Lazăr Vlăsceanu (1979) said that "second type of accomplishment intends to improve or modernize the educational practice, according to the pre-established objectives". In the author's vision, both can correlate within a planned process of innovation. The same author mentions that change has the size of reform "because it proposes innovations and re-dimensioning at the structure level, combining methods of teaching-learning with evaluation". Education is a subsystem of social system. Changes in education are a social process which affects structure and functionality of the educational system in the following directions: impoverishment and decline of structure and functionality of system, so, regression; enrichment of structure and its functionality, so, development. The first direction leads to crisis. It can manifest by decreasing social control upon school, by abandoning the old system of norms and values without installing a new one, by normative crisis, by not recognizing authority. The second direction takes the shape of innovation and supposes its application and production of positive effects.

Stan Kesen (1975) appreciated that, unfortunately, change take place more often after the manager identifies crisis characteristics, underlining therewith that a more rational approach and less expensive is the one according to which managers try to anticipate the need for change and to design innovative measures before serious problems appear. Prediction and forecasting in managerial activity are needed in order to produce innovation. Prediction identifies the most probable status of the educational system in a certain moment of future. Forecasting takes into consideration a large range of possible results in order to open the way for more options of success than prediction can achieve. Prediction and forecasting, together with imagination and creativity, can play an essential role in coordinating change in the education field.

Water supply and sewerage providers usually operate as natural monopolies. A natural monopoly occurs on a specific market if a single company can provide services to that market at lower costs than any combination of two or several companies. The present article deals with methods of setting fees for water supply services.

Keywords: water supply, monopoly, full recovery of a cost, fee setting policies.

General remarks

A natural monopoly occurs when a company has efficient technology, often associated to market needs, not as a consequence of government or competition activities. As a rule, natural monopolies have sharply descending average and marginal cost curves, on long periods, so that the market has room for only one company that fully benefits from the available economies of scale and provides services to the market. This is why natural monopolies are often a typical object for government regulation in terms of price, quality and conditions for entering the market. Natural monopolies essentially exist due to economies of scale and range, being significant in relation to market demand. The main feature of such a monopoly is the very high difference between fixed and variable costs.

A local or regional monopoly situation offers greater flexibility in setting fees. In a competitive environment, competition sets the limits of fees that can be asked for a product. In the case of local water supply and sewerage monopolies, these limits are set depending on the cost of self-provision of the service (which is usually rather expensive and inconvenient) and any additional economical regulation existing at local or national level. To consider fee reform, one should consider the policies and institutions that regulate services provided as part of natural monopolies.

Requirements for setting a fee

Fee setting policies are governed by the attempt to generate enough revenue to at least cover the cost of providing the service. A common characteristic for meeting financial requirements is “average cost assessment” – meaning that fees are calculated by dividing the total cost of services by the total quantity of water which was supplied.

Fees for public water supply and sewerage services are set using the formula:

$$P = \frac{V}{Q}, \text{ where:}$$

P = the price or fee;

V = planned value of activity in the calculation year;

Q = planned quantity in the calculation year;

In principle, the following criteria are taken into account when setting fees:

- a) raw water, electricity and materials expenses are determined taking into account current purchase prices and annual projected quantities;
- b) specific consumption of energy and materials will be taken into account at levels reflecting the actual operation and functioning situation;

- c) personnel expenses will be based on the current legislation, keeping in mind the principle of economic efficiency;
- d) depreciation and/or charges will be taken into account, in compliance with legal regulations;
- e) the delivery price of water will include losses occurred in production, transportation and the distribution system, as approved by the local public administration authorities;
- f) the quantity of water and sewage will be projected on an annual basis;
- g) prices and fees will include a profit share and the *IID* (Maintenance, Replacement and Development) Fund, calculated according to legal provisions.

There are also other ways of setting fees so that they can adequately cover costs. These are usually based on evaluations of average costs.

Cross-subsidizing in favour of household consumers

Shifting the burden of paying for the municipal water system towards non-households is a common and frequent practice. Although it is not a very viable economic policy, household consumers have gotten used to this. This involves a reduction of costs for household consumers to much less than the assessed average cost and a rise of costs for industrial consumers much above the average. Financial requirements will thus be met by rising fees to non-households, this way balancing the loss resulting from the lower fees paid by households and residential areas. There are of course limits for this sort of cross-subsidizing: industrial consumers threaten – and rightly so – to set up their own water supply and sewerage systems – in which case cross-subsidies to households will be reduced.

Conditions for ensuring the necessary revenue and controlling costs

An important aspect for any publicly regulated monopoly, in particular for providers of water supply and sewerage services, is cost control. In the case of inelastic demand¹¹⁶, rising fees cover costs without affecting too much the inflow of revenue – which lifts pressure off the cost reduction aim. The management of a public company is usually reluctant to take employment or salary decisions that will bring about criticism and negative popularity. It would be easy for them to hire people and/or rise wages, and then these costs would be covered by consumers by paying higher fees. These pressures apply to most cases when a fee is set, but in the case of other types of products it is necessary to collect more information regarding the source and type of the cost for the various customers and for various services, for instance, than in the case of setting fees based on average costs. A simple rule for setting fees based on average costs does not require detailed cost-centre tracking or detailed bookkeeping – which makes it easier to hide excessive and unjustified costs.

Efficiency

Full recovery of a cost

Full recovery of a cost (setting the fee on the basis of the full cost) is a fee setting principle that is usually upheld by qualified economists and experts of international organisations such as the EU (according to the Water Framework Directive). They argue that as a rule these services should **not** be cross-subsidized by transfer from other programmes or budgets which reduce fees. Fees should equal (marginally) the cost of providing services to paying users. On the basis of this principle, the EU Water Framework Directive encourages “full cost recovery” fees. The efficiency of fees makes the usage of rare and limited resources more efficient and the effect of inelastic demand will surely lead to the conservation and, very likely, the reduction of water pollution levels.

¹¹⁶ Goods with low sensitivity to price are said to have inelastic or rigid demand. In the case of these goods, prices can vary a lot without consumers changing the quantities they demand. The elasticity of demand is measured by calculating the percentage by which demanded quantity varies when its price varies by one per cent. If the result is higher than one, then demand is elastic; if demand is between zero and one, then

$$E_{x,y} = \frac{\partial \ln(x)}{\partial \ln(y)} = \frac{\partial x}{\partial y} \cdot \frac{y}{x}$$

demand is inelastic. The general formula of elasticity is:

A provider of water supply and sewerage services can set different fees for different customers. This can rely on a variety of reasons, such as preference for a type of customers over another type. Economists encourage the setting of fees based on costs associated to providing services to a certain group of customers. It is simply an application of the “full cost recovery” principle in a slightly more refined way. In this context, this means that a certain group of customers is not responsible for paying or cross-subsidizing the services provided to other customers. The EU Water Framework Directive equally encourages fee discrimination based on the costs that various categories of users generate for the service provider. Unfortunately, the efficient distribution of shared costs to users cannot be made on the basis of sound economic arguments alone (Hall, 1973; Lau 1978). Sometimes this transfer of costs seems plausible, but it ultimately lacks a sound economic justification. For instance, overheads cannot be assigned to users proportionally to the cost they individually generate, because this generalized activity is a common one – all customers do this simultaneously. A few suggestions regarding the allocation of shared costs are to make a distribution that is proportional to:

the number of customers in the system (in a system with 100 customers, each of them pays 1/100 of overheads);

the quantity of water used by each customer; or

the size of sub-system connecting the user to the system.

None of these criteria is backed by an adequate economic justification for allotting shared costs. None is clearly more efficient than the others, although it is obvious that consumption-based allocation is also completely inefficient.

2. Using marginal costs

“Marginal cost assessment” is another principle used for setting fees which is encouraged by economists and international organizations (such as OECD). In other words, a socially-efficient assessment occurs when fees are set to match the marginal cost (rather than the average cost) of providing the service. By definition, in industries with “constant costs” – often associated to technologically optimal production, which has a low volume compared to the size of the market – marginal and average costs are the same. However, in a natural monopoly, such as water supply, average costs often tend to go down in the short term and marginal costs remain the same (or even go slightly up) in the short term.

These are shown in Figure 1 below. A practical explanation of this evolution of average costs in the short term is the large, fluctuating volume of infrastructure costs underlying production. At the other end, any infrastructure is in place before water and sewerage services can be provided. The marginal cost (MC), after the infrastructure is built, is the sum of operation costs, such as costs associated to energy, labour and chemical compounds used for producing a cubic meter of water. The MC axis shows that the constant cost of each water unit is roughly constant. As more water is being produced, the average cost (AC) of production goes down, because the fixed infrastructure costs can be spread over more units. However, in these conditions marginal cost is below the average cost at all production levels which ensure the optimal usage of the production capacity.

Figure 1 Short-term costs of the water supply service: decrease of average cost

From the point of view of social efficiency, the use of infrastructure does not cost anything once it is operational; all the fixed infrastructure costs are sunk costs. The efficient level of providing the service is the one equalling demand and marginal costs. Thus, efficient fees should be set to match the level of the marginal cost, and the customer should be able to buy as much water as it wishes, so long as the capacity of the system is sufficient. From a social point of view, any other fee setting method would lead to the water supply system being underused.

This policy could however create financial problems for operators, because the product cost, set to match the MC (marginal cost) is lower than the AC (average cost). Figure 2 shows an example of situation in which demand (D) of water supply services crosses MC and AC below the current capacity. When product fees are set at MC (F_{MC} – MC fee), demand for the service is Q_0 . This is the efficient marginal cost based on the provision of the service in these circumstances.

Figure 2. Setting the fee to match the marginal cost in the short term

One of the problems generated by this example of marginal cost assessment is the fact that generated revenue ($F_{MC} \cdot Q_0$) is lower than the cost of providing the service at that level ($F_{AC} \cdot Q_0$). Setting fees at MC level results in a short-term budget deficit for water supply operators. Moreover, this deficit could last for years if the operator has built a system whose capacity is large compared to demand.

Setting efficient fees in cases where there is significant capacity excess is a problem currently faced by water supply providers. Due to economic restructuring, water demand from industrial users has gone down dramatically, which resulted in a significant capacity excess. In most cases, the result was a reduction of revenue for the water provider. Efforts to compensate this financial loss included the rise of fees for residential users. But most often the result of this action was a further reduction of water demand. As it can be seen in Figure 2, above the point where D (demand) crosses AC (average cost) fees are sufficiently high to cover costs. This is F_{CR} , the fee level at which costs are recovered.

However, a large part of the capacity excess has been financed by government subsidies, so that the MC function is probably not much higher than the AC function. On the other hand, demand for water supply and sewerage services may be less elastic than presented above, especially if fees rise and conservation becomes more difficult. Even so, many managers argue that fees should be based on average costs. This will ensure that total revenue covers total costs. Although the short-term result will also be an inefficiently low level of demand for water supply services, they think that the disadvantage of losing efficiency is small compared to the advantage of financial stability brought about by the average fee/average cost ratio.

Another fee setting strategy is combining the marginal cost in the form of product taxation strictly linked to operation costs with a fixed fee per customer meant to compensate the lack of revenue. The fixed fee is a fixed amount with no significant influence on the efficiency advantages of the use of the marginal cost principle for setting the other part of the fee. This option also has the advantage that it can be set and allotted to customer using practically any criterion, except for the level of service used up by the customer (volume of consumed water). On the other hand, the importance of a fixed fee could be very high. In cases such as the one described by Figure 2, the fixed fee can be as high as the average cost of the good. This is why finding a means of adopting the usage of MC combined with a fixed fee that is acceptable for providers of water supply and sewerage services can prove difficult.

Consumers' paying capacity is not an observable criterion, which is why there are several operational options. A more common option is the "two-part assessment", in which two fees are set. Such a method is presented in Figure 3. The first fee – a product fee, is set at a lower value than the average price and it applies only to the initial consumption levels, e.g. the first 2 cubic meters of water per month in a

household. The second fee is higher, in many cases much higher than the average price, and it represents a product fee applied to any consumption exceeding 2 cubic meters per month.

Figur

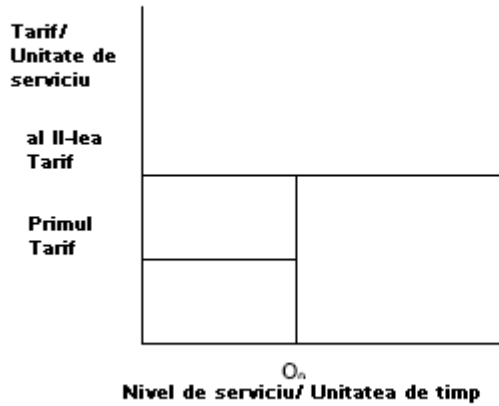

Figure 3. The two-component fee, the second part being set at Q_0 .

The two-component fee is considered by many a compromise between efficiency and performance objectives. The underlying assumption in this case is that consumers who lack the ability to pay are even less willing to pay. They are going to use the service very little, at levels below Q_0 . It is assumed that other customers are more capable (and willing) to pay, and therefore will use water services intensely, above the Q_0 level. If most consumers consume above Q_0 , then the second component of the fee is roughly equal to the marginal cost, and this way a socially correct message will be sent to customers who account for demand. In these circumstances, revenue might go down.

THE REENGINEERING OF ORGANIZATIONS WITH ERP IMPLEMENTATION

Tanasoica Laura-Georgeta

Romanian-American University, Faculty of European Economic Studies, Address: 1B, Expozitiei Boulevard, Sector 1, Bucharest , lauratanasoica@yahoo.com, Telephone no: 0744.936.182

Abstract. The use of the reengineering, as a technique of "strategic self-improvement," within the competitive and financial context, needs to be qualified by organization culture as a key contingency. A lot of organizations have significantly changed their business processes in order to remain competitive in the global market. Such process improvements were obtained mainly by business process reengineering (BPR or BPRE) efforts. The objective of reengineering is to eliminate non- value-added activities and administrative barriers. The hostility of the context, made by multiples changes that occur, has forced decision makers to undertake strategies of reengineering, restructuring, delayering and downsizing, also with the adoption of Enterprise Resource Planning (ERP) systems whose implementation projects seek to streamline an organization's processes by integrating the information flow into a single system.

Keywords: reengineering, information, technology, change, manager.

The reengineering of organizations and ERP concepts

Hammer and Champy¹¹⁷ define reengineering (BPR or BPRE) as "the fundamental rethinking and radical redesign of business processes to achieve dramatic improvements in critical, contemporary measures of performance such as cost, quality, service and speed" (p. 32). Parnaby¹¹⁸ defines a business process as a seamlessly linked and integrated natural group of skills and competences that has a clear interface with other processes. This business process has a set of inputs. It processes these inputs in an integrated manner to add value and to produce a completed identifiable set of outputs. In many cases these processes are likely to "cut across a traditional vertical functional organization"².

Enterprise Resource Planning (ERP) systems attempt to integrate several data sources and processes of an organization into a unified system. A typical ERP system will use multiple components of computer software and hardware to achieve the integration. An ERP system has two key components: a common database- the system that allows the departments of a company to store and retrieve information in real-time and a modular software design- a variety of programs that can be added on an individual basis to improve the efficiency of the business. The modular software designs link into the common database, so that all of the information between the departments is accessible and real-time.

A lot of organizations have significantly changed their business processes in order to remain competitive in the global market. Such process improvements were obtained mainly by combining business process reengineering (BPR) efforts with the adoption of Enterprise Resource Planning (ERP) systems. While the objective of BPR is to eliminate non- value-added activities and administrative barriers, ERP implementation projects seek to streamline an organization's processes by integrating the information flow into a single system. Benefits related to both BPR and ERP implementation projects result from the capability to efficiently combine organizational changes with information technology^{119 120}.

The concept of "doing more with less" described above has typically come to imply an attempt to achieve significant increases in asset utilization and labor productivity; that is, to generate more value with fewer resources and fewer staff. That is the fundamental reengineering objective.

The hostility of the context, made by multiples changes that occur, has forced decision makers to undertake strategies of reengineering, restructuring, delayering and downsizing. According to this argument, BPR and

¹¹⁷ Hammer, M. and Champy, J., *Re-engineering the Corporation*, Nicholas Brealey, London, pg 32, 1993

¹¹⁸ Parnaby, J., "Business process systems engineering", *International Journal of Technology Management*, Vol. 9 Nos 3/4, 1994.

¹²⁰ Esteves, J., Pastor, J., and Casanovas, J., "Monitoring Business Process Redesign in ERP Implementation Projects", *Proceedings of the Americas Conference on Information*, 2002

restructuring are the inevitable (and logical) consequence of external exigencies. BPR and restructuring are therefore forced strategies associated with asset utilization rates and cost reduction.

The reengineering cannot be done without competent, well-trained and properly motivated managers. Therefore, they are a key strategic asset to the enterprise. In that way, they may be any or all of the following: reservoirs of knowledge and experience; thinkers and planners; leaders; agents of change and, also, sources of continuity and stability in times of change; visionaries; competitors; entrepreneurs; cultural exemplars; managers of quality and service; resource managers; centers of individual, personal excellence; mentors and coaches; arbitrators and disciplinarians; controllers and stewards; guardians of standards and ethics, bastions against abuse and defenders against corruption.

In performing these roles within the specific culture and context of the organization, managers on an individual and a collective basis can add value to customer and enterprise in a manner which is unique to that enterprise, and which cannot be copied by competitors. Many of these roles cannot be performed by ordinary employees, no matter how well trained and motivated they are and no matter how much they have been empowered. In any case, it can be argued that the retention of strength in management and specialist depth is an essential defense against unpredictable market and technological conditions; and the risk-management and problem-solving needs to which they give rise. It will be important to avoid "burning out" an experienced and critical group of staff on whose judgement and problem-solving capability the enterprise depends for long-term survival.

In these respects, therefore, the possession of management quality and depth is a critical success factor. There is no effective substitute for an experienced management team. Organizations with competent and well-resourced managements are likely to be at a consistent and long-term advantage over those who do not possess such a capability. They are likely to be at an even greater long-term advantage over those organizations that have followed short-term fashions for delayering and the elimination of managerial and relational experience that may be impossible to replace quickly in the longer term, and whose dispersal may give rise to competitive advantage elsewhere.

Dr. Raymond Manganelli, Chief Executive Operating of New York-based Gateway Management Consulting and coauthor of *The Reengineering Handbook* (AMACOM, 1994), is the originator of Rapid Re, a five-stage, 54-step modular approach to reengineering. The winner of five teaching excellence awards, he leads the American Management Assn.'s seminars on process reengineering and serves as a visiting faculty member at Columbia University Business School's Executive Program in Business Administration.

Dr. Manganelli has a refreshingly democratic view of reengineering. He believes that most companies can quickly learn the process-improvement strategy for themselves and that small companies have as good a chance of reengineering success as their larger brethren. The name of his favorite "reengineer" should come as a surprise to those who think of reengineering as a new idea. He says that the only way to learn doing reengineering and the only way to gain freedom from consultants is by having a road map. He emphasizes the distinction between a road map which can give the best route for the company and a blueprint, on the other hand which doesn't give lots of choices. He considers that if two different companies apply reengineering in the same way, the outcome will be different and that is the way it should be.

Only 15 to 30 % of a company's work adds value. That means that 70 to 85 % of all the work is of no value. Baring this in mind, it is very important to understand when the company's activity has departed from the optimal path. As an answer of the question "Why should small companies bother with reengineering at all?" Dr. Manganelli emphasizes that the "Reengineering principles and concepts are ways of building and rebuilding to facilitate growth. Small companies should be looking at this as a way to step up. The organizations that embrace this are the ones that will survive and thrive in the 21st century".

Also, Robert Pellerin and Pierre Hadaya ¹²¹proposed a framework for teaching BDP and EPR concepts, framework which can be used and taken into consideration by any company which is interested in maintaining its market position in spite of the changes which occur. The proposed framework was developed to center the organization transformation process on business process redesign and not on the ERP solution itself. The framework was developed in three steps: first, a literature review on BPR

¹²¹ Pellerin, R., Hadaya, P., "Proposing a New Framework and an Innovative Approach to Teaching Reengineering and ERP Implementation Concepts", *Journal of Information Systems Education* West Lafayette, pg 65, 2008

methodologies led them to adopt Kettinger¹²² work as the foundation for their new framework. This was the first step. Then, the AcceleratedSAP® methodology was selected, so that they could compare BPR activities to those conducted during an ERP implementation project. This was the second step. Finally, the similarities, redundancies and disparities between the two methodologies were identified, resulting in the development of an integrated framework for conducting business process redesign during ERP implementation projects. Reengineering requires process and organization change activities, but an ERP implementation requires the transformation of a larger number of business processes. This wider scope justifies firms' decisions to choose a more rigorous planning methodology when implementing ERP systems. AcceleratedSAP® is one of the most popular and well-documented methodologies¹²³. The AcceleratedSAP® ERP implementation methodology is composed of five phases, each subdivided into major activities. During the first phase, named Project Preparation, initial project planning and preparation are conducted to define the major objectives, the implementation strategy and the organization of the project. In the second phase - Business Blueprint - the company's business process requirements are documented and the original project goals, objectives, and overall schedule are improved. In the next step of Realization the new processes are developed through a system configuration; the Final Preparation finalized the system's preparation, including testing. The fifth phase - Go Live and Support - moves the project from a pre-production environment to live operation. This final step monitors system transactions and optimizes system performance.

Robert Pellerin and Pierre Hadaya identified this very structured and rigorous methodology for teaching BPR and ERP implementation concepts which can be exposed and known not only for the students, but also for the organizations which can obtain a support for the newly reengineering production planning. This framework allows the firms to assess team performance throughout the project as well as taking the necessary corrective actions, through the use of various techniques such as performance measurements and variance analysis.

CHANGE MANAGEMENT – RESISTANCE TO THE CHANGE

Tanasoica Laura-Georgeta

Romanian-American University, Faculty of European Economic Studies, Address: EXPOZITIEI BD, No.1B, Sector 1, Bucharest, lauratanasoica@yahoo.com, Telephone no: 0744.936.182

Changing the way employers operate is hard, but all signs indicate that innovation and transformation are here to stay. Success in the workplace of the future will heavily depend on the ability to anticipate change, understand its impact and apply practical methods to turn chaotic situations into opportunities for growth. Efforts naturally center on the problem, measurement and analysis, and potential solutions, but they often fail to consider factors affecting how improvements will be permanently integrated into daily work. Making the quality system operable was chaotic. The key to coping with resistance is to understand the needs of people who are affected by change. There are practical steps to follow for successful navigation through the uncertainty: 1. Seek accurate information to avoid needless worry. 2. Express concerns to a trusted few. 3. Remember your value. Focused, organizational change management is the prescription that leads to successful programs.

Keywords: management of change, strategy, resistance to the change, processes, technology

Adoption of change management

Changing the way employers operate is hard, but all signs indicate that innovation and transformation are here to stay. Success in the workplace of the future will heavily depend on the ability to anticipate change, understand its impact and apply practical methods to turn chaotic situations into opportunities for growth. Ready or not, a major change is in future. When it happens, there are practical steps to follow for successful navigation through the uncertainty: 1. Seeking accurate information to avoid needless worry. 2. Expressing concerns to a trusted few. 3. Remembering one's value. The organization will reflect the leader's attitude, so it is crucial to rapidly come to grips with the change and identify the opportunity it offers.

Improvement projects, although well intentioned and defined, often slow down in their latter stages because team members and sponsors can lose focus once a solution is found. Efforts naturally center on the problem, measurement and analysis, and potential solutions, but they often fail to consider factors affecting how improvements will be permanently integrated into daily work. Making the quality system operable was chaotic. The key to coping with resistance is to understand the needs of people who are affected by change and actively take steps to address their issues. Here are some phases to sustain change: 1. Define the need and necessity for making improvements. 2. Create and communicate a unifying purpose. 3. Identify formal and informal work alliances and ensure their participation. 4. Create a plan for action. 5. Empower people to take action. 6. Create opportunities for small, meaningful accomplishments. 7. Expand the accomplishments and complete the unfinished change activities. 8. Reinforce the new approach.

The government has been studying and publishing best practices in the public and private sector for more than 15 years. These practices have generated many appropriate recommendations. Despite a desire to improve, however, change efforts often achieve insufficient results. Simply inserting a few best practices will not achieve enduring results. What's missing in most cases is an understanding of how to apply life-cycle principles to each unique program or environment.

Managing change, whether to fix a problem or to improve the environment, is the domain of the change-management process. Request for changes can be created by a customer or user by means of a change-management-supplied interface. Furthermore, other service-support processes can compose a request for change and submit it directly. Once submitted, a request for change is routed to the appropriate personnel to be accepted and categorized. If accepted, the categorized request for change is handled by a process that is customized based on request for change key attributes, such as its category, group, type, and priority. The handle - request for change process manages the life cycle of a change. The five steps that can compose a sample best-practice process for handling a change are: (1) Assess change, (2) approve and schedule change, (3) coordinate change implementation, (4) prepare, distribute, and implement change, and (5) review and close change.

Change initiatives often fail because they focus on only one or two dimensions. Successful programs cross functional boundaries-people, processes, technology and physical infrastructure. Technology is an important consideration, but so are the people who operate the new system, the business processes it supports, and the work locations.

Resistance to the change

While some business strategies analyze the effects of change, management of change focuses on people and how they resist, cope with, and ultimately accept this in the workplace. People resist change for many reasons. They may not understand the objectives driving the change or they may not agree with the organization's new direction. Or, they may simply be anxious about how the changes will affect their jobs. Executive teams that acknowledge the human tendency to fight change-even when change is necessary for business success-take an important first step toward a positive outcome. They use change-management strategies to create a culture that embraces change, and often find that these strategies make the difference between the success and failure of new management processes and system implementations. There are three critical steps that executives must follow to implement change in the workplace: focus on people, communicate strategic messages and combine communication and training. Action learning creates a laboratory where staff and managers work together as they learn new processes and solve problems.

Another key to complex change is a life-cycle approach. Initiatives in each dimension progress in stages. Integration is vital because each dimension affects another, but each has its own requirements and timing. Work should address people, processes, technology and infrastructure.

Concerning people, employees need to be part of the process and they need to be heard. Change-management experts recommend that managers start at the top and speak to every level of the organization about the factors driving change, and how jobs will be different before, during, and after the change occurs. Staff will be much more likely to accept and support the new process if they know what to expect at each phase. An added benefit of this process is that staff members are able to contribute ideas drawn from their varied experience that improve planned processes, save money, and avoid potential obstacles. Corporate communications play a major role in any change-management strategy. Once employees understand the reason for the change, managers must reinforce cooperation with timely, practical, and even inspirational messages.

Resistance to the change was divided along generational lines. Newer, more tech-savvy employees welcomed the change while the older employees did not cope. The company brought specialists who prescribed instructor-led training as a way to introduce changes into the work process. The training started with an overview of how many more orders an individual could place in a given period with the new system and highlighted the reduced time spent on redundant paperwork.

The process depicted is appropriate for a major nonurgent change. A minor urgent change could be handled effectively with a small subset of the tasks shown. The attributes of a request for change may impact which activities are required to handle the request for change. For example, urgent request for changes are handled differently from regular request for changes. Other attributes of the change (customer) may also factor into deciding which activities are included. In a multicustomer environment, the customer may have unique business requirements, such as regulatory requirements, that need to be accommodated in the handle- request for change process. For complex changes that would benefit from release management, the coordinate-change-implementation and prepare-distribute-and-implement-change activities can invoke the release management processes. Overall control of a change, even if release management is employed, remains with change management.

Each customer has a unique organization and unique control procedures. These factors significantly influence the process reference models used by a customer. A readymade process can provide a good start, but it rarely meets all customer requirements. If a company had a complete process reference model for change and release management the readymade process models had to be significantly customized in the field before the company could meet this customer's requirements. Some customers do not have a documented and approved change-management process. For these customers, creating new process reference models and gaining the approval of the IT staff can take a significant amount of time.

As regards technology, a group should not design its business processes without taking into account available technology, organizational structure and work locations-and vice versa. It is not enough to proceed along each dimension at the same time and at the same pace. They have to be combined to produce

a business and technical solution that can be implemented with effective program management and ownership, so employees will accept and adopt the changes.

No single set of instructions can produce enduring transformation in all instances, but with a lifecycle approach, any organization can develop a roadmap for its unique situation. Whether the transformation is large scale or applies to one particular organization or work group, the same universal precepts apply. New company management, systems, and processes affect how people perform on the job so it makes sense to incorporate training with the change management strategy. With the contract adoption program mentioned earlier, a key element was specific training in a variety of media directed toward teams in different business units and geographic locations. The training included online self-help, e-learning, and local experts to provide group or individual assistance as needed. This training ensured that the sales force knew how to implement the new process so that the transition from understanding the "why" to implementing the "how" was seamless.

The cost of change-management programs depends on the size of the organization, its corporate culture, geography, and other business factors.

At the beginning, this may seem overwhelming, but taking into consideration the cost of a failed implementation and the cost of refusing changes, it is much better to assimilate change as a need for each organization, so that it can maintain its position on the market.

Focused, organizational change management is the prescription that leads to successful programs. Executive teams must understand the organization's needs and budget resources, and must address these as part of their plan for change.

To track metrics throughout the program, executive teams need a value and a goal that measure what the process costs, how long it takes, what results are achieved currently, and the expectations after adoption.

THE EFQM MODEL OF ACADEMIC ORGANIZATIONAL EXCELLENCE

Todericiu Ramona

Universitatea „Lucian Blaga” din Sibiu, Facultatea de Științe Economice, B-dul Victoriei nr. 10 Sibiu, ramona.todericiu@ulbsibiu.ro, 0723/333.087

The higher education quality assurance system in our country is not completely developed yet. That is why higher education institutions must take the responsibility of assuring the quality of all of their activities, at all levels, according to the standards.

In order for this process to take place in all higher education institutions, an internal system of quality management was created, or is being developed. The quality management system in a higher education institution focuses on quality assurance and self assessment at all levels according to the standard, but also to the requirements of the external systems of quality evaluation. The implementation of the quality management system in higher education institutions involves both an internal institutional development and an external one, that is, certain mechanisms of institutional control that can somehow guarantee for the quality of the educational process.

Quality, leadership, client, university

According to the ISO 8402-95 standard, quality management system: “guarantees the scientific leadership of the university, the understanding of the tasks and responsibilities by all employees, and the continuous improvement of all activities. The quality systems contribute to maintaining the control, stability and capability of the university in order to determine it to continually improve its overall performance.”¹²⁴

The quality systems in a higher education institution are, in the case of external evaluation, based upon the existence of a model of reference or of a system of criteria (the quality assurance function) and of an internal organization guide (the quality management function). The reference model is chosen exclusively by the higher education institution, by its top management. When implementing such a reference model the university must consider “the objectives set, the government regulations and the experience it has in the field.”¹²⁵

From the structural models mentioned, ISO 9000:2000 is the one easiest to apply as its requirements can be extrapolated to the higher education establishments. It can also constitute the first development stage of a culture of quality. In what follows we shall present the EFQM system of organizational excellence introduced in 1991 and revised in 1997 and 1999 by the European Foundation for Quality Management (EFQM). This model aims at helping European organizations improve their performance. The analysis of the EFQM model should begin, in my opinion, with the presentation of its eight fundamental principles¹²⁶:

¹²⁴ Standardul ISO 8402-1995

¹²⁵ Popescu,S., Rusu,C., Calitatea în învățământul superior – concepte de bază și particularități, p.21, în Popescu,S, Brătianu,C., autori Atanasiu, G., Rusu,C., Oprean,C., Curaj,A., Buzănescu,Șt., - Ghidul Calității în învățământul superior –proiectul Calisro-director Pânzaru,I., Editura Universității din București, 2004;

¹²⁶ Popescu,S., Rusu,C., Calitatea în învățământul superior – concepte de bază și particularități, p.21, în Popescu,S, Brătianu,C., autori Atanasiu, G., Rusu,C., Oprean,C., Curaj,A., Buzănescu,Șt., - Ghidul Calității în învățământul superior –proiectul Calisro-director Pânzaru,I., Editura Universității din București, 2004;

results orientation; customer satisfaction; competitive business leadership; constant purpose and objectives; management by processes and facts; people development and involvement; continuous improvement and innovation; partnership development based on shared advantage; corporate social responsibility.

Fig. 1.1 illustrates the EFQM model criteria applied to the higher education facilities. The system was suggested in 1999 by Expert Group HBO, associate member of EFQM.

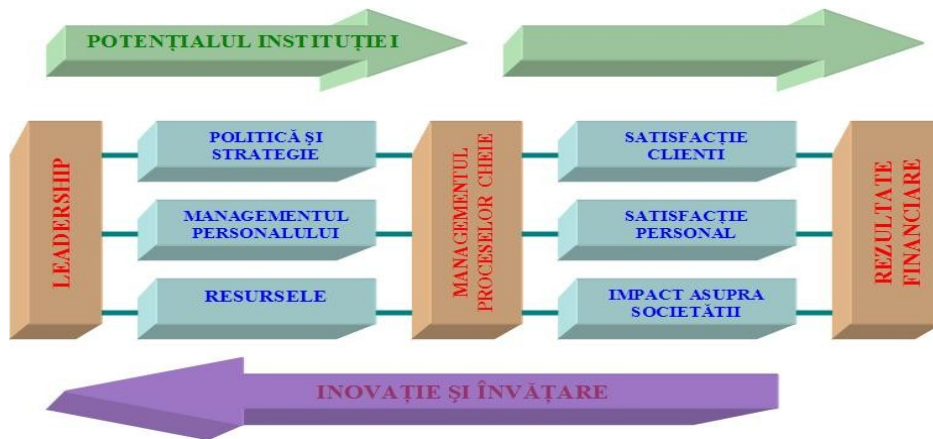

Fig. 1.1. The EFQM Model of Organizational Excellence¹²⁷

After analyzing the model, the following conclusions can be drawn:

- a) Leadership - reflects the attitude and resolutions in which the university management choose to sustain excellence;
- b) Policy and Strategy – reflects the set objectives and how they are accomplished with the help of strategy;
- c) Staff management - the university policy regarding staff planning, development, involvement and motivation;
- d) Resources – it refers to the way in which the university manages its resources for optimal results;
- e) Key Process Management - in the case of education, the following processes are considered: planning-developing, executing-implementing and study programs support. The processes corresponding to research and assistance – consulting can also be added to the model.
- f) Financial results – it refers to the results measurable in terms of: net and gross profits, cash, and costs per student. Other operational indicators that can complete the model are: the medium studies' duration, the abandon rates, students-professors ratio, etc.
- g) Customer Satisfaction - involves defining the various categories of clients, their importance and setting up questionnaires in order to establish their level of satisfaction;
- h) Staff Satisfaction – involves identifying the various categories of university staff, their demands and expectations, and an adequate method of measuring their level of satisfaction
- i) Impact on society – involves identifying the opinions of third parties regarding the relevant contribution of the university to social development

The implementation of a SMQ after the EFQM model and its evaluation are not easy tasks. The criteria mentioned above are not equally important when it comes to the general evaluation. There are also a great number of descriptors. The share of the criteria mentioned as well as the corresponding descriptors differ depending on the maturity stage reached.

¹²⁷ Popescu,S., Brătianu ,C., autori Atanasiu,G., Rusu,C., Oprean ,C., Curaj,C., Burzănescu,St., Ghidul calității în învățământul superior – proiectul Calisro, Ed. Universității din București, 2004, p.37;

The implementation of the quality assurance system in universities will pose a great challenge since the cultural change required is incredibly hard to reach. We hold as extremely important the creation of a so called work culture, of a quality culture in universities so that all actors on this stage understand how important the quality of their work is to the overall performance of the organization.

The EFQM model of organizational excellence applied to universities illustrated below was adopted by Romanian universities in a form specific to the internal organizational environment. Nevertheless, it undergoes constant changing and improving processes in order to adjust to their external environment.

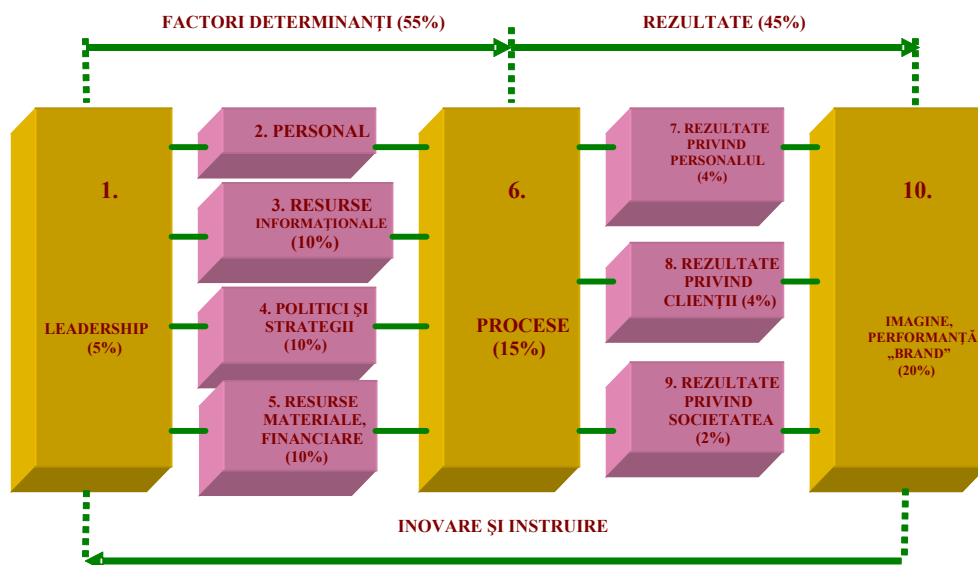

Fig. 1.2 The EFQM model applied to universities¹²⁸

What is characteristic of the model illustrated in fig. 1.2, compared to the excellence model criteria for the European Quality Award, is the importance of leadership that drops from 10% to 5%. The idea is that the election system of the academic top management generates interruptions and changes of policy and strategy depending on the new leadership.

What we like about this model is that the main factor in obtaining quality performance in the case of higher education is the organizational culture, the quality culture (50%). It consists of: human resources (20%), information resources (10%), policy and strategy (10%) and material and financial resources (10%). Another aspect we would like to deal with is Results, which is the image of the university in the academic and business worlds in both internal and external contexts, image that resulted from the performance the university managed to produce.

In any given organization, quality management implementation generates an essential cultural change that, like any other cultural change, faces strong resistance from the part of the staff and of the existent structures. Specialists appreciate that this resistance to change is not specific to the higher education institutions and that it can be encountered in all organizations, but what needs to be highlighted is the force with which universities resist to change. The conservatism specific to universities “has a positive aspect since universities are also the keepers of a nation’s long lasting values, and a negative one that resides from the need for these institutions to generate change and adapt to the dynamic society.”¹²⁹

¹²⁸ Popescu, S., Brătianu, C., autori Atanasiu, G., Rusu, C., Oprean, C., Curaj, C., Burzănescu, St., Ghidul calității în învățământul superior – proiectul Calisro, Ed. Universității din București, 2004, p.37;

¹²⁹ Popescu, S., Brătianu, C., autori Atanasiu, G., Rusu, C., Oprean, C., Curaj, A., Buzănescu, Șt., - Ghidul Calității în învățământul superior – proiectul Calisro - director Pânzaru, I., Editura Universității din București, 2004, p.192;

The approach to the educational quality issues was possible by means of processing and transferring concepts from the economic sector to the public sector. This transfer presented a few difficulties, but most important thing is that the educational environment has some distinct¹³⁰ features:

- a) It is impossible to make a distinction between all that elements and activities that have an impact on the quality system and to quantify their contribution, due to the fact that there has not been reached a consensus over which methods are efficient and which are not;
- b) Academic management and the decision-making processes vary from university to university and are established by the top management
- c) The formative processes that take place within a university are considered to be complex, non-sequential or dependent, non-linear. They can be frequently encountered in situations in which certain people or programs within the same university compete against each other for the same customer, which makes the management of resources, ideas or information even more intricate;
- d) In higher education institutions the delegation of authority is extremely rigid. “The delegation of prerogatives within faculties and departments is inviolable when it comes to teaching and research. If academic freedom were not protected, the very notion of university would decay and disappear.”¹³¹
- e) Faulty communication, the lack of transparency, the absence of useful and correct information concerning the academic activity, lead in turn to low performance. “The university is the one that creates stores and conveys knowledge, but at the same time lacks a coherent informational system regarding its status.”¹³²

All these features make the implementation of a quality management system in universities more difficult and differentiate it from the implementation of such a system in the economic sector. Still, all universities are conscious that the quality management system is necessary, and acknowledge the advantages it offers them when it comes to competitiveness on the educational market.

The development of collaboration between the Romanian higher education and the European and international academic environments requires an adequate structure of the offer and a certain quality. European integration in the field of education and research obviously involves the implementation in universities of certain quality assurance systems in order to achieve a “compatible academic quality, common values and practices that can increase the level of confidence between the organizations that collaborate in order to achieve some purpose, and that can also provide a context for loyal competition.”¹³³

The importance of education in general and of higher education, in particular, for the future of a nation, is common knowledge. Higher education institutions are “the main generators of cultural diffusion nuclei.” The university of the 21st century must conceive a quality management that takes into account all opportunities “continuous, temporary and incidental.” The university has to deal with numerous challenges related to quality thus becoming a University of Total Quality.

Juran believes that quality oriented behavior is the “vital element in attaining a thriving economy. It is also a an essential requirement of Romania’s European integration process and it is in agreement with the declaration of the meeting of the European Ministers in charge of Higher Education that took place in Berlin on September 19, 2003.

We can say that universities have completed their mission (of meeting the specific educational and individual professional development, and the social and economic development needs of the community) only when manage to satisfy these needs to a high quality standard that can allow the individual and the society to achieve performance in an environment dominated by globalization and competition. These quality standards can only be established and maintained when higher education is performance oriented.

¹³⁰ Idem, p. 24;

¹³¹ Idem, p. 24;

¹³² Idem, p. 24;

¹³³ Idem, p. 24;

We can say that a higher education institution is “performance oriented when it constantly improves its offer and results and the staff adopts a responsible attitude”¹³⁴.

The European Ministers in charge of higher education decided in September 2003 at the conference from Berlin that until the following meeting which was to take place in May 2005 in Bergen introduce in their countries a series of reforms. One of these reforms was the implementation of a higher education quality management system. In all documents related to realizing the European Higher Education Area quality assurance plays an essential part. when we analyze the position of the European Union towards this issue we notice that its importance increases constantly. While the Bologna Declaration of 1999 states that “the promotion of European co-operation in quality assurance with a view to developing comparable criteria and methodologies is necessary,” the Berlin Declaration of 2003 says that “The quality of higher education has proven to be at the heart of the setting up of a European Higher Education Area. Ministers commit themselves to supporting further development of quality assurance at institutional, national and European level. They stress the need to develop mutually shared criteria and methodologies on quality assurance... Therefore, they agree that by 2005 national quality assurance systems should include: a definition of the responsibilities of the bodies and institutions involved; evaluation of programs or institutions, including internal assessment, external review, participation of students and the publication of results; a system of accreditation, certification or comparable procedures; international participation, co-operation and networking.”¹³⁵

Thus, as I have already highlighted in this chapter, thinking out and implementing the quality assurance systems is one of the main objectives for European integration, not only for the academic communities within the EU, but also for the countries that are still in pre-adheration stage. Under academic autonomy, the quality issue is a problem that has to do with strategic management as the university is the one who should decide which road to take, which place it intends to occupy at national level, what measures it should adopt in order to achieve its objectives. Out of these measures, the ones referring to quality management are among the most important. Quality management has as starting point “the standards set by the university itself to develop towards applying the best practices, and then towards comparing the various standards which existen at international level.”¹³⁶

We are all aware of the fact that higher education is not a simple service. Specialists say it is a “nursery for creativity and critical sense, the source for renewing society with all of its services.” The increased competition, market expansion and globalization made higher education quality assurance become a major objective of the European University Association (EUA). This objective was expressed in all of the European declarations and treaties: The Sorbonne Declaration (1998), The Bologna Declaration (1999), The Salamanca Statement (2001), The Berlin Declaration (2003), The Bergen Declaration (2005) and has become an important criterion in determining the competitiveness and attractiveness of any given European university. Nowadays, quality assurance is therefore fundamental to the EUA and to the great majority of European universities.

Romanian universities through their latest activities demonstrate they have fully understood the new trends and requirements in the European area and that they have realized that the universities with a saying in international competitions of scientific research, which have earned numerous qualifications and served the environment, began long ago developing internal mechanisms of evaluation and quality promotion.

Beginning with the importance of quality and quality management in higher education institutions we considered that a SWOT analysis of quality management in universities would be very useful. Then, based on the strengths, weaknesses, opportunities and constraints identified we outlined the general and specific

¹³⁴ Popescu,S.,Rusu,C.,Calitatea în învățământul superior-concepte de bază și particularități, p.23, în Popescu,S, Brătianu,C., autori Atanasiu,G., Rusu,C., Oprean,C., Curaj,A., Buzănescu,Șt.,-Ghidul Calității în învățământul superior –proiectul Calisro-director Pânzaru,I., Editura Universității din București, 2004;

¹³⁵ Realising the European Higher Education Area, Berlin 18-19 september 2003, <http://www.bologna-berlin2003>, accesat octombrie,2006;

¹³⁶ Popescu,S.,Rusu,C.,Calitatea în învățământul superior-concepte de bază și particularități, p.22, în Popescu,S., Brătianu,C., autori Atanasiu,G., Rusu,C., Oprean,C., Curaj,A., Buzănescu,Șt., - Ghidul Calității în învățământul superior –proiectul Calisro-director Pânzaru,I., Editura Universității din București, 2004;

objectives of the Romanian universities on half-term and the strategies that can be adopted to meet these objectives.

Strengths: the B.A., M.A. and Ph.D. degrees and faculty staff promotion regulations, the enforcement of the ECTS regulations; the generous offer for study programs; the implementation of a new method of academic training; orientation towards activities specific to various groups of clients; the decreased exodus of university teachers to private universities; the development of the teaching methodology evaluation; the didactic laboratories' equipment; various foreign student and teachers exchange programs.

Weaknesses: the quality assurance policy is not shared by all members of the staff; medium-level managers did not include the entire staff in the quality assurance strategy; bad communication and low feedback regarding quality assurance; reduced interest towards new teaching and learning methods; the ECTS is less functional in the case of intra-institutional mobility; the student evaluation system must be improved by introducing evaluations all along the semester through projects, papers, etc. and not only through questions that involve simple reproductions of information.

Opportunities: universities should depend less on the central government, financially speaking; decisions should be taken by each faculty and each department; international evaluations; implicating the university in quality assurance projects.

Threats: the absence of a coherent quality management strategy at national level; the education bill is going to affect seriously the academic autonomy and the higher education institutions will be less proactive. Following this SWOT analysis of academic quality management the general and specific objectives of the higher education institutions regarding quality management and the suggested strategies can be outlined.

General outlines

Romanian universities aim at accomplishing the following objectives regarding quality assurance:

- Developing the Quality Assurance System in all universities and its implementation in faculties and departments;
- Change in the institutional culture that encourages the involvement of the entire faculty and administrative staff and taking on the continuous quality improvement ethics;
- Continuous infrastructure developing;
- Evaluating quality by participating in projects and joining international networks of quality assurance in the field of higher education;
- Continuous improvement of teaching capabilities by faculty staff;

Specific objectives

- The development of a suite of internal procedures for quality assurance, that are precise and easy to apply to all faculties, departments
- Developing a program of internal audit
- Keeping track of and rewarding quality and excellence in teaching, scientific research and services brought to the society
- The creation of structures specialized in quality assurance at all levels and establishing the responsibilities of each structure
- Constant feedback by students and other client groups (employers, community)
- Changing the institutional culture so that quality self assessment become part of the organizational culture
- Training and certifying internal auditors and specialists in quality management
- Personnel training
- Adding on the web page a series of good practices (e-forum) regarding teaching quality

Suggested strategies

- The use of all available resources (departments, services) for the quality assurance of the activities organized by the university
- Continuing the investments in laboratory equipment

- Developing training courses for persons in charge with quality management and for the other employees (administrative and teaching staff) and developing support materials
- Evaluating students' knowledge at regular intervals
- Adapting the educational offer to the market requirements (employers, students)
- Adopting quality oriented programs and making them public

In conclusion we can say that quality higher education can only be achieved in an environment in which all parties take up full responsibility for the quality of their contribution.

QUALITY IN HIGHER EDUCATION – A CONTINUOUS REVOLUTION

Todericiu Ramona

Universitatea „Lucian Blaga” din Sibiu, Facultatea de Științe Economice, B-dul Victoriei nr. 10 Sibiu, ramona.todericiu@ulbsibiu.ro, 0723/333.087

“A system of management of quality does not guarantee you the winning of the race, but its absence can make you lose it.”

Dr. H. James Harrington

Quality is nowadays a frequently used term in a society in which the competition of products and services on the market has very much increased.

Quality is, without a doubt, not a new, unknown notion. Our ancestors knew, as well as we know, how important quality is. However, the twentieth century has induced major changes in the production of goods and services, extending the area of the quality notion, and, thus, a series of new concepts appeared, like for instance: quality planning, quality control, management of quality, the continuous improving of quality, quality audit etc.

Quality, competition, client, educational services

Experts think that two important forces had a particular impact on quality:

- the Japanese Revolution on quality – generated by the world’s perception about the low quality of Japanese products and which urged the Japanese to adopt a series of measures in order to ensure competitiveness of their products on the market;
- the fact that customers realized the importance of products’ quality (product warranty, environment protection).

Together with other galvanic tendencies, these two major forces have generated for many organizations “the change of a business’ development conditions into symbiosis with the parameter called quality”.¹³⁷

Experts judge that the most important of these conditions that have **encouraged the development of the quality concept** are:

- a) *“Competition*: if formerly quality was perceived as being synonym with higher price, nowadays customers can enjoy quality and a low price at the same time;
- b) *Customer change*: market internationalization determined the rise of customers’ quality requirement, situation which calls for the implementation of a quality system according to the standards in effect.
- c) *The change of the products’ features combination*: every product or service is characterized by price and certain technical functional features, between which it should be a balance;
- d) *The complexity of the product*: progress in all branches determined the reliability demand to the supplier to become more urgent and more accurate.
- e) *The ever higher levels of customers’ expectations forced suppliers up to find different solutions to meet these expectations”*.¹³⁸

Within these conditions, the notion of quality becomes more and more complex, and the concern for its definition becomes considerable. This gradually requires different definitions, though, without reaching a common point of view.

¹³⁷ Pruteanu O., (coord.), Managementul calității, Ed. Junimea, Iași, 1998, p.9;

¹³⁸ Idem;

Many experts assert that the concept of quality, as well as that of “freedom” or “justice”, is a concept very difficult to define, due to its high degree of relativity. The term “quality” is loaded with value and is usually associated, very subjectively, with something very good; in spite of this, each and every person has a different understanding of what quality means. Many well known experts’ preoccupation for quality emerged in a large number of definitions of this concept.

The definitions given by the following qualitytians are worth being mentioned: **J.M. Juran**¹³⁹ “*the quality of a product means its fitness for use*”; **P.B. Crosby**¹⁴⁰, the one who introduces the notion of *compliance* and the concept of “*no faults*”; **Samuel Certo**¹⁴¹ “*how well a product manages to fulfill the purposes it was designed for. In a larger sense, quality is the degree of perfection according to which products and services can be created on the basis of certain characteristic features. This hierarchy is determined by customers, whereas customers define quality from the point of view of aspect, performance, reserve, flexibility and safety. Quality of a product or service influences the organization’s reputation*”; **G. Taguchi**¹⁴² defines quality as being “*the minimum loss imparted by the product to the society from the time the product is shipped*”.

We insist on this definition as it is extremely relevant from the viewpoint of higher education. Thus, the higher education state financed institutions face an alarming peculiarity: both the internal costs of non-quality mirrored in an ineffective usage of the allocated resources, and the external costs (reflected in unemployment, in primary and middle school teachers’ incompetence, in researchers’ and analysts’ incapacity of creating a relevant value) are completely supported by the society.

All these require recognizing and clearly defining the society’s demands and expectations from the higher education institutions, and deciding upon a set of regulations by means of which it can make sure that the university activity points to meet the mentioned demands and expectations.

Dictionaries give many definitions for quality. But there are also **synthetic definitions**: quality means “*customer satisfaction*” or quality means “*fitness for use*”. Actually, quality means solely meeting the customer’s demands and answering their exigencies; basically, it is the extent to which a product fulfils the purposes it was designed for. A reference moment in the evolution of the quality concept was the emergence of the **ISO 8402** standard, which leads to a consensus regarding the definitions, terms and concepts applied to quality.

The **ISO 8402 Quality Vocabulary** standard defines quality as being “the totality of features and characteristics of a product or service that bear on its ability to satisfy stated or implied needs”¹⁴³.

According to this definition, “quality may be expressed by a set of specific features, it exists only in relationship to customers’ needs and refers only to a product as such. Theoretically, quality is defined as a continuous and not a discreet variance. From this point of view we consider that in the Romanian educational system there is a wrong tendency, noted by experts, that of reducing the quality of a university program to the accrediting process, respectively, reducing the continuous nature of the quality function to a set of discreet values under conditions when not only stated, but also implied needs should be satisfied by quality”¹⁴⁴.

Subsequently, the **ISO 2000:2000** standard creates a new vision of the quality concepts, quality being regarded as “*the extent to which a set of implied features satisfies the needs*”¹⁴⁵.

In this context, experts estimate that, if we analyze the case of higher education institutions, on the education segment for instance, the customers’ demands can be expressed in terms like “*what should a graduate from a certain field now and be able to do?*” Nowadays, in their opinion, these are implied demands that are not subject matters of a contract. Identifying and defining them is not only the task of

¹⁴⁵ idem;

higher education institution, but it must be fulfilled together with customers' representatives from that particular field (employers, unions etc.). Defining the demands may also be the fruits of a larger context. It is well known that setting a "qualifications frame" is a major concern at European level and the moment such a frame is defined and ruled by a form of regulation, the relative demands of the necessary skills for a certain qualification of graduates becomes *explicit*.

Major changes in the economic and social environment in the past years determined the passing from the simplistic approaches to quality, that no longer suit current conditions, to a completely different approach on behalf of the organizations in order to survive the competition on the world's markets.

A special concern for quality is noticeable during the past years, a **legitimate** concern in the context of new changes in our country: "*the general interest for ever better public utilities; the fast upswing of competition for attracting resources and students on the educational market; the pressure between efficiency and quality, pressure that becomes more and more intense in higher education*"¹⁴⁶.

On the background of the reorganization of higher education in our country, "the decrease of the dispersion of specializations, the outlining of priorities, cost cutting, performance encouragement focused on quality"¹⁴⁷ are actual corrective measures in the relationship between education and society.

The requirements for our country's education and research integration in the European space of higher education and research, the passing to the economy based on knowledge, innovation and development call for moving to a qualitative stage in the education and research reform process.

Both in Europe, and in the whole world, promoting the concept of quality in higher education represents a complex and very current issue. In European Union member countries this topic has had a constant evolution during the last two decades, being identified several strategies regarding education quality, and simultaneously a series of adequate control techniques and procedures. Tertiary education, and its quality, is, as experts note, strongly influenced at the beginning of the third millennium by the globalization phenomenon with implications of university traditions, endeavors and practices, as well as on the universities' development perspectives in this millennium. In their opinion, Romanian higher education is twice exposed, both to the challenges of the beginning of the twentieth century, and to the challenges that are typical of this transition period our country is running through.

The very fast changes in economy, in information technology, part and parcel of globalization, influenced the emergence of **new terms**¹⁴⁸ in university actors' vocabulary: *market mechanism; educational services; customer; supplier; consumption; decentralization; entrepreneurship*, terms that require a very clear definition.

Although we are aware of the fact that education will never become "*a free market*" in the true sense, its behavior changes under the pressure of contemporary market forces, emphasizing the competition for resources and students, competition in which quality is decisive.

We must underline the fact that debating the aspect regarding quality in educational context was inextricably related to the feasibility of transferring, of taking the concepts over from the economic field into the public sector, even though there are major differences between the two fields in terms of conditions of financing, goals and the method of reference to the exogenous environment.

Bearing in mind the differences between the two fields, it is natural that the transposition of certain practices and techniques from the business environment into the university environment faces a series of difficulties. Despite this, one can perceive at the moment the special interest shown by the university environment towards marketing techniques – subject developed in the next chapter of this work – in order to attract both students and additional resources that are absolutely necessary to an efficient educational process.

The quality of a higher education institution depends "definitely upon the professor's value and bases on all its members' responsibility for their own service at different hierarchic levels, by promoting quality consciousness and discipline of behavior. In order to continuously strengthen and better up the reputation

¹⁴⁶ Popescu,S., Rusu,C., Calitatea în învățământul superior-concepte de bază și particularități, p.14, în Popescu,S,Brătianu,C., autori Atanasiu,G.,Rusu, C.,Oprean, C.,Curaj, A.,Buzănescu,Șt.,-Ghidul Calității în învățământul superior –proiectul Calisro-director Pânzaru,I., Editura Universității din București,2004;

¹⁴⁷ Idem;

¹⁴⁸ Idem;

of the higher education institution and its performances as a quality service provider, it is required that each and every member of the organization endorse the quality policy and procedures of the university, the whole educational system being focusing on excellence and quality in order to become efficient and capable to obtain long-term benefits”¹⁴⁹.

Being a new topic for universities, quality and quality management raises a series of **conceptual** and **practical issues**, like:

- “What means quality for higher education?”
- What is the product of a higher education institution?
- Who are the customers of a university?
- What does quality management for a university mean and how does it act on the main dimensions of university action?
- What is to be done in order to introduce quality management in a higher education institution?
- Which will be the most appropriate criteria for estimating a university’s performances?
- What is the quality management system model adequate for the university institution?¹⁵⁰

In deciding upon the policy, the goals and the strategy that needs to be followed in order to introduce the quality management and insurance systems in higher education institutions, the conceptual statements above are of a major importance.

The new economic and social context related to Romania’s aspirations regarding its European integration implies superior performances in all fields of work. Starting off with its distinct contribution as a long-term investment, the bettering of the education quality will have a clear impact on the quality of life and work. Finally, “the quality of education is a basic condition for the improvement of employment, of social cohesion and economic competition”¹⁵¹.

Studies at national, European and international level regarding higher education quality offer very different perspectives. In Romanian higher education, experts note that, besides the mentioned qualitative improvements and the relative success on international level, there is a parallel process of qualitative decline of the formative and educational activities, process that tends to become dominant in relation to the qualitative improvements in some institutions or of some study programs.

The intensification of the institutional, national and international concern regarding quality insurance, concerns that are visible in all states, including the more developed ones, means the recognizing of the issues regarding quality in higher education. Of course, the question rises: why is a quality approach in universities necessary now? The right answer given by experts is: at least, because of the following **reasons**:

- a) “Nowadays the quality approach in Romanian universities is a *requirement of the society in which universities are active*. Universities need to take the responsibility for the quality of their own activity, this being the only way they can gain the society’s trust in their ability to satisfy its needs and least but not last its expectations.
- b) Secondly, it is a *requirement of modern universities’ orientation towards performance and competitiveness increase*. Experts in university management unanimously agree that the quality system is the only one that **assures**: the efficient control of individual and collective performance, the continuous bettering of processes and activities; the prevention of possible deficiencies; the increase in responsibility and in the involvement degree of the entire academic community.

¹⁵⁰ Popescu,S., Rusu,C., Calitatea în învățământul superior-concepte de bază și particularități, p.14, în Popescu,S,Brătianu,C., autori Atanasiu,G.,Rusu, C.,Oprean, C.,Curaj, A.,Buzănescu,Șt.,-Ghidul Calității în învățământul superior –proiectul Calisro-director Pânzaru,I., Editura Universității din București, 2004;

¹⁵¹ Idem;

- c) The quality approach in Romanian higher education institutions is *an express requirement for Romania's EU integration*. As mentioned before, in September 2003 in **Berlin**, the Ministers of Education in the EU member countries decided that both the EU member countries and especially the countries that run for the adhering elaborate and implement until 2005 a national quality assurance system in higher education. These countries' universities need to suit their offer's structure and content, their results evaluation standards, criteria and procedures in order to cooperate in European research programs and professor and students mobility programs, so that their issued diplomas gain international acknowledgement"¹⁵².

Becoming aware of the role of quality as a decisive factor of the educational process, *universities need to set up a mission and a strategy to allow* "the establishment of an efficient strategic management and an efficient planning process; the assuming of the quality principle – vital for the university activity and the insurance of effective quality assurance and evaluation processes; the global and balanced development of the university; the insurance of the balance between collective contribution, democracy, and transparency on the one hand, and substantiation and efficiency on the other hand when taking decisions"¹⁵³.

The analysis of the international and national tendencies in universities evolution underlined a common and relevant element, i.e. *the inclination to performance of the entire university activity from all points of view*: managerial, structural, financial, from the viewpoint of offer and service quality, of the dimension and, therefore, of the competitiveness increase on the market.

