobile psychosocial d'augmentation de l'efficacité économique, sont inclus dans la fig. 2.

Dans les organisations, l'intéressement matériel représente un rapport de plus en plus approché entre les besoins matériaux-spirituels et la satisfaction effective. Dans la perspective des sciences sociales-humaines, le problème de l'intéressement coïncide avec le problème des mobiles des activités ou, en s'exprimant par un terme moderne, de la motivation.

Bien que complémentaire en rapport avec celle matérielle, la stimulation morale représente un levier principal à l'entremise duquel on contribue à son autorégulation afin d'accroître la production et pour le perfectionnement des relations sociales.

Du point de vue du problème qui nous préoccupe - la corrélation entre le système d'intéressement et l'efficacité économique, traitée sous l'aspect du côté psychosocial - les stimuli moraux relèvent la complexité des besoins humains et se constituent en des facteurs générateurs de satisfaction qui

déterminent une participation consciente et motivée, orientée et concrète au processus d'accroissement de l'efficacité économique.

Dans l'application des stimuli matériels et moraux on doit avoir en vue quelques règles essentielles:

- le degré de participation à l'action d'accroissement de l'efficacité économique est déterminé par la participation avec laquelle on met en évidence les résultats obtenus et on fait les nominations dans la catégorie de ceux méritants;
- dans l'administration des stimulants on doit assurer la prépondérance de ceux matériels et une connexion rationnelle avec ceux moraux, car, à présent, les stimuli matériels ont une plus grande capacité de mobilisation pour le travail orienté vers l'augmentation de l'efficacité économique que les stimuli moraux ;
- l'accroissement de l'attachement face à l'organisation et le développement de l'attitude active de participation au processus d'augmentation de l'efficacité économique peuvent être transformés dans des composants de la stimulation morale ;
- la stimulation matérielle et celle morale doivent être complétées par le comportement civilisé, dicté par des principes et digne.

Dans le processus d'accroissement de l'efficacité économique la sanction et la récompense ne sont pas toujours comprises et utilisées de manière adéquate. On sait que la récompense consolide le comportement positif, et la sanction prévient celui négatif. Cela veut dire que ces deux mesures permettent que la personne soit tenue entre les limites déterminées par la morale et par les lois. Dans ce cadre, la sanction doit agir non seulement comme force coercitive mais elle doit aussi remplir la fonction de prévention des erreurs et des insuccès dans les actions d'accroissement de l'efficacité économique. En même temps, elle sert de moyen d'augmentation de la responsabilité de chaque personne pour les attributions confiées dans le processus d'accroissement de l'efficacité économique. D'après la loi de l'action parallèle, la sanction ou la récompense de la personne influence celui sanctionné ou récompensé aussi bien que l'entier collectif de travail.

Dans l'application des stimuli matériels et moraux on doit avoir en vue quelques règles essentielles:

- le degré de participation à l'action d'accroissement de l'efficacité économique est déterminé par la participation avec laquelle on met en évidence les résultats obtenus et on fait les nominations dans la catégorie de ceux méritants;
- dans l'administration des stimulants on doit assurer la prépondérance de ceux matériels et une connexion rationnelle avec ceux moraux, car, à présent, les stimuli matériels ont une plus grande capacité de mobilisation pour le travail orienté vers l'augmentation de l'efficacité économique que les stimuli moraux ;
- l'accroissement de l'attachement face à l'organisation et le développement de l'attitude active de participation au processus d'augmentation de l'efficacité économique peuvent être transformés dans des composants de la stimulation morale ;
- la stimulation matérielle et celle morale doivent être complétées par le comportement civilisé, dicté par des principes et digne.

Dans le processus d'accroissement de l'efficacité économique la sanction et la récompense ne sont pas toujours comprises et utilisées de manière adéquate. On sait que la récompense consolide le comportement positif, et la sanction prévient celui négatif. Cela veut dire que ces deux mesures permettent que la personne soit tenue entre les limites déterminées par la morale et par les lois. Dans ce cadre, la sanction doit agir non seulement comme force coercitive mais elle doit aussi remplir la fonction de prévention des erreurs et des insuccès dans les actions d'accroissement de l'efficacité économique. En même temps, elle sert de moyen d'augmentation de la responsabilité de chaque personne pour les attributions confiées dans le processus d'accroissement de l'efficacité économique. D'après la loi de l'action parallèle, la sanction ou la récompense de la personne influence celui sanctionné ou récompensé aussi bien que l'entier collectif de travail.

This paper investigates the current practice with regard to the involvement of the purchasing department in NPR purchasing. First we review the literature about NPR purchasing, and especially the major benefits and challenges of involving purchasing department in NPR purchasing. In order to see how are things in practice we conducted an empirical study. The findings of the empirical research are presented at the end of the paper. The main conclusion is that top management – at least in theory – could improve its grip on NPR-purchasing by more clearly creating the conditions for a self-regulating ‘economic system’ within the firm which offers internal departments different possibilities for organizing their respective purchasing activities. These conditions must allow for letting the internal customer be in charge of purchasing themselves, but also offer the possibility of buying purchasing assistance on a ‘market’ and/or developing co-operative relationships with a purchasing specialist.

Key words: purchasing management, control, NPR goods and services.

Introduction

Until recently, academic interest in purchasing was very manufacturing oriented with an emphasis on production buying. The purchasing of non-product related goods and services (NPR) has only gained limited attention from management and researchers (Fearon and Bales, 1995; Telgen and de Boer, 1995; Plăiaș, 2006).

NPR goods and services are known by many names: indirect goods and services, goods not for resale, non-bill of materials. No matter how they are called, the NPR purchases include all goods and services other than raw materials, production items, and MRO supplies, such as: capital equipment (e.g. vehicles, lathes, etc); services (e.g. health care plans, insurance, advertising, legal assistance, and telecommunications).

The obvious characteristic of NPR goods and services is that they are not used in the primary production processes. They are purchased in order to support and facilitate all other activities within the organization. Non-product related purchases have a number of characteristics:

- they comprise a wide range of goods and services, which are often purchased from an even larger number of suppliers;
- they are often time consuming as many are non-standardized items which are usually purchased in small orders;
- they show high end user involvement in the tactical purchasing phase which leads the NPR purchasing process to be spread out all over the company;
- in total there is a lot of money involved in NPR purchasing; however NPR typically receives limited management attention.

A dominant factor to be considered with regard to the importance of NPR purchasing is the yearly amount of money involved. In many services and government organizations such as banks, accounting firms, and hospitals, the total purchase volume can be regarded as purchasing expenditures on non-product related goods and services. In industrial and retail organizations this will naturally not be the case because a considerable part of the total purchase volume consists of purchasing for primary process. However, in the purchasing of NPR goods and services huge amounts of money are involved.

Another typical factor regarding NPR purchasing is the low attention from top management. NPR purchasing is not seen by managers as a necessity, compared to the purchasing of items and services for the primary process. As a consequence, structural attention and management of purchasing of NPR goods and services is not considered as a tool for improving effectiveness and reducing expenditures. Because of the lack of clear and direct insight in the size and contents of the purchasing volume of non-production items and services, managers are missing out opportunities for adding value to their organizations. Is top management sufficiently aware of what is going on in the company? Who buys what? Where? With what frequency? Etc.

Obviously, top management cannot and should not want to know about every purchasing transaction. On the other hand, leave it completely to the departments seems a too costly strategy, given the time and money involved.

Therefore, the question arises: what is the optimal control approach for top management regarding NPR purchasing? What do they need to know and how do they get this information? One of the obvious control tools would be to involve one or more purchasing professionals (e.g. a professional purchasing department). However, there appears to be very little research on this topic.

The main objective of our paper is to investigate the current management control practice with regard to the involvement of purchasing department in NPR purchasing. In a later stage we hope to draw further on this and formulate and design rules for improved management and control.

Literature review

A number of previous studies (U.S. Bureau of the Census, 1991; Fearon and Bales, 1995) indicate that the role of the Purchasing Department is much smaller in the purchase of nontraditional (non-product related) goods and services than commonly believed. These ‘nontraditional’ (non-product related) areas, such as insurance, utilities, consultancy, travel and advertising, are likely to be purchased without the involvement of professional buying practice and skills. For example, the Center for Advanced Purchasing Studies (CAPS) in a study in 1993 (Fearon and Bales, 1993) found that in a surprisingly large percentage of firms, the Purchasing Department had no input to the purchase of nontraditional goods and services (e.g. in 39% of the firms, there was no involvement in the purchasing of services, in 55% of the firms there was no involvement in the purchasing of utilities).

In Michels’ view (1996), a purchasing department can be involved in three different ways: (1) purchasing can be directly involved in NPR purchasing; (2) purchasing can act as an internal consultant/advisor for NPR purchase buyers; (3) purchasing can act as a cross functional team member dealing with nontraditional expenditures.

Results of a recent Purchasing Magazine survey of 1000 corporate buyers nationwide show that purchasing departments take on many activities for service procurement that were once left to the using departments. From a total of 1000 respondents: 70 percent were involved in contract negotiations; 63 percent were involved in supplier selection; 58 percent were involved in contract management; and 5 percent were involved in setting specifications.

As the study shows, the purchasing department has become more involve in the tactical procurement of NPR goods and services. Apparently, these purchasing departments have started to realize that there are numerous opportunities in the NPR procurement and that they have the skills and expertise to ensure that the company receives the best value. In the following table we have tried to synthesize the major reported benefits of involving the purchasing department in the NPR purchasing process.

Major benefits of involving PD in the NPR purchasing	Major challenges of involving PD in the NPR purchasing
cost savings service and quality improvement improving product position in the marketplace	gaining the acceptance, confidence and cooperation of the using department capturing attention of top management developing a value proposition for key customers and management

reducing product or service cycle time	limited availability of NPR purchasing data and information
improved process efficiency	difficulty to assemble teams and other resources needed to control NPR spending
greater compliance to pre-negotiating contracts	rivalries among separate business units or managers
controlled costs	being comfortable with doing things in certain ways
legal protection	
a better informed and prepared supplier	

Table 1: Major benefits and challenges of involving PD in the NPR purchasing

Source: C. Nowikow (1999); W. Atkinson (2000); A. Porter (1999)

While benefits of involving purchasing department in the NPR purchasing process may be numerous there are also several major challenges of involving purchasing department in the NPR procurement (see table 1).

Summarizing, the literature suggests that:

- purchasing's involvement in NPR is still very limited and problematic;
- involvement could offer many advantages, including offering increased control to topmanagement;
- purchasing involvement is subject to horizontal resistance and vertical ignorance.

Some empirical examples

We conducted three focussed interviews with (former) purchasing managers of three different organisations: (1) a former purchasing manager in a worldwide producer of electronic and domestic appliances (2) a purchasing manager in a hospital and (3) a former purchasing manager in a producer of complex navigation systems. Due to space restrictions we only show the summarised results of these interviews, see table 2.

Discussion and conclusions

Relating the findings from the interviews to the theoretical model and literature review, we arrive at the following conclusions.

- If top management does not clearly communicate the different possibilities for professional (specialised) purchasing involvement, effective involvement from an internal purchasing department will remain problematic. The examples suggest that internal customers may refrain from involving the internal department, not so much because they believe the purchasing department has little value to offer but because they fear that involving the purchasing department will necessarily imply involvement from other internal customers. Another problem that becomes apparent from the interviews is that the lack of a clear structure for possible specialized purchasing involvement seriously harms topmanagement's credibility regarding future policies on NPR-purchasing.
- Reasons for not – or no longer – involving the internal purchasing department may include:
 1. political considerations on behalf of the internal customer which have not so much to do with the purchasing department perse;
 2. gradual development within the internal customer's organisation of those purchasing skills which the purchasing department provided thus far;
 3. the internal customer's conviction that the required purchasing skills are not sufficiently dissimilar from his present skills;
 4. the internal customer's conviction that outside help may indeed be beneficial but that the internal purchasing department does not have enough skills to be that 'outside' help and that a specialist consultant from outside the firm is required.

- Reasons for inviting – or allowing – the internal purchasing department to become involved in NPR categories which were previously outside their domain include (1) the internal customer’s conviction that the internal purchasing department can add value by bundling demand from several internal customers and (2) turning to the purchasing department as some kind of last resort after the internal customer’s own efforts have failed. The first reason points to NPR items and services which are not too closely locked into the various internal operations.
- The internal purchasing department may also have to more consciously rethink its approach towards the internal customers in terms of the value they could add. In many cases, for examples regarding the purchasing of energy and ingredients for catering, the purchasing activities are closely complementary to the internal operations and/or require very specific (dissimilar) knowledge regarding the content. This suggests that the internal purchasing department would add most value by developing a dedicated co-operation relationship to this particular internal customer and/or facilitate the process of bringing in outside specialists. As mentioned before, given the wide variety of NPR items and services, the interna
- demand for specialist involvement in each individual item or service will simply be too small and infrequent to justify such an internal specialist.

Table 2: Summarized results of the interviews

All in all, we conclude that top management – at least in theory – could improve its grip on NPR-purchasing by more clearly creating the conditions for a self-regulating ‘economic system’ within the firm which offers internal departments different possibilities for organizing their respective purchasing activities. These conditions must allow for letting internal customer being in charge of purchasing themselves, but also offer the possibility of buying purchasing assistance on a ‘market’ and/or developing co-operative relationships with a purchasing specialist. The lack of such conditions discourages internal customers to involve an internal purchasing department, even if the department could in fact add value. By the same token, the purchasing department is confined to being involved in a (often limited) number of cases where it is clear that bundling of demand will pay off for all parties involved. In addition to these obvious cases, the internal purchasing department could play a useful role as a liaison between the internal customers with their very specific requirements in terms of knowledge and skills and outside-specialists who can offer this specific assistance.

LA SORTIE DE L'IGNORANCE DES PETITES ET MOYENNES ENTREPRISES

Popovici Norina

L'Université OVIDIUS Constanta, Faculté de Sciences Economiques, Aleea Universitatii nr. 1, 900000, Constanta, norinapopovici@yahoo.com, 0724-289869

Faced with the new challenges of the contemporary economy such as the discovery of new production methods, intense competition, rapid economic, social and political changes, companies need to improve their economic performance by increasing their competitiveness. The human resources represents one of the most important investments of a company. This investment, whose results becomes clear once the time passed, is the best way to ensure the enterprise competitiveness and success. To this end, the managers may use three main tools : projects and coherent strategies of action , enterprise organisation, and human resources motivation.

Organisation, motivation, strategy, small and medium enterprises, competitiveness

Une caractéristique propre à la nouvelle économie qui est envisagée à présent, l'économie qui repose sur le savoir, est le fait d'être soutenue par les entreprises de petites dimensions, lesquelles représentent un cadre propice au développement des performances des salariés sûrs de leurs connaissances ; ces entreprises s'adaptent beaucoup mieux à l'élasticité et à la diversité de la demande, assurant ainsi le microdynamisme de l'économie moderne.

Considerations generales sur les P.M.E.

Une cause importante du dynamisme des petites et moyennes entreprises (des P.M.E.) est représentée par le développement de nouvelles activités dans le secteur des services : l'interprétation des informations, l'élaboration des programmes informatiques, les prospections de marchés, les activités juridiques, les activités sportives et récréatives.

Les P.M.E. contribuent pleinement à la résolution de certains problèmes d'ordre social tels que la diminution du chômage et par l'absorption de la force de travail, trois quarts des ressources humaines disponibles étant englobées par ces entreprises.

Les caractéristiques principales de ces P.M.E. sont mises en évidence par Julien [1] :

- la dimension réduite, les contacts directs, les relations de travail informelles ;
- la structure organisationnelle est centralisée, la direction se trouve à la portée de l'entrepreneur, étant fortement influencée par la personnalité de celui-ci;
- la spécialisation est faible et s'adapte aux spécificités des employés ou des équipements disponibles. Les salariés doivent avoir la capacité de changer de poste de travail ou de fonction, les équipements permettre la flexibilité de la production et être à même de produire à des prix compétitifs une grande variété de produits ;
- la stratégie est intuitive et très peu formelle. L'entrepreneur est suffisamment proche de ses collaborateurs et salariés pour leur expliquer verbalement les changements qui s'imposent dans l'activité de la firme, sans qu'il y ait une stratégie écrite, formelle.

La création des ces P.M.E. est un processus hétérogène, éphémère, difficile à repérer dans le temps, processus qui correspond à diverses motivations. Marshall [2] fait une analogie bien inspirée entre une forêt et ce processus de création, de survie et de développement d'une P.M.E. : « la foule des entreprises pourrait être comparée avec une forêt où de petits arbres et des arbres de grandes dimensions, d'espèces diverses coexistent. Il y en a qui apparaissent, d'autres qui arrêtent de pousser, il y en a qui meurent, de telle manière que seuls certains d'entre eux touchent à une dimension appréciable. Certaines espèces végétales coexistent en symbiose, d'autre luttent pour obtenir un espace propre à s'y développer. Certains

arbres vivent une longue période arrivant à la maturité au bout de plusieurs décennies, d'autres ne résistent que quelques années.

Au cours du temps, la forêt se reboise, croît ou bien décroît selon sa dynamique intérieure ou selon les circonstances liées au milieu naturel (changement climatique, incendies, interventions des hommes). Pour que la forêt atteigne un équilibre écologique, fait toujours difficile, il est besoin d'une longue période, certaines espèces n'ayant la possibilité de s'y développer qu'à l'aide d'autres espèces qui ont déjà colonisé le sol, bien du temps en avance ».

Cette analogie met en évidence la forte dépendance de l'évolution des P.M.E. de l'environnement et de la nécessité objective d'adaptation des firmes aux contraintes et aux opportunités spécifiques au contexte où celles-ci déploient leur activité.

En ce qui concerne la direction des P.M.E., il y a trois facteurs négatifs qui l'affectent [3]:

- les patrons cherchent des avantages à court terme qui assurent leur pérennité, la survie de l'affaire et une autonomie confortable, tout en contredisant la théorie classique du management qui suppose obtenir le maximum de profit dans les conditions des évolutions ascendantes de l'entreprise ;
- il est rare que les entrepreneurs aient une formation complète en management. Généralement ils ont une compétence technique insuffisante pour diriger une affaire de manière efficace ;
- les entrepreneurs sont soumis aux pressions des problèmes immédiats ; ils ne consacrent donc pas le temps nécessaire aux réflexions à long terme concernant l'évolution de l'entreprise ;
- les stratégies spécifiques à ces entreprises sont peu formelles, les décisions ont à la base, pour la plupart, l'intuition, le flair, l'expérience des entrepreneurs.

A mesure que la fréquence des changements croît, les entreprises doivent faire croître leur souplesse et leur capacité de réagir, faisant appel à la gestion stratégique. L'application d'un management stratégique permet à la firme d'identifier et de développer un avantage compétitif, permet également aux salariés de s'impliquer dans l'activité de planification, de telle manière qu'ils comprendront mieux les objectifs établis et agiront en accord avec ces objectifs.

La planification, en tant que processus par lequel on élabore la stratégie des firmes, doit s'appuyer sur une rigueur scientifique même si son succès ne dépend pas entièrement des instruments offerts par la science. Elle dépend des bonnes idées, de la créativité, de l'enthousiasme, donc des qualités difficiles à quantifier. Une forte implication dans l'élaboration d'une stratégie intensifie le flux vital des idées et la motivation des individus pour le travail.

Le vingt et unième siècle impose de profondes transformations dans la pensée des entreprises, les artisans principaux des P.M.E. La flexibilité des entreprises, l'interactivité, l'entretien des relations plus humaines avec les partenaires, relations basées sur une collaboration continue entre les stakeholder de la firme en vue d'obtenir et de valoriser les connaissances pour un développement futur, représentent les priorités des entrepreneurs modernes.

Le développement des compétences des ressources humaines – une nécessité objective pour les P.M.E.

La ressource humaine est le capital principal d'une entreprise. Les ressources humaines représentent un des investissements les plus importants d'une firme, investissements dont les résultats deviennent de plus en plus évidents dans le temps. L'investissement dans la ressource humaine est le meilleur moyen d'assurer la compétitivité et l'avenir de celle-ci. Pour chaque entreprise, se battre pour le développement des compétences de chaque salariés semble être devenu une nécessité absolue ; l'entreprise doit être compétente pour devenir ou pour rester compétitive [4]

Les compétences de l'entreprise [5] représentent des combinaisons pertinentes des connaissances et des capacités édifiées le long du temps, combinaisons que l'entreprise détient par les salariés qui la constituent.

L'entrepreneur doit absolument assurer l'acquisition, la stimulation et le développement des compétences de chaque individu, en vue de l'optimisation de la performance des ressources humaines, la performance étant définie comme une fonction de la forme suivante [6]:

Performance = f(compétences x motivation)

Le développement des compétences est un processus qui met en évidence les 3 dimensions de la compétence : le savoir, le savoir-faire et le savoir-être.

Les entrepreneurs ont à leur disposition 3 instruments [7] qui leur permettent le développement des compétences au niveau de ces 3 dimensions : l'élaboration des projets, des stratégies cohérentes d'action, l'organisation de l'entreprise et la motivation des ressources humaines (voir figure 1) .

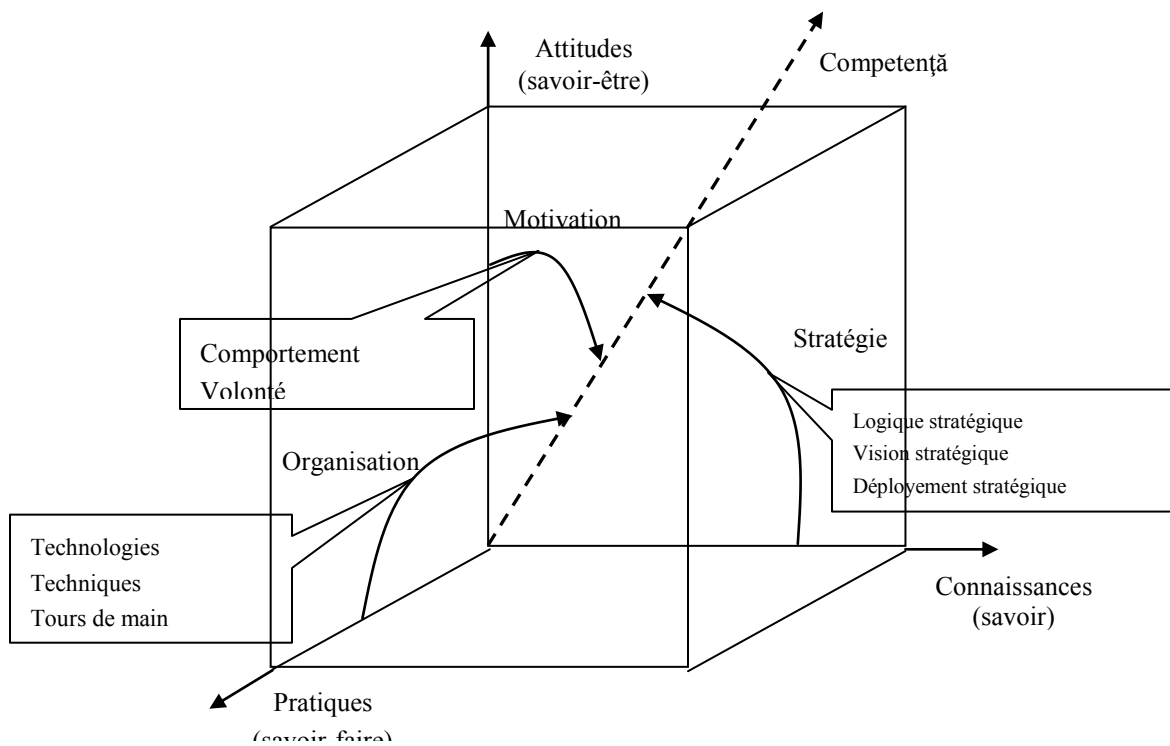

Figure 1 – Les trois leviers d'action du management (adaptation apres Durand [7]).

La planification, le processus par lequel on élabore la stratégie de la firme, établit les objectifs de l'organisation et indique la voie par laquelle on peut atteindre ces objectifs.

Steiner [8] présentait la planification comme un processus où les managers doivent décider « ce qu'il faut faire, quand il faut le faire, comment il faut le faire et qui devrait le faire ». La planification se relève en tant qu'instrument de navigation sur une carte qui indique la destination vers un objectif placé dans le futur.

C'est seulement par la détermination des objectifs concrets, en estimant correctement les ressources nécessaires et les résultats obtenus en chaque étape, que l'entreprise a la possibilité d'obtenir l'avantage compétitif, possédant ainsi un instrument important dans la lutte concurrentielle.

Daft considère que la stratégie a 4 composantes [9]:

- le but – se rapporte aux produits et aux services par lesquels l'organisation entre en corrélation avec le milieu.
- les ressources – se réfèrent au niveau des ressources et à la distribution de celles-ci en vue de la réalisation des objectifs stratégiques.
- les compétences distinctives témoignent de la position qu'une entreprise établit par rapport à ses concurrents (concurrents).
- la synergie définit les conditions qui se font voir lorsque les composantes d'une firme interagissent produisant un effet plus grand que celui qui était obtenu par l'action séparée des parties.

Les objectifs proposés dans la stratégie sont réalisés dans le cadre d'une structure bien définie, là, où la ressource humaine apprend ou développe des pratiques, des habiletés (savoir-faire), en utilisant des techniques et des technologies spécifiques. Tout cela fait l'objet de l'organisation. L'organisation est un centre de coordination collective, un espace où il y a une certaine division du travail, là où les activités sont accomplies et les rôles sont attribués.

Morgan décrit l'organisation par l'intermédiaire de certaines images et métaphores qui dévoilent une nouvelle facette de ce concept complexe, de l'organisation comme [10]:

- un mécanisme technique et administratif ayant des effets sur l'augmentation du rendement, du contrôle et de l'amélioration de la direction dans les entreprises industrielles.
- un organisme vivant : l'organisation est un système ouvert à l'environnement, système se trouvant en continuelle adaptation à cet environnement.
- un cerveau : elle met l'accent sur l'importance de la manière dans laquelle on traite l'information et la décision dans le cadre de la firme.
- une culture : elle souligne l'importance des normes, des règles et des valeurs, des mythes et des rituels dans un système.
- un système politique : l'organisation est un cadre de manifestation du pouvoir organisationnel, de l'influence, de la coalition.
- un espace psychique : c'est l'endroit où le psychisme humain s'exprime, d'une manière consciente ou non, c'est un lieu du plaisir et de la souffrance, un générateur (facteur) de stress et de motivation pour le travail.

Les gens essaient de réaliser certains objectifs ou buts, lesquels, une fois atteints, satisferont, à leur tour, les besoins de ceux-ci.

Tous les membres d'une organisation participent à la réalisation des objectifs de celle-ci, mais la participation se réalise à des intensités différentes d'un individu à un autre. Par le fait de motiver convenablement les ressources humaines, leur comportement facilitera une haute productivité, des performances accrues, une augmentation de l'attachement des individus envers la firme à laquelle ils déroulent leur activité.

Pour avoir du succès dans l'activité qu'ils déploient, les managers doivent connaître les facteurs qui se trouvent à la base du comportement des individus de l'organisation. Un manager, autant il comprend mieux le comportement des subordonnés, autant il sera capable d'influencer ce comportement dans la direction de l'accomplissement avec succès des objectifs proposés par la stratégie de la firme.

Etant donné que la productivité est le résultat du comportement de tous les membres de l'organisation, la motivation de ceux-ci est l'élément essentiel pour l'accomplissement des objectifs de l'organisation.

Dans les entreprises modernes, les managers doivent faire preuve de flexibilité pour l'amélioration de la motivation. Ils doivent accepter le fait que les individus ont des besoins différents, essayant de satisfaire leurs besoins personnels pour la réalisation des tâches de service.

Il est nécessaire que les managers développent diverses formes de motivation pour répondre aux besoins des salariés et pour leur assurer des possibilités de formation et évaluation professionnelle pour les salariés de l'organisation.

Le haut degré d'autonomie des salariés représente un instrument motivationnel très important. Les processus décisionnels participatifs et la délégation permettent aux salariés d'exploiter leur créativité, leur imagination, leurs connaissances et compétences pour des objectifs de haute efficacité.

Cette flexibilité, on pourrait la traduire par une augmentation significative de la productivité, par l'amélioration de la qualité des produits et des services et également, de la satisfaction des clients, éléments qui s'appuient sur une motivation adéquate de l'individu.

Tous ces instruments : la stratégies, l'organisation et la motivation qui permettent le développement de la compétence sur ses trois axes (savoir, savoir-faire et savoir-être) sont interdépendants, se conditionnent de manière réciproque, l'efficacité du système étant conditionnée par l'interaction entre eux et par le fait de se compléter mutuellement.

Conclusions

Toute économie nationale saine s'appuie sur un segment fort des P.M.E. qui viennent sur le marché avec une offre de produits et services à la rencontre de la demande de plus en plus diversifiée et exigeante à présent. Les P.M.E. représenteront pour le proche avenir le vecteur principal du progrès économique, les caractéristiques spécifiques de ces firmes les situant au premier plan du développement économique.

Les P.M.E. constituent une importante source d'emplois, contribuant à l'équilibre entre l'offre et la demande sur le marché du travail. Les P.M.E ont un rôle tout particulier dans l'implémentation des politiques économiques régionales et locales, en assurant un développement équilibré et harmonieux d'un pays [11].

Le nombre réduit de niveaux hiérarchiques contribue à favoriser le climat harmonieux dans les P.M.E, lequel offre un cadre favorable pour y appliquer le management scientifique et pour envisager des méthodes et procédés propres et bénéfiques à l'activité managériale.

L'état roumain, par les leviers à sa disposition, doit créer un cadre adéquat de la réglementation, fiscal et administratif qui puisse stimuler l'activité entrepreneuriale, l'amélioration du statut d'entrepreneur, l'accès plus facile des P.M.E. aux technologies modernes, à la recherche, au financement, pour que ces entreprises de petites dimensions aient la possibilité de se développer et de pénétrer sur de nouveaux marchés avec leurs produits et services compétitifs sur le plan interne et international.

Our research focuses on the challenging subject of package management, including here the main possibilities of capitalising on, recovering and recycling package waste. A current trend ascertained by experts is connected to the increase of the volume of waste correlated with economic growth. The package industry experiences an increase in the competitive environment. There is a real need of all organizations for increased package management.. Undertakings must conduct a process of change to move to a future culture based on continuous improvement and, to really understand what their customers are worth. Through the functions fulfilled and the way it was made, the package satisfies the highest demands of the consumers, goods producers and transporters but equally becomes an active pollution source for large urban centres and the environment.

Keywords : package management ; environmental challenge ; efficient packaging waste management system ; cost competitive solutions ; consumer safety ; consumer behaviour ; continuous improvement.

Package management and the progress towards a sustainable development; European approach of considering the position of the package in the post-consuming stage

The package has become an active pollution source. There is a real increase of the volume of waste correlated with economic growth. Through the functions fulfilled and the way it was made, the package satisfies the highest demands of the consumers, goods producers and transporters but equally becomes for large urban centres and the environment an active pollution source. This permanently feeds the formation of true mountains of residue which attack the lives of the consumers both directly as well as through the decomposing substances.

Regardless to their origin, the continuously growing quantities of waste are hard to manage, especially in the great urban agglomerations having a negative impact over the environment. In this context, the European countries have resorted to the promotion of a rigorous ambient policy, which treats the environment as being a composing part of the companies' strategy. This strategy named by specialists as *proactive* combines the three aspects specific to the lasting development: economical, which proposes an efficient management of resources; social, by warning the people, the community about the direction which must be followed; ambient, because of the fact that the environment in which the company is operating is taken into consideration.