MANAGERIAL REENGINEERING – NECESSITY, OPPORTUNITY AND CHANGE

Todoruț Amalia Venera

Universitatea „Constantin Brâncuși”, Facultatea de Științe Economice, Adresa: Str. Victoriei, bl. 15, et 2, ap. 8., E-mail: amalia_venera@yahoo.com, Telefon: 0745/ 310.900

Abstract. Re-engineering, a new conceptual and functioning pattern in the dynamic and diverse world of business, is an answer or for some reluctant specialists, an attempt to answer to an obvious reality of our times, the deeper and deeper sometimes radical and sped up alterations that mark the evolution of the society. These alterations have a tremendous impact upon the business world and firm management, yet cannot find correspondances in similar actions, as deep and radical. Speeding and rapid diffusion of alterations yields at the firm management level, deep and multiple effects that imposes increasing the decisional reaction speed and all the more for adjusting the firm to alterations.

Key words :reengineering, change, business, management ,development .

1. Concept

The elements that impose the managerial alterations concerning the essence that can only be accomplished through managerial re-design are mainly the following:

- a) Numerous errors manifested within management and its components. In this category the most significant are:
 - ◆ Insufficient and inexistent prevision;
 - ◆ Lack of objectives at the firm level and divided on process and structural components; this shortcoming is manifested in the conditions of lacking a strategy and a realistic policy, centred on market research, diagnosis research and prognosis research;
 - ◆ Insufficient delimitation and dimensioning of some process components (functions, activities, attributions and tasks), which are extremely important in accomplishing the objectives. Concurrently the structural and organizational components (positions, functions, attributions and tasks) incoherent defined, a situation which generates similarities in accomplishing attributions and tasks, narrowing the responsibility and other organizational shortcomings;
 - ◆ The existence of some organizational structure insufficiently flexible, dynamic or efficient that would allow and challenge an aggressive behaviour of a firm towards the national and international environment;
 - ◆ Utilizing the basic organizational documents of the firm – the organizational and functioning regulation, the organizational structure, position requirements – as priority bureaucratic administrative instruments;
 - ◆ Insufficient structuring of authority and responsibility on hierarchical levels of the organization;
 - ◆ Running the decisional processes in an empirical manner, on the one hand without taking into consideration the multitude of information characterizing a certain decisional problem and on the other hand due to adopting the decisions based on the manager's experience, intuition and skill, neglecting the decisional instruments recommended by science, the quality of decisions being low in this case;
 - ◆ The predominantly current character of manager's activity of superior rank, generated by numerous pressures on them presently. Thus they are involved in solving some routine problems because of some deficits concerning the economic relations among firms, of the existent economic financial crash and so on.

Unfortunately the situations when not only the economic manager but also the general manager are after money are frequent enough and these situations are great consumers of time for cashing the money for the sold economic goods, and thus saving the existence and functioning of the firm they run. In this way the strategic problems that have an impact on long term functioning and efficiency of the firm are neglected;

- ◆ The lack of a clear conception, of a systemic vision concerning conceiving and functioning of the informational system;
- ◆ Visible un-correlations between the volume and structure of information driven in the vertical of the management system and the hierarchical position of their beneficiaries – managers and performers – a situation which often bring about a “suffocation” of the managers, especially those of superior rank with useless information and with low degree of aggravation;
- ◆ The number still reduced of management methods and techniques utilized: meeting, delegation, auto dashboard or elements of diagnosis, the management through objectives and the management through budgets;
- ◆ The insufficient methodological elements, absolutely compulsory in utilizing these methods and managerial techniques, a situation which nourish and amplify the empiricism in exerting the management processes.

b) Multiplying the influences exerted by the national and international environment;

c) Multiplying and diversifying the problems with which the firms are confronted and which need a preferment management, generating competitive advantages on the market.

The alterations yielded in the activity area of the firms and under their impact and within them have always constituted a constant of the economic activity evolution, of business world. The actual alterations much more complex, frequent and rapid are a natural carrying on of the old ones, their amplifying of those concurrent with the new realities of the contemporary world.

Drawing a conclusion, the managerial modernization is not only a fashion of the period we pass through, but a necessity to ensure some qualitative parameters superior to microeconomic systems of management. The ample strategic approach answering to such a necessity is represented by the re-design of the management of the firm.

The basic principle is the deep essential exchanges where all the components of the management system should be involved, alterations generating multiple positive effects such as:

- Modernizing the management systems, ensuring the alteration of their structural and functional characteristics in order to meet the requirements of endogenous and exogenous evolutions of the firms;
- Limitation of discrepancies between the technical and technological potential of the firm and the innovational capacity of its management with multiple beneficial effects upon the activity of the organization’s rhythm and efficiency renewal;
- Ensuring the concordance between the dynamics of the firm management characteristics and the requirements of the environment, linking them with the recent evolutions within the theory and practice of management;
- Orchestration of the system functionality to a higher rank with the condition and evolution of the firm’s necessities and possibilities in all the processes;
- Imprinting an emphasized dynamic movement to the activities and outcomes of firms enabling to obtain superior economic performances;
- Favoring the accomplishment of organizational hollonic architecture characterized through the division of the firm in modules with a prominent operational autonomy and developing some operational relations both between subdivision groups and at the organization level. A firm organized in modules is concurrently centralized and decentralized; approached from bottom to top and from top to bottom; autonomous and integrated; ordered and ambiguous; based on management and leadership.

- Developing a state of mind and an organizational culture favorable to obtaining performances by the organization;
- Amplifying the leadership of all the managers categories, superior motivation of the employees to take and accomplish the tasks, thus favoring team work and increase the audience the managers have to subordinates as well as their receptivity for the decisions and actions that the managers make;
- Intensifying the work both at the level of managers and laborers to ensure a larger participation to initiation, preparing and performing the tasks required by an efficient firm strategy and policies;
- Substantial increase of work productivity both physical and intellectual, of goods and services quality, reflecting directly and positively the economic outcome of the firm (turnover, costs, profit and so on).

Re-engineering does not stop in the moment of re-designing the business processes. The radical alterations brought to internal products penetrate the entire organization, referring to positions, people, management and the organization culture. M. Hammer and J. Champy have schematized the system of business as a rhombus presented in Figure 1, having in the corners four main elements in a closed interdependence.

8. Business processes
 1. Positions and structures
 2. Values and persuasion
 3. Systems of management and measurement

2. The interdependency of business elements

S. Beuachemin appreciates that through re-engineering the organizations aim at extremely ambitious objectives implying deep alterations of the organization among which the most important are:

- Reduction of the number of hierarchical levels;
- Diminishing the dimension of administrative units in order to apply the principle “no more papers”;
- Decentralizing the management towards the employees that are closer to the clients by entrusting all the activities performed for the client to a most dedicated person or team;
- The permanent drive towards re-grouping of simple tasks and suppressing the activities without added value tax;
- Implementing an informational system supported by a database easy accessible by all the performers of the process, for instance an application of CRM type to integrate information on clients and suppliers.
- After the radical re-design through re-engineering M. Hammer and J. Champy [Reengineering the Corporation: A Manifesto for Business Revolution] have identified the following types of major changes:
 - Passing from functional departments to process teams. Through re-engineering the division of work from traditional organizations is integrated in a new process greatly simplified. The people that perform the process are naturally grouped in a team that replaces the old structure based on functional departments.
 - Passing from simple operations to complex activities. By creating the process teams, the employees are responsible collectively by the results of the process as an assembly and are not responsible individually for the devised, simple and repetitive operation, which they performed before as specialists. Team work is improved and the abilities, competences, creativity and the individual satisfactions increase. The employees perform as generalists now a variety of operations, their activity being widened and multidimensional.
 - The evolution of employees from subordinates to decisions-making. As a consequence of re-engineering, the employees are no longer simple performers, subordinates to the hierarchical chiefs. They will be entrusted with an increased responsibility within a process team which is

self-led without expecting for the superiors' indications. The essential attributes of the employees become thus: creativity, self-discipline, team work and especially client-oriented activity. Nonetheless some researchers refer to delegation of attribution as to "a false charity act: charity because it follows to present the greater power of decision-making and commitment as a gift and false because it is motivated only to increase the performances and profit and not to improve the structure" [Wilmott H., Business Reengineering and Human Resource Management].

- Changing the training of employees from qualified to educate. Through qualification the employees gain abilities and skills, learning how to work better. On the other hand education opens their perspectives, gives them the opportunity to understand, what they perform and also teaches them why they do this. The employees should not behave as robots, but they have to be educated and creative in order to make the best decisions by themselves to perform their work and obtain the best results.
- Evaluation and motivation is based on results and not on activity. In a traditional organization, the wages of the employees depend on the worked time and not of the real value which can be measured and which is created for the firm and for the client. On the other hand after reengineering, work is performed based on processes, whose outgoing have a certain value whereas the performances can be consequently measured and repaid. The reengineering also changes radically the classic principles for wages. The basic wages have a greater stability and they are not influenced by the seniority or hierarchical position while performances are generously rewarded as bonuses.
- Promotion is based on abilities and not on performances. Since performance is rewarded through bonuses, it would be a mistake to promote an employee only on his performances, without it being obvious that in his new position he could be as efficient without possessing the necessary abilities.
- Transforming the managers from supervisors into counselors. The process team has to show the capacity of self-leading, because it holds the responsibility and the results of the process. That is why it does not need bosses to supervise, but a trainer, a counselor to help it to solve the problems more efficiently. As it happens in every sport, the trainer has to mobilize the people, help them to develop and especially to keep the team working. For this reason, the managers have to be part of the team of process having a leading role in stimulating and amplifying its value.
- Blunting of organizational structure. The autonomy of the process team, its increased decisional power ensures the favorable framework to diminish the role of the managers and of the importance of hierarchy. Thus the organizational structure is blunted, and the number of subordinates for each manager trainer increases significantly. After an ample effort of reengineering carried on in a period of three years, Toyota blunted its pyramid to only 5 hierarchical levels comparatively to the vertical structure of 17 levels it had in 1998 [Bratianu C., The Management of Public Institutions].
- Transforming the managers from evaluators of results in leaders. After the reengineering, the performances and the results of a process depend more on its performers that have increased decisional powers than on the functional-hierarchical bosses that are oriented only towards operations. The main responsibility of the managers is transferred towards design and implementing some viable processes. After the reengineering, the supervisors and managers move closer to the real work, the distance between them and employees or clients is significantly diminished.

Running the way from the manager to the leader suppose showing priority to subconscious, utilizing the intuition and imagination to generate such ideas like those resulted from rationalizing and objective analyses. It is critical the passing from "administration" to innovation, from "competence" to "excellence", from the activity led by the "vision of the firm" to "the personal vision". The leader emphasizes the creativity and the power of the persons around and has time to relaxing, meditation and imagination. The leader is not satisfied any longer with its status, he searches for new challenges, development opportunities, he is flexible, open to new ideas and gives a chance to those ideas that seem an utopia at first sight. Last but not least, the leader has the ability to present to his team members the objectives simply and concisely

and motivationally, too so that he should obtain their enthusiasm and commitment towards the objective. In other words “it is like the conductor whose function is to create coordinated sounds and a tempo adequate through the integrated efforts of the members of the orchestra. Depending on the leadership of the conductor the orchestra will respond.

- The radical transformation of values within the organization. The most important change in the firm culture is the employees’ awareness that they work for the clients and not for the bosses. Nevertheless it is obvious the fact that their activity should be based on an adequate managerial system where the laborers should be motivated correspondingly for their work and for the values they impart, respectively for their orientation towards the client, for their team work, self-discipline, self-education, creativity and responsibility.

Otherwise most of the specialists appreciates that the most spectacular alterations after the reengineering are at the level of organizational culture as it follows in the table 1.

Table 1.

Element	Previous condition	New culture
Mission	Maximum profit for each investment, management through objectives	Ethic behavior, client oriented activity, permanent improvement
Clients requirements	Incomplete understanding of clients’ requirements	Systemic approach for satisfying the internal and international clients
Suppliers	Unidirectional relation	Partnership
Objectives	On short term with limited perspective on long term	On long term
Improvement	Accepting the variable	Understanding and permanent improvement of the process
Solving the problems and making the decisions	On individual basis without a specific structure	Participative and inter-functional
Management style	Objectives that are not always clear	Open style, clear objectives, encouragement of team work
Role of the manager	Plans, coordinates, decides and controls	Communicate, consults, teaches, authorizes, removes barriers
Rewards and recognition	Payment after work; few incentives for the team	Recognition and individual and group rewards
Measurement	Orientation towards collection of data or problems identification	Utilizing the data for understanding and permanent improvement of the process

3. Changing of the organizational culture after the reengineering

Re-engineering, a new conceptual and functioning pattern in the dynamic and diverse world of business, is an answer or for some reluctant specialists, an attempt to answer to an obvious reality of our times, the deeper and deeper sometimes radical and sped up alterations that mark the evolution of the society.

ORGANIZATIONAL CHANGE IN A ROMANIAN COMPANY. LESSONS FROM CFR SA

Toma Sorin-George

Naruo Shinji

University of Bucharest, Faculty of Administration and Business, 135, Calea Serban Voda, Bucuresti, tomagsorin@yahoo.com, shinjinaruo@yahoo.co.jp

After the fall of the communist regime, Romania entered in the transition phase from a planned economy to a market economy. As former state-owned enterprises have been transformed in private companies, organizational change has become a subject of interest in the management studies. Our paper aims to contribute to the increasing European debate regarding the organizational change in ex-communist countries, to demonstrate that organizational change faces higher resistance in transitional countries from Eastern and Central Europe and to propose a four stages model of organizational change in a Romanian railways company. The objectives of the paper were achieved by reviewing the literature, and by using a study case. The company that is the subject of our research is a large, complex organization which is in transition from a state-owned enterprise to a private one.

Keywords: organizational change, management, Romania, railways, CFR

Introduction

In the last decades, organizational change has become increasingly prominent in the management studies and business literature, due to the emergence and spreading of globalization. After the fall of the communist regimes in Eastern and Central European countries the transition to capitalism was a difficult attempt. During the transition process, former state-owned enterprises have been transformed in private companies.

Our paper aims to highlight that organizational change in European post-communist countries copes with a higher opposition than in the capitalist countries. Romania is one example among many others. Our case study has focused on a Romanian railways company facing the challenges of a change process in a highly competitive business environment.

Change in the Romanian economy after 1989

After the fall of the Berlin Wall, the transition from planned economy to market economy that took place in the former Eastern and Central European communist countries changed fundamentally the relationships between the state and the companies. Step by step, almost all these countries eliminated the dependence of their companies on the state budget.

The transition to capitalism in these countries was and still is a historically unique process. Creating capitalism without capitalists represented a difficult task for all European post-communist countries. That is why the need to create a group of private owners became one of the priorities of the transition (King, 1997: 2).

The conditions inherited from the communist regime were different in these countries. Taking into account the huge number of loss-making companies in European ex-communist countries, no previous comparable experience exists to provide viable models for governments in the world economic history. However, some of the most prominent European and American experts argued in the 1990s that “stabilization, price liberalization, and privatization must proceed rapidly, whereas restructuring will take a decade or more” (Blanchard et al., 1991: VIII). In their opinion, most Eastern European countries embraced the market economy system. They concluded that:

- Stabilization and price liberalization were painful for an ex-communist country, as they were in Poland.
- Privatization had to be based on fairness and efficiency, taking place before companies have been restructured.

From the 1908s, privatization was widely considered to be the principal method to improve the economic performance. Some of the conditions needed for a successful privatization were:

- An appropriate legal, regulatory and institutional framework.
- A clear, transparent, and comprehensive strategy.
- Knowledge, expertise and skills.
- An elaborate sales plan (Chang, 2007: p. 21).

After 1989, the privatization of state-owned enterprises has constituted a key point of the Romanian economic reform.

With an excessively centralized economy and in the name of the communist egalitarianism, the private sector was practically absent and the private property was strictly limited before 1989. The economic system was based on the state monopoly. Officially, the rate of unemployment was zero, and everyone enjoyed the benefits of the social system.

The Revolution of December 1989 brought a radical change in all the main aspects of the Romanian society: political, cultural, economic and social. In the beginning of the 1990s many new political parties appeared, claiming anti-communist ideologies. The business landscape has changed dramatically with the collapse of the communist regime. Large-scale privatization took place in all economic domains. Waves of entrepreneurs emerged slowly in a turbulent environment. The creation of entrepreneurship in Romania has been people's answer to the challenges of poverty, corruption, uncertainty, and insecurity.

In the first years after the fall of the Iron Curtain, the economy entered in a long recession phase. Romania experienced unprecedented high rates of inflation and unemployment. The restructuring of the economy involved a "massive reallocation of the labour across many dimensions, including ownership sectors, economic branches, geographic regions, occupations, firms, particular jobs, and a wide variety of activities" (Commander and Coricelli, 1995: 285). After losing their de facto job security workers feared the consequences of the radical socio-economic change occurred in Romania. The social system collapsed and the country was thrown into a period of turmoil. In spite of the fact that market mechanisms have promoted economic development, they failed to produce social justice in Romania.

The adoption of the capitalist system implied not only a major change of the old institutions and social relationships, but also the emergence of new institutions. Also, the cultural dimension of the transition process has to be emphasized. The end of the "egalitarian" communist ideology and the spread of market values into all areas of life have changed the people's behaviour in the last decades. In a Romanian poor and collectivist society the democratic construction of a capitalist society has been rather an unlikely attempt (Chiribuca, 2004: 167).

A transition process began both in Romania and in the world economy. It was a simultaneous global transition toward a fully borderless world economy. In Romania which pursued reforms less rigorously than other countries, government financed for a longer period of time the losses of many large state-owned enterprises (Djankov and Ilayperuma, 1997: 2). Under the pressures of the International Monetary Fund (IMF) and the World Bank (WB), an economic reorganization program was designed and implemented to cover large loss-making state-owned companies. Its fundamental components were the following:

- Macroeconomic stabilization.
- Price and trade liberalization.
- Large-scale privatization.
- Market economy legislation.
- New institutions' creation.

Government has also played a major role in macroeconomic policy, "in investment in basic social services, education, training, and infrastructure, and in creating and maintaining a strong social safety net in order to prevent disastrous social side effects for the most vulnerable members of society" (Berend, 2000: 51).

In the late 1990s, European Union (EU) criticized the lack of coherence of policy making on economic issues, but in the beginning of the 2000s, signs of economic recovery were visible, especially in the services and industry sectors. After 2003, Romania experienced economic growth rates of 5 and 6 %. Starting with 2007, Romania has become member of the European Union.

In sum, Romania faced serious difficulties to cope with change from the communist regime to the capitalist system. The transition process towards a market economy proved to be a painful attempt at both levels (macroeconomic and microeconomic). Pursuing systematic change under the pressure of the international financial institutions and EU, Romania has finally reached the stage of a functioning market economy.

Organizational change in Romania. The case of CFR SA

Initially people expressed naïve optimism by considering that a market economy could be readily achieved in Romania by the privatization of the state owned-enterprises. In time, the transition process was not identified only with the privatization, but also with organizational reforms and increasing competition.

A fundamental change occurred at the microeconomic level. The most spectacular effect of privatization and domestic capital accumulation was the rise of an entrepreneurial attitude and consequently, the creation of many new private enterprises, mostly small and medium ones. On the other hand, state-owned enterprises became private companies. In the communist regime, the enterprises had only one customer: the state. The state planned the distribution and the selling of the goods produced by all enterprises. The Romanian Communist Party (RCP), the central and local authorities took charge of the future of the enterprises. That is why managers could not design and implement economic strategies for their enterprises. They had to obey the rules imposed by the communist regime. Without having autonomy, the Romanian managers only accomplished and put in practice the directives of RCP.

In the first years of transition, the Romanian companies faced a combination of significant weaknesses and threats such as: shrunk markets, lack of distribution systems, diseconomies of scale, insufficient resources, outdated technology, low quality products, costs increase, lack of managerial, financial and marketing skills. Due to deregulation, privatization, corporatization and the appearance of new market opportunities, few companies began to develop and grow. Successful companies owed their good performance largely to management. In post-transition years, the enterprise ownership structure has been established and organizational change is easier to implement (Table I).

No.	The communist regime	The transition process	The post-transition regime
1.	All enterprises are state-owned enterprises, and their continuity is at the discretion of the state.	All enterprises become companies/corporations (corporatization), but their ownership structures are in the process of being defined.	The corporate governance structure has been well defined for each enterprise and the share ownership structure has become relatively stable.
2.	The management (directors) of the enterprises is appointed only by the RCP.	The state has lost the discretionary power to appoint and dismiss the managers of enterprises, yet no definite power to do has emerged.	The management of enterprises is chosen through due process, defined by the corporate law.

Table I- Comparison between different regimes in Romania (adapted from Aoki and Hyung-Ki,1995: 6)

After almost half a century of dictatorship, organizational change faced higher resistance in Romania than in other European ex-communist country. It is highly influenced by new societal values that have emerged as the transition process has taken place. Researchers highlighted the differences in attitudes and values between the workers in post-communist countries and traditional capitalist countries (Alas and Rees, 2006: 187-188). When considering issues like job satisfaction or commitment to the organization differences were found in respect of context-related and job-related attitudes (Table II).

Workers in post-communist countries focus on:	Workers in traditional capitalist countries focus on:
Job security Welfare Standard of living Social order and peace Payment Fringe benefits	Competence of managers Co-operation Social equality and opportunities for development

Table II- Differences between workers in different regimes

The Romanian transport sector has been one of the most dynamic in the transition process. The Romanian National Railways Society (SNCFR) was and still is the subject of a radical organizational change. SNCFR is a big and complex organization which is in transition from a state owned enterprise to a private one.

After the Second World War, Romania had a fairly well-developed and distributed transport network in the communist regime. During all this period, the railway was a major factor in technical and economic progress of the Romanian society, and a factor of stability that could not have been influenced by political events. The transport system was run by the Ministry of Transport and Communication. The structure of the ministry comprised:

- The Board of Management, the Minister and the Deputy Ministers.
- The General Directorate of Post and Telecommunications, the Directorate of Highways, the Department of Railways, the Department of Sea and River Transport, and several other Directorates.

The role of the staff of the Ministry's headquarters was limited to planning, coordination, design, administration, and budgeting. Four Directorates (Planning, Performance and Accounts, Lines and Installations, Traction and Rolling Stock, Operations and Traffic) and seven regional centrals were the components of the Department of Railways. Each of them was responsible for railway operations in seven Romanian regions of the railway network. The Romanian national railways enterprise CFR was one of the biggest state-owned enterprises in Romania, having more than 150,000 employees.

After the Revolution of 1989, CFR became SNCFR, a national railways society. Traffic on railways decreased sharply. The volume of rail freight diminished continuously from 17,854 millions tonnes-km (1999) to 16,401 millions (2000) and 12,926 millions (2005). In 2005, the number of passengers was 92 millions. Nowadays, the length of the railway network is 11,400 km. In accordance with the Directive 440/1991 of the European Council, SNCFR has to ensure the national railway infrastructure with the technical and operating parameters at European standard in order to make it a compatible and interoperable part of the future trans-European railway network.

The reorganization of SNCFR started in 1995 when a WB's loan Railway Rehabilitation project was being prepared. The project aimed mainly to restructure SNCFR, which at that time had more than 140,000 employees. Also, due to the EU Directives, SNCFR was split into five companies. The Governmental Decision (GD) No. 581/1998 represented the document of the setting up of the following railways companies:

1. the infrastructure company CFR SA (Infrastructure business unit),
4. the freight operations company Marfa (Freight business unit),
5. the passenger operations company Calatori (Passenger business unit),
6. the rail management services company SMF,
7. the rail asset management company SAAF.

According to article 12 of this GD, CFR "shall make available the railway infrastructure to the railway undertakings, in non-discriminatory manner, on the basis of the access contract". This was the first legal context to explain the position of CFR SA within the transport sector. CFR provides services to the operation companies (Marfa and Calatori). Through this organizational change of SNCFR, three business units have appeared and are currently operating under the Romanian governmental control. All these units are stock companies, but government owns 100% of the shares. Romanian government decides access charge and provides subsidies for CFR SA and Calatori.

As a state-owned company, CFR's top management assumes that government would cover every deficit with responsibility. Actually, CFR has a very limited flexibility and liberty in corporate management. Decisions related to ticket fare, budgeting, investments and business plan belong to the Romanian government. Top management of CFR can do nothing without government authority in such critical business decisions. As in the past, top management is appointed by the Romanian government. CFR is a stock company, but government owns 100% of the stock. Due to this situation, ownership and management have not been separated as it has to be in a market economy. In order to carry out the separation between ownership and management at CFR, we have designed a four stages model of organizational change. It proposes an incremental, continuous change process that leads to the emergence of a private company (Figure 1).

Restructuring is a key element of the change process. CFR has already started the organizational change process by drastically reducing the number of employees and slimming down the company through the separation of some business units from the main corporate body. It is rather the result of the international pressures on the Romanian government and CFR.

Conclusions

In Romania, taking into account the CFR's concern for a total integration in the European railways system, the privatization is strictly correlated with the EU objectives in the transport sector. The restructuring of the Romanian railways has been a substantial undertaking. Without any doubt, organizational change is necessary for a viable privatization. The importance of our paper lies on the 4 stages model designed for a successful organizational change in a railways company acting in a highly competitive environment.

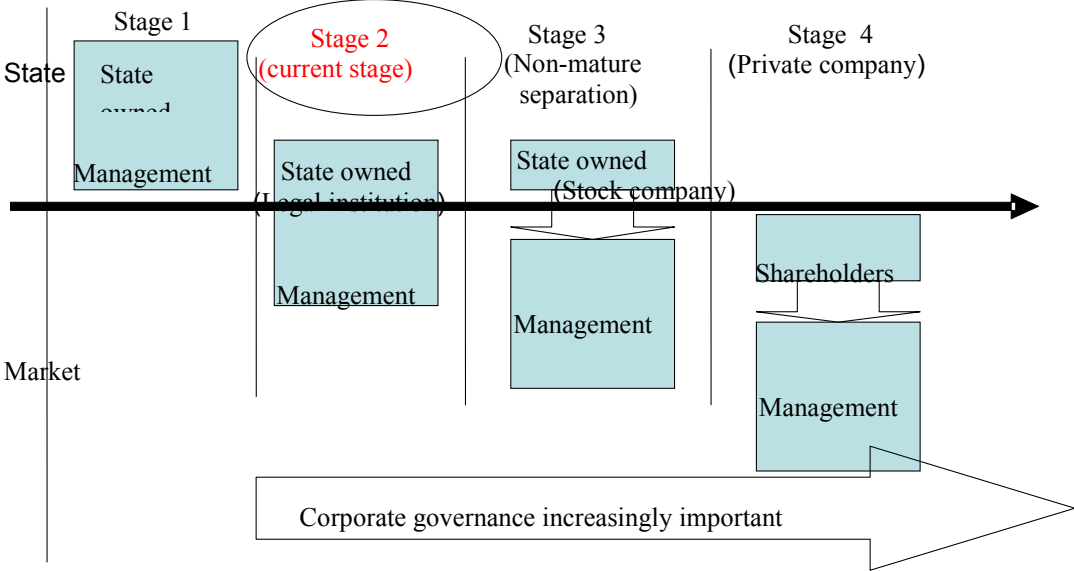

Fig. 1- The 4 stages model of organizational change at CFR

Management consulting helping organizations improve their performance, primarily through the thorough analysis of existing business problems and development of plans for improvement. There is probably no activity about which the opinions are so divided as management consulting. The purpose of this paper is to make some reflections upon what role play the consulting management services as professional service to the firms and how offering these services affects the offering and delivery of other services of the firms. The study is based on an office documentation research within consulting firms and resources. The approach tries to be critical and reflective, examines different consulting roles by developing a typology. The purpose is to aware of these professional services young business people. The FAQ of this service are: "How to choose the best consultant?" and "Why did fail consultant?"

Key words: management consulting, performance, plans of improvement, type of consultancy

1. Generalities

We consider that the benefice of Romania accession to European Union, within the increasing competition framework, can only be accomplished through a superior performance. This is achievable by quality instruments of management that is adapted to the new requirements of the economic environment.

It is getting more and more obvious that for the Romanian reality, management is "the main way towards the economic growth" (Peter Drucker, 1990) and that "management knowledge import may be more productive than technology import" (Richard Farmer, 1992).

The improvement of management practices, so necessary for present Romania, can be accomplished with the help of management consultancy, worldwide recognized as a professional job supporting managers to detect, analyze and solve problems their companies have to cope with in an unrecorded turbulent situation of the environment they activate in. Management consultancy may be approached in two ways: a. as a method (to improve the management practices) and b. as a profession ("job performed by independent, and thus objective specialists that support the enterprise and institution management to reach their objectives and to develop activities in a rational and balanced way" – The Association of Consultancy Management of Enterprises in the USA - ACME). The present paper is meant to be a plea for management consultancy as professional job and as method of offering real support in business, seen as a possible solution to the problems of the Romanian society. In order to fulfil this goal, it has to offer adequate recommendations and solutions, adapted to the specificity and development stage and culture of the respective organization if accepted by its beneficiaries.

Being at the beginning, management consultancy in Romania is still rejected by less experimented economic operators. There are plenty of reasons, the most important ones having to do with the previous experience embodied in "precious advice and indications" offered by "dilettantes". In our view, management consultancy depends on changing this mentality through professional serviced provided by consultants that think and behave as entrepreneurs as we live in a world where the customer's needs are rapidly changing and new opportunities for consultancy appear. A consultant, could be a person or firm, sells its time and competence, in fact it sells a promise, that is a help that satisfies the client's requirements. As any other service firm, the result of management consultancy a tangible product, in fact the recommendation of the client or better said the change that occurred within the client's company if we think of the wished finality. Such a finite product is difficult to define, to measure and to assess and that's why the consultant has to define its service as a distinct product and to offer the client a real, detailed description of this product which can be either a pattern, a methodology that can be applied to certain real problem, or a management system.

As the customers' needs are rather similar, a certain standardization degree of management consultancy services is feasible and desired. The delicate problem is that of designing the product that is to be offered, of standardization-personalization mix, while creating and maintaining a relationship with the client, based on trust, element that greatly influences both the effectiveness of the process and the results.

2. Types of consultancy

Management consultancy is a process, an activity both of the consultant and of the beneficiary likewise, meant to solve a certain problem and to introduce the desired changes within the beneficiary's company. Its objective is obtaining performance, the key to success in business.

Obtaining performance is the result of a sum of factors that are endlessly changing that is why the management of a business needs an approach based on elaboration and implementation of adequate strategies. The theory of management does not offer generally valid solutions; it rather refers to a whole range of practical models and results of the experience of different organisations. It is the consultant's duty to choose the most adequate ones and to implement them together with the beneficiary. When consultancy management refers to the basic objectives, to the organisational policy and strategy, to planning, structuring and to its general control we can say that we talk about *consultancy for the general management*. When it is about a special or functional problem, we say it is about *consultancy for different domains of management*: financial; survey; marketing and distribution; production management; human resources; IT; organizational development; quality management; project management etc. There are some situations when a problem that originally looks like a functional issue, e.g. inadequate promotional methods, in the end turns to be a more profound and extended general management problem.

In fact, a management consultant who performs his activity in the general management area is, actually a specialist whose part is to combine different specialities and turn them into a balanced, coherent, multifunctional and interdisciplinary method. When necessary, he has to have the ability to use his competence and specialist recommendations so as to help his client to do the same. It is the outcome of an evolved attitude, and the paradox is that very often, even those managers especially interested in introducing changes, do not realise what is really means, how to handle it or do not understand that they should start by changing themselves. In these circumstances, the management consultant is required to discover the actual causes of the lack of meeting the social-economic environment, of the reduced openness towards innovation, dealing with factors like being stuck in routine, incapacity to understand the market mechanisms, fear of being considered incompetent, fear of losing control etc.

3. Why should we use consultancy?

Generally, an organisation requires management consultancy when its management feels the need for help to solve the problems it faces. In developed countries to appoint outside consultants to do short-term projects is common in business. More and more frequently, as in-house resources become scarcer and impartiality is required, organizations and municipalities are turning to consultants to get the job done. It is very important to establish if it is really needed this kind of professional service (it is known how cost effective/expensive it is).

The consultant is asked to provoke a change, nevertheless not any change, but one perceived as an improvement. This is far from being a simple thing, as many managers of organisations are still being dominated by the ideal organisation myth promoted by the classical school of management and they perceive the change as being something exterior, standing for a passing from one state to another that is the desired one. Yet, at present, as D. Genlot stated "we have to move from the vague concept of change towards that one of permanent evolution", as the change is integrated to the functioning of organisation and to the seeking for excellence at all levels: product and service quality, productivity, adaptability to the clients' ever changing needs etc. There is one fact: the changing pace is going to increase in the future and the successful management of the change is directly connected to the ability of the managers to understand the everyday reality, to thoroughly plan the changing process, to accept and to professionally conduct this process. Can they do all this on their own when they also have to manage two organisations at the same time: the present one with its current and urgent problems and the organisation of tomorrow which does not press but punishes any delay, causes the loss of opportunities, the unsuccessful accomplishment of greater performances and, eventually stagnation, which actually means being left behind? The answer is no and the practical grounds for making use of consultancy can thus being synthesised as follows:

- Organisation does not dispose of the knowledge or the competences to solve a certain problem having the same chances for success as a consultant who disposes of special knowledge and techniques;
- Organisation does not afford to release managers or consultants from the task they are responsible with so as to perform a sustained and detailed activity for a project or to take advantage of opportunities;
- Routine and habitude prevent even the best managers from properly approaching a problem and seeing it in its real light. They need a “resonance box”, a compass on their way to performance. Independent from the beneficiary’s organisation and not affected by its culture, consultants can answer this imperative;
- Any organisation management needs a report coming from outside in order to justify its decisions. We do not intend to justify here “the political game”, we rather want to underline the constructive and useful role, such as that of reducing the massive resistance to change;
- Through consultancy, organisations learn how to help themselves. They acquire new knowledge and get used with methods adequate for identifying problems and initialising changes.

Issued by the linkage among performance, success and consultancy activities a series of strategic frameworks have been promoted over the years, some of the well known ones are the following:

Table 1 Strategic frameworks promoted over the years and most popular concepts [8]

Concept	year	Consultant	Organization
Portofolio Analysis	1976	Henderson	The Boston Consulting Company
Five Forces	1980	Porter	Monitor Company/Harvard
Value Chain Analysis	1985	Porter	Monitor Company/Harvard
Core Copetences	1990	Hamel&Pralhad	Harvard/Michigan/Strategos
Customer Retention	1990	Rechheld	Bain&Company
Cycle Time Reduction	1990	Stalk	The Boston Consulting Company
Mass Customization	1992	Pine	Strategic Horizonts
Reengineering	1993	Hammer&Champy	CSC
Shareholder Value Analysis/Economic Value Added (EVA)	1993	Stewart	Stern Stewart
Value Migration	1996	Slywotsky	Mercer Management Consulting
Value Net	1996	Brandenburger& Nalebuff	Harvard & Yale
Profit Zone	1998	Slywotsky& Morrison	Mercer Management Consulting

4. Relationship – the premise for success in consultancy

The consultancy process implies two partners: the consultant and his beneficiary (client). Theoretically, the two of them with equal perseverance seek to attain the same objective. Practically, the situation is far more complex as the consultant is a person from outside the organisation who has to achieve a result valid for the organisation without being part of its administrative and human system. In our view the key problem is to create and maintain an effective and constructive relationship based on trust between these two partners. Only having this support can the consultant’s recommendations be understood and more important accepted by beneficiaries. How can such a relationship come into being in reality? Through a special effort expressed by:

- defining the problem together;

- stating the expected results;
- settling the way in which the consultancy mission will occur;
- involving the beneficiary in all the action phases of the consultancy so as to understand and perceive the finality of solutions as being their own;
- demonstrating the competence by understanding and interpreting the real phenomena of organisation at a technical, economic and human level.

In this domain we can remark that the standards for success are usually not clear, because of the width of the problems meet in consultancy, it often goes unnoticed by others and unremarked by insiders. A lot of businesses can increase their success (or turn more or less hard times) by hiring a consultant with full knowledge of constrains, problems and traps.

As recommendation: before thinking about hiring a consultant from the outside, explore resources, skills, and knowledge of your own staff. The organization own employees may be able to contribute with ideas and information that make a consultant unnecessary, and the organization may also be able to use a consultant only for "value-added" services.

5. Conclusion

The changes that occur within the Romanian society in the context of the European accession induce the development of management consultancy action, and we think that the demand for consultancy services provided by specialists is about to increase in the future as the managerial teams become ever more aware of opportunities and effectiveness of management consultancy actions.

Consequently, the management consultancy job is one full of perspective, and the success is given by the close collaboration with the beneficiary. Basically, the aim of consultancy is to stimulate and activate the beneficiary, to contribute to the formation of the organisation "that learns" and moves in the correct direction where successes and failures are just mere episodes.

The behaviour that assures the perpetuation of successes is based on a trust culture, supported by responsibility, initiative and collaboration. It is what professional management consultancy services promote and prove.

DECISION – A KEY ELEMENT IN THE MANAGERIAL SYSTEM OF THE COMPANY

Tureac Cornelia Elena

The management, as a central social function, following the words of Peter Drucker, concentrates its concepts and instruments around the phenomenon of change, a trend that, evidently, gets the size of a managerial revolution in the entire world.

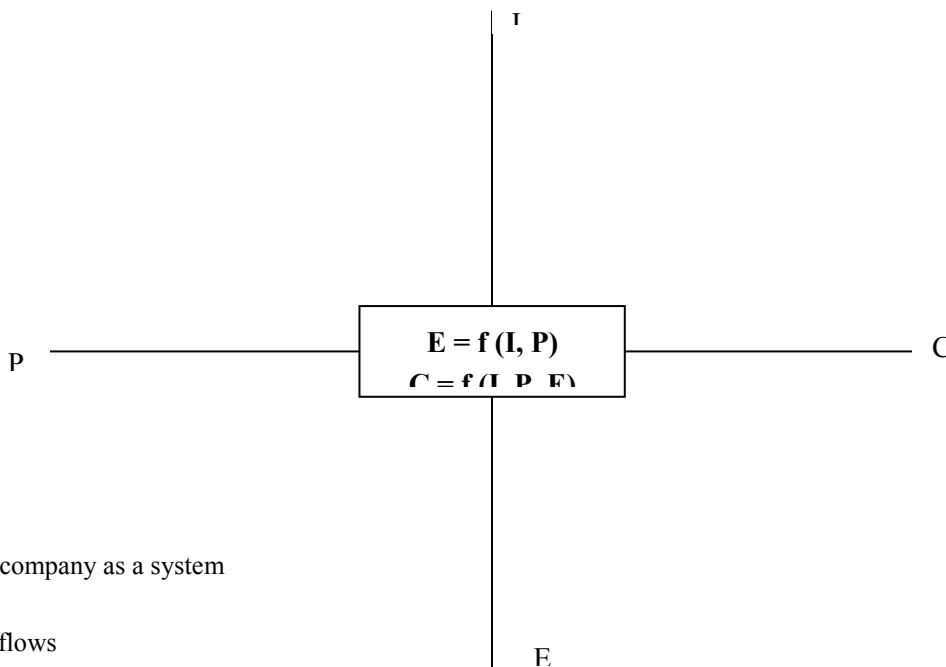

The company is a subsystem of a wider complex system – its environment.

The main management function in a company consists in the adjustment of its way of functioning and of the relations between the organization and the environment as well as between different parts of the organization. Nowadays, management theory and practice are based upon the concept of „ Total Quality Management” (TQM)

Key-words: Decision, managerial system, TQM

The management, as a central social function, following the words of Peter Drucker, concentrates its concepts and instruments around the phenomenon of change, a trend that, evidently, gets the size of a managerial revolution in the entire world.

The company is a subsystem of a wider complex system – its environment. The „company” system can be described as it follows:

The company as a system

I- inflows

E-outflows

P- endogenous and exogenous variables that influence the way of functioning and structuring of the system

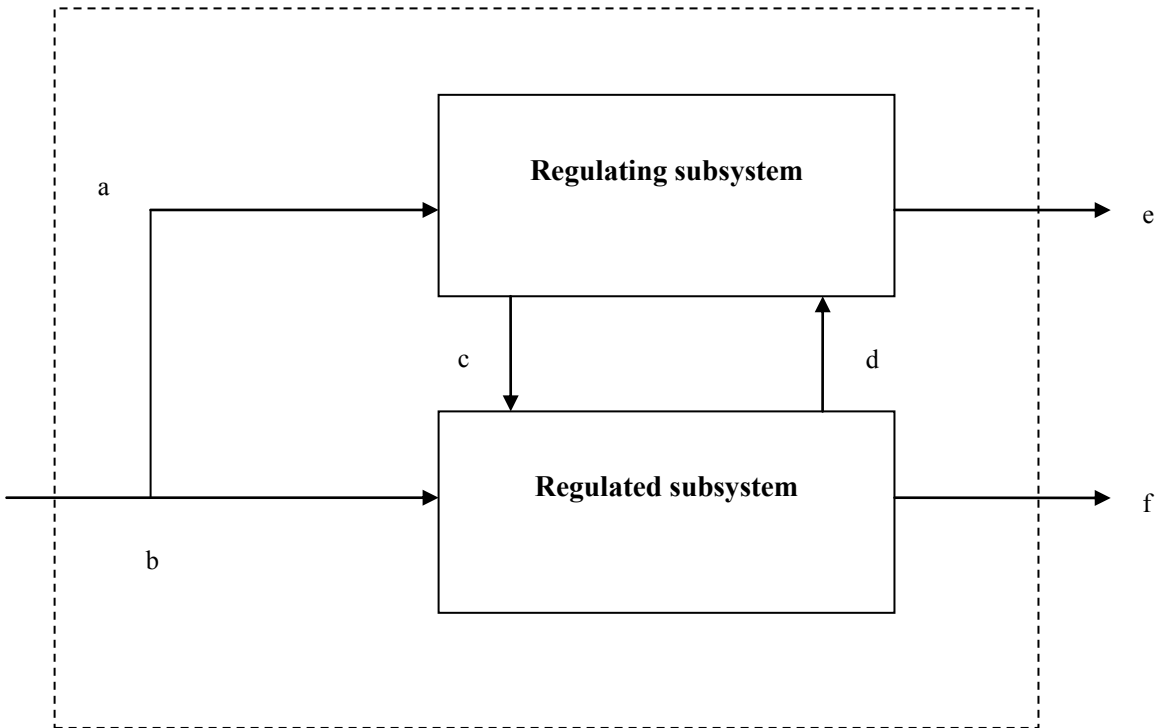

C- the system quality evaluation criteria (expenses, profit, sales figure)

The main management function in a company consists in the adjustment of its way of functioning and of the relations between the organization and the environment as well as between different parts of the organization. Thus, the organization had two types of functions:

performing functions consisting in the physical processes of turning the inflows into outflows whose ensemble forms the regulated or controlled subsystem.

controlling functions that refer to the designing of the operational programs for the performing functions, to the supervising of these programs progress, to the identification of breaches and the application of necessary adjustments for a permanent orientation of the company activities and of its structural parts towards the global organizational objectives.

The functions with decisional competences form the regulated subsystem. This way of organization has a systemic nature. The cybernetic system of the management appears as it follows:

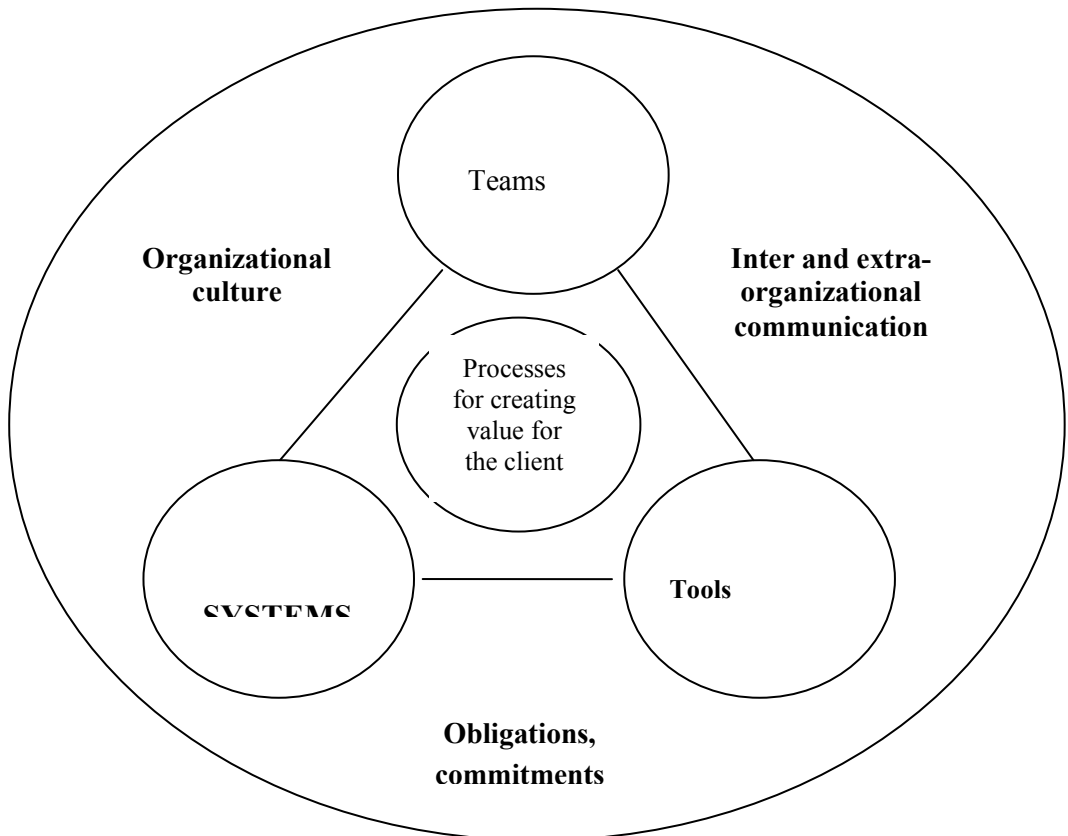

The company, as any other social system, is characterized by the following features:

- It tends to a dynamic, progressive equilibrium
- It has a probabilistic conduct
- It can avoid disorganization
- An increased capability of reaction, auto-regulation and auto-organization
- It contributes to the whole system efficiency development
- Its objectives depend on the contributor factors – individuals.
- It behaves as complex, adaptive entities with a minimal external control.
- The company – system idea is developed so far as to consider the company as a „living system”, part of an „ecosystem” and to go into competition with „other organisms” for surviving.
- The systemic management has the following advantages:

- It allows the deep understanding of internal and external company realities. It offers tools and efficient concepts to deconstruct structures and systems in order to analyze them.
- It allows a holistic, integrative vision.
- It makes easy the informational technologies assimilation.
- It makes possible the evaluation of the social processes as points of reference for management.
- It ensures an adequate conduct.

Nowadays, management theory and practice are based upon the concept of „ Total Quality Management” (TQM)

Each part of an organization has its users, from the interior or from the exterior, thus resulting the necessity for identification of their needs. TQM means quality integration in all the aspects of the management process in order to get lasting performances following the adequate fulfillment of clients needs.

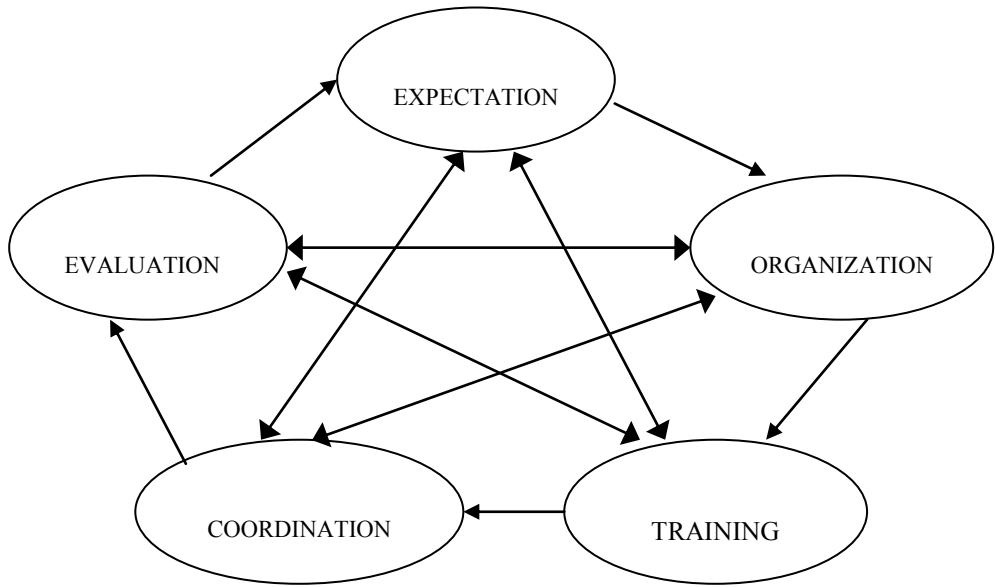

Knowing the consumers needs and the integration in the products quality represent the basis for decision making

Therefore, TQM means implicitly the extension of the systemic vision and it stands at the basis of integrated decisions. The company management develops on two dimensions:

- a developing one;
- a relational one.

The management process can be divided into five functions: expectation, organization, coordination, training and control – evaluation.

At a higher level, expectation and organization are to be found and at lower levels the training, coordination and control functions prevail.

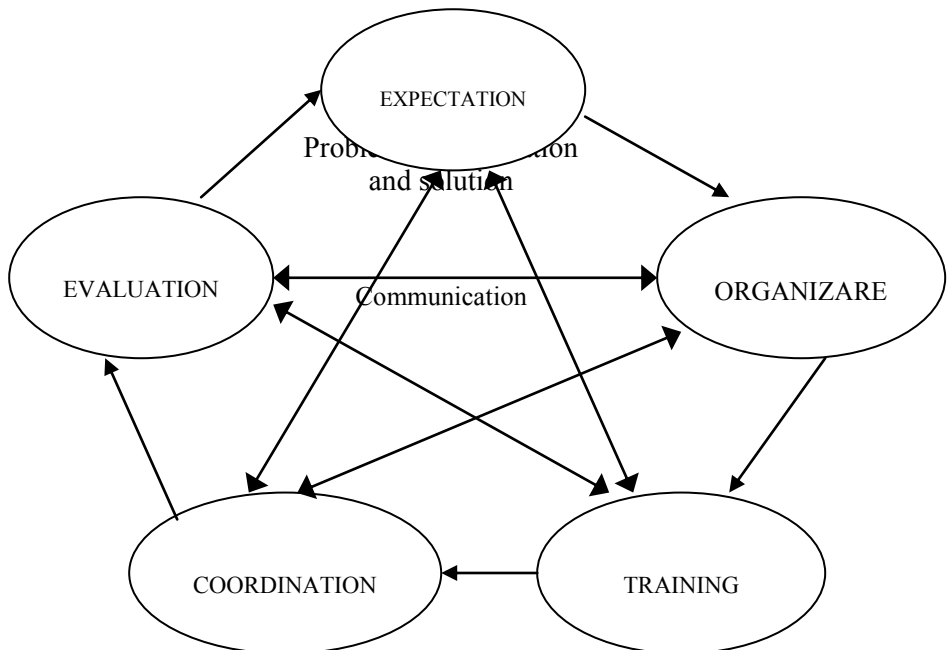

The management sequence

For each stage of the sequence, the manager has three essential tasks:

Working out the problems

Decision making

Communication, as it follows:

The complete management process

The stages of a management system are:

- Determination with accuracy of the objectives system for the company on long term and the way of implementing them, i.e. the company strategy.
- Evaluation of resources required for the company efficient functioning and development, according to the purposes.
- Establishment of sub-objectives and determination of activities and tasks requires for fulfilling the global strategic objectives.
- Inter-correlated designing of the structural – organizational, decisional, informational, motivational and methodological systems.

The efficiency of the decisional system improvement cannot be approached without taking into account the main trends that show at the level of this important company management sub-system. They come as an obvious result to the complexity development of the decisional problems that are to be solved by company management, to the impact exerted by the new structural and functional conditions of economic systems at any level upon the decisional sub-system.

Managerial decision – an integrated approach

In specialized literature a sum of definitions for decision can be found. Thus, O. Nicolescu thinks that decision is „the course of action chosen for the fulfillment of one or several goals”. E. Mihuleac defines decision as being „the choice of one possibility among several ones, the rational option for a way of acting from a number of formulated variants.” A.F. Stones considers that decision is „the process of identification and selection of a course of action in order to solve a certain problem”. Smith thinks that decision is „any action or sequence of actions implying alternatives that must be analyzed”.

According to these definitions, it becomes clear that the decisional act implies the existence of one or several goals, of several alternatives for achieving a goal, the decisional agent having the responsibility to select the best alternative for the given situation by means of analysis, deduction and intuition.

Decision represents a social, deliberate, act of an individual or a group individuals by means of which the goal and the objectives of an action, the directions and the ways of realizing them are set. They are chosen according to a certain need, on the basis of a process of information, thinking and evaluation of the necessary means and of the consequences deriving from the action development.

As it is an act of important social responsibility, the decision reflects:

- A necessity of the socio–economic life and the recommended ways to satisfy it.
- The decision maker will.

An integrated decision means matching present and future decisions taking into account the company strategy and policies. Promoting decision integration must be realized horizontally as well as vertically. Therefore, we can state that the essential elements of a decision are:

- A fundamental view with clearly determined goals
- Designing a precise strategy of action
- The improvement of the pair of values „functional autonomy – unitary coordination”
- Expressing the system correlation of the activities.
- The responsible conclusion of each decision.

Internal and external factors can affect the decision. Here are some internal factors:

- Explaining the objectives and the performance standards
- Knowledge and capacity
- The managers and the employees ability
- The difficulty of the tasks to accomplish
- The staff motivation
- Breaches in information

- Human resources
- Working conditions

Some of the external factors:

- The level, the course and the rate of change in branch or in the activity field.
- Functional or structural legal restrictions
- The importance of the decisions determines the level of management at which they are made and it is appreciated according to the following criteria:
- The size or the period of the engagement following the respective decision.
- The flexibility of plans established on the basis of the decision
- The degree of certainty when taking into consideration the achieving of the objectives
- The human impact

The structure of the decisional process

The decisions that must be made in a company led to their classification into three categories: current, tactical and strategic. **Current decisions** are made at all hierarchical levels and refer to actions aiming at the realization of immediate tasks and obligations. **Tactical decisions** are made at top and middle managers level and refer to definite, immediate actions with some degree of repetition, in conditions of certainty and for an extent of time up to one year. **Strategic decisions** are the most important ones, they raise the most of the problems and any analysis of the decisional process is referred to. These are **specific managerial decisions** and they refer to the ability of discovering, formulating and analyzing a problem in order to find the best solution for it, respectively the best course of action for implementing it.

A decisional process is divided into four distinct stages:

1. Definition and analysis of the problem
 8. Formulation and evaluation of alternative solutions
 9. The choice of the best solution
 10. The implementation of the decision regarding the course of action that is to be followed.

The first two stages can be considered as pre-decisional ones, the third one is decisional and the last one in post-decisional.

According to the certainty of the achieving of the objectives we can have another classification for decisions:

- **Certain decisions** that are usually made at middle and low levels, under well known conditions that may be checked and for objectives with high probability of accomplishment.
- **Uncertain decisions** that are made at high levels and that are conditioned by unpredictable natural and social factors that are hard to control.
- **Risky decisions** that are made by top managers and the probability to achieve the objectives is reduced due to conditions in which they are made and which are hard to anticipate but who depend on a succession of controllable variables.

The quality of the decisional process depends on the way they understand and accept it as being „their own decision”.

The decisional dilemma: centralization – decentralization

The criteria that must be taken into consideration when deciding if a company is centralized or decentralized are:

- The number of decisions taken at low levels of hierarchy in the company
- The importance of these decisions
- The degree of control exerted by top-management upon decisions taken by the employees

This dilemma has both advantages and disadvantages:

Advantages

Centralization	Decentralization
- It ensures uniformity in the way of functioning of the company structural sub-units	- It assigns duties and responsibility from the company top level to component units
- The management performs a coordination and a direct control upon the company units	- It encourages the involvement and participation of several individuals in the decisional process with positive effects upon their motivation
- It ensures the uniformity of decisions	- It makes communication easy
- It eliminates the possibilities of superposition of different activities	- It spreads power and authority in the whole company

Disadvantages

Centralization	Decentralization
- as it isn't distributive, the responsibility will belong to a small number of individuals	- It allows a low degree of uniformity with regard to standards of organizational subunits functioning
- It overwhelms top managers as they must have a global perspective upon the company	- It forces decisional responsibility of some individuals that are not interested in and that do not want to get involved
- It concentrates authority and power at the disposal of a small number of individuals	- It can raise problems concerning the coordination of different elements in the company
- It limits the participation of the organization majority	- It can lead to rivalry and competition between the company sub-units with negative effects upon rationality and general efficiency of the company
	- It needs training programs for the staff, that usually take a lot of time and money

THE DIAGNOSIS IN MANAGEMENT SYSTEM

Udrescu Margareta

Dobre Claudia I.

“Ovidius” University, Constanța, Faculty of Economic Sciences, Constanța, Aleea Universității no. 1, dobre_claudia@yahoo.com, 0241.511000, int. 146

This article is about an introspection that combines the two theoretical aspects of intern and extern diagnosis concluding in an analysis that offer us a vision of the company competition and perfecting the management system. The global diagnostic has a special importance because it allows the evidence and structuring of those problems that need one or more strategic answers. The SWOT model and the other study methods of positioning the company on the market remain the starting point of any action regarding competition context analysis.

Keywords: diagnosis, SWOT analysis, economical performance, competition environment, market, competitive advantage, strategy.

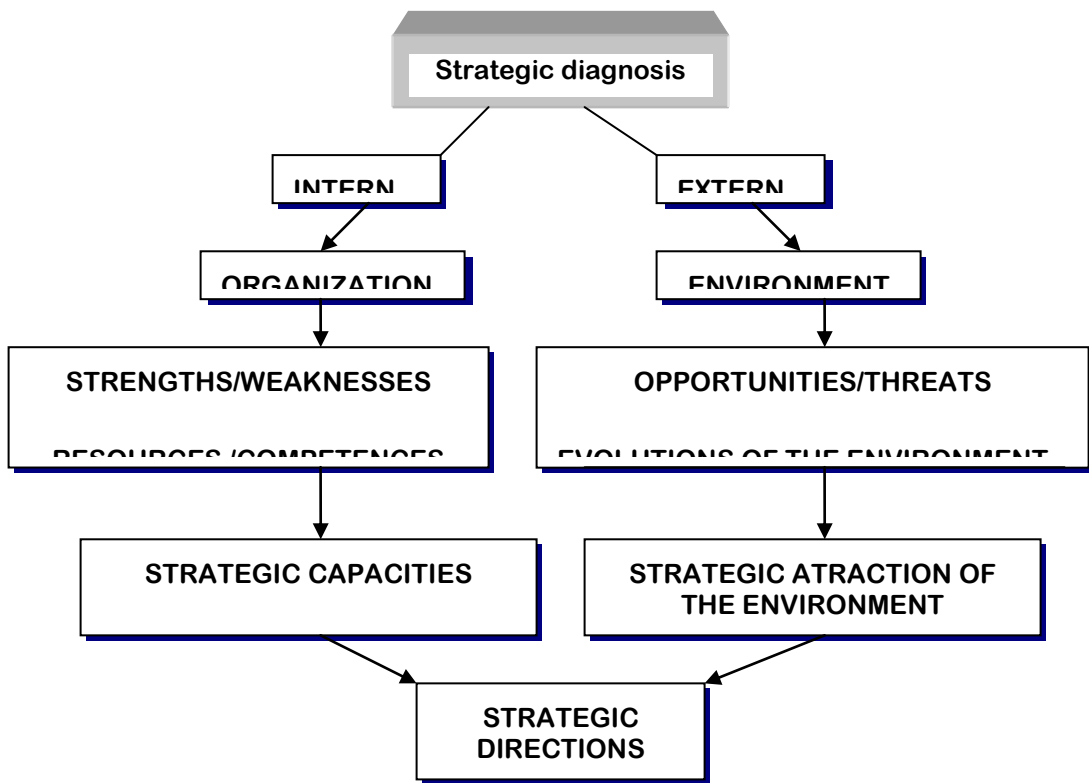

The phases of the strategic march that has to be completed are taken under consideration in competition positioning:

- The analysis of the company’s diagnostic and its competition context;
- The strategic decision, defined by the developing objectives;
- Choosing strategies and implementing them;
- Evaluation and comparison of the results obtained and adjusting the line of the strategy that is adopted.

Formulating strategies is based on the strategic concordance concept between resources and the company’s potential including the external scene. The whole management system, with all its components will follow the combination of the best solutions for achieving and maintaining a high competition level. The environment analysis begins with the factors and the influence investigations which have an important impact for the organization position on the market. The strategic diagnosis is composed by two complementary issues, the intern and extern diagnosis of the organization:

1. The internal diagnosis defines the strategic potential of the company: strengths, weaknesses, by which combination are defined the strategic options.
2. The external diagnosis has as an objective the discovering of the actual situation and the evolutions of the environment of the company, the opportunities and the threats.

Following the results from the combination of the intern and extern diagnosis we can establish the strategic orientations of the company depending on its objectives.

Two direction of the strategic diagnosis

1. The intern diagnosis

To situate the organization in the competition environment it is necessary to realize the matrix of the intern factors in order to determine the internal global power of the company. To diagnose the company potential, we use “the evaluating matrix of the internal factors”. In this matrix, each factor is evaluate through a subunit coefficient (K_i) and a mark (N_i) from 1 to 4.

Strategic domains			
	K_i	N_i	$K_i \times N_i$
A. COMERCIAL CAPACITIES			
Market quota	0,1	4	0,4
The products quality	0,2	2	0,4
The sector image	0,2	4	0,8
Price policy	0,2	3	0,6
Contractual stipulation	0,15	3	0,45
Network distribution	0,05	3	0,15
Products promotion	0,05	3	0,15
Ecological regulation	0,05	2	0,1

	1		3,1
B. FINANCIAL CAPACITIES			
Framing calculated costs	0,2	2	0,4
Efficiency	0,2	2	0,4
Cash flow	0,25	3	0,75
Rate of credit	0,1	3	0,3
Financial balance	0,15	3	0,45
Self financing	0,1	2	0,2
	1		2,5
C.PRODUCTIVIY CAPCITIES			
Technologies	0,15	4	0,6
Production capacities	0,15	2	0,3
The use of production capacities	0,1	3	0,3
Automation	0,15	4	0,6
The production organization level	0,05	3	0,15
Working skills	0,1	3	0,3
Employment qualifications	0,1	3	0,3
Organization of perfection activities	0,05	2	0,1
Products scale	0,15	2	0,3
	1		3
D. MANAGERIAL CAPCITIES			
Structural organization	0,2	2	0,4
Procedural methods	0,2	2	0,4
Decision system	0,25	3	0,75
Informational system	0,1	3	0,3
The motivation capacity	0,15	3	0,45
The innovation capacity	0,1	2	0,2
	1		2,5

Table 1 The evaluating matrix of the internal factors

Analyzing the demand, offer and competition is decisive to establish the external potential of the company and for the competitive profile. It is necessary an external analyze of the company activities: the offer, the demand, the competition. The results of the questions regarding these indicators have to point out the need of the costumers and the market place. The diagnose of the concurrence has to determine: the concurrence strategies, the concepts, the capacities and then to evaluate the concurrence weaknesses and threats. All these information about the competitors give the company resorts to plan its own strategies. The concurrence represents a motivating factor for the company.

2. The external diagnose

For the external evaluation there are some points to mentioning: the products, the quality, the price, the distribution, the variation of the offer and demand. To diagnose the external potential, we use “the evaluating matrix of the external factors”.

External factors	K_i	N_i	$K_i \times N_i$
A. Environment opprotunities	1,00		3,3
The growth of the demand	0,20	3	0,60
Extension of the market	0,20	4	0,80
Using new distribution networks	0,25	3	0,75
Products diversification	0,10	4	0,40
More exports possibilities	0,25	3	0,75
B. Environment threats	1,00		3,5
High cost of row materials	0,20	3	0,60
Insufficient row materials	0,25	5	1,25
Disasters and calamities	0,20	4	0,80
High competition	0,15	3	0,45
Promotional activities of the concurrence	0,20	2	0,40

Table 2 The evaluating matrix of the external factors

From the matrix we can see that the environment offers to the companies opportunities equal with threats. To realize a complete image about the company it is necessary to analyze its market position in comparison with the others competitors from the same sectors of activity. For this, it is used the competitive profile matrix. In a competitive economy, the diagnose is realized in a strategic vision, which consist in recognition of the strengths and weakness of the company with the threats and opportunities from the environment in order to keep its market position and obtain competitive advantage.

The competition is a potential characterized by market advantage. The productivity and its quality are just a part of the circle that outlines competition. To obtain an advantage in a competition it is necessary to analyze every aspect of the corporation using the two techniques, the value chain and the value system. Competition advantage is determined by many factors of influence: the type of organization, the form of competition, the field of activity, the level of knowledge about the competition's information. The way competition has changed during time. Static competition, in which success or failure are determined by the

amount of production factors, transformed in a dynamic competition, that has the following motor factors: technical progress, new market openings and modern management methods, modifies or even overuses the advantages of the competition.

The essence of applying a diagnostic consists in analyzing cause and effect in finding and examining the strong and weak points and also in formulating recommendations. Another important point of this part is the SWOT analysis. It is known the fact that for this the analysis of the strong points and the weak points of the internal resources of the organization is needed also the analysis of opportunities and threats offered by the competitors from the industrial scene. After closing the analysis of the external environment and the internal resources, observing the matching or mismatching between opportunities and threats becomes possible and strong and weak points. Integrating internal and external analysis (comparing the analysis) allows managers to preview existing strategy results or future strategies.

Competition strategy represents opting for a certain chain of activities different from the competitors' or for a different method of execution of the same chain of activities similar with the competitors and integrating constituent activities for achieving a unique and sustainable position in the sector. Trying to make the strategy perfect by making the management system perfect creates a analysis of the strategy through the eyes of the management system. The changes in the management system influence the company's strategy. This way perfecting the four management subsystems leaves its mark on the strategy of action that the company has. Perfecting the strategy through innovation is another important direction. Knowledge has the tendency to get old. For this reason innovation doesn't have to be a unitary appearance, but an interminable reaction to changing situations. Entrepreneurs see the change as a norm and something healthy, they are always on the look out for new changes, and they react to them.

I strongly believe that applying new methods and management techniques, throwing away the negative aspects, we will succeed in a near future to talk about a more performing management system. At the base of the competitor's management system we can find a complex of principles, rules, demands that assure its form. No matter what the organization's characteristics are, the management system holds a number of components that are different from each other depending on the nature, on the characteristics of the instrument that is being used. It's important for managers, for specialists to identify the most significant aspects that implies perfecting the management system, as complex, as difficult to realize, if we keep in mind the number of dysfunctions triggered at the level of every management component and the manifestation of more blocking elements in this field. The starting point and at the same time , the first step of perfecting management systems is represented by trying to find out the financial economic quality and management of the organization that follows the casual evidence of the main dysfunctions and strong points.

THE MANAGERIAL CULTURE, VIEWED AS ECONOMIC CATEGORY

Urban Violeta

“George Bacovia” University, Bacau, Romania, Management Faculty, 96, Pictor Theodor Aman, Bacau, violetaurban@yahoo.com, mobile telephone number: +40/732402484

Abstract. The managerial culture, part of the organization culture, is a major form of manifestation of the human factor at the organization level. During their existence, organizations are seen in different ways due to the powerful influence of the top managers’ professional style and personalities on the people forming the organization.

Keywords: organization culture, managerial culture, corporative culture, organizational culture

The organization culture represents one of the management fields of present interest, with a relatively recent history. The concern for this type of culture is mostly due to the performances of the Nippon organization, performances that can be explained through their specific culture.

It is known the fact that there is a relationship between the organization culture and the obtaining of the competitive advantage on the market and, at the same time, the knowledge of this culture’s elements is necessary in practicing the modern management. Due to Nippon firms’ performances, recorded after the second World War (Japan reached the highest rate of economic growth and the lowest level of unemployment after major losses during the war, without two many natural resources and with a numerous population) the American and West-European specialists interpreted the Japanese success from the cultural point of view, presenting culture as a main factor of the organization’s economic development and durability.

Defining the organization culture is difficult to realize and for this reason there is not a unanimously accepted definition in the specialty literature; yet, all attempts to define the organization culture have as a starting point the human resource. People join within the organization, they come from different environments, with ideas, convictions and feelings that are imparted to others, enriched or replaced by means of customs and rules that exit within the organization. The organization culture is the result of the combination of ideas, feelings, convictions, beliefs, norms and rules.

Organizations must know and understand their own culture because it can help them render their activity efficient; owing to this fact, it has been discussed lately about the culture analysis (culture audit). In our country, the first study on culture research at the organization level was done in 1997¹⁵⁴. The findings were influenced by the mentalities, values and attitudes characteristic to the transition situation.

As the organization is an open, self generative three – leveled (corporative, organizational and managerial) system, one can say that, in every organization there are three interdependent types of culture: corporative culture, organizational culture and managerial culture¹⁵⁵.

The corporative culture is created by the organization’s tangible assets: interior decorations, buildings, furniture, technological equipment, the range of products and services, catalogues, leaflets, pennants, banners, abbreviation the staff’s clothes at their work place.

The organizational culture is known by means of visible elements, related to people’s behaviors (rituals, ceremonies, taboos) and their verbal products (myths, stories, legends of the organization’s history usually sent orally, from generation to generation), as well as by means of invisible elements of spiritual nature, of the same people on top of the organization’s chart (beliefs, values and ethical and moral norms).

¹⁵⁴ State, O., *Cultura organizației și managementul*, ASE Publishing House, Bucharest, 2004, pag. 206

¹⁵⁵ Bontas, D., Urban, V., *Cultura firmei, rezultat al propriilor componente sistemice*, The Scientific Bulletin of “George Bacovia” University Bacau, year VII, no. 1/2004, pag. 17

The managerial culture appears in beliefs, the system of values, the behaviors and expectations of the management team members and is reflected in the used management styles, significantly emphasizing the organization's performances¹⁵⁶.

The managerial culture is greatly influenced by the top managers' personality. Managerial culture refers to: the organization's activity domain (products, services, markets); the management style; business ethics: the attitude towards risks, competitions, clients, employees, shareholders and corporate image.

These three components presented above appear simultaneously, they are not strictly delimited; even more, they become interdependent at the organization level.

The managerial culture is "the system of values, beliefs, aspirations, expectations and behaviors of managers of an organization, reflected in the management types and styles used within the organization, sensibly marking the organization culture content of each firm and its performances"¹⁵⁷. Managerial culture is greatly influenced by the organization's general managers; thus one can say it is personalized.

The components of managerial culture (beliefs, values and norms) help managers to shape their basic opinions on the organization environment, to understand and to interpret what is going on; thus, the group's members can act appropriately¹⁵⁸.

Beliefs take shape in convictions, truths, certainties made known by general formulations on the environment they exist in and develop the organization's activity. Example of beliefs: "we share the success and don't let anyone of us suffer a defeat by himself", "we say what we believe and do what we say", "team work is more efficient" (beliefs of "AXA Consulting" firm, taken from the site www.cariereonline.ro).

Values are features of ideas, facts and phenomena of meeting the social needs and ideals generated by them. Values are propagated in the collective desires and attitudes, imposed and accepted in the organizational group. They can be rendered by the social environment, promoted by the national culture (the attitude towards work, honor, honesty, correctness) or by the organization members' experience, especially the top managers' experience. A research on Romanian firms, concerning the cultural values of an organization, has shown the fact that the first ten preferred attitudes, in a decreasing order of their importance, are: earnestness, discipline, the implementation of responsibilities, performance, creativity, participation and involvement, self-accomplishment, autonomy, democracy and quality¹⁵⁹.

Norms take shape in rules, dispositions taken from laws, instructions. The organizations aiming to support the promotion, implementation and acceptance of the new by means of norms, cultivate values such as creativity and innovation. Other organizations are characterized by norms that tolerate, in some degrees, failure, support successes (grant diplomas, medals, rewards of ability, promotions etc). Conservative organizations are not predisposed to change and thus, they encourage norms the lead to the maintenance of traditions, strict discipline etc. fact that implies the centralization of decisions, official communication, the respecting of the hierarchy, the refusal of proposals and suggestions from the subordinates.

The basic concepts are opinions and ideas given by the management persons and by shareholders, employees, partners, competitors, customers. They render the essence of managerial culture, the management type or style and foreshadow the organization and the employee's perspective.

By means of perspectives, the organizational group's members foresee opportunities that will help them build future actions, to meet the different situations. We can speak about organization perspectives and human being's (employee's) perspectives.

The organization perspectives refer to its environment and are reflected in the development power of the organizational group compared to the competitors in a certain time horizon. They are found in the organization's strategies and in the common objectives and purposes of the organizational group's members.

The employee's perspectives refer to the individual professional performances, the criteria and possibilities of promotion within the organizational structure. They are found in: the performances expected from each

¹⁵⁶ Nica, P., s.a., *Managementul firmei*, Condor Publishing House, Chisinau, 1994, pag. 84-85

¹⁵⁷ State, O., *Cultura organizației și managementul*, ASE Publishing House, Bucharest, 2004, pag. 290

¹⁵⁸ Bontas, D., *Managementul general al firmei*, Moldavia Publishing House, 2003, pag. 50-54

¹⁵⁹ Nica, P., s.a., *Managementul firmei*, Condor Publishing House, Chisinau, 1994, pag. 87

and every employee; the criteria and ways of staff's selection, recruitment and promotion, methods of professional improvement.

The performances expected from each employee taken separately represent components of the strategies and policies formulated by the human resources management. For example, some organizations offer a success career to the self-taught persons, predisposed to study; others promote discipline, routine, the strict observance of regulations and instructions, thus foreshadowing a success career for the persons with an economic spirit, passive but capable of making great effort.

The criteria and ways of staff's selection, recruitment and promotion refer to qualities, aptitudes, skills, professional knowledge, experience - elements that are necessary and obligatory for meeting tasks, attributions and responsibilities specific to a certain job. Generally, one takes into consideration: diplomas, academic degrees, letters patents, professional titles, the attended and graduated education institutions; recommendations given by authority and credibility persons (the candidate's or employee's family members, former colleagues, superiors, underlings, teachers etc.); seniority, professional experience, the performances from previous jobs; interview results, selection contest, periodical tests, evaluations etc.

The methods of professional improvement are generally applied in big developed organizations and they consist in seminars, courses, refresher courses (financially supported by the organization).

The main functions of the managerial culture of an organization are¹⁶⁰:

1. Motivation factor in meeting the set objectives and purposes. The managerial culture reflects the personality of founders, managers and leaders. It influences the decisions and actions of managers that can set norms and standards consistent with their values, in accordance to which both managers and the other employees should be assessed;
2. Offer vision and affiliation to a social category particular for managers. The organization cannot meet its objectives unless the elements of culture are known by all managers and unless these managers act in accordance with these objectives. An organization can survive a long time and can develop if its fundamental beliefs and values are known and put into practice;
3. Factor of the organizational change promotion. Owing to the influence of internal and external factors, a change may be necessary at a certain moment so that the organization could survive on the market and develop. The firm's tradition influences the proportion of the assumed risk degree, the depth of the introduced changes;
4. Favors the organizational learning process. Present-day managers have the roles of monitor (obtaining information) and information disseminator (within the organizational environment and the rendering of information in the external environment); thus they can provide a prompt and qualitative circulation of information towards the inferior hierarchical levels, so that employees can increase their knowledge, formally or informally;
5. It assures the harmonization of values within the organization. The staff hiring can lead to the appearance of new values, norms, beliefs that influence positively or negatively the organization's activities. Thus, the managerial culture has to sort out these values, norms and beliefs and keep them and promote only those bringing value to the organization.
6. It realizes the "cultural control" of the organization evolution. The managerial culture has as mission to induce a certain behavior and way of thinking and manifestation of the organization's members both inside and outside it. The cultural control is to be met at more levels and refers to ethical aspects (norms, values, ideologies) and the emotional ones (pride, loyalty, attachment). The cultural control also occurs when certain relationships and processes are ambiguous;
7. It contributes to obtaining the synergy effect in the firm. The managerial culture includes a mixture of beliefs, values, norms, attitudes that it emphasizes through a synergy effect. This fact succeeds in harmonizing a great diversity of values, attitudes and behaviors and thus in directing actions towards the meeting of the set objectives;
8. Determinant in obtaining the competitive advantage. It has been demonstrated the fact that the managerial culture can influence the success and failure of the organization on the market. Managers, except the fact that they create a set of expectations, have to present the ways they can

¹⁶⁰ Năstase, M., *Cultura organizațională și managerială*, ASE Publishing House, Bucharest, 2004, pag. 112-119

be met; thus, one can succeed in motivating the employees and directing their actions in order to meet the set objectives.

Knowing, analyzing and showing to advantage the managerial culture – all these actions are absolutely necessary both for managers and for each and every subordinate.

The development of the appropriate management styles, of the moral management, of a system of values that promotes the balance between ethics and profit, guarantees the long-term strategic orientation, the keeping of a social climate that should allow the harmonization of individual interests with those of the organization and a dynamics adequate to the evolutions of the competitive market environment's factors.

THE CAREER AND THE MANAGERIAL SUCCESSION

Urban Violeta

“George Bacovia“ University, Bacau, Romania, Management Faculty, 96, Pictor Theodor Aman, Bacau, violetaurban@yahoo.com, mobile telephone number: +40/732402484

Abstract

I have began my paper with some of definitions of the term “career” offered by a series of books on this direction. Further on, referring to a career in managing, I have described the four stages undergone by a person which begins his career as a head of a department, head of a section, of an office, etc, and obtain a job in the executive area and later on, a job as a consulting agent or advisor for the younger managers.

At the end of my paper, I have mentioned the planning and the administrating of one’s career, underlying their importance both for the organization and for the individual.

The term “career”, in the way in which it is explained in the Encyclopedic Dictionary, refers to a job, an occupation, a good position in the society.

Keywords: career, managerial career, managerial succession, career planning, career administrating, programs for managerial development

The Dictionary of Human Resource & Personal Management defines career as the job a person has prepared for and expects to perform it for the rest of his/her life.

Along time, the works on this line have found many meanings and definitions for the term “career”.

Thus, considering mobility or ascension in an organization, the term career is seen as a “promotion”. On the other hand, seen as job, it is estimated that many professions are what we call a career and hence, we use terms as the military career, the managing career, the educational career, whereas other professions are seen as mere jobs (e.g. salesman, carpenter, driver, etc).

Another approach presents the career as “a series of jobs all along ones life” or “a series of positions” in the hierarchical order of the positions the employee takes in a successive manner, following a predictable rule.

Gerry Johns describes the career as being “an evolutional sequence of professional activities and positions occupied by a person, same as the attitudes, the information and the abilities he/she improves on in time. In order to understand the term “career”, Gary Johns mentions three aspects that must be paid attention to: a career means mobility in time; it is the interaction between the organizational and individual factors; and it offers an occupational identity.

The way I see it, a career represents a succession of jobs, positions or occupations that a person has all along his/her life, in one or more organizations.

The managing career is described in the books on thins line as being a succession of the managing positions that a person may occupy during his/her life. The managing career supposes four stages: the initial one, the one of acknowledgement, the one of stabilization and the unemployment one. in the initial or exploring phase, the person usually has first line managing positions (head of an office, of a department etc). As time goes by and the person develops skills and abilities in working with people and also competences in strategic orientation and in obtaining real results, the person can move on to the acknowledgement and stabilization phases, occupying managing jobs in medium and superior hierarchic levels, not necessarily for the same organization. The unemployment or the end of the career is the stage when the manager moves from executive to consulting positions, in order to support the executive managers in managing the organization.

We all know that in a competing society, success mostly depends on the activity the managers at all hierarchical levels have. For some time now, in the big, lasting and growing companies a great deal of importance is being given to planning and administrating the managing career, continuous training and managing succession. (General Electric, Motorola, P&G etc) These are methods confirmed by the declarations of some of these companies’ managers: “From now on, choosing my successor is the most

important decision that I have to make. This is a thing that occupies a great deal of my time ,every day” (Jack Welch, Chief Executive Officer, talking about the successional plans, in 1991, nine years before his retirement.) “A responsibility that we consider extremely important is providing continuity for a competent superior management. We have always done our best in having well-prepared candidates, using training programs for the best of them and we have been very open-minded regarding success ional plans. E believes in the crucial importance of continuity.” (Robert Galvin, ex member of the Central Executive Office, Motorola, 1991).

Jim Collins (the one who wrote the best-seller “Excelling in Business”) and Jerry Porras, the authors of “Built to last. Successful Habits of Visionary Companies” say that, after some research that has lasted for six years, the visionary companies carefully develop, promote and select the managing skills educated inside the company in order to preserve the essential. Thus, General Electric is a durable company also due to the fact that, over one hundred years (the company has been established in 1892) the company has had very good managers, all of them coming from their own “managing nursery”.

The process through which the companies develop, promote and select the managers from the inside is considered a process of continuous self-consolidation, “a loop of continuity in managing”.

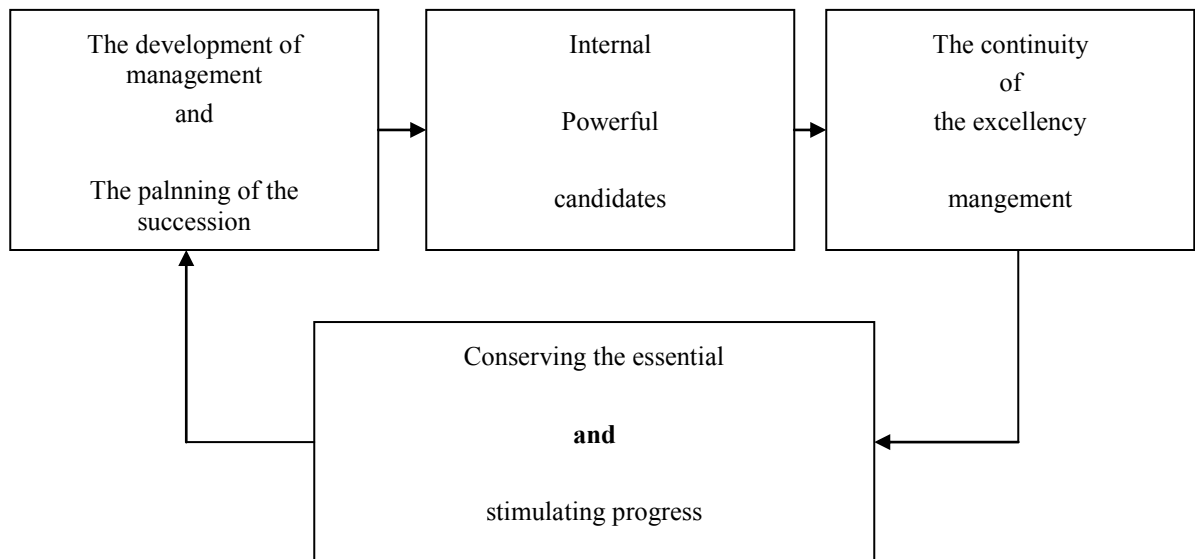

Figure no. 1. The continuity looping of the interior management

If one of the elements presented in figure no.1 is missing, it appears some discontinuities of management which oblige the organization to recruit and select mangers from outside it and thus making a distance from the fundamental ideology. The discontinuities can not lead to progress, the organization „slumps” itself because of the leading deficiencies. Thus, the „curve” of continuity of the leading board becomes the “hole in the leading process and the salvation syndrome”.

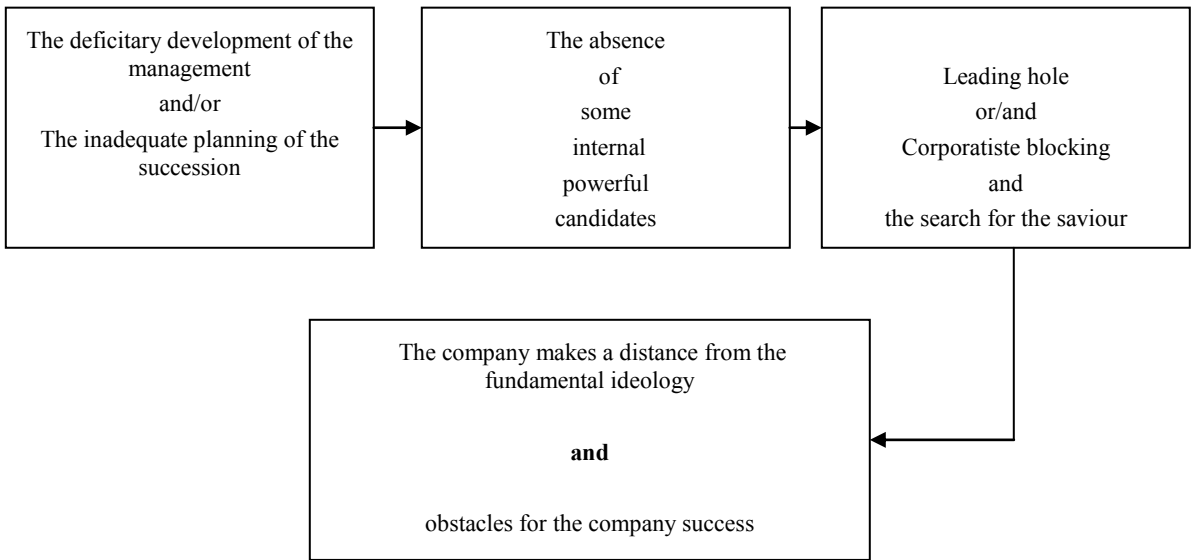

Figure no.2 The hole in the leading process, the corporatist blocking and the savior syndrome

The planning of the career is a very complex and systemic process for establishing the career’s objectives, for the elaboration and the implementation of the strategies necessary to assess the results and the opportunities. The process of career planning engages both the responsibility of the individual and of the organization.

Thus the individual needs and aspirations should harmonize to the needs and opportunities of the organization. The planning should take into consideration the fact that each member of the organization has his/her own needs, desires and that the individuals represent the human capital of the organization and they come from different environments with different backgrounds, experiences, skills knowledge beliefs being capable to change and discover new ways of acting if the opportunities stand very clear or if they are encouraged, supported, guided, motivated. The career management is the result of the interaction between skills and the accomplishment desire of the individual and the opportunities offered by the organization. The individual is much more satisfied of his/her career if the organization can offer him/her the professional environment in which he/she can put unto light his learning experience, skills and capacities.

Much more a company can offer a fit working background for an individual but at the same time, this background can be hostile for another individual. This fact is supported by Jim Collins and Jerry Porras, through the following examples: “if you are ready to adopt with enthusiasm the business pattern Hewlett-Packard, then your place is not at Hewlett-Packard. If you can not easily adopt the fanatic devotion towards clients of those of Wal-Mart, then your place is not at Wal-Mart. If you do not desire to be “procterised”, then your place is not at “Procter and Gamble”. If you do not want to join the crusade for quality (even if you work at the canteen of the company), then you do not have a place at Motorola and it is for sure that you will not become a “motorolan”. If you put under question mark the right of the individual to take his/her own decisions concerning the choice of what he/she can buy (as, for example, cigarettes), then your place is not at Philip Morris. If you can not accept the Mormon influence, the cleanliness and the devotion in serving the others of those working at Marriott, then you would better stay apart. If you can not embrace the idea of integrity, of “magic” and of “cosmic dust” and if you can not transform yourself into a hardworking, well-dressed individual, then you do not like to work at Disneyland.

In order to be more efficient, the planning of a career one should realize an agreement between the goals of an individual career and the personal needs of the organization, between the individual efforts to develop and the training programs elaborated by the organizations. The career developments programs aim to steady harmonize the individual needs and the organization opportunities which are changing permanently. The choice and the development of an individual career should be regarded within the context of life and development of a family and not only as employees of an organization.

Unfortunately, in many organizations in Romania, the detailed plans of the professional career evolution of the employees are not present, and even more, the companies do not have a policy of the career evolution capable to guide the training activity or the development of human resources and motivate the individual performance. Such a policy could be a model to follow for the employees in order to compare their expectations, desires, aspirations and be able to control their efforts towards a self improvement of their activity.

I consider it is useful to develop some programs of initial and permanent formation of the managers at the level of post-gradual, master, doctorate studies and the elaboration of some programs for managerial development and career planning at the level of the organizations.

Resume

ERP System (Enterprise Resources Planning) has a positive impact upon the corporate performance, offering the possibility to adjust the main economic processes already applied by its organizational diagram, so as the decisions are done in real time.

A contemporaneous tendency in area of the market of human resources applications consists in mixturing these ones with the ERP systems among the companies.

The use of ERP systems involves:

- *Identification of needs*
- *Control of data reliability*
- *Control of divisions during implementation*
- *Involvement of a mix of division in the process of implementation*

Key concepts: corporate, performance, systems

The success of corporate units in the markets, is closely link to their capacity to gather information, to select and administrate them according to the activity specific, to analyze the dynamics of performance ratio, and to take optimal decisions under different assumptions. By this way, the corporate activity can be permanently adapted to the new challenges coming from the market and from the competitions.

The human resources is, without doubt, considered as among the most important ones for employer. Efficient use of labor force and the possibility to asses the employees performance, the optimization in the recruitment process, the training of personal - are only few of the elements being the base for a business success.

The new trend in area of human resources is to transform this activity from an administrative one, into a strategic instrument of planning and development the business. The management of human resources generates a major role in profitability increase. So the use of IT System for administrating the human resources is a necessity.

The IT solutions used in the human resources management are supposed to be able to offer dedicated functions for assessing the employees efficiency and to supply an efficient training. Additionally, a dedicated IT application is able to lead to lower costs done by HR departments, and so to preserve the profits.

In the last years, the market of HR software has recorded an important development. The increase of IT business was link to the diversification and quality enhancements of managerial applications including the human being factor. Nevertheless the wage payment software remain the main core available for management decision makers.

Although the market is good enough for exclusive wage payment software applications, the IT companies started to feel the need of diversification their services toward human resources managerial solutions in order to increase the efficiency. It is a common behaviour of progress no matter the area of activity, nor the business dimension, while the focus is done upon the services' quality enhancements, and plus value-creation.

Among medium and big companies there is a higher interest for acquiring the specialized modules for assessing the employees, recording the brief cases and increasing the selection, all these are programs looking for gaining competitive advantages.

Under such market demand, it is no wonder that the share of specialized IT application continues to increase.

Real time decisions

The modern tendency is to generate a IT application that is capable to integrate main economic flows, so a decision is done in real time.

One such system having quite a good success is called FRP (Enterprise Resource Planning).

According to the related definition, an integrated system of management of human resources includes all data and process available into a company under the same umbrella. The users appeal a unique data base in order to save data coming from different modules. Having a module-based structure, there are available decision making processes and data updates in real time upon all main activities a company can have:

- Resources management
- Finance
- Supplying
- Sales
- Planning and monitoring the production, so on.

A modern trend is to develop and then to integrate very complex modules applications into the existing ERP systems. In this way, there were built IT products at high degree of specialization and company dedicated which in the next stages are to be included progressively in to ERP systems. A main demand is in area of wage payment, accounting operations, payments and transfers, maturities and scheduled debts.

The heart of ERP system is the data base. It has to be easily compile by all market programs, and the results should be reliable. Besides, the report obtained by operative actions should required a simple working interface and a decent time consuming.

The diffusion of Internet link to the need of mobility and accessibility to informational resources of data base systems, have lead to worldwide use of client-server architecture even in the area of human resources.

The modern business market imposes the availability of dedicated functions inside each IT module especially in area of human factor. Because, even if the strategy is wrong or good, the final result is due to human resources implications. Under such premises, the main costs are expected to be lowered by an adequate allocation policy of all resources.

More and more companies realize regarding the increasing importance of integrated IT system, the need of a dedicated human resources management module. So the big companies are more and more exigent when asking for IT applications and solutions. There are preferred complex IT solutions offering efficiency in resources management, being avoided the simple programs that cannot be put in interaction with other modules.

Implementation of HR management solution inside of ERP integrated system offers a high degree of interoperability with the other applications and modules, so a better efficiency and coordination. As result, once an information about a person is inserted in the system, it becomes available to all other modules in real time while all data bases are also updated together with the reports using those data.

The dedicated IT solutions in Romania started to become more and more complex, from a simple wage and present application, toward an evolution tracking of employee even from the moment of interview. There are solution that search for certain feature in all administrated data base of a company, looking for example for educational level, or studies participation, or individual career. In the same time the report are more and more complicated. In the present days, a simple wage report is no more sufficient because now it involves statistics applications or other professional data. One of most challenging request is to lower the administrative cost using integrated IT software, related to the incoming process of human resources transformation.

The role of IT system upon the human resources department depends on one side from the degree of development of the subject company, and on the other side from the position of human resources

department in the company structure of decision makers. Thus, an entry level company will almost certainly request simple IT solutions focused especially on the bonus and wages identification and administration. A more complicated IT integrated system is not preferred by small companies because of the simple things it needs: small data back-up data; easy update of reports to any organizational changes. When the company becomes bigger, its human resources activities increase in importance due to: diversifying the wage packages and recruiting methods, training and performance assessing. As a result, there is the moment for the market of IT integrated modules that are able to cover all new needs.

Before making the choice for implementing an integrated IT software there are to be considered the following:

- Identification of company needs

This stage requires identification of data flows for such applications. So, it is necessary to fulfill an overall informational analysis of company as element of success. In the case that the analysis is not complete, the additional cost during exploitation are to be much more important than the savings obtain with IT appeal.

- Control of data integration

The capacity to maintain and develop the coherent data is always an important thing because the rate of error has to be strictly control. In fact, it can vary from one industry to another one. So, the importance of the dedicated specialized solutions will mean the possibility to enhance the safety degree (= good operative results) of activity.

- Implied-divisions implication in the process of implementation

Organizational history and management can be a brake for the integrated IT systems. There are many situations when the management overlooks the boomerang effect of the issues that request for IT integrated software. So the complexity of data implies the use of all divisions using a certain data, not only one divisions because the lack of reliable data will appears. It is not simple, in fact there are complicated flows' modulation, and a high degree of communication it is suggest.

As principle, the human resources management application being integrated inside of a aggregate IT software, will bring thus a high flexibility in order to respond the particular tasks of a certain company, and also will respond the updated legislation for the contractual period. Such a module should be built up in order to allow:

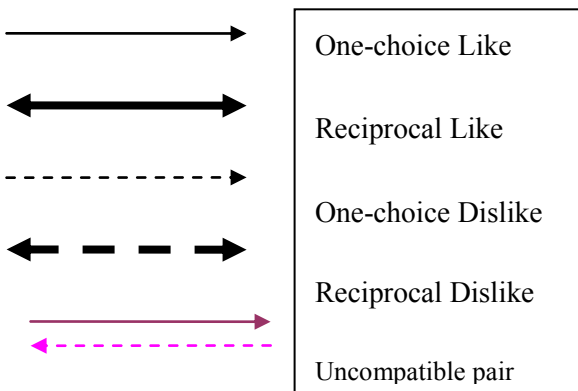

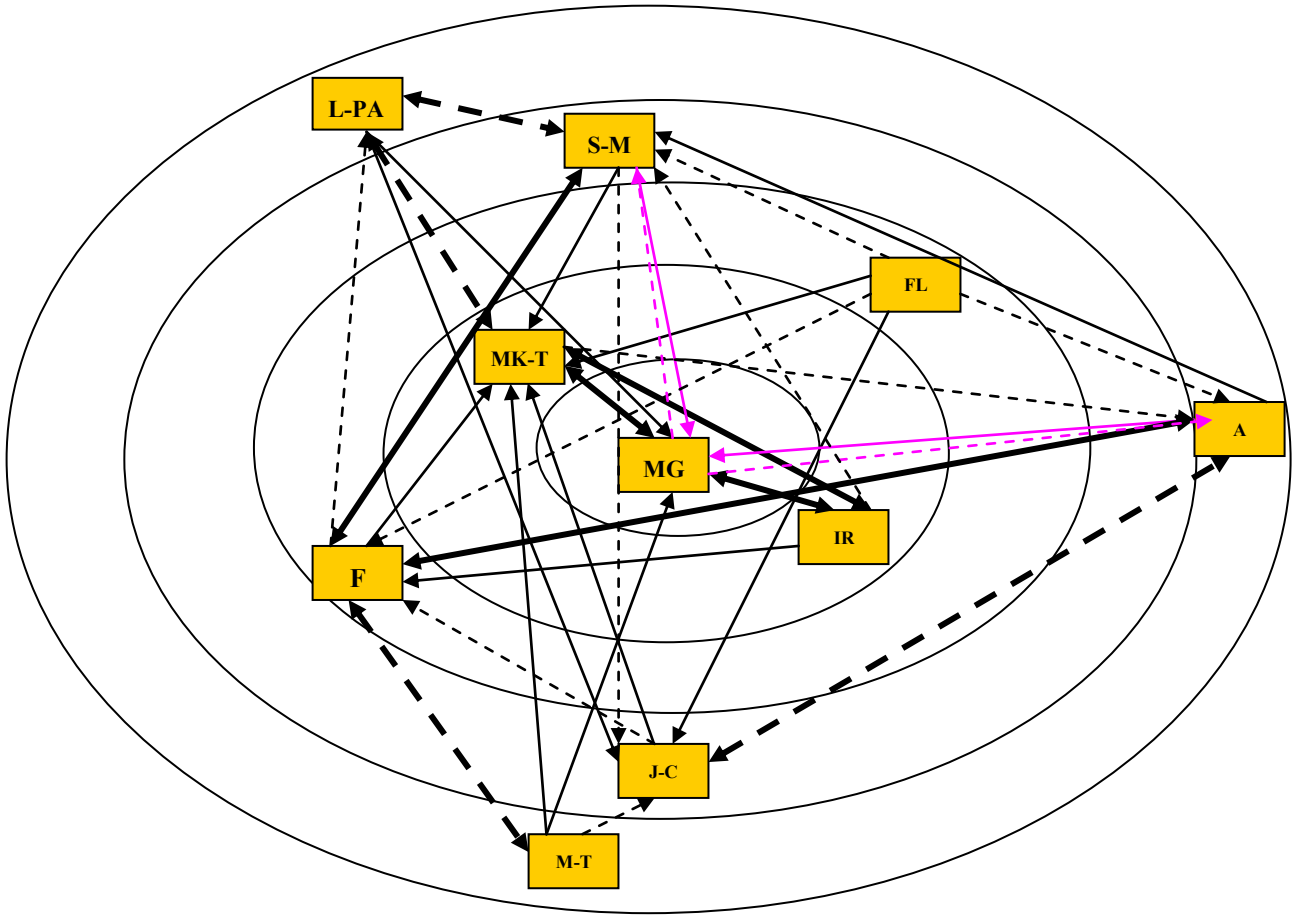

- selection and personal recruitment
- wages administration together personal and professional data
- training and administration of trainings
- computing the efficiency of employees both in quantitative and qualitative area
- tracking the individual career of employee
- reporting statistical indicators
- So, the IT module is to participate actively to
- lowering costs and increase efficiency
- lowering the efforts done in area of human resources management
- performance tracking
- security and data protection
- real time access to different information
- transparent integration among modules
- respect to the law

The contemporaneous practice, has shown that a good created and implemented ERP system has as result a better administration and efficiency of enterprises. In conclusion, the contemporaneous economies are mechanisms that require the company for implementing viable IT solutions in all domains, including human resources. It is a natural process of transforming the old professional function of hr department toward a new one called the business partner.

APPENDIX. THE SOCIOGRAM (Likes&Dislikes)

FROM TQM TO GQM – A NEW SHIFT IN A GLOBALIZED WORLD

Sitnikov Catalina Soriana

University of Craiova, Romania, Faculty of Economics and Business Administration, Str.A.I.Cuza, nr.13, 200585, Craiova, Dolj, inasitnikov@yahoo.com, +40 251 411317

We witness today a tremendous intensification of global competition that turns to be and to become an obvious reality for new and old businesses, for the companies that meet complex challenges in every phase of corporate management. Among the management areas that should come under a careful examination, quality management is one of those that must be examined afresh when economies, markets and industries operations become global.

As practice proved, quality management concept evolved from the engineering and statistical concepts, centered on the statistical quality control, to the large view of the concept that encompasses broad organizational issues and scopes. Today, the quality concepts are under the domination of Total Quality Management(TQM). Concepts standing out as main factors in TQM implementation are these days well established and used: customer value satisfaction, continuous improvement, total organizational involvement.

Though TQM is successfully used by many firms, many conceptual and practical questions remain unanswered while global markets and industries are a fact of economic reality.

In this context, Global Quality Management (GQM) is a new and emerging area of quality management practice but, despite its frequent use, it is not yet defined, analysed and researched. This paper makes GQM its research focus in order to contribute to the understanding of the concept, and to establish a track for new and future research.

Keywords: quality, management, total quality management, global quality management

A new vision over TQM

Many authors noticed that it has become something of a cliché to say that organizations have gone through a lot of changes in recent years. Although, it is obviously that the changes at business environment level are common for all times, the last transformations have something significantly different.

Since the 1960-1970s the development of the economies, societies and world gained new features. During these years, three different but interacting processes took place. The rapid development of information technologies, that exceeded all forecasts; then it was the globalization, which highlighted the significance of the environment as of global unifying connection, and the last process was formation and increased pressures of different non-governmental movements and stakeholders' groups. These processes and reaction influenced by them stipulated development of the new social structure - net society, new kind of economics, and new virtual culture.

Nowadays, most of the transformations are associated with *external* pressures. External pressures may be understood as pressures for change, associated with a number of global phenomena.

In this new given environment, it is obviously that management shifts from a situation where the future was controlled by focusing on internal forces, to a situation where any company must deal with lot of external pressures.

In this context, Total Quality Management (TQM) was one of the most commonly used change management tools. At first sight, the traditional approach of the evolution of quality management concept from inspection to control, assurance, and, finally, total quality management, does not build a visible link between

quality function and external pressures. On this ground, the changes in quality management concept are to be underlined:

- Quality as a quantitative aspect, emphasizing qualitative factors.
- The reactive function of control changing to a preventative function of assurance, and to a proactive vision of quality.
- Moving from focus on the final product, to quality on tasks and processes.
- A global perspective of the organization has emerged as a result of the increasing integration of different aspects of quality, as so the social and environmental aspects are now added to commercial dimensions of organization.

During the last years, the purpose of quality movement, as part of quality management evolution, is achieving business excellence. Many researchers notice that most of current business excellence models focus predominantly on a single bottom line of financial results rather than also attending to the social and environmental impact of businesses. However, the top most common and widely used quality management tools for measuring business excellence, The Malcolm Baldrige National Quality Award and the European Quality Award, are using wider approach. Principles of business excellence are linked with corporate social responsibility goals, i.e. these business excellence models are measuring, and therefore are promoting methods of managing external pressures. Society results, along with people results, partnership and resources, and customer results are among the key evaluation criteria. This is a true evidence of the quality management movement extending its scope to include social and environmental responsibility to address the changed demands of today's business.

TQM is today seen as an organization-wide effort that emphasizes three core principles:

- Customer orientation.
- Process orientation.
- Continuous improvement.

The concept of customer focus is developing into meeting the needs of a broader group of customers including human stakeholders, environmental stakeholders and other interested parties in societal sustainability.

TQM, as a management philosophy, has elevated the implementation of quality management practices from operational to strategic level. Sustainability cannot be separated from evolution of TQM, since sustainability itself should be defined as the ability of organization to adapt to change in the business environment, to capture contemporary best practices, and to achieve and maintain competitive performance. The evolution of TQM therefore always evolves along with the changes in the business environment.

It is widely believed among scientist of TQM field, that TQM approaches may be applied to the future business environment; just the boundary conditions of TQM should be assessed and understood. In stable environment, the TQM approach for continuous improvement is appropriate and effective. In the context of a recent uncertain global environment, agility becomes a core competence for organization that must develop capabilities to adapt quickly to the changing environment. Therefore TQM theory should reconsider conception of continuous improvement as a contrary or supplement to innovation.

Many researchers had a vision of TQM development in the future as integrated system of four basic pillars:

- TTM - total transformation management
- TCM - total customer management
- TIM - total information management
- TRM - total resource management

There exists lack of the literature and empirical evidence of focus on the relationship between TQM and a corporate strategy. It was emphasized that strategic quality management is seen as the key to being competitive; however, the philosophy needs to emphasize integrity, environmental issues and social responsibilities as key elements.

Summarizing the above said, it is assumed that TQM will evolve to strategic TQM and sustainable TQM, both of which may contribute to successful organization management and coping with emerging changes of global business environment.

In this context, it is required the movement beyond TQM to develop a quality concept that reflects the nature of global corporations and their markets. In the last years, this concept was called "Global Quality Management" (GQM). From the several definitions allocated to the concept, one seems to be appropriate to the changing global business environment:

The strategic planning and integration of products and processes to achieve high customer acceptance and low organizational disfunctionality across country markets.

The definition incorporates the basic philosophy of TQM, but recognizes the challenges for quality management when the organization's business is worldwide. As the number of country markets in the global network increases, the diversity of quality environments across country markets requires that the organization balance local customer requirements with realistic supply-chain capabilities within and across markets.

GQM overview

GQM is a significant extension of the TQM concept. Although it has in common with TQM a highly customer-oriented philosophy, the expanded geographical and cultural boundaries of quality-related activities require a more dynamic and integrative approach.

TQM marked a major conceptual and managerial advance in its linkage of production with marketing, as well as other quality-related functions. Still, in the context of a single country organization, the organizational implications of TQM are relatively straightforward. Even when multiple countries are involved, such as a company importing raw materials from abroad, the organizational requirements can be coordinated from a home headquarters. In a complex network of quality chain activities, coordination from a single headquarters becomes untenable. GQM entails organizational adjustment.

Spurred on by regional economic integration in Europe and North America, and the high economic growth of Asian countries, large international companies are building globalized production networks with regionalized systems in several locations.

The varied vertical and horizontal linkages of subsidiaries have not been formed by centrally controlled mechanisms but, rather, according to each subsidiary's individual situational needs. Situational factors include availability and access to raw materials and components, capabilities and technology access of the subsidiary, and the subsidiary's access to local markets and market channels. The result is that the constellation of quality-related activities becomes region-specific. In some subsidiaries the quality chain may be fully integrated; in others, it may be appropriately partial.

A key characteristic of GQM is the networking of activities within and outside the firm, along with other elements of the overall supply chain. The diversity of markets across countries introduces constraints such as differentiated customer requirements, but also offers opportunities such as greater economies of scope. In this context, there is a high premium on GQM, which enables great flexibility. Because of the great number of configuration possibilities for networking, corporate control of GQM cannot be centralized at a home headquarters. Instead, a combination of regional headquarters coupled with global coordination appear to be a hybrid mechanism that allows adaptation to regional differences while enabling cross-fertilization among the corporation's subsidiaries. In the age of multiple headquarters, GQM is the appropriate quality management concept.

Viewed from an upper level, the next evolutionary stage, GQM can be linked to TQM through a set of key comparisons.

Objective

Comparing TQM with GQM, the main concepts behind TQM are maintained, but GQM enlarges the objective to encompass the concerns of multiple functions across multiple countries. A domestic firm attempting to apply TQM in an environment with multiple markets and manufacturing sites is beginning to engage the issues that are raised with global markets and manufacturing. GQM expands the concepts and issues even further to include national sovereignty, language and cultural distinctions, geography, and tax, tariff and currency considerations. The level of complexity in objective is importantly increased.

Market Focus

TQM and GQM are similar in focus on the market, but the number and diversity of customer requirements across markets implies that customer satisfaction may be more difficult to achieve, especially if resources are limited. As the notes on the expansion in objective underline, customers' perceptions of value are likely to differ widely, much more widely than is possible in varied sites within a single country. On the other hand, a wise market research coupled with creative multi-national design may make it possible to generate and meet demand for global products, particularly where new technology is involved.

Cultural sensitivity is a particularly problematic aspect of perceived customer value. The well-worn axiom "Think global, act local" puts the matter succinctly. The objective is products and services that are locally acceptable, yet are designed, developed, manufactured and distributed under a global environment, which embraces intelligent strategies that fit together.

Production Focus

TQM and GQM are similar in their production focuses, but GQM involves extending TQM to the point where disfunctionalities begin to appear. Involving all functions and all levels in all countries, which is the case in a complete global extension of TQM, naturally entails a seemingly endless set of possible configurations. Not all functions may be located in a particular country. If a business unit finds that domestic suppliers are not price-competitive or that technologies are incompatible, it may be forced to link up with suppliers abroad. Likewise, a need for familiarity with local markets may motivate linkages with foreign distributors.

In this expanded multinational "supply chain," a new perspective is called for that is beyond functional integration in the context of a single country. Therefore, the resulting organization of production likely will have to be based on a linkage among organizations across country boundaries. Consistent with this is the fact that production decisions cannot be centralized in a home country headquarters, as may be possible in the simpler TQM environment. Responsiveness to diverse market needs is likely to require maintaining a network of multiple headquarters. The key capability that enables companies to minimize potential disfunctionalities in a global context is flexibility. Production processes that simultaneously allow low volumes, high variety and low cost can offset the disadvantages of diverse marketing requirements.

Information Systems

The technological advances provide the information systems support for effective global operations, including GQM. However, in most instances, it is not the hardware or software part of the system that poses the challenges. It is more likely to be the information infrastructure that is locked into architectures and organizational designs based around earlier technologies.

Ideally, the existence of TQM variants throughout a global organization should offer such benefits as internal benchmarking and transfer of the lessons from successful TQM applications. Capturing such potential advantages requires sound and timely information moving freely throughout the global organization. Information networking among manufacturing units becomes instrumental. GQM should, therefore, not be viewed as simply "connected" TQM units. It is imperative that a global company establish an effective quality audit system that can routinely measure and transfer quality management "know-how" across TQM units. Given the rapid pace of technological development and change, GQM requires an integrative effort that links subunits across countries.

Technology Network

Since the factors and competitive situations across countries can be expected to be quite different, networking can consist of any combination of technology, supplier, production, distribution and marketing activities across markets. Sometimes, not all of these functions and activities can be satisfied within an intra-company network. For example, emerging technologies may have to be acquired from outside the firm and/or from abroad. The concept of networking has to include outside or foreign firms and science and technology organizations.

An important trend in global management is the formation of strategic alliances whereby companies strive to share complementary assets. While the concept is deceptively simple, its implications for GQM certainly are not. An integrated and harmonious quality management and improvement system are difficult to achieve in alliances that are a merger of companies with different histories and styles of TQM. In

practice, there are many obstacles within strategic alliances that inhibit organizational learning and transfer of "know-how." If managers can recognize and reduce these expected obstacles, the result should be increased GQM effectiveness. Clearly, inter-company compatibility of quality systems is a consideration when selecting alliance partners.

Conclusions

This paper focus on GQM tried to define the boundaries of an emerging quality concept and practice. The most of the recent transformations in organizations' business environment are associated with external pressures at the global level. External pressures are understood as pressures for change, associated with a number of global phenomena. In order to be successful in the future knowledge-based environment, companies will need to implement strategies and new tools for simultaneously creating economic, social and environmental values.

Total quality management philosophy needs to be rethought and recreated in the context of recent global transformations that make the shift to global quality management. The most likely and reasonable developments for contemporary total quality management should be made by incorporating approaches of sustainability and strategy to the concept of total quality management turning it into a more complex and large concept, global quality management.

REMARKS ON THE IMPORTANCE AND NECESSITY FOR PUBLIC ENTITIES TO ASSOCIATE IN ORDER TO PERFORM EFFICIENT ACTIVITIES OF INTERNAL AUDIT

Ghita Emil

Universitatea „Spiru Haret” - Centrul Universitar Craiova, Facultatea de Management Financiar Contabil, Str. Brazda lui Novac, nr. 4, ghitaemil@yahoo.com, 0744614536

Summary. In Romania, due to territorial extend of the audited entities, we deal with a great number of isolated departments for internal audit, consisting of 1 to 2 auditors.

The international audit standards recommend that the number of internal auditors should cover at least the minimum of activities performed by the departments for internal audit. Related to this matter, the first-class international practice recommends that their number should be of three intrrenal auditors at least.

The internal auditors of these departments consisting of 1 to 2 individuals encounter particular problems concerning the documentation, standards acquiring or implementation.

Key-words: internal and public audit, obligatory procedures of internal audit, risk analysis, realizing the function of internal audit through association (employment or office), chief employment or office for internal public audit, the Ministry of Public Finances the Central Unity for Internal and Public Audit Harmonisation (CUIPAH).

The analysis of organizing and functioning of compartments for internal audit in public institution

Apart from the subjective issues mentioned above, the internal auditors of these departments face also objective issues on the sense that they are not able to insure the accomplishment of some compulsory proceedings within an audit action, such as:

- activity of supervising the method used for internal audit tasks, respectively use of all proceedings, assessment of risk analysis, test examination during the on-site intervention, quality of remarks and recommendations, of internal audit reports, supervision of recommendations implementation;
- ensuring a program for quality development and improvement concerning the internal auditors' work.

The situation mentioned above is encountered both in local and public establishments which are chief credit rulers (city halls) and in other central public institutions (agencies, offices, authorities and others) which are not subordinated or they are not under the coordination or authority of other public organizations, but which make circulate annual budgets of 100,000 to 2,000,000 Euro, consecutively, in 3 - year's time and which, according to the Law no.672/2002 on public and internal audit, they are obliged to found departments for internal audit.

To analyze this matter, the Central Unity for Internal and Public Audit Harmonization - C.U.I.P.A.H. set forth *the assessment report for the current status of internal audit organization in small-sized central and local public entities subordinated to another entity*, discussed by the Comitty for Internal and Public Audit - CIPA, in December 2004.

The conclusion of the assessment report was that within the public and local entities, which make circulate an annual budget, the equivalent of 400,000 euro in Romanian currency, it is difficult to make available the position of internal audit by own forces, the reasons being the following:

- reduced amount of allotted funds;
- limited domain for auditing;
- lack of trained personnel;
- management misunderstanding the part that the internal audit plays.

All these objective limits make it necessary to find out some more flexible methods for making available the position of internal audit within these small-sized public entities and to dissolve the departments consisting of 1 to 2 internal auditors, isolated and spread on territory, founding some effective and operational structures.

The assessment report analyzed the possibility that the internal audit structures, within the territorial General Directorate of Public Finance, should generally perform the audit in small-sized public institutions, chief credit rulers which make circulate an annual budget of 100,000 euro, taking into account that in this case there are only 67 public entities in the entire country.

Meanwhile, the assessment report considered also the possibility of increasing the limit for small-sized public entities from 100,000 to 2.000,000 euro whose regular audit should be performed by the Ministry of Public Finance, as well. In this case, the number of small-sized public entities grows from 67 to 735, meaning that the Ministry of Public Finance can not provide it, not even in the farthest future. All these lead to the conclusion that it is necessary to find out a solution of partnership among these small-sized public entities and together may perform the position of internal audit, in accordance with the International Standards provisions.

To this effect, we recommend *to perform the position of internal audit in association, respectively by creating common structures of internal audit providing the position of audit for more entities with compatible activity domains.*

This method could be used in small-sized public entities, especially those which make circulate an annual budget of 100,001 to 2,000,000 euro, its equivalent in Romanian currency.

In these cases, the association is going to build up on geographical criterion, on main means of communication by joining the entities of the larger villages, cities or towns. Generally, it is recommended that by association to be founded departments of minimum 3 internal auditors in order to provide a complete covering, but it is considered that a structure of 5 to 7 individuals working full-time would be more efficient for the internal audit activity in order to be sorted out on performance criteria.

The executives of public and local institutions, which wish to associate for organizing, operating and performing the internal audit, will keep in view, at least for the start, the following aspects:

- grouping up the public institutions on size criteria in order to create the associations;
- setting up the rights and obligations of the associating institutions executives concerning the conception and provision of headquarters, furniture articles, computers etc., for the internal audit departments;
- selection and working frame for internal audit organizing structure with an executive personnel in order to comply with the law conditions related to professional training, integrity and required objectivity;
- provision of juridical assistance on termination of association contracts, of conditions of executive activity development within the internal audit department;
- effectuation of supervision and control proceedings for norms implementations by the territorial General Directorate of Public Finance.

Depending on the amount of activities, as well as on the number of public institutions that form the association, the organizing structure that is under construction -department or office - will include the executive position - departmental manager or head clerk - as well as a suitable number of executives, internal auditors, respecting the legal provisions of the Statute of municipal officers.

The internal audit departments or offices of the associated entities perform internal audit team - work and the resulted reports are presented to inform on and to be approved by the executives of the respective public institutions.

Dependant on the way the activity of the association internal audit department or office goes, the contractual parties could as well anticipate other necessary rules, proceedings and activities, on the basis of the amendments and completions to be set out and mutually agreed on in the document attached to the initial contract of association.

The internal audit department or office of the local and public institutions association subordinates to the executives of the local component institutions, and for the operational management of the internal audit department is empowered, having the mutual consent of the executives of the local and public associated institutions, the executive of the local and public institution where the internal audit department performs its

activity. If the internal audit structures operate within a different headquarters it is essential to be set out an operational executive system for them.

The manager of the internal audit department or office, by the obligation stated by the local and public associated institutions, does not have to get involved in the elaboration of the proceedings for internal control within the local and public associated institutions. Also, the manager is appointed/dismissed by the competent executive of the local institutions, having the approval of the C.U.I.P.A.H.

The internal audit applies to all the activities performed within the local and public associated institutions concerning the foundation and use of the public funds, as well as the administration of the public inheritance, aiming at implementing, according to the law, the internal audit which examines the actions took on the financial effects on the basis of the public funds or inheritance in order to respect the assembly of principles, procedural and methodological regulations which are applicable to them.

Every three years at least, but not restricted to this, within every local and public associated institution, the internal audit department or office of the association audits the following :

- a) the budgetary and legal engagements from where derive directly or indirectly the payment obligations, inclusively the social funds;
- b) the payments took upon by budgetary and legal engagements, inclusively the social funds;
- c) the sale, mortgage, cession or rent of the goods from the private sector of the state or of the territorial and administrative unities;
- d) the cession or rent of the goods from the private sector of the state or of the territorial and administrative unities
- e) the public funds collection, respectively the method used for authorizing and setting up the debt security, as well as for the facilities offered on their cashing;
- f) the budgetary credits allocation;
- g) the accounting system and its liability;
- h) the system of taking decisions;
- i) executive and control systems, as well as the risks associated to such systems;
- j) data processing systems.

The territorial structures of the M.P.F., delegated by the C.U.I.P.A.H., will supervise the implementation of these principles performing together with the executives of the local and public associated institutions periodical analyses on the way the internal audit departments or offices organize and carry out the internal audit tasks stated in the activity programme.

The internal audit departments or offices, on the basis of the statutory tasks, periodically report to the executives of the local and public institutions, as well as to the internal audit structures within the territorial General Directorate of Public Finances and within the one in Bucharest, the accomplishment of the legal tasks and the method of implementation, in time and respecting the general norms concerning the performance of the activities of the scheduled internal audit tasks.

The territorial General Directorates of Public Finances and those from Bucharest periodically inform the Territorial Councils of Public Administration on the methods used for organizing, operating and performing internal audit activities within the local and public associated institutions.

The territorial General Directorates of Public Finances and those from Bucharest present to the C.U.I.P.A.H. annual reports on internal audit structure, operation and performance within the public associated institutions.

The C.U.I.P.A.H. annually brings up to the executives of the Ministry of Public Finances the Report on the internal audit activities performed by association with the public associated institutions.

Conclusions

We consider that the suggestion to perform the association of the small-sized internal audit departments is possible and it will have an influence in complying more strictly with the provisions of the international standards and with the first-class practice recognized in the domain.

The manager of the internal audit department or office within the associated public institutions is responsible for organizing and performing the internal audit activity, ensuring, according to the law, the execution of the following tasks;

- a) elaborates and passes on to be approved by the executives of the associated public institutions the methodological norms of internal audit, norms that are put forward to the C.U.I.P.A.H. to give its notice;
- b) elaborates and passes on the internal audit planning to be approved by the executives of the associated public institutions;
- c) carries out the internal audit assignments aiming at the assessment of the financial management and control system within the associated public institutions, paying attention that these comply with the legal, right, economical, efficient and effective norms and presenting to the executives the respective reports;
- d) informs the C.U.I.P.A.H. on the recommendations unimplemented by the executives of the local and public associated institutions, as well as on their consequences;
- e) periodically reports to the public associated institutions the remarks, conclusions and recommendations resulted from the internal audit activity;
- f) elaborates the annual report on the internal audit activities;
- g) in case it is identified any disorder or possible prejudice, he immediately reports it to the executives of the public associated institutions.

Factually making the association represents a structuring issue which will serve all the public institutions involved in association and will have an influence on the performance of some audit tasks in accordance with the norms of each institution and under the conditions of providing corresponding independence and objectivity as the internal auditors concern.

Also, after association, the costs will lessen due to a higher quality and a greater efficiency of the internal audit activity that may direct to reach some elements of performance.

Abstract: Work quality depends on intellectual and physical capacities of the employees. The theory of human capital supposes that persons can improve productivity by voluntary activities of investment in education and health and even by migration. Wage differences translated this way the fact that persons are not willing to make investments in the same manner, in formation. Mincer establishes, in 1974, a relationship that can be easily tested between salaries, number of study years and professional experience. Other studies impugns the justification of salaries increase during active life, only by investments in formation, made by the unit, bringing as an example in the increase with ancientness and / or experience. Even so, studies measuring the impact of continuous formation, realized in units, on salaries and productivity, are multiplied. The present article presents these evolutions with their nuances, showing that higher efficiency at ancientness is tightly connected to formation episodes and that the hypothesis of asymmetry can not be permanently invoked in this field.