The package is a product whose role ends in the moment when the product of content has started to be used. The crossing from the stage of a product to a stage of waste is fast and imposes taking important decisions regarding the environment. For the adequate choosing of a package it is also necessary to analyse its position in the post- consuming stage, specifically the possibility that the waste products can be valued or eliminated without endangering human health and without using procedures or methods which could affect the environment, it would present risks for the pollution of the air, water, flora, or fauna, it would cause phonic pollution or an unpleasant smell.

European Union and the fundamental stages in the building of a package waste management system

At a regional level waste managing is based on strict principles, which have followed the assuring of a good functioning of the Single European Market. Thus, regarding the Direction proposed in 1992 by the European Commission and voted for in 1994, regarding packages and waste packages, it must be mentioned that specialists considered that certain specific criteria are imposed which must be met by the national economic instruments in order to avoid the limiting of commerce and the distortion of the competition, criteria regarding efficiency, the scientific base and the cost benefit ratio, ensuring at the same time the compatibility of the economic instruments with the “Single Market.”

The foundation of the Directive regarding packaging and package waste, approved in 1994, was article 100A of the Treaty from Rome. The main objective of this directive was thus the harmonisation of the national regulations to avoid the distortion of competition. The first priority is the prevention of the production of package waste, setting three main objectives in this sense: reduction at the source; elimination of toxic substances that can enter into the production of packaging and, especially, of heavy metals; the capitalisation on packaging throughout the recycling of materials, the incineration with energy recovery, obliteration and profitability. The present direction concerns all waste packages, whether they come from industry, commerce, offices, workshops, services or households, regardless of the material they are made of, whether they are packages to sell, to transport or for extra packaging. The member states of the European Union must include the objectives of the direction in the Plans for waste management which they must establish, according to article 7 of the 75/442/CEE direction, dating July 1975, whose 1992 change enabled the creation of the national “ECO-EMBALLAGES”.

The legislations of some communitarian countries have indirectly imposed economical instruments, soliciting the companies to recover and recycle the waste packages and regarding the establishment of private waste packages management systems. Thus, the legislation of Germany, as well as France’s, includes laws which impose the recovering and the recycling of waste packages and, in certain conditions, allow private waste management organisations to collect, sort the waste and to ship them for recycling. As a result of these laws, the two underlined systems, respectively “Duales System Deutschland” (D.S.D.) and “Eco-Emballages” (E.E.) have been founded for the managing of waste packages.

Individual companies are obliged to join these organisations. In change for paying the licence, the companies can sign on their own packages, the sign of these organisations (“The green dot”). The package marked with the green dot is handled by the D.S.D and, respectively, E.E. and here the licensed companies end their legal obligations. In these conditions, the fees received by the private companies for waste management should undergo the same criteria – applied to economical instruments by a member state.

However, the European Directive dating December 1994 concerning packages and waste packages stipulates that the sign, applied on the package or on its label, must allow the consumers to distinguish the reusable packages or the ones that can be refilled, from the recyclable packages. Thus, the nature or the used packaging materials must be indicated in order to facilitate their return, re-utilisation or capitalisation.

In the European Environmental Policy, waste management is included in a global approach, respecting security, health and the environment, being contained in an integral system of operation management. This policy is based on the application of the methods, which should allow the reducing of the quantity of produced waste. Among waste management methods, the reduction of the source is found, for this purpose, procedures or specific operation conditions are adopted. Most of the times information regarding waste engendering and their distribution cannot be compared because national settlements and waste classifying systems differ from one country to another. The European Union, through its settlements, has created a common context for the approach to this problem.

In order to limit the spreading of irrecoverable packages it has been proposed that these should be taxed, the resulting funds following to be used to buy and exploit collecting and treatment measures of waste produced by lost packages. Efforts have been focused on three objectives: assuring waste transportation till the final eliminating point (stimulating a minimum of “attacks” against the environment); avoiding or reducing waste production; development of waste recovery, re-using and recycling. In order to achieve these objectives it was necessary that evacuation standards and rigorous applicable prescriptions should be adopted by those who incinerate waste.

The stage of implementing European Directive 94/62/CE amended through Directive 2004/12/CE; legal framework of packaging waste management in our country

In Romania, the qualified authority which has attributes and responsibilities in waste management is the Environment Ministry. The latter compiled the *National Waste Management Strategy*, aiming at the implementation of an integrated system for the management of all types of waste, efficient from an ecological and economical viewpoint. The National Commission for Material Recycling aims, through its program *completing the legal framework characteristic for this field, the increase of the weight of reusable materials* used in the paper, plastics or rubber industries, etc.

The activity of managing packaging and packaging waste is based on the principles provided in Emergency Government Ordinance no. 78/2000 regarding the regime of waste, completed with Law no. 426/2001. In 2002, the Romanian Government issued *G.D. no. 349, on April 11, 2002, regarding the management of packaging and packaging waste which regulates management in view of preventing or reducing the impact on the environment.*

The principles specific to the activity of packaging waste management, included in G.D. no. 349/2002 regarding packages, are: the prevention of the production of packaging waste; reusing packaging; recycling of packaging waste; other forms of capitalisation of packaging waste which leads to the reduction in the quantities eliminated through final depositing. Economic agents, producers of packaging and/or packaged products, which use a marking and identifying system for the packaging in order to improve the activities of recovery and recycling of packaging waste, are obligated to apply the marking and identifying systems provided by the legislation which is applied right on the packaging or on the label, which must be readable and durable even if the packaging is opened.

The implementation of the provisions of the European Directive involves substantial investments for the building of processing installations for packaging waste as well as for the development of the market of secondary raw materials originating from recycled waste. The largest part of capitalised industrial waste (approximately 55%), is recycled within generating units (reuse, recovery) representing a minimisation action. Only 5% of the waste was capitalised through sale to companies which use them as secondary raw materials in the production process. Over 6% of the waste was capitalised through its sale to the population. Due to the fact that in Romania there is no separate collection of household waste, it can be stated that approximately 36% of the elements, representing recyclable materials (paper, cardboard, plastic, glass, metals), are not recovered, but eliminated through depositing. Thus, large quantities of secondary raw materials and energy sources are lost. The current legislation provides that until 2010, a recovery index of 50% will be achieved of the total quantity and a material reusability index of 25%, with a minimum recovery proportion of 15% for each type of material. In Romania, in this context, the Public Sanitation Service has an important role. Establishing the framework for the organisation, management, regulation and monitoring of the public sanitation service in towns is done with the observance of the provisions within the national strategy regarding solid waste, as well as those found in the directives of European Union. The specific issues taken into consideration are: the introduction of specific regulations, including measures of implementation and control and their observance; the diversification of economic instruments; the improvement of the statistics of waste; the compilation of the sector and regional plans for waste management; ensuring ecological transport conditions, as well as the monitoring of the transport of waste from the production point to final elimination.

Organisations with concerns in the area of packaging waste management in Romania

Romania must implement a credible, transparent and efficient packaging waste management system. The existence of such a packaging waste management system is a condition for integration to the European Union. The Eco-Rom Ambalaje SA organisation, a non-profit organisation, operates according to Romanian and European legislation and aims at managing all its resources in order to fulfil the objectives connected to implementing in Romania European Directive no. 94/62/EC regarding packaging and packaging waste. Eco-Rom Ambalaje SA promotes efficient solutions of packaging waste management. This packaging waste recovery organisation was founded at the end of 2003 and is similar to that of European Union member states: Eco – Emballages in France, FOST Plus in Belgium, ARA – Austria,

Duales System Deutschland in Germany. Eco-Rom Ambalaje SA, as the named organisation, is not profit oriented, but oriented to the promotion of an efficient and sustainable solution for the process of packaging management.

Eco-Rom Ambalaje SA officially represents in Romania the European “Green Dot” packaging management system, Romania thus joining the 26 states from Europe and America where this system operates. The license was granted to the organisation Eco-Rom Ambalaje SA, for Romania, by the European Organisation PRO Europe, which owns the rights to the “Green Dot” brand. Through the “Green Dot” system, economic agents who have the obligation to capitalise and recycle packaging waste can transfer, through a contract, the responsibility of capitalisation and recycling of packaging waste to the organisation Eco-Rom Ambalaje SA, which in turn signs partnerships with local authorities, with sanitation and transport companies and with companies specialised in recycling. Economic agents who adhere to the “Green Dot” system will be able to apply the “Green Dot” symbol on the packaging of their product. Thus, the buyer will know that the producing or importing company of the respective products is a socially responsible company because it has committed to having the packaging from its products, collected from the population in separate containers, recycled or capitalised.

Venture Capital Strategies for Innovative SME's

Gabriela Prelipcean

Mircea Boscoianu

University "Stefan cel Mare" Suceava, Facultatea de Stiinte Economice si Administratie Publica, 13 Universitatii Street, 720229 - Suceava

We analyze the venture capital strategies for optimizing the financing of SME's, considering that this aspect might contribute to the innovation process. We analyze the special role of VC finance in influencing innovation strategies. VC can push towards building absorptive capacity and towards more permanent in-house R&D efforts. Public funding relaxes financial constraints, but does not lead to a build-up of absorptive capacity. Our focus is on the special role of VCF's venture capital in shaping companies' innovation strategies and the company's ability to attract VC investors. There is also a strong contribution on the role of VC in the commercialization stage of innovations.

Keywords: venture capital (VC), VC funds (VCF), innovative SME, foreign direct investment (FDI)

1. Introduction in VC financing strategies

The problem of investment options according to the financing possibilities is critical in the case of SMEs which operate in emerging economies. The limited access to finance of SME's in developing countries influence the investment options and the overall strategies. The timing of investments is very important for small companies, with a chronic lack of access to finance and because of the moral hazard implications. The capital markets overlook small business opportunities because of high information and transaction costs (capital gap problem, Smith - 2002) and this problem is even more critical in emerging markets.

Venture capital (VC) is a specialized form of financial intermediation whose success in supporting innovative companies through the provision of finance and monitoring and advice services has generated much research. VC- sophisticated investors, whose partners have *extensive knowledge* of the industry and often previous *managerial experience*, strong commitment to *generate high returns* in the medium term makes them active investors (Bottazzi, Da Rin, and Hellmann- 2007).

Venture capital (VC) could provide a strong support to innovative companies. VC entrepreneurship and innovation are closely connected. Entrepreneurs, have innovative ideas that require substantial capital, but lacked the funds to finance (Gompers, Lerner 2002). VC evolved as a response to this critical need. VC represents a robust solution to finance the high risk, potentially high-reward projects (Gompers and Lerner 2002). VC can only exist when there is a constant flow of opportunities. Venture capital pushes towards *building absorptive capacity* and towards *more permanent in-house R&D efforts*. Beyond the financing role, there exist also a strong support provided by the venture funds to innovative firms which consist of *providing market linkages* and *sharpening the business plan*.

Emerging countries spend large amounts of public money on promoting VC (Da Rin, Nicodano, and Sembenelli (2006), Di Giacomo (2004)). Helping the creation of national VC- increase the amount of innovative R&D and contributes to economic growth through the creation of knowledge spillovers (Keuschnigg, Nielsen -2003).

2. R&D firms- a key driver of economic growth

There is a focus on understanding whether the increasingly high-powered incentives of central corporate research leaders are related to the innovation process

The concept of the *centralized laboratory* (campus-like facilities employed many thousands of researchers, many of whom were free to pursue fundamental science with little direct commercial applicability) was refreshed in the early of 1990s when corporations began fundamentally rethinking the role of these centralized research facilities. There was a different perception regarding the disappointing commercial returns and intensified competitive pressures. R&D firms undertook a variety of changes to these facilities: paring the size of central research facilities in favor of divisional laboratories and more tightly linking the compensation of central research personnel to the economic objectives of the corporation. There are *long-run implications of these changes*: the decline of centralized research facilities to "risk minimization" on the part

of corporations and an inappropriate emphasis on "the needs of today's customers" instead of longer-run objectives.

Kortum, Lerner (2000) demonstrates that *venture-backed firms* are approximately three times as efficient in generating innovations as *corporate research*. Holmstrom, Milgrom (1997) proposed "multi-tasking" concept. When an agent has multiple tasks to perform, only some of which can be measured with precision, it may make sense to offer compensation schemes with flat or very limited sensitivity to performance. Otherwise, the agent may neglect the activities that cannot be precisely measured. The effect of different types of performance pay -compensation in the form of option holdings was considered together with the riskier behavior induced by *increased volatility/ option value* (Smith, Stulz -1985, Hirshleifer, Suh - 1992).

Scientists and engineers in research facilities are likely to have a portfolio of projects that they can work on, with varying degree of observability. As the incentives offered by the corporation increase, researchers may be led to spurn riskier but important long-run projects in favor of straightforward efforts (Holmstrom, 1989). As a result, it may make sense to offer weaker incentives in these settings (Lazear, 1989).

Another branch of the literature examined the *relationship between innovation and the shifting compensation of the managers responsible for corporate R&D*. The sensitivity of compensation to performance is positively related to performance, but declines with the volatility of performance (Aggarwal, Samwick-1999). The negative risk-incentive relationship holds in firms with a centralized R&D organization and R&D-intensive firms, with higher effects on firm value. Stronger incentives are associated with more innovations; we cannot distinguish between whether *the effect of performance pay* is due to *better project selection or better people selection*.

In the accounting literature, R&D choices related to the incentives of top management: Dechow, Sloan (1991)- examined R&D expenditures of firms with chief executive officers (CEOs) in their final years of office spend less on R&D during the CEOs' final years. Eng, Shackell (2001) demonstrated no evidence that the adoption of long-term performance plans for senior management has implications for R&D spending.

Related to the organizational structure of R&D to innovation, Cockburn, Henderson, and Stern (1999) examined *the intensity of research workers' incentives for the distinct tasks of basic and applied research*. Argyres and Silverman (2004) demonstrated that in particular, firms with centralized R&D organizations generate innovations that are more cited, than do firms with decentralized R&D organizations.

3. The development of VC strategies in emerging economies

In *the initial phase*, there is a focus on the acceptance of VC. The VC funding firms should meet the following criteria: technology involved should be new, promoters/ entrepreneurs using the technology should be relatively new, professionally qualified, with inadequate resources to finance the project, the minimum size of VC, prohibited investment by VC funds in the equity shares of any institution providing financial services to promote early stage financing.

In *the growth phase of VC*, is essentially to attract high quality foreign investors. The focus is on institutional investors, but this category prefers portfolio investments. Foreign direct investing (FDI) in R&D has enormous spill-over effects. The main critical success factors for the growth of VC are: the regulatory, tax and legal environment –structural flexibility, fiscal neutrality and operational adaptability; resource raising, investment, management and exit should be simple and flexible and driven by global trends; VC- should become an institutionalized industry that protects investors, operate in an environment suitable for raising the large amounts of risk capital needed and for spurring innovation through start-up firms in a wide range of high growth areas; VC funds as well as venture finance enterprises are able to have global exposure and investment opportunities; R&D infrastructure in the form of incubators- promoted by governmental support and private management- for faster conversion of R&D and technological innovation into commercial products. Nearly all VCs are hesitant to invest in startups with inexperienced business personal or in firms with unclear scalable business model, especially in emerging economies.

The main recommendations in the stimulation of the VC industry are:

- to eliminate multiplicity of regulations relating to VC;
- VC funds tax pass paradigm (VCFs- treated as pass through vehicles);

- the pool of domestic VC needs to be augmented by increasing the list of sophisticated institutional investors permitted to invest in venture capital funds (funds available for VC is limited and is predominantly contributed by foreign funds);
- flexibility in investment and exit, as a condition of liquidity;
- economic situation and innovation have a strong correlation;
- the gap between better off states and poor states are increasing;
- innovation funds- clustered, distribution of R&D centers of global firms and innovative small firms are clustered;
- to stimulate FDI in R&D because of their enormous spill-over effects;
- locational decisions are mostly based on cluster advantages and specialization;
- the relationship between VC and clustering is intensifying and local linkages are becoming important.

The earlier policies of deliberate dispersal are likely to be ineffective. Local factors and specialization is becoming important for innovation.

Till recently, VCFs did not provide any of the following types of assistance to industrial enterprises namely: expansion capital, buy-out finance in the form of management buy out or leverage buy-out, acquisition finance and sick company rehabilitation finance.

A specialized investment fund for VC's (SIF-VC is in fact a fund of VCF's) could be an innovative but also efficient solution for supporting innovations and high opportunity projects by providing equity or loan. SIF-VC represents an revolving fund that invests in equity capital or gives soft loan. The success rate should be more than 80% as the selection is based on both commercial and technical feasibility.

There are different views of VC's role in shaping portfolio companies' innovation strategy: a) good timing of investment processes, including VC exit (Gompers -2007, Michelacci, Suarez- 2004); b) the 'company builders' role and the double moral hazard model of venture capital (Holmstrom, Tirole, 1997); c) the concept of absorptive capacity which exploit new knowledge (Cohen, Levinthal- 1989, Kamien, Zang-2002). R&D activities have two different effects: a) to directly generate new innovations; b) to provide the ability to identify, evaluate, and absorb internally different forms of know-how which has been generated outside the firm. B investing in the build-up of absorptive capacity through in-house R&D, companies may therefore increase their ability to generate future innovations by remaining actively tuned on what others are doing and ready to exploit the opportunities that scientific and technological advances create. From a management perspective, absorptive capacity is the ability to combine external sources of knowledge for the production of innovative products. The combination of internal and external sources of knowledge is an important factor in explaining many successful innovations (Cockburn, Henderson-1998, Freeman -1991, Mowery, Oxley, Silverman-1996). Internal know-how is important both for screening external know-how and for incorporating it into innovations. The ability to incorporate external know-how further increases the level of internal R&D. Neary (2007) proposed a new model of the innovation process with an evaluation of the effectiveness of alternative public policies. The absorptive capacity makes subsidies to R&D more efficient than those to research joint ventures.

4. Conclusions

There were presented new insights into the positive contribution of VC to building successful companies. Relevant for management, as venture investors will affect SME's strategy at an even earlier stage than at the product commercialization phase. Relevant for a more complete evaluation of public policy towards innovating firms, may be socially more efficient than providing purely monetary support for these SME's.

The VC industry has started with the creation of innovative firms. Venture capital (VC) strategies will reduce the capital gap for entrepreneurial firms. The main observations are the following:

1. VC-is becoming a major mechanism for stimulating innovation and entrepreneurial growth. There is a need to enhance availability of VC in developing countries/ emerging sectors and systematic initiatives for simulating entrepreneurship through use of venture funds. The distortions in the capital market due to over regulations and multiple controls are also a problem that is hindering the growth of VCs.

2. In emerging economies there is a strong expertise needed for managing new ventures and managing VCF's. Most of the off-shore VCF's have a strong experiential base and provide support and business contacts. VC's brings the balance between business and technology so that innovation becomes a commercial success.
3. Most of the new ventures have benefited from venture capital, especially those supported by the off-shore funds. Aspects of support provided by VCF that adds value are: monitoring the business plans, support for getting business contacts from other countries and bringing an external perspective in the business plan.
4. VC growth and industrial clustering have a strong positive correlation. FDI, starting of R&D centers, availability of VC and growth of entrepreneurial firms are getting concentrated in clusters. The cost of monitoring and the cost of skill acquisition are lower in clusters, especially for innovation. Entry costs are also lower in clusters. Creating entrepreneurship and stimulating innovation in clusters have to become a major concern of public policy makers. This is essential because only when the cultural context is conducive for risk management venture capital will take-off. Clusters support innovation and facilitate risk bearing. VCs prefer clusters because the information costs are lower. Policies for promoting dispersion of industries are becoming redundant after the economic liberalization.
5. An analysis of venture assisted firms clearly shows that the factors contributing to the success of innovative firms are essentially: strong experiential base, vision and urge to achieve something and a realistic business plan.
6. Bank operated venture capital funds are relatively risk averse and they have a weak experiential base. Local funds are focusing on software services and retail business but not innovative products. The real growth of venture capital in emerging markets is conditioned by the entry of off-shore venture funds.
7. The presence of academic research institutions is a prerequisite for the success of venture firms.
8. One of the untraded externalities that stimulate venture growth is idea that moves faster and evolves quickly in clusters.
9. In developing countries venture funds are not fully evolved and, it may be necessary to start public venture funds. Public venture funds can act as seeds of entrepreneurship. Special attention may be essential for this so that commercial and technical perspectives are integrated. In developing countries public policy should support and evolve institutional systems for stimulating public venture funds. The government supported quasi-venture fund- effective in stimulating innovations. Good corporate governance of venture funds is one of the critical success factors that have helped to select and support innovations.

Developing countries have to harmonize the capital market requirements and venture capital needs so that they can stimulate entrepreneurial firms that focus on high-tech innovations. Though most of venture funds state that high technology is their priority only firms started by experienced persons find support by VCFs. Capability for assessing venture projects continues to be a weak area in the case of developing countries.

The project harmonizes with the general objective of Program 4 „Partnerships in priority fields” – and might contribute to the enhancement of the CD competitiveness, through the stimulation of partnerships in priority fields, and is applicable for the initial and the continuous formation of human resources, from the point of view of quality and the creative potential, and the formation of the Simulation Laboratory of a Virtual Organization, as means of implementing the project.

It also applies to the specific objectives in the field of „Socio-economic and humanistic” research, since it identifies and provides solutions for one of the main drawbacks of the Romanian society: „THE ABSENCE OF EFFICIENCY IN THE FORMATION OF HUMAN RESOURCES, FROM THE PERSPECTIVE OF EDUCATION AND THE CREATIVE POTENTIAL”, directly connected to education and the initial and continuous formation of resources. The project also connects with the aim of Program 4 - „Partnerships in priority fields” – since it creates the conditions for an efficient collaboration between partners and participants to the project of CDI development, having in view to find a solution to the problem: „THE ABSENCE OF EFFICIENCY IN THE FORMATION OF HUMAN RESOURCES, FROM THE PERSPECTIVE OF EDUCATION AND THE CREATIVE POTENTIAL”.

Key words: REFORM; PARTNERSHIPS; QUALITY; HUMAN RESOURCES; RESEARCH

Chapter 1: Starting the Project

Project: THE INITIAL AND THE CONTINUOUS FORMATION OF HUMAN RESOURCES THROUGH THE ANALYSIS AND THE DEVELOPMENT OF VIRTUAL ORGANIZATIONS can be attached to Program 4 – Partnerships in priority fields – part of the National Plan for Research, Development and Innovation II.

The Problem we have identified is: “THE INEFFICIENCY OF HUMAN RESOURCES FORMATION, FROM THE PERSPECTIVE OF EDUCATION AND THE CREATIVE POTENTIAL” being **caused** by the following:

1. The absence of laboratories for the research and the simulation of virtual organizations;
2. The absence of coherent programs, aimed at the initial and the continuous formation of human resources;
3. The professorial staff is insufficiently trained in order to be able to make an actual presentation of the economic activities of organizations;
4. The difficulty of the large scale dissemination of different studies and research materials, concerning the activity of organizations, by communicating or publishing them both in Romania and abroad;
5. The absence of participation, on the part of the professorial staff and the undergraduate, Master of Science or doctoral students to the conferences and meetings having a technical and scientific

- character, in the fields related to the initial and the continuous formation of human resources (round tables, workshops, national or international symposia, national/international fairs);
6. The impossibility to connect to the national and the international research networks, which concern the initial and the continuous formation of human resources;
 7. The absence of programs for the professorial staff, the undergraduate, Master of Science or doctoral students, concerning the periods of service, probation or practice, and **their effects**;
 8. The professorial staff, the undergraduate, Master of Science or doctoral students have no direct connection to the practical reality and do not manage to fully integrate the humans resources into the economic field of activity;
 9. Human resources are formed neither on the initial stages, nor continuously, from the perspective of a type of education based on research and the stimulation of the creative potential;
 10. The professorial staff, the undergraduate, Master of Science or doctoral students have little information about the new discoveries achieved by means of research, presented at the manifestations with a technical and scientific character, in fields that are related to the initial and the continuous formation of human resources (round tables, workshops, national/international symposia, national/international fairs);
 11. The human resources do not benefit from the method of the initial and the continuous formation, by means of the large scale dissemination of materials that present the outcomes of studies, research activities, developments and innovation conducted at both the national and the international level;
 12. The human resources, with regards to the initial formation, and even less to the continuous one, do not benefit from a practical initiation concerning the economic activities of different organizations.
 13. The initial and the continuous formation of human resources, in the absence of coherent programs, is inefficient;
 14. The initial and the continuous formation of human resources can be achieved provided that there exist some laboratories for the analysis and the simulation of virtual organizations.

The aim of the project is: THE INITIAL AND THE CONTINUOUS FORMATION OF HUMAN RESOURCES, THROUGH THE ANALYSIS AND THE DEVELOPMENT OF VIRTUAL ORGANIZATIONS (FICRUCDOV), having the following objectives:

1. The development of laboratories for the analysis and the simulation of virtual organizations;
2. The elaboration of coherent programs for the initial and the continuous formation of human resources;
3. The organization of courses and training sessions for the professorial staff, in order to enable them to practically present the economic activities of organizations;
4. Organizing the interception of the dissemination - and at the same time the large-scale dissemination of our own outcomes, through the publication of studies and pieces of research concerning the activity of organizations, in national papers and abroad;
5. Ensuring the participation of the professorial staff, the undergraduate, Master of Science or doctoral students to the manifestations with a technical and scientific character, in fields that are related to the initial and the continuous formation of human resources (round tables, workshops, national/international symposia, national/international fairs);
6. Providing connection with the national and the international research networks that concern the initial and the continuous formation of human resources;
7. Elaborating schedules for work/practice sessions for the professorial staff, the undergraduate, Master of Science or doctoral students which **aim** at the following;
8. The professorial staff, the undergraduate, Master of Science or doctoral students will have connections with the practical reality and will manage a full integration of human resources in the economic field of activity;

9. The resources will be formed both on initial stages and continuously, from the perspective of a system of education based on research and the stimulation of the creative potential, through the connection with the national and the international research networks;
10. The professorial staff, the undergraduate, Master of Science or doctoral students will be aware of the new developments, achieved as a result of research activities, that are presented at conferences with a technical and scientific character, in fields that are related to the initial and the continuous formation of human resources (round tables, workshops, national/international symposia, national/international fairs), and the participation to such manifestations;
11. The human resources will benefit from the method of the initial and the continuous formation, by internalizing materials and ideas that are being disseminated, and will learn, at the same time, how to disseminate the different outcomes of their studies, research, development or innovation, making use of communication through the national and the international papers;
12. Human resources in the process of initial and continuous formation will have the possibility to benefit from a concrete, practical formation with regards to the economic activities of the organizations;
13. The enhancement of the efficiency in terms of initial and continuous formation of human resources, starting from a range of coherent programs;
14. The initial and the continuous formation of human resources will be achieved in laboratories aimed at the analysis and the simulation of virtual organizations.

The project can be included in the priority domain of research 9 - The socio/economic and humanistic research 9.2 – The quality of education; The research theme – The initial and the continuous formation of human resources, from the perspective of quality education and the stimulation of the creative potential.

The project was designed in conformity with the Package of information for Program 4 – „Partnerships in priority fields”, The 2008 Competition of the National Center for Management Programs.

tru Programul 4 – „Parteneriate în domenii prioritare, Competiția 2008 al Centrului Național de Management program.

Chapter 2: Describing the project from a scientific and technical point of view, including the degree of novelty involved and the possibility to put into practice the result of research activities

The stage of the S/T achievements in the field, at the European level, concerning the initial and the continuous formation of human resources, resonates with the desiderate of creating a common European space, as concerns the higher education. The achievements are directed towards the re-configuration of an „academy-without-frontiers” tradition, while focusing on the type of education process that is adequate for the knowledge society. Projects concerning the work force with high qualifications in the academic field; the unbounded mobility of the workforce; the existence of a common European framework for qualifications, in which each national framework of qualification can register, with the aim of preparing people for professions that are recognized and accepted everywhere on the job market. The most appreciated project, concerning the structural reform of higher education systems in European countries is that which includes three successive and cumulative cycles: the first stage, or Bachelor, with a length of study of three or four years; the second stage, lasting for one or two years, expressed in credits that are accepted in the entire space of European higher education, albeit a few exceptions; the third stage, regarding the doctoral studies, lasts for three years and is completed with the doctoral thesis. For the time being, the national institutions and systems of higher education do not use different criteria and procedures for the admission in each stage of education.

The stages of S/T achievements in the field, at the national level, concerning the initial and the continuous formation of human resources, as presented in the European Project Report, Trends IV, (ENQA, 2005), are confronted with a series of problems, most of them concerning the efficiency of the first stage, and the difficulties professors and students are confronted with, due to the re-organization and the adaptation of the curriculum at the new structures. The first cycle is being questioned on a large scale, since it is too short to ensure a qualification that is accepted on the job market. The reform interferes, at a certain extent, with the students’ program of study. The professors need to re-organize their courses and way of working, as well

as the system of evaluation, in other words they need to concentrate their efforts on a process of professional formation.

The project contributes to the development of knowledge in the field, having in view the politics of economic and social cohesion, establishing connections between the initial and the continuous formation of human resources, from the perspective of education quality and the creative potential, as well as the demands on the job market.

The novelty and the originality of the project lies in the creation of a background for the initial and the continuous formation of human resources, related to the European criteria and standards for the professional and academic formation. The mechanism for the implementation of the project is conceived as a Laboratory for the Simulation of a Virtual Organization, generated by the high technologies of development.

The complexity of the proposed solutions is directly related to the dimension of ensuring the quality of higher education learning, which might constitute a starting point for the dialogue between European universities, governments and organizations, with the view of creating the EHEA (The European Space for Higher Education Area).

The general and the specific objectives of the project are the following:

- The identification and finding solutions for the main social problems, related to education and the stimulation of the creative potential of human resources, with the view of development at the local, regional and national levels;
- The development of laboratories for the analysis and the simulation of virtual organizations;
- The elaboration of coherent programs for the initial and the continuous development of human resources;
- The organization of courses for the formation and the training of university professorial staff, so that they might practically present the economic activities of organizations;
- Ensuring the participation of the professorial staff, the undergraduate, Master of Science or doctoral students at the conferences with a technical and scientific character, in fields that are related to the initial and the continuous formation of human resources (round tables, workshops, national/international symposia, national/international fairs);
- Ensuring the connection to the networks of national and international research centres that have in view the initial and the continuous formation of human resources;
- Elaborating the programmes for the participation of the professorial staff, the undergraduate, Master of Science or doctoral students at the work/practice stages, that have the following aims:
 - The achievement of the project has in view ethical aspects based on the group of moral principles and procedures applied in the activity of scientific research, technological development and innovation. It is in conformity with the Law no. 206/2004, the Law 64/1991, re-published, and the Law 8/1996. The international regulations in the field, as well as the specific European legislation of the European Community, concerning the CDI activities, will be observed.
 - The activities related to the objectives we have in view will be achieved in VIII stages:
- Stage I. The creation of the laboratory for the simulation of the virtual organization, needed for the initial and the continuous formation of human resources, which represents a necessary mechanism for the implementation of the project:
- Stage II. Elaborating the curriculum for the Bachelor cycle of education, involving the laboratory for the simulation of the virtual organization:
- Stage III. Configuring the curriculum for the Master of Science students, using the laboratory for the simulation of the virtual organization:
- Stage IV. The curricular formation of the doctoral student, using the laboratory for the simulation of a virtual organization:

- Stage V. Presenting the research activity in a doctoral thesis with a double orientation, towards the remarkable results in the field on the one hand, and towards a development of the type: leadership, innovation in complex contexts, making strategic decisions, understanding the learning processes, acting towards the improvement of social norms and the interpersonal relationships, social progress and ethical motivation, on the other hand
- Stage VI. Planning the study programs as means of getting beyond rethorics, in favor of a reality centered on the student, with the help of the laboratory for the simulation of the virtual organization:
- Stage VII. The program of initial and continuous formation of human resources, shifting from magister courses to the interactive teaching process, in the laboratory for the simulation of the virtual organization:
- Stage VIII. The large-scale dissemination, by means of communicating and publishing the results of the project, at both the national, and the international level:
- The estimated S/T results, corresponding to the activities performed during each stage are:
- Stage I: The Laboratory for the Simulation of the Virtual Organization, a mechanism for the implementation of the project (LSVO)
- Stage II: The curriculum for the Bachelor level of study, using LSVO
- Stage III: The curriculum for the master of science level, using LSVO
- Stage IV: The curriculum for the doctoral level, using LSVO
- Stage V: The research project, materialized into the doctoral thesis, using LSVO
- Stage VI: Study programs focusing on students and the usage of LSVO
- Stage VII: The program for the initial and the continuous formation of human resources, using LSVO
- Stage VIII: Reports; Presentations; Publications; Technologies; Patents; Studies

The viability of the project is ensured by the fact that, by means of international projects and as a result of some international initiatives (The European Council, The European Commission), the necessity of establishing common aims, procedures and methodologies at the European level emerged as essential, as far as the quality of academic studies is concerned. The achievement of the common background will bring about the problem of meta-accreditation, which might become a mechanism for ensuring quality, as a result of the development of institutional activities among academic educational institutions in several European countries. At the European level, some common conceptual, reference and guiding frameworks will become functional. At the national level, the authorities bring their contribution by creating the legal context and the necessary authorizations in the field, as well as by providing the financial support.