Key words: human capital, education, continuous formation, productivity, winner title

I. INTRODUCTION

Work quality depends on intellectual and physical abilities of workers. Human capital is presented as an endogenous factor, resulting from investment variants coming from families, employees and of the unit in education, to which will be added the skill (ingenuity), migration and even health. This hypothesis regarding human capital allows emphasizing two conclusions. First of all, using reproducible human capital by formation, accumulating and allowing assimilation of new technologies contributes at economic increase, as theories of the endogenous increase suggests. Secondly, splits of remuneration are explained by the fact that persons agree to interfere in a different manner in necessary formation of occupying some more skilled positions. That is why, salaries distribution taken into account the dispersion of the education levels.

Even if there appeared several complementary theories connected to formation and distribution of salaries, the theory of human capital is situated at the basis of economic problems regarding education and formation. The present study aims to offer information connected to the theory of human capital, being limited to investments in education system and in enterprise. It represents the winning model (Mincer, 1974), that become a reference in determination of wages, but also other econometrical works, which attempted to measure capability of education and experience.

II. HUMAN CAPITAL, CONCEPT AND PARTICULARITIES

The human capital can be defined as skills, knowledge, qualifications that the individuals of an organization has. It is about a capital because it is obtained with a certain cost in rare resources, i.e. time and/or money, in order to generate fluxes of satisfactions, incomes or utilities. The capital is human because it is found at each individual and it cannot be separated from it. Made up of both innate elements and acquired by costs, the human capital is submitted to the same rationality logic, which supposes a comparison between efforts and effects.

Another definition for human capital is an ensemble of competences, qualifications and other abilities held by an individual in productive purposes. It can be innate or obtained during the school, university life

or during the professional experiences, by transmitting knowledge and qualifications. The Human capital takes shapes such as intelligence, physical force, or knowledge given by family. It depends on genetic or family factors and less economic ones and it is supposed to be less shapeable in time. Its purchase cost are low and concern the attention that parents have for their child and the monetary benefits are supposed to be fixed in time. In the theory of the human capital the competences acquired are considered (Becker, 1964), in the same time, a *good that lasts* (it can be learned at any age), a *specific good* (everyone's competence are their property, being limited by their physical and intellectual or unexplored abilities without one's will) and a production good (they determine de productivity of the individual) and it has to be considered this way a *production factor* (just as land or cars owned).

The human capital theory is analogically built with the physical capital theory. Education and training are considered investments that the individual make rationally, with the purpose of making a productive capital inseparable from one's person. Any training action is costly. The relative costs that accompany this action are of two types:

- an opportunity cost, equivalent with the salary that the individual might claim if he would work in the time afferent to this training;
- a direct cost, caused by the expenses used in this investment.

The knowledge acquired by the individual represents a lasting source of incomes if it is used in professional activities. Accumulating human capital contributes to increasing the competences of the individual and its managerial productivity, because when balancing the level of the salary tends to increase. The efficiency in the human capital investment is obtained by the difference between the flux of the salaries that the individual has after the training and the flux of salaries collected by then. It will be profitable to invest if the difference between the updated values of these fluxes is positive and it exceeds the investments costs. The decision to invest depends at the same time of the comparison of the expected profits of the educational investments and the alternative investment (financial or physical). Mincer (1958) explains the first, the differences of salaries by the fact that all individuals are not as willing to train in order to have qualified positions. Schulz (1961) mentions that individuals can improve their productivity by willing to investing in their training, and thus it appears the idea of human investment. Becker (1974) develops the theoretical background and calculates the first, the profit indicators of the educational investment in USA. Ben Porath (1967) offers a rigorous solution to the issue of educational investment in the life cycle and shows that it is profitable to train completely at the beginning of one's life.

With all its simplicity this idea of the analogy between the human capital and the technical one, has limits that justify the restraints that the educational investment concept met in practice. However, the fact that he underlined in time the particularities of the human capital and deduced the necessary consequences among other for his financing and for the genesis of the social inequalities, made Becker's theory to be accepted and frequently used.

The main specific characteristics of the human capital, determined by the fact that it belongs to an individual are its customization, limitation and opacity.

The customization translates the fact that this chapter can't be separated by its holder. Making and using this chapter involves a total participation of the individual that holds it which explains the importance of the time in the cost of one's training. In order to train, an individual must give up remunerated activities. The remuneration level that one can claim depends n the level of training reached. As a result the cost of the investment increases at the same time with the stock of the human capital accumulated. Customization is in the same time a natural protection against risks of fraudulent appropriation by somebody else. Customization can have consequences that determine the limitation of the external financing opportunities in training. The people who decide and the beneficiary of these investments are people different from the investor (an organization), and the fear that the trained employees can leave discourages such a process. Still connected to the human investment it is important to notice that the credit market is less perfect than the one meant for financing the physical or financial investments, which grant higher warranties at a possible insolvency of the customer. This is the reason why the margin cost of the capital financing is superior of equal to the long term interest existent in the financial markets. This cost is increasing when one goes to more and more onerous financing sources (political resources, individual loans etc). It depends on the richness of the mobilized resources by each individual and becomes responsible of the inequality of chances.

Limitation of the human capital supposes that the possibilities of acquiring this capital are up to the physical and intellectual abilities of the individual. Thus, the margin profit of the investment must decrease while the individual effort increases. Moreover the investment in human capital is costly in time, and the period for perceiving benefits is limited by the human life time. Starting from these findings, Ben Porath shows in 1967, that if the margin profit of the investment is decreasing for an individual, it is beneficial to plenary devote to studies at the beginning of life and to continue the investments in trainings in a decreasing rhythm along time. Another interesting conclusion mentions that the choice of training options depends on the ability of individuals to valorize its results and of the importance of the resources that can be mobilized for financing the training. This is why the optimal level of investment in the human capital is powerfully individualized.

Opacity of the human capital. The knowledge and skills of a person are not aimed by a manager from the first meeting. At the beginning of the employment contract the manager doesn't know the real competences of the employees in his organization and may be tempted to offer the same age to different productivities. The signals that come after a period can determine the necessary differences from this point of view. The diploma shows a certain level of investment in education. The orthodox version of the human capital associates to a higher diploma a higher productivity and it is opposed to the signal theory (Aron, Spencer, 1973), according to which the diploma only has the role to select individuals the productive abilities of which are different. In the light of this theory, education does not necessarily increase productivity but it informs managers about the initial qualities of employees and their qualification for the suggested position. It plays the role of a signal for managers who can't observe directly the abilities of eth employees. From this point of view, the educational system simultaneously fulfills two functions: the one of passing knowledge and the one of selections of skills. The theories of human capital and the signal theory can be considered complementary.

III. PATTERNS OF THE RELATION BETWEEN HUMAN CAPITAL AND SALARY

Pattern Ben Porath (1967). Being inseparable of the holder, decisions regarding use will be taken as part of life cycle. It is supposed that each person maximizes the actual value of its human richness. If work market is concurrent and economics is stationary, salary is equal with marginal productivity, which evolutes depending on gathered human capital. Human capital reserve gathered at one moment "t" increases from one year to another depending on human investment that was realized in this interval and will be depreciated in conformity with a certain rhythm. Gross human investment depends on time and personal effort submitted, of the reserve of human capital gathered and of other resources, like didactic material that was used. Its expense is composed of financial costs (school, didactic material) and from an opportunity cost proportional with its productivity from previous period.

Human capital reserve increases as long as the gross investment is superior to already gathered reserve. This is the reason why the level of salary increases as long as net investment remains positive. Gross investment tends to be diminished once with age, as for, on one side, its opportunity cost increases and, on the other side, because the number of years that remain to register supplementary incomes and to consume more will be diminished naturally, alongside age. Also, human capital depreciation increases with age, due to the fact that this can not be separated by its bearer. Net investment will diminish in the same time while age advances, and from here results the fact the salary level increases with age up to a certain point and the decreases.

Winning functions (Mincer, 1974). Porath's patter allows characterization in a rigorous manner of the incomes profit, in time, but its empirical application is not obvious. Numerous concepts (Willis, 1986), like human capital, can not be observed directly. In 1974, Mincer published a material in which combined the theoretical stringency and empirical application. Starting from schooling model, in which it derivates in an analytical manner the effect of the educative investment on incomes, Mincer makes this procedure a general one, by including investments realized during active life. His pattern describes a situation in which gathering human capital does not cease once with formal education, but will be prolonged by successive actions realized during professional life. Marginal profitableness of investments in continuous formation is decreasing, so that the intensity of professional investments diminishes with age. By including in calculus a square form of professional investments, it will be taken into account their marginal profitableness and can

be given to this relation, profiles age - salary. Mincer connects the logarithm of the salary observed during schooling investments (measured by S time, spent in educational system) and pre-school (measured by professional experience, EXP), reachign relations:

$\ln W_{it} = w_0 + r_s S_i + r_e EXP_{it} + r_{ee}(EXP_{it})^2 + uit$, where:

W_{it} – person's salary in „t” period

r_s – efficiency obtained during school;

r_e – efficiency obtained during professional activities;

S_i – years of scholar study;

EXP_{it} – professional experience;

uit – ensemble of random elements that interfere in determining salary

IV. INVESTMENT IN FORMATION, REMUNERATION AND WORK VERSION

In his paper, Becker distinguishes general human capital from the specific human capital. Investment in formation will be considered general, if the employee which takes advantages of this will register an increase of marginal profitableness, the same in all enterprises. The efficiency of the investment will be the same for persons, disregard the enterprise in which he will decide to work as well as the salary received. That is why, other criteria will determine him to elect the company to which will work. In such a situation, the enterprise will avoid financing the formation, because he will not be able to finance the formation, as he will not be able to compare formation costs by future winnings, by increasing productivity, as the employee decides to leave. In case of perfect general formation, cost will be supported by the employee.

Specific investment in formation takes place in an enterprise and offers knowledge of valid competences, only as part of this. The person, taking advantage of such a formation will have an efficiency and higher salary only as part of the enterprise which made this investment. Mobility of the employee on market of work force will be reduced, as a result of loss that he might register. Such a situation determines a separation of cost and advantages of formation between two partners, which is convenient for both parts. Remaining as part of the same company, a person ensures himself a salary superior to the one that might ask for in another part, where will not have the same marginal productivity. The existence of this type of formation can justify the simultaneity of great salaries and existence of great stability in the enterprise that he financed.

Opposition which appears between general formation and specific formation presents to attention the problem of ancientness in the enterprise. If, in the function of earnings will be introduced a variable which measures work ancientness, it can be observed that years spent in the same enterprise have a superior value in comparison with the situation when they might have registered at other companies. In the proportion in which specific capital increases with ancientness, an employee gathers more and more competences that will be used more or less exclusive at his working place will have a salary that will increase with the ancientness and is more and more less susceptible to receive it.

Studies focusing attention on direct measure of formation received in the enterprise have the tendency to multiply. They use given information in which is mentioned time afferent to formation or its nature. A part of this will be interested, on the other side, of the impact of formation received as part of working field and productivity of persons, and on the other side, of the capacity of formation to be transferable from one company to another. Besides these studies, have been realized estimates of informal formation, or of formation at working place, through which was proved to emphasize the diversity of the modalities to obtain productive capacities. In an analyze for the direct measuring of the informal formation, Loewenstein and Speltzer showed, in 1994, that this represents a preponderant part of total formation from an enterprise (96% in case of first three work months). Informal formation can be received by contact with other employees, with superiors, learning by experience, learning by watching, and can not be dissociated of productive activity. The existence of some measurement errors of the variables of formation (formal and/or informal) are repercussions on estimation of efficiency that are associated, as Loewenstein and

Speltzer, showed in 1999. To prevent this aspect, there is an alternant manner which supposes realization of an intercession similar to the ones of Mincer, through which will be measured the effects of informal formation on winning in direct manner, starting from profiles of individual earnings. An extension of this pattern allowed the evaluation, in France of year 1992, at 44, 40 hours annual average on employee of informal formation, which represents about 80% from total information realized in the enterprise.

In which concerns organized formation (formal), majority of researchers evaluates a positive and important beginning of this, on employee. Starting from American information offered by organism PSID, Brown identifies an efficiency of over 11%. His ascertainment goes further, underlining the efficiency of the ancientness which is tightly connected to formation episodes. Brown concludes that effect of ancientness is due, mainly, to capital gathering and not to an asymmetry of information, as concurrent theories of human capital states. Another researcher, Booth (1991), emphasis also a powerful and positive correlation obtained mainly in case of off-the-job-training.

Another problem which might have been the object of several researches regards transfer of formation received in a previous enterprise. Results showed that this formation has an important impact on worker productivity in the actual enterprise. In 1994, Bishop discovers that training received in the previous enterprise increases sensible and essentially the productivity in the enterprise he is working at present moment, after at least one year of ancientness. This discovery completes the ideas of Stankiewicz, according to which general continuous formation develops especially the capacity of workers to adapt to new situations and so, increases future productivity. Other researchers (Baron, Berger and Black, 1993) establish, starting from worker's productivity that formation realized in the enterprise, no matter if formal or informal determines a higher increase of productivity, in comparison with the one of the salary. This way they justify the fact that the powerful mobility of workers in SUA compels them to bear a part of formation costs.

Even though, if training received during active life can be transferred and is essentially general, it can be observed that workers finances it by accepting some leaving salaries (debut) which are smaller.

CONCLUSIONS

Studies realized by several researchers allowed the emphasis of a tight connection between formation and salaries. The difficulty which appears in defining the measurements of investments in human capital prevents precision determination of the effects and evaluation of their dimensions. Using empiric verifications of the theory of the human capital depends on the availability of information which will support detailed information on training episodes.

One of the main critics addressed to the theory of human capital, concerns resources in competition frame. Even studies mentioned in the field of formation did not underlined the hypothesis of an information asymmetry, must be understood the fact that nature itself of the human capital is one of sources of imperfection on work market. As human capital is incorporated to a person, it can not be developed without the person's consent and this influences the nature of exchange relations between employee and employer. The theory of human capital joins theories of research of a working place, of assortment of theory of contracts, which refers implicitly to the power that capital incorporation offers to employee, in exchange relations.

LE STRESS PROFESSIONNEL DANS LES SECTIONS DE PRODUCTION

Gradinaru Puiu

L'Université de Pitești, La Faculté de Sciences Économiques,

0745902875, gradinarudoru@yahoo.com

Extrait: La préoccupation pour le stress au lieu de travail est relativement nouvelle pour les Compagnies Roumaines que dans celles de l'Occident. En voyant les résultats, un sur trois employés de UE (40 millions de personnes) est soumis au stress au lieu de travail. A cause de cela, on perd chaque année 1 million de jours de travail. Aproximativement la moitié des employés manquent le travail à cause de la perte d'intérêt. On peut expliquer ça parce que les compagnies imposent des conditions de travail très dures ce qui conduisent à un haut niveau de stress, on constate aussi le taux croissant d'absentéisme au lieu de travail.

Les problèmes créés par le stress dans les conditions industrielles et les grandes dépenses pour maintenir la santé, imposent aux chercheurs du monde entier, l'élaboration des méthodes de combattre les facteurs qui sont des "inducteurs" de stress.

Motes clé: inducteur de stress, le management des changements organisationnelles, réducteur de stress, ergonomie.

LE MANAGEMENT DE STRESS DANS UN MILIEU DE TRAVAIL

L'intérêt augmenté dans l'élaboration et à la réalisation des programmes de management de stress au lieu du travail, pourrait être expliqué comme suit:

1. les employeurs ont commencé à se rendre compte du fait que, le stress au lieu de travail représente un problème majeur, non seulement pour le système de la santé publique mais aussi pour, la production industrielle qui demande la formation d'un fond spécial de dépense.
2. L'augmentation du niveau de compréhension, du mécanisme d'action du stress et ses interactions avec les différentes analyses des maladies, en incluant le dérèglement somatique de l'organisme de l'ouvrier.
3. Dans une mesure considérable on perfectionne la méthodologie d'identification et de l'appréciation du stress au lieu de travail .
4. On élabore les processus de réalisation et de légalisation des méthodes, qui permettent la diminution de la manifestation du stress au lieu de travail.
5. On obtient des témoignages que les programmes de formation qui entrent dans le domaine du management du stress au lieu de travail, influencent d'une manière rapide la situation financière de la corporation, et augmentent le degré de satisfaction des employés pour le travail fournie.

On doit mentionner que, l'opinion de la majorité des chercheurs et des pratiquants, se réduit de plus en plus au fait que la plus importante tâche de nos jours c'est "la production". Pour résoudre ce problème on emploie le système d'appréciation du stress professionnel, qui tient compte de quelques niveaux de manifestation de stress dans la société.

Chacun d'entre eux a un type de stress ou des "inducteurs" d'état de stress, pour chaque type d'inducteur on propose quelques types d'interventions des "réducteurs".

Groupés dans des catégories formelles et informelles, ils permettent la détermination du volume nécessaire aux mesures de contrôle personnelles ou organisationnelles par rapport avec les potentielles réactions d'adaptation.

LE MANAGEMENT DES CHANGEMENTS ORGANISATIONNELS

Il faut préciser qu'on a élaboré une série de mesures d'élaboration consultatives en ce qui concerne la diminution des niveaux d'évolution des situations de stress dans le rang des employés .

Les consultations prévoient l'emploi des méthodes d'identification "des inducteurs" du stress au lieu de travail (une tâche trop grande, des situations de conflit imprévues), des méthodes ergonomiques au lieu de travail qui prévoient la diminution de l'influence ou l'exclusion totale des inducteurs qui identifient le stress. L'avantage de cette approche permet la découverte des sources de stress au lieu de travail. Dans le même temps, les managers sentent le déconfort, parce qu'une telle méthodologie peut amener des changements dans les opérations traditionnelles, avec la modification du système déjà utilisé dans le domaine de la production.

Comme règle, quelques actions faites dans la direction de l'augmentation du niveau de stress au lieu de travail conduisent aux changements organisationnels pour améliorer les conditions de travail. Ces changements prévoient:

- -l'établissement de la tâche pour l'employé en conformité avec ses capacités et ses ressources;
- -la perfection de l'ergonomie au lieu de travail, permet l'assurance de la stimulation et la facilitation de démontrer les capacités;
- -la détermination du rôle de l'employé dans le processus du travail, et l'établissement de ses responsabilités;
- -la possibilité de l'ouvrier de participer aux réunions et à la prise de décisions
- - l'amélioration de la communication, en excluant la méfiance
- -assurer le soutien pour résoudre les rapports sociaux entre collègues
- -l'organisation des cours de réqualification, compatibles avec les possibilités et avec la responsabilité de l'employé.

Même les efforts faits pour améliorer les conditions de travail, ne peuvent pas exclure le stress en totalité. À cause de cela, la méthode la plus efficace est considérée comme une approche combinée.

LE MANAGEMENT COMBINÉ POUR PRÉVENIR LE STRESS AU LIEU DE TRAVAIL

À présent, il manque le management standard, qui doit montrer la manière de prévenir l'état de stress au lieu de travail. L'élaboration d'un tel programme et la prise des décisions correspondantes, sont influencés par quelques facteurs: les dimensions et la complexité de l'organisation, l'accès aux ressources et spécialement l'unicité du problème de stress. Comme règle on mentionne la suprasollicitation de l'employé, le manque de communication et de la flexibilité. Même s'il y a des difficultés dans l'élaboration des mesures universelles sur le stress au lieu de travail, on peut résoudre ça avec un paquet qui doit inclure des principes sur la conduite. Un tel paquet suppose l'emploi d'un programme de management pour combattre le stress, comme suit:

La première étape: Identifier le problème.

À cette étape on étudie les limites des situations de stress et, on analyse aussi, les sources du stress. Dans le même temps, on étudie les dimensions de l'organisation et l'accès aux ressources de travail. Dans les petites compagnies, on discute de ce problème du stress (des discussions entre les managers de la compagnie et les représentants des employés) pour prendre des informations sur les facteurs qui provoquent le stress. Dans des organisations ce type de débat pourrait être utilisé pour apporter des informations sur les conditions qui provoquent le stress.

N'importe quelle méthode employée, l'information doit inclure les caractéristiques de tours de travail, des dates sur le niveau du stress, que les ouvriers confrontent; l'état de leur santé et le degré de satisfaction de travail fourni. Le guide d'orientation des spécialistes dans le domaine du management est constitué par les conditions suivantes de travail, que l'apparition du stress emporte :

- -la nature de la tâche de travail (l'encombrement, une courte pause, le prolongement des heures supplémentaire de travail, l'agitation et la routine dans l'abandon des problèmes ont pour conséquence l'insuffisance du temps pour trouver la solution ce qui n'est pas nécessaire au professionnalisme de l'employé.
- - le style de management (manque de liberté de l'ouvrier à la prise de décision. le manque de communication dans le processus d'organisation du travail)
- -les relations entre ouvriers (l'environnement social défavorable, le manque de soutien le manque de compréhension

- -le facteur de travail (des conflits et l'indétermination (des conflits manque de détermination pour la résolution de leurs problèmes de travail,un haut niveau de responsabilité)
- -le problème de la carrière (des conditions dangereuses de travail,l'aide d'avancement dans leurs carrières)
- -les conditions dans l'environnement de travail (des conditions physiques infavorables et dangereuses , ainsi que l'agglomération dans l'entreprise, la pollution de l'air).

Les résultats issues des enquêtes et des observations doivent être analysés avec la formation de la réponse (dans cette compagnie il ya des problèmes de stress au lieu de travail ,quelle est le degrés d'inclusion a ce problème dans des différents sections de travail .

La deuxième Etape: la réalisation des interventions

Après la découverte du stress au lieu de travail, il faut essayer d'étudier son sphère d'action . Cette étape élabore des stratégies d'intervention pour prévenir les conditions du stress dans les petites entreprises la discussion sur l'identification de problème de stress peut conduire l'idée de liquidation de stress et la prévoyance de son développement.

Dans les grandes entreprises le management de stress peut être formel parce qu'ici il pourrait apparaître la nécessité dans l'élaboration des recommandations basées sur l'analyse effectuée des données de la première étape du management et l'obtention d'une consultation faite par des experts externes.

En dehors de cela,il pourrait apparaître une telle situation:l'un des inducteurs de stress,par exemple l'état de tension dans l'environnement de travail se développe dans tous les companies ,alors,dans ce cas, il est nécessaire d'avoir une large information.

Si un tel facteur est dépisté dans une subdivision séparée,il faut prendre une décision concrète sur la révision du processus de travail.Si l'état de stress est observé,l'intervention se fait sous forme de modification organisationnelle du lieu de travail,pour accorder l'aide psychologique nécessaire.

Il n'est pas nécessaire de prendre beaucoup de temps pour effectuer une série d'interventions,ainsi que,la réalisation des mesures peut être effectuée rapidement.En ce qui concerne ce type d'intervention on peut aussi rapporter le perfectionnement des méthodes de communication,effectuer des formations.

La troisième étape:L'interprétation des résultats des interventions

Une telle appréciation` est pas nécessaire pour établir l'effet des résultats obtenus a la réalisation du programme de management du stress et pour la détermination des lieux inédits,

Pour effectuer cette analyse, on doit établir un temps limite pour la recherche des lieux du travail et de l'enquête des employés parcequ'il ya des interventions qui prévoient d'effectuer des modifications organisationnelles différentes,le recherche doit avoir un caractère de courte où de longue durée.

L'appréciation des résultats de courte durée peut être effectué par trimestre ce qui assurera la dépistation du premier effet a la réalisation du programme de prévention du stress et donnera la possibilité d'effectuer la correction des mesures suivantes sur le management du stress.

Si on tient compte du fait que des types d'interventions ont un effet insignifiantes(les études de longue durée effectués a chaque année) nous permettent d'établir l'efficacité réelle des programmes de prévoyance et l'exclusion du stress au lieu du travail .

Dans ce cas, les recherches doivent être focalisées sur la communication et sur l'analyse des informations similaires.

Les deux (2) premières étapes du programme de management du stress dans ce plan on doit mentionner le fait que les employés ce sont soumis a la mission de prévoyance a l'action du stress: ils sont les premiers a observer les effets de l'intervention .

La détermination des dépenses au niveau de la compagnie peut être utilisé pour renforcer l'intérêt des employés sur le travail et sur le maintien de leur santé.ceci démontre que le stress au lieu du travail occupe petit à petit le droit d'appeler le syndrome du XXI siècle

On suppose que ce problème va aussi continuer dans les entreprises Roumaine .Pour accorder l'attention au problème du stress au lieu de travail, on peut considérer,de justifier et opportuner.Il reste a anticiper la processus de résolution du problème et la fixation du temps raisonable au niveau du seuil et l'effet négatif

commençant avec l'introduction des situations de stress ,nécessiteront l'emploi des différents méthodes de management ,leurs descriptions a été donnée ci dessus.Les interrogations seront a l'ordre du jours pour les manageurs autohtons de haut niveaux :<que faire?>Partialement cette réponse est représentée ci dèssus . Une autre question traditionnelle pour la Roumanie est *qui est coupable?*qui pourra être mise au cas où la mesure préventive ne sera pas prise.,les hopitaux seront pleins d'ouvriers affectés du stress .

Abstract: Businesses in lohn evolve differently, according to the partner country and to the activity sector. In certain cases they go all the way to consolidate partnership relationships between foreign and native companies. In other cases they delay the adaptation of local companies to environment changes. In conclusion, business contribution in lohn to the dynamics of regional integration is very much diversified.

Keyboard: businesses in lohn, evolution of the lohn, the lohn in European Union states

In Romania, during 1960-1970 intense efforts were made to industrialise the country and large production capacities were set up both in the heavy industry and in the consumer goods industry (furniture, clothing, footwear, marble, faience, ceramics etc.). However a discrepancy was created between the financial and human effort for production on the one hand, and for marketing, especially for the external trade on the other hand. There are many causes for this, among which:

1. product creation was not encouraged, as many engineers were oriented towards productive sections; product creation sectors didn't have the proper quantitative and qualitative labour force;
2. training of economists for external trade was strangled.

In the last decade of the 20th century and currently, the offer of labour force qualified in external trade has developed, however changes in passing to own-brand trade did not occur, because the Romanian economy has been corrupted on a larger scale: production, finance, external trade etc.

In order to perform direct exports, an innovating management-marketing activity is necessary within companies, but most of the Romanian company managers do not intend to develop own brand production or to promote modern management and marketing. This is how in the last decade of the 20th century and in the beginning of the first decade of the 21st century, lohn has come to represent the main method of export for the Romanian companies producing consumption goods, especially clothing and footwear.

Textile-clothing industry held in the last years about 25% of Romanian exports and 17% of the population employed in industry. The number of factories from this branch increased from about 800, as there were in 1989, to about 8.600 in 2002. Currently, more than 80% of the exports of clothing factories are made by means of lohn, Romania being seen as “a tailor of Europe”.

It is suggestive that in 2000-2002 our country was classified on the sixth place in the EU import of clothing and clothing accessories, holding in the same time the first place among the countries of Central and Eastern Europe as a supplier of clothing items. Romania has also taken the seventh place in the EU export of clothing and accessories, being classified on the first place among the Central and Eastern Europe countries as a commodity market for these products.

The footwear industry represents another branch in which production in lohn holds an important weight. In 2000 unlike 1990, the number of companies increased from 202 to 1.807, production decreased from 1 billion dollars 856 million dollars, and the volume of sales on the internal market reduced from almost 700 million dollars to only 19 million dollars. The greatest part of the footwear industry is exported by lohn but in certain cases there is the following situation: Romanian factories supply the shoe faces which imply greater technological exigencies in manufacturing than soles; the latter are brought by foreign partners and are marked with the origin country and company, therefore the trade mark. As in the case of clothing, the footwear produced and exported in lohn by Romanian companies returns to the Romanian producer with a

very high price.

The consequences of lohn generalization in Romanian industry are contradictory. On the one hand, it has contributed to employment and obviously to obtaining currency contribution for the Romanian entrepreneurs. On the other hand, the capitalization of Romanian companies is slow and modest, and the profit obtained by lohn export is small. Moreover, the sector producing threads, fibres and fabric has been deteriorated, a traditional sector of Romanian industry with an economic history of almost 200 years.

Another shortcoming of the lohn is that the Romanian companies, even those which had or still have an own brand, lost their identity because the manufactured products are sold with the sequencer's brand. Similarly, lohn remains uncertain in the future because sequencers shift easily where the costs are more reduced hence profits are bigger. Therefore it is required that Romanian managers reconsider their position towards long-term extension of the economic businesses in lohn, orienting themselves towards selling quality products on the internal market and passing to own-brand exports.

In other countries too, such as Poland or the former Czechoslovakia, the proportion of businesses in lohn in textile industry reaches high levels with significant increases ever since 1991. In these countries the lohn took the place of direct trade, its dynamism compensating for the absolute decrease of direct trade. In other sectors specific evolutions appear. In Hungary for example, in the sector of mechanical industry the weight of lohn decreased within the context of dynamic growth of direct trade. This would mean that Hungarian companies are about to gain autonomy. In the Czech Republic, in this sector there are possibilities to make partnerships with companies from Germany.

In the Czech Republic as well, the footwear manufacturing and the electrical sectors are characterized by a combination between businesses in lohn and direct trade. This means that foreign companies, mainly the German ones are consistent in their relationships with local partners, while also promoting independent exchanges. In other words, within these two sectors the German lohn with the companies from the former Czechoslovakia determined a consolidation of the local capacities. This could be the first step in creating transnational production networks.

However businesses in lohn are not always beneficial. Withdrawal of German partners from the footwear industry in Hungary had devastating effects that the growth of direct trade could not overcome. In the Czech Republic, in the leather goods and printing industry and especially in the food products sector, businesses in lohn had a continuous growth, without a significant increase of direct exports.

Currently, Romanian footwear manufacturers are orienting themselves towards the internal market. For years, most of them preferred to produce for the export under labels such as Pierre Cardin, Hugo Boss or Gianfranco Ferre.

For example: All the two million clothing items issued each year from the Vesti-Ro plants used to hang until the last year on the hangers of some occidental shops such as H&M, Steilmann or Christian Dior. But starting with this year Vesti-Ro decided to sell a small amount of the production on the internal market under own label: Senso. In five years it plans to cover the local market with these products. All the five Vesti-Ro plants will produce then only for the local market. Change in orientation of the manufacturer from Focsani - a reference company in the field, with annual income of over 10 million dollars - marks a new trend in the Romanian textile industry. More and more clothing factories which so far made profit almost exclusively from the production in lohn are now attempting to launch and enforce own clothing brands on the internal market.

The main motivation of this trend is the fear that the accession of Romania to the EU will lead to wage increase, forcing Western companies to look for cheap labour in other countries, from East. Western manufacturers might even reorient themselves towards China, once this country is free to export as much as it wants as from 2005 when the "Multi-Fiber Agreement" expired, agreement which enforced export quotas to the member countries of the World Trade Organization (WTO). In the absence of export limitations, China will control 50% of the textile world market, according to the estimations of the future European trade inspector, Peter Mandelson, unlike 28% as it is controlling now and 19% as it used to control in 1995.

It is estimated that the Lohn in Romania will survive for at most 4-5 years, referring to the labour system where over 85% of the clothing industry operates. The alternative - that is own brand launch - is not a simple business. First of all, because it has to compete with famous international companies, then, because Romanians' purchasing power is still low. Last but not least, the competition caused by the invasion in

proportion of 75% of the market with cheap forged products, adding the high costs involved by launching a brand and opening own shops will not bring immediate profits.

The advantages of companies with own brands are for the future and not for the present and it is possible for them to have a smaller profit than those working in lohn, she says. The idea of those investing in their own brands is to try to gain average income customers. That is those who are not satisfied with cheap products but do not have sufficient income to invest in expensive foreign brands such as Steilmann, Marks and Spencer or Benetton. This segment will increase with the purchasing power and we can say there is enough room on the market. Romanian purchasers, so the manufacturers say, are more and more educated and place an increasing importance to the quality of products. This general trend will push a part of the consumers of cheap Chinese products dominating the market, towards the Romanian production, superior in quality and not very expensive.

The occurrence and consolidation of Romanian brands offering competitive products more expensive than the current Chinese products but cheaper than the foreign brands will gradually orientate consumers towards superior quality products. However, purchasers must be first of all accustomed to local brands. This is more and more difficult to achieve since the Romanian market becomes increasingly interesting for the western manufacturers. „

But Romanian factories get a reduced income quota, being paid only for the manual labour of the tens of thousands employees. The lohn system implies that all the necessary raw materials are supplied by the foreign company and the Romanian company delivers the finished good in the requested amount, therefore ensuring a profit of 0.7-1 euro per piece. Those marketing brand clothing all around the world are the great fashion houses which conclude execution agreements with native garment workers. The lohn will decrease, therefore from now on less and less brand products will be produced in Romania.

Thus, even if our country has acceded EU with the most powerful clothing industry, compared to the other European states, 3.000-4.000 micro enterprises, about 40% of the native companies, risk closing their doors because of an unfavourable concourse of factors:

- the existence of a great number of vulnerable enterprises without own brand and without implemented quality standards,
- pressure to raise workers' wages
- high credit costs.
- It is estimated that a third of the Romanian clothing factories might disappear after accession, as a consequence of lohn delocalization (loss of agreements by the Romanian factories and their winning by countries with cheaper labour force, such as Ukraine or Moldavia).
- It is well-known that the volume of the Romanian production in lohn has already decreased from 80% to 60%. Of the 5.000 clothing manufacturing companies existent in Southeast Europe (3.500 in Romania, 1.500 in Bulgaria and 300 in the Republic of Moldavia), 3.800 are clothing exporters in lohn, of which about 3.200 only in our country. In the last three years the Romanian lohn reduced its weight in the total of exports with about seven percentage points, reaching 45% in 2006. Theoretically, less lohn means more stable exports and in the same time, more products 100% "made in Romania". Similarly, the lohn tends to shift in the sectors where the labour force is much better paid. The part which is not so good but is anticipated is that the clothing and textile industry, where a great part of the lohn agreements are concluded, reduced its speed.

Although it reduced its weight in Romanian exports, the lohn continued to increase its value in the last three years, from ten billion euros in 2004, to almost 11.6 billions last year. "The lohn is a necessary evil for each economy in formation. It offers market and it sets performant labour regulations, even though it is not always well paid. Instead of closing your factory it is preferable to accept lohn agreements, especially if your partner is also providing the equipment to make the ordered products.

By means of outsourcing operations, developing nations such as Romania received both raw materials, materials, semi products and the technological documentation and the know-how necessary to perform the products and services contracted. Therefore, the offer of developed nations to the emerging economies represented an opportunity for the latter, contributing in the same time to a more efficient use of the labour force and to the increase in living standards of these countries.

Has Romania got to be too dependent on outsourcing? This dependence is generally related to the level of wages and therefore of the labour cost. In our country it is a greater dependence than in countries like Hungary, Poland or the Czech Republic, but smaller than in the case of Bulgaria or Ukraine.

Maintaining the tendency of diminution of lohn contribution, both in the total export and in the total import can be seen as a maturity sign of the Romanian economy. To this positive factor is also added the trend to shift the lohn from the sectors with a small added value to those involving more sophisticated technologies and labour force than in textiles, for example. As proof, the lohn in the trade with products of machine-building industry has speeded up lately. This industry has gained from the outsourcing process an income of about two billion euros only last year, according to the National Commission on Prognosis. In the same time, the light industry, although it holds the first place in outsourcing, gained 1.8 billion euros from lohn. Wood products, including furniture brought 0.3 billion euros.

Moreover, according to the National Commission on Prognosis, textiles and garments recorded in the last years a reduction of competitiveness as a consequence of wage rising, of national currency appreciation but also of the strong international competition.

The lack of labour force had consequences in the decline of this sector too. Last year in Light industry the number of employees diminished with 6%, compared to 2005, and the lohn orders decreased with almost 5%. It is expected that this trend continues in the following years as well.

The accelerated decrease of lohn volume, although alarming for the companies in the field, does not represent another national danger because it is compensated by the development of other sectors. No country can remain dependent on lohn if it wants to resist on long term in the world economy. To be the tailor, the shoemaker or even the electrician of the West is short and average term solution that needs to be replaced with own brands. Otherwise one remains a colony of the great economic powers with market and technology. "The chance of Romania, for the moment, is that losses in the lohn of light industry were compensated and even overcome in volume by the one in the other sectors".

The European Union states are the main recipients of the lohn in our country. Last year almost 86% of the lohn export of Romania went to these countries. In the case of Light industry, over 97% of sales went to the Union. There are high values in other branches too: the machine-building industry (84.5%), articles from concrete, stone or glass (94.9%), wood products, including furniture (74.8%). The most important partners in the case of lohn trade are Italy and Germany, countries to which exports in amounts of 3.1 billion euros and 2.5 billion euros went last year.

A partner that becomes more and more interested in sending outsourcing in Romania is Hungary. If the amount of lohn export to the neighbour country was of 264 billion euros in 2003, last year it reached 640 billion euros. There is a slight tendency for certain companies that produced until now in Hungary to place a part of the production in Romania, because the labour force is cheaper than in our country. According to the Hungarian official, especially the branch offices of multinational companies that wish to optimize their costs appeal to this practice. Almost 80-85% of the Romanian-Hungarian trade is carried out between big multinational companies with production in both countries.

But not only the branch offices of the multinationals present in Hungary send their production to our country, There are more and more West-European companies that renounce their lohn agreements with Hungarian partners in the favour of Romanian ones or even partners from countries where costs are even smaller. Hungary is less and less interested in the lohn production because the labour force costs increased very much in our country. Romania is still attractive for this type of agreements, but as wages rise here too, the lohn will diminish.

Important changes as concerns the lohn take place not only among states, but also on the level of economic branches in our country. If in some industries with small added value it began to lose outsourcing agreements in favour of countries such as India and China, in other sectors in which the added value is big our country will still be able to remain attractive in the following years. Recently, the great world actors in the area of IT - IBM, Oracle, Microsoft - have opened in Romania regional supporting centres in which they employed or intend to employ an impressive number of specialists. A great number of products will be externalized to these centres.

Currently over 90% of the Romanian software trade is made of outsourcing; however the actors in this industry estimate that the situation will change in the following years. The competitiveness of the Romanian companies will diminish compared to the one in India, China or Russia, because of the great rise

in wages. Outsourcing was essential for the development of Romanian software industry, but it is time we passed to services with bigger added value in order to maintain our competitiveness on the international level.

For a time horizon between three and five years, Romania is still going to be a destination for the outsourcing projects in software. After this period of time, although the wages of Romanian programmers will continue to be smaller than the Western ones, the difference in cost will not be big enough in order to account for the inherent risk arising from the management of this type of projects.

In general, the outsourcing phenomenon presented for Romania a series of advantages, the clearest one being the maintenance of jobs in the sectors that received such agreements. However there were other benefits too, such as the technology transfer that accompanied foreign investments, the growth of the level of labour force qualification and managerial ability, including in the marketing field. Hereto are added the increase of competitiveness, the connection to quality and control standards, specific to the external markets. In the same time it permanently helped to diminish the trade deficit and the current account deficit of our country.

Despite this favourable contribution, the evolution of the External trade of Romania has become increasingly alarming. While exports increased last year with only 37% compared to 2004, imports raised to over 55%, and the trade balance deficit has doubled. This situation became more prominent in the first months of this year. 44.9% of the Romanian export for 2006 was made from lohn agreements. Their amount rose to about 11.6 billion euros.

COSIDERATIONS REGARDING THE COMPETITION OF IMMS (SMALL-SCALE MANUFACTURING COMPANIES) FROM THE WESTERN PART OF OUR COUNTRY

*In the present paper we have started from the definition and evolution of the **enterprising** concept, then we defined **competition** and we also presented the conclusions that we had drawn as a result of the analyze and the interpretation of data from he questionnaires that had been debated upon.*

We will approach only 2 domains of study, from the total of 7, those being: 1. The firm and the evolution of business in the last 5 years; 2. The effects that integration in the Unique European Market had upon the competence of the business.

Furthermore, based on the established and studied pattern, we have started by defining one IMM (Small-Scale Manufacturing Companies) and by talking about its evolution, according to present Romanian legislation, which classifies them according to three levels: micro, small and middle – scale manufacturing companies, in accordance with the rate of turnover, net worth and number of employees, issues that have to be analyzed for 2 years one after another.

Key words: enterprising man, competition, earning capacity

1. Enterprising concept – definition and evolution

The term of 'enterprising' comes from the French word "entreprendre" which means to venture, to organize, to begin to do something. During the time, this notion had different semnifications, from which here are presented the following:

Early period. In the past, the typical enterprising man could be found among the military men and merchants. Then, the wars were often waged because of economical reasons. The military leaders could obtain considerable benefits applying a successful strategy, by assuming substantial risks. The merchants of those ages were risking their fortunes as well. Many a time the merchant and the soldier of fortune were the very same person. The soldier/ merchant of fortune was taking the physical and emotional risk of such an action and the capitalist the economical one. At the end of the mission, the latter would receive 75% from the total gain and the merchant, the rest.

Middle Ages. In the Middle Ages, the commerce was seen as an degrading act because of the restrictions imposed by the Church upon the capital bids, the typical enterprising man being a cleric that had as duties the following: the construction of imposing architectural projects, such as castles and fortifications, public buildings, monasteries and cathedrals. Implicated in such projects, the enterpriser was not risking at all, furthermore he was a project leader who was using most of the times the lordship provided resources. The Middle Ages writers, although were more preoccupied with deontology, asserted that a good merchant had to be moderated concerning the risks, to be well informed upon the quality and price of goods, careful at details and prepared for a possible failure.

The 17th century. The enterprising man was a person that would conclude an agreement with the Government in order to carry out services or for achieving a certain product, thus assuming the risk of such a transaction. In England, the earth scalpers and farmers were considered to be enterprising men.

The 18th century. Inside the economical theory, the role of the enterprising man was first recognized during this century. The French economist, Richard Cantillon, associated the undertaking of risks with the enterprising man. He considered the enterprising man the main figure in economy, the person that incurred risks, because “he bought at a doubtless price, but sold at an unsteady price, so he assumed risks.” During the same period, in England, there took place an industrial revolution, process inside which the enterprising man had a significant role in undertaking the risks and transforming the resources. The word “merchant in fortune/ adventurer” was replaced by the term “undertaker” –enterprising man, about which Adam Smith wrote that it became synonym with the common businessman. In this period the enterprising man proved to have a great capitalist spirit.

The 19th century. During this century, the enterprising man was seen more like from an economical perspective. For the first time in economics literature, the employer activity, virtually became synonym with management, in contemporary meaning of the word. The French economist, J. B. Say, stated that the enterprising man should have been able to oversee and manage. Say, underling the main qualities of an enterprising man, said that: “the enterprising man is asked to have a combination of moral and judgment qualities, perseverance, acquaintance of the world and businesses.”

In Germany, there is a difference between enterprising man and manager. The former is liable for the issues specific to business world. On the contrary, the manager, if he worked good enough, can feel no concern as his conscience of an accomplished duty is clean. The enterprising man is considered not only an innovator but also an undertaker of risks, his income being the result of two aspects: one income according to the “entrepreneur risk”, and the other rightful for his “ingenuity”.

Starting with this century, in the U.S.A., there is attached importance to the enterprising man, who was considered to be “the main agent of output”. A successful enterprising man has predictable power, organization and administrative skills, unusual energy and leader qualities.

F. Walker has identified four enterprising man categories:

- Enterprising men are those persons who can be remarked by their natural authority, intelligence, promptitude, and award in their actions;
- Enterprising men are those persons gifted with a great power of prediction, very undoubtedly, they foresee and understand dangers, and do not discourage themselves because of disasters.
- Enterprising men are those who make decent businesses, more due to exertion than to his own essence;
- Enterprising men are considered to be those lucky gainers that sometimes (most of the time they don not) succeed, people that are in business because of the extra estimation of their qualities as they were encouraged by their friends who wanted to entrust them their commercial and banking capital.

The 20th century. During 20th century the enterprising man became synonym or at least associated with merchant company and capitalism, being recognized as an agent of change. He is a creative person, with new business ideas, who does contribute at the evolution and lucrative aspect of the company. J. Schumpeter said that the enterprising man is that person that innovates and realizes “new combination” inside the production. From a psychological point of view, the enterprising man is considered to be the type with personal accomplishments. Security, prestige, the power and the services brought to society are important reasons for the growth of the profit.

Defining the enterprising man. There is no definition unanimously accepted. Some authors consider that the enterprising man is the person that assumes his responsibility in identifying and obtaining the resources of a business, stressing at the same time the moment of initiation of the affair. Other authors consider that the enterprising man is the person that administrates the necessary resources to start or/ and to develop a business, and who also focuses on innovation and elaboration of new products and services. According to this definition the enterprising man not only does he begin a business, but he also has an innovating spirit. At the same time, he is seen as the person that takes the risk of organizing the resources that produce wealth.

The enterprising man may be defined as the person that initiates and develops an action, assuming all the risks in exchange of certain material and personal satisfactions. This definition underlines four important aspect of the enterprising man, those being the following:

- the enterprising man is the person that initiates and develops an action, he is an innovator in his field of activity, the greatest area being then economical one;
- the enterprising man incurs the risks of his actions, which may be: financial, psychological or social;
- the enterprising man is an innovator as he always realizes combinations of already existing things, in some situations he is even the inventor;
- the enterprising man can have satisfactions as a result of his work, satisfactions that may be classified as: material, psychological, moral or social.

Next, we are presented a definition of the enterprising man that puts the accent upon the organizational aspect of his activity and upon the nature of his labor: the enterprising man is the natural person commissioned or a legal person who, individually or in association with other natural authorized persons or together with artificial persons, organizes a merchant company named corporation in order to initiate commercial activities and obtain profit by achieving material assets or by carrying out services selling them on the market on competition conditions (definition regarding the stimulation of the private enterprising man for initiating and developing the small and middle-scale manufacturing companies).

In a more accessible meaning, management was defined as follows: to obtain things for people. But in a more specific sense of the word, management is the process inside which are established the objectives, where the resources are organized in order to accomplish the settled targets and, then, where are evaluated the results in order to determine the future actions, proper definition for the IMMS as well. In the professional literature, especially in English we may find terms like: “*small firm management*” (small-scale companies management), which means small company, in every country, or “*small business management*” (small-scale businesses management). In the Romanian legislation we use the small and middle –scale manufacturing companies (abbreviated IMM) which includes three categories of companies, so we can discuss about one IMM’s management (and we generalize the management concepts for all those three categories of corporations) or we may speak separately about the small/middle-scale manufacturing companies. We can also use the notion of “small business management”, when we refer only to new created businesses by the enterprising men, according to L346/2004, finalized by setting up a company = small-scale company (between 9 an 49 employees).

2.The competition concept

The competition of Romanian IMMS and the impact factors were studied by ANIMMC, the result being published in the annual report of the already named agency and also in its publication.

The competition term associated with a company suggests safety, efficiency, quality, high productivity, adaptability, success of the modern management, high quality products, most favorable prices. Competition is a complex notion which may be defined as the feature of a firm to get through on the market in a competition with similar companies. The competition of a concern is influenced, to a great extent, by the capacity of understanding, of adapting to the environment. To be competitive is an objective phenomenon present in the surrounding world.

In the professional literature of the last decades, competition became a key term, there also existing many opinions concerning this concept through which is in fact explained the position of the organization on the market.

Competition may be defined as being:

- the growth of products quality combined with a minimum level of costs;
- the preservation of quality at a fixed level but having as restrictions the increase of productivity;
- the reduction of the prime cost of products or services, the growth of the use of materials, the importance given to the market researchers and to the tastes of clients;
- gain of technical performances and exploitation economics offered by the market producers in addition to other similar products and services or considered to be standard;
- the capacity of the organization to gain in home and external market competition conditions.

Competition is a complex phenomenon. Thus competition is the capacity of obtaining a high productivity based on an innovative utilization of the human, material and financial resources. Competition may be also defined as being the capacity of creating value with the aid of an innovating process together with the beginning of a technical progress, for more and more sophisticated and over-particular clients who are able to pay big prices for the superior utility that they perceive.

Furthermore, competition is seen as a complex economical phenomenon that undergoes many methods of quantification, that assures the success of the players in the competitive game both in micro and macroeconomics aspect. It also may be defined as the capacity of products/ services to successfully resist to the market test, having as result constant growths of productivity and living standard.

Having the already stated definitions, one may say that competition is the key of a lasting development because it does not produce itself, it has to be planned and to suit itself to the proper context. Competition is an economical agent's, product's or service's, person's or activity's quality to be liable to face the competition. In what a company may concern, one may identify the following competition categories: global, financial, commercial, human, managerial, technical, organizational. The first one presupposes the realization of a critical inventory about its available capacity, meaning the strong and weak points of the company, with special reference to the success and competition factors. As strong features of the company that help at maintaining a high level of competition we name the followings: the productivity of work, the cost of work, the level of satisfaction of the beneficiaries, the quality of products and services.

3.The results

The study regarding the financial performances of the analyzed companies is based on the absolute values of the rate of turnover indicator and clear profit. The rate of turnover of the companies from the sample, as the first indicator of the dimension of their activity and as determiner of the market position, has evaluated, the average value heaving from 1.619.542 RON in the first year of study (2002) to 2.136.864 RON in the last year of study (2006) with an average rate of annual growing of 10% and a multi annual growth rhythm of 1,37) the biggest values existing in the "Productivity" branch.

Also, in comparison to the first year of activity, the growth is significant: the companies presented in the samples have realized a growth of 2,37 the volume of activity in the existence period. The growths refer to an extremely large area, the biggest recorded growth being a multiplication of 230 times of this indicator. The growth rate of the rate of turnover is 8,75% for the next period. The main causes of this growth are presented both in the emergence of the Romanian business environment and in the regional business environment (exogenous causes), and also in the interior of the organization, being perceived as determiners for the evolution of clients' satisfaction, for the improvement of employees' training and for the positive development of organizational capacities of the owner and of the managerial team.

The clear profit is the most relevant indicator for a main category of stakeholders: the entrepreneur/ owner. The evolution of the profit was considerable, the analyzed sample passing from an average loss of -56.571 RON in 2002 to a clear average profit of 57.434 RON in the last year of study, with an annual growth rate of 9,55% and a multi annual growth rate of 1,28 (values comparable to those associated with the rate of turnover which also denotes an evolution of the commercial profit).

The growth in comparison to the first year of activity is significant, the profit growing over 5 times. The growth rate of the clear profit is limited at a superior level by a company that has reported a multiplication of 204 times of the clear profit, the most values being in the multiplication interval of 1,5 – 2,5. As a result, in general the satisfaction of the stockholders is good. The presupposed rate growth of the clear profit is 11,9% for the next interval, bigger than the rate of turnover due to the descending trend of the exploitation costs. The main causes of this positive evolution are found in the improvement of competences and managerial skills with the help of so called "life – long learning", the causes being also present in the improvement of the distribution network and in the reduction of costs, by upgrading the technology and modernizing the plants and productivity capacity (including the growth of the grade of usage of technical utilities) and also by developing the professional competences of the employees.

The output per man-shift reflects the efficiency of employees in order to create the rate of turnover. It shows how many quarters of rate of turnover are created by using a unit from the human resource. In what the studied companies may concern, they pay approximately 1200000 RON /employee, more than in 2002, when the recorded value was 72.000 RON /employee. This evolution means an important increase, having

in particular intensive causes (the growth of utility rate, the technological and professional competence improvement).

The economical lucrativeness reflects the base wages of the invested capital showing how much of the exploitation profit (before interests and taxes) goes to an assets unit (meaning to an invested capital unit). The rate of economical profit for the analyzed companies was approximately 18%, which means that at 100 RON total used assets there are obtained 18 RON exploitation profit. The indicator of value is in a process of growth in the last five years (from 15% in 2002). This shows a better usage of the permanent capital with direct effects upon the companies' efficiencies. The indicator of value was bigger than the inflation rate and than the average rate of interests which permits the manifestation of the so named "financial lever" effect. From the sectors point of view, it is the biggest in the IT&C industry (almost 40%), in industry and services (almost 18- 20%), and not so present in the constructions industry (almost 12,5% and in commerce 16%).

In what the competition of the determined business by its integration in the unique market may concern, we have remarked the followings:

- the positive aspects of the adhesion of Romania to EU upon the business are: the unlimited access to the new market (state 60,4% from those who have been questioned, strongly correlated to those that consider as important the growth of demanding for the products/services offered on external markets) and the unrestricted goods traffic (according to what 55,2% of the questioned people have answered);
- the access opportunities to know-how, technology, management are less appreciated, 61,2% of those asked are doubtful in what the access to these opportunities may concern; the explanation being the easier access to these opportunities, Romania being in the adhesion period to EU. The questioned do not believe either in the access to the informational resources of the European Institutions (only 38.8% having a distinct opinion).
- as a result of the adhesion to EU, the sources of financing are also less considered (only 38,1% appreciating them, a cause may be the fact that people do not know these possibilities of financing or the fact that they are difficult to be accessed). The certitude of the questioned persons that as a result of the adhesion of Romania the profit will be influenced (or the rate of turnover) is big (aspect reflected by the statistics Lambda, Gamma and Kendall that have the values approximately smaller than 0,05), but the adhesion influence upon the profit won't be a strong one (the statistics coefficient value being more towards 1 than to 0).
- the unrestricted goods traffic will affect in proportion of 20% the rate of turnover/ profit, the certitude of those questioned being very big (the value of the same statistic coefficients being under 0,05), the same thing happens with the access to the new markets by adhesion to EU and with the access to the received funds upon the evolution of the profit or rate of turnover.
- the main negative aspect upon businesses is considered to be, in the questioned opinion, (53,7%), the growth of competition on the Romanian market, followed by the growth of wages (43,3%). The growth of legal restrictions imposed by the adhesion mechanism is not considered to be a negative aspect upon the adhesion of Romania to European Union (most of the questioned do not consider the increase of restrictions for the environment safety to be a negative orientation upon businesses – 71,6% in the protection of consumer - 84,3% in the products/ services' quality -88,1% in the protection of labour – and in specific company's domain of activity – 87,3%).
- most of the questioned people do not consider to be a direct link between the apparition of new settlements specific to EU regarding the protection of the environment and the evolution of the rate of turnover/ profit (aspect presented by the statistic coefficients Lambda, Gamma and Kendall that have bigger values than 0,05).

In what the impact of Romania's adhesion to EU upon the profitability of the company (the weight factor of the clear profit inside the rate of turnover) may concern, the asked persons answered:

- 20,9% consider that the share of clear profit inside the rate of turnover will increase with 0-4,99%/ year; the companies' profit of whom representatives indicated this answer has increased in average, in the studied period, with 839,05%.

- 19,4% consider that the profit of the firm will rise with 5 - 9.99% a year after the adhesion of Romania to the European Union; the companies' profit of whom representatives indicated this answer has increased in average, in the studied period, with 701,58%;
- 18,7% have the opinion that the weight of the clear profit inside the rate of turnover will grow over 10% a year as a result of the adhesion; the companies' profit of whom representatives indicated this answer has increased in average, in the studied period, with 210,49%;
- 24,6% consider that the profitability of a firm will stand-by, at least a period, after Romania's adhesion to EU; the companies' profit of whom representatives indicated this answer has increased in average with 138,92%, in the analyzed period;
- 6% consider that the weight of the clear profit inside the rate of turnover will decrease with 0-4.99%/ year after Romania's adhesion to EU; the companies of whom representatives indicated this answer have recorded in the studied period an average loss of 6,78%, fact that may support their statements;
- 4,5% consider that the profitability of the company will decrease with 5 - 9.99% a year after Romania's adhesion to European Union; the companies' profit of whom representatives indicated this answer has increased in average, in the studied period, with 21,77%, not a very significant growth in comparison to the other, recorded by the companies of whom representatives expect at a profitability's development at the same time with the adhesion to EU;
- 3,7% consider that the weight of the clear profit inside the rate of turnover will decrease with over 10%/ year after Romania will have adhered to EU; the companies' profit of whom representatives indicated this answer has increased in average, in the studied period, with 2,20%, not a very big growth in comparison to the other, recorded by the companies of whom representatives expect at a profitability's development at the same time with the adhesion to EU;
- In what the possibility of failure may concern, after Romania's adhesion to European Union, there has not been recorded any answer, which means that there is expected a positive aspect;

The target of this research is a better approach and understanding of the expectations and preoccupations of IMMs from the western part of Romania, taking into consideration, at the same time, the competition conditions. In the professional literature, that treats this issue, there are presented much more modalities of understanding competition companies. There does not exist a unanimously accepted definition of competition and we have to admit that there is a lack of information regarding the definition of this concept, but it is well known that the terminology comes from professional literature. The competition is the main ability of a company to perceive changes in the internal and external environment and also, the capacity of adapting to these changes in order that the obtained profit should assure long term working of the firm. It is a surviving fight (Chikan (2001)).

“The competition among the companies represents one firm's ability to offer products/ services for which the consumers are more willing to pay in comparison to competitive products, in a continuously manner and according to the social responsibilities standards and as long as it assures the company's profitability.” One condition is that the company should detect and be able to adapt to changes of the environment and from inner of the company by satisfying the criteria of competitive market.” (Chikan A., Chako, 2005). Competition is nothing else but a different term for productivity, taking into consideration the rate of growth of a company in comparison to others (Krugman (1994)). Competition is determined by productivity, it depends on the company's strategies, is partially the result of a relationship between the firm and the local business environment and depends upon the social and economical objectives and it is influenced by external factors. (M. Porter). “Country's productivity is finally established by their own companies' productivity. We cannot talk about a competitive economy unless the companies that operate inside of its territory are competitive.” A company that finds itself in a competition knows how to use its strong points in order to exploit the opportunities offered by the environment and to reduce the negative influences of other external factors (Dăniaiață, Bibu, Predișcan, 2006). A small-scale manufacturing company is in competition on the local and regional market if: it survives more than 3 years and its able to

have profit after its launch; the positive growth rate is inbetween 1-5% (we call this firm “competitive company oriented towards surviving”); the increase rate is higher than 5% (“competitive company oriented towards development”). There are several modalities of maintaining the competitiveness on the competitive home market. Companies should have succeeded on home market and, at the same time, orient themselves towards international markets.

It is very important to have and maintain a healthy business environment, at which industry must permanently adapt to. Thus, the companies from the western part of the country will be obliged to implement radical structural changes, to direct the resources to more productive, viable, transparent concerns, as a response to the market signals.

Companies will have to strengthen their competitive characteristic both on home and external market. Thus, if the competition on the home market is correctly implemented, it should increase local (Romanian) and European companies' success.

There is a big discrepancy in the reduced number of successful companies and a great number of enterprising persons with lack of managerial skills, not prepared to survive to this strong competition. The diminution of this discrepancy won't be possible without paying very much attention to the exploitation of creativity and innovation with the help of the development of the entrepreneurship.

Inside an economy based on knowledge, the competition of small and big enterprising men will depend more and more on their capacity to provide products with high adapter amplifier at competitive prices. On the one hand the globalisation and on the other hand the freedom of trade will be the factors that will influence the majority of companies to become competitive on an international level even when they totally operate on the Romanian market. In order to become and maintain themselves competitive, the IMMs need a coherent strategy in business domain, for increasing the efficiency, reducing the prime costs and for improving the quality and image of the products. This strategy should include: investments in development and research, new technologies, improvement of the managerial activity, elaboration of creative and attractive projects, an efficient marketing of the products.

Marketing is a direct selling meaning of the product. IMMs often see marketing as a secondary activity which can be made by a mandatory or even ignored and work basing themselves that they have a product that sells anyway and the only problem would be its enough pervueance. Taking into consideration that marketing is an activity that needs resources, IMMs have limited resources and the internet may play an important role in this field by creating a web page in order to make your company and products/ services popular or with the help of an electronic commerce solution.

IMMs can be presented on the internet with relatively low prices and may compete with big-scale manufacturing companies in equality conditions. Thus, the market study can become more accessible to IMMs and the consumers' opinions and reactions can be analyzed by completing an on-line form where clients may opinion upon the products/ services of that company. The IMMs which adopt this electronic commerce as a development instrument for the business can obtain quality benefits that will reinforce their position on a competitive market. This benefits refer to: the possibility to attract clients as quickly as possible; the possibility to arrive quickly on new outlets; the possibility to create new products and services; a bigger team of enterprising men capable to start a business; higher flexibility to the demands of the market; the possibility to reduce the access time on the market; a shorter period of delivery; better relations with clients and more conditions to keep them; much information and improved communication; a technologically advanced image of the company; the opportunity to use new means to furtherance the company; a certain level of operation – the small-scale manufacturing companies to enter competition both on local and national level.

Electronic trade offers the companies the possibility to develop worldwide and attract clients from all over the world. Thus, with the help of internet, IMMs can enter competition with big-scale companies. Technical and scientific information represent an important strategy resource in assuring IMMs competition because they depend on external sources of information, having a limited capacity to produce technical and scientific information on an internal scale. By being able to localize frequently used resources, the IMMs can identify new resources, can achieve pieces of information regarding new innovating products and technologies, new markets, new providers and potential business partners from the whole wide world. The IMMs can improve the services that they provide to consumers as web pages allow a natural interaction with the clients and the consumers can oversee their online orders. And besides the improvement of the services, the costs will be reduced, too.

USING MANAGERIAL SIMULATIONS IN THE PROCESS OF TEACHING AND LEARNING MANAGEMENT

Zamfir Andreea

Academy of Economic Studies Bucharest, Faculty of Management, 6th Piata Romana RO 030173 Bucharest Romania, zamfir_andreea_ileana@yahoo.com, +4021.319.19.00/250

Currently, there is a major interest in economic and managerial education and training because of the knowledge society development. New ways to equip teachers and learners with the competences and skills they need for the knowledge society and economy should therefore be found. Development of the information and communication technologies has opened new perspectives both for the students and teachers. Computer applications, computer games and simulations are often used within the teaching and learning processes. The aim of this paper is to present the managerial simulation used in the process of teaching and learning Management at the Faculty of Management from the Academy of Economic Studies in Bucharest.

Key Words: information and communication technologies, web-based education, management, managerial simulation, PRELEM XXI.

Introduction

This paper explores how the use of computers and managerial simulations could improve the process of teaching and learning Management. I believe that managerial simulations should be used for teaching and learning Management because they could improve the team work, the critical thinking, and the decision making. The study is based on evidence provided by articles, books and personal experiences. The research question was answered by analysing published sources and interpreting evidence. Another way of approaching this question could be collecting and analysing empirical data from the students and teachers and comparing the results with the findings of this study.

Computer games, such as PRELEM XXI, could be used to produce rich educational materials which support collaborative learning. At Faculty of Management from the Academy of Economic Studies in Bucharest we have deployed this game within the context of managerial education. This paper reports on recent research focused on the education of economists specialized in management science. The motivation for this study was justified because business and economics involves a social dimension, meaning that people learn, work and live both as individuals and as teams, as society. Another reason is that PRELEM XXI was designed to produce real situations within the wood industry processing. It supports multi-player interactions as well as individual thinking and learning. All these factors make this game a viable vehicle for the study of Management, providing tools for creating realistic economic and managerial environments.

Background

In the last few years, there has been a growing understanding of the important role of information and communication technologies (ICT) in education. Various new models of education are evolving in response to the new opportunities that are becoming available by integrating Web-based technologies (Barak M., 2007). The interdependence of communicative interaction, new technologies, the development of computer applications, the design of computer-based tasks and focused activity for learners to become critical thinkers and creators of knowledge is a reality of the new educational model. (Kimber K. et al., 2007).

Knowledge-based society needs major changes in the educational programs, being necessary to prepare teachers from all fields, in such way to use the information technologies in computer assisted learning (Pănoiu M. et al., 2006). When teachers are using the ICT in learning activities these become more attractive (Ilomaki L., Rantanen P., 2007), but not all teachers are convinced that ICT should be an integral part of their teaching strategies and this is one of the most difficult barriers for effective ICT integration (Barak M., 2007). However, this resistance to change is more specific to older teachers that were not used to the new technologies.

E-learning services deliver electronic learning materials to distant learners and it is considered to be the new vehicle that would lead education to new learning methods (Vovides Y. et al., 2007). E-learning could be defined today as the technology and the services used within the teaching and learning processes. It is a wide term covering all the range of previous educational applications such as Computer Based Training (CBT) and Web Based Training (WBT), as well as more recent technologies such as Learning Management Systems (LMS), virtual classrooms or labs and digital collaboration (Doukas N., Andreatos A., 2007).

In Web-based learning environments, maintaining interaction is more challenging than in face-to-face learning contexts because of the time and space separation enabled by the technology. In the context of Web-based learning environments, researchers and designers have shifted their focus from learner–content interaction to learner–learner interaction as well as from the quantity of interaction to its quality (Woo Y., Reeves T. C., 2007). Despite advances, more and better research aimed at improving the learning effectiveness of online interaction is nowadays needed. E-learning management systems are used to deliver courses at a distance via the Internet. These systems include sub-systems that present content as well as facilitate student–student and student–teacher interactions (Rovai A. P., 2007). Both online and face-to-face classes could be enhanced with communication technologies and the use of real time interaction in virtual worlds. These innovative tools can extend the content and enhance the effectiveness of instruction. They are free or inexpensive opportunities that support collaborative projects, meetings, and the building of communities based on reality or focused on inventive constructions. Technologies that support faculty/student and student/student interaction, whether real time or asynchronous, promote and support collaboration and discussion (Yoder M., 2008). With the development of the Internet and its communication and sharing affordances such as Email, chat, Web discussion forums, and other technologies, people are being exposed to more varied and frequent interaction opportunities than humans have ever experienced before (Woo Y., Reeves T. C., 2007). This fact could lead to a better learning and teaching process and also to the development of new and attractive methods for teaching and learning.

Universities and other higher education institutions are highly involved into knowledge creation, diffusion and learning. University's competitive ability depends on institution opportunity to share, spread and adapt knowledge as well as it is created. Modern students will require regular updating of their knowledge, skills and competences. (Beleviciute I., Sileikiene I., 2006). Therefore, teachers should conscientiously redesign their courses and adopt new instructional methods and appropriate technologies to fully exploit the benefits of web-based learning environments (Lee T. H. et al., 2007), and computer simulations in education. Flexible and innovative teaching and learning based on computer applications will expand and will change the educational process. Within a knowledge-based society the educators and their organizations have a changing role, but, in the same time, they need to manage the processes associated with the creation of their knowledge assets and to benefit from the use of computer applications. In this respect, the skills and competences needed for the knowledge-based society and the impact of using computer applications to the teaching and learning processes are becoming important issues to analyse.

Use of PRELEM XXI managerial simulation for teaching and learning Management

The process of teaching and learning Management is a very complex one because the students need to develop different skills related to psychology, communication, critical thinking, economic and social thinking, decision making etc. (Zamfir A., 2008). This study is the result of some years of personal experience in teaching Management for Romanian students and using managerial simulation entitled PRELEM XXI in class in order to develop the skills that students need for their further activities in the knowledge-based society.

PRELEM XXI managerial simulation was created and developed by a group of teachers from the Faculty of Management from the Academy of Economic Studies in Bucharest. They also created a forum for the PRELEM XXI managerial simulation (figure 1), where the students and other people interested could find information related to the game. The forum is structured as follows: General Information (general rules, useful documents, the situation of decision introduction for the Faculty of Management from the Academy of Economic Studies in Bucharest), Discussions (supply, production, equipment maintenance and repairs, sales, marketing, human resources, research and development, investments), and Varied other subjects (diverse).

Managerial simulation PRELEM XXI has some characteristics such as (Nicolescu O. et al., 2005):

- PRELEM XXI is a general managerial game which simulates most of the activities of an enterprise in order to achieve the main objectives of that enterprise;
- PRELEM XXI is a team managerial game, because the students work in groups;
- PRELEM XXI is a computational managerial game which processes information using the computer;
- PRELEM XXI is an interactive managerial game, because the actions and decisions adopted by the participants are influencing each other to some extent;
- PRELEM XXI is a medium-superior managerial game, because it simulates management and execution processes within the enterprise made by the medium-level and superior-level managers.

The time now is Fri Apr 18, 2008 9:41 am

Figure 1 PRELEM XXI Forum Index

Within managerial or industrial games such as PRELEM XXI each student is a member of a group (virtual company) and the class is split into 4-5 groups (virtual companies). The final decisions are the sum of individual decisions first and group decisions second. The initial data (inputs) are identical for each of the 4-5 companies. However, the big number of decisions adopted (circa 60-65 decisions per simulated month) rapidly differentiates the behaviour of each company. Playing the game is based on decisions obtained from calculations and foundations manually executed, and the final result is obtained through successive processing of these decisions, simulating on P.C. 12 months of industrial activity (figure 2).

INDUSTRIAL ENTERPRISE GAME (MANAGERIAL SIMULATION)

IDENTICAL INITIAL MOMENTS (Listing Reports)

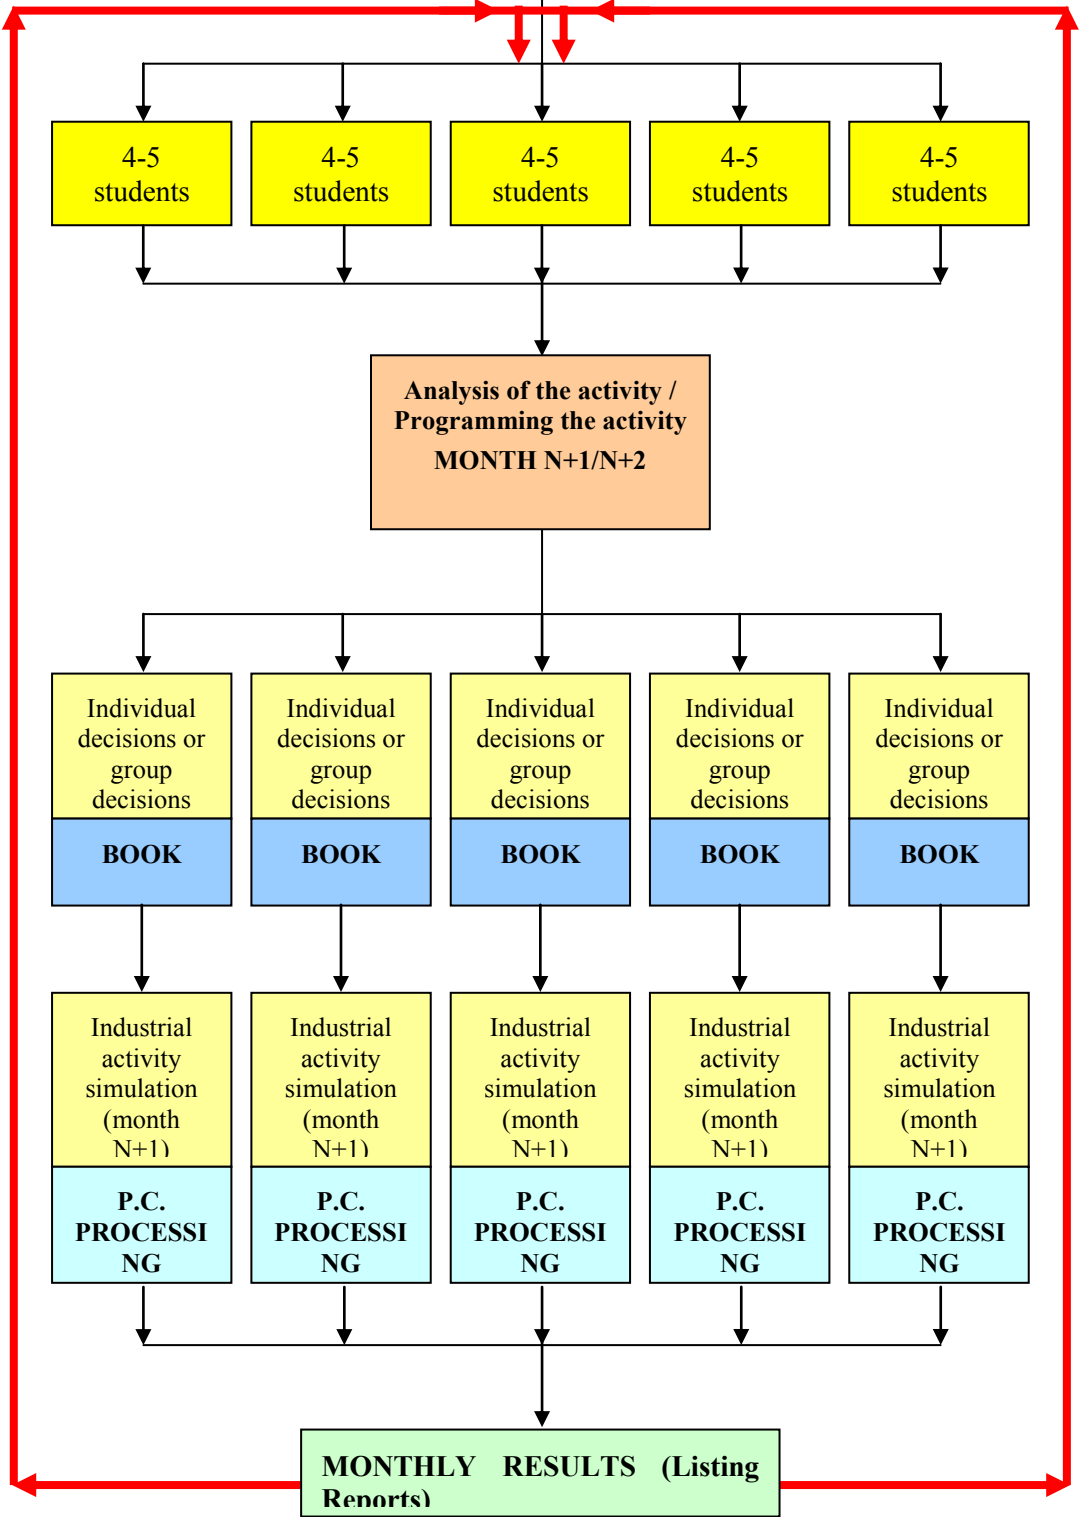

Figure 2 General structure of PRELEM XXI managerial simulation

Simulated activities within PRELEM XXI game are: foresight (prevision), technical conception, investments, supply, production programming, production, equipment maintenance and repairs, sales, products marketing, financial activities, accounting, and human resources. The students take on decisions for each simulated activity, based on the PRELEM XXI book, on their previous learning and on their managerial knowledge. Basically, the students from each simulated company must adopt many decisions, such as: annual forecasting; monthly forecasting; supply decisions; scientific research decisions; new products assimilation decisions; production decisions; marketing and sales decisions; human resources decisions. After taking on the decisions, the students must introduce the data into a computer in order to be processed and wait for the managerial reports with the results of the simulation. The situation of decisions introduction can be found on the PRELEM XXI forum and it is revealed as an illustrating example in figure 3 and figure 4 (<http://www.prelem.cnesmc.ro/viewforum.php?f=2>, <http://www.prelem.cnesmc.ro/viewtopic.php?t=2>).

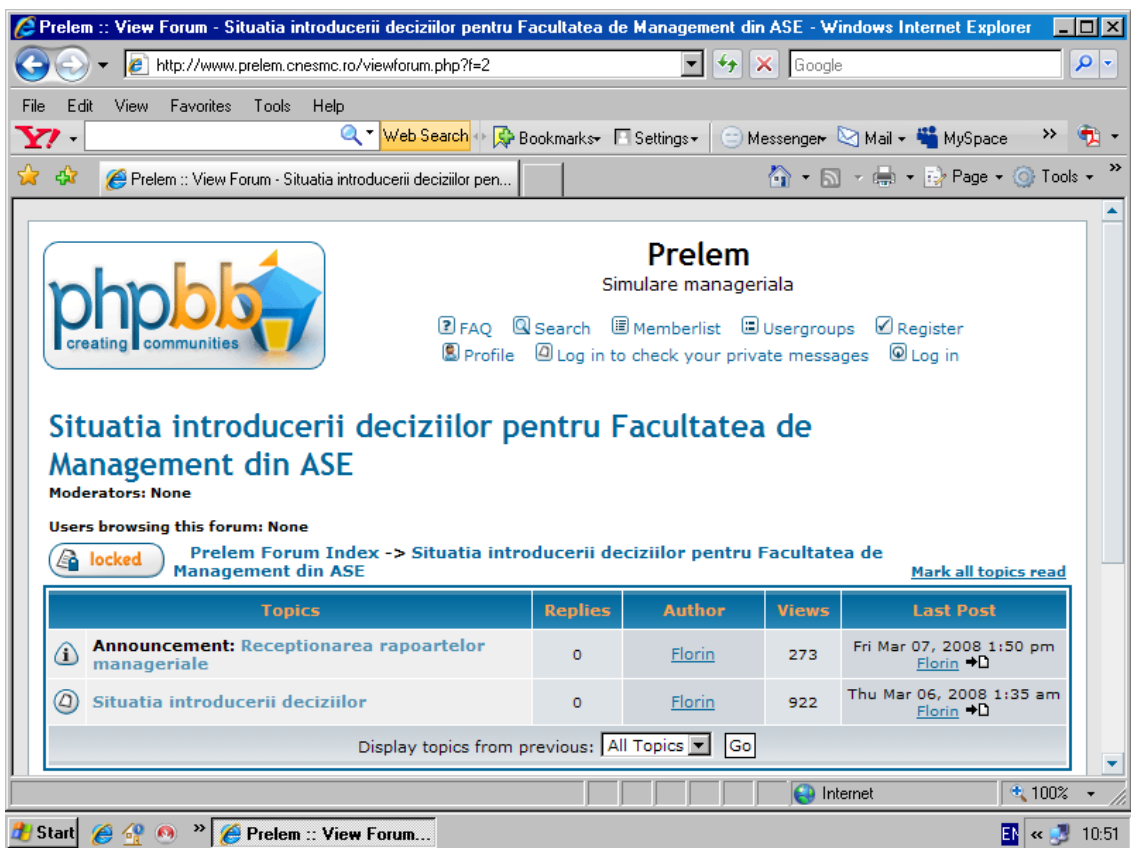

Figure 3 Decisions introduction situation on PRELEM forum

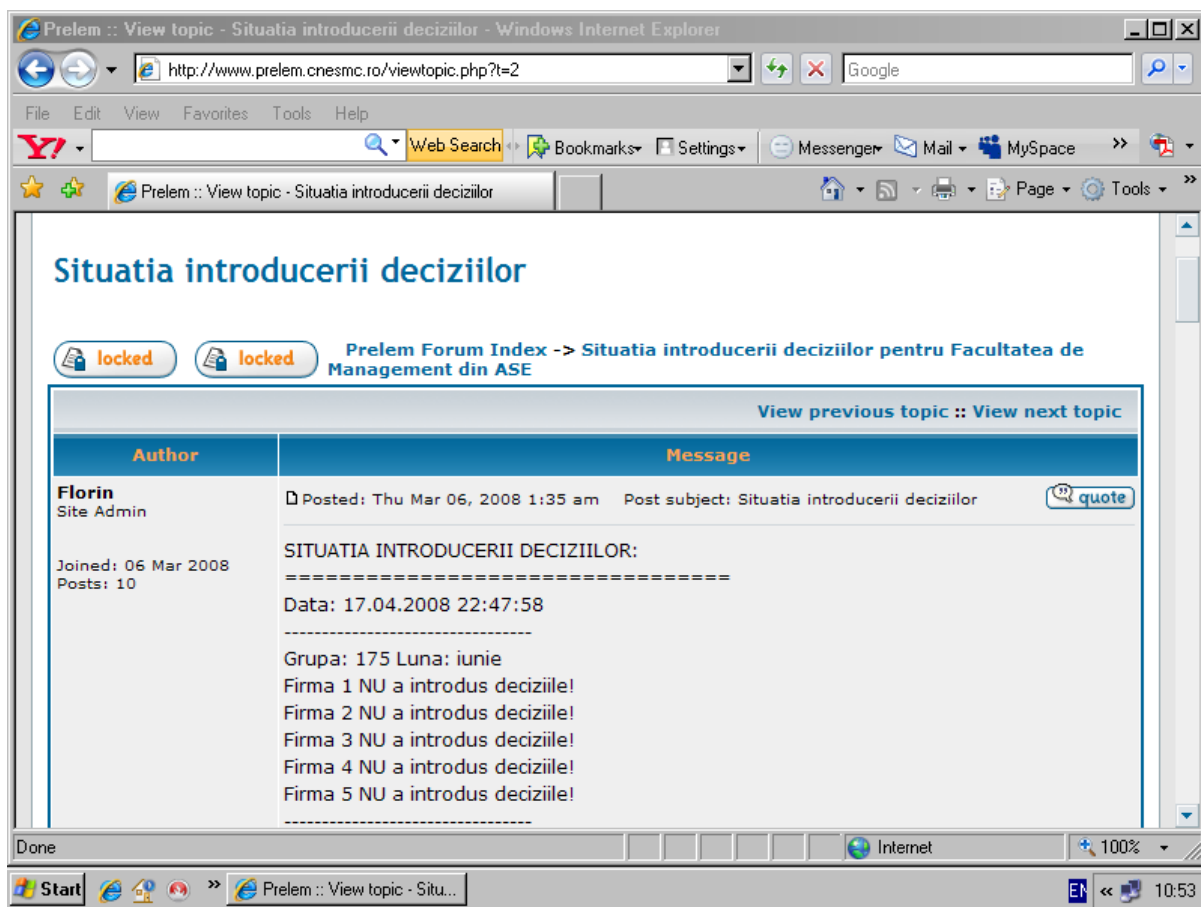

Figure 4 Decisions introduction situation for one group of students

Managerial reports are sent (E-mailed) by the simulation coordinator to each company after the managerial decisions processing. These reports contain the results of the simulation for a simulated month, grouped on the following activities: forecasted objectives situation; validated decisions situation; processed decisions situation; products assimilated in fabrication situation; functioning technologies situation; research activity situation; starting material situation; production situation; human resources use and equipments use situation; selling and products stocks situation; marketing studies situation; costs and profit situation; financial activity situation; achieving forecasted objectives situation.

Conclusion

We can conclude that the simulation is quite important to assimilate the theoretical concepts in Management and to put them in practice. Also, the managerial simulation enhances the teaching and is more attractive for the students. PRELEM XXI is quite simple to use, due to the advantage of not having to learn a new “language”, and because of this the students could concentrate on the analysis and decision making process. The simulation becomes an aid during the teaching-learning process to reinforce the theoretical concepts. The simulation promotes competition between the companies (groups of students), but in the same time, it promotes team work inside the companies.

MARKETING

ENTROPY AND THE ECONOMIC SCIENCE

Abstract: The paper presents the evolution of the entropy concept, from its introduction by Clausius, by the particular formulation of the second principle of thermodynamics, to the present theories. Thus, there are emphasized the essential aspects of the second principle that most specialists have agreed upon, which led to particular formulations concerning the existence of entropy and its growth in irreversible processes. The most importance approach concerns the second aspect of the second principle, the one related to the growth of entropy, fact that generated most contradictions in interpreting the concept. There can be identified, within this context, two important tendencies: A. researchers who state that, for development entropy has to decrease or to remain constant, fact that generated a multitude of well-known paradoxes (Maxwell's demon, irreversibility paradox, the universe thermic death etc.); B. researchers who state that entropy, and implicitly the reversible processes cannot be controlled, the evolution having as price, the entropy. This paper does not try to reconceptualize the entropy, nor to diminish the dispute fluctuations, but rather to rearrange in human nature's norms a constraint that we cannot separate yet: entropy and its growth.

Keywords: entropy, isolated system, unbalance processes

At present, it is difficult to grasp a definition as there are a multitude of definitions in the literature of the many sciences using it; these definitions, although they have a clearly stated common point, have each of them a historical conflict between the notion of entropy and evolution. The most recent definitions are:

- A measure of a system's energy incapacity of doing mechanical work; a measure of the disorder degree; the more increased the entropy is, the greater the disorder (Oxford Dictionary of Science);
- Thermodynamic measure reflecting the irreversibility of macroscopic processes (physics); measure that measures the uncertainty of a given message measure as compared to the previous one (the theory of communication); measure that indicates a system organization degree (Romanian Language Dictionary);
- Dissipated heat, spread in irrecoverable heat (J. de Rosnay);
- The number of microstates generating a macro state; Boltzmann's logarithmic formula (R. Baierlein);
- The number of things (particles') freedom degree in system, multiplied with Boltzmann's constant (D.R. Shroeder);
- A function of nonconservative thermodynamic state, measured by the number of microstates a system can have, which correspond to a degradation of useful energy (McGraw-Hill);
- A direct measure of chaos in a system (R. Chang);
- A measure of energy dissipation in certain temperature conditions (P. Atkins, J. de Paula);
- An index of a system tendency for spontaneous modification (D. T. Haynic);
- A measure of a system's partial loss of mechanical work capacity, as a result of irreversible processes (J. Cutnell, K. Johnson);
- A parameter expressing the disorder state of a system at atomic, ionic or molecular level (Essential Dictionary of Science).

The notion of entropy is related to the second principle of thermodynamics, defined in 1850 by Clausius and Kelvin. Entropy was at the beginning a conceptual invention, necessary in explaining some reversible ideal processes. Thus, the term of entropy was invented by Clausius, in 1865, following a study in the period 1856-1864 on reversible ideal thermic machines.

On the second principle of thermodynamics, the specialists have concluded that it has two essential aspects, which have led to two particular enunciations:

- The existence of entropy: there is a state measure called entropy, noted by S , which can be determined mathematically, additive measure, which grows in irreversible adiabatic processes and is constant in reversible adiabatic processes. Here follows the primary formulation of the principle: heat passes only from a warm body to a cold one.
- The growth of entropy: in irreversible adiabatic processes, entropy grows.

Although there have been approaches related to both aspects, by Planck, Caratheodory, Affanasieva, one has to take into consideration the interpretations of the second aspects, especially that given by Clausius. According to him, any activity that is created due to non-uniformities, differentiations in a system, evolves irreversibly to the disappearance of these differences, of the initial conditions, of its own existence conditions. In other words, any activity consuming resources, matter energy is destined to disappearance. The systems, the societies we live in, Universe as a whole is condemned to thermic death.

The starting point, in this erroneous approach of entropy, was a breach in the general theory (the second principle) that was then generalized to the level of reality as a whole. This breach was caused by the interpretation given by Clausius to the physical-chemical activities of matter. But Clausius stated that in some conditions, completely particular, a physical-chemical (isolated) system can have an implacable, irreversible destiny to a thermic balance. Clausius was wrongly understood, even though he maintained this point of view, by generalizing that any activity with entropy growth will undoubtedly lead to disappearance, to states of equilibrium where entropy will have reached its maximum.

The dimensions of anxiety towards this idea were in accordance so that many of the 20th century theories using the concept of entropy were justified to ask it to decrease, adapting, by adjustments and approximations, theoretical formulations that annulled its becoming.

The concept of entropy was most often interpreted in:

- The classical thermodynamics. The interpretation was macroscopic, entropy being just a state function. Clausius, Gibbs
- The statistical thermodynamics. The interpretation is at a microscopic level, where entropy is defined as a number of microstates resulting from the macroscopic observation of the system. Boltzmann, Maxwell
- The theory of information. Entropy has an information nature, being different from the one in thermodynamics. Shannon, Weaver, Draganescu, Onicescu.
- Economics. Entropy is seen as a measure of (economic) evolution. Georgescu-Roegen.
- The thermodynamics of un-balance processes. Entropy is seen as a measure characterizing evolution, irreversible processes being uncontrollable. Prigogine.
- Quantum mechanics. Entropy is related to the intrinsic uncertainty of quantum states. Von Neumann, Stotland, Pomeransky, Bachmat, Cohen.

Most of the above theoretical constructions had as a starting point the entropy seen through the classical determinism, its message being wrongly understood. Thus, there has been defined the principle of entropy decrease, translated by different theoretical attempts to infringe the second principle. All these attempts generated numerous paradoxes: Maxwell's paradox (Maxwell's demon), Gibb's mix paradox, Boltzmann's paradox (theorem H), irreversibility paradox (Zemela and Loschmidt), the paradox of Universe: thermic death, the biological paradox etc.

Boltzmann tries to demonstrate the first aspect of the second principle, the existence of entropy in reversible processes by the classical mechanics determinism where reversibility had two senses:

- In the sense of Poincare cycles, where reversibility is seen at a macroscopic level, like the movement of planets around the Sun. this reversibility introduces a correction, that is it neglects that whole movement of the solar system within Galaxy. This mechanic reversibility is valid only in one point of Universe.
- In the sense of Newton's equation, which contains square time. According to this aspect Boltzmann will obtain two time arrows, one for time τ where the system evolves in a sense,

existing also the possibility of the opposite direction evolution when time is $-\tau$. This fact is related to a temporal reversibility, an extremely complicated one (temporal symmetry).

These two complementary aspects, reversion and inversion were strongly criticised by Prigogine who proved for chaotic systems, which have a temporal horizon measured in time Liapunov, that they cannot come back to an initial state when the reversion time of the system (Poincare time) is greater than Liapunov's time. The system considered by Boltzmann is one with many particles, of the great systems category, which can become very easily unstable.

Boltzmann's demonstration of reversion and inversion, of infringement of the second principle appeals to the well-known H theorem, defined according to molecular speeds distribution. A consequence of this theorem was that H function must always decrease in an isolated system, or, at the most, to remain constant, in the case of the statistic equilibrium. Boltzmann showed that H has to be proportional with the minus sign entropy. This led to the formulation of the principle, that entropy must decrease, Shannon taking the conclusion as such, replacing the proportionality recommended by Boltzmann with the perfect equality (even though there can be stated that there are fundamental differences between the informational entropy and the thermodynamic one).

Prigogine categorically states that irreversibility (in the microscopic processes world) cannot be explained according to the reversible laws of the classical dynamics (the sufficient reason principle). Any attempt to render meaning to irreversibility, evolution of any kind, by means of sufficient reason language is destined to failure.

Boltzmann's partial failure could have been caused by the fact the classical dynamics had evolved without any constraint. In defining the physical systems of the classical dynamics nothing is lost, the reversibility determining their evolution completely. Boltzmann wanted to the same thing in thermodynamics, as well, but failing in doing so, he introduced approximations, setting a precedent. Even though the introduced approximations were more related to the human subject than to the observed one, this precedent is an extraordinary one. The precedent created by the second principle of thermodynamics will be used later by the great conceptual schemes of the 20th century physics, the second principle was still seen as a failure, as a weakness of human nature of maintaining uniformity and predictability.

The inclusion in any scientific law of a constraint related to the impossibility of human nature of having unlimited net information, represents, on a large scale, our becoming ideal. The certainties are elaborated in the whole world of reversible processes, of any nature, where tendencies are conserved, knowledge becoming so high that becoming has no sense any longer, if at least one certainty is not broken. Of course, any science cannot impose itself but by positivism, by what it can confirm in any moment, but its destiny is implacable when its becoming is impossible, when the normative and intuition are no longer revealed. The normative and intuition do not impose apparently strict reference points as compared to the positive which is indissolubly linked to a validation criterion specific to each science. In physics the validation criterion is based on neutral experiences as compared to the social-economic-science, for example, where the criterion for establishing the truths is a direct one, supposing a dialogue between subject and object. Thus, physics-related certainties, where the factual reality is that of microscopic objects, little personal, are very solid and hard to break.

Could we reach the same conclusion for the real world, as well? How would certainties be elaborated in such a world and how stable would they be? How would a reversible process look in the real world and how useful would it be to our evolution?

The answers are given by questions: What could we take from the thermodynamic physics in economic science? How could we understand the entropy of the microscopic world in the real world? What processes would be useful to the individuals' evolution?

I think that for the economic science evolution we have to include the imperfect knowledge constraints. Even though Georgescu-Roegen did not admit the theoretical character of the economic science just because its positivism is a weak one, I do not think that it is absolutely necessary that the economic science should have a clear-cut positive.

If physics were annulled the greatest certainty Heisenberg indetermination principle, then it would definitely not revolutionize just the economy, but the whole science. In the same manner, if the economic science would overcome one of its great indeterminations, the consumer's behaviour, do you think that it would be any revolution? Do you think that the inventory of a machine that would read tastes and thoughts

would be of any use? For us, simple individuals, definitely not. But isn't this already happening? Information systems that gather data on consumers will certainly not be able to make objective specifications, issue certainties, but for information, communication of a certain nature oriented to the simple individuals. Stimuli, of any kind, make us more controllable; preserve certain tendencies so that certainties related to our behaviour can be issued. But this leads to the disappearance of differences between individuals, of different behaviours leading to the uniformization of the mass, to evolutions not far from equilibrium

The idea I want to reach is related to the apparent contradiction between entropy and development, evolution of any kind. Out of the multiple theoretical attempts to break the second principle, it has been stated that in order to separate order and disorder, the entropy has to decrease. Any of these attempts did not practically succeed in surpassing the second principle, which still remained one of the greatest constraints of the real world. Despite this, the entropy was asked to decrease, some of the important theories related to evolution being based on this principle.

But, in order to make entropy decrease, activities, processes have to be irreversible, this fact contradicting the principles of becoming. Entropy decrease can be produced theoretically at equilibrium when the average remaking of differences would remove the equilibrium system, a very improbable situation. Most activities and processes, corresponding to some entropy-growth evolutions cannot be explained by reversible processes. The entropy decrease principle will prove to be an incorrect one.

Reality cannot be dissociated from any entropy growth. The entropic indetermination principle, the modern formulation of the second principles, leaves many degrees of spatial-temporal freedom to (irreversible) processes, being in favour for the creation of the new by a very large sum of combinations (modifications). The entropy (law) principle demands that each combination (modification of the present) should take place with an entropy growth, without indicating the way these combinations take place. There can be no direct action on entropy, but on the entropy cause: the systems' activities and the conditions determining them (resources, energy, and experiences).

Remarkable contributions were brought by Ilya Prigogine and Nicolae Georgescu-Roegen who demonstrated the first by dissipative structures, unbalance complex structures, able of evolving far from equilibrium, the latter by permanent fluctuations, that evolution is not in any kind of contradiction with entropy. The entropy-producing activity is no longer synonymous with degradation, with the disappearance of differences. There are two different approaches of the two: Prigogine's exploration started in the world of physical-chemical processes, the unbalance structures manifesting, for the first time, at macrocosmic level, farther from reality; Roegen's approach is related to the real world.

The extraordinary contribution of Roegen is very subtle; even though the entropy law relates any becoming to a n entropy growth, nobody in the whole science made the necessary correction, on the contrary most of the time entropy was asked to decrease. Any entropy growth represents an evolution, a difference between what was and what is, but without stating a proportionality between the entropy growth and the result of becoming. Thus entropy defines in a very large sense becoming, some adjustments being necessary. As a matter of fact, the entropy indicates the evolution way, not the way in which it takes place. Roegen mentions that becoming should not take place with uncontrolled evolution growths, on the contrary the entropy growths are associated with low entropy that many interpreted as negentropy, negative entropy, a confuse notion, coming from the interpretation of the second principle of thermodynamics through the classical dynamics. Thus, the Romanian scientist makes a distinction between the consumption of resources, energy and entropy production. So, a convenient becoming state, of an enterprise development can be reached with a low entropy production, which can be interpreted by a sustainable transformation of resources and energy.

The production of entropy is an abstract notion, difficult to quantify and calculate. It is directly linked to the degree of transformation (an entrepreneur's skills, competences etc.) but also to the useful activity (of the same entrepreneur). If the degree of transformation is very high and the useful activity reaches a high output, one can say that the entropy production is relatively low, so rational. If, on the contrary, the useful activity has a low output, the entropy production will be high, the entrepreneur dissipating uselessly many resources, energy and experience.

The entropy in the economic field has to be analyzed as marginal entropy, with perceptible growths from one period to another, from one process to another, the total entropy of a system being impossible to define and quantify.

The ideal situation would be that of discreet entropy growths from one period to another. Although these growths are not major, the becoming principle is observed as well as that of a sustainable development that should observe the natural environment by a rational consumption of resources and energy.

As far as natural resources are concerned, they represent the support of any economic activity, but are depleting. In a first stage, this is worrying as together with their depletion, the support of economic activities will be almost impossible. It is prefigured a situation that the theory cannot solve but by an adjustment. If the place of consuming-resources would be taken by the experience of human nature, this can be a solution in the future. But it is just an adjustment that only time will support or not.

In conclusion what could the entropy of thermodynamic physics say to the social-economic science:

- First of all, that the differences present in a complex system, such as the real world, are absolutely necessary for becoming. The differences, the non homogeneities among individuals, present at a social level, will support the opportunities at a macro level. The reversible processes, with no entropy growth represent theoretically the basis on any evolution, without being evolutions in themselves. The reversible processes create certainties that are elaborated when tendencies are preserved and there are no longer differences from one moment to another. For becoming, certainties have to end. The end of certainties has to manifest ordinally. There is, though, a constraint: the denial of certainties must not necessarily determine a breach, denying the way that made it possible. This denial is oriented both towards the past it inherits, and towards the future it suggests. Roegen suggested the use of arithmomorphic, analytical models for the confirmation of reasons, of some certainties. Schrodinger and Roegen noticed that diversity, fluctuations come from the cultural inclinations of the simple individual, making it difficult to analyse with a mathematical model. The errors generated by generalization were not compensated, but on the contrary, were maintained or amplified. The individual's economic actions cannot be dissociated from its cultural inclinations. These things do not simplify the analysis, but on the contrary, the powerful inclinations towards culture indicate an uncontrollable variation of behavioural configurations (patterns).
- Thus, an environment with profound cultural tendencies of individuals evolves unpredictably. The lower the cultural inclinations, the more preserved the tendencies will be; evolution can be described by means of an analytic model, as individuals tend towards a controllable mass, the certainties, the positive of the social-economic science becoming more evident.
- The consideration of analytical, arithmomorphic models for the outlining of the economic science positivism is a necessary condition but not a sufficient one.

Reversible thinking is definitely very useful, having a high output concerning the elaboration of decisions and provisions that are fast and less complicated. There are, though, some elements I consider essential in every science affirmation. They refer to the subtle and keen thinking. By studying the entire science at a subtle and keen level, a very interesting aspect is revealed: affirmations of keen and subtle geniuses become predictions that later are confirmed, becoming certainties even though there was a great period of time between their affirmation and the constraint of some models for their confirmation. These affirmations contradicted each time the order previously established. Their geniality is unique, being based on an intense effort, of regular exercises that involve routine activities, reversible ways of thinking, the basis of mental abilities absolutely intuitive and of keen and subtle thinking.

Newton and Clarke "felt" that concussions represent the occasion of some force losses that produce the new. This enunciation was elaborated long before the formulation of the second principle of thermodynamics.

Boltzmann, even though he introduces a profound confusion, was aware of the evolution of the atom notion, as well as of the entire structure of theoretical physics. Boltzmann has the extraordinary merit of being free, with an undogmatic point of view.

Einstein represents the central point, the most subtle and profound, and he represented models of thought in thought, strongly contested up to their confirmation.

Roegen gave another quality to the new, from other points of view than his colleagues', great economists, giving up to the framing of the economic science in some logic formalism subtly and profoundly indicating that the economic determination is utopian as long as the individual has real liberties of thinking.

- Entropy is a loss, a price paid to evolution. This is exactly what evolution is: the difference between new and old – and this is entropy.

It is very possible, and this is how it should be, that in a short time entropy would be differently outlined and interpreted, going beyond engineers' or economists' necessities, it would observe the evolution principle, relating first of all to the world we try to describe, defining the constraints on which evolution is permanently articulated.

THE ROLE AND IMPORTANCE OF MARKETING RESEARCH IN RETAIL

Bălășescu Simona

“Transilvania” University of Brasov, Economic Sciences Faculty, Address: Valea Cetatii, no. 13, building A18, apt. 19, E-mail: simona_balasescu@yahoo.com, Mobile phone: 07292856658

Abstract: The work approaches the features of collecting and using information in retail commerce, as well as the characteristics of the marketing research in this area of activity. In a successful retail distribution field, the information must move freely and efficiently between the three main parts of commerce (supplier, merchant and consumer). The result is a better communication and a better anticipation of the expectations of all three parts. The entrepreneurs who rely on unsystematic or incomplete research, e.g. intuition, increase the failure possibilities. The information system specific to commerce anticipates the data required by the retail managers, collects, organizes and stores, systematically, relevant data and directs the informational flux towards taking the right decisions. This kind of system implies retail marketing research.

Key words: retail, data, research, consumer, profit.

Introduction

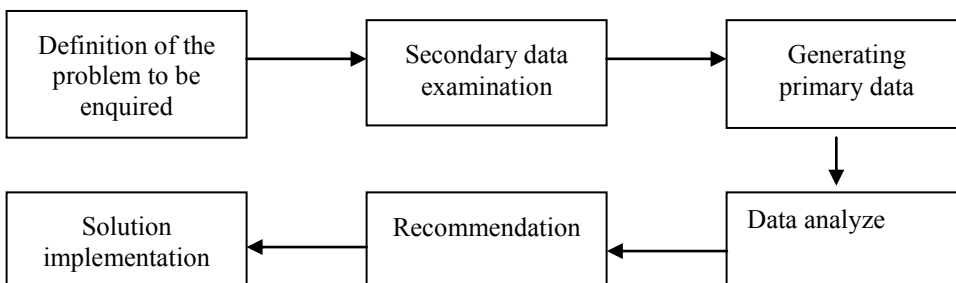

Retail marketing research implies the following steps: the definition of the problem to be enquired, secondary data examination, data examination, solution proposal and solution implementation. If the problem is not correctly defined, applying a secondary data might enlighten the situation, but if secondary data is not available, primary data is the only option. The potential disadvantages might be: costs, limited access, collecting irrelevant data.

Marketing research process

Marketing research process requires a collection of data and its analysis concerning certain problems connected to the retailer. In some companies this kind of research is one of the elements of the data system, as in other companies it may be the only kind of processed and used data. Marketing research implies certain activities, such as [1]:

- The definition of a certain problem to be enquired;
- The examination of the secondary data;
- Generating initial data, if necessary;
- Data analysis;
- Building recommendation;
- Solution implementation.

This process cannot be done in one step, but it is a complex and systematic process. Figure no.1 emphasizes the way the research process is developed. Each activity is sequentially made; secondary data is examined only after the problem is defined; the interrupted line around “primary data” suggests that they are generated only if secondary data is not efficient. The entire process is defined immediately after the following figure:

Retail marketing research [2]

The problem must be clearly defined in order to be solved. What information does the retailer need in order to take a decision? Without the exact knowledge of the problem appears the risk of collecting irrelevant and confuse data. Here are some problem examples for a shoe store . The first problem tries to compare three locations and it is completely structured. Meanwhile, the second one has an “opened ending”:

- Out of three possible stores, which one should I pick?
- How can we increase the sales for men shoes?

When secondary data is involved, the retailer looks upon data picked for other purposes than for solving the current problem. This data can be internal or external. When primary data is used, the retailer stops to information collected especially for the enquired problem. This data can be collected by the means of surveillance, observation, experiment and simulation. It is very important for merchants to take under consideration the following:

- The collected data categories are very diverse (as well as the costs);
- Only the necessary data, referring to the enquired problem, ought to be collected;
- Primary data are usually necessary only when secondary data is inadequate.

The following data should be collected for the problems of the shoe store, mentioned above:

The definition of the problem	Necessary data for solving the problem
1. Store location?	1. Data concerning transport, traffic, consumer profile, rent, store size, government allowed competition, the three locations observation (by the owner).
2. How to improve sales?	2. Sales records for the past five years on each range of goods, consumer surveillance in a neighbor store.

Required data for potential problems [3]

After the data is collected, it must be analyzed in order to establish the information and connect it to the definitive problem.

Alternative solutions must be underlined as well – the following table shows the advantages and the disadvantages of the alternatives of sales growth, as well as of each location:

Problem	Alternative	Advantages and disadvantages	Recommendations
Store location?	Location A	Best transport, traffic and consumer profile. Highest rent, smallest storage, high competition.	From far more advantages than disadvantages.
	Location B	Bad transport conditions, traffic and consumer profile. Large storage, no competition.	
	Location C	Intermediary on all plans.	
	Multiplying the range of goods	It will attract and satisfy more consumers. High costs. High storage level. Reduces the turnover for other goods.	Lower prices and higher addition:

How to improve sales?	Giving up some assortments and specializing on certain products	It will attract and satisfy a certain category of consumers. Excludes many other segments, costs and low stocks.	increasing the number of clients makes up for high costs and small incomes – the combination will determine the company to develop.
	A slight price diminish	Sales increase; unitary profit reduces.	
	Advertising	Will increase the flux as well as the number of clients; high costs.	

Research based recommendations

Secondary data. Advantages and disadvantages. [4]

Secondary data has certain disadvantages:

- Putting together data is not an expensive operation: company records, government publications, business publications, and so on and so forth, all have low cost;
- Data can be collected quite fast: for instance company records, bibliographic sources, web sites, etc., all are easily accessible;
- There are many sources where to collect data from;
- A secondary source may contain information which is not easily accessible to the retailer;
- The result is amazing when data is supplied by trustful sources;
- The retailer may at first have a vague idea about the problem which is to be enquired, and the secondary data will help in defining better the problem.

Except these advantages, there is a range of disadvantages that ought to be mentioned, disadvantages brought by the use of secondary data:

- Data accessible at the specific moment of time might not fit to the problem enquired due to the fact that it was collected for other purposes;

- Secondary data might be incomplete. For instance a service shop wants to know the following data about cars: fabrication year, type, and distance in kilometers. A car office can supply any data but the distance in kilometers;
- Information might be obsolete. Statistics collected each 2-5 years might not be proper in the present day;
- Secondary data correctness must be drastically checked;
- Certain secondary data sources are known for their weak data collecting techniques, therefore they must be avoided. If contradictory data appear, a better data source must be found, with a good reputation.

Secondary data is used in any types of marketing research. It consists in writings, numbers or symbols, previously collected and stored, based on different requests, objectives and hypotheses, other than those had in view when using it. There are many sources and many types of secondary data. The difference between them is that some are internal while others are external.

Internal secondary data is data accessible within the company and it is the first data that must be searched for:

- Company budget and efforts in covering the budget deficits;
- Sales analysis together with the profit and loss account in order to determine the strengths and weakens of the company, for improving the company's activity;
- Keeping the report resulted by using primary data for a future use as secondary data;
- Activity reports.

External secondary data is provided by sources from outside the company. This data might be obtained from governmental or nongovernmental sources. Some of these sources may be libraries, reports of different organizations (both governmental and nongovernmental), magazines, newspapers, academic reports, etc.. Nowadays, the Internet is a common means of collecting external secondary data. Usually it is collected from trustful web sites or by searching in books, magazines, and so on. Using these sources (external) must be done only if the internal sources are insufficient.

Primary data. Advantages and disadvantages.

Primary data refers to any verbal information, written, numerical or symbolical, that reflect behaviors, opinions, evaluations, attitudes, reasons, intentions and preferences, obtained for the first time by using different means of collecting information, from those who possess it (people, institutions, companies, etc.). [5].

Totally unsolved problems may remain after using all secondary data. In this case it resorts to primary data. Here are some of the advantages brought by using primary data:

- Primary data is collected as a response to the exact needs of the merchant;
- The information is actualized;
- The data categories are created only for the enquired problem;
- There is no contradictory data from different sources;
- Primary data is the only possible alternative when secondary data is not enough.

There are also some disadvantages:

- It is harder to obtain;
- Collecting primary data takes more time;
- If collecting only primary data the success odds are limited;
- Irrelevant data might be collected if the problem is incorrectly defined.

The sources in this case might be, just like at secondary data, internal or external. The internal sources are cheaper and more easily to access, but the external data is more relevant and formal.

The most common methods used for collecting primary data are either the experiment or the simulation.

The experiment is a type of research in which one or more elements of the strategy are used under control. These elements might be: price, “shop hours”, and so on. The great advantage of using the experiment is that it can demonstrate the cause and the effect (a lower price leads to higher sales). Experiments can be made both in the laboratories and on the “field”. Laboratory experiments offer the possibility of direct measurement of the effects of the stimulus applied to the subject. Field experiments are realistic, but the measurement is more difficult. The main disadvantages of experiments are high costs and disturbing factors.

The simulation is a kind of experiment in which a computer program is used to manipulate the elements of the strategy. There are two types of simulations: simulation based on mathematic elements and “virtual reality” based simulation. The first kind builds the model of a controllable and uncontrollable retail environment. No consumer cooperation is required. This kind of simulation is more popular due to the advanced software existing nowadays. The second kind of simulation uses interactive software that allows participants to simulate their behavior in the most possible realistic way. Unfortunately there is a low supply for this kind of software.

Conclusions

The information circuit in a commercial system is essential for the well going of the activity. There must be a great communication among all parts of the system in order to avoid conflicts that can weaken the proper functioning. The main key in this “Swiss mechanism” is the merchant, due to his intermediary part between the supplier and the consumer. If this part is held in giving information, then the entire system will “limp”. Even if each part is held in giving information they, must first think that splitting data and afterwards collecting it is in their own interest, in order not to supply information that might affect their activity afterwards.

Not all collected information is correct and complete, therefore there must be avoided marketing strategies based on wrong information. Patience is the strength in collecting data and in creating a marketing strategy. If the retailer is anxious to obtain profit as soon and as fast as possible, the situations discussed above appear.

Creating a data base is important for each company, no matter its size. The information stored must be correct, must have as many documentary sources as possible; data must be well organized, systematically organized, in order to permit a fast usage and access; it must be updated very often. If the retailer considers that he neither has the necessary experience nor the necessary personnel to create the data base by himself, he must contact a specialized company. The cost for such a data base must not exceed 1.5% of the sales in the given area [6].

The companies that have a more complex administration, including more than one data base, must create a data storage/warehouse in which all data bases are gathered together for a better and more facile administration. This storage helps in eliminating redundant data and it must be accessible to all employees, no matter where they access from.

Only after going through all these steps of collecting information, a marketing strategy can be made in order to provide a better satisfaction to the clients’ needs, and in order to achieve a profit growth.

The strategy can be based on secondary data or on primary data (discussed within this work), but to use it, there must be at first a problem to be solved with the help of this information. Marketing research also uses processes as the experiment or the simulation. These two processes can be put into practice with the cooperation of the consumers and by analyzing the consumer behavior in specially created conditions.

THE NECESSITY OF STUDYING BUYING BEHAVIOR, CONSUMPTION AND USE OF INDIVIDUAL CONSUMPTION GOODS BY COMMERCE FIRMS

Bălășescu Simona

“Transilvania” University of Brasov, Economic Sciences Faculty, Address: Valea Cetatii, 13, building A18, apt. 19, E-mail: simona_balasescu@yahoo.com, Mobile phone: 0729285665

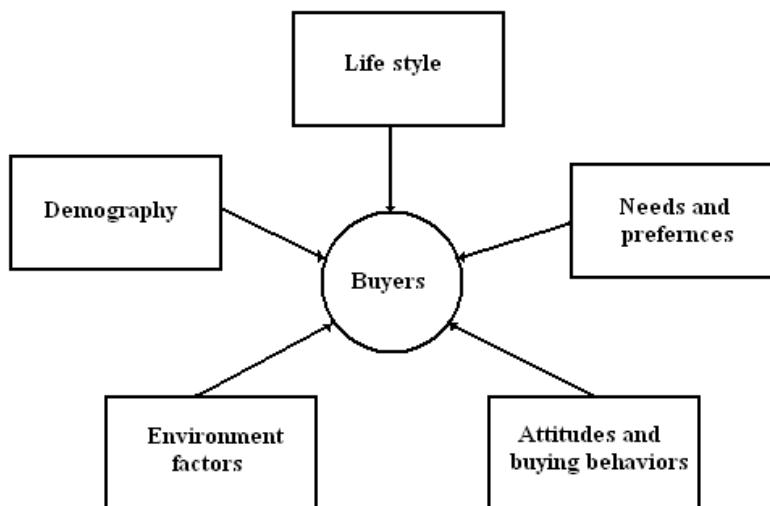

Abstract: The quality of a selling strategy depends on how well a company can identify and understand its clients, and on how well it can make the market strategy mix so that it can be attractive to clients. This leads to the identification of characteristics, needs and attitudes of the consumers, to the acknowledgement of the way people make decisions, and in the end, to the creation of a proper marketing plan. Selling strategy also implies studying the environmental factors that influence buying decisions.

Key words: buying behavior, influence factors, retail, market strategies.

Introduction

A place in which the merchant can interfere so that he can attract as many clients as possible, is the consumers' decision taking process. In any stage of this process it is important that the merchant supports and direct the consumer, making sure that the process ends in an acquisition. The merchant must understand that once the acquisition is completed, his job does not end, post-selling services being just as important as support and guidance provided by the merchant, his connection to the client, enquiring the clients' decision in order to create a further positive image on his company.

Merchants will not be able to satisfy always all the needs of the consumer; nevertheless, those who will be able to foresee chances in needs and preferences of the consumers and adjust their activity to these changes, will survive and prosper. [1]

Factors of influence on buying behavior

The present work discusses the most important aspects regarding these factors of influence on buying behavior and decision of individual consumers.

Demography and lifestyle of consumers

The demographical parameters are objective, measurable data and easily to identify of population. Lifestyle refers to the ways individual consumers and families live and spend their money.

Demography

Consumers can be characterized by certain demographical factors, such as sex, age, population growth rate, average age, alphabetization rate (the percentage of the people who know how to write and read), language, size of household, civil status, income, migration, address, occupation, education, race and so on. These factors affect the way in which shopping is done, as well as merchant actions and activities. Therefore, a merchant ought to have certain knowledge on general tendencies, as well as on demographical aspects of its target market.

Regional data is more useful due to the fact that most merchants are local or regional. Because most merchants are local or they operate only in some regions, they must collect information about people who live in their area of activity, especially about potential clients.

For a business and a given location, the characteristics of the target market can be studied on the basis of the demographical factors, leading to a proper strategy including: [2]

- Market size – how many people does the potential target market has?
- Sex – are there more men or more women on the potential target market? Or their number is equal?
- Age – which are the main age intervals the retailer aims?
- Size of household – which is the average size of a household of potential clients?
- Civil status – are potential clients married or not? Do families have children?
- Income – does the potential target market has low, average or large incomes? Is there any chance for the available income to be used for luxurious acquisitions?
- Retailing – which is the prognosis for regional sales of goods and services?
- Birth rate – what importance does the birth rate have to the offer of goods and services of the retailer?
- Mobility – what is the percentage of the people within the potential target market who move inside and outside the business?
- Where do people live – how wide is the trade area from which potential clients can be attracted?
- Employee level – does the potential target market also include women who work?
- Occupation – what industry do people work and what is their occupation?
- Ethnic and racial history – does the potential target market cover a distinct group, ethnically and racially speaking?

Consumers' lifestyle

Consumers' lifestyle is based on social and psychological factors and it is influenced by demographical factors. Referring to demography, a merchant should first have some knowledge on consumers' perception of lifestyle, and then determine the lifestyle attributes of his own target market.

The following social factors are useful in identification and understanding of the consumers' lifestyle: [3]

- Culture;
- Social class;
- Reference groups.

There are also some psychological factors that are useful in identification and understanding the consumers' lifestyle: [4]

- Personality;
- Social conscience;

- Attitudes / opinions;
- Perceived risk;
- Acquisition importance to consumer.

A merchant can make a profile of the lifestyle of the aimed consumer, by answering to the following questions and using the answers to create a development strategy:

- Culture – which are the most important values, rules and traditions that characterize the potential target market?
- Social class – do the potential clients belong to the inferior, middle or upper class? Are there any social movements?
- Reference group – who do the clients ask for guidance in different acquisitions? How does a company look towards opinion leaders?
- Household / family life cycle – in what stage of the cycle are most clients situated?
- Spare time – how do people spend their time? How do people feel about shopping time?
- Personality – do potential clients have personality features that can be identified?
- Attitudes – what is the opinion of the potential target market on the retailer and his offer, within the context of a specific strategy?
- Perceived risk – do the potential clients feel any risk concerning the retailer? What goods and services have the highest perceived risk?
- Importance of acquisition – how important are the goods and services offered to the potential clients?

Needs and preferences of the consumers

When the profile of a target market is sketched, a merchant should identify the needs and the preferences of the buyers. From the commercial firm point of view, needs are requests of buying accordingly to the present lifestyle and demography, and preferences are arbitrary goals that have an impact on attitudes and behavior.

The merchant who wishes to satisfy both needs and preferences of the consumers, should find answers to the following questions: [5]

- What distance are the clients willing to travel to get to the merchant?
- What are the preferred hours? Is there necessary the presence of a nighttime or weekend schedule?
- What is the desired level of client services?
- How large should the ranges of goods and services be?
- What is the desired level of quality for goods and service?
- What importance does the price have?
- What are the measures the retailer must take in order to reduce the perceived risk?
- Do different market segments have special needs? If yes, what are those needs?

Attitudes and buying behaviors

We shall focus on consumers' attitudes towards shopping, place where they shop and the way they decide to buy.

Shopping directed attitudes:

Many researches were made on these attitudes, due to their importance in retail. Merchants should focus on changing existent negative perceptions. These researches emphasized the following: [6]

- Pleasure for shopping – it is not as important as it used to be. In order to obtain a satisfying experience, a retailer must offer a challenge, like discount hunting, the opportunity to get out of the house or office, or simply spoil clients a bit.
- Shopping time – it is desirable to be as shorter as possible due to the pressures of working and family. This leads to the phenomenon called “exact shopping”, meaning: searching for the goods as quickly as possible;
- Why do clients buy, or don’t buy a certain product – it is essential to know why do buyers leave the selling point without buying something. Ten reasons were found:
 - They cannot find an attractive style;
 - They do not find the proper size or the product is out of stock;
 - Nothing fits;
 - No guidance is provided;
 - Access is difficult in and out the selling point;
 - Very high prices;
 - Stressing experience;
 - They cannot find a good price;
 - The selling point does not provide a convenient merchandise;
 - Merchandise is out of season.
- Attitudes on market segments – the following classification is based on 4 types of clients:
 - Stewards – are interested in prices and convenience;
 - Visionaries – who want a social experience;
 - Speed buyers – want to buy fast;
 - Elites – they are looking for quality brands.

The decisional process of the buyer

Besides identifying target market characteristics, a merchant must also know the way people take decisions. This implies an acknowledgement of the consumer behavior, representing the process through which people determine if, what, when, where, how, whom from, and how often to buy goods and services. Such a behavior is influenced by the peoples’ past and features.

The decisional process must be understood from two different perspectives:

- What good or service does the client wish to buy;
- Where to buy from (is the client decided to buy).

A consumer can take these two decisions together or separately. If he takes the decisions together, the person will ask for guidance for the entire process. If the decisions come separately – “what” to buy vs. “where” to buy from – the person will collect information and advice before visiting a retailer, and he sees the retailer only as a place where to buy from.

In the decision of buying or not a certain good (“what”), the buyer takes into account characteristics as resistance in time, oneness, value, easiness in use, and so on. In the decision of selecting the retailer (“where”), the buyer takes into account the location, variety, credit availability, support personnel, schedule, client services, and so on.

The decisional process has two parts:

- The effective process;
- The factors that influence that process.

There are six steps of the process: [7]

- Stimulus;
- Problem awareness;

- Information search;
- Alternative evaluation;
- Buying and post- buying behavior.

The process is affected by both demography and lifestyle.

Environmental factors that influence buyers

Among the factors that influence the attitudes and behaviors of the buyers, there are the following environmental factors:

- Economic situation;
- Inflation;
- Infrastructure of the place people buy from, like heavy traffic, criminal rate, parking places, and so on;
- Merchants' price war, or the price war between merchants and producers;
- The tendency to more people who work at home;
- Governmental legislation, as well as local legislation, regarding the schedule, new constructions, consumers' protection,
- The evolution of rules and value within the society.

Even though all these elements have an impact on individual consumers, they tend to influence even more the actions of merchants and their marketing strategy. Merchants must take into account the way living standards change. [8]

Conclusions

The commercial firm comes into contact every day with hundreds or thousands of people. Each one of them has needs and preferences and there are never two persons with exactly the same needs and preferences. They can be similar, but not identical.

Nevertheless, certain groups will be characterized by tendencies, preferences, tastes, will be influenced by certain demographic factors (age, sex, education) as well as social factors (culture, social class), which sort of eases the merchant's work that consists in answering as fast and as correct as possible to these needs and preferences of the consumers, so that the business works in an efficient and profitable way.

Demography and consumer lifestyle that form the target market, will help the merchant in understanding consumers and the factors that influence their decisions, factors mentioned above (demographical, psychological and social). The merchant will also pay attention to the impact of these factors on the general tendencies in shopping.

The issues discussed above are not enough. Further more, the merchant will direct his attention towards the needs and the preferences of the consumers, being able to distinguish the two of them – a consumer may wish for a higher quality product, but to afford only a lower quality one because of his financial situation.

As a conclusion, it is vital for a merchant to collect as much information as possible about the features of the target market and conceive a strategy to fit best the needs and preferences of each consumer.

CONTRIBUTION TO THE DEFINITION OF THE PARTICULARITIES OF CONSUMER GOODS DISTRIBUTION MARKETING

Bălăşescu Marius

“Transilvania” University of Brasov, Economic Sciences Faculty, Address: Valea Cetatii, no. 13, building A18, apt. 19, E-mail: balasescu.marius@gmail.com, Mobile phone: 07292856658

Abstract: Both producers and consumers are separated within contemporary society by different aspects, such as distance, needs, etc.. These gaps must be filled – therefore results distribution marketing, as intermediary phase between production and consumption, meant to assure the equilibrium on the market, as well as the flow of selling-buying processes. The necessity of distribution marketing is emphasized by competition, the need of integration within the market, solving different problems, and so on. Companies, no matter their nature and size must always know and observe the needs of the market by the means of research, studies and analysis, in order to be efficient. Distribution marketing implies not just market research, but complex studies – technological, economic, demographical, psychological, and so on.