The risks related to the completion of the project are of minor importance and can be due to the fact that the efficient ways of motivating the main persons involved in the process are still unclear, since the institutional motivation is very important for the evaluation to be an efficient one and taken into consideration afterwards.

The base of this research was a comparative analyse of the international practices in the field, in order to identify the most important tendencies in public services management. Considering the results of this research, there were identified the fundamental principles of an intelligent management model for public management (subsidiarity, public value and deliberative governance). Starting from this point, we proposed a new intelligent management model applicable in romanian public sector, which can be structured into three major components: top management component (executive and deliberative), operational management component (back office) and communication component (front level). As a case study, we focused in particulare on the water supply public service and we developed a methodology for projecting the front-office component starting from the necessity of optimising stakeholder satisfaction.

Key words: public management, intelligent services, intelligent public organizations, top management, back and front office

1. International theories and practices concerning the implementation of management models in public administration

In the theory of management, a definition of management models can be related with the concept of “model” which can be defined, in the vision of Karl Deutsch, as a *representation of a real system in order to reveal the actual characteristics of the analysed situation, the selective operations by which these characteristics can be experienced, and the system of symbols by which this data can be presented*. Applying this definition at the level of public administration system, we can consider that a public management model must integrate functions for organising, explaining, understanding and predicting the behaviors of the public administration system, which can be identified as administrative and political practices. The public administration system must be approached as a depended field, strongly conditioned by the influence and implication of stakeholders. In the evolution of public administration we have identified practices specific to different management models. The most important are the following ones:

1. The “public realm” management model, which is a creation of the nineteenth century and was developed because private markets were either bad at fulfilling social purposes or produced effects that were socially unacceptable.
2. The “orthodox” management model, which has some critical elements like: careers open to talents, consistency and predictability delivered through a rules based framework and limited scope for innovation below the highest levels of management. While successful for a long period, the “orthodox” model failed to adapt successfully to growing affluence. It was argued that public services had fallen behind the differentiation of tastes that was taking place in private markets. Bureaucracy was seen as an impediment to successful service delivery and “one size fits all” solutions were said to be incompatible with rising citizen expectations.
3. The “public choice” management model that offered a ready made philosophical foundation for scepticism about the role of the public sector. It suggested that self-interest motivates public

managers just as much as it motivates entrepreneurs in the private sector. The correct policy response must be to privatise where possible and open services up to competition.

4. The „new public management (NPM)” management model which is characterised by markets, competition, and targets. This type of model was adopted with enthusiasm in New Zealand and United Kingdom. However, this management model was criticised because it is considered to give more attention to outputs rather than outcomes and it doesn't support the traditional values of public service, personal responsibility and professionalism.
5. The “third way (reinventing government)” management model, which is an evolved form of NPM. It still has a focus on markets and competition above all else and gives a very weak account of citizenship – suggesting that users of public services should be defined as customers.
6. The “public value” management model is the most recent approach that correlates the shareholders value in the private sector by implementing corporative governance principles in the public services. The principal advantages of this management model are: improving efficiency, effectiveness or fairness in service delivery, introducing new programmes to respond to meet a new political aspiration or a new challenge facing the organisation, Recasting the mission of the organisation so that its old capabilities can be used more effectively and responsively, reducing the claims that government organisations make on taxpayers and reclaiming these resources for private uses.

Modern **intelligent management models** for public administration, has the quality to capture the notion of deliberative governance – the idea that citizens are more than consumers and ought to be able to influence the design and delivery of services. Public managers have to develop a continuous dialogue with their “authorising environment”, which helps to create pressure for continuous improvement. Furthermore, the involvement of citizens can allow managers to develop targets that relate to outcomes that the public genuinely value. It is also possible to use the management techniques to develop metrics and assess the quality of engagement with citizens.

2. A conceptual approach of an intelligent management model for romanian public administration

The starting point for developing an intelligent model for public management, applicable for romanian public administration system, is a diagnostic analyse of the operating mode for the public services, including modes of reforming, and also the relationship between the public services and the most significant stakeholders in its environment: central and local public administration authorities, citizens, public services operations, NGOs, international boards etc. There is necessary for this analyse to took place at a macro level. but the study must capture also the varieties of micro-level practices. The diagnostic of the romanian public administration system has revelead some major **disfunctions** regarding the managerial practices, that were reflected in a low degree of citizen satisfaction, generated by:

- a) birocracy;
- b) big costs and low productivity;
- c) a great level of politisation of public management;
- d) low transparency;
- e) the lack of qualification of human resources;
- f) unflexible and unstable structural organisation;
- g) deficiencies regarding the organisational culture and leadership;
- h) lack of effiience and efficacy;
- i) inexistence of an integrated information system for local public administration.

The conclusions of the diagnostic were that the public system needs a new type of leaders and a new kind of management practices, which are oriented for delivering quality public services to citizens and economic agents. Practically, the **fundamental objectives** of such a model can be resumed as: increasing the satisfaction level for the public administration stakeholders (citizens, businesses etc.), increasing managerial performances in local public administration by transforming the classical public management

system in an **intelligent** one, based on electronic administration principles. The principal **characteristics** of the proposed intelligent model are the following ones:

- a) The system is developed on a WEB platform with interoperable applications, and the interface with the beneficiaries is principally based on an complex set of e-services and mobile services solutions.
- b) The interface of the system has a great level of interactivity with the users and also flexibility, because his applicability must be both at central and local public administration levels.
- c) The systems is structured on three components: top management component (executive and deliberative), operational management component (back office) and communication component (front level) (Figure no. 1).
- d) A big level a subsidiarity which means that the decisional system of public management must be reprojected in order to increase the participation of citizens at decision processes. This also means promoting the concepts of e-Democracy and e-Participation.
- e) The armonization of public services with the necessities and requests of the different stakeholders (citizens, businesses, public institutions and NGOs).
- f) A big rate of reaction to different internals and externals stimul.
- g) Maximum transparency.
- h) Informations rationality.
- i) Effiience and efficacy regarding the usage of management functions.

Figure no. 1 The levels of an conceptual intelligent model for public managemment

As it is shown in Table no. 1, the three components of the proposed management model corresponds to the three decision levels in public administration. Considering the subsidiarity which is the basic principle of the model, the most important decision level is the third one. Actually, the front office is the one that delivers “public value” to citizens and businesses and has a major influence on the quality of public services. Also, this component is in charge of obtaining feedback from the stakeholders, in refining public preferences and transmitting them to strategical and tactical levels. This is a model of deliberative governance, which creates pressure for countinuous improvement and innovation, based on the market reaction.

Level	Component	Structure	Area of responsibility	Methods	Instruments
1	Top	Executive and deliberative	Strategical and tactical decisions	Management by objectives, previsional management, management by exceptions, change management	Group and individual decision support systems, IT dedicated solutions
2	Operational	Organisational structures from	Operationalisation of tactical decisions;	Project management, management by budgets,	Workflow management, digital

		inside the public institutions	current decisions; integrating, analysing and transmitting decisions	management by costs	signature, ERP, distributed information systems, internal networks (Intranet, LAN etc.)
3	Front office	Components specialized in PR	Communication between public institution and external medium	Case management, electronic information of citizens, research techniques, customer relationship management, workflow management	Information and communication technologies integrated on Internet platforms

Table no. 1 Intelligent model components

3. Case Study: Front-office component optimisation: a stakeholder-oriented management model for romanian water supply public services

The performances of water supply public service are influenced by a large number of organisations from public or private sector, of different importances and sizes. The actions of those “actors”, defined in the context of this paper as “stakeholders”, have a great impact on the key performance indicators related to the water supply market. This impact can be splitted in three categories:

1. *Technical impact:*

- the quality of the service;
- the rehabilitation of the supply network;
- restructuring and reorganisation process;
- the usage of modern technologies for water treatment, its distribution monitoring, and for the losses reduction;
- the setting-up of purifying stations.

2. *Economical impact:*

- the correct determination of the investments efficiency within external financing programs;
- the promotion the economical analysis, according to the European standards;
- a scientific base for the determination of the two-part tariff structure for water supply public services;
- establishing the organisational and functional structure necessary for the external payment of public services taxes and the introduction of the unique bill;
- setting-up possibilities for the implementation of specific management methods and techniques regarding the competition conditions or the natural monopoly;
- introduction of unique indicators of benchmarking in order to monitor the operators activity efficiency.

3. *Social impact:*

- the correlation of the population affordability level for these public services with their economic costs;
- the reorientation of the operators activities in order to satisfy the needs of the consumers/beneficiaries;
- conditions for economical water consumes, environment and limited natural resources protection.

Considering the fact that the public water system is used by most of the inhabitants and private companies, the water supply service must fulfill certain standards and quality criteria. For this reason, when we refer to the stakeholder problem, we must consider that in this category can be included many other organisations, not just water supply operators, which play different roles in planning, controlling, informing the consumers, and taking decisions in the areas covered by operators. Generally, we can

identify *seven stakeholder categories*: operators, consumers, public administration authorities, governmental agencies and authorities, professional associations, research and development organizations and financing institutions. We consider that the principal management technique that can be used in the analyse of the stakeholder sector for water supply services is the **stakeholder matrix**. In order to define the importance and influence of each stakeholder, we can consider the following **criteria**:

- The *capacity* of the stakeholder to influence positively or negatively the performances of the service, that can be quantified by using an international benchmarking system such like the benchmarks developed by IWA (International Water Association) and IBNET (International Benchmarking Network for Water and Sanitation Utilities) or the ones promoted by World Bank. The capacity of the stakeholder is determined by the power to promote and sustain his interests on the market, by controlling important resources or key informations.
- The *influence area* of the stakeholder, which is determined by the number of inhabitants that are affected by his decisions, and by the covered geographical area of the service.
- The *economic power* of the stakeholder, described by the principal techniques and financial indicators of his activity, by the quantity and quality of the controlled resources, and by his capacity to attract financing institutions.
- The *interest* manifested by the stakeholder regarding the achievement of a high efficiency and efficacy level for the management and quality of the service.
- The *social position* of the stakeholder, which is given by his visibility and credibility at local, regional, national or international level.

Considering this criteria, we can promote a classifying system for the stakeholders of water supply public service that groups them in 4 categories (A,B,C,D) and 16 subgroups (Figure no. 1).

		Stakeholder Importance			
		Unknown	Little/ No Importance	Some importance	Significant Importance
Stakeholder Influence	Significant Influence	C		A	
	Some Influence	C		A	
	Little/ No Influence	D		B	
	Unknown	D		B	

Figure no. 2 Water supply service stakeholder matrix

The first area (A) includes the most powerful stakeholders from the water supply market, who have the greatest influence on the service performances. This means that any strategic action (legislative modifications, operators regionalisation, implementation of the binom tariff etc.) must satisfy their interests. In the A category we can identify the following „actors“:

- The most important water supply operators* in the region, that covers a large geographical area and many beneficiaries. Generally, those stakeholders operates in big cities and has operating licences (from class I to III) from the National Regulatory Authority for Municipal Services). Also, they have a much greater financial capability then the other operators in the region.
- Regional Council*, that administrate the public and private domain and is responsible to develop strategies, forecasts and economical development programs. This stakeholder can influence decisively the management of the service at tactical and strategical level, by increasing the cooperation between the local councils of the region, especially the small ones.

- c) *A serie of operatos with moderate influence and importance*, that operates in medium towns with more than 30.000 inhabitants. Their influence is limited to the covered area. Ussually about 15-20% of the region's population is supplied by operators from this category.
- d) *Local Councils*, whith moderate influence which is given by their lack of capability to attract external financial resources. This is why European Union recomends their association in order to obtain finances to sustain regional development projects. Presently, in most of Romania's small towns, local councils are also water supply service providers.
- e) The *Ministry of Administration and Interior*, with moderate influence because of his responsibility to analyse the legal situations of the water supply public services.
- f) *Other ministeries, authorities and governamntal agencies* (ANRSC- National Regulatory Authority for Municipal Services, Ministry of Environment and Water). ANRSC has a direct influence on the service performace by licensing the operators from the market, and the Ministry of Environment and Water is one of the principal organizations that can accelerate the process of infrastructure and service quality development by promoting european financing programs like FEDR (European Fond for Regional Development).
- g) *Representative international financial institutions* (European Bank of Reconstruction and Development, European Investment Bank, World Bank, Council of Europe Development Bank etc.), with medium influence on the market considering the fact they control a large ammount of financial resources, but their influence does not affect directly the quality of the service. In this context, a priority that operators must consider in order to increase the interest of these stakeholders is the use of some specific techniques such as: masterplans, cost reduction programs, post-fesability studies, mathematical models for forecasting evolution of the tariff etc.

The second area (B) includes the stakeholders that are very important for the continuity of the service, but with small influence on the service performance. Although, considering their significative importance, there is a strong need to protect their interests. In this category we can identify the following stakeholders:

- a) *Consumers* (population and companies), which represents the beneficiaries of the service. These stakeholders are affected first of all because of the monopolistic character of the service. Also, their actions are limited because of the lack of visibility and preoccupation of the organisations responsible for promoting the interests of the consumers, such as the Office for Consumer Protection, the Regional Directions of Public Health, some research&development organisations and the representants of civil society.
- b) *National Administration of Romanian Water*, represented by regional departments, who has the quality of unique operator for the surface and subsurface water resources. This stakeholder has a direct influence because of his responsibility to approve the regional water management strategic plan.
- c) *Federations and professional associations* (Romanian Water Association and Romanian Local Authorities Federation). The influence of this stakeholders is insignificant and hard to be quantified, but their importance is high because they can accelerate the transfer of knowhow, disseminate best practices and increase the operators visibility. Those are premises for an intensification of investments in research and development and training of operators personell.
- d) **The third area (C)** includes stakeholders with moderate influence on the market. Also, these stakeholders doesn't have a direct interest to increase the managerial performance and the quality of the service. For this reason, they can be considered a significant source of risk. Zone C includes:
 - e) *A group of medium sized operators* with small importance and influence because they cover a small part of ther market (cities between 10.000 and 30.000 inhabitants).
 - f) *The Prefecture* of the region, that cannot be considered a stakeholder with significant importance, but that strongly influence the performance of the service. This stakeholder monitorise the implementation of projects which are financed by international institutions and verify the legality of the local public authorities decisions in the field of water supply service.
 - g) *National Authority for Consumer Protection*, represented by her regional offices, who monitorise the way operators respects the rights of the water supply service consumers.

- h) Finally, *the fourth area (D)* includes the stakeholders with limited or unknown influence and importance. Even so, their interests must be considered in the regional development strategy. The stakeholders includes *the rest of the water supply operators*, who operates in small sized villages, with less than 10.000 inhabitants. Even their influence and importance is very limited, if they are grouped in associations, they can become a powerful decision unit. Generally, about 30-40% of the region's population are supplied by this type of stakeholders.

By identifying the connections between the importance and influence of the key stakeholders, on the one part, and the management performance and service quality, on the other part, we can evaluate the efficiency and the potential risks of the current organisational and functional framework of the supply system. This analysis can be used to identify way of action in order to implement european directives regarding the operators regionalisation and the promotion of local council associations in order to access the financial resources needed to sustain regional development projects.

Communication in a psycho-pedagogical context is influenced by three major factors: similarity, proximity and group integration. Educational communication lies at the junction between a scientific discourse and an artistic one, because the teacher is also an actor who plays his part so well, that spectators are interested in his performance not only during the ongoing course, but also during the ones that are to follow. Wherever he comes from, the Romanian person can be kind and gentle, hospitable, faithful, and so in love with the nature to the point that the two cannot be separated. Predisposed to meditate, to philosophize, faithful, bold and courageous, silent sometimes, but voluble other times, able to overcome many obstacles, with an extraordinary sense of humour, any Romanian listens with great pleasure to a story and immediately looks for its meanings, respects other people and likes to be respected, and is also endowed by nature with the ability of building beauty.

Key words: education, communication, the Romanian social space, the Romanian culture

Intercultural educational communication

Culture, in any of its meanings, as a **process, product or behaviour**, fulfils important functions in the formation of man and mankind itself. In this paper, our goal is to present two of them: the function of **acquisition of socially useful information**, on one side, and the function of **communication**, on the other side, both within the educational system.

Looking at the educational phenomenon from the perspective of interculture leads to its finality: *the free, complete and harmonious development of human individuality, the formation of autonomous and creative personality* (The Law of Education, no.84/1995).

If the subject of knowledge interacts with the values of the cultural patrimonium such as knowledge, capacity, competence, and if the performance of the social factor from the teacher's side is influenced directly by the subject's cultural level, it follows that the educational level can not be separated from the cultural level, just as education forms the individual for himself within social relations systems. Thus, the educational curriculum is permanently configured by general beliefs, norms, activities, institutions and communicational patterns, generally reunited under the name of culture.

Intercultural education has the goal of making educated people sensitive to respecting diversity, tolerance, solidarity, all of this with a generous purpose: the harmonious life of (present or future) citizens in multicultural societies. This form of education is not to not be mistaken for the amelioration of emigrants'

integration, or for the courses which consist of presenting their cultures and language exercise. In other words, it does not imply the positive discrimination of minorities.

Moreover, intercultural education has two major objectives:

- promoting and developing respect for cultural diversity and
- making the educational institution an intercultural one.

Strategies or ways of materializing intercultural education in educational institutions have been developed, among which the professor's adhesion to the values of interculturality plays a central part. Such values are: acceptance of cultural diversity, freedom of choice, praising what one does, implication in action, tolerance, non-violence, self-respect and respect for others alike, empathy, negotiation, cooperation, ability to overcome preconceptions and stereotypes, equality of chances.

Why is it so difficult to accept cultural diversity?

Social psychology may have an answer. Because of the fact that sometimes cultures differ a lot, it becomes difficult for an individual to completely understand foreign cultural aspects, since he lies under the influence of his own cultural identity. This presents *unique culture-specific models of behaviour, which are foreign to people from other cultural environments* (Giddens, 2000, p.32).

The individual defines himself as a factor of belonging or reference to a given social category and acknowledges its stereotypes, his social identity being a part of his self-conception. The feeling of identity and the self-perception as being different from other members of society lies at the foundation of this difficult tolerance for other people. As if being different one from another as individuals wouldn't be enough, people are also different as groups of individuals.

Communication in a psycho-pedagogical context is influenced by three major factors:

- **similarity** (persons who find themselves in similar social-educational situations, who share the same interests, activities etc, stand a higher and more acute communicational probability);
- **group integration** (intercommunication is easier within the group than between groups, especially because, within a certain group, the status and parts are more clearly outlined);
- **proximity** (the possibility of interconnection and communication in the case of persons who are close to one another increases, as compared to them being separated).

Social communication plays a fundamental part in the exchanges and interactions which prefigure the setting-up of a consensus-based universe. It represents, in its interindividual, institutional and mediational aspects, *a condition of representation and outlining of social thinking*.⁸⁵

Educational communication lies at the junction between a scientific discourse and an artistical one, because the teacher is also an actor who plays his role so well, that spectators are interested in both the ongoing performance as well as the ones that are to follow.

A teacher's communicational competence is an essential benchmark, very often neglected in validating a fruitful communication. It represents a grafting of linguistic competence overlapping social competence, and it is based on the capacity to establish competent and efficient communication relationships with the students, but also on efficient teaching and evaluation methods.

We can easily assimilate the group of students and the teacher with a team, educational communication with an organizational one, especially during seminar activity. There is an obvious similarity between the leader of an academical group and the formal organizational one. It has been known for a long time that the stimulation of the cooperation between members of a group will lead to its cohesion, with integration and acceptance effects on all other members. We can not expect intercultural values to be implemented by limiting ourselves to theoretical presentations. The teachers' active implication in their activity at seminars is necessary for stimulating the students' active integration and participation to building a genuine team.

⁸⁵ Jodelet D., 1995, *Reprezentările sociale, un domeniu în expansiune*, în *Psihologia câmpului social: reprezentările sociale*, București, Societatea Știință și Tehnică

Productive discussions are necessary for efficient meetings, which are themselves necessary for the teams with special results. Each meeting of the team should include measures to facilitate the unfolding and progress of discussions. Obviously, the leader of the team should use his skills in order to generate fruitful discussions; the team will be more successful if every member of the team learns and uses these measures.

The Romanian Social Space

Social space movement is ensured by a big number of dependant variables, which stimulate adaptive behaviour and innovative aspiration of any social action agent. It is a movement which depends on the social-cultural evolution of the community, of social experience accumulation and of the system of norms and values which ground communal life on a certain step of its historical development.

Researchers of this wide field of social study (H. Garfinkel, P. Berger, T. Lukmann, A. Mucchielli, A. Schutz)⁸⁶ have discovered that *reality from the perspective of active social subjects is given by all of the social representations which give meaning and consistency to the components of human life.*

The social environment forecasts an anticipation discourse on any child: long before the subject exists, the place it is assumed he will occupy is pre-invested by a group with the hope the social-cultural model will be ideally transmitted. The subject, on his part, searches and must find in this discourse benchmarks which can allow him to project himself into the future.

The ideological verb does not offer to the individual a range of possibilities he can chose from, but a **moral truth** which it would be disgraceful and unworthy to avoid.

In a deified universe, **society** becomes a system of different roles and social classes, whose members are intrinsically unequal. *Only professional competence generates their degree of implication, of participation according to merit, the right of functioning.* Switching roles is a way of acquiring competence or of isolating oneself. Within the system, the individual is confronted with pre-established organizations, each with its own rules, settlements and obligations and the feeling that these rules are immutable. *There is a proper behaviour for every circumstance, a linguistic formula for every confrontation and right information for any given context*⁸⁷.

The relationship between the living dimension and the reflexive one of social ontology is looked upon from new angles, now that functional amelioration of traditional tools and qualitative diversification of the modern ones have been generated by the current technico-scientific revolution.

The status **of the tool as a general social relationship** has been reanalyzed, beyond the limit of pragmatism and instrumentalism, because industrialization induces shifts even in the quality of human relationships.

Technological rationality receives a status of being praxilogically complementary in the sense of humanizing behavioural patterns initiated by the increase in weight the technique in the social space itself.

The man of electronic times seeks salvation in order to escape anonymity, mediocrity and to be able to make himself heard **from within a group.**

The need for selective adhesion to the environment, as well as that of cooperation, is amplified by the alienation through isolation, so specific to modern man. As Octavian Paler said, the paradox of our times in history is that *„we have more accessories, but less time; we have more functions, but less mind, more knowledge, but less judgement; more experts and still more problems... we have increased our fortune, but reduced our values. We have learnt how to make end's meat, but not how to live a life. We have added years to life and not life to years. We have even reached the moon and returned, but we face problems when we need to cross the street, to meet a neighbour. We have conquered outer space, but not the inner one. We have conquered the atom, but not our prejudices. We have built more computers: to store more information, to produce more copies than ever, but we communicate less and less.”*

⁸⁶ apud Cristea D., 2001, *Tratat de psihologie socială*, Ed. ProTransilvania

⁸⁷ Moscovici S., 1995, *Fenomenul reprezentărilor sociale*, în *Psihologia câmpului social: Reprezentările sociale 1995*, București, Societatea Știință și Tehnică

Technological civilization has the task to *axiologically discover the people who seek themselves in the complexity of their time*, when technology must remain a means for rediscovering the inner self, an attitude towards existence.⁸⁸

The movement of social systems on all levels and compartments of communal life implies the existence of functional structures, which:

- should objectivize the axiological, normative and teleological imperatives of social institutions and
- should assure people's and groups' engagement and training in activities leading to achieving the objectives of the respective institutions.

The most recent shape of the social space is generated by **the virtual component**⁸⁹, which is generated by the proliferation of ways to produce and administrate **information, the most recent tool as a form of interpersonal, communal and institutional networking**, endowed with the potentially infinite capacity of amplifying the socializing background.

Romanian cultural features have been extensively studied by researchers, who have also identified several peculiarities. C.Radulescu-Motru considers that Romanian soul is welcoming, tolerant, lover of justice, religious; for him, a Romanian is courageous, preoccupied by what the others have to say about him and has a joyous soul.⁹⁰

Doina and Alexandru Catana have tried to draw up a *cultural matrix of Romanians*⁹¹ and have identified positive cultural traits, of which we have decided to mention the following: *patience, fatalism, heroism, rapid assimilation of foreign influences, intelligence, adaptability*, but also negative features, such as: *indifference, indiscipline, lack of courage etc.*

In a wide on the field study made in 1994, Ilie Puiu Vasilescu⁹² reveals some features of the self-perception that Romanians belonging to the different geographical regions have. Thus, Romanians from all over the country characterize themselves as being *open, communicative and energetic people*, have a *warm and understanding, careful and delicate* interpersonal style, although significant scores have been reached with regard to *a strong state of stress, anxiety* and overwhelming worries; also, more than half of the tested Romanians place themselves *in the category of those who are very dedicated to labour*.

Although the Romanian nation, *stricto sensum*, has only existed for 87 years, since the Great Union of 1918, the Romanian ethnical identity has preserved itself in all geographical regions where they have lived. While some consider themselves to be Europeans, others see themselves as Romanians, but most of them identify themselves, in fact, with the geographical region they come from and consider themselves as "banateni, ardeleni, olteni, moldoveni, regateni, dobrogeni or bucuresteni".

All have noticed, empirically, that there are significant differences among them, that in everyday life people ask one another *where they are from* and that it is enough to deny belonging to one region or another to be immediately labelled, placed in rigid cognitive schemes, whose owner immediately launches the appropriate adaptation behaviour. Maybe this could also be explained by the fact that, for many hundreds of years, *the outsider* has meant *danger* or *enemy*.

Wherever he comes from, the Romanian person can be kind and gentle, hospitable, faithful, and so in love with the nature to the point that the two cannot be separated. Predisposed to meditate, to philosophize, faithful, bold and courageous, silent sometimes, but voluble other times, able to overcome many obstacles, with an extraordinary sense of humour, any Romanian listens with great pleasure to a story and immediately looks for its meanings, respects other people and likes to be respected, and is also endowed by nature with the ability of building beauty. Finally, *a man among men*, artist and philosopher, the Romanian

person surprises with calm and patience when facing the difficulties of life. Romanians love nature, good life and above all, God.

Suggestions for further research

We think that further research should focus on:

- intercultural education
- Influence of organizational university culture on students' performances
- Peculiarities of communication (including didactic communication) in Romanian university culture
- Implementing ethics principles in Romanian university life
- Causes and effects of organizational change in the Romanian university field

PARTICULARITÉS DU MANAGEMENT DES SERVICES DANS LE COMMERCE DES PRODUITS NON ALIMENTAIRES

Rusu Corina

Université Chrétienne „Dimitrie Cantemir” București, Faculté de Sciences Économiques de Cluj-Napoca, Romania, Str. Teodor Mihali, nr.56, Cluj-Napoca 400591, corina.rusu@cantemircluj.ro, 0264-414751, 0741257995

Together with the products` high degree of quality, the performed services and their high degree of quality, can significantly contribute to orienting the commercial companies towards their clients. This aspect has been emphasized in the last years, especially in those fields where there is a limited freedom of action upon production programmes of the product or types of products, as at this stage, interventions were performed in terms of subsidiary service range enlargement. An extremely dynamic field of Commerce – non-alimentary trade, presents certain particularities regarding not only the system of service performance, but especially the management of these services. Throughout the scientific paper, we have focused on the particularities of service management within non-alimentary trade.

Mots clé: management des services, orientation vers les clients, services complémentaires, qualité des services.

Simultanément avec la croissance de l'importance des services dans la différenciation de l'offre et dans l'établissement d'un avantage concurrentiel, ont été créés les prémisses pour l'opérationnalisation et le mesurage de la qualité des services dans la pratique des entreprises, notamment des entreprises commerciales. Par l'utilisation des concepts de Value Added Services et de qualité des services, ainsi que par l'application de ceux-ci dans la pratique commerciale, on a en vue l'accentuation de l'orientation vers les clients et l'attachement des clients actuels à l'entreprise analysée, par la prestation de services qualité, innovateurs. Le management des services mise tant sur la dimension de l'offre, que sur celle d'interaction de l'orientation vers les clients (figure 1). La stratégie économique et les tactiques de toute entreprise commerciale doivent partir de quelques principes centraux de management desquels il faut tenir compte dans la concurrence du marché. Toute activité qui implique des décisions doit se baser sur la connaissance des réalités (demande, possibilités d'offre, perspectives) et des objectifs poursuivis. Une place importante dans ce contexte est détenu par la demande, l'orientation vers les clients et l'optique de marketing.

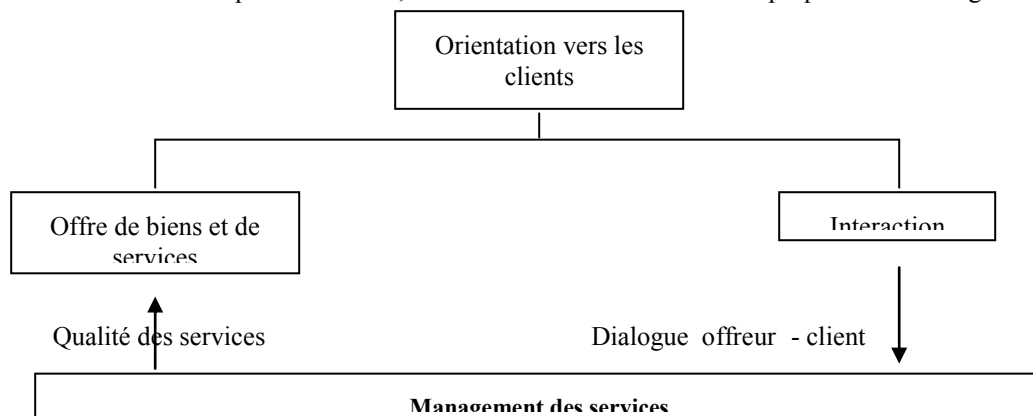

Fig. 1. L'orientation vers les clients et le management des services

Source: Bruhn Manfred, „L'orientation vers les clients. Le fondement de l'affaire de succès”, Éd. Économique, București, 2001, p. 70.

Le management des services consiste [3] dans une «*somme de décisions et d'actions concernant l'ensemble des processus déroulés, en mettant l'accent sur la répartition, la structuration et l'ordination des prestations en conformité avec les exigences et les attentes des clients, tout cela dans les conditions d'un coût aussi bas que possible, entrevu à long terme*». Le management doit assurer la mise en corrélation adéquate dans le cadre de l'entreprise, des composantes, des unités et des différentes catégories de personnel, ainsi que la coordination entre ceux-ci et le système de moyens et d'installations existants, nécessaires pour les prestations de services ; dans ce but, le manager est celui qui doit assurer la gestion des capacités desquelles dispose l'entreprise, ainsi que de tous les fonds de l'entreprise.

En vue de réaliser les aspects mentionnés ci-dessus, le management accomplit deux groupes de décisions et d'actions : la projection du système fonctionnel de l'entreprise et l'adoption des décisions concernant l'équipement technologique et le personnel de l'entreprise ; l'organisation opérative, l'exploitation et le contrôle de la fonctionnalité de l'entreprise et de ses sous-systèmes (l'activité qui vise en général à une période de temps plus courte que dans le cas du premier groupe de décisions et d'actions), respectivement la programmation et le contrôle de toutes les activités du point de vue quantitatif et qualitatif, en vertu de l'encadrement dans certains niveaux de coûts.

La projection d'un management adéquat aux services propose la résolution [2] de certains problèmes au niveau de l'entreprise, tels que:

- L'organisation adéquate de l'entreprise, par la constitution de structures organisationnelles adéquates, qui prennent en considération tant les exigences du milieu interne, que celles du milieu externe;
- La projection de systèmes informationnels de marketing, adéquats pour la structure organisationnelle adoptée;
- La modification du système décisionnel de sorte à refléter en totalité l'optique de marketing, respectivement l'orientation vers les clients.

Pour pouvoir résoudre tous ces problèmes, il faudra tenir compte des aspects suivants [4]:

- La reconnaissance de l'avantage que reçoit le consommateur pendant l'utilisation d'un service de l'entreprise, respectivement la compréhension du mode dans lequel la qualité totale est perçue dans les relations avec les consommateurs, sans se modifier dans le temps;
- La connaissance du mode dans lequel l'entreprise, par l'intermédiaire du personnel, de la technologie ou d'autres catégories de ressources, est capable de produire et de livrer cet avantage;
- La prévision et le tracement du mode dans lequel l'entreprise respective devrait être organisée et dirigée pour réussir à fournir des services de la meilleure qualité;
- L'organisation des activités de l'entreprise de sorte que les services offerts correspondent aux objectifs des parties impliquées (personnel, consommateurs, société), si ces objectifs sont eux aussi atteints.

Les particularités et le contenu des *principes du management des services* peuvent être synthétisés comme il suit [2]:

1. L'équation du profit

Ce principe peut être défini par le fait que la compréhension par le consommateur de la qualité du service pourra générer du profit à l'entreprise, si les décisions concernant l'efficacité externe (la satisfaction des consommateurs) et les décisions concernant l'efficacité interne (la productivité du travail) sont parfaitement mises en corrélation. Il est impérieusement nécessaire que dans la direction de l'activité d'une entreprise qui fournit des services aussi, l'efficacité interne soit intégrée à celle externe et aux relations avec les consommateurs, parce que les préoccupations prépondérantes de la direction pour les coûts et la productivité du travail mènent finalement à la diminution des préoccupations liées à la qualité des services fournis.

2. L'autorité décisionnelle

C'est le principe conformément auquel les décisions doivent être décentralisées vers la zone d'interaction consommateur prestataire, vu que les décisions stratégiques doivent être prises à un niveau supérieur. Il serait idéal que le personnel de contact ait l'autorité de prendre certaines décisions sur place, de sorte que les occasions de vente et les possibilités de corriger ou d'éviter certaines erreurs soient fructifiées au maximum. Pour que ce personnel ait la compétence de prendre des décisions et d'agir dans un délai utile, en vue de dérouler une activité de qualité, il doit être préparé à reconnaître les diverses situations qui peuvent apparaître dans les relations avec les consommateurs, pouvoir résoudre tous les problèmes (même ceux à caractère privé) qui apparaissent comme une transgression de la prestation standard du service, de sorte que le bénéficiaire de ce service soit pleinement satisfait. Même si les décisions d'importance stratégique pour l'entreprise sont prises par la direction supérieure, les connaissances et l'expérience du personnel de la première ligne sont utiles dans ce cas aussi, grâce à l'expérience dans la prestation du service et grâce aux relations permanentes avec les consommateurs. Il est digne à remarquer dans ce contexte le fait que la participation et/ou la consultation du personnel dans la prise des décisions créera un attachement envers l'entreprise de celui-ci et peut être considéré ultérieurement comme un élément motivateur dans le déroulement des activités.

3. La structure organisationnelle

Ce principe envisage le fait que l'entreprise doit être organisée et que les activités doivent être structurées de sorte à assurer la mobilisation des ressources pour réaliser les activités du personnel de la ligne de contact avec les consommateurs, ce qui suppose l'élimination des structures inutiles. L'efficacité d'une entreprise qui fournit des services est beaucoup plus élevée quand la direction ne s'implique pas directement dans les décisions opérationnelles quotidiennes (sauf dans des cas exceptionnels), au niveau prestataire – consommateur, mais elle accorde son appui stratégique et les ressources nécessaires pour accomplir les objectifs de l'entreprise. Les changements qui sont intervenus dans l'organisation des entreprises qui s'occupent de la prestation de services aussi sont en fait le résultat de changements intervenus dans ses stratégies et ont à la base les principes du management des services. Le niveau de la direction centrale n'est plus positionné au sommet de la pyramide et il ne représente même plus l'élément déterminant pour le succès ou pour l'échec d'une entreprise prestataire de services ; mais en revanche apparaît le personnel de contact, comme étant un élément central de la structure organisationnelle, qui établira si l'entreprise sera ou non profitable. Cette nouvelle structure organisationnelle met en évidence le fait que les relations horizontales sont plus développées que celles verticales, c'est-à-dire qu'a lieu un « aplatissement » de la pyramide, par le transfert des tâches et de l'autorité du personnel administratif et de la direction au personnel ayant des fonctions opératives.

4. Le contrôle des activités de l'entreprise

C'est le principe conformément auquel la direction doit concentrer son attention vers l'encouragement et le soutien du personnel, mais en présence de certaines réglementations qui visent à l'activité de celui-ci. Vu que les services ne peuvent pas être standardisés (du moins pas en totalité, mais éventuellement dans certaines activités composantes), le personnel prestataire a besoin d'un certain degré de flexibilité pour pouvoir fournir des services de qualité, qui soient à même de satisfaire les exigences des consommateurs, ou même en cas de situations imprévues. Dans cette situation il est préférable de tracer des lignes directrices en ce qui concerne le déroulement de l'activité de prestation, à la place de certains standards rigides, ce qui fait que le contrôle soit dirigé vers l'encouragement et l'appui du personnel (autrement dit, un changement d'attitude).

5. L'évaluation de l'activité du personnel

Ce principe régleme le fait que la satisfaction des consommateurs par rapport aux services de l'entreprise est et doit être au centre de l'attention dans le processus d'évaluation de l'activité. Ce qui fait que, lorsqu'il est possible, il se réalise une évaluation de la productivité du travail et de l'efficacité interne. Bien que les critères d'efficacité externe aient priorité dans l'évaluation de l'efficacité, il ne faut pas négliger ceux qui visent à l'efficacité interne.

6. Le système de récompense

L'utilisation d'un principe concernant le système de récompense a en vue le fait que l'établissement d'un certain système de récompense est l'une des attributions de la direction des entreprises ; le principe stipule le fait que le système de récompense doit être basé sur des prestations de qualité, tenant compte de toutes les composantes de la qualité d'un service.

La plupart des entreprises commerciales recourent au moment présent aux services qu'elles peuvent offrir aux clients, pour les gains qu'ils peuvent obtenir de la part de ceux-ci. Par exemple, actuellement les vendeurs d'automobiles obtiennent la plupart de leur profit non pas de la vente effective des produits, mais de la fourniture en vertu de contrats des divers services liés au financement, à l'assurance et à la réparation des automobiles. Il y a même des entreprises qui créent un secteur distinct pour les prestations de services, qui pendant le temps peut devenir très profitable comparativement à la commercialisation effective.

L'attention particulière accordée au management des services dans le commerce avec des produits non alimentaires est due à des prémisses qui ont été à la base du développement de ces services, parmi lesquels nous rappelons :

- La préoccupation continue des producteurs et des commerçants de satisfaire les besoins socio-culturels des consommateurs, par l'intermédiaire d'une offre qui corresponde autant mieux que possible au pouvoir matériel et spirituel de ceux-ci, pour assurer finalement la croissance du niveau de la qualité de la vie, ont eu comme effet l'assurance d'un « service » dans l'usage des consommateurs, service qui peut être interprété comme étant la satisfaction supérieure des exigences toujours plus diversifiées des consommateurs ;
- La super personnalisation des produits – respectivement le pouvoir d'un seul produit de « maîtriser » un certain segment du marché ou d'assurer un service de base aux consommateurs d'un certain segment. Cet aspect a eu des implications profondes dans le domaine des relations avec les consommateurs, la communication avec eux acquérant des valences particulières, pour une meilleure connaissance de ceux-ci et de l'image sur le produit dans la conscience des consommateurs.
- L'accent mis sur le management de la qualité totale, qui a marqué une nouvelle époque de la civilisation de la qualité.
- Les permanents renouvellements dans le domaine des biens d'usage prolongé, les produits sur lesquels sont concentrés de préférence les services post-vente, parce que les consommateurs seront préoccupés en permanence d'acquérir les produits les plus performants, les appareils et les articles de cette catégorie, ayant en vue la facilitation du travail et le confort augmenté qu'ils peuvent assurer dans l'utilisation.

Tenant compte de toutes ces manifestations, les commerçants ont été et sont en permanence préoccupés de la création d'une politique efficace de servir les clients, d'assurer des services optimaux avant, pendant et après la vente. Aucune entreprise commerciale qui désire le succès sur le marché ne peut pas négliger ces services, justement parce qu'elle est consciente de leurs buts, qui soutiennent les objectifs généraux de l'entreprise. Il est à mettre en évidence dans ce contexte le fait que l'opérationnalisation des objectifs dans le domaine des services est une composante importante de la planification stratégique du management des services, en absence de laquelle on ne peut pas mesurer et contrôler l'orientation vers les clients et le positionnement par rapport aux concurrents. On utilise dans ce but le groupage des objectifs en économiques et psychologiques, comme il suit [1] :

- Les objectifs économiques sont directement liés au but d'obtenir un gain, comme par exemple : le degré de couverture des coûts par les revenus, le quota du marché, le volume physique et la valeur des ventes / des prestations de services. Dans la formulation des objectifs économiques du management des services il est particulièrement important d'établir les mesures et/ou les indicateurs par lesquels on peut exprimer le volume (la quantité) des services vendus.
- Les objectifs d'ordre psychologique se réfèrent, en essence, aux processus mentaux des acheteurs et ils ont une importance particulière parce que leur atteinte contribue indirectement à la réalisation des objectifs économiques. Pour le management des services dans le commerce avec des produits non alimentaires (et non seulement dans cette branche du commerce) il est important de suivre les objectifs suivants :

1. L'amélioration de la qualité des services ;
2. La croissance du degré de satisfaction des clients ;
3. L'accentuation de l'attachement des clients envers l'entreprise ;
4. L'amélioration de l'image de l'entreprise ;
5. La croissance de la satisfaction et de la motivation des salariés

Grâce à l'interaction entre le client et le prestataire de services, tout comme grâce à l'interdépendance entre la motivation des salariés – la qualité du service – la satisfaction du client – le succès économique, les objectifs concernant le personnel acquièrent des valences particulières dans le management des services. Par exemple, pour un dealer auto, les objectifs liés au personnel sont les suivants : la création d'un milieu de travail favorable, l'assurance de toutes les conditions nécessaires en vue de dérouler une activités efficiente, pour que chaque employé puisse dire que son entreprise est le meilleur employeur.

Certains services pour les clients se développent dans le temps et deviennent prestations indépendantes, qui peuvent être commercialisées par des départements spécialisés dans le cadre des entreprises commerciales et indépendamment – tout comme, par exemple, les contrats d'entretien pour les photocopieuses offertes par certaines entreprises qui commercialisent ce produit. Dans ce sens, il est impérieusement nécessaire que ces départements de services pour les clients soient vus comme des centres de profit et aucunement comme des centres de coût. Cela arrive parce que la plupart des fois, ces offres de services post-vente peuvent constituer une offre pour les produits de la concurrence aussi, non seulement pour les produits propres. Dans cette situation apparaît comme nécessaire la définition du service pour les clients par un nom indépendant et la nécessité de positionner la prestation comme marque, l'organisation en tant que telle du management de l'entreprise prestataire, ainsi que la prise en considération des aspects suivants[1] :

- L'établissement d'un programme de service pour les clients, notamment en ce qui concerne le type et le volume des prestations offertes, ainsi que l'établissement de la qualité des services pour les clients ;
- La réalisation d'un système uniforme d'établissement des tarifs, l'établissement des conditions d'exécution, l'établissement des mensualités contractuelles et des conditions contractuelles de la prestation ;
- L'attraction de divers prestataires de services pour les clients dans le système d'ensemble, l'organisation de la logistique du service pour les clients, notamment en ce qui concerne l'approvisionnement avec des pièces de rechange, l'organisation et l'orientation des techniciens impliqués dans la réalisation des prestations respectives ;
- La présentation de ces services pour les clients dans le cadre de la publicité classique, le développement de certains programmes bien mis en œuvre afin d'attirer les acheteurs pour les services fournis, la diffusion de prestations de services pour la clientèle incluses dans les ventes personnelles, la présentation de ces services dans le cadre des foires, dans le cadre des rencontres publiques ou avec la presse.

En général, en vue de choisir les solutions les plus convenables du point de vue organisationnel concernant les services post-vente, le management de l'entreprise partira de l'analyse des aspects suivants:

- Les caractéristiques de chaque segment du marché abordé, respectivement : les caractéristiques géographiques, de climat, les caractéristiques technico-économiques dans lesquelles fonctionneront les produits commercialisés, l'intensité à laquelle le produit sera utilisé, les caractéristiques de l'infrastructure, le degré de nouveauté des produits sur les marchés respectifs, le niveau d'instruction/de qualification des utilisateurs et les éventuels décalages qui puissent apparaître dans ce sens, l'élasticité de la demande du produit respectif en fonction du volume, de la structure et de la qualité des services complémentaires au produit physique;
- Les caractéristiques technico-économiques, fonctionnelles, de maintenance, de fiabilité et de disponibilité des produits commercialisés;

- Le contenu et la structure de chaque type de service post-vente possible à être offert ;
- Les fonctions que l'entreprise commerciale désire exercer par l'intermédiaire du réseau de services organisé.

Les services post-vente constituent le principaux services offerts aux acheteurs de produits non alimentaires, même si dans les dernières années se sont développés extrêmement rapidement les services financiers aussi, le financement à mensualités ou en système leasing (ceux-ci étant offerts directement par le commerçant).

Dans la littérature de spécialité [5] sont présentées quelques tendances majeures dans le domaine des services d'entretien des produits:

- les producteurs fabriquent des produits plus fiables et beaucoup plus facilement à réparer, d'un côté à cause du passage de la production d'équipement électro-mécanique à celle d'équipement électronique qui est plus sûr dans le fonctionnement et plus rapide à remettre en fonctionnement, et d'autre côté à cause de la croissance du nombre et de l'importance des produits structurés de manière modulaire, ce qui permet en une certaine mesure qu'ils soient entretenus et réparés par le propriétaire;
- les acheteurs acceptent toujours plus difficilement les paniers de services standard pour acheter un produit physique, sollicitant toujours plus fréquemment des services séparés, le paiement distinct de chacun et la possibilité d'acheter seulement les services qu'ils désirent;
- a augmenté toujours davantage le nombre des entreprises indépendantes prestataires de services d'entretien et de réparation ;
- a augmenté la fiabilité des produits et la période de grâce accordée, ce qui fait que les contrats de service offerts au moment de l'achat du produit soient moins attractifs pour les acheteurs, qu'ils perdent de l'importance ;
- la croissance du nombre d'offres de services d'entretien et de réparations a déterminé la diminution des prix et implicitement des profits des entreprises prestataires.

En conclusion, le management des services spécifique à la commercialisation des produits non alimentaires doit prendre des décisions et ensuite agir, en ce qui concerne la mixtion des services offerts, la qualité et la source de ces services liés ; la clé d'une stratégie réussie notamment en ce qui concerne les services de réparation et d'entretien est représentée par la projection des services de sorte qu'ils se détériorent le plus rarement possible, et si une certaine défection intervient, le produit doit être facilement et rapidement réparé, avec des frais autant réduits que possible.

In the more and more competitive environment, managers are concerned with employees' satisfaction, as a key factor for organizational effectiveness, efficiency, and development, and for the successful implementation of corporate strategy. In this paper, we analyzed the relation motivation-performance-satisfaction, and the importance that intrinsic and extrinsic rewards have for increasing employees' satisfaction. The individual is satisfied if he is intrinsically and extrinsically rewarded. On the one hand, the employee perceives that own performance that results from the effort he expended, and that was enhanced by personal competence and commitment, is important, interesting, challenging, stretching. On the other hand, the employee feels that peers and superiors recognize (praise) and fairly reward (pay, promote) his contribution to organizational effectiveness, efficiency and development. Different studies showed that employees' motivation to achieve good performance increases when they have a positive perception on managers, company, and coworkers. Statistics demonstrate that top 100 employers in Europe and The United States of America enjoy annual growth rates bigger than 20%, and receive each year six times more job applications than the number of employees. Most of the employees in these companies show commitment, reporting that they would stay with their organization for more than five years. Research performed in Romania by GFK, starting with 2005, confirm the results released by the international studies. Romanian employees appreciated respect, recognition, challenging work as more important than fair payment. Research showed that job satisfaction leads to defensive behavior, sabotage, absenteeism, turnover. Dissatisfied employees will not perform at peak level, even if they do not leave the organization, which has negative consequences on organizational performance. That is why we presented in the paper a program meant to maintain and increase employees' satisfaction within organizations.

Key words: strategy, performance, motivation, satisfaction, reward

Managers' Tasks in Successfully Implementing and Executing Strategy, in an Increasingly Competitive Environment

In dealing with continuously increasing competition, managers in the global business world have two major, interconnected tasks, both very important for competitive advantage: to develop strategy and to build organizational performance in order to implement and execute it successfully. Strategy involves performing different activities than rivals', or performing similar activities in a different way, defining a unique position, making clear trade-offs and tightening fit⁷. Achieving organizational performance is a necessary part of management, which means performing similar activities better than rivals, involves change, flexibility and relentless efforts to achieve best practices. Through good performance, strategy is implemented in a manner which satisfies the needs of its stakeholders. Organizational performance includes effectiveness, efficiency, sustainable growth, and last, but not least, employees' satisfaction. Thus, it involves understanding and shaping organizational behavior. It is difficult to understand and influence the behavior of one person or a small group; understanding and managing the behavior of people in larger organizations numbering in the tens of thousands spread across many locations and national cultures is extremely complex. It, therefore, represents one of the most difficult challenges faced by general managers today².

Employees' Satisfaction – Key Factor of Organizational Performance

Employees' satisfaction or morale refers to their positive emotional response to their job and to their work performed individually and/or as part of a group. Morale frequently has more of a group or organizational connotation than satisfaction.

Ignoring employees' satisfaction is to risk some highly negative consequences, such as inability to retain valuable employees or to recruit desired talent. Job satisfaction manifests itself in different ways in different people. Whether job satisfaction is high or low depends on a number of factors including: how well a person's needs and wishes are met through work, working conditions, the way in which an individual defines himself or herself through work, and individual personality.

The Relationship Motivation – Performance - Satisfaction

Job satisfaction has been an important part of Human Resources Management since 1924, when researchers at Hawthorne Plant in Chicago, part of the Western Electric Company began to study the impact of lighting on labor productivity. Then, they discovered that human interaction, affecting morale and motivation, was much more clearly influencing work outcomes than lighting. Further experimentation led researchers to the conclusion that productivity depended at least in part of cooperation and enthusiasm in team work. These were related to the interest that the supervisor had for the work group, lack of coercion or force, and the extent to which workers participated in making decisions and changes that would affect them⁹. At that time, high satisfaction was thought to be a cause for high performance. It was assumed that managers could improve performance by satisfying workers through pleasant working conditions, adequate rewards, and the like. Nowadays, however it is generally accepted that this cause-effect relationship is an incorrect view of the connection between satisfaction and performance. Modern research suggests that the relationship must be the other way around: high performance may cause high job satisfaction, which is reinforced by the rewards that accompany performance⁶. Figure 1 presents the relationship between motivation, involvement, performance, and satisfaction⁸.

The individual is satisfied if he is intrinsically and extrinsically rewarded. The employee is intrinsically rewarded if he perceives that individual performance resulted from the effort expended is important, interesting, challenging, stretching. The employee is extrinsically rewarded if he feels that the colleagues and superiors recognize (praise) and fairly reward (pay, promote) his contribution to organizational effectiveness, efficiency and development. Two factors influence individual performance or achievement: competence and commitment.

- The first factor, competence, is a function of knowledge and skills, which can be gained from education, training, or/and experience. Competence is different from ability. Ability, or potential, is something people are born with, and can easily do. Competence, on the other hand, can be developed with appropriate direction (mentoring, coaching, education, and training) and organizational support.
- The second factor, commitment, is a combination of confidence, and motivation. Confidence is the measure of a person's self assuredness, a feeling of being able to do a task well, whereas motivation is a person's interest in and enthusiasm for doing all the efforts to perform a task well. When Herzberg researched the sources of employees' motivation during the 1950s, and 1960s, he discovered that the things that make people motivated and satisfied on the job are different from those that make them dissatisfied. Managed badly, environmental (hygiene) factors such as low salary, uncomfortable work space, bad rules, make people unhappy. But even if managed brilliantly, they don't motivate employees to work harder or smarter. People are motivated, instead, by factors that feed their need for growth and achievement: interesting work, challenge, and increasing responsibility⁴. Realistic expectations that effort will lead to desired performance, and consequently to desired outcomes, appropriate group norms, support, intergroup behavior, and human resources policies and practices, as well as appropriate leadership style will develop and maintain employees' motivation. There are four combinations of competence and commitment that call for four different leadership styles³.
 - Directing style, for people who lack competence but are enthusiastic and committed, who need direction and frequent feedback to get them started.

- Coaching style, for people who have some competence but lack commitment, who need direction and feedback because they are still relatively inexperienced, who also need support and praise to build their self-esteem, and involvement in decision making to restore their commitment.
- Supporting style, for people who have competence but lack confidence and motivation, who do not need much direction because of their skills, but support is necessary to bolster their commitment.
- Delegating style, for people who have both competence and commitment, who are able and willing to work on a project by themselves with little supervision and support.

Figure 1. The motivation-performance-satisfaction model

Employees' motivation to achieve good performance increases when their perceptions on managers, company, and coworkers is positive. These perceptions enhance satisfaction, and pride. These positive emotions drive motivation, which fuels creativity, productivity, commitment to work, and team cohesiveness. That is why, companies that are considered very good employers enjoy outstanding performance. Statistics show that top 100 employers in Europe and The United States of America enjoy annual growth rates bigger than 20%, and receive each year six times more job applications than the number of employees¹¹. Most of the employees in these companies show commitment, reporting that they would stay with their organization for more than five years.

Hay Group compared half a million committed and uncommitted employees from more than 300 companies¹². Of the 50-plus satisfaction criteria analyzed, pay was the least important. Of all factors in employee satisfaction and retention studied by Hay Group, the most important was the opportunity to learn new skills. Dissatisfied employees, ready to leave within a year, reported: „I'm in a job that does not allow me to learn and use new skills". Another top factor uncovered by Hay Group was coaching and feedback from supervisors. High performers are the employees most interested in receiving feedback. If they don't get it, they think: „This company doesn't care about me". Hay Group proved again that employees do not leave companies, they usually leave bosses. If manager does not treat direct report right, none of the other criteria matters. In a Kepner Tregoe survey¹³, 16% of respondents identified conflict with the boss as one of the three most common reasons for the departure of top-performing employees. What to do with bad bosses? Kepner-Tregoe lists „a stairstepping process for conflict resolution". Among seven practices it found at companies effective in retaining employees: „A common practice for retention that leaders

employ is to offer legitimate alternative avenues that allow employees to circumvent their immediate supervisor, if necessary, and get their problem resolved". Motorola, for example, allows workers to take grievances to senior executives.

When asked which events caused by managers increased their satisfaction, employees also think of interpersonal events, for example circumstances in which managers praise them, work collaboratively with them as peers, create a relaxing atmosphere, provide emotional support. However, research showed that the most important managerial behaviors that increase employee satisfaction are: *enabling their progress* and *treating them decently*, as human beings¹.

- *Being able to make progress* in the work is very important for employees' satisfaction. That is why providing direct help, providing adequate resources and time, and reacting to success and failure with a learning orientation, versus an evaluating one, are the appropriate managerial behaviors. One of the most important managerial behaviors is setting of clear goals. People make more progress when managers clarify where the work is heading and why it matters. When goals are not clear, work proceeds in wrong directions and performance suffers, lowering motivation. When managers do not do their best to facilitate progress, people draw their own conclusions: they either imagine that their superiors consider their work unimportant and willingly undermine it, or they consider them as being incompetent.
- *Interpersonal relations* have to be in tandem with progress. Praise without real work progress or at least solid efforts towards progress, has little impact on satisfaction, and can even lead to cynicism. On the other hand, good work progress without any recognition, or worse, with criticism about trivial issues, lead to sadness or anger. The best situation is when people are aware that they did a good job, and managers appropriately recognize it.

Employee Satisfaction in Companies that Operate in Romania

Since 2005, GFK Romania¹¹, together with *Capital Magazine*, carried out surveys regarding the employee satisfaction, for creating "The top of the best 100 companies to work for".

In all these three years when the survey was carried out, it was demonstrated that the employees in the top companies - where it is assumed that the physiologic basic needs are satisfied - praise most to be respected, to have their merits acknowledged, to work in a constructive environment. These are thus the motivating factors, according to Herzberg's theory. It should be noticed the fact that the salary importance decreased, descending from the second position, where it was in 2005, to the fifth position in 2006 and 2007. The hygiene factors are in Romania on the last positions in the hierarchy of the employees' preferences, too. The meal tickets, the relaxation and sport facilities are on the last three positions of the 37 satisfaction criteria analyzed by the participants to the survey. The survey showed that the Romanian employees appreciate, besides the salary, the degree of adaptation of the compensation package to the individual specific needs. They consider this supplementary effort a proof of respect and appreciation.

Ways to Improve Organizational Performance, through Increased Employees Satisfaction

Research showed that job satisfaction does not necessarily lead to better job performance. However, defensive behavior, sabotage, absenteeism, turnover were reported as certain behavioral consequences of frustrated employees. Dissatisfied employees will not perform at peak level, even if they do not leave the organization, which has negative consequences on organizational performance. Studies show that in organizations exist more types of employees: enthusiastic for their whole stay in the company; enthusiastic for approx. six month; disappointed after a short while; allergic to work.

Managers in good organizations are consistently acting in order to maintain at high levels employees' enthusiasm, and minimize the level of disappointment. Factors that lead to these positive results are:

- A proper orientation process, in which supervisors show respect to new entrants;
- Support for new employees to achieve as soon as possible the necessary level of competence, and to maintain it in time. Training, coaching, mentoring are very helpful in this respect;
- Stimulating work conditions, that enhance performance;
- Interesting, challenging, significant work;

- Involvement in the decision process;
- Effective managerial process, characterized by constructive feedback, empowerment;
- Discharge of the employees that are allergic to work,

Top management would be wise to assess satisfaction levels in their organizations – by business unit, and by job category. One way to do this is to use climate or satisfaction surveys at intervals.

Such surveys lead to an understanding of what should be changed in the organization, and what topics should be kept and enhanced, in order to increase satisfaction. To be useful, the questions should be relevant, and the response rate high enough to lead to a relevant aggregated satisfaction indicator. It is important that the evolution in time of the satisfaction indicators is tracked, and that indicators are computed for and compared among the various business units of the same organization at a certain point in time. Comparisons with other companies are extremely important.

- *The questions* should address issues related to different factors that influence employee satisfaction such as: career, leadership, collaboration, communication, work conditions, etc. Key employees should be involved in developing the questionnaires, which should be relevant to the organization and not too long. To make the process more useful, it is important to create a method through which factors of satisfactions are ranked according to their perceived importance.
- More factors lead to satisfactory *response rates*:
 - *Good communication* is extremely important in order to make employees aware that they have to fill in questionnaires and convinced that this process is beneficial for them;
 - The *period of the year* when the questionnaires are handed to employees is extremely important: periods with high workload, or holiday periods are not appropriate;
 - The trust that confidentiality is protected is crucial;
 - *Employees' confidence in the worthiness of their effort* has to be built in order that they maintain their commitment in time.

Towards this end, participants in the survey should be informed about the results obtained. More than these, they should be involved in the process of developing actions meant to increase their satisfaction, and let know how these actions were implemented, and with what results.

So, if well managed, such surveys lead to increased satisfaction, on the one hand because they detect things to be improved in the organization, on the other hand because employees feel that they are part of the decision making process, proof that top managers respect them and believe they are significant for the organization.

Abstract : Organizational culture is defined as an assembly of traditions, values, procedures, conceptions and attitudes which creates the context of activities in the organization (McLean and Marshall).

The elements of organizational culture, in opinion of many authors, are structured on many levels, depending on more criteria such as:

from point of view of behavior, these elements are structured in three levels: trust and beliefs imprinted in consciousness of staff ; values and attitude for which employed made an option; individual and group behavior inside the organization.

concerning the content, the elements of organizational culture can be structured in three levels (D. Roberts): surface level – behaviors, slogans; second level – values and standards regarding of good and wicked in organization, development of organization and employed; deep level – believes, convictions of staff.

considering the action area and his characteristics, inside of organizational culture we distinguished: institutional subculture – at the level of the component parts of organization; professional subculture – concerning the professions inside the organization.

The main factors who determine the organizational culture are presented in this paper and they are: founders and owners; managers; group of work; characteristics of organization; the environment (juridical, economic, cultural, technologic).

Key-words: organizational culture, levels of the organizational culture, the factors of the organizational culture

1. Definition of the organizational culture

Each organization represents a multitude of personalities who, in time, as consequence of the relationships that appear, confers to the organization a distinct character, unique. That is why, we cannot talk about the existence of two enterprises with absolutely identical features; each enterprise has specific problems and certain solutions of solving them.

The organizational culture constitutes a field of management, with a history relatively recent, which started to gain a general acceptance barely in the second decade of the 20th century.

Defining the organizational culture McLean and Marshall showed that this represents “an ensemble of traditions, values, procedures, conceptions and attitudes that create the context of the activity within the organization”.

In the opinion of the famous Dutch professor Geert Hofstede, the organizational culture is:

- holistic, in the sense that it represents more than the sum of the component parts;
- historically determined, because it reflects the evolution in time of the organization;
- connected to the elements of anthropological nature;

- socially founded, because it is created and kept by the group of persons who form the organization;
- difficult to change due to the complexes of the implied human elements.

The companies have ‘cultures’, as people have ‘personalities’. The culture of a company is its collection of beliefs and organic reactions almost instinctive, of heroes and negative characters, of realizations, interdictions and commandments. Some of these, as the neurosis of some people, are so deeply rooted, that their origin is lost in the darkness of the passed events, while others have living causes, visible.

The important aspect regarding the culture of a company is that people can familiarize better with the organization or even to anticipate the way of behavior, if they succeed to understand ‘the chemistry’ of its content. A commandment of the type ‘know yourself’ is pretty difficult for an individual. The company rarely knows what it needs to know about itself. To an individual, the way it is perceived his/her behavior can be shown by his/her best friend, the family’s doctor or by one of his/her colleagues from the study group. For a company, the observer who has the objectiveness and the interest to discover the mechanisms that lead to the functioning of the culture can be someone from the outside: an investor, a journalist, an analyst or a client.