Key words: distribution, marketing mix, policy, market, objectives.

The necessity of distribution marketing

The distribution process, interposed within goods flow, has in view the means and operations that assure goods and services to intermediaries or final consumers, leaving them a numerous range of options of time, place, size, choice, price, etc., according to the needs they manifest on the market.

In the interval of time interposed between production and consumption, space filled by distribution, there is a series of economic activities, such as: merchandise delivery, transportation, depository and storage, en-gross and en-detail selling, material, financial and human resources mobilization, property titles transfer, and so on.

These activities, because they have a double role - the satisfaction of the clients' needs and the growth of the number of the businesses which generate the profits of firms, firms which take part in commercial transactions - involve the necessity to conceive a specialized domain of marketing, to offer both a way of thinking, as well as a direction towards optimization of the two main preoccupations of companies: satisfying consumers and profit. Defining the coordinates of distribution marketing, we have to face the fact that these options can be seen as coordinates of a new marketing mix – distribution mix – concerning the market, the range of goods, commercial services, the price, communication and merchandising.

The Marketing Policy and Strategy in the Distribution Firms

The marketing policy of a distribution firm consists in special components and modalities of leadership of the commercial activities which contribute to the realization of the general policy of the industry. Just as within global marketing policy, the *Centrum* of the distribution marketing policy is the strategy, which concentrates all actions and activities regarding the company management.

Inside the distribution sector the strategy has also a double part: general orientation of the industry activity and the duty establishment in regard of achieving the proposed objectives for each stage, and the adaptation possibilities of the industry activity to the market evolution.

According to this strategy contains two important parts:

- The market definition or market delimitation in which the industry proposes to act;
- The organization of the marketing mix.

Market definition and delimitation are specific to the strategy axis. All concepts, methods and techniques of general marketing are meant to offer companies the possibility to determine and delimitate the area in which they operate, according to their objectives, possibilities and chances. Also through the specific way of presenting the market issue, goods distribution marketing, by the means of its strategies, can set the

basis for sector decisions regarding offer, intermediary price policy, communication system, as well as for other aspects of company management.

When establishing the marketing mix – which combines resources: material, financial and human within some programs that take into account achieving the established goals, specific elements are less visible, emphasizing the necessity of delimitating the new concept.

Product policy in distribution marketing:

The conceptualization of the product policy – component of the marketing mix – in the distribution domain starts with the idea that the offer of goods and services outlines through its combination a well defined product policy in distribution field, given the conditions in which the intermediary works and what he can offer to the consumer. In such case we consider that the delivery man has connections with other producers, fact which will actually lead to a market differentiation, on one hand, and, on the other hand, the delivery man has to confront to a very large and different number of people from area to area, which leads to larger or narrower offer, deeper or less deep, based on the area and the clientele. Within the same product specific policy, distributors must define the way of action concerning commercial duties. The product policy must include the selling point, which is defined by dimensions, departments, assortment, presentation and ambiance.

Price policy in distribution marketing:

The outlining of the price policy inside the distribution marketing must start from the fact that the intermediary generally calculates his own selling prices, having in sight an additional supplement. This supplement is established in percentage, depending on the selling price. Price is the most efficient element that attracts clients. Taking into account the large number of products that are sold at different prices, results a heterogeneity of price strategies, based on the life cycle of the product, competition, costs, “me too” price strategies, etc.. Because of the typical problems that the commercial firm has to confront with, the price policy assortment has to take under consideration the following things:

- The objectives had in view by the commercial firms (sales, profit, investment profitability, etc);
- The chosen strategy (winning a market, consumer loyalty, defeating competition, etc.);
- The in-force settlement for a specific market place on which it works.

Distribution policy in distribution marketing:

Along with the complex problem referring to the product and range, price and promotion, the universe of distribution includes as well a complex system of relationships which offer support to this department. The modern economy generates new requests related to the space which interposes between the producers and the consumers.

This space transforms itself into an action field for many intermediaries: [1]

- Merchandisers (wholesalers, etc.) – buy on their own and resell the merchandise;
- Agents (brokers, representatives) – who prospect clients and makes contracts in the name of the producer;
- Logistics supporters (transporter companies, banks) – facilitate the distribution operations without taking part to the commercial negotiations.

Having all these aspects under consideration, the distribution marketing must do the following:

- Outline specific systems of relations which characterize the content of the economic circuits or the distribution channels;
- Do a continuous prospect and establish effective manipulation systems of the merchandise, the transportation, presentation and the selling, as well as sustaining logistics of the respectively process (all these create the content of the physical distribution).

In specialty dictionaries, distribution policy is seen as a specialized policy of commercial companies, referring to logistics activities, choosing the intermediaries, establishing the selling points, assortment policy, price policy and the promotional activities specific to distribution firms.

Promotional policy in distribution marketing:

The establishment of the promotional policy must be structured in two directions: one that refers to the strategy of communication and another one which refers to the activities of merchandising. The first direction has in view another two objectives: the assuring a positive image of the selling points and the other one consists in substantial and immediate intensification of the buyers' stream. Publicity is the means of achieving the first objective, as well as public relations, increasing personality of own selling points and increasing deliveries to consumers. Achieving the second objective implies fast advertising, publicity at the selling points, persuasiveness of sales agents and promotional activities (demonstrations, presentations, etc.). Merchandising is an activity specific to distribution, and it is the part of distribution that integrates the way goods are presented at the selling point, by the means of any technique that attracts clients, such as: presentation, sorting, packaging, exposure, etc. [2]

Wholesaler marketing decisions

Wholesalers have confronted themselves with new competitors, more selective clients, new technology, and programs for direct buying of the merchandise, institutionalized people and other intermediaries. As a result, wholesalers had to improve strategic decisions on selected markets, positioning and marketing mix – the range of goods and services, prices, publicity and distribution.

When it comes to the marketing mix of the wholesalers, they must decide on goods, services, prices, publicity and distribution. The activity of the wholesalers is sorting the goods and services they offer. Wholesalers are under the pressure of offering a complete range of goods and of supplying them immediately, when the market asks for them. Today's wholesaler reduces the range of products which they offer in order to concentrate only on the profitable ones. The price is another important decision to be taken by the wholesaler. The wholesaler adds usually 20% to the costs of the merchandise. The expenses represent about 17% and the rest of 3% go to the wholesaler. Although the promotion can be essential to the wholesalers' success, most wholesalers are not orientated towards it. Publicity, promotions, PR, etc., are unplanned and irregular. Distribution is essential to wholesalers who have to select positioning and utilities. Wholesalers place their businesses in places with low rents and tend to invest little money in buildings, equipments and systems. Big wholesalers reacted when faced with growing prices, and they invested in technology. Orders are introduced by retailers directly into the computerized system of the wholesaler, and goods are moved by mechanisms and transported straight to the loading platforms. Contemporary wholesalers adapt their services to the needs of the clients and seek for ways of cost control and reduction.

Tendencies in Wholesale

- Wholesalers admit that on long term they want to increase the efficiency of the marketing channel. Therefore, they must constantly improve their services and reduce their costs.
- The consolidation of this sector will diminish in a significant way the number of the existing wholesalers. The firms that will remain will evolve strongly especially through acquisitions, fusions and geographical expansions.
- The difference between large retailers and large wholesales will diminish. Many retailers have warehouses, or they are hypermarkets that have more than one function of wholesales, while many wholesalers practice on their own a lot of retailing activities.
- Wholesalers will continue to increase the services provided to retailers – prices specific to retail, advertising support, etc..
- Globalization lead to an expansion of some wholesalers world wide, being a threat to other companies. [3]

The Decisions of the Retailer

Due to the marketing instruments, came up the necessity of profound meditation on the problems of the commerce companies. Distribution marketing is not an abstract concept, but a very realistic one. Its realism consists in a number of procedures that make both markets and commercial strategies known.

Nevertheless, it also refers to the operational aspects of instruments available to a store manager to satisfy clients.

The internal and external environment of the retail firm

Distribution subordinates itself, more than other economic sectors, to economic conjuncture, fluctuations in the standard of living of consumers, etc.. All these elements can be analyzed by the means of internal and external environment elements.

The elements of the internal environment are as follows:

- Environmental factors that influence the methods and techniques of retail – they must adapt to the changes in economy and competition, standard of living, etc..
- Managerial perception of distribution, which implies 3 fundamental aspects:
 - A real orientation toward consumer, which is possible by taking into account clients' opinions (research).
 - Adaptation or anticipation tendency of social change.
 - Profit analysis – many large markets (super/hypermarkets) considered more important selling objectives than profitability, leading to a lack of financial independence.
- The structure and organization of a commercial company is an integrated part of the distribution marketing. Independence grade of selling points is a key factor: in some cases the strategy is completely independent; otherwise, the strategy of the selling points is subordinated to a decision centre.
- Strategies derive from company preoccupation for relations with an oscillating environment, for defining all possible options from all areas; coherent and complete commercial decisions are written and periodically actualized.
- Tactical variables are what we like to call “retail mix”, or “retail marketing mix”, referring to the organization of the ways of action on targeted market segments, in order to achieve the established goals.

The external environment refers to the uncontrollable factors of the environment. The evolution of society, economy, and technology has a huge impact on distribution firms. The managers of companies or selling points must identify environmental factors that may influence their activity, in order to be more efficient.

Strategic decisions

Regarding the objectives of a commercial company, they must be established in order to obtain efficiency in their activity, and they can be achieved by the means of marketing instruments.

- General objectives – if the firm already exists, general objectives must be established, such as: a better existence on one or more markets, or entering new markets; proceeding with the selling activity or diversifying it towards one or more directions.
- Performance objectives
 - Commercial objectives (having the highest turnover in town, commercial covering of a country or of a region of the world, control over other distribution groups);
 - Financial objectives (reaching a certain profit or turnover, having a certain profitability, keeping costs low);
 - Social objectives (having a certain human productivity within the selling point, improve working conditions, trainings);
 - Communication objectives (improving image, improving weak point of the selling points, exploitation of the strengths).

A strategy is put into practice through a method that implies taking 4 steps:

- A better acknowledgement of the company environment, especially of uncontrollable factors with potential high influence;
- Identifying market segments;

- Taking an original position to impress clients by the means of a better image of the selling point;
- Choosing the marketing mix that better corresponds with the selling point.

The System of Retail Commerce and its Marketing Mix

- The System:

Retail Activity can be represented as a system which activates and develops in an environment that integrates numerous factors because of four controllable elements: price, range, physical distribution and store communication. In the middle, there are the sighted consumers of these 4 elements. Their intensity will depend on the existing resources: financial means, the structure of the company, means to observe the consumers' behavior. Social-economic forces, technological development, government and organizations of consumers work together with the suppliers and competition to restrain the company freedom regarding its means of action.

- The elements of retail activity are:

- Products and services policy - every type of merchandise sold must be carefully defined as well as the services that accompany it. This implies assortment planning, assortment control, buying practices and supplier relationship, inventory, service policy before/at/after selling;
- Price policy – activity costs must be established, as well as the brand price, in order to price the products correctly;
- Distribution policy, which refers to the following elements: location of the store; selling methods; logistics; the system which registers the sales; the battle against losses; decoration of the store.
- Communication policy, which refers to: the staff; the shop window; publicity; public relation policy.

The Distributors' Marketing Mix:

The concept of marketing has been recently introduced in retail distribution and even if its efficiency is already appreciated, there still are firms in which physical distribution dominates marketing functions. This explains why companies, instead of developing specific strategies, they imitate one another. It is necessary to define the marketing policy, which is responsible for choosing the possible targets and methods in order to achieve the goals, and, at the same time they must look after the inside and outside compulsions of the firm. We suggest commercial offers to different segments of clients creating together with different elements of the marketing mix a homogeneous ensemble. M. Charlot noticed the low number of distributors with an explicit marketing policy. The reason is that most of them take instant decisions, without a rational, written plan. To remedy this, planning method is required, such as: data bases analysis, strategy definition, and tactical action. [4]

The Outlined Tendencies in the Evolution of Commerce and Their Implications in Commercial Activities in Romania

- Following the tendency of the acquisitions and merging, we can observe a concentration of the commercial segment;
- We assist to a growing integration of the food merchants and the non-food merchants in the same commercial area;
- The quality and quantity of information asked by the consumer grows; this leads to the growth of the distribution costs;
- The presence of the discount shop-chains will strengthen through a process of label concentration;
- The multi-specialization of large commercial areas and the reorganization of the products ranges continues;

- The number and quality of services offered to the client are increasing, fact which leads to a growth of costs. [5]

ACQUIRING AND USING INFORMATION STRATEGIES IN RETAIL

Bălășescu Marius

“Transilvania” University of Brasov, Economic Sciences Faculty, Address: Valea Cetatii, 13, building A18, apt. 19, E-mail: balasescu.marius@gmail.com, Mobile phone: 0723033458

Abstract: In an efficient retail distribution channel, information flows freely and efficiently among the three main parties (supplier, retailer, and consumer). As a result, the parties can better anticipate and address each other's performance expectations. Retailers often have a vital role in collecting data because they are in direct contact to buyers. Either developing a new strategy, or modifying an existing one, good information reduces the risk of taking incorrect decisions. Useful information should be acquired through an ongoing, well-integrated process. A retail information system anticipates the data needs of retail managers; permanently collects, organizes, and stores relevant data; and directs the flow of information to those who take decisions.

Key words: retail, information, distribution channel.

Information Traffic in Retail

The ultimate condition for obtaining an efficient information distribution channel consists in the freedom and efficiency of information movement between the three parts that form the economic system: supplier, retailer and consumer.

The following figure emphasizes the information flow in retail:

Information flow in retail

Further more, we shall see what information is required by the commerce aggregates : [1]

- The supplier requires the following information:
 - from the retailer: sales approximation, stock rotation, competition feedback, “loyal” consumers situation;
 - from the consumer: attitude towards certain styles and models, brand loyalty expansion, the will to pay more for higher quality;
- The retailer requires the following information:
 - from the supplier: notices on the new models and on modifications brought to the models, guidance for use of complex products, sales prognosis, justification for price increases;
 - from the consumer: the reasons why they buy from the retailer, what they like and what they don't like, where else do they buy from;

- The consumer requires the following information:
 - from the supplier: assembling and using instructions, expanding warranty;
 - from the retailer: about warehousing special merchandise, about accepted payment possibilities;

Retailers often play an important part in collecting data for other members from the distribution chain, due to their direct connection to the consumers. For a better information circulation, collaboration and co-operation are imperative – especially between suppliers and retailers. This is not always easy, as a senior executive retailer claims: “Retailers and suppliers, normally, do not like to share information about the supply chain. They have the tendency to keep secret this information even if revealing it may be in their own interest. That’s why there still is a conflict between suppliers and retailers at all levels of the supplying chain. For this reason the supplying chain shows a deficit”[2]. Fortunately many retailers started to improve the traffic of information, due to the fact that they started to realize the importance of transparency of information to their activity.

Retailers fall often into temptation of guiding research strategies on incomplete and inadequate information because of the lack of time and funds, but also because of the lack of experience in marketing research. The consequences can be devastating. Here are some examples:

- Use of intuition: A theatre asks \$10 for a ticket no matter the day or the performance. The manager believes that because the performance is the same, the audience should pay the same price for a ticket for the Monday’s morning performance or for Saturday’s evening performance. If he had analyzed the theatre’s informational system, he would have known that the audience is lower on Mondays, people preferring to go to theatre on Saturdays. Therefore, tickets should be cheaper in weekend so that clients be as many as possible.
- Copying the strategy of a successful competitor. A local independent book shop decides to reduce the price to the best sellers down to the prices of a book shop chain nearby. It has losses and goes bankrupt. The costs are too high to face competition. The firm missed its strengths: personnel service, friendly ambiance for clients and close connection to the local community.
- Low acknowledgement of consumers perception: A florist reduces the price for flowers that have more than two days since they’ve been in his shop from \$17 down to \$5 per dozen, due to the fact that, even if they have a shorter life time, they don’t sell. What the florist didn’t know is that “old” flowers are seen as low qualitative flowers, and customers do associate low price to low quality, and the low price confirms their doubt and determines them not to buy those low price flowers.

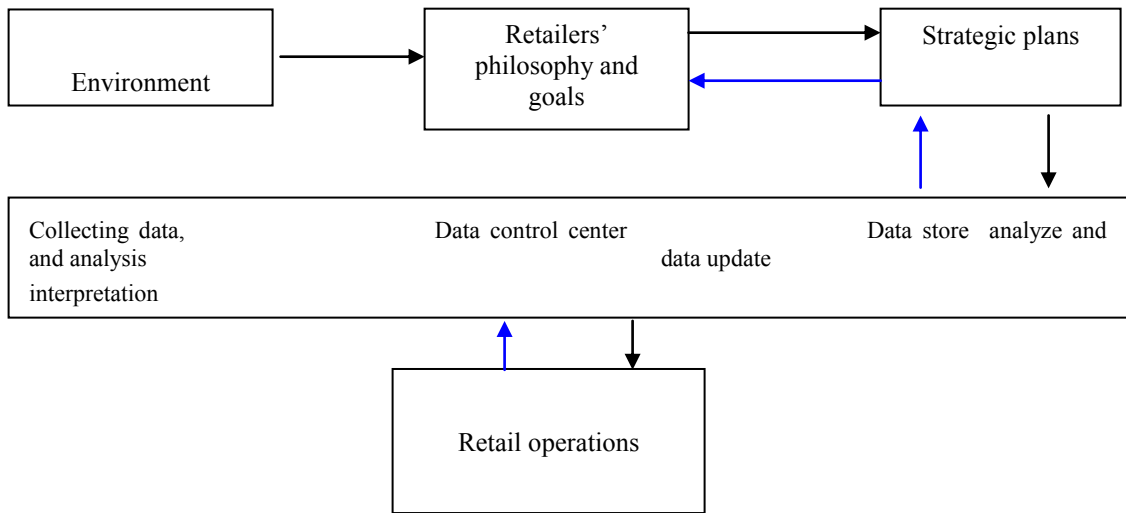

What are the conclusions to be drawn from these examples?

Inadequate information can lead to a bad strategy that will not achieve the desired goals, or even worse, that will have exactly the opposite effect. This can be avoided by marketing researches that set the bases for gathering proper information.

Informational System in Retail

Collecting and analyzing data mustn’t be seen as a quick solution to one problem. It is a part of an integrated ascending process. A Retail Informational System (RIS) anticipates the needed data, organizes and stores relevant data in a continuous data base; it directs the informational flow towards taking the best decisions.

The way an Informational System is built and used is showed in the following figure: [3]

—————> Implementation

—————> Feedback

Informational System in Retail

A good informational system has a few strengths:

- Information is organized and centered on the company;
- Data is stored and verified, so to anticipate opportunities and avoid crisis situations;
- Strategic elements are controllable;
- Making new strategies is faster;
- Quantitative results are obtained and cost-benefit analysis is possible;
- Information is directed towards the right addressee;

RIS – initially requires a lot of effort and time, and setting the basis of such a system takes complex decisions.

Building a RIS requires the following decisions to be taken:

- What active role should it have?
 - The RIS ought to be pro-active and supply any relevant data, and answer any possible question.
- Should the RIS be managed from the inside, or by an external source?
 - Any way is convenient as long as the RIS is guided by the information required by the retailer.
- How much should it cost?
 - Usually, retailers spend between 0.5% up to 1.5% of the income on such a system.
- What kind of technology should the RIS be managed with?
 - Many companies rely lately on technologies meant to lead the informational process (PC, low cost networks, low cost software, etc.).
- How much data is required?

- The purpose of the informational system is to supply enough quantity of information to allow the retailer to build proper strategies. There must be a balance between few information and information overload.
- How should information be stored for future use?
- Storing the information must allow a fast search and finding.

Most retailers hire a CIO – Chief Informational Officer, to supervise the system. Informational System Departments often have annual planning. Computers are used by most companies that have data analysis systems, as well as the Internet for certain functions of the system. 25 years ago most computerized systems in retail were used only to decrease errors from the pay desks, or to improve, fasten and ease inventory. Nowadays, they set the bases for informational systems and are used for monitoring, ordering, and transfers between shops. Such activities can be managed by all retailers.

What is Data Base Management? [4]

Data base management allows retailer to: collect, integrate, apply and store data referring to certain interest areas. It represents a major element in RIS and can be used together with the consumers' data base, with the data base of product ranges, and with the sellers' data base.

Building the data base implies 5 stages:

- Private data base planning and aggregate planning;
- Establishing the required information;
- Finding necessary data;
- Storing the information so that it allows fast usage;
- Updating the data base regularly, to emphasize demographical changes, recent acquisitions, etc.;
- Data analysis, that leads to finding strengths and weak points of the company.

Information can be provided by internal or external sources. A retailer can develop the data base from internal sources by keeping a close record of the data and by a proper arrangement.

Data bases in retail can be:

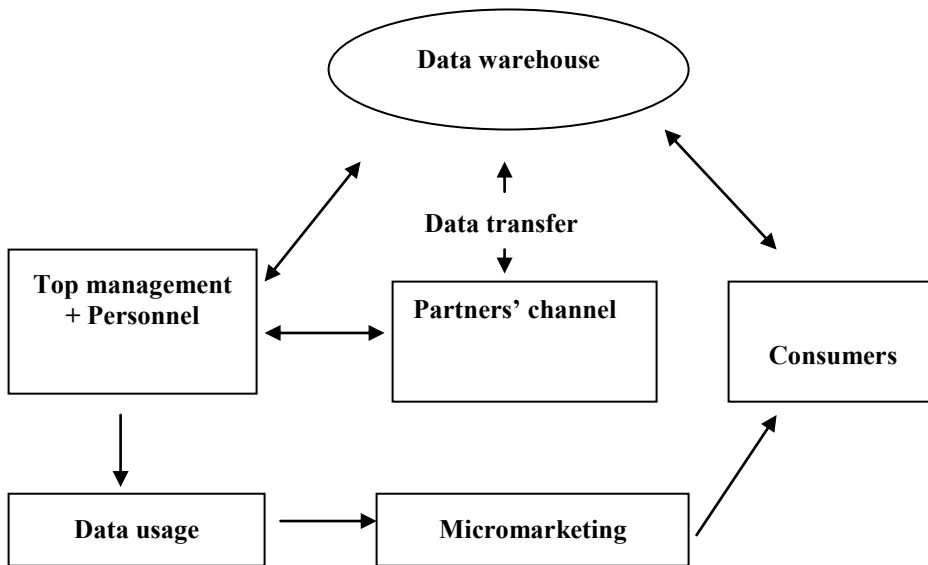

- Consumers' data base – it includes: sales frequency, bought products, total sales, demographical data, payment possibilities;
- Seller's data base – total sales on each period of time, all sales towards consumers on periods of time, best selling products, company profit, marginal profit, delivery time and service quality;
- Data base for product ranges – total sales categories per periods of time, product sales per periods of time, marginal profit of the company, and percentage of products on price reduction.

Developing a data base, externally, can be achieved by contacting specialized firms that supply data base for money. Donnelly Marketing, a subsidiary of infoUSA, owns a data base with information about almost 95% of the companies in the USA. DQI data base is a source of demographical information and life styles.

In order to efficiently manage a data base, the following aspects must be taken under consideration:

- Does the top management know the strategies of data bases and does it know how the data bases are used?
- Are there any persons or departments that monitor the data base?
- Is there any initiative checked to see if it is successful or not?
- Is there any mechanism that signals data about problems or opportunities?
- Are there intersections of client acquisitions and different departments of the company?
- Is the data base actualized any time there is an interaction with a client?
- Are there alternatives for clients who do not wish to appear in the data base?
- Is the data base frequently checked to avoid redundancy?

The following figure shows the way data base management works:

The way of functioning of the data base management

The latest appearance in the data base management is the data warehouse, the place in which copies of all data bases of a company, accessible to all people in the company from any location. Usually, a data warehouse is stored on the company's server PC. It is an appropriate place for all or at least for some of the most important data the company collects in its system. The process of data warehousing emphasizes the data collected from different sources for better usage and accessibility. [5]

The data warehouse has the following structure:

- Data warehouse – where data is physically stored;
- The software – allows multiplying data bases and transfers to the data warehouse;
- Interface – to process requests;
- Guide – for data categories stored;

A data warehouse has some advantages, such as:

- Employees can access quickly, easily and simultaneously data from any location;
- There is more input space for data first stored;
- Redundancy is easily avoided;
- Analyzing and using data is easily because it is stored in only one location.

The data warehouse can be used by all retailers (average and large size), but small ones, because they do not face a large flux of information.

Data is collected by the means of UPC and EDI. In order to be more efficient, many retailers base their activity on UPC (Universal Product Code) and EDI (Electronic Data Interchange). [6]

By the means of UPC, products or labels are marked with a series of vertical compact lines, each of them representing an identification code. The lines are read by scanners at the front desks. Cashiers don't have to write the code manually unless they are forced to. Due to the fact that the code cannot be read by customers, the retailer is forced to add a label containing information about the product (price, size, color).

The advantages of using the UPC are:

- Better information on the product;
- Improving inventories;

- Fasten transactions;
- Increases productivity;
- Avoid redundancy;
- Better information coordination.

Nowadays, there are approximately 5 billion scanning operations per day, meaning that the UPC is used 5 billion times per day.

EDI allows retailers to exchange information permanently, by the means of the computers, regarding: delivery time, unitary sales, etc.

A NEW CHALLENGE - THE MARKET REPRESENTED BY WOMEN

Bija Monica Suzana

Aurel Vlaicu University, Faculty of Economics, Arad, Romania, Corresponding author: Monica Bija, e-mail: monicabija@yahoo.com

Mateoc- Sirb Nicoleta

USAMVBT, Faculty of Agriculture Management, Timisoara, Romania

Abstract: *This paper tries to explain some reasons why big corporations assign increasingly funds, in order to conquer a billion dollars market: a market represented by women.*

Key words: *marketing to women, publicity, advertising campaign*

Motto: "Excepting for her sex, a woman is a man..."

Jean- Jacques Rousseau

INTRODUCTION

The terms in which Rousseau describes the force reports among men and women are those that will make history during the following centuries, emphasizing the very well known habit of mind according to whom women should rest incarcerated in families, a "natural" organization, while men should have access to the world, in the "labyrinth of culture", permitting the growth of vices and corrupting passions.

Why should we concentrate on women?

- Because women take all financial decisions.
- Because women keep control in everything regarding health.
- Because women have a higher life expectancy than men.
- Because women are the ones who start new businesses.
- Because the income of women increased substantially in the last decades.
- Because women conquer rapidly top management positions.
- Because women are better seller than men.
- Because women buy(almost) everything.

Women and men are different. Very different. Very, very different. Women and men have absolutely nothing in common.

Women buy lots of things. Women buy all things. The market targeted to women represents the number one opportunity in the nowadays economic development. Men are totally hopeless and ignorant when it comes to women desires.

MATERIALS AND METHODS

Statistically talking, women constitute the majority of population (51%). More than that, their buying capacity share exceeds this number. The preferences and women's priorities should be integrated in marketing initiatives of the companies, instead of being marginalized as an isolated program. Women are "leaders" when the family has to take decisions of purchasing something. Hoping that they can determine to buy, or to convince their husbands to buy, advertising companies realized they should impress women creating campaigns according to the wishes of women.

A recent study realized by MERCURY RESEARCH on 10.000 persons, analyses aspects like: consumption of media, consumption of products and trade marks, life style and demographic characteristics of Romanians. Based on the knowledge from TGI, Mercury Research has made a short

evaluation of employed women from Romania, high educated analyzing aspects like: how many women are educated, have a job, what makes them different from the active women, with high education, from men but from the rest of the population from the point of view of style life and attitude.

Every product from the market is well thought to serve a special category of buyers. The same thing happens with publicity campaigns which, for being efficient, they have into account that public who is probably interested in the products they promote. According to a GTI study, 75% from persons who have the biggest power of decisions when it comes about shopping are the women. The fact that women decide when it comes about shopping has attracted the desire of advertising campaigns to orient their messages to this category of publicity. "Being the most accessible and most profitable, consumer goods has known a very fast development in Romania. It's true that recently even the bearers has started to allow a more attention to publicity, but the Romania market has been dominated for many years by the consumer goods publicity.

Active women, high educated are in general young (25-44 years), married, incomes over average, working more that 40 hours a week. Their life style is determined by modern orientation and life rhythm. They are twice more orientated to spend holydays abroad and the major part holds cards. Among them we find more Internet users than the average (21% comparing 11%). Educated women are more concerned about their health; consequently they are life insurance holder, 50% more than the average in the urban area.

According to Eurostat, Romania has the highest percent of women licensed in sciences and engineering in Europe. At the level of 2005 year, 35.8% of Romanian high educated women (ages between 25-64) had a license in sciences and engineering, percent which exceed the average registered in all 25 European Union countries, 12.8%. Romania is followed by Estonia with 21.9% and Bulgaria with 29, 5%. In the same time, 55.9% of persons who graduated an engineering or science university were women. Women "buy" culture, 38% of them were at least twice a year to the theatre, opera, museums, comparing with the 20% average. Also 79% of educated women bought a book, versus 69% of educated men, and 49% against average.

Each product on the market is projected to serve a certain category of consumers. The same thing happens with the advertising companies, which, in order to be efficient, keep on eye that category of potential clients who is more interested in the promoted product. As TGI (Target Group Index) sustains, 75% of the decision making persons are women when we talk about purchasing.

The fact that women have the power in purchasing, publicity campaign started to channel their messages to this publicity share. The first step was made in the fast moving goods field, taking into account that these are very accessible and generate immediate profit. It is true that lately the producers and distributors of durable goods started to give an important role to publicity, but Romanian market was dominated by the fast moving goods advertising.

An analysis made by Graffiti BBDO and Insider based on personal Drive Analysis and TGI, divided women in three categories: the first category includes women with ages between 30-44 years, married, with children, high revenues, named by specialist "sophisticated". This category of women choose the most expensive stores, luxurious ones, the price doesn't have any importance in the decision making. The brands that raise the interest of these clients, besides the international recognition, transmit sophistication.

Another category is formed by "modern women"; it means women aged 25-34 years, with a good financial statement. These women use to satisfy more then basic necessities, choosing premium brands. It was noticed that women belonging to this category are more faithful to brands they use, being emotionally connected.

The third, but not less important category is the family's group, 35-49 years, having an average education and medium revenues.

Although educated active women have few spare times, they spend it mostly together with the family, far from home, because they enjoy trips in week-ends. This type of woman can afford to take dinner in restaurants, and to buy something expensive, especially clothes. From financial point of view, in general, active educated earn less money then active educated men. Comparing the consumer behavior of this category, we can see that a higher percent of women having a job are more dedicated to the budget than men. They prefer shopping in en-gross centers, while men prefer supermarkets and malls.

What men think about women dealing with money?

15% of them consider them being better than women in budgetary control. Only 5% of women agree this idea.

An important channel for sending information to public is the Internet. For a too long period marketers showed attention to male public, 18-35 years old; about them everything is known. Due to the fact that online shopping is exponentially increasing, becomes vital for marketers to understand what women expect from the Internet. The reason for this is that women represent more than 50% of Internet users.

Comscore.com confirm that in 2007 the fastest growth had the so called "women community" share. The unique numbers of visits made by women raised 35%, from mil. 52 to mil. 70. These figures are completed by the increasingly women's blogs at global level.

So, what the online woman wants?

43% of women Internet surfers visited a video provider site (like you tube); a year before the percent was 27%. Unlike men, women visit these sites with a high frequency. Women watch more video news; women prefer new materials instead of old ones; women are more opened to video presentations). They bought decreasingly: tourism, clothes, health, beauty, children clothes, financial products, food. The higher incomes in a family, the higher share of shopping on Internet.

Women have a more powerful impulse of buying than men. For example, in USA, 24% of SUVs are bought by women, at global level, 40-45%; 75% of persons who decide the trends in publicity are women, 95% percent of purchasing decisions happen because of the "veto" right of women. Consequently, we should accept that women have their place in this story. Their place has to be very well designed in the world of 4x4, especially when we talk about children safety.

A campaign launched by Graffiti BBDO and Pepsi Light dedicated to women, shows that "Only a woman can understand that writing an SMS to 'him' may take hours, that advice from girlfriends are not only pleasant, but necessary; that without them ones can't pass through all difficult moments; that shoes are not only for walking to the office or to the gym; that the difference between kaki and brown is huge. That is normal to be upset when he is not calling, and is perfectly ok when women can't help calling him. Only a woman knows how to eat a salad, in the mean time to keep looking to his pizza. Or a bigger size of jeans is a drama. Only a woman can understand all these. And Pepsi Light.", says a statement of the agency. The new Pepsi Light campaign intends to overstep the perfect women stereotype, and to go deeper into the dilemmas and desires of real women. This strategy wanted to make Pepsi Light an emphatic brand with the so complex universe of nowadays woman. A woman waits for a call from her boyfriend. Another is not decided at shopping. Apparent simple situations, not too much action, but full of emotions for a woman. These are the new spots of Pepsi Light, where simple parts of the women's life were captured. Most women prefer true stories, presented in a funny and interesting manner, against the "hot" jokes, according to the biggest agency in USA, JWT Worldwide. The study based on interviews with experts and ordinary people all over the world, tries to find out what makes women laugh. Martin Weigel, global planner for JWT said: "At women, that kind of humor who makes them laugh from all their hearts comes when somebody or something touches the H point- Humor Spot". To find this H point means to understand in what way the feminine humor differs from the male one. While the male humor wants to create a certain atmosphere using jokes, the study discovered that the typical feminine humor appears at a spontaneous conversation level. They tell stories about what could have happened to them, what they noticed, or what other people told them.

To amuse them, women use as raw material everyday life, which they deal with everyday, and they prefer it. They look for something they can compare, put in an original and interesting manner. For this kind of style can be used relationships, private life, children, work, something seen on TV. Because of their nature and education, women tends to put themselves into the others positions, to feel sympathy.

Men's humor starts from the subliminal thought: "thanks God it didn't happen to me"; women start thinking: "What if it could have happened to me?"

The brands who want to touch the H point must understand that feminine humor not means that a continuous laugh should be provoked, and is not necessary to strive to be the funniest by all means. It's about a flash in the eyes, about the capacity of noticing everyday life with humor and sympathy, to have an optimistic vision about life. This is a subtle difference, and, in the same time, essential, between a funny brand and a brand with a really good sense of humor. The second category is the one more valued by women.

The first study on humor in publicity was made in eight countries and was based on numerous discussions with specialists (anthropologists, writers, journalist, and humorists) and with women with ages between 20

and 35. The main conclusion of the study: women appreciate real stories, presented in a fresh and funny way, instead of the classic jokes. Women use humor to create intimacy, publicity should have as basis dialog and spontaneity, while men's humor consists in laughing about the jokes. Women have everyday events, which take almost all their times, so these are their main conversation subjects.

The feminine humor varies in each culture. In Thailand, the noisy laugh is considerate a lack of womanhood, and express vulgarity. In France, as well as in Latin America, the vulgar humor is not compatible with seduction. On the opposite, in Great Britain, women don't hesitate to adopt a male attitude, alcohol consumption.

As a conclusion, the 'subtle' brands with a good sense of humor is desired by woman. Only the special magazines for woman, Bridget Jones novel/ movie, or "Sex and the city", succeeded to evoke the feminine humor, which is unfortunately insufficiently exploited by advertising.

In the planning step, researchers, brand managers, sales and marketing managers, all persons involved in communication with clients, should assure the fact that the marketing strategy won't miss the consumers which represents the biggest opportunity for consolidating sales, the market share and the profit: women.

Among simple things we already knew, but we weren't aware them we can count:

1. She needs care, he needs trust;
2. She needs understanding, he needs acceptance;
3. She needs respect, he needs appreciation;
4. She needs devotion, he needs to be admired;
5. She needs recognition, he needs approval;
6. She needs assurance, he needs to be encouraged.

There are basic things, which transposed into advertising messages, can have a huge impact on the consumer who is very sensitive to the way in which he/she is perceived by the coexistent society.

Women represent a very important segment of the staple goods market, even more important than some retailers admit or even realize. The situation changed as time passed by and feminine standards are also reflected in the offers existent on the market. Nowadays, women buy almost everything, including products which were one thought to be masculine (personal computers, cars, digital apparatuses, etc.) and are not afraid to express their opinions and preferences.

There is a genuine art of the way in which marketing tries to adapt itself to the needs of the women buyers segment. Many retailers are afraid that by addressing women they will lose their potential male clients. Nevertheless, this is a preconceived idea. Reality has proved the exact opposite. The moment you exceed women's expectations you automatically exceed those belonging to men. Women want the same things as men, perhaps even more. But we have to admit that they are more pretentious than male buyers.

However there isn't a women's universal market. According to culture and mentality, each feminine segment has its own, specific characteristics. It is absurd to believe that a single, 25 year old woman at the beginning of her career and a divorced, 45 year old woman, who has owed a business for several years, can have the same needs and worries.

CONCLUSIONS

The marketing that addresses women is in fact an applied marketing, because it has the precise purpose to analyze what really counts for a woman and also to determine the way in which her needs can be fulfilled. Women standards are very high when it comes to the acquisition of a product. Many companies manufacture a product without even consulting the very segment which they address and without paying attention to the characteristics of the product.

It is very difficult to obtain a woman's trust into a certain product. Women remember everything, especially minor details and imperfections. They enjoy being respected and taken into consideration. Many companies treat women as if they were invisible or they pigeonhole them.

Nevertheless quality is essential. However, this does not mean a purposeless adorned object, which has no practical usage. It means a product that corresponds to the woman's expectations and standards and which anticipates her needs. It has to fit and mirror her lifestyle. Not only will she repay with loyalty the products

of a certain company but she will also recommend them to her friends, thus showing her feelings and attitude towards a certain brand.

***Abstract:** Customer Relationship Marketing represents a relatively new approach for the companies that wish to create a profitable long term relationship with their clients. CRM applications allow companies to collect and to use information about their customers in order to customize their offer for every client, to increase client's trust in the company and to coordinate their relationship with clients a lot more efficient in all market stages. Every company may take advantage of a relationship marketing approach. In the present work paper we propose to examine the most important strategies necessary for companies to implement relationship marketing and also we would like to expose the benefits for the firms that already use relationship marketing strategies. In some situations, this approach is easier to implement (business to business situations or service industries), in others, such as consumer goods industries, it is more difficult. In conclusion, a relationship marketing strategy is becoming a must for surviving on market.*

***Key words:** customer relationship, management, relational marketing, strategy.*

1. Introduction

The Customer Relationship Management – CRM represents an essential tool for a company desiring to create a long term, profitable relation, with its clients. CRM has developed from a technology uniting a telephone call with an interface offering information to the respective client– CTI or Computer Integrated Telephony. The client felt as being in the center of attention of the company by the customized message it received.

At present, CRM uses the Internet and the potential offered by the data bases. CRM development was possible due to the constantly increasing volume of personal information as well as due to the use of a set of specific characteristics of the client, regardless the way this contacted the company. Thus, one can speak about the transforming of the traditional marketing in a relational marketing.

2. Traditional marketing vs. Relational marketing

The relational marketing may be define as a continuous process used by the company to create „value” for its clients, having as starting point their individual needs. The specific traits of this concept may be the most emphasized by a comparative review with the traits of the traditional marketing, as can be noticed in the following table:

Table no. 1

Traditional marketing vs. Relational marketing

<i>Traditional marketing</i>	<i>Relational marketing</i>
Accent put on a sole transaction	Accent put on assuring a good relationship and the retention of the buyers
Short term thinking and acting	Long term thinking and acting
Directing towards the product characteristics	Directing towards the client's benefits
Moderate contact with the clients	High contact with the clients

Capitalizing the company's resources by directing towards the market	Capitalizing the company's resources by directing towards the clients
Limited engagement towards buyers	High engagement in providing products and services to clients
Short term empathy	Empathy and long term relations
Quality is mainly a concern of the production	Quality is the concern of all employees.
Non existing of a structure to continue the business	Creating a structure to strengthen the partnership relations, creating clubs or groups of members for the frequent buyers.
Focusing on sales	Partnership relations directed towards results
The basis is the result of the sales	Fast, certain and lasting results leading to building relations
Concluding a business means searching for another	One sale means a start, the target being the results and long term business
Non differentiated marketing	Customized marketing (1 to 1)

The main objective of a relational marketing strategy is making loyal the clients and winning their exclusivity. The starting point of this process represents the potential clients, those who would be able to acquire the goods and services of the company. The company hopes that, once bought its products, the satisfied clients will repeatedly come back. The company will further make sustained efforts to transform the repeatedly coming back clients, experiencing a high satisfaction level in relation with the products and its services, in loyal and stable clients. The maximum fidelity level one client may feel towards the company, its products/services or trade marks, represents its exclusivity. The exclusive client is the one appealing to only one of the products/services or only to a certain trade mark to satisfy its needs.

3. CRM STRATEGY

In the context of transgressing towards the relational marketing, the management of the organizations, adopting new vision, needs a data basis containing information about its clients, in order to administrate efficiently the relations with these. Thus has occurred the need to apply a CRM strategy by using Internet and its offered facilities.

At present, there is no unique definition for CRM, due to the fact that there is a large variety of CRM. CRM represents essentially a strategic approach occupied to create an improved value for the shareholders by the development of some relations in accordance with the main clients and the important market shares. CRM unites the IT potential and the potential of the relational marketing strategies to create profitable and lasting relations with the main clients and shareholders. CRM offers increased opportunities to use data and information both for understanding the clients and for creating value together with these. This needs an inter-functional integration of processes, people, operations and marketing capacities, representing a premise through information, technology and applications. Thus, CRM means building and keeping a long term relation with the consumer. This relation is based on the IT technologies and on the use of Internet. A unique data basis of addresses provides the company complete information about all clients and assures the control of the sales.

Main functions of a data basis:

- Administration of existing partners/clients, information and their unique features;
- Collecting data about a certain partner/client using several sources as: operational data, records of the business transactions taking place between the company and the client, offers sent to clients, orders, meetings with clients, their complaints etc.;
- Transforming the data gathered from several sources about a certain client in a coherent information, easy to access, offering a complete image about the respective client.

CRM applications help the companies to collect and use data regarding the clients by 2 mechanisms:

- making possible the collection of information referring to each transaction made by a client;
- further, the information took over is processed and converted in the data base, in knowledge about the consumer.

4. STAGES OF CRM STRATEGY

In order to implement a CRM solid solution, at the level of the company, running through some important stages is required:

- winning the support of all organizational levels;
- identifying and dividing the clients per groups of interests;
- achieving a client structure;
- measuring performances;
- planning.

Stage 1 – winning the support of all organizational levels

In order to implement the CRM strategy it is required, first of all, to accept the concept at the level of the whole organization. It is very important that people understand the CRM concept, the need to use it, the advantages that may be obtained as consequence of its application, the content, functioning, implications for the design of the website.

Stage 2 – identifying and dividing the clients

A viable CRM strategy must be based on establishing a customized relation with the most important among the clients of the company. Each client must be treated with differentiation, because each has specific needs. The Internet offers the possibility to treat in a differentiated manner each person, because each individual is unique and has unique desires and needs.

The achievement of a valuable CRM presumes understanding the needs and desires of each client, as well as the way these desires may be satisfied using the Internet.

In this stage running through 4 sub stages is required :

1. identifying clients, especially the most valuable for the company;
2. differentiating clients, their dividing using a series of criteria such as the value for the company, the needs and their unique desires;
3. interacting with clients, establishing methods of gathering more and more information about the clients of the company, what are they the most interested of, what make them sensitive, etc.;
4. customizing, finding ways of communication adjusted to every and each client which must be based on the knowledge accumulated about these.

An important classification is the one dividing the clients in 3 categories.

MVC: Most Valuable Customers, representing the main value of the company

MGC: Most Growable Customers, clients with a high growing potential

BZ: Below Zero Customers.

Each group may be divided in subgroups, based on demographic data, of the known needs, desires. Thus, the company's strategies must be designed so that to provide:

- retention of those in MVC group;
- transforming MGC in MVC;
- reducing costs in order to serve those form BZ category.

Another classification of the portfolio of clients of an organization may be achieved from the profitability potential and its value viewpoints. Thus, there are four categories of clients: „star” clients, „productive” clients, „question mark” clients and „problematical” clients.

The „star” clients are the clients characterized by a high potential of profitability and by a high value, fact leading to directing the company towards a strategy of their customizing. The „star” clients are represented by persons appealing only to the products and/or services of the company to satisfy their needs.

The „productive” clients are those having a high value, but with a relatively low profitability potential. This category of clients need less important investment from the company, but measure of making them loyal may be practiced, such as customizing client cards.

The „question mark” clients are represented by clients presenting a high profitability level, but a relatively reduced value, the objective of the company being to try to transform them in „star” client.

The „problematical” clients have a low level of profitability and sometimes, do not present real chances of development. Under these conditions, for this category of clients, no measures of customizing are imposed, but there is a trend of excluding them from the company area of interest.

The company will decide, after such a classification those categories of clients to direct to its efforts in a view to winning their fidelity and even of the exclusivity. Thus, as concerns the „question mark” clients, obtaining their loyalty will be tried, for the „productive” clients obtaining their fidelity is recommended and in case of the „star” clients reaching the exclusivity is to be tried.

Stage 3 – achieving a client structure

This stage is very important for the company, because it achieves a profile of the needs and desires of the different groups of clients, as well as of the method they may be better satisfied by means of the Internet. The process of achieving a „Customer Mapping” presumes an interactivity between the company and the client, an „active” listening from the company, as well as an activity of learning the needs, desires of the main clients.

The point of starting in designing a „Customer Map” must be the client itself, and not what the management of the company desires or what makes the competition. A CRM strategy must be based, thus, on what the clients needs and search for, rather than what the company’s management thinks.

Stage 4 – measuring performances (results)

In this stage a set of easy tools allowing the company to measure the traffic recorded on the website had in view, but especially methods to emphasize the impact the CRM strategy had among the clients must be found.

Measuring the efficiency of the investment in CRM is difficult, if classical indicators, such as ROI (Return of Investment) are used. The advantages offered by such a strategy are most of the time qualitative and less measurable from the quantitative viewpoint. Never the less, a series of studies show there is an average ROI of approximately 10 months, which may differ depending on the company or project. The basic idea is that CRM projects should be based less on technology and more on creating and maintaining a relation with the clients and other partners of the company, on selecting the information needed and on training and motivating the employees.

Stage 5 - planning

The last stage in the development of a CRM strategy is represented by establishing a plan. This should include aspects such as: objectives, method of measurement of the performances, methods of changing the attitudes, changes at the organizational level, the design, content, functions and method of interaction, etc.

5.CONCLUSIONS

Creating a profitable and lasting relation with the clients and the employees contributes to a significant increase and to obtaining a profit, fact representing the premise of any business. The staff employed in sales reduces the cycles of sales and increases significantly the indicators of performance (turnover per client, turnover per category of products/services, enlargement of orders etc.), the marketing expenses decrease, creating opportunities and attracting clients are considerably improved. The company achieving all these activities may enhance the productivity and may reach the objective of clients retention, under the conditions where the costs decrease and the promptitude as concerns settling the clients requirements increases.

Implementing a CRM solution brings advantages by optimizing all the processes related to the relation with the clients. These applications are meant to „release” the employees from a series of useless activities related to the potential or existing clients, so that those to become preoccupied to work efficiently and with pleasure and focused on what means the most for the clients: offering high quality products and services.

Abstract: In public services as well as in private services, the clients are given by consumers or users of the respective service and constitute the fundamental element of the firm environment bor of the respective institution. Being a heterogenous variable, diversity gives them a special power on the activity level of the institution, thus the user can, through his decision of buying or not a service; train the institution into a vicious circle. In choosing goods or services, the consumer needs information which allows him to choose the ones offering him a maximum of satisfaction. But the consumer does not always have the necessary operational information to take the respective decision.

Key words: consumer, public services, buying behaviour, decision of buying.

When talking about public production we have to consider a production addressed to the whole community of a society. It has a lot of convergence and divergence points reported to the private production. Mostly, the production is a production of services, namely: information, a regulation, and diverse advice, commercial and administrative services. It has to be accessible, cesionabilă and it has to answer to the needs of the community. Thus, public marketing has to take into consideration the needs of potential users and the way they can meet these.

In public services as well as in private services, the clients are given by consumers or users of the respective service and constitute the fundamental element of the firm environment bor of the respective institution. Being a heterogenous variable, diversity gives them a special power on the activity level of the institution, thus the user can, through his decision of buying or not a service; train the institution into a vicious circle.

The buying behaviour of public services has many classical factors on its basis: psycho-social and sociological factors, personal factors.

Psycho-social and sociological factors like social state, family and services to a great number of clients irrespective of their social state. Consuming public services varies based on the progress reference groups. The purchase of public services realises an equal difusing objective of of family life cycle. The user of public services is influenced when choosing by the groups in which he evolves, groups which can adopt positions favoured by the individual user. There will be chosen, for example a particular type of public transportation instead of another, because the group he is in has special habit of using it. In the same way, the groups can prefer some signs referring to products or services; but not all groups have the same kind of influence on the public user and not all signs amitted by groups are integrated by the user. On the other hand, the public user can be influenced by groups, which he does not join. Still, usually the public user in his quality of consumer receives the influence of individuals at a certain level, since the informational channel, through which peoplke communicate most easily and rapidly is the speech.” This informational channel is more credible if it is activated by opinion leaders. These leaders can be noticeable, imitated or mediatized personalities. With all these, still we cannot exactly say what the influence of these groups upon the behaviour of public service user is.

Personal factors. In choosing a public service the user is pressured by his personality. The main elements forming the personality of the user of public services are: cultural inheritance, endogenous variables related to the user and exogenous variables related to his environment.

The cultural inheritance of the user of public services is determined from childhood, being given by habits related to language, education, consume, relation to the state, being in fact a social inheritance (Linton, 1983)

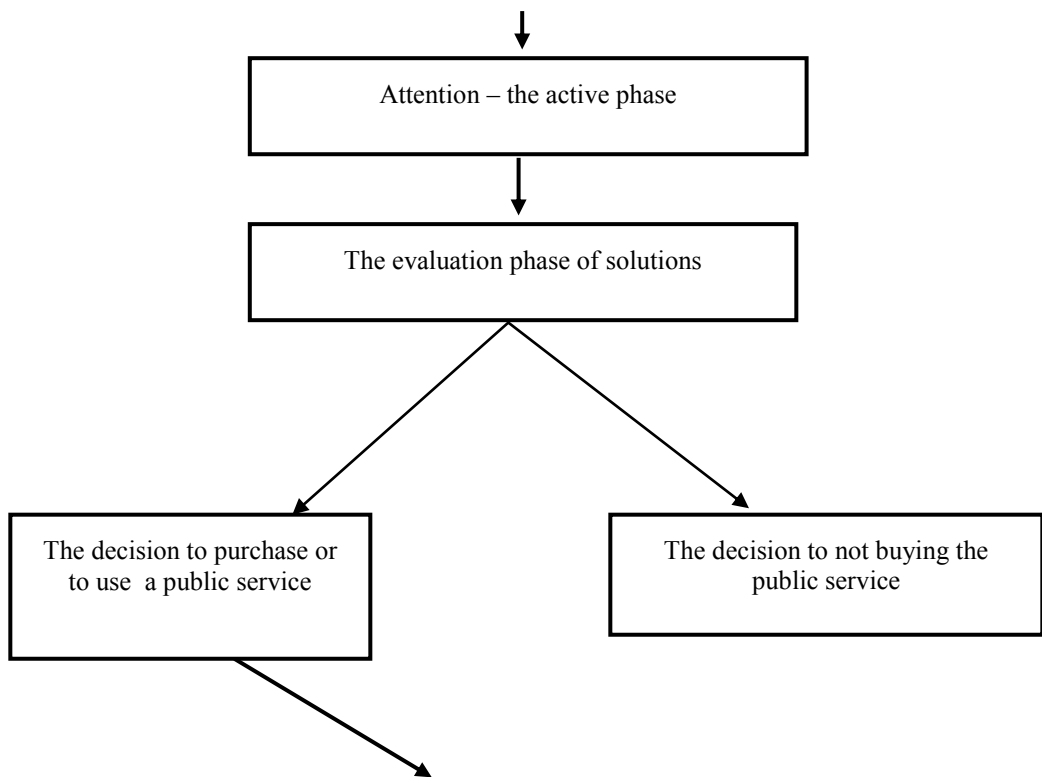

The endogenous variables related to the user are formed by motivation, individual attitude and personality. The nature and intensity of consumer of public services can be presented gradually, starting with the hierarchy of needs proposed by Abraham Maslow. Thus, every need can be hierarchized so that after satisfying one, one can pass to a superior need. Out of the means by which marketing can incite the consumer in finding a consume motivation would be promotion and publicity, by which new types of behaviour are suggested because "...there are people who knowing that their need can be satisfied provokes the birth of a new spontaneous need ...". (Courteline, 1977). The individual attitude has an important role in the convincing process and the behaviour of the public service users, since it constitutes the link between a motivation which was badly evaluated and the active behaviour of the user. The personality as behavioural factor of purchase has no direct relation to the purchase behaviour and the usage of public services but can be expressed through the using behaviour of these services.

The exogenous variables realized by the environment of the user of public services are numerous, graded after importance, namely: profession and economical position. From the point of view of profession, satisfying professional needs of a user of public services refers to satisfying needs of counselling, informing, travel, social protection, health which should be taken into consideration by all public institutions in their projects of developing service offers. The economical position of a person offers the public institution enough elements to allow the knowledge of purchase types and the possibility of use of public services by the consumers. Thus the institution has to define an adequate strategy for their users (patients, contributors or beneficiaries), promoting individual ways of satisfying users and respecting the principle of citizen equality.

In choosing goods or services, the consumer needs information which allows him to choose the ones offering him a maximum of satisfaction. But the consumer does not always have the necessary operational information to take the respective decision. In the public domain the user or the consumer needs precise information. Sometimes, information can be offered by the respective institutions, as it is in case of fiscal, judicial or traffic information, but in other cases the public institution does not offer complete information needed by the consumer to make the choice because of different reasons like: lack of informational means, bureaucracy or due to lack of marketing means. In order not to aggravate the insatisfactory state of the user, institutions should focus their attention to diffusing information and precise recommendations, i.e. they should work on the quality of the public service.

The decision of purchase or choice of a public service is a complex process, having the characteristics of public services. The marketing has to take into consideration the elements which take part in the choice of the consumer of public services. The expectations of the consumer regarding public services are linked to the particularities concerning their accessibility, namely:

- there should be a nearness of the institution to him, an impossible mission due to the numerous administrative structures;
- to simplify access proceedings to services;
- mediation of information and communication channels do not offer satisfying answers to the user of public services .
- In public marketing it is important to find out who the user of the services is? Is there a certain type of user? Are there more types of users? Will there be segments of clients of the public institutions? In most cases an average user has no unidirectional relationship to a public service. In most cases he is a polyvalent user. A decisional model of purchase for the user of public services can be represented in the following way:

Although complex, the process of decision taking in purchase or usage of public services varies based on the existing risk level, the existing interest, growth of purchase or importance of counselling. The process of purchase or usage decision of a public service is not an unthought act. In each phase of the decision phase it can be guessed the possible action of the institution concerning optimization of the result. As the presented figure shows, the purchase process of a public service has more phases. Each phase has its particularities, we are going to try to present in the following paragraphs.

- The appearance of public need can be natural (it is the case of the need for formularies for income declaration or renewing of ID cards, or passports) and in most cases responds to some external and internal stimuli. In this phase the respective institution has to act concretely by putting in function study structures of the market and of the elements, allowing the knowledge of the market.
- Attention – the active phase in which the user of public services starts to look for information regarding his needs, analyses them from the qualitative and quantitative points of view. Thus the public option will be made only if the public service is qualitative. If the public service is not the one wanted or is not of the wanted quality, its user has to find commercial services of better quality. In this case the qualitative difference will be reflected in a higher price of the respective service.
- The evaluation phase of solutions, in which the potential user makes up a hierarchy of the possibilities he has, measures their efficiency, their level of answering his problems. The institutions should integrate this phase and answer to it developing information about goods and public services, which can be done by them.
- The decision to purchase or to use a public service marks the end of the studying and evaluation process of the possible solutions. The individual, in principle, should choose goods or services he really prefers. This is possible, but in most cases can be influenced by different external factors. Thus, the social factor will change the option of the individual, based on the common consumer options of the family or the searched ostentative effects. The factor “risks” attracts the possibility of the appearance of a technical financial risk. Thus we can say that there is non-comprehensible limit of worrying and uncertainty at the potential user.

Taking into consideration this type of behaviour, the institutions should try to meet this type of problems.

- The phase after-purchase, or after-usage reflects the worrying not to ignore the obtained satisfaction of an individual. The measurement of satisfaction, total or partial, or of dissatisfaction determines the institution to make changes, the objective of which is the improvement of the brand image by higher quality of the effected service. It would be indicated if the institutions could anticipate the reclamations and potentially reduce the deceptions. For example institutions could send tank-you letters to users for their choice, suggesting to send proposals and criticism referring to the service they used.

Since the user of goods and services is not a consumer like all others, the public institutions should make up a special way of treating client relationships. Thus, they have to adapt their methods and marketing techniques to the specific of their activity, taking into consideration that mostly the public production is the object of citizen's criticism. This is forced by the idea that in the private sector business is better administered than in the public sector and bureaucracy are easy targets.. For this reason, public institutions have to be ready to fight with efficient methods. On the other hand, the clients of the public institutions have some characteristics regarding the relationship user-production and characteristics regarding the decision for the public service.

The characteristics regarding the relationship user-public production has at its basis the idea that the user of public services acts under the influence of a common consumer having a conception about the public institutions. For the most of the consumers, the phenomenon of birocracy and of negative image of public institutions determines a conditioning more psychological than real against everything that means public service. Thus, when a citizen becomes the user of these public services, he has different behaviour to the user of the private services because of many reasons and namely:

- the problem of meeting the public;
- time and queques of public;
- the problem of birocracy;
- absence of post-selling service;
- problems in public information.

The most criticism of public services is linked to the informative and communication aspects. The criticism brought to the relationship quality/price, distribution problems, characteristics of service are less frequent. Thus, public marketing will become a marketing of infoemation and public relations.

The user of public services has a series of problems regarding the interpretation of the public service notion.. Does the citizen know the public service? The answer to this question represents the mission of public institutions realizing the research of public welfare, respectively that of consumers. But the public institution is more than this, it means an economical ensemble, an ensemble of people,of structures, of budgets, of objectives and administration. The primary idea of public service does not cover the whole of social and economical criticism brought to the institutions. The public institution is part of the national economy, open to administration techniques, financial audits, to human resources administration and to marketing. THsu there will be created a contradiction between the judgement of citizens, generating birocracy and a public institution intending to be odern and rational. Marketing will have the task of clarifying these convinctions and the institution should prove its adaptability and accessibility. The users have to have some privileged targets for public marketing, which will have an essential mission: to change the antibirocratic judgement. This is the idea of public marketing, dedicated to promotion, information, counselling, to public and adaptation.

Abstract:

The Romanian clothing market is a crowded one with a lot of powerful competitors, especially Asian firms with their cheap products. In order to survive on this market the Romanian clothing companies should adapt their products offer to well defined segments of customers. In this paper we split the Romanian clothing market into segments. We used the chi-square test to find if there is a relation between income, age, sex and education of the Romanian people and the monthly amount spent on clothes.

Key words: Romanian clothing market, segmentation, chi-square test

I. Introduction

The textile and clothing industry is one of the oldest in the world. The oldest known textiles, which date back to about 5000 B.C., are scraps of linen cloth found in Egyptian caves. The industry was primarily a family and domestic one until the early part of the 1500s when the first factory system was established. It wasn't until the Industrial Revolution in England, in the 18th century, that power machines for spinning and weaving were invented.

According to a GfK study made for Wall Street Journal Europe¹⁶¹, four out of five Europeans and Americans buy clothes because they need them. So we can notice that the clothing industry is a very old and important industrial sector all over the world. The clothing industry is a very global industry, with constantly increasing trade flows all over the world. The Romanian clothing industry has a long tradition and experience from the 19th century, as well as a good fame around the world as its products are present in many countries of the world.

Since 1 January 2005, The WTO Agreement on Textile and Clothing no longer exist. There was implemented a measure stipulated for some time, that is the total abolishment of the quota system for the imports of textiles and clothing. Before the Agreement took effect, a large portion of textiles and clothing exports from developing countries to the industrial countries was subject to quotas under a special regime outside normal GATT rules.

The total liberalization of the world trade with textiles and clothing opened the way to the imports from Asia as well as to the interest of the big companies for the cheap workforce in these areas. The Asian firms (Chinese, Indian) and the companies from Turkey became powerful competitors on both domestic and foreign markets. China is the biggest player on the UE-25 market with a share of 31,5% in the European market. China is the most competitive production base for the time being due to an immense oversupply of labor in the rural provinces and young educated workers who make possible the keeping of the wages at very low levels.