The nature of the culture of an organization can be understood and viewed better if it is seen through the eyes of a foreign visitor. When someone sees the organization from a new angle, can perceive that intangible ‘social putty’ that holds everything together: the way in which the language, norms, values, rituals, myths, anecdotes and routine create that ‘coherent reality’ that molds the work of the people and the attitude they have towards it.

All the processes that take place within an enterprise, irrespective of their nature, are influenced by the organizational culture. Practically, in each organization there can be differentiated a formal and an informal organization, that cannot be separated. If the formal organization functions according the rules, politics and procedures, the informal organization develops spontaneously and can include individuals from different organizational levels. The informal organization implies relationships and human interactions within the organization, which are not officially prescribed, and has a dynamic character. It helps to the reduction of the tensions and is due to the needs of people of affiliation, friendship, security.

Within it, there can be distinguished the informal network of communication. Sometimes, this helps to the supplementation of the formal communication and often transmits the information more rapidly than through the official channels of communication. There are also disadvantages; thus, there can be transmitted erroneous information, suspicions, and half truths.

2. Levels of the organizational culture

Williams, Dobson and Walters structure the elements of the organizational culture on three levels:

- of beliefs and convictions, registered in the consciousness of the personnel of whom often is not aware of;
- of values and attitudes, which the employees of the organization choose and display;
- of the individual and group behavior within the organization, that can be perceived through spontaneous and systematic observations.

D. Roberts decelerates within the organizational culture other three levels:

- the exterior level, of surface – behaviors, slogans;
- the second level – values and norms partied by the employees of the organization regarding to what is good and bad, assuming the risks, the development of the organization and the employees;
- the tertiary level or profound level – beliefs, convictions of the employees.

Within the organizational culture of a company there can be differentiated, through the characteristics, more organizational sub-cultures:

- institutional sub-cultures – are shaped at the level of the main organizational sub-divisions of the company;

- professional sub-cultures – reflect the specific of the main categories of employees according to their profession.

3. The factors of formation of the organizational culture

The factors that influence the formation of the organizational culture, in general, and of the organizational culture of business, are numerous. From these we have stopped upon the most important.

The working group. The working groups appear in organizations in different forms. The working force is created by a formal authority, the organizations being networks of working groups. The variables that determine the formation of the group can be delimited into the personal characteristics (personality, experience, training, attitudes), situational variables (the tasks to fulfill, available space, the way of granting the awards – respectively the group as a whole or the individual). Groups appear due to the need of affiliation, the necessity to reach the goals, physical approach, compatibility between the personalities, the attitudes and values of the individuals. The nature of the group and the number of members affect the perceptions regarding the nature of the organizational culture. Each employee brings into the organization convictions, attitudes, behaviors, from whose intertwining results the organizational culture.

The implication regarding the mission of the group influences the cultural perceptions. At the same time, the relationships within the group are decisive for the process of creation of the organization's culture.

The general existent attitudes towards the risk and the existence of conflict, the types of relationships of communication will have a considerable impact upon the working group. They affect, at the same time, the amplitude of the innovation and organizational creativeness. According these factors, the members of the organization will develop an impression about 'what kind of working place is that'.

The style of leadership of the managers. This has a considerable effect upon the culture of a group. If the manager is distant towards his/her subordinates, this attitude can have a negative impact upon the culture. The trust in the manager, the embodiment of the chief in a positive example can influence favorably the efficacy of the group.

The managers always influence, substantially, the organizational culture, their influence being proportional to the hierarchical level. At the same hierarchical level, the influence differs from one manager to another, because the level of training and the leading style are not the same.

The organizational characteristics. They can affect, also, the type of culture that it is developed. The organizations differ according attributes as measure and complexity. Between the complexity of the organization's culture and the size of the company (that can be expressed through the business figure, capital, number of employees) there is a direct proportional report. Moreover, the big organizations tend to higher degrees of specialization and towards a bigger impersonal character.

Usually, in the small companies the culture is more homogenous, while in the big companies are clearly shaped the sub-cultures. The organizations, also, differ according the degree of formalization (expressed in rules, politics, norms) and after the degree of decentralization and autonomy.

The history of the company represents a factor with profound influence upon the organizational culture with tradition; at the same time, it differentiates the cultures of these organizations from the cultures of the new enterprises. The stage of the life cycle of the company can constitute an important factor rarely taken into consideration.

The economic situation of the company influences the organizational culture by its restrictions and economic facilities.

The founders and owners. In many cases, the founders create the philosophy of the company and determine the basic values. The owners of the company can exert their influence from more points of view: of the type of owner (natural and/or juridical persons); the number of owners. When there are a reduced number of owners, their influence can be more profound

The environment (juridical, economic, cultural, technological). The juridical environment can influence the organizational culture positively or negatively. When it includes contradictory elements its influence upon the organizational culture is negative. The economic environment of the company reflects the status of the national economy. Thus, the economic crisis is also reflected at the organizational level. The individual who enter or are within an organization of businesses are 'impregnated' with the values, beliefs, attitudes that come from the national culture. The economic culture is derived from the national culture and

presents particularities for each country, which manifests upon other variables – owners, employees, managers. The technique and technology used refer to the degree of technical endowment and the type of technologies used, which have implications over the organizational culture. Thus, the amplification of the degree of technical endowment of the companies has implications over the content of the organizational culture, after the reduction of the frequency and intensity of human contacts.

4. Short conclusions.

The cultural elements that are defined by Edgar Schein as ‘solutions learned of the problems’ identify two types of learning situations, which in practice intertwine.

In case of positive solution of the problem, the group tries different answers until the problem is solved. On the contrary, in case of avoidance of anxiety, once an answer is learned because it avoids successfully the anxiety, it will probably be repeated by an undefined number of times. Thus, all the rituals, the models of thinking and the behaviors can be initially motivated by the need of avoiding a situation of anxiety.

The cultural elements based on the reduction of anxiety will be more stable than those based upon the positive solving of the problem, due to the nature of the mechanism of reduction of anxiety and the fact that the human systems require certain stability for avoiding anxiety.

The majority of the cultural solutions within the new organizations come from early founders or leaders of these. The founders have the biggest influence, but, while the group is consolidated, its members will find their own cultural solutions.

There is a certain ‘force’ of the culture, which can be defined according to: homogeneity and stability of the members of the group; the dimension and intensity of the experience shared by the group. If a group has a long and prosperous history, succeeding to defeat more difficult problems of survival, it will have a strong culture.

If the group is characterized by a fragile stability, by its members who were together for short time and did not confront with no difficult problem, the group will have a weak culture, even if the individuals within the group may have very strong individual presumptions. There must be sufficient experiences shared by the group, in order to have defined a culture. From this point of view, the companies with tradition can be considered as having strong cultures, while the very young companies can be considered as having weak cultures. There can be stated that the individual is subject to a process of socialization to which it is subjected any member of the society.

The organizational socialization is the process through which the new members learn the basic goals of the organization, the preferred means by which can be reached the goals, the responsibilities, the models of behavior, the rules and the principles that allow the maintenance of the identity and integrity of the enterprise.

The socialization can be collective and individual, formal (attributions in this respect revert to the managers and the departments of human resources) or informal. Irrespective of its type, we remark two features:

- it is continuous;
- often, the members are not conscious of its existence.

Because the culture serves to the function of stability of the external and internal environment of an organization, there must be ‘handed in’ to the new members, who must perceive it as correct. We cannot forget the following aspect: some new members bring new ideas and can thus contribute to the changing of the culture, especially if the ideas are brought to the highest levels of the organization.

Abstract: Businesses in lohn evolve differently, according to the partner country and to the activity sector. In certain cases they go all the way to consolidate partnership relationships between foreign and native companies. In other cases they delay the adaptation of local companies to environment changes. In conclusion, business contribution in lohn to the dynamics of regional integration is very much diversified.

Keyboard: businesses in lohn, evolution of the lohn, the lohn in European Union states

In Romania, during 1960-1970 intense efforts were made to industrialise the country and large production capacities were set up both in the heavy industry and in the consumer goods industry (furniture, clothing, footwear, marble, faience, ceramics etc.). However a discrepancy was created between the financial and human effort for production on the one hand, and for marketing, especially for the external trade on the other hand. There are many causes for this, among which:

1. product creation was not encouraged, as many engineers were oriented towards productive sections; product creation sectors didn't have the proper quantitative and qualitative labour force;
2. training of economists for external trade was strangled.

In the last decade of the 20th century and currently, the offer of labour force qualified in external trade has developed, however changes in passing to own-brand trade did not occur, because the Romanian economy has been corrupted on a larger scale: production, finance, external trade etc.

In order to perform direct exports, an innovating management-marketing activity is necessary within companies, but most of the Romanian company managers do not intend to develop own brand production or to promote modern management and marketing. This is how in the last decade of the 20th century and in the beginning of the first decade of the 21st century, lohn has come to represent the main method of export for the Romanian companies producing consumption goods, especially clothing and footwear.

Textile-clothing industry held in the last years about 25% of Romanian exports and 17% of the population employed in industry. The number of factories from this branch increased from about 800, as there were in 1989, to about 8.600 in 2002. Currently, more than 80% of the exports of clothing factories are made by means of lohn, Romania being seen as “a tailor of Europe”.

It is suggestive that in 2000-2002 our country was classified on the sixth place in the EU import of clothing and clothing accessories, holding in the same time the first place among the countries of Central and Eastern Europe as a supplier of clothing items. Romania has also taken the seventh place in the EU export of clothing and accessories, being classified on the first place among the Central and Eastern Europe countries as a commodity market for these products.

The footwear industry represents another branch in which production in lohn holds an important weight. In 2000 unlike 1990, the number of companies increased from 202 to 1.807, production decreased from 1 billion dollars 856 million dollars, and the volume of sales on the internal market reduced from almost 700 million dollars to only 19 million dollars. The greatest part of the footwear industry is exported by lohn but in certain cases there is the following situation: Romanian factories supply the shoe faces which imply greater technological exigencies in manufacturing than soles; the latter are brought by foreign partners and are marked with the origin country and company, therefore the trade mark. As in the case of clothing, the footwear produced and exported in lohn by Romanian companies returns to the Romanian producer with a

very high price.

The consequences of lohn generalization in Romanian industry are contradictory. On the one hand, it has contributed to employment and obviously to obtaining currency contribution for the Romanian entrepreneurs. On the other hand, the capitalization of Romanian companies is slow and modest, and the profit obtained by lohn export is small. Moreover, the sector producing threads, fibres and fabric has been deteriorated, a traditional sector of Romanian industry with an economic history of almost 200 years.

Another shortcoming of the lohn is that the Romanian companies, even those which had or still have an own brand, lost their identity because the manufactured products are sold with the sequencer's brand. Similarly, lohn remains uncertain in the future because sequencers shift easily where the costs are more reduced hence profits are bigger. Therefore it is required that Romanian managers reconsider their position towards long-term extension of the economic businesses in lohn, orienting themselves towards selling quality products on the internal market and passing to own-brand exports.

In other countries too, such as Poland or the former Czechoslovakia, the proportion of businesses in lohn in textile industry reaches high levels with significant increases ever since 1991. In these countries the lohn took the place of direct trade, its dynamism compensating for the absolute decrease of direct trade. In other sectors specific evolutions appear. In Hungary for example, in the sector of mechanical industry the weight of lohn decreased within the context of dynamic growth of direct trade. This would mean that Hungarian companies are about to gain autonomy. In the Czech Republic, in this sector there are possibilities to make partnerships with companies from Germany.

In the Czech Republic as well, the footwear manufacturing and the electrical sectors are characterized by a combination between businesses in lohn and direct trade. This means that foreign companies, mainly the German ones are consistent in their relationships with local partners, while also promoting independent exchanges. In other words, within these two sectors the German lohn with the companies from the former Czechoslovakia determined a consolidation of the local capacities. This could be the first step in creating transnational production networks.

However businesses in lohn are not always beneficial. Withdrawal of German partners from the footwear industry in Hungary had devastating effects that the growth of direct trade could not overcome. In the Czech Republic, in the leather goods and printing industry and especially in the food products sector, businesses in lohn had a continuous growth, without a significant increase of direct exports.

Currently, Romanian footwear manufacturers are orienting themselves towards the internal market. For years, most of them preferred to produce for the export under labels such as Pierre Cardin, Hugo Boss or Gianfranco Ferre.

For example: All the two million clothing items issued each year from the Vesti-Ro plants used to hang until the last year on the hangers of some occidental shops such as H&M, Steilmann or Christian Dior. But starting with this year Vesti-Ro decided to sell a small amount of the production on the internal market under own label: Senso. In five years it plans to cover the local market with these products. All the five Vesti-Ro plants will produce then only for the local market. Change in orientation of the manufacturer from Focsani - a reference company in the field, with annual income of over 10 million dollars - marks a new trend in the Romanian textile industry. More and more clothing factories which so far made profit almost exclusively from the production in lohn are now attempting to launch and enforce own clothing brands on the internal market.

The main motivation of this trend is the fear that the accession of Romania to the EU will lead to wage increase, forcing Western companies to look for cheap labour in other countries, from East. Western manufacturers might even reorient themselves towards China, once this country is free to export as much as it wants as from 2005 when the "Multi-Fiber Agreement" expired, agreement which enforced export quotas to the member countries of the World Trade Organization (WTO). In the absence of export limitations, China will control 50% of the textile world market, according to the estimations of the future European trade inspector, Peter Mandelson, unlike 28% as it is controlling now and 19% as it used to control in 1995.

It is estimated that the Lohn in Romania will survive for at most 4-5 years, referring to the labour system where over 85% of the clothing industry operates. The alternative - that is own brand launch - is not a simple business. First of all, because it has to compete with famous international companies, then, because Romanians' purchasing power is still low. Last but not least, the competition caused by the invasion in

proportion of 75% of the market with cheap forged products, adding the high costs involved by launching a brand and opening own shops will not bring immediate profits.

The advantages of companies with own brands are for the future and not for the present and it is possible for them to have a smaller profit than those working in lohn, she says. The idea of those investing in their own brands is to try to gain average income customers. That is those who are not satisfied with cheap products but do not have sufficient income to invest in expensive foreign brands such as Steilmann, Marks and Spencer or Benetton. This segment will increase with the purchasing power and we can say there is enough room on the market. Romanian purchasers, so the manufacturers say, are more and more educated and place an increasing importance to the quality of products. This general trend will push a part of the consumers of cheap Chinese products dominating the market, towards the Romanian production, superior in quality and not very expensive.

The occurrence and consolidation of Romanian brands offering competitive products more expensive than the current Chinese products but cheaper than the foreign brands will gradually orientate consumers towards superior quality products. However, purchasers must be first of all accustomed to local brands. This is more and more difficult to achieve since the Romanian market becomes increasingly interesting for the western manufacturers. ,,

But Romanian factories get a reduced income quota, being paid only for the manual labour of the tens of thousands employees. The lohn system implies that all the necessary raw materials are supplied by the foreign company and the Romanian company delivers the finished good in the requested amount, therefore ensuring a profit of 0.7-1 euro per piece. Those marketing brand clothing all around the world are the great fashion houses which conclude execution agreements with native garment workers. The lohn will decrease, therefore from now on less and less brand products will be produced in Romania.

Thus, even if our country has acceded EU with the most powerful clothing industry, compared to the other European states, 3.000-4.000 micro enterprises, about 40% of the native companies, risk closing their doors because of an unfavourable concourse of factors:

- the existence of a great number of vulnerable enterprises without own brand and without implemented quality standards,
- pressure to raise workers' wages
- high credit costs.

It is estimated that a third of the Romanian clothing factories might disappear after accession, as a consequence of lohn delocalization (loss of agreements by the Romanian factories and their winning by countries with cheaper labour force, such as Ukraine or Moldavia).

It is well-known that the volume of the Romanian production in lohn has already decreased from 80% to 60%. Of the 5.000 clothing manufacturing companies existent in Southeast Europe (3.500 in Romania, 1.500 in Bulgaria and 300 in the Republic of Moldavia), 3.800 are clothing exporters in lohn, of which about 3.200 only in our country. In the last three years the Romanian lohn reduced its weight in the total of exports with about seven percentage points, reaching 45% in 2006. Theoretically, less lohn means more stable exports and in the same time, more products 100% "made in Romania". Similarly, the lohn tends to shift in the sectors where the labour force is much better paid. The part which is not so good but is anticipated is that the clothing and textile industry, where a great part of the lohn agreements are concluded, reduced its speed.

Although it reduced its weight in Romanian exports, the lohn continued to increase its value in the last three years, from ten billion euros in 2004, to almost 11.6 billions last year. "The lohn is a necessary evil for each economy in formation. It offers market and it sets performant labour regulations, even though it is not always well paid. Instead of closing your factory it is preferable to accept lohn agreements, especially if your partner is also providing the equipment to make the ordered products.

By means of outsourcing operations, developing nations such as Romania received both raw materials, materials, semi products and the technological documentation and the know-how necessary to perform the products and services contracted. Therefore, the offer of developed nations to the emerging economies represented an opportunity for the latter, contributing in the same time to a more efficient use of the labour force and to the increase in living standards of these countries.

Has Romania got to be too dependent on outsourcing? This dependence is generally related to the level of wages and therefore of the labour cost. In our country it is a greater dependence than in countries like Hungary, Poland or the Czech Republic, but smaller than in the case of Bulgaria or Ukraine.

Maintaining the tendency of diminution of lohn contribution, both in the total export and in the total import can be seen as a maturity sign of the Romanian economy. To this positive factor is also added the trend to shift the lohn from the sectors with a small added value to those involving more sophisticated technologies and labour force than in textiles, for example. As proof, the lohn in the trade with products of machine-building industry has speeded up lately. This industry has gained from the outsourcing process an income of about two billion euros only last year, according to the National Commission on Prognosis. In the same time, the light industry, although it holds the first place in outsourcing, gained 1.8 billion euros from lohn. Wood products, including furniture brought 0.3 billion euros.

Moreover, according to the National Commission on Prognosis, textiles and garments recorded in the last years a reduction of competitiveness as a consequence of wage rising, of national currency appreciation but also of the strong international competition.

The lack of labour force had consequences in the decline of this sector too. Last year in Light industry the number of employees diminished with 6%, compared to 2005, and the lohn orders decreased with almost 5%. It is expected that this trend continues in the following years as well.

The accelerated decrease of lohn volume, although alarming for the companies in the field, does not represent another national danger because it is compensated by the development of other sectors. No country can remain dependent on lohn if it wants to resist on long term in the world economy. To be the tailor, the shoemaker or even the electrician of the West is short and average term solution that needs to be replaced with own brands. Otherwise one remains a colony of the great economic powers with market and technology. "The chance of Romania, for the moment, is that losses in the lohn of light industry were compensated and even overcome in volume by the one in the other sectors".

The European Union states are the main recipients of the lohn in our country. Last year almost 86% of the lohn export of Romania went to these countries. In the case of Light industry, over 97% of sales went to the Union. There are high values in other branches too: the machine-building industry (84.5%), articles from concrete, stone or glass (94.9%), wood products, including furniture (74.8%). The most important partners in the case of lohn trade are Italy and Germany, countries to which exports in amounts of 3.1 billion euros and 2.5 billion euros went last year.

A partner that becomes more and more interested in sending outsourcing in Romania is Hungary. If the amount of lohn export to the neighbour country was of 264 billion euros in 2003, last year it reached 640 billion euros. There is a slight tendency for certain companies that produced until now in Hungary to place a part of the production in Romania, because the labour force is cheaper than in our country. According to the Hungarian official, especially the branch offices of multinational companies that wish to optimize their costs appeal to this practice. Almost 80-85% of the Romanian-Hungarian trade is carried out between big multinational companies with production in both countries.

But not only the branch offices of the multinationals present in Hungary send their production to our country, There are more and more West-European companies that renounce their lohn agreements with Hungarian partners in the favour of Romanian ones or even partners from countries where costs are even smaller. Hungary is less and less interested in the lohn production because the labour force costs increased very much in our country. Romania is still attractive for this type of agreements, but as wages rise here too, the lohn will diminish.

Important changes as concerns the lohn take place not only among states, but also on the level of economic branches in our country. If in some industries with small added value it began to lose outsourcing agreements in favour of countries such as India and China, in other sectors in which the added value is big our country will still be able to remain attractive in the following years. Recently, the great world actors in the area of IT - IBM, Oracle, Microsoft - have opened in Romania regional supporting centres in which they employed or intend to employ an impressive number of specialists. A great number of products will be externalized to these centres.

Currently over 90% of the Romanian software trade is made of outsourcing; however the actors in this industry estimate that the situation will change in the following years. The competitiveness of the Romanian companies will diminish compared to the one in India, China or Russia, because of the great rise

in wages. Outsourcing was essential for the development of Romanian software industry, but it is time we passed to services with bigger added value in order to maintain our competitiveness on the international level.

For a time horizon between three and five years, Romania is still going to be a destination for the outsourcing projects in software. After this period of time, although the wages of Romanian programmers will continue to be smaller than the Western ones, the difference in cost will not be big enough in order to account for the inherent risk arising from the management of this type of projects.

In general, the outsourcing phenomenon presented for Romania a series of advantages, the clearest one being the maintenance of jobs in the sectors that received such agreements. However there were other benefits too, such as the technology transfer that accompanied foreign investments, the growth of the level of labour force qualification and managerial ability, including in the marketing field. Hereto are added the increase of competitiveness, the connection to quality and control standards, specific to the external markets. In the same time it permanently helped to diminish the trade deficit and the current account deficit of our country.

Despite this favourable contribution, the evolution of the External trade of Romania has become increasingly alarming. While exports increased last year with only 37% compared to 2004, imports raised to over 55%, and the trade balance deficit has doubled. This situation became more prominent in the first months of this year. 44.9% of the Romanian export for 2006 was made from lohn agreements. Their amount rose to about 11.6 billion euros.

DETERMINATION OF THE BEST MAINTENANCE METHOD BASED ON THE TOTAL MEDIUM MAINTENANCE COST

Romocea Marius

University of Oradea, Faculty of Electrical Engineering and Information Technology, Universităţii
Street nr.1, mromocea@yahoo.com

Abstract When approaching the maintenance activity, cost represents a complex element due to the fact that the performance parameters of the operation of the equipments are fundamented on statistical basis. This paper presents different cost categories, depending on the applied maintenance method, fact that allows the department Manager adopt the best decision for extending the lifetime of the equipment or replacing it.

The exemplifications in the present study case confirm the fact that the preventive maintenance policy is the most profitable one, the corrective one being extremely costly. The conclusions given at the end of the study case serve the elaboration of the maintenance amelioration plans.. The most convenient cost will be obtained if we replace the equipment at the MTBF moment, but this fact will lead to extremely high investment expenses.

Keywords: maintenance, cost, repair, disturbance.

INTRODUCTION

The economic criteria that help the decision taking when choosing the best maintenance method are bound up with costs, with the efficient determination of their level. The economic efficiency principle, set at the basis of the leading process aims the knowing of the economic effects of the expenses needed for the maintenance activity [1].

The informations regarding the maintenance activity expenses and costs are improved along all the stages of the leading process, beginning with the palnning activity and ending with the reception of the works. The calculation of the maintenance activity costs fulfils the role of a binding element between two components: the material and the technical one, on one hand, and the value one, on the other hand, being an alignment factor in the operative leading. The costs prominence can be made based on the maintenance types or on the equipment [2].

THEORETICAL BASIS

The determination of the maintenance systems costs will be accomplished with the help of the total medium maintenance cost per time unit. Regarding the fact that the main applied types of maintenance systems are the corrective and the preventive maintenance, we distinguish the following costs categories:

- The total medium corrective maintenance cost per time unit (C_1 , in lei/t.u.).
- The total medium preventive maintenance cost per time unit (C_2 , in lei/t.u.)

Regarding the existent corrective maintenance systems we distinguish the following costs categories [3]:

- The total medium curative maintenance cost per time unit (C_{11}).

$$C_{11} = \frac{p + P}{MTBF} \cdot \left[\frac{\text{lei}}{\text{hour}} \right] \quad (1)$$

where:

p = cost of one preventive intervention (lei);

P = cost due to the fall of the equipment (lei);

MTBF = mean time between failure, respectively average of the interval of time between two successive falls, being expressed in hours. This indicator is statistically determined.

- The total medium palliative maintenance cost per time unit (C_{12})

This cost type distinguishes itself from the previous one through its p , P and $MTBF$ values and, as a consequence, we have:

$$C_{12} = \frac{p + P'}{MTBF'} \cdot \left[\frac{lei}{hour} \right] \quad (2)$$

where:

P' = additional cost paid in case the equipment falls;

$MTBF'$ = mean time between failure after the standardized period, being expressed in hours. This indicator is smaller than the initial value of $MTBF$.

- The total medium preventive maintenance cost per time unit (C_2)

For dimensioning the preventive maintenance activity there can be used the following costs categories:

- The total medium systematic maintenance cost per time unit (C_{21}):

$$C_{21} = \frac{p + P \times F(t)}{m(t)} \cdot \left[\frac{lei}{hour} \right] \quad (3)$$

where:

$F(t)$ = disturbance probability of the critical element considered in the t service period. At the end of this period a corrective intervention will be necessary.

$m(t)$ = the medium using period of the critical element considered (in hours).

In case of a systematic preventive replacement at the end of the T period, $m(t)$ may be expressed as being:

$$m(t) = \int_0^T [1 - F(t)] dt \quad (4)$$

Out of (4) results that the $m(t)$ period is inferior to T period of systematic preventive replacement.

If it gets to a damage, we place it in the situation of a corrective maintenance, where $m(t) = MTBF$.

- The total medium conditional maintenance cost per time unit (C_{22}):

$$C_{22} = \frac{p + g}{K_c \cdot MTBF} \cdot \left[\frac{lei}{hour} \right] \quad (5)$$

where:

g = the conditional maintenance application cost expressed as the sum of the acquisition expenses for the necessary collectors and sensors.

K_c = the conditional intervention coefficient that, as a rule, increases $MTBF$

- The total medium forecasting maintenance cost per time unit (C_{23}):

$$C_{23} = \frac{p + g}{K_p \cdot MTBF} \cdot \left[\frac{lei}{hour} \right] \quad (6)$$

where:

K_p = the forecasting intervention coefficient that will substantially increase $MTBF$.

STUDY CASE

The object of the study is the comparative analysis of the costs of different policies that may be applied in case of the maintenance of Adller machines for sewing leather faces, from one section that is specialized in footwear production.

The used data have been extracted from the functioning norms of the equipment, the technical book of the sewing machine, and, those regarding the costs, have been furnished by the bookkeeping service and the production manager:

- The cost of a preventive intervention at this equipment is 20 lei,
- In case the machine would get out of order (a medium complexity disturbance), according to the maintenance costs register there results that its repair would get to a medium cost of 250 lei,
- At a standardized functioning period of 10.000 h, MTBF is 250 h,
- In case of applying a systematic maintenance, the disturbance probability $F(t)$ would be 0,35, corresponding to a medium using period $m(t)$ of 320 h,
- For the maintenance of this type of equipment there can also be used a controlling device for the technological functioning parameters for the main sub-assemblies that costs 400 lei at a guaranteed functioning period of 2.500 h,
- A conditional intervention costs 40 lei, getting to a K_c coefficient K_c of 1,5.
- The last types of devices used for the general control of the functioning parameters cost 1000 lei and the producer guarantees for 5.000 functioning hours, a K_p coefficient of 2,5, at the same application cost of the method,
- One part of the sewing machines has an outdated standardized functioning period and, consequently, one is not able to obtain a MTBF' smaller than 50 h, by any means,
- The new machines are guaranteed for a functioning period of 1.000 h.

According to the formula (1), we obtain a total medium corrective maintenance cost per time unit:

$$C_{11} = \frac{20 + 250}{250} = 1,08 \left[\frac{\text{lei}}{\text{hour}} \right]$$

If the machine is used over the standardized functioning period, the medium palliative maintenance cost on time unit would be:

$$C_{12} = \frac{20 + 250}{50} = 5,4 \left[\frac{\text{lei}}{\text{hour}} \right]$$

If we use a systematic maintenance, then the total medium systematic maintenance cost (C_2) would become according to (3):

$$C_{21} = \frac{20 + 250 \times 0,35}{320} = 0,34 = \left[\frac{\text{lei}}{\text{hour}} \right]$$

If we choose the acquisition of a measuring and controlling apparatus, then the cost applied for the conditional maintenance g becomes:

$$g = \frac{400}{2500} \times 250 + 40 = 80 \text{ lei}$$

Accordingly, the total medium C_{22} conditional maintenance cost becomes according to relation (5):

$$C_{22} = \frac{20 + 80}{1,5 \times 250} = 0,27 = \left[\frac{\text{lei}}{\text{hour}} \right]$$

The application of the forecasting maintenance methods will lead to g' expenses calculated as being:

$$g' = \frac{1000}{5000} \times 250 + 40 = 90 \text{ lei}$$

The medium forecasting maintenance cost per time unit C_{23} will become:

$$C_{23} = \frac{20 + 90}{2,5 \times 250} = 0,16 \left[\frac{\text{lei}}{\text{hour}} \right]$$

4. CONCLUSIONS

Analysing the obtained results we can draw the following conclusions that allow us choose the best alternative regarding the maintenance system that should be applied:

- the most economical maintenance policy is the forecasting one, representing 0,16 lei/hour. But, this implies the acquisition of an A.M.C. that is costly, even if it proves its efficiency in time. In addition, this facilitates the avoidance of the non-quality costs of the obtained products;
- but, with a less costly investition one can choose the conditional maintenance that will also lead to reduced costs, close to those of the forecasting maintenance;
- if there are no funds for applying the conditional maintenance, then the systematic maintenance is the most convenient from the point of view of the hour-cost (0,34 lei/hour);
- the corrective maintenance is extremely costly, leading to a total medium maintenance cost of 1,08 lei/hour;
- if we want to use the sewing machine only during the guarantee period (when we have no corrective maintenance expenses and MTBF can be considered 1.000 hours) and then replace it, then, the most convenient alternative is the corrective maintenance, the medium cost per time unit being in this case:

$$C'_{11} = \frac{p}{MTBF} = \frac{20}{1000} = 0,02 \left[\frac{\text{lei}}{\text{hour}} \right]$$

- the most convenient cost (0,02 lei / hour) will be obtained if we replace the equipment at the MTBF moment, but this fact will lead to extremely high investment expenses. But, this strategy presents the advantage of the possibility to permanently have last generation equipmet, the unit costs of production being maintained at an acceptable level considering the productivity increase.

THE PROQUALITY NATIONAL PROGRAMME – THE MAIN APPROACH TO IMPROVEMENTS IN COMPETITIVENESS ON THE GLOBAL MARKET, TO REDUCING THE GAPS AND TO INSURING A LASTING

Rosca Remus Dorel

Universitatea din Oradea, Facultatea de Stiinte Economice, Oradea, str. Universitatii nr. 1, Catedra de Management-Marketing, remus_rosca@yahoo.com , 0740/246610

The Japanese miracle is not a miracle. The outstanding evolution of the Japanese economy after the Second World War owes to both the cult for labour present in the Japanese society and to the influx of knowledge on quality passed on by the two American scientists, Deming și Juran in the 1950s. The postwar economic recovery programme of Japan focussed mainly on the high quality of products.

Based on the realities of the Romanian economy, we thought it mandatory for a person preoccupied and dedicated to the field of quality to conceive a project for promoting the cult of quality in the Romanian society, aimed at improving the individual, organisational and national performance in this respect, for the ultimate increase in general welfare.

Key words: quality, The National Proquality Programme, mission, objectives, strategic model, specific projects and activities

From our point of view, **The National Proquality Programme (PNP)** should be managed by the Romanian Government, by the Ministry of Economy and Finance to be more exact, involving all interest groups: associations and NGOs that are concerned with quality (e. g.: ASRO – The Romanian Standards Association; ARC – The Romanian Association for Quality; FRPC – The Romanian Foundation for Quality Promotion; FRPC Juran – The “Joseph M. Juran” Romanian Quality Award Foundation, SRAC – The Romanian Society for Quality Assurance; RENAR – The Romanian Accreditation Association), the business environment represented by the Employer’s Association, the top management and the quality managers, the academic environment, the local public administration institutions and other state institutions, the mass-media and the consumers. The programme could be transferred to the responsibility of an NGO, but we encourage the first alternative, due to the decision-making powers, the available resources and the authority typical of a government.

The Proquality National Programme Mission:

- The improvement of the Romanian economy’s competitiveness by promoting the quality-specific managerial philosophy and practices, all aimed at the final result, EXCELLENCE;
- The improvement of the quality of life for the citizens by promoting the cult of quality and the quality products on the market.

The Proquality National Programme Objectives:

- a) The top management awareness of the importance of quality as strategic business element in the context of business globalisation;
- b) The training of all-level personnel in the organisation in the spirit of quality (the cult of quality and use of quality management-specific methods and instruments);
- c) The promotion and the support for the implementation of quality standards. International standards play a key role on international markets;
- d) The support for the efforts of certification (of products or systems) made by organisations in accordance with national and international standards;
- e) The harmonisation of the Romanian legislation with the EU law;

- f) The facilitation of access to domestic and foreign information in the field of quality;
- g) The facilitation of co-operation between the academic and business environments in quality-related projects;
- h) The adaption of the efforts towards preparing the workforce on high-school and graduate levels for the workforce market needs by including certain quality-specific fields of study in the curricula;
- i) The development of the quality-specific institutional infrastructure;
- j) The facilitation of foreign assistance through the co-operation with international organisations in the field;
- k) The promotion of the J. M. Juran Romanian quality award;
- l) The promotion of “quality brands” for the products manufactured or sold on the Romanian market;
- m) The education of consumers in the spirit of quality.

The Proquality National Programme Strategic Model:

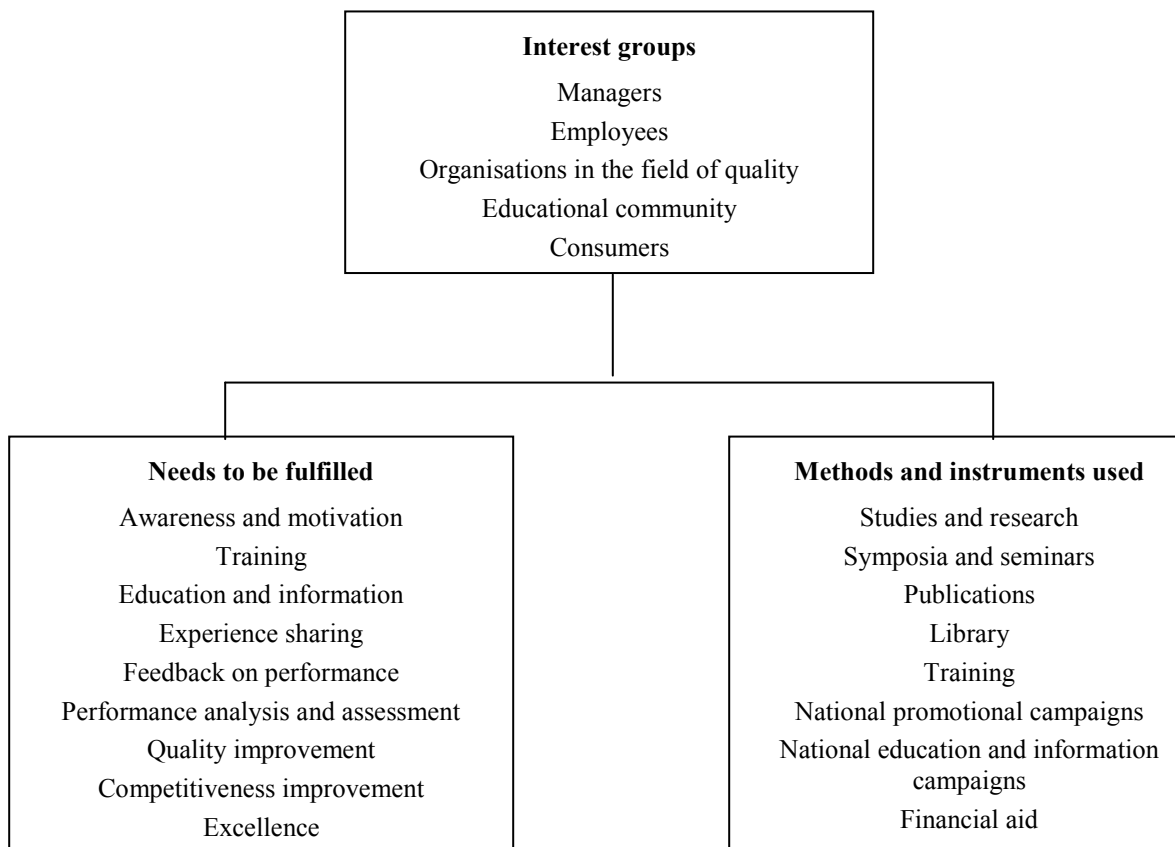

Fig. 7 - The Proquality National Programme Strategic Model⁹³

The Proquality National Programme - Specific Projects and Activities

All projects and activities initiated within the Proquality National Programme are aimed at achieving the objectives laid above and at fulfilling the mission for which it was created. They can be grouped in:

1. Infrastructure projects;

⁹³ Adaptation after the FUNDECE strategic model – The Argentinian Business Foundation for Quality and Excellence

2. Training projects;
3. Educational and information projects;
4. Quality promotion projects;
5. Financial aid projects;
6. Projects for rewarding outstanding performance in the field of quality.

1. Infrastructure projects are aimed at creating an infrastructure, a system through which the central-level initiatives should flow and the local-level ideas should easily reach the central level and the creative potential of certain target groups should be made available. The most important infrastructure projects are:

- a) The county-level development of a PNP cell, within the Prefect's Office or the Chamber of Commerce. They will have the role of implementing initiatives on the local level, central-level projects and will insure the necessary feedback. The PNP cell network will insure the uniform distribution of information in the field of quality on the national level, to avoid neglecting the countryside. Thus, an impulse for improving the competitiveness of the entire economy will be generated and not only that of the capital city, an aspect which should not be ignored socially;
- b) The creation of quality circles⁹⁴ within high-school and university educational establishments, made up of teaching staff and pupils and students, respectively. The PNP cell in every county will assist these circles. Their purpose will be: the improvement of the quality of the teaching process; stimulating the "educator – educated" partnerships; the distribution of quality-related information, promoting the principle "Do something right from the beginning and every time". Thus, the aim is to introduce and promote quality as a lifestyle for the new generations, vital for the economic and social future of the country.

2. The training projects will have two target groups: the top management and the other quality managers within the organisation. Regarding the firýt group, the objectives are:

- The awareness of the importance of quality as strategic business element in the context of business globalisation;
- Highlighting the top management responsibilities in implementing a quality management system: communicating the importance of quality within the organisation, defining the policies and objectives in the field of quality, insuring the necessary resources for their achievement, using the creative potential of employees by practicing an active management and implementing the system of suggestions, periodic assessment of organisation capabilities in offering quality and initiation of appropriate preventive and corrective actions;
- Highlighting the importance of the quality management system certification within the organisation, according to standards from the ISO 9000 family, this representing a premise: that of improving the quality of the obtained products; of foreign partnership;
- Presenting the SR EN ISO 9001:2001 quality standard and its main scopes;
- Presenting the TQM-specific modern management methods and techniques that allow the achievement of EXCELLENCE.
- The training programmes for quality managers within the organisation aim at:
 - Presenting the SR EN ISO 9001:2001 quality standard and its main scopes;
 - Achieving the internal quality auditor certificate;
 - Presenting the most used instruments in quality management.

3. Educational and information projects shall be given a central place within the PNP, based on the premise that quality is mostly a matter of culture, of values (personal, organisational and national). The most important educational and information projects refer to:

- a) Publishing a bulletin with national and international information on quality. It will also include a virtual copy;

⁹⁴ We add that the notion of "quality circle" is not given the classical meaning in the field-specific literature

- b) Creating a library with field-specific literature. An important place within it will be represented by a collection of “case studies” from managerial practice. Thus, Romanian managers will be encouraged to share their experiences. The library will gather quality-specific publications from Romania and abroad;
- c) Publishing DVDs with quality-specific themes;
- d) The project “Appreciate quality”. It aims at informing and educating consumers in the spirit of quality, highlighting the benefits of purchasing quality products, the rights consumers have and the possibility of filing complaints in case of dissatisfaction;
- e) The project “The month of quality” shall have a strong educational and information purpose. The month of November will be declared the month of quality on a national level, organising various activities dedicated to this theme;
- f) Organising a round table where all the actors from the field of quality will be invited, for the purpose of facilitating the exchange of information and experience;
- g) The introduction of quality-specific fields of study in the curriculum, so that every high-school or university graduate should study at least the basic aspects of the quality theme. An important role in this respect will be played by the Ministry of Education, Research and Youth, who will have to understand the importance of such a project;
- h) Organising seminars with the participation of international specialists who share their experience from developed countries, presenting the models to follow;
- i) The introduction of the Romanian barometer of client satisfaction. Its main role will be that of monitoring the client satisfaction on certain product markets (material goods or services). The barometer-specific objectives will be: comparison of the performances of various fields and industries regarding the client satisfaction; comparison of individual performances of organisations with the industry average; reflection of the evolution of performance over time; forecasting regarding the evolution of performance. The barometer will represent a guide for consumers and a representative feedback, conclusive for the bidders on the market.

4. Quality promotion projects are aimed at raising the awareness of the Romanian citizens, both as employees and consumers, regarding the importance of quality and their motivation towards achieving it. The main promotional projects will consist of:

- Presenting and promoting the Proquality National Programme in all environments of the Romanian society. Its importance and the need of involvement from the part of the entire society will be underlined. The most important promotional instruments used will be: e-marketing and public relations;
- Broadcasting cleverly made TV and radio ads in order to sensitise the society in the matter of quality viewed in its entire complexity;
- The annual selection of a number of companies within which PNP representatives will promote quality by holding seminars in front of the employees;
- Promoting of a quality brand for the products sold on the Romanian market, labelled “Q”, to allow consumers to easily identify quality products. The management of a quality brand implies rigour and transparency.

5. Financial aid projects refer to:

- Granting scholarships on graduate and postgraduate levels for those persons willing to refine their knowledge in the field and showing outstanding interest and skills;
- Granting financial aid to organisations willing to achieve a certification according to the standards from the ISO 9000 family or other international standards. In our opinion, priority should be given to organisations who export at least part of their production.

6. Projects for rewarding performance in the field of quality regard the persons and organisations with outstanding performance in the field. In this respect, the “Joseph M. Juran” Romanian Quality Award will be managed. It will consist of two sections: companies and personalities, respectively.

The chances of success for the **Proquality National Programme** are influenced decisively by the following factors:

- The degree of involvement of the government;
- The programme-level leadership;
- The quantitative and qualitative resources;
- The degree of receptivity of the Romanian society towards such an initiative;
- The programme-specific organisational structure. The model we propose is presented in annex four.

We estimate that the first effects of the implementation of the Proquality National Programme will appear after at least three years. We consider the PNP to be of vital importance to the Romanian society and economy. They need a new type of leadership, a new system of values that centres around quality and performance, regardless of the level of analysis (individual, organisational, national). The Proquality National Programme represents a premise to speak about the “**Romanian miracle**” in the not so distant future.

Abstract: The change has become a fundamental indicator for contemporary economy, from society to organization, every component being submitted to a continuous modification process of constructive and functional parameters. The current market economy is chiefly marked by the globalization tendency of the competition, by major and rapid changes of technologies and human resources.

Adapting organizations to the changes emerged in the external environment represents one of the managers' constant preoccupations focused on maintaining the organization's effectiveness as well as on increasing its performance.

The organizational change aims at some aspects extremely different from the point of view of its complexity, starting from the reorganization of the working teams to the elaboration of some new strategies or the improvement of the organizational structure.

Key words: managerial change, organizational development, models of change

Motto: "Give me the serenity to accept the things that I cannot change, the courage to change the things that can be changes and the wisdom to distinguish one from the other." Reinhold Niebuhr

Updating organizations to the changes emerged in the external environment represents one of the managers' constant preoccupations. In many circumstances, adaptation actually demands an organizational development by improving the strategies and the organizational structure in order to increase activity effectiveness. Management specialists pay special attention to the organizational structure.

R. Richard, used to consider in one of his papers that "the organizational development represents a planned effort, coordinated by the top level management which aims at the entire organization and is intended to increase effectiveness, to improve the working conditions by modifying processes and using the information of the science of behavior."

This presentation of the concept displays some **features** of the organizational development:

- - The improvement may be addressed to the entire management system or only to a part of it;
- - The process is based on a large variety of methods and techniques specific to the entire management system or only to a part of it;
- - These measures seek to make some changes mostly in the employees' behavior;
- - Managers pursue both to implement these changes and to maintain and improve them;
- - The organizational development is meant to increase effectiveness that is a rational usage of resources and an increase in the quality of products and/or services, in the work productivity and a permanent improvement of the working environment within the organization.

We must underline the difference between the concepts of organizational development and organizational change. The organizational development refers to the conception, design and implementation of some changes that indulge the efficient usage of resources and the increase of economic effectiveness. The organizational change aims at some aspects extremely different from the point of view of its complexity, starting from the reorganization of the working teams to the elaboration of some new strategies or the improvement of the organizational structure. As a matter of fact, the change represents, generally speaking,

*“the activity of replacing a thing with another or someone with someone else: granting a thing a different shape, aspect, modifying, transforming, adapting, enriching and improving”*⁹⁵.

Today we discuss a lot about **change management** which consists of *“the totality of new concepts and methods with direct or indirect applicability upon organizations and people in order to survive and flourish in a generally very mobile environment”*⁹⁶.

We can also say that **organizational change management** consists of *“the totality of processes of anticipation, organization, coordination, training and control, of some measures meant to replace, modify, transform or reform the organization’s shape and content in order to increase its efficiency and competitiveness”*⁹⁷.

Change management is a complex process which regularly goes through several **stages**: *establish the factors that initiate change; recognize the need for change; diagnose the issue/issues; determine the methods and the alternatives for change; identify the factual conditions; selecting the most adequate methods for change; surmount the resistance to change; implement and coordinate change.*

In our opinion, organizational change and development are extremely important processes in adapting the company to the environment where it operates in order to increase performance and competitiveness. If they are well known and correctly implemented they may represent modalities of assisting the process of emphasizing the organization out of the competition.

According to some specialists, the organizational transformation is successful if we respect the following **prerequisites**:

- - managers must be willing to operate changes within the organization;
- - employees must analyze the organization’s values and classify them into good or bad ones;
- - changes must be accepted by most part of the employees and managers;
- - agents of change must deal with the problem in case they face resistance to change;
- - changes must be associated with study in order to comprehend the new thing and its implications upon the organization;
- - most employees must recognize the necessity of making the respective changes;
- - the organization must be responsive to turn to specialized people inside or outside the organization in order to analyze the current situation and to recommend solutions in order to resolve the issues;
- - employees must be permanently informed about the stage of change and its effects on short, medium and long term.
-

In some circumstances, the change is accompanied to a certain extent by risk and incertitude⁹⁸. There are organizational cultures where people reject the change and try to stand against it. These objections hinder its implementation. In other organizational cultures, with an environment open to study and communication, changes are welcome. To surpass these problems that hold a clearly opposing position to the change, in general, we need to choose carefully the personnel responsible for the implementation of the process of organizational change.

The activities for the organizational change are regularly done with the help of three **categories of personnel**:

⁹⁵ Puiu Al., “Management-analyses and comparative studies”, Economic Independence Publishing House, Pitești, 2004, p. 281

⁹⁶ Puiu Al., “Management-analyses and comparative studies”, Economic Independence Publishing House, Pitești, 2004, p. 282

⁹⁷ Burduș E., Căprărescu G., Androniceanu A., Miles M., “Management of organizational change”, Economic Publishing House, Bucharest, 2003, p. 23

⁹⁸ Lynch R., “Corporal strategy”, ARC Publishing House, Bucharest, 2002, p. 838

- *Specialists inside or outside of the organization*, people with experience in the organizational processes and having qualities that allow them to carry out an audit of the organization and put changes into practice;
- *Specialists in different fields regarding the organizational development* (rewarding system, quality control, informatics, organizational design);
- *Manages that have a certain experience, certain knowledge and qualities in designing and implementing change*. They play the most important role in managing change as they are deeper involved than the consultants.

The separation between the three categories of personnel involved in improvement is, most times, difficult as their roles are sometimes switched.

The research made in the field of organizational change has demonstrated that the specialists that obtain remarkable results in this domain have a series of **qualities and knowledge** such as: ability to diagnose a problem, knowledge of inter-human communication and human behavior, capacity to set up goals, ability to solve problems, imagination, fairness, impartiality, flexibility, awareness, self-confidence, trust in people. In a word, they have the qualities of leaders that permit them to provide everyone with the necessity of change implementation. The persons involved in an organizational change process must be intelligent, well-prepared from a professional point of view, must act in good faith and be ethical. Many important companies such as Levi-Straus, Intel, Procter&Gamble have created their own consultants in organizational development and change. Usually, it is necessary to make mixed teams of specialists inside and outside the organization. As the organizational performance issue is a delicate one, the changes proposed by the specialists must be assimilated and accepted by the employees, not imposed.

The instruction of the specialists in change is made, according to the American research, through training programs, workshops inside and outside various training specialized institutions (universities, labs), Master's programs or even doctorate programs. These training programs must be accompanied by many hours of practice that allow the specialists to know as many companies and circumstances as possible. The activities of change consultants are oriented to increase the company's profitability, its competitiveness on the market where it functions. They must also solve the interest conflicts that may arise between employees and company. They must demonstrate integrity in their relations with the organization's members in order to anticipate any possible communication problems.

Generally, there could be various **problems**⁹⁹ that specialists must solve tactfully so that the change implementation becomes possible: *the misunderstanding, the wrong usage of data and information, the employees' forced usage in the change process, the conflict between values and purposes, the faulty techniques*.

The misunderstanding is the situation when the two parts, the specialist in organizational improvement and the employees work together in unclear conditions. The changes that the specialist intends to make are in contradiction with the managers or the other employees' deeds.

The wrong usage of data and information is possible when there is no agreement between the employees and the agents of change. If the information provided is used to blame the organization's members, they do not present the real one, but they twist reality.

The employees' forced usage in the change process may lead to the emergence of some disagreements or conflicts that practically hinder the change process. That is why, it is necessary that the agents of change inform the employees about the change process in order to provide their participation.

The conflict between values and purposes comes forth when the objectives set by the change process are not clear and they contradict the modalities of achieving the respective objectives.

The faulty techniques are those habits which the specialists in change apply and which are not adapted to the specific of the organization or are not sufficiently known to be implemented.

⁹⁹ Burduș E., Căprărescu G., Androniceanu A., Miles M., "Management of organizational change", Economic Publishing House, Bucharest, 2003, p. 31

The change becomes difficult even under favorable circumstances. First of all, the change is determined by fear: the fear to lose market, the fear to lose jobs, the fear of cutting off profits and the fear of failing. Some strong organizations faced problems before taking the change into consideration. For example, Xerox and General Motors lost more than 30% of their market; IBM registered record-breaker financial losses.

An efficient model of organizational change¹⁰⁰ could be the following:

- Everyone must assimilate the necessity of change.
- There must be a common conception regarding the way in which the change will affect the organization.
- Everyone must have the feeling of being involved in the improvement process.
- Top management must be the first to undertake change and be a model for the rest of the organization.
- Management must eliminate barriers.
- Every employee must be informed about the impact of change.
- Everyone must undertake a training program in order to obtain high performance in the new environment.
- An evaluation and feedback system must be introduced.
- A proper environment for taking risks must be provided.
- Command management must be replaced by persuasive power management.
- Exemplary behavior must be rewarded.

The models or the theories for change represent those conceptions regarding change planning and implementation in the organization and describe the specific activities imposed by the initiation and development of change in an organization. The most important models for change enumerated by specialists are: Edgar Schein's model, Kurt Lewin's model, the model for research, the model for contemporary adaptations to research, the model for systematic approach, the general model for change planning.

In some regions, especially in the Scandinavian countries, a series of models for change are being applied. For example, the LOM program involving 100 companies was applied in Sweden. This program was centered on the idea that the development of communicational abilities and structures using an overall and profound approach of the organization determines, on the basis of a strategy, different changes in the company's performance. Similar to this program, the JOY Program was applied in Finland and was finalized with appreciable positive results.

In order to simplify the process of change, competitive organizations regularly formulate ideas that synthesize the conception regarding activity development. For example, the **American Bankers Insurance Group** from the United States of America has created an informal behavior guide, carved into stone and placed at the entrance of its headquarters.

This guide is made up of ten commands:

- You will never get into trouble because you enterprised something, but for not doing it. You have the right to say: I was wrong!
- Stay away from the central area of the competition and be proficient in products innovation and marketing.
- To get profit you must follow the ABC rule: Adequate motivation system, Better solutions to complaints and financing based on Common sense.

¹⁰⁰ Harrington H.J., Harrington J.S., "Total management in the 21st century company", Teora Publishing House, Bucharest, 2000, p. 101

- The most important person in a company is the one that succeeds in selling all products.
- The executive management has the duty and the responsibility to put questions about everything and to everyone.
- When you are in a business you must wonder: Why am I so lucky?
- If you reach a managerial position you do not receive authority but responsibility.
- To accomplish your objectives you need highly trained and strongly motivated employees.
- The most important personal qualities integrity and perseverance.
- Never offer your support to an unfair person.

Creating an organizational culture suitable to change means promoting change on the internal market and involving employees in the external market issues and environment realities. The more stimulated is the employees' self-confidence, the greater availability they will display in taking the risk of change.

THE NECESSITY TO PROMOVION THE MANAGEMENT BASED ON KNOWLEDGE

***Abstract:** Taking into consideration the current conditions, in which “information is often assimilated with power” the major interest for most organizations stands in collecting the necessary knowledge at a high qualitative level and using it with maximum efficiency, through its materialization into adequate managerial conducts, actions and decisions. Together with the assurance of the material, human resources, both international and financial, the performing organizations are more and more preoccupied by the production, transmitting, usage, depositing and protection of knowledge, especially of the strategic ones, essential for the companies’ development. The information became more and more a resource, a major asset, a main product and at the same time a strategic advantage for organizations, fact that has a significant influence over the content and the way of manifestation of the management, imposing with acuteness the promotion of the management based on knowledge.*

***Key-words:** management based on knowledge, information, culture of knowledge, a learning organization.*

From Michael Lester’s point of view, the management based upon knowledge is a key process, that through the capitalization of changes determined by both digital technologies and internet, contributes to the obtaining of economic performance in the countries, companies and the involved industrial branches, thus determining an increase of the life standard of the population. This approach shows the vision of the IT staff and gives a great importance to knowledge and innovation, the analysis of the managerial problems being tightly connected to the top information technologies.

From the management specialists’ point of view, one can notice the remarks belonging to Christina Rollo and Thomas Clarke that state the fact that management based upon knowledge is not a goal in itself but derives from the actual interests of the organizations in developing the field of production and the knowledge flow with the purpose of adding economic value.

The functionality and efficiency of management based on knowledge derive from its characteristics, namely: acting like an organization that is willing to learn; creating a tradition in knowledge; using data bases that include knowledge; mapping knowledge; dividing knowledge between employees and the other stakeholders; developing communication based on knowledge; leadership manifestation; using team work; learning from negative and positive practice.

In order to carry out some competitive activities it is necessary that the companies should maintain and develop continuously their knowledge portfolio that is they should be transformed into **organizations that are collecting information all the time**. The success of this step is conditioned by the fact that all the employees should become aware of the necessity of transforming the knowledge into the main resource of the company, as an intensive involvement of the managers within this process. Knowledge accumulation and the efficient usage of these are achieved either through the process of individual learning, at the level of each employee, or through the organizational teaching, achieved through a great scale of methods: allotting consultancy and specialty assistance, special programs of perfecting outside the organization, training courses inside the organization, etc.

The organization involved in the process of learning is characterized mainly through:

- supports the process of learning, research and communication with the purpose of achieving the organizational objectives;
- provides all the time opportunities of learning for all its components, because the organization that is involved in this process of learning means first of all employees that are studying;
- assures the mixture between individual and organizational performance;
- considers the generated tension as a source of energy and renaissance;
- the process of knowledge and taking into consideration the factors that influence the organizational learning: the environment, the organizational culture and structure, the company's strategy, the employees, etc.

Within the successful implementation of the management based on knowledge, a decisive role has the organizational culture that according to Adam Flor, can represent "either the greatest enemy or the greatest ally". That's why it is necessary the "**construction of a knowledge culture**" whose definitive elements should be as it follows:

- is receptive at new things, at the innovation within all the activities of the organization;
- situates in the first line people and knowledge and not material things or elements;
- is focused on the individual and organizational learning and the intensive participation of the employees at taking decisions;
- is motivating in taking risks, actions and performance and tolerant in front of failures and errors, especially within the innovation process;
- lays the accent on the development of agreement, collaboration and cooperation among specialists based on knowledge;
- is open for both internal and external stakeholders, the relations among these being based on mutual respect and correctness.

As in the current context knowledge exerts a significant impact upon the performance and functionality of the organizations, it is necessary the **usage of data bases that include knowledge**. These include the assembly of knowledge within a company, structured according to the way they are obtained, the form of presentation and the domains of usage. As a rule, the knowledge used within a company is divided into two main categories, namely: external and internal, which in their turn are individual and organizational. The structure of knowledge is necessary because the costs of identification, getting, integration, usage, protection and capitalization are sensitively different.

Within the companies that use an impressive volume of complex and diverse knowledge, that have a crucial impact upon the obtained performance, there is often used the **mapping of knowledge**. This stands for a process that has as a goal the identification of the main resources of the existing knowledge and their usage among the stakeholders of the organization.

The success of the promotion of management based upon knowledge is conditioned by the induction to the staff of the organization of the conception and conducts according to which **the parting and usage of knowledge between employees and the other stakeholders** is a normal and efficient approach both individually and organizationally. For this thing it is necessary the existence of a strong material and moral motivation, that should make the knowledge possessors share others as well and help them to use it. They should be convinced that after this process, through feed-back and other generated connections there can be obtained the amplification of the initial knowledge value, simultaneously with the increase of prestige and the development of the initial possessors of knowledge. This process is influenced by the existence of an organizational culture that promotes the sharing of knowledge among employees.

Altogether with the increase of dynamism and the complexity of the socio-economic phenomena, with the increasing tendency of change in all the domains of activity, it is more and more obvious the fact that the obtained results are influenced directly by quantity, quality and opportunity of the available information, provided through communication. The increase of complexity of the managerial process, the appearance and the usage of some perfected means of communication and decision make that the technology of information be viewed as an indispensable instrument for management, because as Robert Heller stated,

the manager should be “excellently informed”. The intensification of the organizations’ interests for the promotion of management based on knowledge determines ***the development of the communication based on knowledge***, because one of the “keys” of the efficiency in management is the achievement of good communication at all hierarchical levels.

In order to put into value the multiple features of the management based on knowledge it is necessary the existence of a strong ***leadership***, more intensive and stronger than the one exerted within classic organizations. This derives from its accent laid upon knowledge and innovation and at the same time from its role of putting into value the silent knowledge of the stakeholders. *The main parameters of the leadership of the organizations and of the management based upon knowledge* are:

- directing the leadership towards a daring vision, that is simultaneously dynamic, creative and communicational;
- focusing on ideas, on knowledge value and the promotion of the “new”;
- paying an increased attention to the harmonization of the roles, responsibilities, rewards and the estimation of the other stakeholders of the organization;
- using on a large scale the “populist” communication at the level of the whole organization and at all hierarchical levels;
- possessing a great capacity of work and a permanent curiosity every time for everything that is around;
- the leader’s possession of knowledge, multiple abilities and capacities, fact that will permit him/her to encourage diversity, creativity and initiative among the members of the organization.

Another important characteristic of the management based on knowledge is ***the usage of the work in team***. Team activity favors the dynamic effects that keep alive the continuous development, stimulates the individual qualities favorable for cooperation and interdependence and the active communication is favorable as far as some pre-established targets are settled, strengthening the cohesion inside the organization.

From the analysis of the functionality and performance of the organizations based on knowledge there came out several pragmatic conclusions, ***some major errors in putting into application the new type of management as well as some key aspects in perfecting and increasing the managerial efficiency***. These elements with a general character that appeared from the experience of the organizations that promote management based upon knowledge represent extremely useful reference points for the managers of the organizations, for consultants, trainers and examiners in specific domains.

The studies made by specialists in domain has shown a series of *errors* within the implementation of the management based upon knowledge namely: focusing with priority on the stocks of knowledge in the disadvantage of the flows of knowledge; the consideration that human beings are not rational all the time and from here the consequence reflected in neglecting the process of thinking; replacing the human nature contacts and the direct communication with contacts and communication based on technologies; the approach stressing the systematic leading of the place of work just as simple as a car is driven; the separation of knowledge from its usage and asking for measurements and direct estimations of these, etc.

In a similar way, *the major aspects with a determinant role in the efficiency of the management based on knowledge* are: identifying the knowledge and information that people need and providing it on time; integrating the creation and usage of knowledge within the economic process both inside and outside the organization; creating communities based on knowledge within the key area of the economic process; connecting people to the process of treating information with the purpose of achieving economic performance, etc.

All the characteristics presented above state the increased complexity of the management based on knowledge and the decisive role of the human factor in creating, implementing and exerting it efficiently. Through implied logistics, used specialists and permanent process of actualization, development, usage and protection of knowledge it attracts considerable costs, being a very expansive management. Although not practicing the management based upon knowledge is even more expansive having negative effects upon the obtained results, on a long period of time determining even the collapse of the organization.

The decisive role held by knowledge in all domains of economic activity through the impact exerted upon the functionality and performance of the organization, asks for the promotion of the management based upon knowledge. The characteristics of the management based upon knowledge show its increased complexity and the significant role of the human factor in creating, implementing and exerting it efficiently.

THE RECRUITION AND SELECTION OF THE COMMUNITARY OF THE CIVIL SERVANTS

Secară Carmen Gabriela

Universitatea din Pitești, Facultatea de Științe Economice, Pitești, Jud. Argeș, Str. Negru Vodă, nr. 42, bl. C3, sc. A, ap. 18, carmen.secara@yahoo.com, 0740145444

This article analyzes all the aspects about the career of the public administration personnel, specifically: the recruiting, time of probation, the public functionary probation.

A public servant must be judged by what he does not do as a professional in his own sphere C. Towards this end, a system to judge the qualitative and quantitative output of an employee has to be devised.

One of the sectors of public administration reform in Eastern and Central Europe is the development of human resources as well as improvement of it. Though the new EU countries are rich in educated and well-qualified public servants, imperfect legislation and currently existing training system impede the progress of public administration.

Key words: career, human resources, public administration

The recruitment is the activity of the human resource management which identifies the sources of qualified candidates in order to occupy a job and determines them to apply for occupying some new or vacant jobs within an organization.

1.Considerations regarding the activity of recruiting within the European organizations

Within the employment policy of the human resources within the states of the European Union, certain aspects are the most representative. One of them is the role of initial forming which is considered to be crucial in Great Britain. Most of the European organizations began to develop forms of original flexibility. The functional mobility and the management of the European career of the human resources, along with the standardized evaluation systems, allow the creation of authentic ways of promoting the young human resources.