¹⁶¹ http://www.gfk.com/group/press_information, "We buy clothes because we need them", 2006

The clothing market is a vast one. The products become, in most of the cases, after the processing, a part of the clothes. Generally, the clothes can be considered products of strict necessity for the clients and the demand for those products appears as soon as the income appears.

II. Material and Method

We used for our investigations exploratory, descriptive and causal research. We obtain primary and secondary data through one personal (face to face) interview based on short questionnaire. The main goal of the conducted study was to identify the attitude of the Romanian people regarding the acquisition of clothes. The questionnaire is structured in two parts: the first one contains eight questions which give us basic information and the second one includes questions for the classification of the respondents.

The information we got was neither sensitive, nor threatening; we used clear, unambiguous, structured and unstructured questions. In order to identify the representative sample we used STATGRAPHICS soft. For a standard error of ± 0.03 the sample was 1068 Romanian people.

First we tried to find which of the classification variables (age, sex, income, education) worth to be used in the segmentation of the Romanian clothing market. We want to find which of these variables have a significant influence in the activity of clothes shopping. So it is important to know if age, sex, income or education influence the amount spent on clothes. We used the chi-square test from the STATGRAPHICS soft to identify the relation between: age and amount spent on clothes, sex and amount spent on clothes, income and amount spent on clothes, education and amount spent on clothes. For the relation we found we will identify its intensity. Taking into account these intensity values we will establish the order of the variables we will use in segmentation.

III. Results and Discussions

The starting point of our investigation was the situation of the Romanian companies involved in the clothing sector after the total liberalization of the world trade with textiles and clothing.

The domestic market seems lost for the Romanian companies in the face of the Asian imports especially after the total liberalization of the world trade with textiles and clothing. There is no market in Romanian at this moment for the domestic products. Too many products are manufactured that the domestic market cannot absorb. The specialists maintain that, unless one has a network of shops, one cannot adapt the price of the products according to the market conditions, cannot withdraw a product that does not sell; all in all, one does not have many chances.

Through the market segmentation we will identify different segments of costumers, with specific needs and wishes. The Romanian companies could adapt their product offer, taking into account these costumers segments.

From the analysis of responses at the question regarding the monthly amount spent on clothes (Figure 1.) it can be seen that most of the Romanians (36%) spend between 50-100 RON. About 35% of the people spend less than 50 RON. The percentage of those who spend between 100 and 150 RON is almost equal with the percentage of the customers who spend over 150 RON. We can also observe that over 70% of the Romanian costumers spend less that 100 RON on clothes per month, which is a small amount.

Figure 1. Monthly amount spent on clothes

Regarding the income of the interviewed persons we found out that the biggest segment of the population (40%) earn between 400 and 1000 RON per month. A significant percentage (31%) is of those who made less than 400 RON. For an income between 1000 and 1600 RON we have a percentage of 17% and for over 1600 RON we have only 12%.

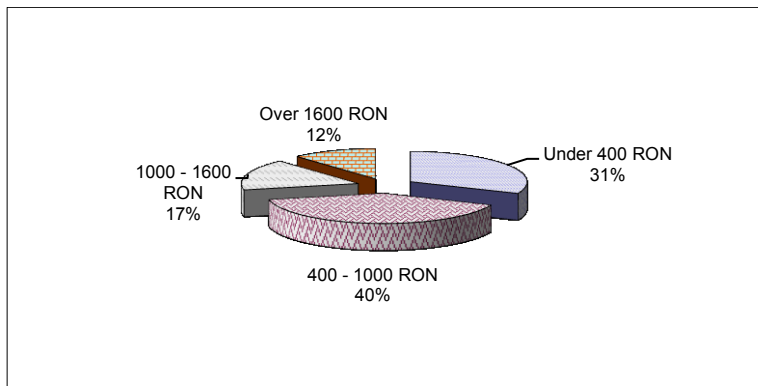

Figure 2. Population monthly income

Concerning the age of the interviewed persons we have: under 20 years (11%), between 20 and 30 (29%), between 30 and 40 (16%), between 40 and 50 (26%), between 50 and 60 (13%) and over 60 (5%).

Figure 3. Population age

The number of the men and women who answered the questions was almost equal, in percentage 46 % men and 55 % women.

Figure 4. Population sex

As we can see in the Figure, the majority of the interviewed persons (45 %) have attended a high school and the smallest segment (4 %) has a master or a PhD degree. The other segments are represented in as follows: elementary (17 %), college (12 %) and university (22%).

Figure. 5 Population education

3. In order to identify if the age influence the monthly amount spent on clothes we used the chi-square test from the STATGRAPHICS soft. We first obtained the frequency table for age and amount (Table 1.)

		<i>Monthly amount spent (RON)</i>				<i>Total</i>
		<i>Under 50</i>	<i>50 - 100</i>	<i>100 - 150</i>	<i>Over 150</i>	
<i>Age (years)</i>	<i>Under 20</i>	37	45	18	18	118
	<i>20 – 30</i>	92	116	60	35	303
	<i>30 – 40</i>	33	58	29	48	168
	<i>40 – 50</i>	100	103	38	40	281
	<i>50 – 60</i>	67	50	15	8	140
	<i>Over 60</i>	43	15	0	0	58
	<i>Total</i>		372	387	160	149

Table 1. Frequency table for Age and Amount

From the frequency table we can notice that the persons over 60 years old have spent under 100 RON per month for clothes. Probably the low income and the mentality were the causes. For the age categories under 50 years it can be notice that the majority of the people has spent between 50 and 100 RON per month for clothes.

We start with the hypothesis that there is no relation between the age and the amount spent. The chi-square test performs a hypothesis test to determine whether or not we can reject that hypothesis. With 99 % confidence level we can reject the hypothesis that there is no relation between age and amount, so we can say that the age of respondents has a significant influence on the monthly amount spent on clothes.

In Table 2 we have the two dimensional distribution of frequencies for income and amount. We can notice that:

- the majority of the respondents with low income spend less than 50 RON per month for clothes;
- the majority of the people with medium incomes (between 400 and 1600 RON) spend between 50 and 100 RON
- the majority of the costumers with big income spent over 150 RON per month to buying clothes.

		<i>Monthly amount spent (RON)</i>				<i>Total</i>
<i>Monthly Income (RON)</i>		<i>Under 50</i>	<i>50 - 100</i>	<i>100 - 150</i>	<i>Over 150</i>	
	<i>Under 400</i>	168	109	37	21	335
	<i>400 – 1000</i>	150	183	65	41	430
	<i>1000 – 1600</i>	36	65	37	40	178
	<i>Over 1600</i>	18	30	30	47	125
<i>Total</i>		372	387	160	149	1068

Table 2. Frequency table for Income and Amount

To find out if there is a relation between monthly income and the monthly amount spent on clothes we performed the chi-square test. We obtained that with 99 % confidence level the income has a significant influence on the monthly amount spent on clothes.

It can be notice from Table 3. that the persons with higher education spend more many on clothes than the persons with lower education.

		<i>Monthly amount spent (RON)</i>				<i>Total</i>
<i>Education</i>		<i>Under 50</i>	<i>50 - 100</i>	<i>100 - 150</i>	<i>Over 150</i>	
	<i>Elementary</i>	87	58	21	14	180
	<i>High-school</i>	188	178	65	53	484
	<i>Vocational studies</i>	46	50	20	13	129
	<i>University</i>	44	89	47	55	235
	<i>Master, PhD</i>	7	12	7	14	40
<i>Total</i>		372	387	160	149	1068

Table 3. Frequency table for Education and Amount

Performing the chi-square test on the education and the monthly amount spent on clothes we obtained that with 99 % confidence level the education has a significant influence on the monthly amount spent on clothes.

In Table 4 it can be notice that the men and the women spend on clothes between 50 and 100 RON per month. The number of the persons who spend under 50 RON and between 50 and 100 RON is almost equal and has no relation to the sex of the interviews people.

		<i>Monthly amount spent (RON)</i>				<i>Total</i>
<i>Sex</i>		<i>Under 50</i>	<i>50 - 100</i>	<i>100 - 150</i>	<i>Over 150</i>	
	<i>Female</i>	210	217	76	80	583
	<i>Male</i>	162	170	84	69	485
<i>Total</i>		372	387	160	149	1068

Table 4. Frequency table for Sex and Amount

Using the same hypothesis test with 99 % confidence level we cannot reject the hypothesis that there is no relation between sex and monthly amount spent on clothes. We decrease the confidence to 95 %, then to 90% and even for 80% we could not reject the hypothesis. So we cannot say that the sex of interviewed people has a significant influence on the monthly amount spent on clothes.

Using the previous results obtained, we decided to use for the customers' segmentation only the criteria with significant influence on the amount, which are: age, income and education. To establish the order of these variables we analyzed the intensity of the relation between the three variables and the amount spent on clothes.

The intensity of the relation between the variables can be measured by dividing the calculated value of the chi-square to the value found in the distribution table of the chi-square, for the same Df. Taking into account the income, age and education we have obtained the following results:

- $\frac{154.54}{21.67} = 7.13$ for income;
- $\frac{106.35}{30.58} = 3.47$ for age;
- $\frac{77.73}{26.22} = 2.99$ for education.

In conclusion we can say that income is the first variable for segmentation, followed by age and education.

IV. Conclusions

By splitting the populations after the monthly income it can be create for segment. The characteristic of these segments are:

- A half of the population (50%) with low income (under 400 RON) spend under 50 RON per month for clothes;
- The biggest percentage (43%) of the people with an income between 400 and 1000 RON spent buy clothes spending per month between 50 and 100 RON;
- The people with an income between 1000 and 1600 RON, in majority (37%) they are spending between 50 and 100 RON for clothes;
- The majority of the people with big incomes (38%) up to 1600 RON spend more then 150 RON per month for buying clothes.

It can be notice that the Romanians with biggest incomes spend more many on clothes than the others. But the percentage of the Romanians with big incomes is a small one only 12% of the population. In conclusion we can say that the biggest part of the Romanians spend less than 100 RON per month for clothes. It means that they spend between 20% and 25% of the minimal wage in Romania.

Taking into account the age of the persons we found some interesting facts:

- The biggest percentage (38%) of the youngest people (under 20 years old) spends between 50 and 100 RON for clothes. Significant parts of the youngest people (31%) spend less then 50 RON. In conclusion we can say that the 69% of the youngest people spend less that 100 RON per month for clothes;
- The people with the age between 20 and 30 years spend in majority (68%) less than 100 RON per month;
- Concerning the people between 30 and 40 years old we can notice that 35% spend between 50 and 100 RON. An interesting thing is that a big percent of people from this age category spend more than 150 RON;
- The majority (73%) of the people between 40 and 50 years old spend less than 100 RON for clothes;
- 86 % of the people with the age between 50 and 60 years spend less than 100 RON for clothes;
- Almost 75% of the old persons spend less than 50 RON.

So it can be notice that the majority of the Romanians from all the age categories spend less than 100 RON per month for buying clothes.

Regarding the education of the respondents we can split the population into five segments with specific characteristics:

- Almost a half (48 %) of the population with elementary studies spends less than 50 RON per month on clothes;

- Three quarters (38 %+36 %) of the people who attended a high school spend less than 100 RON in a month on clothes;
- The majority (73 %) of the persons who has vocational studies spends less than 100 RON;
- In the segment of the people with university studies the biggest percentage (37 %) spend between 50-100 RON per month;
- 35 % of the people with the highest education (master and PhD) spend more than 150 RON.

We have noticed that the majority of the people from each educational category spend less 100 RON per month for buying clothes, excepting the people with high education, who spend more money for clothes.

Resuming all the analysis it can be noticed that the majority of the Romanians spend less than a quarter of the minimal wage per economy (100 RON) monthly for clothes.

USING MARKETING RESEARCH IN ORDER TO IMPROVE CRM - A CASE STUDY FOR MOBILE TELEPHONY IN ROMANIA

Brandabur Raluca Ecaterina

Academia de Studii economice Bucuresti, Facultatea de Marketing, Pta Romana nr 6, Bucuresti, raluca.brandabur@mk.ase.ro, 021-319.19.01/237

Popscu Andrei

Present work is a case study that illustrate how can be used marketing research concrete in order to improve CRM in a company.

Key words: Qualitative marketing research, CRM, loyal customers

CRM, or Customer Relationship Management, is a company-wide business strategy designed to reduce costs and increase profitability by solidifying customer loyalty. True CRM brings together information from all data sources within an organization (and where appropriate, from outside the organization) to give one, holistic view of each customer in real time. This allows customer facing employees in such areas as sales, customer support, and marketing to make quick yet informed decisions on everything from cross-selling and upselling opportunities to target marketing strategies to competitive positioning tactics.

However, effective customer relationship management requires much more than simply tracking buying behaviors. A truly effective CRM strategy requires you to get personal, to understand your customers' preferences and to ensure that these preferences are reflected in how you communicate with your customer, each and every time. The best way to improve CRM is finding more details about their client using best marketing research techniques.

Each project must be approached by a business perspective, not simply from a research perspective that means :

- First understanding the industry and the key players
- Then fitting the research to a bigger context
- Not relayed or “canned” methodologies, but customizing each project to fit its unique needs

Qualitative research resides at the touchy-feely end of the research spectrum. It is an open-ended method of acquiring information about the consumers' product requirements (what they want) or product perceptions (what they think of what you've got). While the variations are limitless, this type of research typically takes the form of focus groups, user testing, or email feedback. Qualitative methods can be useful in all stages of development and tend to be quite popular. These methods are very tangible to marketers and developers because they most often involve sitting a group of people down in a room and actually talking with them about the issues at hand.

Focus groups are very popular because the results they provide are immediate, accessible to the lay person, and often reveal issues that developers and marketers hadn't previously considered. If an interviewee says something of particular interest during a focus group, the interviewer can probe deeper into the topic, uncovering information that might never be gleaned from a dozen brainstorming meetings.

Research scope: Improve CRM loyal clients, personal users (not companies)

Objectives: Evaluate programmes with regards to

- Simplicity / ease of understanding
- Attractiveness: is the reward perceived as attractive?
- Do loyal customers feel appreciated enough?
- Is the offer attractive enough for customers with lower spend and short tenure?
- Are spend possibilities well-balanced and attractive?

- What differentiation in service level according to customer status (value and tenure) is preferred, what other service differentiation is desired?

Methodology: 6 mini-groups with loyal mobile phone users from all major 4 companies 4-6 persons per group, age 25-55, minimum 15 euro per month paid for mobile telephony

Market overview: Romania's top three mobile telephony operators, Orange, Vodafone and Cosmote, had together 22.236 million customers at the end of 2007, exceeding by over half a million the population in the country, of 21.565 million people.

Cosmote Romania, the local unit of Greek mobile network operator Cosmote, attracted 2.386 million new customers in 2007, triple compared to 2006. In 2007, Orange Romania and Vodafone Romania attracted 1.77 million customers (+22% on year) and 1.09 million customers (+14%), respectively.

Other mobile telephony operators on the Romanian market are Telemobil, which operates Zapp Mobile network and RCS&RDS, which started operations on mobile telephony market in October last year.

The Zapp Mobile network had 470,000 customers at the end of 2006, and the figures exceeded half a million customers in July 2007, according to Telemobil data.

Main findings:

- companies care is more oriented to important business clients than to 'very many small users'
- The general perception is that this reward is mainly dedicated to companies, not being accessible to personal users
- Loyalty rewarding is more a communication volume rewarding than a seniority rewarding
- Rewarding is not similarly offered to all, being perceived either proactive or reactive with business customers
- Main elements important in retention of clients :
 - Network coverage
 - Signal quality
 - Tariff plans / calls optimization
 - The number of partners in the same network
 - Keeping the telephone number
 - Convenience
 - Rewarding system

Conclusions and recommendations:

Using this information customer relationship management (CRM) helps businesses to gain an insight into the behaviour of their customers and modify their business operations to ensure that customers are served in the best possible way. In essence, CRM helps a business to recognise the value of its customers and to capitalise on improved customer relations. The better you understand your customers, the more responsive you can be to their needs.

There is a need of differentiation as opposed to individual users in terms of all services that has to be delivered to business customers:

- Dedicated call center and client service
- Higher invoice and seniority reward
- Usage optimization services to be available as a pro-active approach for all business customers (from medium to high profiles)

The following services as *specially designed offers to loyal customers* were needed and suggested by respondents

Optimization plan proposal / subscription change

Special subscriptions or tariffs reductions

Gifts / handsets or discounts

Consistent communication (frequent, constant) of companies offers (current and new services) will show care and respect to the business customers – both constant INFORMATION and proper EXPLANATION should be assured

Special interaction in terms of client service to loyal clients was generally considered a loyalty rewarding payment (direct calls, dedicated client service)

More flexible services should be addressed to business customers that already achieved a special status - Gold and Platinum

- For tariffs negotiations
- For invoice payment postponing situations

Usage of various sources of informations: media, email, papares, short messaging, envelope, direct consultant call.

Personalized communications “*dear mrs/ms X*”

Just as a small group of customers are the most profitable, a small number of complaining customers often take up a disproportionate amount of staff time. If their problems can be identified and resolved quickly, your staff will have more time for other customers.

MARKETING STRATEGY SUBSTANTIATION IN THE AUDIOVISUAL DOMAIN

Budacia Elisabeta Andreea

Romanian-American University, Faculty: Management Marketing, 1B Expoziției Ave., Sector 1, Bucharest, andreeabudacia@yahoo.com , 0722.29.92.93

The marketing strategy represents the main direction towards which an enterprise focuses its human, material, financial and informational potential in order to fulfill its objectives. The market strategy in the audiovisual domain is a wide one in terms of the nature of its objectives and the proportions of its material and organizational resources. This is the starting point for the other strategies and represents the finality of a television's activity. Regarding the mix marketing for the services in the audiovisual domain, one should take into account both its classic components, namely the product, the price, the placement and the promotion, and modern concepts and the specifics of the audiovisual services, such as: the celebrities and the viewer (the relationship with the audience).

Key-words: marketing strategy, audiovisual domain, market share

Any television, as economic agent, is confronted with a series of problems which impose changes, supplementary efforts for the development of its activity, ensuring supply sources, improving techniques and modifying forms of organization. All these issues can have a positive or a negative effect on its stability. Therefore, a television should have clear policies, efficient strategies and adequate tactics.

Conceptual delimitations regarding the marketing strategy in the audiovisual domain

The marketing strategy represents the main direction towards which an enterprise focuses its human, material, financial and informational potential in order to fulfill its objectives. The marketing strategy expresses "the path chosen by the enterprise towards the fulfillment of the objectives" established in terms of certain processes which are of two types: market strategies and mix marketing strategies¹⁶².

The market strategy in the audiovisual domain is a wide one in terms of the nature of its objectives and the proportions of its material and organizational resources. This is the starting point for the other strategies and represents the finality of a television's activity. Therefore, the success of a market strategy depends primarily on its realism, its level of substantiation and the efficiency of the means that were used. The reference terms that serve for the application of the market strategy are, on the one hand, the enterprise's possibilities which represent endogenous factors and, on the other hand, the external environment of the enterprise's endogenous factors.

The typology of market strategies which can be applied by a television, can be examined, analysed and structured in terms of the television's position with respect to the main dimensions and characteristics of the market, as in the following table:

¹⁶² Olteanu V., Marketingul serviciilor- o abordare managerială, Ed. Ecomar, București, 2003

Supply-demand relation	Content of environmental relations	The position of the enterprise as opposed to competition	The position of the enterprise towards viewers	Market exigency
Differentiated	Partnerships (preferential relationships, tolerance and cooperation)	Differentiation	Attracting, maintaining, recovering	High exigency
				Medium exigency
Undifferentiated or insufficiently differentiated	Competitive relations	Imitation	Indifference	Low exigency

Table no.1: The typology of market strategies specific for audiovisual services¹⁶³

Regarding the mix marketing for the services in the audiovisual domain, one should take into account both its classic components, namely the product, the price, the placement and the promotion, and modern concepts and the specifics of the audiovisual services, such as: the celebrities and the viewer (the relationship with the audience).

Table no.2: The mix marketing in the audiovisual domain

a) The product

Satisfying the viewers' needs is accomplished through the consumption of services which are created and offered by TV stations through a complex process that involves numerous human, material, financial and informational resources. The set of actions that a TV station takes in order to establish its objectives, choose its strategies, program and develop clear measures, represents the product policy. In practice, it represents the behavior of the TV station in relation with the environment in which its activities take place regarding the dimensions, structure and evolution of the services which are in fact the objective of its activities.

b) The price

Establishing prices, price competition and the way in which consumers perceive the respective prices, represent an important issue. On the Romanian audiovisual market, the price issue is practically inexistent because TV stations do not require taxes for broadcasting their TV shows. In Romania, the only pay-TV station is HBO. Practically, the only price that Romanian viewers pay in order to have access to the TV shows broadcast by TV stations is 30 RON per month.

c) The distribution

According to the classical definition, distribution represents a set of activities which take place in a certain space and time that separate production from consumption¹⁶⁴. The inseparability and intangibility of

¹⁶³ Olteanu V., Marketingul serviciilor- o abordare managerială, Ed. Ecomar, București, 2003 (adaptare)

¹⁶⁴ Florescu C. (coordonator), Marketing, Ed. Marketer, București 1992

services might leave the impression that distribution is almost inexistent in this domain. In reality, the producer and the consumer are often separated in time and space; they may meet because of certain activities. Therefore, distribution represents a set of activities which take place in a certain space and time that separate the producer and the consumer¹⁶⁵. In the case of audiovisual services, the producer and the consumer can meet anytime without restrictions because the material support (the TV set) is present in the consumer's home. However, there are exceptional situations in which the encounter between the demand and the supply on the audiovisual market cannot take place; this may be the case of some cable firms or of the company Electrica. In the case of services offered by TV stations, we cannot talk about the classical fluxes of distribution because here there is no actual sale and, implicitly, there are no negotiations, transactions, etc.

d) The promotion

Given the fact that the offer on the Romanian market increased very much, the services offered by companies in the audiovisual field depend on the promotion activity. The viewers' perception of the TV station and its programs has the most important role in the promotion activity. A television's communication system represents the main focus in order to achieve success on the market and the most important elements are the physical aspects, the other environments and the personnel. The communication realized by a TV station should be conceptually well organized in terms of its two components: internal and external communication. The former refers to communication within the respective television and among its employees. The latter refers to visual symbols, public relations and especially to the media and even to the external architecture.

e) The celebrities

We should take into account the personnel that comes in direct contact with the public, those persons who host TV shows and are considered to be "celebrities". Certainly, the quality of the TV shows does not depend only on the evolution of these celebrities, because, behind the scenes, many others contribute to their success. TV stars are important for a TV station because they usually represent the respective TV show and TV station and because they "sell". A clear and well organized personnel policy is an important element for the success of a TV station. In order to achieve the best results, a television company has to take into account certain aspects such as: selecting and hiring the most competent candidates, permanent training of the staff, forming work teams on the basis of clear criteria, encouraging initiatives and creativity, communication on a formal and on an informal level.

f) The viewers

According to the marketing viewpoint, the whole process of offer realization should be based on the viewers' needs. An anticipative analysis should take into account the following aspects: the consumer's level of satisfaction or dissatisfaction, the consumer's behavior towards the media product, the contact with the product and developing a sense of fidelity towards the TV shows of the respective TV channel. The audiovisual consumer's behavior towards the proposed offer refers to the contact between the viewer and the proposed TV shows. The contact may be direct (the respective person watches a certain TV shows) or indirect (friends, neighbors, media, etc.). Another important aspect is the viewers' fidelity towards TV brands. Nowadays, under the influence of certain factors such as the offer's variety, information about offers, similarities between audiovisual offers and time pressure, the consumer's fidelity towards a certain brand decreased. A viewer is loyal to a certain TV show if he/she watches it repeatedly and he/she is convinced of its value. Brand fidelity in the audiovisual field represents the consumer's inner commitment to watch a certain TV show repeatedly. Fidelity differs from repeated watching; the latter refers to a mere manifestation and lacks motivation.

The stages of the marketing strategy specific for the audiovisual domain

Formulating the marketing strategy should take into account establishing objectives and strategies and choosing the proper mix marketing, which will represent the key to success for a television that obeys the conditions imposed by the market. If attracting viewers is also considered a significant objective in

¹⁶⁵ Olteanu V., Marketingul serviciilor- o abordare managerială, Ed. Ecomar, București, 2003

marketing, then it cannot be done without a proper market-oriented strategy, taking into account both the audiovisual consumers and the competition. Then, the strategies should be applied through marketing tactics, which should be part of the mix marketing projected for each one of the chosen market segments. These tactics will practically lead and give a certain direction to the enterprise's marketing strategy.

The marketing objectives which were established through the marketing strategy should take into account the television's general objectives. Marketing objectives may be quantitative, those which refer to ratings, the level of market coverage and attracting a large number of viewers, but also qualitative, referring to the television's image or the image of a certain brand. In order to establish a marketing strategy, a television should take into account the decisive elements' mix which refers to the following aspects:

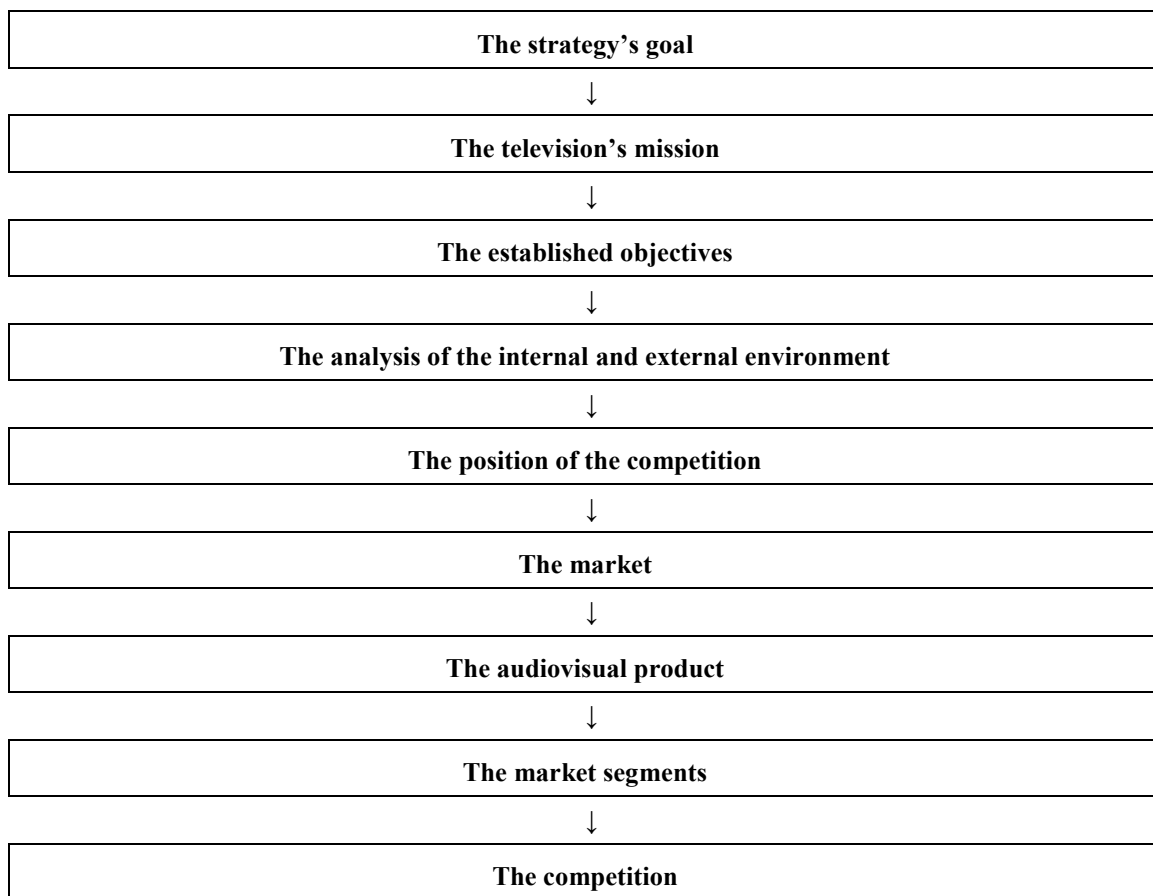

Table no. 3: The stages of the marketing strategy specific for the audiovisual domain

- a) **The strategy's goal.** The goal of the marketing strategy is to “push” the television from its prior position into a more competitive one. In other words, the television should develop a strategy in order to reach and maintain a competitive advantage on the market. This step is part of the strategic vision.
- b) **The television's mission.** The television will project all its market-oriented strategies depending on this major component of the strategic vision.
- c) **The established objectives.** The strategy will be established according to the main objective of the television's activity. The objectives will depend on the television's position on the audiovisual market and on its human, material and financial resources. Hence, the strategic objectives will be chosen after a deep analysis of the environment and the television's resources. The objectives should be coherent, realistic and challenging.

- d) **The analysis of the internal and external environment.** In order to establish its objectives and marketing strategies, the television has to analyze the opportunities and the threats from the external environment as well as its own qualities and flaws, which will lead to choosing the best strategic option.
- e) **The position of the competition.** Identifying this position will allow the television to form a general view of its own position on the market and an orientation of the competitive strategy.
- f) **The market.** The evolution of the market represents an important factor in making a strategic decision. The stages of this evolution are similar to those of the life cycle of a product
- g) **The audiovisual product.** The life cycle of the product indicates its evolution on the market, each stage being characterized by certain features which will determine the television to establish certain strategies accordingly.
- h) **The market segments.** Any marketing strategy should be established in terms of the identified viewers groups, needs and preferences. The level of the demand present at a certain moment in time on the audiovisual market can also be taken into account.
- i) **The competition.** The orientation of the whole marketing activity towards the market forces the television to take into account its direct and indirect rivals. The television should try to choose that marketing strategy which will allow it to obtain a competitive advantage.

THE ANALYSIS OF THE GREEN PRODUCTS' DEMAND

Burja Camelia

*University „ 1 Decembrie 1918” Alba Iulia, The Faculty of Science, Nicolae Iorga Street, no. 11-13,
Email: cameliaburja@yahoo.com, Phone:0258/811512*

Abstract. The current trends on the world market regarding the safety insurance for food are heading towards the consumption of green products. Reaching this option requires to direct the production in accordance with the consumers' preferences on the basis of some thoroughly made market studies. The paper presents aspects regarding the gathering and analysis of market information about the demand of green products.

Keywords: market, green products, dispersion analysis, demand analysis

1. The green products market

Reaching the objectives formulated at European level as part of the legislation regarding the green production (Regulation EC no. 834/2007), namely guiding the production in accordance to the market by respecting the consumers' preferences for green products, puts at the center of the food traders' attention the consumption characteristics which are felt on the green products market.

At European level, the main trend which manifests on long term is the development of the green products' consumption, with a special interest manifested for quality. Growing an ecological conscience makes the European consumer to avoid traditional food products which imply a certain degree risk for the environment or for the health and can make the consumer to manifest growing preoccupation for the identification of the green products from the market supply.

The investigations conducted by the traders in order to know the green products market targets getting the information which will be at the basis of setting adequate production and marketing programs. In order to achieve this, the marketing studies contribute to the adjustment of the green products' offer in accordance with the demand's characteristics, by putting at the disposal of the buyers the wanted supply in the asked quantity and quality, without neglecting to optimize the producers and tradesmen's profit.

Stimulating the green products' demand and developing the specific internal market are closely tied to the consumer's perception over the advantages offered by these products and generally to the volume of knowledge owned by the buyers in the ecological field. Consumers often make a serious confusion between green products, naturist products and diet products and the role of the ecological certification system for food products is not very well known.

Green products are healthy, disease free, without harmful residuals and with a balanced content of bioactive and mineral substances. They result from an ecological technology, a technology which doesn't use chemical fertilizers and pesticides and which contributes to preserving the agricultural ecosystem.

Thus, we can say that the efficient functioning of the green products' internal market depends on the implementation of the principles, norms and methods of ecological production imposed at Community level, which at the end guarantees the setting of a durable system in the agriculture of each European Union member.

Although *the green products market in Romania* is the result of a short forming period (only 7 years) according to the manifested trends it shows perspectives of an important growth in the next period. The grounds behind this statement are:

- the reorganization mechanism of the agricultural sector has had as side effects the abandonment of a large land area or the practicing of some growing systems in an almost traditional manner. Because of the lack of technical equipment and as a consequence of a drop in the use of chemical fertilizers and treatments for the health of the plants (usually very expensive) the agricultural areas need a relatively short conversion period (2-3 years) to be transformed in ploughs destined for green products;

- a growth of the areas used to cultivate green products is estimated to reach 400.000 ha in 2010, a 2.72% increase from the year 2000, which is an important factor in the organic food sector's development;
- there is a legislative, institutional and normative work frame which regulates and stimulates the organic production;
- the recent joining of Romania to the European Union facilitates the free entering on the organic market in conditions of a fair competition, which can be for the Romanian producers an advantageous export opportunity;
- green products ensure for the traders at least similar economic performances to the ones resulted from the conventional production;
- the perception of the Romanian consumers about green products is favorable, they are considered healthier and less harmful for the environment;
- the population's demand is growing (the turnover for the commerce with food products has grown in December 2007 with 162,3% in comparison to the year 2000) and so are the incomes (in January 2008 the real salary grew with 21,9% from January 2007), which can constitute a basis for the development of the green products consumption;
- the certification system for the green products, which was recently introduced, allows an easier identification of these products and contributes to the growth of the consumers' trust in their quality;
- green products start to make their presence felt in more and more stores.

In order to see the way in which the consumers perceive green products it is necessary to approach the entire chain of obtaining, processing and turning into account the agricultural products with an ecological character. The green products' demand is in tight dependency with the perception of the consumers regarding the impact the products have over the quality of life and over the social-economic environment. This is why it is considered that the essential element which allows the orientation of the agricultural producers is the correct determination of the consumers' attitude manifested on different segments of the green products market.

2. Collecting information about the green products' demand

In order to identify the definitive elements of the green products' demand it is necessary to organize a marketing research which has at its base a complex statistical observance program of a representative collectivity. The registered data must refer to a large number of statistical variables, among which: the types of bought products, the size of incomes, the preference for green products, the reasons behind buying green products, the favorite characteristics, the frequency with which the population buys these products, observations and suggestions.

The main formulated objectives for the statistical study refer to identifying the trends manifested on the green products market regarding demand and finding out the degree in which the size of the incomes influences the demand for green products.

Questions	Answers	Responses (%)
1. What food products do you prefer to consume?	conventional products <input type="checkbox"/>	84
	green products <input type="checkbox"/>	16
2. Do you or another member of your family buy green products?	yes <input type="checkbox"/>	5
	no <input type="checkbox"/>	95
3. If no, which are the reasons your family doesn't eat green products?	they are too expensive <input type="checkbox"/>	56
	I don't trust them <input type="checkbox"/>	8
	I don't know which products are green <input type="checkbox"/>	30
	they don't look as good as conventional products <input type="checkbox"/>	6

4. If yes, which are the reasons your family eats green products?	they are healthier <input type="checkbox"/>	77
	they taste better <input type="checkbox"/>	7
	growing them doesn't hurt the environment <input type="checkbox"/>	16
5. How often do you buy green products?	81-120 days	6
	41-80 days	30
	0-40 days	64
6. What type of green products do you buy?	vegetables <input type="checkbox"/>	21
	fruits <input type="checkbox"/>	25
	cheeses <input type="checkbox"/>	15
	milk <input type="checkbox"/>	28
	meat <input type="checkbox"/>	7
7. How do you appreciate the quality of green products?	sausage <input type="checkbox"/>	4
	Very good <input type="checkbox"/>	24
	good <input type="checkbox"/>	30
	satisfying <input type="checkbox"/>	35
	unsatisfying <input type="checkbox"/>	11
8. When buying, how much does it influence you the aspect of the product and its presentation?	a lot <input type="checkbox"/>	68
	a little <input type="checkbox"/>	21
	not at all <input type="checkbox"/>	11
9. Do green products contain alimentary additives, conservations or genetically modified organisms?	yes <input type="checkbox"/>	15
	no <input type="checkbox"/>	20
	I don't know <input type="checkbox"/>	75
10. If you appreciate the green products' quality, do you think it's good to recommend them to other people?	yes <input type="checkbox"/>	89
	no <input type="checkbox"/>	11
11. The incomes of your family can be included in the group of:	reduced incomes <input type="checkbox"/>	7
	medium incomes <input type="checkbox"/>	27
	large incomes <input type="checkbox"/>	65
12. What are your observations regarding green products?	they are hard to identify on the shelf (logo) <input type="checkbox"/>	25
	the advantages of eating green products are not known <input type="checkbox"/>	42
	the absence of advertising <input type="checkbox"/>	25
	they can't be found in small stores <input type="checkbox"/>	13

Table 1. The marketing research answers' centralization

To investigate consumers, a partial statistical observation is organized under the form of a statistical inquest based on a questionnaire. The interviewed persons constitute a representative sample of consumers of 351 randomly selected persons.

The data obtained from the sampling are systematized on various criteria in order to know the characteristics of the green products' demand. The questionnaire's content and the results of the investigation are presented in table 1.

The inquiry shows that food traders target especially the categories of population with big incomes (65%), who frequently buy this type of products at a distance of 40 days the most (64%). Although the consumers' preferences are orientated towards green products too (16%), nevertheless only 5% represent the constant demand for green products, because they are too expensive (56%) or people don't know how to identify the products (30%). The consumers of green products purchase them because they are aware of their benefits for the health (77%), others think green products can preserve the environment (16%) and a smaller number prefers them for their taste.

The demand is orientated mainly towards milk (28%), and the vegetal green products, like fruits and vegetables, represent 46% of the total. The constant consumers generally appreciate their good and very good quality (54%) and most of them think the products should be recommended to other people.

The knowledge degree regarding the green products' characteristics is low; most people don't know if these products contain or not alimentary additives, conservations or genetically modified organisms (75%) and 15% of the buyers give a wrong answer. The consumers' opinion regarding the improvement of the green products' situation is materialized in recommendations like: taking measures to popularize green products in order to know their characteristics, including commercials; popularizing their identification elements, namely the logo which will help to make a quick selection of the products; extending the commercialization system for green products to smaller shops, not just supermarkets.

3. Establishing the influence factors for the green products' demand with the help of the dispersion analysis

The dispersion analysis is a useful instrument in marketing researches and when it's used to study the green products market it facilitates a better knowledge of its characteristics. In the case of a statistical population, the dispersion analysis can be used to highlight the relations between its characteristics (statistical variables) and it can also be useful to evaluate the consequences generated by an independent variable over a dependent variable. If the variables have a numeric expression, the dispersion analysis techniques allow the concrete measurement of the influence an independent characteristic has upon the resulted variable. In the case of statistical characteristics expressed with words, with the help of the dispersion analysis we can find out if there is a determination relation between different definitive elements of the collectivities and the studied phenomenon.

The dispersion analysis patterns known under the name of the *F test* were introduced by the R. A. Fisher and can be single-factorial which ensure the evaluation of the influence a single factor has over the resulted variable; and can be multi-factorial, which allow studying the effect of a least two factors. With the help of the questionnaire regarding the correlation between incomes and the frequency of the demand for green products (table 1) we can establish the existence of the inter-correlation relation among them.

The statistical characteristics that present interest are the X variable, which is the independent characteristic and a grouping factor for the data named "the size of the incomes"; and the Y variable, which is the dependent characteristic represented by the "supply period for the population (number of days)".

The information collected about the statistical collectivity is structured on income and is presented in table 2.

Size of incomes	Supply period (days)											
	0-10	10-20	20-30	30-40	40-50	50-60	60-70	70-80	80-90	90-100	100-110	110-120
Reduced	-	-	-	-	-	-	3	-	7	9	4	2
Medium	-	-	6	-	12	46	23	10	-	-	-	-
Large	91	86	27	15	-	10	-	-	-	-	-	-

Table 2. The consumers' groups of green products based on their incomes and supply frequency (a representative sample with an error margin, 95%, 2008)

Using the dispersion analysis leads to a 723 value of the F function, this has as correspondent a theoretical value of 3.07 at a meaning level of 0.05 and two degrees of freedom. Because the obtained value is much bigger ($F_{calculated} > F_{chart}$) we can say with a 95% probability that the size of the incomes a family has influences the demand for green products and is a determinant factor.

Conclusions

The analysis and interpretation of the results obtained from the marketing research lead to the identification of specific aspects which can be considered current features of the green products market in Romania:

- the buyers of green products are a part of the population with large incomes, this being an essential factor for the demand;
- the internal demand for green products has a small dimension;
- the buyers which are constant have a small weight per ensemble;
- the main reason for the weak sales of green products is their high price;
- there isn't enough knowledge about the differences between conventional and green products;
- green products are not usually found in the regular supermarket networks and to specialized stores have access only the buyers who live in the respective town;
- the stores specialized in green products are not well known;
- most green products' consumers live in big towns where the supermarket network are also placed;
- most green products' consumers buy fruits, vegetables and milk;
- for the green products' consumers the consequences of these products over the health and the environment are important;
- most consumers are poorly informed and are not fully aware about ecological problems;
- buyers don't know the identification logos for green products.

The concerns to know better the demand for green products in our country can be justified with the need to identify and foresee the characteristic elements of the ecological consumer, this way the producers from the food sector can make in time structural changes and reorient the production in accordance with the norms of the ecological production.

In the near future, we expect an improvement of the information level and of the ecological education, the alignment to the concept of ecological production and the embracement of the European consumption model by the Romanian buyers. When these conditions are met the satisfaction degree of the buyers will depend in a large measure on the quantity in which the supply of food products is green and can ensure an improvement regarding the quality of life, and bring benefits for the environment.

Taking into consideration the advantages associated with the ecological production (both by the consumers and the producers) and manifesting a growing interest for the development of this sector are basic elements which will contribute in the next period to the essential transformation of the food sector in Romania.

Globalization represents a fundamental transformation of the structures, organization and nature of international commerce. The extension of globalization and the emergence of transnational societies has brought along an increased preoccupation for the components of the marketing mix, especially the distribution policy.

Key words: globalization, distribution process, international retailers

Globalization represents one of the most important concepts necessary for understanding the contemporary European reality. The changes this process develops are noticed throughout different fields: social, political and economical. The process of migration and the demographical tendencies influence the movement of work forces in the work market. Some of the involved aspects are women taking part to work, job crisis, unemployment and the risk of own business.

The concept of 'globalization' is used in different types of definitions: analytical (peculiar sides of the social life), realistic and historical. Despite ambiguity in defining it, globalization goes with the dynamics similar to re-conception of some notions such as state-nation, organization and community.

The most obvious signs of economic globalization are the constant acceleration of the increasing rhythm of international commerce and of the trans- frontiers investments, and also the increasing in competition which should result in welfare.

Globalization represents a fundamental transformation of the structures, organization and nature of international commerce. All the industrial sectors undergo deep structural changes which become more obvious in the sectors highly based on advanced technologies (such as car industry, pharmaceutical industry, telecommunications, etc).

Economic globalization can be defined by three peculiar dimensions: discipline in global market, financial contents and economic network. The market discipline refers not only to goods and products but also to work and capital. The financial contents refers to the speed money travels across the borders and the economic networks are founded on the economic information.

Globalization redefines the role and functions of nation state, emphasizing its strategic role in coordination – the form of intelligent competitive state – opposing to the interfering redistributive state, specific to the period after the Second World War.

The extension of globalization and the emergence of transnational societies has brought along an increased preoccupation for the components of the marketing mix, especially the distribution policy.

Starting from the mid '90s, the process of distribution internationalization has intensified; the number of retailers looking for an expansion on foreign markets has grown every year. Thus, large groups of distributors, such as: Wal-Mart (U.S.A.), Carrefour (France), Ahold (Holland), Tesco (England), each of them dominant on their internal market, have extended their distribution activities in a growing number of countries.

According to Deloitte, in 2004, the top 10 world distributors could be characterized as follows:

Table no. 1.

<i>Place</i>	<i>Group</i>	<i>Country</i>	<i>Main activity</i>	<i>Turnover (thousand million usd)</i>	<i>Percent of sales on international market (%)</i>
1.	<i>Wal-Mart</i>	<i>USA</i>	<i>Non food</i>	<i>285,2</i>	<i>20,00</i>
2.	<i>Carrefour</i>	<i>Franța</i>	<i>Food</i>	<i>90,4</i>	<i>50,80</i>
3.	<i>The Home Depot</i>	<i>USA</i>	<i>Shop</i>	<i>73,1</i>	<i>5,70</i>
4.	<i>Metro</i>	<i>Germania</i>	<i>Cash&carry</i>	<i>70,2</i>	<i>49,00</i>
5.	<i>Ahold</i>	<i>Olanda</i>	<i>Food</i>	<i>64,7</i>	<i>80,00</i>
6.	<i>Tesco</i>	<i>Anglia</i>	<i>Food</i>	<i>62,3</i>	<i>15,00</i>
7.	<i>The Koger Co.</i>	<i>USA</i>	<i>Food</i>	<i>56,4</i>	<i>0,00</i>
8.	<i>Sears Holdings Corp</i>	<i>USA</i>	<i>Shop</i>	<i>55,8</i>	<i>22,00</i>
9.	<i>Rewe</i>	<i>Germania</i>	<i>Food</i>	<i>50,7</i>	<i>28,00</i>
10.	<i>Intermarché</i>	<i>Franța</i>	<i>Food</i>	<i>47,3</i>	<i>30,00</i>

First 10 world distributors in 2004

This ranking of the top 10 world distributors shows that European distributors prevail and their main activity is in the food sector, whereas the other distributors, namely the Americans, are mainly activating in non-food fields. Another conclusion of this ranking concerns sales on international markets, and the European distributors clearly stand out in comparison to the American ones.

The increased internationalization of trade was generated by:

- external factors, such as: the saturation of national markets, the restrictive legislation in certain countries, the price fall of transportation, the existence of groups of international consumers having the same homogenous needs regarding trans-cultural products;
- internal factors, such as: the search of superior growth and profitability levels to those in the home countries, the geographical distribution of risks connected with multinational exploitation, the strong belief in an exportable know-how, and the distributor's desire of power growth, both when it comes to sales and the capacity to negotiate with international producers.

The interest of more and more distributors in creating relations with transnational companies is determined by:

- **The power and dependency of relations** – transnational companies are the suppliers having the most important negotiation power in their relations with distributors. The power of transnational companies resides in the products offered on the market and their notoriousness in the relation with distributors. Their power is considered by specialists to be a contribution to the distributor's turnover. The increasing investments of transnational companies in marketing and logistics in order to develop a distributed administration on supplies, marketing or merchandising, have almost succeeded in generating a dependency of distributors, while suppliers benefit from the advantage of being almost indispensable to the latter.
- **Common goals for suppliers and distributors** – common projects are undertaken in marketing, merchandising and logistics.

- **Trust** – Trust is mainly based on competencies awarded to the partner and is basically limited to the technical aspects of a partnership.

The retail European market presently illustrates the fact that many retailers are willing to become members of a group of acquiring in order to increase their purchase power and also to preserve their commercial independency. This fact is determined by the arrival on the Central and Eastern European market of international retailers that have started to bring trouble for the locals. The main groups of acquiring on the market are:

Table no. 2

<i>Groups of acquiring</i>	<i>Members</i>
<i>EMD</i>	<i>ABVassilopoulos (Grecia), Axfood (Suedia), Delhaize Group Europe (Belgia), Delvita (Cehia), ESD Italia (Italia), Euromadi Eberica (Spania), Markant Central European (Cehia), Markant Deutschland (Germania), Markant Slovensko (Slovacia), Mega Image (România), Musgrave Group (Irlanda), Nisa – Today's (Marea Britanie), Super Gros (Danemarca), Superunie (Olanda), Systeme U (Franța), Tuko Logistics (Finlanda), ZEV Markant (Austria)</i>

<i>Coopernic</i>	<i>Colruyt (Belgia), Conad (Italia), Co-op Schweiz (Elveția), Leclerc (Franța), Rewe (Germania)</i>
<i>Crai</i>	<i>Different store of independent retail and wholesalers from: Albania, Italia, Malta, Elveția</i>

Main groups of acquiring in Europe

Strategic alliances consist in starting ad-hoc companies with a local partner in view of administrating the business partners' common initiatives. In the internationalization process, strategic alliances bring the opportunity to overstep strategic, administrative and political boundaries inherent when a company penetrates an external market.

The main advantages of strategic alliances are the following: easier access to new markets, division of costs and risks, knowledge and experience sharing, increased competitiveness, the synergic effect of common resources.

On the other hand, strategic alliances also have a series of disadvantages, such as: incompatibility of partners, access to information, division of profits, the risk of losing one's autonomy, the variation of the initial data.

After 1989, Romania has been subject to a complex process of economic, social, and institutional reform generated by changing the communist political system, becoming a free country and embracing market

economy. This complicated process is developing along with the globalization of world economy and our adhesion to European and Euro Atlantic organizations.

It is very important for Romania, as well as for the other developing countries that their authorities together with the international community, on constructive positions of partnership, come up with a reasonable balance between economic adjustment and developing, between the costs and advantages of globalization.

Romania is only part of production and distribution in multinational companies, lacking for the time being the necessary force to play an active part on international markets.

Although there are several Romanians that have been awarded international prizes for inventions and innovations, Romania is only a beneficiary of these forms of international collaboration.

After the 1990s, large multinational companies have taken the opportunity to enter the Romanian market. A still fragile, economically challenged market did not allow the development anticipated by analysts. After 1996 though, important cities, especially Bucharest, have experienced the first changes.

The first modern retailer to conquer the Romanian market was La Fourmi, a company of Lebanese capital, in 1991. It was followed 5 years afterwards by the first cash&carry store of the German group Metro. This has made it possible for Romanians to envision another type of commerce: quick shopping for superior ranges of products to the usual store, with a different yet practical display.

In 1999, BILLA group opens their first supermarket in Bucharest and a new type of cash&carry store opens as well: Selgros Cash&Carry.

The year 2001 was a premiere for Romania and for the retailing market due to the opening of the first hypermarket, Carrefour.

The largest share held by international retailers in Romania belongs to discount stores (40.9%), followed by supermarkets (28.6%), hypermarkets (18.5%), cash&carry stores holding the smallest share (12%). The large share held by discount stores was determined by the fast expansion of this channel, as well as by the appearance and continuous development of logistic warehouses. This has made it possible for discounters to be the segment having the best and widest spreading across the country, especially to medium-sized and small towns.

At the end of 2006, the position of international retailers in Romania was the following:

Table no.3

<i>Nr. crt.</i>	<i>Name of store</i>	<i>Type of store</i>	<i>Number</i>

International retailers in Romania

According to these data, we could assume that Romania is not only an attraction for food retailers, but also for the new producers and distributors. Thus, merchants will be able to go on strengthening their positions on the market by obtaining a continuously larger market share.

Abstract: In Romania the use of the strategic marketing as a basic element in the relationship to the suppliers by the companies from the B2b market is at an incipient level, sometimes even at the level of the “subconscious”. In order to be able to develop the practice it is necessary to have a theory well organized and adapted to the nowadays requirements of the field of the suppliers relationship marketing on the B2b market. Therefore a need of information about the present degree of implementing the strategic marketing by the companies on the B2b market in their relationship with the suppliers in Romania and especially the identification of the ways in which the organizations use these methods and techniques of segmentation, targeting and positioning in order to develop the relationships with their suppliers appear as necessary. Starting from this premise the following research has as its goal the analysis of the way in which the organizations which are active on the Romanian B2b market use the strategic marketing in the segmentation, targeting and positioning of the suppliers.

Key words: supply – chain management, segmentation of the suppliers, targeting of the suppliers, positioning of the suppliers

Segmentation, Targeting, and Positioning of the Suppliers

In order to integrate the economical and commercial activities at the level of the supply – delivery chain the development of some close partnerships between the client and suppliers is necessary. The development of the supply – delivery chain implies that all the companies are involved in the process to share information about clients, the real level of demand, the level of the transactions at the selling points and strategic corporate plans. In order to develop a good supply-delivery chain is very important the way in which the company from business to business market uses strategic marketing instruments in segmenting, targeting and positioning of the suppliers

Market segmentation represents the process of division of a collectivity into homogenous groups according to one or more criteria. Through segmentation a fragmentation of the relevant market into homogenous units, respectively partial markets is targeted with a view to its differentiated processing of this.

Also for the organizations on the B2b market, considering the importance of the process of supply and the complexity of the supply delivery chain, the acquire of an appropriate segmentation of the deliverers is very important. In the use of the segmentation as a strategic marketing method for the identification of the segments the use of the following criteria is recommended:

1. criteria regarding the supplying company which contain variables like: general coordinates of the company, staff and management of the company, experience of the supplying company, production facilities which it has.

2. criteria regarding the long term vision of the company with the following variables: financial aspects, economical performance and financial stability, organizational strategy and culture, technological aspects, safety of the supplier, business references;
3. criteria regarding the business behavior of the supplier with the following variables: attitude of the selling staff, production and selling equipments which it has, quality and availability of the offered products, behavior of the technical staff, competence of the management

Targeting of the suppliers implies the development of the marketing mix for one or more segments of suppliers identified following the segmentation. Two very important factors must be considered when a segment of suppliers is chosen for being targeted by a company or another.

1. attractiveness of the respective segment of suppliers.
2. compatibility between the respective segment and the acquisition goals, the strategies and the resources of the company.

The attractiveness of the segment of suppliers can be assessed through one of the following aspects: the dimension of the respective segment (number of potential suppliers), growth rate of the respective segment, existent competition in the respective segment, respectively the bigger the competition is the more appropriate it is to target the possibility of the company to obtain better conditions of acquisition being bigger the loyalty towards the company manifested by the respective segment of suppliers, expected levels of profit.

Compatibility is given by the measure in which the suppliers from the respective segment can satisfy the expectations of the company on the B2b market regarding: the availability of the product, the price of the product, the offered services, the possibility of a partnership.

In accordance with the assessment of the two elements the following strategic alternatives of targeting a segment of suppliers can be chosen:

- Non-differentiated strategy of targeting all the segments of potential suppliers;
- Differentiated strategy when it focuses on two or more segments. The optimum variant would be two segments with a division of share between the two of 60/40.
- Concentrated strategy when the company on the B2b market is focused on one single segment of suppliers.

The segmentation strategy offers the totality of the segments that are active on a market as well as the presentation of every type of segment, the presentation of the methods of selection for them to the company. Once the segment is defined the next objective of strategic marketing is the positioning of the company within the chosen segment. The term **positioning** means the way the marketing program of a company is perceived by the buyer regarding the applied marketing strategies by the main competitors, that is the way in which the products are positioned in relation to the competitors in what concerns the marketing mix. Essentially the positioning is defined as the placing of the objects to be sold (products, services, organizations, personalities) in a multidimensional market model with the goal to insure a well defined place in the psychology of the consumer.

One of the most used methods for positioning products on the market is the “perception map” of the consumers. This identifies the differences between the characteristics of the products through the use of multidimensional staging of the perception and preferences. The localization of the characteristics on such a map is performed usually through taking into account of two criteria, such as accessibility of the offer and the relation quality – price. The company will choose from the variants so obtained the group of characteristics which insure the best position for it. Regarding the positioning of the product, there are two theories which lie at the base of the positioning methods in practice: *the theory of the maximization of the position*, which is the attempt to reduce the existent distance between the position of the product and the expectations of the consumer without considering the products of the competitors; *the theory of the maximization of the plurality*, which is the positioning of the product considering the products of the competitors and the distance between them and the expectations of the consumers.

The same basic concepts can be used also in the theory of the positioning of the suppliers by the company on the B2b market but also in the way this is positioned in relation to the other potential suppliers.

The positioning of the suppliers towards the company using the perception map implies following successively two stages:

- a) Which are the main characteristics required by the company from the potential suppliers. These can be: the availability of the product, the quality of the product, the price, the offered services etc.
- b) The intensity of each of these characteristics for each individual supplier.
- c) On the basis of these two variables a “map of perceptions” can be realized for each individual supplier which will lie at the base of the acquisition decision.

The positioning of the company towards the potential suppliers also implies two stages:

- a) The identification by the company of the main advantages looked for by the supplier within a partnership and the importance of each one of these;
- b) The maximization of the position, which is the attempt to reduce the existent distance between the company position and the expectations of the supplier;

Quantitative research regarding the relationship of the companies in the field business to business in Romania with the suppliers

In Romania the use of the strategic marketing as a basic element in the suppliers relationship marketing by the companies from the B2b market is at an incipient level, sometimes even at the level of the “subconscious”. In order to be able to develop the practice it is necessary to have a theory well organized and adapted to the nowadays requirements of the field of suppliers relationship marketing on the B2b market. So that a need of information about the present degree of implementing the strategic marketing by the companies on the B2b market in the relationship to the suppliers in Romania and especially the identification of the ways the organizations use these methods and techniques of segmentation, targeting and positioning in order to develop the relationships with the suppliers appear as necessary. Starting from the exposed problem the presented research has as its goal the analysis of the way in which the organizations which are active on the Romanian B2b market use the strategic marketing in the segmentation, targeting and positioning of the suppliers. The research has also a secondary goal, and that is to see if the usage of elements from relationship marketing in the development of the relationships with the suppliers by the companies on the B2b market can be identified.

The researched collectivity is represented by the companies which are active on the territory of Romania, in the B2b field in urban spaces (towns of over 50,000 inhabitants), whether they are local or foreign, of any field of activity. In the case of this research the personal “face to face” interview was used as a way to gather information and the questionnaire as an instrument. In order to determine the test sample on which this research was performed, no random method of sampling was used because the researched problem represents a new element in the research studies of marketing in Romania, that is why it was treated as an exploratory research, which offers the information necessary for a subsequent planning of a research on a representative sample. A number of 80 companies in the B2b field in Romania were interviewed.

The analysis and the interpretation of the results of the research showed the following aspects regarding the relationship with the suppliers of the Romanian companies. In what concerns the main criteria used in the assessment of the suppliers taken into account in the management of the suppliers portfolio by the company on the B2b market, these are in the order of importance: quality of the supplied products, price of the products, facilities of payment obtained from the suppliers and the obtained discounts. These results prove that although the most important thing taken into account is quality, the others have as base the price which means that, although the Romanian companies need quality products, they do not afford them and wish to buy at the best prices and with payment on term. It is observable that although worldwide for the companies on the B2b market the most important characteristic taken into account in the assessment of a supplier from the point of view of an acquisition center is the availability of the product, for the companies in Romania this characteristic is only on the 5th place as importance. This fact proves that the supply delivery chain is not very well organized and the companies use big raw materials stocks and not systems of JIT type which may allow them to solve more efficiently the other problems which they have in relation to the availability of liquidities (big stocks of raw materials - > financial immobilizations - > low liquidity- > need advantages related to the price, payment ways). It is also remarkable the fact that in the analysis of the questionnaires for the most important four criteria, the response which was selected most frequently was “totally agree”.

Criteria use in the assessment of the suppliers

The low result obtained by the supplementary services offered by the supplier presents the availability of the companies to give up some supplementary services only to get a better price for the basic product. Still this claim reflects a simplistic way of thinking from the companies on the B2b market in Romania which regard the cost of the supply only through the price of the basic supplied product and not through the integrated logistic cost which contains also the offered services but can generate on the whole savings of scale in the activity of the company. It is also noticeable the low importance in the degree of novelty of the purchased product, thing that can be understood considering that generally a new product is associated with a high price and maybe with a low quality but especially a low safety in exploitation. It is also noticed that the most unimportant criterion used in the assessment of the suppliers is the modality to promote the offered product which confirms strongly once again the minor role between the promoting techniques for advertising or sell promotion on the B2b market.

In what concerns the most important elements taken into account in the selection of the suppliers the safety of the supplier is on the first place, business references which reveal the wish of the companies on the B2b market to have durable relationships with their suppliers. Anyway correlating this characteristic with the importance of long term relationships in the assessment of the suppliers which received mediocre points in the first section of the questionnaire we can say that the leaning towards assessing the suppliers first of all according to their safety rather leads to a kind of an idea of comfort in supplying. It is also noticed the fact that the production facilities of the supplying company are the least important in the selection of the suppliers which proves that although they consider quality as the most important characteristic in the assessment of a supplier this is not assessed on the basis of objective criteria. In support of this affirmation there is also the fact that the production and selling equipments received an inferior score. Analyzing the results from this section we notice that generally the companies do not stress the importance on the human resource of the supplying company as a consequence of low notes obtained by the staff and the management of the company and even by the competence of the technical staff.

Analyzing the third section of the questionnaire, the one through which the opinions of the company are expressed on the B2b market in relation to their main suppliers we notice that generally these consider their relationship to the main suppliers as being one of partnership. Generally they consider that the staff from the supplying company are serious people, they try to fulfill their tasks, in the majority of the cases they negotiate correctly, say the truth, represent a real counterpart, do not try to cheat.