In Great Britain, there isn't a cvasimonopoly of occupying the human resources, just exactly A.N.P.E owns it in France, the used methods of recruiting being:

a) The small advertisings made in media

In this respect, the daily "Times" created a special supplement, "Times Higher Education Supplement" which is similar to the daily "Campus" of the newspaper "Le Monde" from France.

b)The private recruiting agencies are to be found either under the shape of the recruiting agencies-selection, or with consultants specialized in recruitment "head hunters" for the high level managers. The recruitment and selection agencies can offer even temporary jobs.

c) Job centers

These are the British equivalents of the A.N.P.E and depend on the governmental organization "Manpower Services Commission". Destined to those who seek for a job, this job centers offer their services freely in all the sectors of the industry and in trade.

d) Professional and Executive Recruitment –PER

The mission of this agency of recruiting the specialists and the executive managers and consists in the connections between the organizations which recruit and the persons which are searching a working place. One of the means used by PER consists in publishing the work offers in the magazine "Executive Post", publication which circulation exceeds 200000 copies as well as in "Graduate Post", publication reserved to owners of University diplomas who are in search of a working place.

e)The British organizations put a very remarkable stress on the formation of the new employees and practise the reconversion of the employees and the internal promotion¹⁰¹. Practices as decreasing the importance of the age conditions and flexible work programmes (especially for the feminine population) are more and more often used inside the British organizations, even more than in the European ones.

Inside the British organizations, the balance of the ages is assured by recruiting young people for less qualified jobs, the internal promotion allowing them the access to the superior jobs.

In terms of mobility , the British feature stands in the disjunction between the basic education (school and highschool) and the professional route.

In the other European states, the used methods of recruitment don't differ very much.

We can observe that both the advertisings published in mass-media and the spontaneous candidatures are the most preferred in the recruiting activities. We also observe¹⁰² in the olandophone Belgium, the importance of orientation and positioning services for the human resources. Being very active,these services dispose of a various and wide range of support mechanisms in the main universities.In the francophone Belgium, the professional contacts established by the didactic staff, the relationships of the family and of the friends occupies an important place. In Denmark, since 1980, the great universities created special courses for counselling and forming the young people with a regard to finding a working place. In Ireland, the orientation services are very active and, within them are organized visits inside the enterprises.

Recruiting and selection programmes made by a specialized recruiting agency

Step 1: The analysis of the organizational context

- **Analysis of the organization strategy and of the vacant job:**
 - analysis of the general context of the organizational strategy;
 - ◆ the definition of the job (the main responsibilities, the ierarchical position in which it is function, wage payment, general conditions for work etc);
 - ◆ making out the profile for the ideal candidate.
 - analysis of the job and of the general conditions of framing by the specialists of the recruiting agency;
 - ◆ the proposal of the profile for the ideal candidate;
 - ◆ evaluating the dimension of the recruiting activity.

Launching the mission

- - finalizing the analysis of the job and adopting the final decision together with the representatives of the organization,regarding the ideal profile of the new employee;
- accepting the ways and of conditions for intervention of the specialists at the recruiting agency ;
- launching the mission.

Step 2: Recruiting and selecting the candidates

- ***Studying the place of developping the activity for the future recruited person***
- - paying a visit to the place where this one will work;
- - analysing the management of the professional career and of personalities belonging to the potential colleagues,superiors,subordinates;
- - getting other information specific to the future activity of the newly employed.

Investigation and preselection

- consulting the agency card index;
- locating the potential employees;

¹⁰¹ L'Agence Nationale pour L'Employ, Magazine Enterprise et Carriere, March, 1999

¹⁰² Iulia Chivu - Dimensiunea Europeană n managementului resurselor umane, Editura Luceafărul, București, 2003, p.113

- collecting the general preliminary regarding the potential candidates;
- contacting the candidates;
- making the preselection, evaluating the candidates and making their classification
- obtaining the supplementary information regarding the candidates.

Final selection

- drawing up the preliminary report for the client; analyzing the candidate; their comparative evaluation and prefiguring the final directions of action;
- detailed discussions with the selected candidates ,analyzing their psychological profile;
- checking the references and obtaining the complete information about the candidates.

Step 3: Adopting the decision of employment

- detailed examination of the candidates' files , along with the representatives of the organization and selecting the persons which corresponds to the requirements of the job ;
- organizing an interview with the selected persons;
- assuring the assistance of the decidents in order to adopt the final decision and the negotiation of the employment proposal.

Step 4: Integration of the new employee

Following the integration in job and organization of the new employee:

- approaching the new employee and the organization during the testing period of time;
- having an interview with the new employee at the end of the testing period of time;
- finalizing the file for the organization.

Recruitment of the communitary civil servants

In the member-states of the European Union, the legislation has general and specific conditions of occupying certain positions from the public administration ¹⁰³;

There are 4 distinct models regarding the recruitment and selection of the civil servants in the following way:

- the model of a common minimum of formalities which implies the obligation of publishing the vacant jobs, model valid in Holland and Denmark;
- the German model characterized by selection in steps and the free recruitment also assumed by Luxembourg ;
- the British model characterized by a recruitment made through an independent commission, also assumed by Ireland;
- the French model characterized by organizing the competitions and preparations in schools of professional instructions of the civil servants which are responsible for the preoccupation of professionalism ¹⁰⁴.

In the European democracies, the recruitment of the civil servants, impartial and having a high qualification is one of the essential roles of the state, the recruiting being basically made on the ground of two principles:

a) The principle of the equality at the access

¹⁰³ Ilie Gorjan - Administrative Law , Lumina Lex Publishing House, Bucharest ,2005, page 195.

¹⁰⁴ Dana Apostol Tofan- Discretionary power and the power excess of public authorities , All Beck Publishing House, Bucharest, 1999, p. 292

This principle is present in the Declaration for the Human and Citizen Rights since 1789, and it is resumed in the article number 21 of the Universal Declaration for the Human Rights with the following wording: "all the persons have the right to accede, in conditions of equality, to public positions in their own countries". In this way, restrictions and discriminations formulated on sex, religion, race, opinions¹⁰⁵.

The only accepted limitations are those regarding the nationality, morality, age conditions and psychic abilities.

b) The principle of the public competition

France and Spain are countries which proceed like that in recruiting for almost all the jobs within the public administration except ones that are the object of a political nominalization.

In France there is the prestigious school of instructing the high civil servants "Ecole National d'Administration", which assures the selection of the professionals and then their solid instruction in order to be integrated in key-positions of civil servants. The admission at this institution as well as the subsequent selection of them in order to occupy high positions in the French Administration is very tough. By the system of the competition, two major objectives are being fulfilled:

- the correct evaluation of the candidate's capacity ;
- guaranteeing the independence of the authority which have the task to select ;
- Italy also admits, this principle, but this applies in a reduced number of fields, among which the diplomacy and magistracy .

In Great Britain and Belgium, the evaluation of the candidates' capacity is done through independent organisms.

In Germany, the candidates must follow a formation course before they apply for a job within public positions. Both in France and in Germany, the public position is considered an independent force which assures "the continuity of the state". This act like a mediator between the state and society and guarantees the respect of the public interest.

In Great Britain, the civil servants are considered faithful assistants of the government chosen in a democratic way. Of course, the ministers have a certain discretionary power in naming the high servants directly subordinated to them.

The first chapter of the third title from the statute dedicated to "the officeman career" ,has as a regulation object " the recruitment " of the communitary officemen.

We find the dominant principle in this matter according to which "the staff's recruitment" is done by competitions "with oral and written tests" organized by each institution (there are, in the same time interinstitutional".

After analyzing the dispositions of this chapter, we detach the following principles which governs the recruitment of this category of civil servants:

- a).the recruitment must assure the selection of the most competent persons, of those which, by their qualities, by education and instruction, can determine remarkable capacities;
- b). the recruitment must assure the selection of the persons which corresponds from the viewpoint of their integrity to the attaining the statute of an officeman for a communitary organism;
- c).the recruitment must be done on sufficiently large geographical basis, so that it can assure the access to the communitary functions of as many representatives from the member-states of the EU.(art.29).

Therefore, it is necessary that " the recruitment should take into consideration, beyond the competence criteria and job interest, the necessity that a certain geographical balance should be assured between various nationalities.... "

Article 29, by paragraph number 3 statutes that "no public function can't be reserved to the departmental representatives of an established member-state".

¹⁰⁵ J. Rideau – Droit institutionnel de l'Union Europeene, 6e ed. Montchristien, 1997, p. 391

This aspect acquires an even larger importance within the direction functions.

d) the recruited person should meet those necessary conditions in order to acquire the position of community officeman¹⁰⁶.

e) the recruitment is done with a competition, which is the rule¹⁰⁷.

We therefore detach the conclusion that the recruitment of the community officemen is dominated by the competition principle, which admits certain exceptions, in the cases purposely and limitatively stipulated by article 29(2) from the Statute.

By the regulations adopted by the Community, by practice and jurisprudence of the Court, there have been followed up making a policy in the matter of the European public function in order to allow the access and maintenance of certain capable persons to face the complex problems which are attributed to the invested ones.

The difficulty to achieve such a desideratum was underlined in the specialized literature: "No juridic rule, no matter how well it is conceived, won't hinder the clientage, nepotism and all the other forms of corruption¹⁰⁸".

The juridic rules reside in the elimination at the maximum of the practice to name in a discretionary way, of the policies and practices by which it is followed the deviation of the goal and the significance of this extremely important institution for the theory and practice of the EU.

2. Required conditions for the community officemen

Initially, the European organizations adopted the system according to which the office workers are recruited and appointed by the hierarchic boss, who, at his turn is elected by the delegates of the states. The system was also adopted by ONU which allows complete liberty to the general chancellor in order to recruit the staff, in the conditions fixed by the General Assembly.

At the recruitment of a future European officeman, two categories of conditions are taken into consideration:

Fixed conditions, which are the same for all the candidates, namely:

a) Nationality which imposes that the respective person should be a departmental representative for a member-state of the Union.

Article 28, paragraph(1) stipulates this condition at its first letter in the way that "it can't be an office-worker the person which is not a departmental representative in a member-state of the Communities...". In the continuity of the text it is accepted the possibility of a waiver given by the authority invested with the power of appointment".

b) The condition regarding the exercise of the civil rights

This condition is stipulated by the same text as the previous one, which forbids the acquiring of the office worker statute by the person who doesn't enjoy the exercise of the civil rights.

c) The condition to satisfy the obligation stipulated by the recruiting laws in the military field, more exactly performing the military service for men (article 28, letter "b").

d) The guarantees of morality, which are deduced from the rap sheet and from presentation of some references and recommendations.

¹⁰⁶ These conditions are deduced from the interpretation of the article 28 from the statute which establishes "who can't be appointed an office worker", resulting, per a contrario, which are the conditions which have to be fulfilled in order to acquire such a quality ".

¹⁰⁷ We say this, because it is admitted by article number 29, paragraph (2) from the statute that another procedure of recruiting that the one belonging to the competition can be adopted by the authority invested with the power of appointment...". This other procedure can't refer to anything else but the recruitment of the office workers from the grades A1 and A2 or, in exceptional cases can refer to those positions which involve a special qualification.

¹⁰⁸ Jean -Luc Bodiquel - La fonction publique europeene, in Revue Internationale des Sciences Administratives, vol.61, no.3, September 1995, page 506

Such a condition is supported, according to Lassale, by the argument that “An individual who is not moral in his country of origin ...can't be part of a supranational community,in which the main object is ,in the end, serving the interests of the departmental countries”.

e) Physical abilities which excludes the existence of some infirmities or diseases which can hamper the exercise of the function. Article 28, letter “e” imposes the condition that the future office worker “should satisfy the conditions of physical abilities demanded for the exercise of his functions”.

f)The condition that the respective person should prove the profound knowledge one of the languages of the Communities and of a satisfactory knowledge of one of the Community language,in the necessary measure of exercising the function which he/she is summoned to do. (“art.28.”f” letter).

We consider that the statute imposes the knowledge of two languages of the Communities, among which one in a profound way ,while the other in a satisfactory manner.

g) Other conditions :

Variable conditions:

To this category usually belong: titles, diplomas, level of experience. The positions from a superior category denote a superior professional background.

All the international institutions have as a dominant tendency as an appointment that “to assure the organization the services of the persons which possess the highest work ability, of competence and integrity”,such as is stipulated,for instance in art.4 from ONU statute.

There are 2 criteria at the base of the selection:

a)The criterion of the merit which is established according to the nature, the grades obtained by the office workers, this being governed by similar principles to those from the national legislation. This criterion deals with the classical difficulty of making distinction between the very good, good and the worse office workers .

b)Besides the merit, in the selection of the European agents there are other objective elements, too , such as age, work age, age in a certain grade etc.

THE IMPORTANCE OF THE CIVIL SERVANT'S DEONTOLOGY IN ACHIEVING THE CAREER

Secară Carmen Gabriela

Universitatea din Pitești, Facultatea de Științe Economice, Pitești, jud. Argeș, str. Negru Vodă, bl. C3, sc. A, ap. 18, carmen.secara@yahoo.com, 0740145444

In order to have a career, the two basic conditions must be concomitantly fulfilled, namely stability and continuity. A professional civil servant will know that, besides the two conditions, will also have to prove a dignified behaviour inside the organization. He will have to know the legislation which rightens the professional deontology and to appropriate it, both theoretically and practically.

The reason for which we opted to present this theme lies in the acknowledgement of the fact that, no matter how competent and professionally performant a civil servant would be, if he hasn't got an ethic behaviour, everything is useless.

Key words: career, legislation, ethic behaviour

1. The ethics (deontology) of the civil servant

The criticism regarding the existent corruption in certain administrative sectors can't be ignored in defining the objectives of the administrative units. It is absolutely necessary to pay a special attention to the ethics in exercising the public function as an essential characteristics of the office workers who are under the service of the administrative unit.

The study of the problem regarding the ethics in exercising the public function became a basic element in order to succeed that the units of the public administration in Romania should be able to integrate the principles of efficiency, of the market economy and the efficaciousness which the Constitution provides such as serving the general interests.

The described phenomena don't constitute an originality of our society, nor of our administrative system. They are also found in occidental countries with well-defined market economies. Nevertheless, the intensity which it should attain –in this way it is fundamentally conditioned the efficaciousness of our administrative system, it will depend, to a great extent on its incorporation as a remarkable aspect in an ample formulation of the objectives for the fiscal unity. The consideration of the external environment is considered like a basic element in a proper orientation of public politics.

The administrative- territorial unity is, more than other organisms, an institution of human resources. This means that any strategical action which would want to make will have to be put into practice, in a 100% proportion by the civil servants who are subordinated to it.

The administrative unit, unlike other institutions is based on human resources which represents distinct characteristic features:

- from the viewpoint of their training, they are very qualified persons;
- they work in structures of administrative services with a high level of identity;
- in great part, they are owners of a culture and value system specific to the service they belong to.

These characteristics make that the relation of the institution with the internal environment should be fundamental in order to carry out the strategic objectives. This is the other environment in which there must be done a jump from a policy of simple administration of the human resources to a more strategic relation which should assure their involving into the policy of the administrative unit. In this environment, the main task which the administrative unit should carry out would be the identification of the human resources with its objectives and their involving in the idea of public policy.

The human resources must become active agents of the administrative unit policy, surpassing an attitude which, traditionally, was more passive. The system of incentives and the ways of organizing the work must be oriented in this direction. There has to be a motivation in the direction of involving the human

resources, into the conglomerate of values, principles and objectives which were enounced. It also has to be stimulated their participation in the process of taking decisions. In this way, the triangle incentives-motivation-participation represents the fundamental element in the process of transforming the of the territorial-administrative unit towards an effective public policy.

It is obvious that the participation is unequivocally conditioned by motivation which must find a natural finality in those incentives. Existing relations of interconditioning, it mustn't be forgotten and neglected that motivation has a coherent system of incentives which stimulates the staff to a more active and efficient participation in attaining the required objectives for any administrative unit.

1.1 The notion of deontology for the civil servant

The notion of "deontology"¹⁰⁹ can be defined both from etymological point of view and as its object of research. From etymological point of view, the word "deontology" comes from the Greek language, from the Greek words "deon" , "deontos" which means "what is due" and "logos" which means "science".

We can define the deontology as a complex system of rules which outlines a certain professional and private behaviour. And because deontology contains both rules which sanction the behaviour of the various professional categories (as a result of committing a misbehaviour or violating a rule at the working place) and rules which aim the private behaviour and which are not sanctioned by juridical norms, it was asserted that it is at the limit between law and moral.

Consequently, we can define the deontology of the civil servant as being the complex of the norms which governs the professional and private behaviour of the civil servant.

The deontology should find itself in all the forms of expressing of the individual ¹¹⁰. Such as it was expressed in the doctrine of the administrative law , "the deontology of the national civil servants presents the characteristics that they act in the name of the public authority, that they represent the authority's instrument of willing and acting"¹¹¹.

1.2 The sources of the civil servant's deontology

They can be classified in two big categories:

- written sources;
- unwritten sources.

The main source by right of the civil servant's deontology is the Constitution of Romania which establishes the principles underlie the professional behaviour of the civil servant as well as the conditions of access in a public function ¹¹².

The Constitution of Romania establishes the following:

- the principle of equality for all the citizens in front of the law completed with the principle according to which no one is above the law(art. 16,paragraph 1 and 2);
- the principle of trustiness towards the country ,which practically represents a consequence of the article 16 from the basic law,according to which "the public.civil and military functions and dignities can be occupied just by persons which have exclusively Romanian citizenship and the stable residence in the country" (article 16, paragraph 3);
- the principle of discharging the duties, with a whole-heartedness, by the citizens entrusted with public functions,in which scope they will be sworn in ,what is required by law (article 54, paragraph 2);
- the principle of non-dissemination at the occupation of a public function ,case in which the state guarantees the equality of chances between women and men (article 16,paragraph 3);

¹⁰⁹ The collocation was used for the first time by the English lawyer Jeremy Bentham in the work entitled "Deontology or the science of moral"

¹¹⁰ Nicolae Cochinescu "Introduction into juridical deontology",Magazine "The law" no.4/1995

¹¹¹ Paul Negulescu "Handbook of administrative law" ,second edition, Bucharest , 1943,page 52

¹¹² Doina Popescu, Andreea Drăghici – „The deontology of the civil servant”, Paralela 45 Publishing House, Pitești 2005, p. 26

- the principle of obeying the Constitution and the law;

The law is also another source of the civil servant's deontology. We refer here, first of all, at the law regarding the conduct code of the civil servants which settles the norms of professional conduct for the civil servants and also to the organic law regarding the statute of the civil servant and other laws by which it settles various categories of civil servants.

The conduct code of the civil servants enacts the principles which govern the behaviour of the civil servants:

- a) the supremacy of the Constitution and law, principle which is also found in the fundamental law, according to which the civil servants have the obligation to obey the Constitution and the laws of the country. Consequently, like any citizen of the Romanian state, the civil servant has the obligation to obey the laws of the country, and the inobservancy of these obligations as a principle implies the liability of the civil servants in a deep relation with the grossness of the committed deeds
- b) the priority of the public interest¹¹³, principle according to which the civil servants have the duty to consider the public interest above their personal interest, in exercising the public function. This principle must compulsory govern the activity of the local and central administrative structures. Denying the application of this principle in public administration means denying the existence of an efficient administration in the citizen's service, fact which directly determines the occurrence of corruption and bureaucracy, which lead to an administration with a lack of transparency and difficult;
- c) assuring the equality of treatment of the citizens in front of the authorities and public institutions principle according to which the civil servants have the duty to apply the same juridical regimen in identical or similar situations. The treatment which the civil servants apply to the beneficiaries of the public services must be the same, without being influenced by subjective factors in order to disturb the developing of the public activity in normal conditions¹¹⁴;
- d) professionalism, principle according to which the civil servants have the obligation to fulfil his/her job duties with responsibility, competence, efficiency, correctness and conscientiousness. The professionalism is a ground rule which governs both the professional conduct of the civil servant and his/her moral conduct.
- e) the impartiality and independence, principle according to which the civil servants are obliged to have an objective attitude, neuter towards any political, economical, religious or other interest in exercising the public function. Impartiality represents that abstinence to discriminate in favour of a person within the job relations;
- f) moral integrity, principle according to which the civil servants are forbidden to require or accept, directly or indirectly, for themselves or for others, any benefit or advantage in considering the public function they hold or to abuse in some kind of way of this function. This principle tries to regulate a situation which, unfortunately, appeared after 1989, namely the corruption at the level of local and central administration, as well as ultra vires action. Regarding the last aspect, Law no. 7/2004 stipulates in article 3, letter „f” an interdiction, in the sense that „the civil servants are forbidden...to abuse in any way of the public function”. In order to avoid the corruption and the power abuse, the law provides the obligativity of the the form of return both at appointing in the public function and at the dismissing from it;
- g) the freedom of expressing and thinking, principle according to which the civil servants can express and underlie their opinions, obeying of the juridical order and good manners;
- h) the honesty and correctness, principle according to which in exercising the public function as well as in discharging their job duties, the civil servants must be of good will;

¹¹³ The public interest is defined as that interest which implies the guaranteeing and obeying by the public institutions and authorities, of the rights, liberties and legitimate interests of the citizens, admitted by Constitution, internal legislation and the international agreements to which Romania belongs.

¹¹⁴ In the specialized literature it was asserted that as long as in the public function there is an individual, these problems of subjective nature can't disappear, because the man himself is a subjective element

- i) opening and transparency, principle according to which the activities carried out by the civil servants in exercising their function are public and can be subjected to the monitoring of the citizens. Transparency implies to carry away the citizens in the activity developed by the public authorities, providing by the civil servants of some information which regards the good progress of the activity within the respective collectivity.

The governmental resolutions and orders¹¹⁵, the regulations of internal order which contains norms by which a certain professional and private conduct of the civil servant is established from certain authorities or public institutions also represents sources of the civil servants' deontology.

A very important source of the civil servant's deontology is represented by the international regulations (the international agreement) which, inasmuch as they are approved by Romania, they become integrant of the internal law.

The common law, as an unwritten source, represents a source of the civil servant's deontology only regarding certain categories of civil servants (for example in the domain of diplomacy). Even the jurisprudence could be enumerated in the category of the sources for the civil servant's deontology for the reason that the administrative law is a branch of the law which doesn't benefit from a proper code.

1.3 The ground rules of the civil servant's deontology

By the ground rules of the civil servants' deontology are understood those guiding ideas which should find themselves at the base of all the activities developed by the civil servant and which have the role to determine the efficient functioning of the service or institution to which they belong. These can result either from the fundamental law or by their particular statute.

1. The principle of the Constitution supremacy and the obedience to the law

This principle is stipulated in article 51 from the Constitution of Romania, being compulsory to all the citizens of the country and moreover, to the civil servants as owners of the public authority. As a consequence, in the developing of their activity as well as outside their job, the civil servants are held by this fundamental duty.

11. The equality of treatment towards all the beneficiaries of the public service

This principle gets the foundation in article 16 from the Constitution of Romania which obliges the civil servant to a non-discriminating conduct and to an equal treatment towards all the beneficiaries of his services.

12. Transparency
13. Efficiency and effectiveness
14. Responsibility according to the legal provisions
15. Orientation towards the citizen
16. Stability in exercising the public function
17. Hierarchical subordination

2. The conduct and discipline of the public function/contractual function

As most of the jobs, both the public function and the contractual one are regulated by conduct codes including norms regarding the ethic and discipline of the function, the main objectives of these codes being those of assuring the growth of the public service quality, a better administration in achieving the public interest and the contribution to the elimination of the bureaucracy and corruption from the public administration in general. The applying of the conduct codes requires, first of all, knowing and understanding of these norms.

¹¹⁵ For example, the governmental resolution (GR) no. 1083 regarding the organizing and functioning of the disciplinary commissions within the public authorities and institutions.; governmental resolution no. 1084 regarding the methodology of evaluation of the individual professional performances of the civil servants, as well as litigating the grades which were granted. GR no. 667 /1991 regarding some measures in order to assure the social prestige of the civil servants (published in the Official Monitor no. 205 since 8 October 1991), the governmental decree (GD) no. 82/2000, GD no. 284/2000, GD no. 291/2000 etc.

General norms of conduct for the civil servants:

- assuring a qualitative public service;
- loiality towards Constitution and law;
- loiality towards the public authorities and institutions;
- the freedom of opinions;
- norms regarding public activity of the civil servants;
- norms regarding the political activity in exercising the public function;
- norms regarding the usage of the personal image in considering the public function which he/she holds;
- norms regarding the frame of the relations in exercising the public function;
- norms regarding the conduct within the international relations;
- interdiction regarding the acceptance of gifts, services and other advantages;
- norms regarding the participation at the process of taking decisions;
- observing the principle of the objectivity in evaluation;
- norms regarding the usage of the prerogatives for public authority;
- norms regarding the utilization of the public resources;
- norms regarding the limitation of taking part to acquisitions, grantings or rents;

General norms of professional conduct of the contractual staff

- assuring a qualitative public service;
- observing the Constitution and laws ;
- loiality towards the public authorities and institutions;
- the freedom of opinions;
- norms regarding public activity of the contractual staff;
- norms regarding the political activity of the contractual staff;
- norms regarding the usage of the personal image in considering the public function which he/she holds;
- norms regarding the frame of the relations in exercising the duties specific to the function;
- norms regarding the conduct within the international relations;
- interdiction regarding the acceptance of gifts, services and other advantages;
- norms regarding the participation at the process of taking decisions;
- the objectives in evaluation;
- norms regarding the hindrance of the abusive usage of the duties related to the function they hold;
- norms regarding the utilization of the public resources;
- norms regarding the limitation of taking part to acquisitions, grantings or rents;

At present, the coordination and control of applying the conduct norms is in the task of the National Agency of Civil Servants – for the civil servants, respectively in the task of the Ministry of Administration and Home Affairs, the Foreign Office and the Ministry of National Control Authority- for the contractual staff ; it is not stipulated the existence of a distinct structure at the level of the local public institutions which should deal with the popularization and implicitly, the monitorization of these provisions.

Considering the importance of the internalization of these norms by all the civil servants and the contractual staff , we recommend that inside each department of human resources, especially at the level of the County Councils, the chief of the department should assume the responsibility of adviser on ethical problem thus avoiding the violation of the conduct codes on the reason of law ignorance.

For a real efficient application of the law, it is desirable that the conduct standards should be assimilated as a natural conduct and not to be imposed by disciplinary sanctions.

We witness today a tremendous intensification of global competition that turns to be and to become an obvious reality for new and old businesses, for the companies that meet complex challenges in every phase of corporate management. Among the management areas that should come under a careful examination, quality management is one of those that must be examined afresh when economies, markets and industries operations become global.

As practice proved, quality management concept evolved from the engineering and statistical concepts, centered on the statistical quality control, to the large view of the concept that encompasses broad organizational issues and scopes. Today, the quality concepts are under the domination of Total Quality Management (TQM). Concepts standing out as main factors in TQM implementation are these days well established and used: customer value satisfaction, continuous improvement, total organizational involvement.

Though TQM is successfully used by many firms, many conceptual and practical questions remain unanswered while global markets and industries are a fact of economic reality.

In this context, Global Quality Management (GQM) is a new and emerging area of quality management practice but, despite its frequent use, it is not yet defined, analysed and researched. This paper makes GQM its research focus in order to contribute to the understanding of the concept, and to establish a track for new and future research.

Keywords: quality, management, total quality management, global quality management

A new vision over TQM

Many authors noticed that it has become something of a cliché to say that organizations have gone through a lot of changes in recent years. Although, it is obviously that the changes at business environment level are common for all times, the last transformations have something significantly different.

Since the 1960-1970s the development of the economies, societies and world gained new features. During these years, three different but interacting processes took place. The rapid development of information technologies, that exceeded all forecasts; then it was the globalization, which highlighted the significance of the environment as of global unifying connection, and the last process was formation and increased pressures of different non-governmental movements and stakeholders' groups. These processes and reaction influenced by them stipulated development of the new social structure - net society, new kind of economics, and new virtual culture.

Nowadays, most of the transformations are associated with *external* pressures. External pressures may be understood as pressures for change, associated with a number of global phenomena.

In this new given environment, it is obviously that management shifts from a situation where the future was controlled by focusing on internal forces, to a situation where any company must deal with lot of external pressures.

In this context, Total Quality Management (TQM) was one of the most commonly used change management tools. At first sight, the traditional approach of the evolution of quality management concept from inspection to control, assurance, and, finally, total quality management, does not build a visible link between

quality function and external pressures. On this ground, the changes in quality management concept are to be underlined:

- Quality as a quantitative aspect, emphasizing qualitative factors.
- The reactive function of control changing to a preventative function of assurance, and to a proactive vision of quality.
- Moving from focus on the final product, to quality on tasks and processes.
- A global perspective of the organization has emerged as a result of the increasing integration of different aspects of quality, as so the social and environmental aspects are now added to commercial dimensions of organization.

During the last years, the purpose of quality movement, as part of quality management evolution, is achieving business excellence. Many researchers notice that most of current business excellence models focus predominantly on a single bottom line of financial results rather than also attending to the social and environmental impact of businesses. However, the top most common and widely used quality management tools for measuring business excellence, The Malcolm Baldrige National Quality Award and the European Quality Award, are using wider approach. Principles of business excellence are linked with corporate social responsibility goals, i.e. these business excellence models are measuring, and therefore are promoting methods of managing external pressures. Society results, along with people results, partnership and resources, and customer results are among the key evaluation criteria. This is a true evidence of the quality management movement extending its scope to include social and environmental responsibility to address the changed demands of today's business.

TQM is today seen as an organization-wide effort that emphasizes three core principles:

- Customer orientation.
- Process orientation.
- Continuous improvement.

The concept of customer focus is developing into meeting the needs of a broader group of customers including human stakeholders, environmental stakeholders and other interested parties in societal sustainability.

TQM, as a management philosophy, has elevated the implementation of quality management practices from operational to strategic level. Sustainability cannot be separated from evolution of TQM, since sustainability itself should be defined as the ability of organization to adapt to change in the business environment, to capture contemporary best practices, and to achieve and maintain competitive performance. The evolution of TQM therefore always evolves along with the changes in the business environment.

It is widely believed among scientist of TQM field, that TQM approaches may be applied to the future business environment; just the boundary conditions of TQM should be assessed and understood. In stable environment, the TQM approach for continuous improvement is appropriate and effective. In the context of a recent uncertain global environment, agility becomes a core competence for organization that must develop capabilities to adapt quickly to the changing environment. Therefore TQM theory should reconsider conception of continuous improvement as a contrary or supplement to innovation.

Many researchers had a vision of TQM development in the future as integrated system of four basic pillars:

- TTM - total transformation management
- TCM - total customer management
- TIM - total information management
- TRM - total resource management

There exists lack of the literature and empirical evidence of focus on the relationship between TQM and a corporate strategy. It was emphasized that strategic quality management is seen as the key to being competitive; however, the philosophy needs to emphasize integrity, environmental issues and social responsibilities as key elements.

Summarizing the above said, it is assumed that TQM will evolve to strategic TQM and sustainable TQM, both of which may contribute to successful organization management and coping with emerging changes of global business environment.

In this context, it is required the movement beyond TQM to develop a quality concept that reflects the nature of global corporations and their markets. In the last years, this concept was called "Global Quality Management" (GQM). From the several definitions allocated to the concept, one seems to be appropriate to the changing global business environment:

The strategic planning and integration of products and processes to achieve high customer acceptance and low organizational disfunctionality across country markets.

The definition incorporates the basic philosophy of TQM, but recognizes the challenges for quality management when the organization's business is worldwide. As the number of country markets in the global network increases, the diversity of quality environments across country markets requires that the organization balance local customer requirements with realistic supply-chain capabilities within and across markets.

GQM overview

GQM is a significant extension of the TQM concept. Although it has in common with TQM a highly customer-oriented philosophy, the expanded geographical and cultural boundaries of quality-related activities require a more dynamic and integrative approach.

TQM marked a major conceptual and managerial advance in its linkage of production with marketing, as well as other quality-related functions. Still, in the context of a single country organization, the organizational implications of TQM are relatively straightforward. Even when multiple countries are involved, such as a company importing raw materials from abroad, the organizational requirements can be coordinated from a home headquarters. In a complex network of quality chain activities, coordination from a single headquarters becomes untenable. GQM entails organizational adjustment.

Spurred on by regional economic integration in Europe and North America, and the high economic growth of Asian countries, large international companies are building globalized production networks with regionalized systems in several locations.

The varied vertical and horizontal linkages of subsidiaries have not been formed by centrally controlled mechanisms but, rather, according to each subsidiary's individual situational needs. Situational factors include availability and access to raw materials and components, capabilities and technology access of the subsidiary, and the subsidiary's access to local markets and market channels. The result is that the constellation of quality-related activities becomes region-specific. In some subsidiaries the quality chain may be fully integrated; in others, it may be appropriately partial.

A key characteristic of GQM is the networking of activities within and outside the firm, along with other elements of the overall supply chain. The diversity of markets across countries introduces constraints such as differentiated customer requirements, but also offers opportunities such as greater economies of scope. In this context, there is a high premium on GQM, which enables great flexibility. Because of the great number of configuration possibilities for networking, corporate control of GQM cannot be centralized at a home headquarters. Instead, a combination of regional headquarters coupled with global coordination appear to be a hybrid mechanism that allows adaptation to regional differences while enabling cross-fertilization among the corporation's subsidiaries. In the age of multiple headquarters, GQM is the appropriate quality management concept.

Viewed from an upper level, the next evolutionary stage, GQM can be linked to TQM through a set of key comparisons.

Objective

Comparing TQM with GQM, the main concepts behind TQM are maintained, but GQM enlarges the objective to encompass the concerns of multiple functions across multiple countries. A domestic firm attempting to apply TQM in an environment with multiple markets and manufacturing sites is beginning to engage the issues that are raised with global markets and manufacturing. GQM expands the concepts and issues even further to include national sovereignty, language and cultural distinctions, geography, and tax, tariff and currency considerations. The level of complexity in objective is importantly increased.

Market Focus

TQM and GQM are similar in focus on the market, but the number and diversity of customer requirements across markets implies that customer satisfaction may be more difficult to achieve, especially if resources are limited. As the notes on the expansion in objective underline, customers' perceptions of value are likely to differ widely, much more widely than is possible in varied sites within a single country. On the other hand, a wise market research coupled with creative multi-national design may make it possible to generate and meet demand for global products, particularly where new technology is involved.

Cultural sensitivity is a particularly problematic aspect of perceived customer value. The well-worn axiom "Think global, act local" puts the matter succinctly. The objective is products and services that are locally acceptable, yet are designed, developed, manufactured and distributed under a global environment, which embraces intelligent strategies that fit together.

Production Focus

TQM and GQM are similar in their production focuses, but GQM involves extending TQM to the point where disfunctionalities begin to appear. Involving all functions and all levels in all countries, which is the case in a complete global extension of TQM, naturally entails a seemingly endless set of possible configurations. Not all functions may be located in a particular country. If a business unit finds that domestic suppliers are not price-competitive or that technologies are incompatible, it may be forced to link up with suppliers abroad. Likewise, a need for familiarity with local markets may motivate linkages with foreign distributors.

In this expanded multinational "supply chain," a new perspective is called for that is beyond functional integration in the context of a single country. Therefore, the resulting organization of production likely will have to be based on a linkage among organizations across country boundaries. Consistent with this is the fact that production decisions cannot be centralized in a home country headquarters, as may be possible in the simpler TQM environment. Responsiveness to diverse market needs is likely to require maintaining a network of multiple headquarters. The key capability that enables companies to minimize potential disfunctionalities in a global context is flexibility. Production processes that simultaneously allow low volumes, high variety and low cost can offset the disadvantages of diverse marketing requirements.

Information Systems

The technological advances provide the information systems support for effective global operations, including GQM. However, in most instances, it is not the hardware or software part of the system that poses the challenges. It is more likely to be the information infrastructure that is locked into architectures and organizational designs based around earlier technologies.

Ideally, the existence of TQM variants throughout a global organization should offer such benefits as internal benchmarking and transfer of the lessons from successful TQM applications. Capturing such potential advantages requires sound and timely information moving freely throughout the global organization. Information networking among manufacturing units becomes instrumental. GQM should, therefore, not be viewed as simply "connected" TQM units. It is imperative that a global company establish an effective quality audit system that can routinely measure and transfer quality management "know-how" across TQM units. Given the rapid pace of technological development and change, GQM requires an integrative effort that links subunits across countries.

Technology Network

Since the factors and competitive situations across countries can be expected to be quite different, networking can consist of any combination of technology, supplier, production, distribution and marketing activities across markets. Sometimes, not all of these functions and activities can be satisfied within an intra-company network. For example, emerging technologies may have to be acquired from outside the firm and/or from abroad. The concept of networking has to include outside or foreign firms and science and technology organizations.

An important trend in global management is the formation of strategic alliances whereby companies strive to share complementary assets. While the concept is deceptively simple, its implications for GQM certainly are not. An integrated and harmonious quality management and improvement system are difficult to achieve in alliances that are a merger of companies with different histories and styles of TQM. In practice, there are many obstacles within strategic alliances that inhibit organizational learning and transfer of "know-how." If managers can recognize and reduce these expected obstacles, the result should be increased GQM effectiveness. Clearly, inter-company compatibility of quality systems is a consideration when selecting alliance partners.

Conclusions

This paper focus on GQM tried to define the boundaries of an emerging quality concept and practice. The most of the recent transformations in organizations' business environment are associated with external pressures at the global level. External pressures are understood as pressures for change, associated with a number of global phenomena. In order to be successful in the future knowledge-based environment, companies will need to implement strategies and new tools for simultaneously creating economic, social and environmental values.

Total quality management philosophy needs to be rethought and recreated in the context of recent global transformations that make the shift to global quality management. The most likely and reasonable developments for contemporary total quality management should be made by incorporating approaches of sustainability and strategy to the concept of total quality management turning it into a more complex and large concept, global quality management.

SOCIAL INNOVATION – MODERN INSTRUMENT FOR SOLVING THE PROBLEMS OF LOCAL COMUNITIES

In present there is a certain perception along free time of the young. Messenger, internet and television are the new recreation and amusement ways that favours sedentary life, in the detriment of tourism and fresh air walks.

The counteract of the phenomenon can be materialized through social innovation principles, concepts that suppose a new vision upon sustainable development of local communities.

The elaboration of Suceava city development strategy has to take into account the potential problems of the community. The green spaces that are insufficient and the complete detach of the young from nature can be the strategic points of the new strategy. This work wants to offer possible solutions regarding sedentary life problems of the „Messenger Generation” and the lack of green entertainment areas.

Keywords: social innovation, development strategies, local authorities, Messenger Generation, Active Park

Social Innovation – the Changing Vector

The concept of the social innovation supposes a new perception on the continuous development of the local communities. The social innovation produces interest because it can solve some esthetical-administrative problems, reducing the negative economic impact on the green areas. It is referring to the social needs, concomitant unparalleled with the developing of new products, services and organizations that activates in solving the contradictory aspects.

Innovative societies (local authorities) are those whom, in one moment of their evolution, should respond to some challenges, being in the situation to innovate. Either it was about the integration of the socio-cultural disparities, assimilating the results of a scientific revolution or economic development, the administration of some regions or populations, those societies should manifest receptivity in front of the market needs, trying to bring a surplus of novelty and originality to the area.

In this way it was proved that: societies that are opened on the knowledge exchanges with other averages, implementing of the modern technologies, know-how and those whom manifest a special sensibility on the new elements and concepts, insufficient thoroughly, are more innovative, developing an efficient and complex politic establishment. On the other hand, ethnocentric and autarchic closed societies are not innovative and, un-disposing of a differential political establishment; lose the collation with averages much more dynamic and much well organized.

The sophistication of the life way and the diversification of the cultural models, creation, imposing and acceptance of new rules means the birth of the social innovation as system of transformative collective activity. Civic spirit supposes the capacity of the imaginative anticipation and so, of the original adapting on the average and unknown situations. Multilateral life style of the human groups with the social innovation also meant the apparition and development of the social systems interactions – biosocial, ecosocial, economical, cultural, communicational, political – and also, setting up the comprehensive durable texture inside the global society.

The identity crises and the indifference on the contemporaneous socio-technologic evolution, on the background of their inadaptability to the modern times tasks, do not allow the harmonious development of all the Romanian social averages. For example, it is eloquent the North-East Developing Euroregion situation, known on the media plan, as being the poorest region of the European Union. Even if an improvement is observed of the life stile in Romania north-east area, locally, the discrepancy are more and more evident, and this, on the background of the missing coherence and weakly managerial initiative.

Starting from here, the hypothesis as per the dispatch between social innovation and a comprehensive model of the politic helps the society in understanding, proving to be an IQ test and collective cohabitation.

The three E, base directions (empower, educate, enhance) that fundament the power of the local authorities follow on the implementation and realization of the social innovation principles. Local authorities represent the community and, as following, taken decisions, have to be in the citizen service. Also, town halls must take all measures needed to educating and inoculating the responsible spirit in citizen's line and not finally, the society must be encouraged to identify the responsible measures dispatch with natural frame, on the preventing environment pollution and the autochthon sustainability potential, concomitant with socio-cultural inheritance dissemination to the next generations.

Pylons of the Social Innovation

Source: <http://www.socialinnovationpark.org/>

All categories of stakeholders can be involved in actions of social innovation; from the big international actors, to little economic agents, from the enterprising interested on their own image, ONG, to the local authorities or large public. Most of the times, social innovation is the best solution in maintain the biodiversity in the areas affected by human activity.

Messenger Generation

Climatic modifications conditioned, mainly by the ingravescence of the greenery effect, will have a special impact regarding the future perception of children on nature. Natural environment loses more and more land and people are totally emotionless, hypnotized by the technological liveliness and caught up with open eyes in the modern world traps.

The big guilty people of the false valuable scale of our children: television and internet, are easy to identify just to a superficial analyze of the environment. Epochal discoveries of the last 50 years, facilities that in the Romanian society, from the absence of an alive option, became the traps flaws, making the human idiotically, to not think anymore, to not actuate anymore, are double edged weapons. Those two modern information averages can satisfy the unusual thirsty of knowledge of today young's but, many times this valuable informational springboards seems to generate a lot of adverse reactions. Messenger Generation mix up the internet discussion carried with friends with that addressed to a stranger. Unfortunately, the reading absence it is observed to young people from our days in their way of expressing. The wrong use of different terms, semantic incoherence, propositions without subject or predicate and suburb expressions dominate in the communicational language of children and adults. The internet and the television that monopolize almost all the time are the main factors that influence them the language transformation.

School is the one that must find methods and means to attenuate the harmful effects of television and internet, with assuming the educational management. To come to the long-expected behaviour changes, it is needed that the main educational factors: family and school to action convergent upon child. As like, influenced by own life experience, family has the trend to consider that it is enough to take care only to

satisfy the primary needs of the child (food, clothes, daily expenses), ignoring the importance of the affective communication and of the development of belong feeling, at school comes the hard task to form and educate the child.

Unfortunately, at school and kindergarden it is studied much less than sufficient „The knowledge of the environment” but, very trendy are foreign languages, mainly English, and computer skills. The contact with the environment is for the young people from town a real adventure or, worse, a punishment that they had to execute during the summer vacation.

In these conditions, shouldn't surprise anyone the fact that in many children's conception: cows are pink, rabbits eat just carrots, mouses scare cats, the fruit of the beech is acorn or that tamagotchi are some very cute animals.

The association: grass, water and forest are synonym for most of the young people with fun. The interference of those three elements represents the place where in weekend music is listened, “mici” are served (traditional Romanian food made with meat) and specially, they can enjoy themselves with a lost of bear. The beauty of some of these places does not raise very much the interest because the reason that for the trees shadow, grass freshness and water coolness are searched is based on the space need to organize parties with friends. At apartment house you can not organize something like this because there isn't enough space and neighbours forbid you to manifest like a “rebel”.

The Green Areas Crises in Suceava

The air pollution in the urban area with exhaust gas, massive land clearings, growing urbanization, restraint of the green areas and vegetal protection chains, the stress, the phonic pollution, the unemployment and the high temperatures during the summer are specific elements in the urban area. The relation between the climacteric changes and the interest manifested towards the nature is in inverse proportion. We are living in a hostile environment where the nature is a simple piece of scenery, strongly anthropized.

The vegetation, fundamental element of the natural environment, is an important factor in the self purification of the atmosphere, this being the reason why we cannot conceive its lack in the urban arrangements. So, the main purpose of the green spaces arrangement in the urban zone is the improvement of the environment status. It also must not be neglected the esthetical and social contribution of the vegetation, which supposes the disconnecting and the relaxation of the citizens.

The Suceava city does not have very much green area, parks and pleasure zones. According to the data supplied by the County Statistics Department, the Suceava city had in 2005, 29,79 square meter of green space/inhabitant, much under the 50 square meters/inhabitant recommended by the World Organization of Health.

Only in three years, the measures of green spaces expansion, actions initiated by the local authorities of Suceava, supposed the allocation of over one million lei for planting 130.000 trees, most of them on the houseful associations domain. Such initiatives are welcomed, but unfortunately the involvement of the citizens in this action was not very deep. Most of the young people are impassive and totally not interested of the natural environment or the quality of the breathable air from Suceava city.

In these conditions, the application of some strategic policies with innovative character must be done, measures which to pursue the creation of a free green zone, sheltered from the restrictive human economic actions, even in the centre zone of the city. It is in view, in a first phase, The Şipote Dendrology Park located between the ultra central zone „22 December – House of Culture of The Syndicates and The Reign Citadel of Suceava. By actions like: „*The nature protest against The Internet*” or „*The secrets of green therapy*”, „the Messenger Generation” is especially aimed, together with the population segment between 25 and 40 years. The main purpose is the return of the young people and adults in the middle of the nature, realizing about the importance of the parks, the intensification of the civic spirit and special respect towards the environment. If the initiative will be a successful one, such actions could be directed also towards The Zamca Forest, planning to be expanded in the future for other green areas from the meadow of the Suceava River or the ICAR zone.

The Şipote Dendrology Park and its extension – The Park of The Citadel, are under the direct administration of The Forest Department Suceava. Although the City Hall of Suceava initiated all the necessary steps for this forest in order to go from the public domain of the state in the local public domain, The Suceava Local Council did not really manage to take in custody this green area. The uncertain statute

of this forest is to be seen in the cleanliness and the negligent aspect of this green area. In the future, a long term strategy: 30-50 years, of development of the Suceava City must be conceived, which to include also the durable development of the Șipote area.

Nature Rediscovery

For the walks lovers, this forest-park has immeasurable sentimental value. The beauty of the zone is incontestable, but the lack of lanes, banks and the presence of the nettles and PETs discourage the entertaining actions. So, some solutions with social character must be found, solutions to permit the town inhabitants, and especially young people, the spending of the spare time in the middle of the nature.

How can the Suceava young people be convinced that the plants and animals species are menaced with disappearance, when they still exist, and especially how we sensitize the people in this respect? Since we do not have the support of the public, but only declaratively it is very difficult to offer an incentive to the citizen in this respect. We are going in this way to the situations on the territory of the communicational marketing, of the social responsibility and of innovation.

Starting from the lack of time allocated for walks, continuing with brainless questions at first sight such as „do I have internet access there?” and continuing with the superficial perception of the nature, seen only as a scenery object – most of times the people going for a walk with the dog in the park without observing the nature -, all these strongly impose the social innovation.

What if the Șipote Dendrology Park would have the aspect of a zoo in the air, with deer, stags, wild rabbits, foxes and squirrels protected by law? What if the modern technology would be combined with the nature charm and the practical utility of a park? What if we would adopt a tree? What if we would stay and talk with that tree? It would be weird, but I think that it would be very thrilling. The concept of *Active Park* would be probably the most adequate for this forest.

The transformation of the forest from the centre of the city into a zoo park would be a novelty for Romania. What can be more pleasant than to walk your lover around some deer, to look around for squirrels or to admire bored little rabbits that run from here to there? All these under the discreet, but attentive observation, of a closed circuit video system. The persons which make an attempt on the silence and the liberty of the animals will be severely amended, being liable of prison if they do not respect ad-litteram the regulation of the park.

The idea of a tree adoption seems not only roty, but also attractive, even interactive. Starting from the premise that the number of the trees is limited and their value is immeasurable, the people that want, especially young people, from Suceava, but also from other areas, can adopt for a reasonable sum around 20 lei, one, maximum two trees from the park. The relation of kindred is valid for 2 years, with the possibility of prolongation for a year more, if the Suceava adoptive parents visit the „child” tree at least two times a month talking and caressing it. The adoptive parents from other localities have the moral obligation to visit their „son” at least two times a year. The tree will have a name, will have its own birthday and will be easy to identify using a code given by the geographical localization with the help of the GPS. At the park entrance, the ones interested can hire for 3 hours (tariff 5 lei) a GPS which can be used at the identification of the adopted tree location, the establishment of the geographical coordinates and will facilitate the transmission of the visit confirmation signal to a command centre. In case that the ritual is not respected, the parents will be degenerated from the parental rights.

By introducing a personal code the custodian will have free access to wireless internet 15 meters around the adopted tree. An IT platform connected to the internet will also exist, and will show online the list of the adoptive parents, its photo, the identification dates of the tree in keeping and the stage of the bilateral meetings. At the end of every year, from the most devoted parents will be nominated, the father, respectively, the mother of the year. The happy model parent will be promoted by the mass-media and, if he/she wants, can keep the „son” for the rest of his/her life, but with the respect of the ritual.

Conclusions

All these can be possible only after the preliminary arrangement of the park, organizing which supposes the realization of lanes and tracks for cyclists, the planting of the turf, the securization of the zone, the promotion of such a project and the declaration of this area as natural interest protected zone. Starting from

this social innovation, the marketing strategy is to try the transformation of the park into the city symbol together with the Reign Citadel.

Grace to the social innovation principles such ideas will get to new relating and interaction concepts between man and nature. The respect towards the nature will be priority and the presence of such oases, green and quiet, in the urban centres can bring the young people in the middle of the nature. Only in this way the perception of nature will be different and the social innovation will not miss from the regional development strategies.

Intuitively, we understand that a problem is a difference between an existing situation and a desired one. We will issue the solution of the problem, according to the current legislation framework and to some education arguments strongly anchored in the social and economic reality of present and future. Regarding the psychological aspect of the problem, we point out the fact that its formulation requires clear determination in time and space to the related components of the decisional situation. Therefore, within the structure of a decisional situation we will distinguish: action options or possibilities to solve the given problem and nature conditions reflecting the framework where the analyzed process goes on, being detached from the problem body by the analyst or decision maker.

Key words: decision, centralization, education system, research, strategy.

The Decentralization of Decision Making in Education - A Problem which Requires a Quick Solution

A “problem” is generally understood as a difficulty which, without being able to be passed automatically, presupposes an empirical or a conceptual research. Within the structure of a problem, we distinguish three components: the body, the generator and the solution (if it exists). The body of a problem is represented by previous knowledge related to the field where the problem is formulated. This can appear as various statements within the problem content, but these are not questionable and neither are they a subject of research. The genesis of this problem - for which we intend to find a solution- has many causes that have influenced its appearance. Among these, the main cause is represented by the hyper-centralization which described the management of the educational system before 1989, the rest having a secondary role.

Frequently, two aspects of the concept of “problem” are analyzed: the psychological content of the problem (well-known as the decisional situation) and the structure of the linguistic formulation of the problem. The two aspects refer to the question act (psychological aspect) and the modality of expressing a question into a language (linguistic aspect).

The decentralization of decision making is a variable which cannot be controlled, but its probability of performing can be known. We can include the prediction of nature conditions (possibilities of uncontrolled variables to perform) and actions’ consequences (forecasted results of implementing identified strategies into various hypostasis of nature conditions development) into the structure of a decisional situation. These can be shown in a decisional matrix, which entirely reflects the decisional situation. Matrix rows represent strategies, columns – nature conditions, and matrix elements – consequences.

The decision criteria include the rules according to which one of the action strategies will be chosen. The correct formulation of the problem to be solved and its delimitation from other sets of problems with which it interacts determine most of the accuracy of the decision made. It is often said that a well formulated problem is half solved. A problem will be well formulated only if it is well conceived and well stated. For a problem to be well conceived, none of the assumptions should be false, and to be well stated, it should obey some rules, such as: the number of generator variables should be equal to the number of unknown quantities; if there is only one variable, it should be elementary, if it is non-elementary it should be the result of a mixture of well stated problems. In practice, the statement of a problem should detail the basis at

the level of knowledge and perception of the one which has to solve it. Detailed statement of a problem will be the one in which the entire body is described, in its complexity.

The concept of complexity, as well as its role in the solving problems process, was a topic of many research papers, reaching the conclusion that this represents an attribute or a property of a problem which can exist for some of them, and which cannot exist for others. This attribute is independent of the human will, giving an objective character to complexity. At the same time, complexity can be defined as a relation between the observer and the observed, between the knowing subject and the known object (subject). This type of defining gives a subjective character to complexity. The report between observer and the observed object is dynamic; therefore, as its degree of knowledge grows an initially complex problem tends to become simple. In this case, the main cause of complexity is represented by the individual (decision maker) who, in the problem formulation process, represents an entity which manipulates information relating to the decisional situation. This process involves a set of physiological, cognitive and intellectual factors, which, together with the psychological assumption of the decision maker, determine correctness in formulating problems.

All these factors determine decision makers to differently expose information about the decisional situation and to associate various degrees of complexity to the problem. When we speak about problem complexity, we especially refer to elements of the decisional situation. The primacy is not held by its number, but by the nature of their relationship and performance obtained through its interaction.

In our researched situation, one and the same problem will have different dimensions (as number of variables and the relationship between them) and, probably, other degrees of complexity, because it will refer to different hierarchical levels of the organization of education units. Accepting the complex character of some problems, we will notice that some of the complexity sources are represented by uncertainty. Generally, through uncertainty we will understand the absence of some relative knowledge about present and future consequences of an action, lack of certainty in demonstrating truth or difference between what is known and what should be known in order to make the right decision. Therefore, uncertainty can be complementary to knowledge, having one of the two shapes: total or partial.

We see that this concept depends on the degree of knowledge of future evolution of processes, decreasing during accumulation of knowledge and information. Like the concept of complexity, uncertainty can be an attribute of a process or event (it is about accidental events) and exists, in an objective manner, independently of our will. The concept of uncertainty is frequently followed by the one about risk without being confounded with it. Configuration of problems is possible also by applying some methods for reduction of complexity degree. The problem which makes our research topic is the decentralization of decision making from the level of the Ministry of Education and Scholar Inspectorate to the level of schools with corporate body.

The Necessity and Opportunity of Decision Making Decentralization in Pre-university Education in Romania

Throughout history, Romania has known periods in which local power existed and was manifested at administrative-territorial units' level. Of course, those periods did not have fully democratic connotations, such power being carried out especially by economic power holders. During the period when Romania was lead by the communist regime, all state power was concentrated in central institutions and their decisions were made by local institutions. During the communist period, local institutions decisions had to respond to some reasons for making central decisions. After 1989, when a democratic regime was installed in Romania, a regime based on political pluralism and separation of state powers, a turn was made towards establishing and completing economic and social reforms. These reforms aimed especially at the relieve of the economic power from the state, power which used to be held by a unique owner, and to decentralize it towards structures organized according to the private property principle. Due to this fact, private Romanian education did not develop enough as to compete to the state education.

Therefore, a situation has appeared whose anti-educational effects constantly aggravated and generated a very critical status that was also seen by political actors. It is about contradictions between the need for education requested as seriously as possible by the community area from which Romania takes part and the possibilities of the Romanian educational system to satisfy it. The obligatory segment of education is the one in which main educational processes are involved.

If in occidental European countries - members or non-members of the EU- the basic education system is always a local community responsibility, in former communist states this system continues to be centralized and entirely financed by the state budget. This situation, where the education unit -the basic cell of the educational system- is controlled from a distance through decisions of some administration institutions, such as scholar inspectorates and the Ministry of Education, without taking into consideration the organizational culture within each school partly, is compromising to the system's good development.

Decisional factors from education constantly admitted that the actual managing system of the education system in Romania is old and negatively affects society. Nevertheless, adequate measures for the organization alignment at least to the situations in occidental European countries have not been taken yet. The restraints showed by Romanian governors lead to the increase of the damage of education system, which nowadays does not have coherence in achieving its goals, with a poor and unclear management who produces much hard solving confusion.

From the previously stated diagnosis, we see that Romanian pre-university education system is negatively influenced by certain internal and external factors which decrease its potential and place it in an area with many problems. In our opinion, also confirmed by the research papers already written about the Romanian pre-university education system, its bad operation is especially caused by the fact that units are managed from a distance and not by a proper management which to act as a team in performing some centralized directives from the ministry and scholar inspectorates. To eradicate this situation it is necessary and appropriate to have a decentralization of decision making at the school level, as it is in the school area where education and training goals are being accomplished.

The possibilities which Organizational Structures in Education Have in Order to Accomplish the Objective of Decentralization

Any organized activity is characterized by the existence of some precise goals, by a more precise definition of status and roles, by reference to objectives, tasks and competences, by a strict delimitation of activity fields (work segmentation).

Emil Păun (1999) considers that the appearance and development of some communication networks, as well as some hierarchical structures has gradually led to the transformation of the organized activity into organizational structures.

Raymond Boudon (coord.), Edhard Freidberg (1999) appreciate that an organization is a social object and a social process living in the core of human action. In society, there are many types of organizations which evolve in their own fields, obeying their own rules. The major part of our activity is done in these kinds of organizations. At an early age, we are in pre-scholar and scholar organizations and afterwards we depend on professional organizations. Organizations exist thanks to people, and people do organized activities because they are a part of these organizations.

Emil Păun (1999) defines organization as a system of activities structured around some results (purposes, goals) precisely formulated, which involve a large number of individuals who have well established statuses and roles within a differential structure, with positions of management and coordination of activities.

Organizational culture was defined in many ways, but common elements of these definitions are: beliefs, faiths, values, norms and regulations, member's attitudes and behaviours. The organization is identified by its culture. Each organization expresses in its own way the above mentioned common elements. Therefore, faiths, beliefs and values represent subjective interpretations of organization members to some life aspects; norms and regulations are accepted by organization members, and member attitudes and behaviours assure its functioning.

Luise Stall, Dean Fink (1985) give some interpretation to scholar culture, to be the observed behavioural regularities, including language and rituals; norms which develop within working groups; dominant values supported by the organization; guiding philosophy of organization policy; game rules in order to have a good relationship with others within the organization; emotions or climate within organization.

Even if Schein agrees with the fact that these meanings reflect the organization culture, he does not consider them as its essence. He sustains that we start to know a school culture when we break its unwritten rules, and a manager should create and organize the organization culture.

Professor Emil Păun sets the following values of the scholar organization development: the orientation towards action, based on purposes, goals and priorities; the orientation towards the actors of the education act, professors and students; the consolidation of the cooperation between organization members; the development of competition; the stimulation of self-improvement and self-development; the increase of members' responsibility for the quality of results; participative management and value of social partners.

The culture of the organization is governed by norms, which represent members' position towards the value and usage of objects, opinions, activities, life styles, etc. Values appeared as an expression of ideas, to which an outsider does not have access, because, being clear to everyone, they are rarely stated in words. Outsiders listen and follow carefully the accepted modalities of speech and behaviour within the scholar organization. Afterwards, it is demonstrated that they have availability and capacity to integrate, to understand rules which should be followed, principles on which these rules were created. Culture defines reality for those inside the organization, gives them support and identity and creates a framework for learning.

Emil Păun (1999) considers that "school is an organization which produces learning". With this description, there are other organizational aspects as well. Scholar culture plays an important role in changing our schools.

Luise Stall, Dean Fink (1985) said that "while a school focuses on efficiency of formal and organizational structures, it tends to neglect cultural and informal dimension".

According to Rosenholtz (1989), "among main conceptual problems there is the fact that students' learning process was associated with some scholar characteristics without empirical support about the way in which these characteristics come to affect the internal dynamics of school". In the scholar organization, change cannot take place if the cultural dimension is neglected and if this culture is operating against the organization. Changes are determined by understanding school culture. The school organization culture can be also influenced by political, social and economic powers. Changes in the education policy at national or local level can produce changes in the organization culture. In order to resist, school has to be prepared to handle society challenges. There are authors who consider that once formed, an organization culture can remain unmodified.

Bolman and Deal (1991) consider culture as both a product and a process; as a product, it represents the wisdom of our ancestors who were part of it, and as process, it is constantly updated and re-created when new members see the wheels go round and they become professors. If organization members are not open for change, and if new members cannot influence culture, and they just learn it, then this organization culture does not change, does not develop. Since culture is created by organization members, it changes together with them.

Changes in school culture can be also provided by the manager. Between organization culture and structure there is interdependence. Culture can be indirectly affected, but structure cannot be modified. If structure modifies without producing changes to culture, these changes can be superficial.

In the scholar organization there are also some subcultures. These subcultures can appear around the interests of some groups and can pull the school in various directions. They have a certain autonomy which is manifested into assertion of their own values. In school, a dominant culture can exist, represented by the manager's actions, and also cultures which represent more groups, each one with its own norms. Managerial culture is different across countries. In an educational system in which the director is a real manager, its influence is bigger because he makes decisions. In the Romanian education system, the director executes more than he decides, because decision comes from high levels or it is made by a managerial team. In this situation, a managerial culture cannot be structured yet.

Teaching staff culture is the most powerful within the scholar organization, but also divergent. Within this culture some subcultures may develop with a different evolution. Some of them are in potential status, others are dominant, and control. These subcultures vary depending on: sex, learning age, studies, interests, type of framing etc. Even if in schools politics is not an issue, some subcultures related to some political ideas may appear.

Students' culture is manifested in the relationships among them. The main type of organization of this one is the class. Student culture is also influenced by their relationships with their professors, with the school manager and external environment. Students' culture covers values from family culture or influence groups (musical, artistic, sports etc). Norms from students' culture are also related to norms of education unit. In a

scholar organization, school climate has a strong influence on organization activity and, implicitly, on the results obtained by professors and students. School climate is formed by relationships professor-professor, professor-director, professor-student, student-student; managerial style of the manager; quality of human resources management etc. The manager can influence school climate, because he can mediate relationships between organization members and he can create a climate in school community.

Thus, we conclude that changes which take place within the Romanian educational system are strongly influenced by the culture of scholar organizations. Therefore, decentralization of decision making in education is a tough process, but possible to be done because Romania's adherence to the EU and its gradual integration in the European structures also involves the alignment of education process to European standards.

The Change of Education Management - Necessity of Change

Stan Kossen (1975) said that in order to observe the necessity for change and innovation promoting, it is enough to imagine that we had a sleep of some dozen of years, a sleep synonymous with stagnation, while in the world many changes took place in habits, behaviours, values, language, resource availability, structure and organization of industrial activities, hobbies, (...), music styles etc. Peter F. Drucker (1986) said that "not to innovate, that is to defend the day of yesterday, is more dangerous than to make the day of tomorrow". Taking into consideration this statement, as well as the fact that we live in a world of a continuous and stunning change, it is obvious that the problem of a change in education represents a necessity. Change is necessary especially because, unfortunately, often changes take place only after field management recognize the crisis status, be it a crisis about education policy, about knowledge, self-knowledge, human resources, management, financing etc. Innovation in education can be done through an education reform and pedagogical change. The first one refers to a type of structural and systematic innovation or systematic and structural innovation, which affects functioning and structural relations on entire educational system, having, therewith, an intersystem reference.