Criteria used in the selection of the suppliers

Going to the last section of the questionnaire we notice that the biggest score is granted to an affirmation which also reveals the partnership between the two companies, more exactly the fact that there is an information and assistance change between the two entities. Anyway it has to be noticed that although there is some opening to the change of information between the parties, this does not apply when we talk about confidential information or access to the patents or inventions although they could be useful in the supply delivery chain.

By connecting the variable “long-term relationships” mentioned in the first section with the variable “we provide confidential information to the supplier” and by comparing the calculated value of hi square it can be noticed that there is a correlation between the two variables. Taking into account the statement according to which “we supply confidential information”, this is a negative statement (one total disagreement, 7 total agreements) and we may assert that although the companies operating in the B2b field tend to lean towards the development of long-term relationships with their main suppliers, they are not willing to provide them confidential information. Also, by comparing the calculated value of hi square (it can be noticed that there is a correlation between the variables “quality of supplied product” and “our supplier is the holder of quality certificates”). Taking into account that generally interviewed companies mentioned the quality of the product as being the most important criterion in assessing the suppliers, the latter maintain their position on account of the fact that most of the main suppliers benefit from quality certificates for supplied products. This correlation may suggest the fact that as far as the product policy adopted by the B2b market with respect to their suppliers a very important element is represented by the implementation of a quality stability strategy, thus one may conclude that the supply of high quality and constant quality products is sought after. It is common knowledge that a quality certificates reasserts the maintaining over time of a constant character of quality corresponding to the products or services provided by a company.

In conclusion, the most important criteria used by the companies operating on the Romanian B2b market in Romania are: quality of the product, price of the product, credit facilities granted, discounts granted, availability of provided supplied, long-term relationships and services provided by the supplier. By making a comparison to the theory that puts emphasis on availability of the product, then on quality, price, provided services and the possibility of developing long-term relationships, thus we may state that as far as Romanian companies are concerned, the decision of the purchasing department is made based on arguments regarding quality and price. The surprising fact is that although price and the other features thereof are very important, companies do not seem to deem as important the availability of the product that generally is equivalent to the liquidity generation. As far as for the elements taken into consideration in the selection, segmentation and targeting of the suppliers are concerned, the security of the supplier company occupies the first place, then the attitude of the sales staff, the experience of the supplier and his economical stability. Generally it was opted for criteria related to the security of the relationship with the suppliers which emphasizes the interest in the development of partnership. As far as for the opinion of the companies on the B2B market is concerned towards the main supplier as well as their reflected attitude towards them a dual relationship can be seen meaning that they consider that the supplier is serious about the business relationship this also being the company’ attitude. At the same time there is a note of

skepticism in the relationship with the supplier, the contract being considered very important, the confidential data exchange is absent, generally the supplier is not helped with issues of quality although these might affect the company.

Abstract: Trade shows and exhibitions are an important marketing instrument, as they help companies in completeing their main objectiv: to obtain profit. As they are expensive for small companis it is very important to be able to measure the result of the prospecting activity and the process strats by establishing specific and measurable goals. We will present also some instruments that companies can use in order to establish if their event was or not a succes.

Key words: prospecting activity, instruments, trade fairs efficiency

Why you should participate in Trade shows?

In a competitive business environment trade shows and exhibitions have become very important all over the world. These are specialist market places that allow exhibitors to promote their products and services, reach new customers and generate new sales while giving the visitors the opportunity to find out about the products and services on display. Trade shows and exhibitions give business people the opportunity to make useful contacts with other people working in their industry and are an important promotional tool. Trade Shows and Exhibitions can be very helpful, as they:

1. Demonstrate the product or service to customers face-to-face interacting with them and get the response and feed back of the product on the spot
2. Test new markets or launch new products and services
3. Give the companies the chance to find out directly from the customers about their exact requirements
4. Are very good opportunities for networking
5. Concentrate many potential customers and suppliers in one place.

Apart from buyers and sellers, trade shows can also attract journalists, media. But, if not organised carefully and if the participants do not know exactly what they want to achieve, trade fairs can be an expensive waste of time. So companies must be sure of what they want to achieve and make the goals *specific and measurable*. Also, an important part is choosing the event and planning it. When it's over, the follow up of the contacts is very important and based on their goals they should evaluate what they got out of the trade show.

It is essential for companies to find the right trade fair. Exhibition organizers must **understand macroeconomic trends**, business models, must know the markets. Mr. Jiri Kulis¹⁶⁶ consideres that exhibition trends in the different sectors have an understandable correlation to the GDP trends and the deductions made from knowledge of economics and markets are prerequisites for exhibition successes. If the area of interest the fair covers is too specialised or too broad, it is unlikely to attract visitors or exhibitors.

¹⁶⁶ Advisor to CEO Velethry Brno (CZ)

If one company is exhibiting some products, then it should start by making a profile of the customers they want to reach, identify their special interests and where they are located. Then they should take a look at the most likely trade fairs for their industry sector and try to match them with these customers. Most established exhibitions will be able to provide a detailed breakdown of the number and type of visitors from previous years. This will give a good indication of whether the types of customers they are targeting are likely to be there.¹⁶⁷

Regarding the effects of the macroeconomic impact of trade shows different elements can be discussed: tangible economic effects and intangible economic effects. *Tangible effects* are quantitative, quantifiable, measurable effects with regard to additional Gross Value of Production (GVP), Gross Domestic Product (GDP), Employment and Taxes. These are normally the basic arguments in case of a decision to invest. *Intangible effects* are usually not measurable: Image, Marketing, Investment, Politics, Tourism. For example, a survey at Brno trade fair shows that total effects indicate that the additional Gross Value Production in Czech Republic was 7.1 times the turnover of Veletrh Brno, while the total employment effect has been 16 times higher than the total workforce of the company. Employment effect is spread almost all over the industries.

Instruments for measuring the efficiency of the prospecting activity

- AUMA Trade Fair Benefit Check - Instrument for calculating trade fair efficiency

More and more exhibitors want to calculate the cost-benefit ratio of their trade fair participations more precisely. However, because most of the companies frequently do not formulate any exact trade fair objectives, the benefits of participations are often not determined; the focus is thus primarily on the costs. As a result, some companies believe that trade fair participations have an unfavourable cost-benefit ratio.

AUMA - The Association of the German Trade Fair Industry has, therefore, in close cooperation with the exhibiting industry and the trade fair organizers, developed the *AUMA Trade Fair Benefit Check*. *Trade fair benefits* represent costs of alternative marketing instruments. The basic idea is that exhibitors should first be clear which objectives they wish to achieve, to what extent they wish to achieve them and how they can measure their achievement. The utility value of quantitative objectives is determined by the costs which would be involved in the use of alternative marketing instruments. Thus, for example, the extremely expensive sales force would have to be employed more intensively if the company wished to achieve a specific number of contacts to new customers by means other than a trade fair participation. The utility values thus calculated for the individual trade fair objectives are added together to arrive at the quantitative utility value of the trade fair participation.

In addition to this, the exhibitor checks what the achievement of qualitative trade fair objectives is worth to him. The value of such objectives is expressed as a percentage of the total expenditure. Subsequently, within the scope of the trade fair check, the costs of the participation are calculated taking into account the desired benefits. These costs are then compared with the total utility value of the quantitative and qualitative objectives.

Trade Fair Benefit Check addresses itself particularly to small and medium-sized companies. The tool should, furthermore, persuade the exhibiting industry, first of all, to consider the benefits and only then the costs of communication. It should contribute to an examination of the entire spectrum of possible trade fair objectives and to the formulation of exact objectives as the precondition for effective monitoring of success¹⁶⁸.

Step 1: Establishing the targets. We will present a list of the quantitative targets and how they can be measured, as they are described by The AUMA "*Trade Fair Benefit Check Model*":

¹⁶⁷ <http://www.upublish.info>

¹⁶⁸ http://www.auma.de/_pages/start_e.aspx

Quantitative objectives

Measurement system

Contact targets

- | | |
|--|---|
| 1. Care of regular customers | - number and importance of the regular customers on the stand |
| 2. Acquisition of new customers | - number and importance of the potential customers on the stand |
| 3. Acquisition of new cooperation partners | - number of new cooperation partners |
| 4. Acquisition of new employees | - number of new employees |
| 5. VIP service | - number of VIP served on the stand |

Communication/information service

- | | |
|---|---|
| 1. Increase awareness | - number of stand visitors
- number of total fair visitors
- number of brochures distributed
- prompted/ unprompted recall after the trade fair |
| 2. Improve the image of the company or individual brands | - judgments and opinions of stand visitors
- changes in attitudes of stand visitors |
| 3. Establishment and cultivation of relations with the media | - number and quality of the contacts with media representatives
- number of participants at press conferences
- number of press folders distributed
- numărul de mențiuni în media |
| 4. Market research: customer behaviour, trends, acceptance of the product | - judgments and opinions of stand visitors
- judgments of staff personnel |
| 5. Qualification of sales staff | - number of participants
- sales training sessions, sales meetings during the trade fair |

Presentation targets

- | | |
|--|---|
| 1. Presentation of products/ services/ technical processes | - number of clients who were effectively informed and attended the presentation |
|--|---|

Sales and distribution targets

- | | |
|---|---|
| 1. Contacts (sales) concluded during and after the trade fair | - level of direct revenues, during and after the trade fair |
| 2. Implementation of new business terms | - value of the improved contractual terms |
| 3. Opening of new markets | - number of inquiries from new sales markets
- number of inquiries from new target groups
- number of new product inquiries |
| 4. Development of new sales channels | - number of new distribution channels |

Source: www.auma-fairs.com

The *qualitative targets* are analysed from the point of view of the relevance from very important to without importance, being expressed as percentage from total costs.

Step 2: consists in establishing a budget control. The total costs of a trade fair participation are made up of the following items: basic costs (stand rent, etc), costs of stand construction and design, as well as depreciation, costs of stand service and communication, costs for transport, handling and waste disposal, personnel and travel costs and other costs.

Step 3: generates the cost-benefit comparison of trade fair participation by adding the benefits (quantitative and qualitative) and decreasing the total participation costs.¹⁶⁹

- CEIR Exhibition Industry Index (CEIR Index)

The tool produced by the Center for Exhibition Industry Research (CEIR) is called the CEIR Exhibition Industry Index (CEIR Index). In addition to the aggregate information on the entire industry, the CEIR Index provides a detailed performance analysis of the American industry divided into 11 industry sectors.

First, they planned to produce the CEIR Index annually, but it is in the best interest of the industry to have a more frequent measurement, so a quarter by quarter analysis will provide a more comparable unit of statistics. In order for CEIR to accomplish this, they needed to increase the pool of participating events, therefore increasing the amount of applicable data. The Center for Exhibition Industry Research (CEIR), with the help of several organizations, created a leading performance indicator that could be applied to the entire exhibition industry called the CEIR Exhibition Industry Index (CEIR Index). The result is reflected in the first publication of the CEIR Index Report.

The CEIR Index measures year-over-year changes in four key elements: net square feet (NSF); attendees, exhibitors and revenue. The information was gathered from data provided from over 250 events. The events were placed into 11 sectors, and the data was aggregated by sector from 2000 to 2003. The year-over-year changes were then translated into an “index value,” using a base value of 100 in the year 2000¹⁷⁰.

Methodology

The CEIR Index is designed to be representative of the universe of exhibitions, which are defined as any event with at least 3,000 net square feet of exhibit space. The basis for this universe was the Exhibition Industry Census, which catalogued over 13,000 events. Of these 13,000 events, approximately 10,000 were business-to-business exhibitions, which comprise (in round numbers):

- NSF – 500 million;
- Attendees – 60 million;
- Exhibitors – 1.5 million; and
- Revenue – \$10.3 billion.

The remaining 3,000 events were business-to-consumer shows.

The CEIR Index is designed to offer a representative sample across 11 industries or sectors, so the universe of 10,000 business-to-business exhibitions breaks down as follows:

Industry Sector	Number of events	% of total
Professional Business Services	1,440	14.4%
Consumer Goods and Retail Trade	580	5.8%
Sports, Travel, Entertainment, Art and Consumer Services	920	9.2%
Food	370	3.7%
Government, Public and Non-Profit Services	1,190	11.9%
Building, Construction, Home & Repair	240	2.4%

¹⁶⁹ http://www.auma.de/_pages/start_e.aspx

¹⁷⁰ CEIR Index Report

Industrial/Heavy Machinery and Finished Business Inputs	440	4.4%
Communications and Information Technology	1,270	12.7%
Medical and Health Care	2,340	23.4%
Raw Materials and Science	810	8.1%
Transportation	390	3.9%
Total Events	10.000	100%

Source: CEIR Index Report

The building blocks for the CEIR Index are the percent change numbers (year-over-year) in each of the four metrics for an individual event. For each “pair” of numbers (the same metric for the same event in two consecutive years), a percent change value was calculated. For example, if an event’s professional attendance went from 12,000 in 2001 to 13,200 in 2002, a percentage change of +10% was recorded. For revenue, the only metric measured in dollars, inflation was taken into account in the percent change calculation.

Each of the 11 industry segment sections provides results that can be compared to the Overall CEIR Index metrics by year, the sections are designed to offer a discussion and analysis:

- **Overview** – discusses broader industry/sector trends;
- **CEIR Index Trends Table** – provides CEIR Index results by metric and year;
- **CEIR Index Trends** – offers year-over-year analysis of the CEIR Index results by metric;
- **CEIR Index Graphs** – displays graphs of the CEIR Index results by metric.

In the CEIR Index Report, the first analysis section is for the overall exhibition industry. The total for the overall exhibition industry declined 2.0% from 2000 to 2003, with the poorest performing category being Revenue, which fell nearly 6.0% over the period. Given the impact of September 11th and the global recession during this period, the declines in exhibition activity were surprisingly modest compared to other industries and other marketing media.

The most Revenue decline is due to the tightening of corporate budgets that began in the spring of 2001. By the end of August 2001, some 77% of businesses had imposed a level of travel restrictions due to the soft economy. Corporate marketing budgets were also trimmed significantly. This was first felt in advertising revenue, but eventually had an impact on discretionary spending that usually accompanies participation in exhibitions. Sponsorships, collateral advertising and registration fees all experienced revenue declines during this time.

Additionally, the exhibition industry was forced even reduce prices because of the lower budgets. This was a sharp blow to the industry, which regularly increased exhibit space rates and sponsorship fees. As the metrics began to show improvement from 2003, revenue continued to decline because the industry operates on an annual cycle lead-time. Since prices and offerings are fixed 12 months in advance, price increases lagged improved industry economic conditions.

Lastly, exhibition companies responded to current market conditions by offering deals and incentives to exhibitors on exhibition space and entry fees to exhibitions. These programs did not generate additional revenue for the exhibition companies, but they did increase net square feet and the number of Exhibitors attending events. As a result, both net square feet and Exhibitors rebounded in 2003.

The main problem now is whether or not this instrument of analysis of the evolution of the trade fair industry, created for the US and Canada markets can be applied also for the European market.

As a conclusion, it is very important for companies to be able to measure the efficiency of participation to events such as fairs and expositions. As many companies consider them only a cost for their marketing budget, they may choose not to attend, the main problem being that they do not know how to measure the benefits, which is very difficult, as most of them do not establish specific and measurable goals. Therefore, the instruments presented can be a very useful aid for less experienced companies.

COMPETITIVENESS OF ROMANIA AS A TOURIST DESTINATION

Cătăneț Alina

The Media University, The Faculty of Management of Affairs, Elena Caragiani street, no. 7, bloc 2G, sc. 4, ap. 43, sector 1, Bucharest, alinacatanet@yahoo.com, 0722178336

Radu Cătălina

Academia de Studii Economice, The Faculty of Management, Barajul Sadului street, no. 3-5, bl.N12-N13, sc. B, ap. 155, sector 3, Bucharest, kataradu@yahoo.com, 0723549743

The aim of this paper is to summarize the importance of the competitiveness concept for the Romanian tourism sector, bringing in front of the analysis the last Tourism & Travel competitiveness report of the World Economic Forum.

Key words: competitiveness, competitive advantage, comparative factors, tourism

What is competitiveness?

Competitiveness is a large concept; it can be observed from many perspectives: through products, firms, branches or industries of one economy, countries, regions and continents. Also, it can be analyzed in the short run or in the long run. The definitions presented in the economic literature provide both a micro and macro interpretation of competitiveness. From a macro perspective competitiveness is a national concern and the ultimate goal is to improve the real income of the community; it can be observed a strong connection with the economic growth. From a micro perspective, it is seen as a firm level phenomenon.

At the firm level, competitiveness is the ability to provide products and services more efficiently than its main competitors. For being competitive, any firm must provide products and services, which will satisfy the complex desires and needs of the modern consumer.

At the industry level, competitiveness is the ability of the country's firms to obtain sustained success compared to foreign competitors. Competitiveness at the industry level is a better indicator of the economic health of the country than competitiveness at the firm level.

The indicators for counting the competitiveness at the industry level include:

- overall profitability of the country's firms in that industry,
- the country's trade balance in that industry,
- the balance of outbound and inbound foreign direct investment,
- the measures of cost, price and quality at the industry level.

Competitiveness in international tourism

In the last years, international tourism conditions have changed a lot. For every country, in order to remain competitive in the international tourism market, it has become necessary to address these challenges. In the context of globalization, the number of destinations increases and also the distances among them. In this moment, is considered normally that a Romanian traveler wants to fly thousands kilometers for a holiday far away for Romania, for example in Barbados Isle. Some years ago, this destination seems unreachable. For such products and services, travelers are willing to pay a large price to satisfy their complex needs.

At the tourism level, in order to gain competitiveness, there are two important factors to discuss: competitive and comparative elements.

- a) Competitive advantage refers to tourism infrastructure, the quality of management, the skills of the workforce, the government policy and others. They can be obtained and improved with the help of Government and tourism firms.

- b) Comparative advantage refers to natural, cultural and social attractiveness like: climate, beautiful scenery, attractive beaches, high mountains, country life and others. From a country to other, the natural, cultural and social factors can not be reproduced with the same passion or attractiveness.

While comparative factors are close to primary tourism supply, the competitive factors refer to secondary tourism supply. Without tourism firms and government policies, the tourism destination is not capable to sell natural attractions, while without primary supply the tourism infrastructure is not useful. Both primary and secondary factors are correlated and interdependent in the same time.

Models of competitiveness for the tourism sector

After the specialists Murphy, Pritchard and Smith (2000), at the base of their model of competitiveness for the tourism sector, is the nature of the tourism offering product, which from a destination perspective can be regarded as “an amalgam of individual products and experience opportunities that combine to form a total experience of the area visited”.

A big number of quantitative and qualitative variables can be connected to the notion of destination competitiveness:

- Quantitative variables: the number of tourists, the market share, the tourist expenditure, employment.
- Qualitative variables: the attractiveness of the places, the richness of culture and heritage, the quality of tourism services.
-

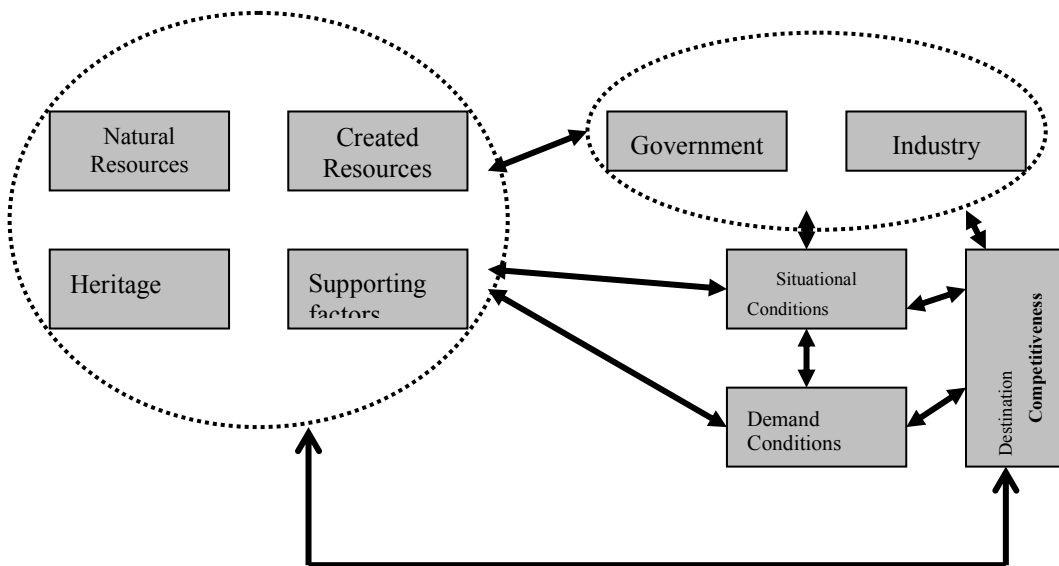

Other specialists have included in their competitiveness model for the tourism sector variables like:

- transport system (Keyser and Vanheove, 1994),
- environment conditions, tourism as a leading sector, distribution channels and the dynamic private sector (Poon, 1993),
- facilities, accessibility, quality of service, overall affordability, location image, attractiveness, climate and environment (Go and Govers, 1999, a study which contains the key factors for measuring a destination’s competitive position relative to other destination)
- Physiography, culture and history, market ties, activities and events (Crouch and Ritchie, 1999)

Dwyer (2003) has composed a model of competitiveness for the tourism sector including seven main categories factors:

- Natural Resources
- Heritage
- Created Resources
- Supporting Factors
- Destination Management (Government and Industry)
- Situational Conditions
- Demand Conditions

The seven determinants of the model only taken together can create the ability of the tourism sector to add value to its products, in order to obtain the competitiveness of this sector.

The Dwyer's model of destination competitiveness

The four elements placed in the same box: natural resources, created resources, heritage and supporting factors generate attractiveness for the places to visit. The four elements include the next factors:

- physiography, climate, flora and fauna,
- history, customs, traditions,
- tourism infrastructure, special events, entertainment, shopping
- general infrastructure, quality of services, hospitality and accessibility of destination.

The factors included in the “situational conditions” can modify or even mitigate the destination competitiveness, through a positive or a negative influence.

The “demand conditions” contains awareness, perception and preferences of the tourists for a special location.

The level of competitiveness for Romania's tourism

Three years ago, the World Economic Forum embarked on an effort to better understand the determinants of Tourism & Travel competitiveness and the challenges that face the industry at the present time.

In the latest edition, Romania is situated on the sixty-nine place, in a top formed by one hundred thirty countries from entire world.

The determinants of the Tourism & Travel competitiveness are:

- Policy rules and regulations
- Environmental sustainability
- Safety and security
- Health and hygiene
- Prioritization of Travel & Tourism
- Air transport infrastructure
- Ground transport infrastructure
- Tourism infrastructure
- ICT infrastructure

- Price competitiveness in the T&T industry
- Human resources
- Affinity for Travel & Tourism

The determinants of competitiveness for Romania's tourism

The first three countries in this top are occupied by Switzerland, Austria and Germany.

The Romanian tourism is through the least competitive countries in the world because of the air transport infrastructure and ground transport infrastructure.

The Romanian's biggest problems are: the lack of transparency in taking the governmental decisions, the quality of roads, the sustainability of sector development, the marketing efficiency.

However, the strong points of Romania in this report were: the cultural level of people, the history, the presence in the market of the renting cars great companies, the little number of SIDA infestation, the hospitality of the people.

Between the most attractive Romanian destinations for the stranger tourists are: Danube Delta, Bucovina, the Romanian seaside, the Carpathians.

Romania has an enormous tourist potential, but inefficiently exploited. However, the future for Romania's tourism is seeing well, after the opinion of the specialists, as they placed Romania on the seven place from the growing perspectives of tourism industry. They saw a 7.9 percent of annual growing forecast for period 2008-2017.

SOME ASPECTS REGARDING THE IMPORTANCE OF POINT OF PURCHASE COMMUNICATIONS IN THE MARKETING COMMUNICATIONS MIX

Chițu Ioana Bianca

Transilvania University of Brașov, Faculty of Economic Sciences, Prundului street no. 37, Brașov, tel. no. 0740 050 894, e-mail: ioana.chitu@unitbv.ro

Tecău Alina Simona

Abstract: In our days, corporate managers are becoming more and more aware of the important benefits of relationship marketing and integrated marketing communications. Point of purchase communications are a powerful marketing tool, because they reach the consumer at the moment when, and the place where, they taking decision. This paper tries to present some aspects such as objectives, tools and effectiveness of point of purchase communications.

Key words: point of purchase communications, interior displays, store imagine

Introduction

One reason for today's increased focus on consumer sales promotions is the change in TV viewing habits. Advertising audience is more and more fragmented and manufacturers and retailers must turn on to new methods to reach these moving targets. Usual consumer sales promotion techniques include point of purchase materials, coupons, electronic coupons and convenience cards, cents-off promotions, refunds, rebates, premiums, sampling, combination offers, contests, sweepstakes a.s.o. A successful integrated marketing campaign may include several of these techniques along with media advertising, public relation, publicity and direct marketing. Thus, point of purchase communications must reflect what consumers have seen on television or on billboards ads and correspond with public relations efforts or direct marketing. It has been shown that when advertising and point of purchase communications are combined, as compare to using advertising only, sales increase by more than 100%.

In 2004 The Point of Purchase Advertising Institute (POPPI) conducted a consumer buying habits study in several European countries (like UK, France, Italy, Netherlands, Denmark and Belgium). This institute used entry-exit interviews, so the consumers were interviewed twice, once before entering in the store (to measure the planned budget and the planned purchases) and again after leaving the store (to measure the budget spent, the actual purchase and the perception of point-of-purchase materials). The result was that the purchase can be classified in four main categories: *specifically planned purchase* (the consumer has bought the specific product and brand), *generally planned purchase* (the purchase of not specific brand), *substitute product or brand purchase* (the consumer intended to buy a specific product or brand, but actually purchase another product and brand), *unplanned purchase*. In Europe an average of 67,2% of brand purchase decisions are made in the store, witch is comparable to the in-store decision rate of 72% for American consumers. The number of in-store decisions is highest for younger and higher-income consumers, larger households and consumer accompanied by children. This figure may be a little bit exaggerated because all consumers have specific needs, but they did not think of in advance and these are also including as *unplanned*. But, in any case, point of purchase communications can be very effective, with a great impact over the consumers.

Point-of-purchase communication techniques

Point of purchase communications can be defined as any promotional materials placed at the point of purchase such as interior displays, printed materials at shop counters or windows displays. It also includes in-store broadcasts, video screen demonstrations, shopping-trolley advertising, shelf talkers, coupon dispensers, wastepaper baskets and interactive kiosks (device by means of which the consumer can

interactively retrieve information about the shop and the supply). Thus, both retailers and manufacturers make use of in-store media, retailers control the point-of-purchase displays and manufacturers packaging. Recently, static signs have begun to give way to electronic, dynamically updated point-of-purchase displays that present targeted product information, instant coupons, and more. The software used to control these dynamic point of purchase displays typically allows for near-real time content updates, allowing brand managers to run instant marketing experiments, geographically targeted promotions campaigns a.s.o. Dynamic point of purchase displays can vary greatly in size, from a 6" shelf-mounted LCD to 42" (or larger) plasma and projection displays, helping deliver targeted marketing content to shoppers at the point-of-decision.

Besides these specific communications instruments, also very important factors in point of purchase communications are store imagine, store organization, store atmospherics, product presentation and product's package.

Store imagine can be defined as "an individual's cognitions and emotions that are inferred from perception or memory inputs that are attached to a particular store and which represent what that store signifies to an individual", it consists of both affective and cognitive factors. Related to store imagine is "store personality". While store imagine refers to a mental representation of all dimension that are associated with a store, store personality is limited to dimension that reflect human traits. This concept consists in several factors like enthusiasm (welcoming, enthusiastic, lively and dynamic), sophistication (chic, high class, elegant, stylish), unpleasantness (annoying, irritating, loud and superficial), genuineness (honest, sincere, reliable and true) and solidity (hardy, solid, reputable, thriving). Different consumer segments appreciate a different store personality and a different store image.

The way a store is organized can have an impressive implication for marketers. The way that total space of a store is divided into areas or departments can have a great impact on its profitability. In the first place, the retailer should try to maximize the space dedicated to selling activities and minimize the non-selling space. In the second place, the retailer has to decide where to place the different merchandise groupings in the store. The main criteria for merchandise location are the consumer buying behaviour and the merchandise compatibility. Also, studies shows that particular store layouts are very attractive to consumers, consumer seem to walk through the store in a counter-clockwise direction, they usually tried to avoid turns and like to continue to walk in the direction they are going, also, they look and buy products situated on their right-hand side, broad aisles on the walls are most preferred and, are more visited by the majority of the consumer.

The product presentation is not an easy thing; the most aspects that have to be considered are the product assortment, the space allocated to each product and the shelf position. No doubt, the retail assortment has to match consumer (target) needs. A common practice in shelf management is that shelf space is allocated according to the market share or retail margin. On the other hand, space allocation based on market share is an example of circular reasoning, since shelf space depends on market share, which in itself partly depends on shelf space. Recent shelf space allocation models also include product profitability for each item, demand interdependencies (a fixed amount of shelf space requires that an increase in the space of item A may raise the sales of A, but the decreased shelf space of item B may, at the same time, cause a fall in the sales of B) inventory levels and product stock-outs. There are some best options regarding shelf position, like at eye level or to the right of the brand leader.

Atmospherics can be defined as the effort to design buying environments to produce specific emotional effects in the buyers that enhance their purchase probability, since atmosphere is apprehended through the senses. The dimensions of store atmosphere are visual dimension (colour, brightness, size and shapes), aural dimension (volume, dimension), olfactory dimension (scent, freshness) and tactile dimension (softness, smoothness, temperature). The majority of the atmospherics research seems to support the relationship between store atmospherics, emotions and consumer behaviour. A good understanding of store atmospherics and store dynamics is very important, both for the manufacturer and the retailer.

The product's package is a component of the product element and also an exhibitiv medium that can determine the outcome of retail shelf competition. Package designers must make the package exciting, appealing and in the same time functional. A recent research revealed that packaging can influence consumers behavior long time after the actual purchase has been made (for instance, it appears that larger pack sizes encourage greater usage volume per usage occasion, or induce to consume the product more frequently, simply because of the presence of the product in the household inventory).

The objectives, strengths and weaknesses of point of purchase communications

Point of purchase communications involve all the aspects of the store and the store environment that can signal something to customers about the quality, price or product assortment, whether is initiated by the retailer or by the manufacturer.

The primary objective of using in-store communication techniques is to direct attention of shoppers and to stimulate them to make purchase, but point of purchase communications can serve various objectives like

- *Attract consumer attention* and differentiate the store from the competition through an attractive exterior and interior store design, so increasing the likelihood that the consumer will enter the store.
- *Remind* consumers of ongoing or previous advertising or other forms of promotion like public relations, sales promotions, or other previous campaign, reinforcing, thus, the communications message.
- *Inform* consumers about the product, the store a.s.o
- *Persuade* consumers to enter in the store or to buy some specific products, to influence their decision-making at the point of sale and to trigger impulse purchase.
- *Building an image*, point-of-purchase communication also can serve to help with building an image for the retailers and for the manufacturers.

In order to draw some conclusions the point-of-purchase communication are good at attracting attention and providing information. Their ability to persuade is potentially strong, as these displays can highlight particular product attributes at a time when shoppers have devoted their attention to the purchase decision process. From managers point of view, the absolute and relative costs of point-of-purchase communication are low, more than that, management can easily fine tune point-of-purchase communication to reflect changing conditions.

However, these messages are usually directed at the consumers who are already committed, at least partly, to purchasing the product or one from their evoked set. Point-of-purchase communication messages fail to reach those not actively engaged in the shopping activity. Another weakness of point-of-purchase communication is that there can be difficulties maintaining message continuity across a large number of outlets, unless rigorously controlled by store management, the large amount of point-of-purchase communication materials can lead to clutter and deterioration in the perception shoppers have of a retail outlet.

Conclusions

As a push technique, good dealer displays may induce a retailer to carry a certain line or to promote a new product. However, point-of-purchase communication is primarily a pull technique consisting of advertising or display materials at the retail location to build traffic, advertise the product and promote impulse buying. Point-of-purchase communication tools have increased in importance with the trend toward self-service retailing (more and more retailers use this form of sales in Romanian stores). With a fewer and less knowledgeable salespeople available to help them, customers are forced to make purchasing decision on their own. The proliferation of point-of-purchase communication displays has led retailers to be more discriminating in what they actually use. Most of them like hypermarkets (Carrefour, Cora, Real), and other supermarkets or discount markets are beginning to insist on well-designed, attractive materials that will blend nicely with their store atmosphere. In our country, retailers, a great part of them, recognize the importance of point-of-purchase communication, but, unfortunately they experience many shortcomings in current practice.

The changes in the competitive environment determined the small and medium enterprises to identify new ways to satisfy their clients and to offer them constantly value in a way much more efficient than their competitors. In order to gain competitive advantage, the firms must choose the type of competitive advantage that she is trying to obtain and the field in which she will obtain it. The choice for the competitive field or for the activities of the firm can play an important role in determining the competitive advantage because the firm aims to establish a profitable and sustainable position against the forces that determine the competition in its field of activity. The survival of small and medium enterprises in a highly globalized and competitive environment suggests that these firms have different competences and they use them efficiently.

Keywords: competitive advantage, strategic competitive advantage, small and medium enterprises

1. Small and Medium Enterprises situation and competitive advantage

The changes in the competitive environment determined the small and medium enterprises to identify new ways to satisfy their clients and to offer them constantly value in a way much more efficient than their competitors. In order to achieve these they must be competitive that is to have the capacity to increase their income by raising their sales and / or profit margins on the market they are operating on so they can protect their positions in the next competitive rounds as their products and processes evolve.

According to the European Union classification the small enterprises represent those firms that have less than 50 employees and maximum ten millions Euros revenues; the medium enterprises represent those firms that have less than 250 employees and maximum fifty millions Euros revenues.

OECD (Organisation for Economic Co-operation and Development), in its report regarding Small and Medium Enterprises presented some of their characteristics:

- **Small and Medium Enterprises represent a large part of the economic sector**
 - Small and Medium Enterprises will continue to represent a large part of the economic sector and will generate most of the profit. Even so the sector of Small and Medium Enterprises is characterized by highly dynamism and a powerful entrepreneurial activity, it must be kept in mind that many of them are small mature enterprises that serve the local market, many of them struggling to remain competitive.
- **Small and Medium Enterprises represent an important source of innovations**
 - According to the last researches approximately 30-60% from the small and medium enterprises from the production sector from OCDE countries can be characterized as innovative. Smaller firms tend to be more and more innovative, engaging step by step in efforts for research and development and innovation in fields related to commercialization of

the existing technologies, creation of products and services and the implementation of the flexible working practices. The smaller innovative firms have the agility to answer quickly to the technological changes and customers needs. However, can experience problems in acquiring the resources needed to answer to the rapid changes; some of them solved this problem by joining to the cooperation networks in order to improve their innovative capabilities.

- **In a global market small and medium enterprises are internationalizing progressive**
 - In a global market, the internationalization is vital for small and medium enterprises. Although many of them continue to focus on local market, an important part of them are becoming international and have to design products and services for international market. Market liberalization and deregulations, which contribute to the global trend of restructuring, are exposing small and medium enterprises to a powerful international competition making them to substantially cut the costs. Further more, the increasing of the technological complexity and higher costs related to research and developments are forcing the smaller firms to search for the connections and alliances on the global level. Such arrangements are including partnerships in international strategic alliances, participation (active or as a target) to the international mergers and acquisition; acting as a specialized supplier for the multinational corporations; involvement in the globalized networks informal and/or electronic.

Many small and medium enterprises are not ready for participating to this type of business connections and need assistance to access strategic information and technology, especially IT&C; many small and medium enterprises are also lacking of proper managerial capabilities and well trained employees in order to face the challenges of the global market.

In final years the concept of competitive advantage started to occupy the central place in the firms' strategies. Firms learned to speak more and more about the notion of competitive advantage like something they must have.

In order to gain competitive advantage, the firms must choose the type of competitive advantage that she is trying to obtain and the field in which she will obtain it. The choice for the competitive field or for the activities of the firm can play an important role in determining the competitive advantage because the firm aims to establish a profitable and sustainable position against the forces that determine the competition in its field of activity.

Once gained, the competitive advantages can be eroded, can be copied or counterattacked by competitors, therefore for a company is important to gain these advantages, but more important is keeping them over vast periods of time, allowing the firm to situate itself in front of the competition for a long time. A competitive advantage can be born by implementing a strategy of value creation that hadn't been implemented before by other competitors or can be born by realizing the same strategies by competitors, but in a superior way. Maintaining the competitive advantages over long periods of time transform them in strategic or sustainable competitive advantages.

In order to maintain their strategic competitive advantages firms must to constantly offer superior value for their clients. The strategic competitive advantage allows for a firm to maintain and improve its competitive position on the market. It represents that element that allows firm to survive for a long time in front of the competition.

The base of the long term success of a firm is made by the obtaining and maintaining the strategic competitive advantage. That is why the key element in strategic marketing is represented by the identification of the resources and firm's behavior that can lead to strategic competitive advantage.

2. The sources of obtaining competitive advantage

The sources of the strategic competitive advantages can be found in three categories: the first category contain the competitive advantages seen from the point of view of the industry structure, being enounced by Michael Porter. The second category is based on the resources and the third category is based on relationships.

So, in the vision of Michael Porter the five competitive forces which influence the firm's activity and which put pressure on it, are: the threat coming from the new firms entered on the market; the intensity of

the current competition; the pressure from the replacement products; the negotiation power of the buyers; the negotiation power of the suppliers.

The resource based perspective it is based on exploring strong and weak points of the competition in order to identify the causes for a potential strategic competitive advantage. Barney defines the firms' resources as it follow: "the firm's resources gather all the goods, abilities, organizational process, firms' attributes, information, knowledge etc. controlled by a firm which allow it to conceive and implement strategies that are improving its effective power and efficiency".

The third perspective, the relationship one includes the relations between the firms as a rare, valuable and hard to imitate resource which can be a source of competitive advantage. Firms are participating to various business relationships, over their life cycle, together with the customers, clients, partners and competitors. Unavoidable the firm's performance will be influenced positively or negatively by the business and by the entire network of relations established.

Systematically, the sources of obtaining strategic competitive advantages can be divided in:

- **Characteristic capabilities.** The strategic competitive advantage is obtained by constant development of new capabilities and resources as a response to rapid changes of the market. Among these resources and capabilities, the knowledge represents the most valuable asset.
- **Human resources.** In the modern economy, the competition is a matter of goods and services. A factor that can differentiate an organization by its competitors, producers of goods or services from public or private sector, is represented by its employees that is the way the firm administrates and use its human resources.
- **Radical innovation.** The firm's long term success is related to its capacity of innovation. The firms' investments in products and processes improvement are leading to profit, but the radical innovation is one that will lead the firm on new markets.
- **The externalization of the competitive advantage sources.** Recently, the attention of the researches moved from analyzing the firm alone toward analyzing its supply chain as a whole unit for gaining competitive advantage. The success key for Toyota seems to be the effective integration of the supply process which leads to improvement of the strategic management of the firm as well as the timing of the production process of the firm with the suppliers, creating the system *just-in-time*.
- **Organizational culture.** The power of the organizational culture is another competitive advantage. A firm positioned to success can built and maintain a culture oriented toward innovation, in which employees are following the cause and the mission of the organization.
- **Firm's management.** The manager is the one shaping a group of people into a team, transforming them in a force that allows for a firm to obtain strategic competitive advantages.
- **Knowledge management.** The growth and globalization, combined with the rapidly development of the information technology had enabled firms to create sophisticate systems of knowledge management in order to create strategic competitive advantages.
- **Scale economies** represent an important quantitative factor being obtained according with the production volume, enabling to the firm to significantly reduce costs, especially the fixed ones.
- **The superior value offered to international clients.** The competitive advantages result from the firm's ability to achieve the activities either to lower costs than their competitors either in other ways that create value for the client and allow firms to ask for a higher price.

3. Research on small and medium enterprises from Vâlcea County

The research on small and medium enterprises was part of the project "Identification of the small and medium enterprises' factors determining competitiveness increasing and cluster opportunities. Methods and techniques for an European entrepreneurship", financed by CNCISIS. It was done on 73 small and medium enterprises from various sectors. Among others problems the research was trying to establish the elements used by small and medium enterprises in order to achieve competitive advantages. The research was conducted on two ways: first, we tried to identify the elements that constitute the competitive potential from the firm point of view; second we analyzed the competitive instruments used by firms.

In the research of the elements that constitute the competitive potential from the firm point of view we used 25 elements, as it follows:

1. Possibilities of financing the current activities
2. Possibilities of financing the development from its own funds
3. Possibilities of financing the development using external means
4. The quality of production equipments
5. The advance of the production technologies
6. The flexibility of the production system
7. The technical culture of the employees
8. Research and Development spending
9. The quality of the staff involved in Research and Development
10. Possibilities to acquire modern constructions and technological solutions
11. The quality level of the management system
12. Rank given to quality assurance problems
13. Access to key resources
14. Knowledge of present and future needs of costumers
15. Knowledge of competitors
16. Rank given to marketing activities
17. Rank given to expansion on foreign markets
18. The quality of the staff involved in marketing.
19. The level of marketing spending
20. The quality of the motivational system
21. The employee attitude
22. Professional level of the team.
23. Desire to improve qualifications
24. Knowledge of the firm and its products on the market
25. Reputation (image, good recognition) of the firm

Evaluating the importance of the instrument for the firms it is interestingly to notice that in 2 of the 25 measures of the competitive potential the mean assessment of the weight exceeded 5,00, and in the weight are of bellow 3,00. The highest ranks are attributed to the following factors:

- Reputation (image, good recognition) of the firm (M=5,21),
- Knowledge of the firm and its products on the market (M=5,02),
- Knowledge of present and future needs of costumers (M=4,86),
- Knowledge of competitors (M=4,70),
- Rank given to quality assurance problems (M=4,60).

Regarding the evaluation of the situation of applying the competitive instruments compared with firms' competitors the highest ranks were attributed to the following measures:

- Reputation (image, good recognition) of the firm (M=4,40),
- Knowledge of competitors (M=4,29),
- Knowledge of the firm and its products on the market (M=4,21),
- Rank given to quality assurance problems (M=4,02).

Attention must also be paid to the fact that the assessment of each factor of the competitive potential is bellow the weight of respective factor. Generally, it can be stated that, in opinion of the firms under study, their competitive potential looks good. Only 16 among proposed measures of the competitive potential were obtained an average score of above 3,00, which means that the firms under study are better than their average rival in those areas.

It is also significant that in 4 of the 25 factors the mean assessment of the situation exceeded 3,00, which indicated a slightly higher competitive potential than the average rivals on the markets.

At the same time, we remark that the standard deviation of assessment of each factor is smaller than the standard deviation of respective factor, yet big. This fact shows that the sampling is good, since the firms work in very different terms.

For the competitive instruments used by firms, we used the followings:

1. Price
2. Quality
3. Technological advance
4. Complexity of offer
5. Packing
6. Promptness of deliveries
7. Payment terms
8. Advertising and sales promotion
9. The frequency of launching new products
10. Distribution network adapted to client
11. The range of services
12. Quality of the services
13. Price of the services
14. Warranty terms
15. The brand of the product

Analyzing the instruments of competing, the highest weights were attributed to the following instruments:

- Quality (M=4,93),
- Quality of services (M=4,58),
- Promptness of deliveries (M=4,23),
- Complexity of offer (M=4,21).

It is surprising that the launching new products were assessed as unimportant. This fact proves that the market economy is out of order.

Also, we observe that the conception of managers regarding to weight of instruments of competing diverge, since the values of standard deviation are bigger.

The evaluation of the situation of applying the competitive instruments compared with firms' competitors show that the majority of those instruments (11 of the 15 instruments) were assessed in the interval 3,00 - 4,00. The best situation seems to be in the following areas:

- Quality (M=4,19),
- Promptness of deliveries (M=3,93),
- Quality of services (M=3,93).

Motto: “You should always try to go up very high, if you want to see very far...”

Constantin Brancusi

Although many people believe that entrepreneurs are born like this and they cannot be trained, experience has proved that they can be taught, and a positive environment encourages entrepreneurial thinking, improves the innovation concept and leads to a higher level of economic and social support.

Business development involves studies on the desires and choices made by people. Never can be the economic system self sufficient to meet completely people’s needs that is why an efficient system of supplying resources, insufficient related to the unlimited desires of goods and services, has been always asked for.

The present market is characterized by an increased competition, its challenges calling for new solutions and techniques. World competition, taxes, profits, wealth, inflation, recession, jobs, unemployment, abundance, lack of resources, modern devices, all these aspects have a strong impact upon the options and action strategies in business.

Keywords: entrepreneurship, small and medium enterprise, competitiveness

The entrepreneurship concept, through its complex content and the large number of meanings, has not allowed a direct definition that should be accepted by all economists or that should be applied in any economy because it may leave out any valuable element that defines its history. Researchers in the field face the lack of a common notional framework. In its history, researchers in different fields of social science have brought different definitions and interpretations in order to define this notion, considered sometimes, abstract. Thus, entrepreneurship has been identified with uncertainty, the activity of productive resources coordination, innovation, capital supplying.

The entrepreneur has been seen in different ways. Richard Cantillon, J. B Say, Joseph Schumpeter or Peter Drucker define the entrepreneur trying to identify his place and the role in the business field.

The entrepreneur is likely to risk his career, time, and financial safety, to assume risks in the name of an idea, a person that “looks for change, is sensible to change and exploits it as an opportunity.”

“In Romania, Virgil Madgearu is the one who has defined entrepreneurship, explaining the notion of entrepreneur as a result of that of enterprise.” Entrepreneurial business differs according to the organization type and projects typology. Nowadays, there are different organizations that support entrepreneurs: specialized government agencies, business incubators, scientific parks and non-governmental organizations.

Entrepreneurship can be seen as a process of discovering, evaluating and exploiting opportunities, which take the form of a business. Therefore, entrepreneurship is an important concept in the economic theory that each and every stage has adapted in order to meet the innovations and the spirit of those times.

Entrepreneurship is sometimes difficult, many businesses having a short life because of bankruptcy. The community culture has an important influence on entrepreneurship.

The present market is characterized by an increased competition, its challenges calling for new solutions and techniques. World competition, taxes, profits, wealth, inflation, recession, jobs, unemployment, abundance, lack of resources, modern devices, all these aspects have a strong impact upon the options and action strategies in business.

The business operates like an open system, always influenced and moderated by the external environment factors. As a consequence of the received and sent information, the company tries to fit its environment and to influence the external systems it has contact with. Entrepreneurial relations are based on mutual flows of information and responsibilities that exist among entrepreneurs and customers, employees, shareholders and the local community.

Specialists have in view two steps in the process of economic development in developing countries: economic growth and market changes. Within this context, entrepreneurship is considered to be the force that generates both growth and change, being a necessary tool in the economic development process.

Since entrepreneurs are closely related to innovation, new methods of production and new goods in a country are conditioned by their existence, the entrepreneurs being the ones that change the market. In spite of entrepreneurship important role, few countries have developed supporting programs, many of them supporting entrepreneurship only in the form of international companies and less, in the form of a national, specific entrepreneurship.

The entrepreneurs have many qualities required by their desire to achieve the aimed goal: initiative and tenacity, risk involvement, efficiency and quality, following specific goals, tasks specification and their improvement, self confidence, the ability to persuade and to influence partners and employees, knowledge in many fields.

Entrepreneurs have the ability to use different means in order to achieve certain skills, specific and behavioral techniques that can be learned, practiced and perfected. The success in business depends to a large extent on the ones involved in different actions. They should own many native skills, developed through a thorough economic training and underlined through experience and other people's notice.

A business success depends on the people that manage it, on the entrepreneur's skills and abilities. People have tried to make his profile but they have come up to the conclusion that there is no pattern for those who want to belong to the business world. Alfred Marshall suggests that people can be trained to get the necessary abilities. Unfortunately, the opportunities regarding entrepreneurs' improvement are often limited by the economic environment. Although, the entrepreneurs own some common skills, they are completely different, and their success depends on the economic situations in which they operate.

Different researchers have underlined certain features they believe are common to all entrepreneurs. Thus, the latter are considered to be risk bearers, coordinators and organizers, leaders, innovators and creative imitators.

The literature in the field has mentioned the existence of demand and supply theories, regarding the way in which people can become entrepreneurs. According the demand theory, anyone can be convinced by circumstances or opportunities to become an entrepreneur. Researches show that their decision is based on their conviction that they can influence their destiny, their self-confidence determining them to think so.

A more general theory says that the entrepreneurs are the result of a combination between opportunities and people well positioned that can benefit of these opportunities, taking into consideration the way in which the environment factors (capital, competition) influence the entrepreneurs' number.

On the other hand, most successful entrepreneurs are, in their turn, family entrepreneurs, owing to a large extent their success to the training offered by their families.

In Western countries there is a general impression that any entrepreneur belongs to lower social classes, immigrants or people with little education, lead by the strong desire for affirmation. And this is due to the fact that the first studies done in this field describe the entrepreneur's features in social-demographic and motivation terms in order to define his profile. This type of analysis does not take into consideration the environment that is in permanent change, influencing thus the entrepreneur's characteristics. Romanian entrepreneurs, according to statistics, are mainly young men, under 40 years old, high-school and university graduates that had previously worked as unskilled workers (the large number of companies founded between 2000 and 2003 by former unskilled workers can be a consequence of the entrepreneurial

orientation of those who had been made redundant in state-owned companies, benefiting of compensation and support for setting up and developing a business).

The large number of definitions and their content prove that the entrepreneurs' world is a very different and heterogeneous one. Its nature is very much influenced by personality factors, family and professional experience, mainly, by the economic environment.

The economic power, interstate integration, low costs, competition are true mechanisms that emphasize the entrepreneur's vocational elements. The environment elements, that are in permanent change require a permanent adjustment of such mechanisms.

The entrepreneurial activity involves the existence of many categories:

- entrepreneurs that try to impose their own business idea;
- entrepreneurs and team leaders or family business members, interested in other people's experience;
- investors, the ones that bring the capital and at the same time provide the possibilities of supplying or selling the products;
- all those involved in training activities: authorized accountants, specialists, banking staff, etc;
- politicians that set up, on a local or national level, the economic or fiscal policies, encouraging or stopping the business development.

The European Union provides a favorable context for developing the entrepreneurial spirit, an important context for an economy. That is why, the studies identifying the secrets of the entrepreneurs' behavior that have had success seem to be a real necessity. Nobody is born to be an entrepreneur. Success does not rely on the entrepreneur's origin, but his needs and tenacity influence it, the economic and cultural environment. The study of the entrepreneur also requires a psychological analysis of his complex and multidimensional behavior. He should be placed within a team or within an economic system, environments that can influence his behavior.

These elements help him overpass the obstacles in order to take advantage of the opportunities he is offered. The nature of this process is the one that calls for an original way of thinking and initiative spirit. The business development also brings inherent failures, determined by the existence of such notions as risk and innovation.

The entrepreneur can study the changes on the market in order to identify the opportunities that can appear in future. He has to take into consideration the fact that "business moves fast and opportunities move even faster". Innovation is the one that develops such changes.

A successful entrepreneur investigates and analyses the change in order to find opportunities for innovations. Peter Drucker identified seven sources for the new opportunity: the unexpected (success or failure); incompatibility (a difference between what really and what we expect to be); the need; the market and the industry structure; demography; changes of perception; new knowledge. The factor "chance" explains why many entrepreneurs have remained modest people in spite of their success.

The entrepreneur is the one who proposes and achieves a business, a businessman. He should be a credible person, endowed with will and strong motivation, as well as with professional and managerial abilities that determines the orientation towards an optimal satisfaction of customers.

The business success depends on the entrepreneur's qualities and the personality, on: intellectual and behavioral abilities, skill and competence got through learning and experience.

From the behavioral point of view, "the winner is sometimes characterized by a very strong dynamism and by an unchallenging energy that helps him to act, generating as main behavior features, the ambition and the desire to succeed, and especially the behavioral dynamism (personal engagement, self-determination, tenacity).

To all these one can add empathy, a characteristic of human personality, that interferes in any kind of inter-human relations and it involves a clear understanding of the partner's psychology in order to anticipate his/her intentions and behavior and to communicate efficiently and in agreement.

Empathy is very important in activities that involve the partners' understanding and their reaction anticipation in certain situations: education, health, business, and politics.

By analyzing the entrepreneur's personality one can underline the necessity of some compulsory abilities: efficient communication, cooperation, trust, the ability to attract other people, self-control and the controlling of other activities, innovation.

Any entrepreneur should be acquainted with communication and behavior techniques, with will and courage, the competition environment challenges.

The economic system of independent initiative is based on the private property, the price system and competition, profit motivation and the technical application of the knowledge about production and delivery processes.

The entrepreneurial spirit is an optimal combination between innovation, risk and the ability to take decisions in uncertain conditions generated by the market evolution.

Here are three components of any entrepreneur: to identify an opportunity; to follow this opportunity behind the existent resources; to believe that this opportunity can also be achieved. The entrepreneurs can be named the "engines" of change.

The entrepreneur is a person that takes the risk of setting up his own business, is a person that proposes and performs a business, a credible personality, with strong motivation, as well as with professional and managerial competence that determines the orientation towards customers' optimal satisfaction. The existence of some national differences in entrepreneurial activities, the fact that some countries are more entrepreneurial than others generate the profiles of a country in entrepreneurial perspective.

Within national economic systems and the European and the world economy, small and medium size firms are commonly associated with companies of the same size, small and medium size companies.

The entrepreneurs have much the same characteristics as leaders. The former are sometimes compared with managers and administrators that are more methodical and less likely to take the risk. The need of success and the desire to build, pragmatism, the need of independence and achievement, shrewdness, creativity, gumption, education together with professional experience complete an entrepreneur's characteristics. He has to be able to synthesize information from many sources, to be persuasive, to know how to mix shrewdness with honesty.

Nevertheless, psychological and financial satisfactions are strong incentives for taking the risk of setting up an independent business. For those who appreciate independence, free initiative is attractive. However, the entrepreneurs' independence is limited by their responsibilities for the customers, for their employees, for community.

Although many people believe that entrepreneurs are born like this and they cannot be trained, experience has proved that they can be taught, and a positive environment encourages entrepreneurial thinking, improves the innovation concept and leads to a higher level of economic and social support.

The entrepreneur should have a strong desire for the adventure of starting a business.

The philosophy of personal business can be seen in terms of quality and performance whose meaning regarding the present affairs in Romania undergoes a process of re-definition. Within the present context, when Romania is a member of the European Union, the manager of any business should be as much concerned with complying the performed activities to the European standards, aspect that should receive much importance. This is one of the main conditions for success, and in many cases for the business survival. In order to succeed on a market marked by a strong competition, quality products are the main necessity.

Success is not a sudden phenomenon. In order to succeed one has to work very hard and should also have some special qualities. Here are some personality qualities: perseverance, severity, involvement and correctness, permanent informing and entrepreneurial training.

The traditional indices of success, for obtaining the highest profit are differently regarded. Success is closely related to a positive image of the business whose cornerstone is trust, with the need for creative challenge. In order to enter the business field, the entrepreneur needs vocation, opportunities and projects, stimulation and support, freedom to plan his time and activities, freedom to manage the family aspects, personalized working environment, ethical agreement between work and personal values, good human relations, permanent learning and the gain of the customers' respect.

Having an important role in business, the entrepreneurial spirit represents a special resource for free initiative economy. The entrepreneur sacrifices his energy, time, knowledge, and managerial knowledge and takes risks for running a private business, for providing the goods and services required by customers.

The entrepreneur plays a key role in taking the risks resulting from the market evolution, he is willing and able to take the risk of offering new products and services to customers, generating thus new fields of activity and new markets. The entrepreneur has a dynamic role in creating new jobs for obtaining new products and services.

At the same time, the entrepreneurs are motivated by the desire of independence and power, assuming the decision role in organizing the economic resources in order to generate new products and services. The possibility of exercising authority and of deciding upon the economic resources is attractive for many people, as well as the entrepreneurial spirit. One can thus appreciate that the entrepreneurial spirit is a mixture of innovation, risk and the ability to take decisions in uncertain conditions generated by the dynamic evolution of the market.

The reward for this vital production factor is the profit. In Romania there are not few those who had the courage to start a business on their behalves.

Ovidiu Nicolescu, a representative of the National Council of Small and Medium Size Enterprises In Romania, within the latest Convention of the council, in April 2008, mentioned that "in order to keep the pace with the European member states we need ten thousands of new companies, hundred thousands of trained staff... In the last two years, the number of Small and Medium Size Enterprise has gone up to 25.000 yearly, but the growth is still necessary to be increased." Romania has to develop a new generation of entrepreneurs whose personal abilities should be trained as early as the primary school and developed at higher levels, in high schools and universities. The necessary abilities: responsibility, directness, adjustment, initiative and managerial spirit should allow them to identify and implement appropriate strategies for entering on marketing and maintaining their position. Changed from an owner into a manager, the Romanian entrepreneur must find an identity and his own history that will make him distinctive in the European context.

A MARKETING STRATEGY ON PHOTOVOLTAIC MARKET

Coita Dorin Cristian

Universitatea din Oradea, Facultatea de Științe Economice, dcoita@uoradea.ro

Abstract: Photovoltaic is an increasingly important energy technology. Deriving energy from the sun offers numerous environmental benefits. It is an extremely clean energy source, and few other power-generating technologies have as little environmental impact as photovoltaic. In this article we explored some dimensions of photovoltaic market and suggested a marketing strategy for solar panels manufacturers

Key terms: Photovoltaic Market, Solar Panels, Strategy

Photovoltaic Market

Photovoltaic is an increasingly important energy technology. Deriving energy from the sun offers numerous environmental benefits. It is an extremely clean energy source, and few other power-generating technologies have as little environmental impact as photovoltaics. As it quietly generates electricity from light, photovoltaic produces no air pollution or hazardous waste. Moreover, it does not require liquid or gaseous fuels to be transported or combusted. Also, because its energy source, sunlight, is free and abundant, PV systems can offer virtually guaranteed access to electric power.

There are basically two technologies for producing solar panels:

1. Solar panels with Poly Crystalline silicon based technology. This technology has several characteristics:
 - a) **Is mainly based on silicon as raw material.** The global silicon market is quite restricted and closed. The price of silicon increases constantly. For some years silicon supply (processed silicon) was the bottleneck of the PV industry. Due to the vast expansion of production capacities of known players and the introduction of new capacities by new players, silicon capacities will reach 8-10 GWp by 2010. As silicon is a major raw material for c-Si technologies (93 % in 2006), silicon capacities predefine the upper production limit for the industry.
 - b) **The panel is useful only for one side.**
 - c) **The sun has to be perpendicular on the panel.** In order to be effective, the sun has to be perpendicular on the panel, so a motor is needed for each panel to rotate it after the sun.
 - d) **The shadow effect.** This effect makes the capacity of producing energy to decrease dramatically when there is a cloud or some shadow on the panel.
 - e) **Production of panels it's not environmentally friendly.** There are a lot of chemical substances needed for producing Poly Crystalline silicon panels which makes the production to be contaminating.
 - f) **High prices of the panels.** Prices express the high costs of raw materials and the cost of the production. Estimated production cost increases to 3,5 Euro per W.

2. Thin Film Technology.

Approximately 4 GW of Thin Film capacity is expected to be available by the end of 2010. This would represent 20 % of the overall module production capacity. Although all technologies face high expansion rates, Thin Film capacities are currently expanding at a faster rate than capacities for other technologies.

The TF industry expects to penetrate some of the traditional markets for PV, while creating entirely new applications categories, based on TF PV's cost, weight and flexibility. Integrated building products are particularly attractive to the TF PV maker, because the requirements of this sector fit well with the characteristics of TF PV and the addressable market is large. A potential for TF PV in the mobile and disposable electronics markets has also attracted interest in certain quarters.

Advantages of the Thin Film Technology are:

- **Effective:** This technology thin-film silicon allows reaching the lowest device cost per WP. Estimated cost per WP is 90 cents (EUR).

- Costs, weight and flexibility.
- Future Potential: this technology shows major development potential for the future. Higher energy harvest is enabled by tandem cells and future development
- Less silicon: large area thin-film silicon solar modules require only a fraction of the expensive silicon absorber material. In fact, it requires silene gas which is a waste of silicon factories
- High productivity: The solar cells are deposited directly on large area glass substrates resulting in very high productivity
- Plenty of raw materials: No shortage on any used device materials exists
- Environmentally friendly: The device materials used are all environmentally friendly
- Can be used in future functions of the buildings: By their large size and attractive, uniform appearance thin-film silicon solar modules are also ideally suited for building integrated photovoltaic (BIPV) solutions. Thus, total cost can be reduced by combining photovoltaic power generation with building functions.
- Can be used as glass for windows: As a building material A-Si can be used as glass for windows, can be cut in pieces, doesn't require curtains, better technology than termopan

Actual Market

According to EPIA's study *Global Market Outlook for Photovoltaics until 2012*, the solar PV market has been booming over the last years and it is forecasted to confirm this trend in the coming years. By the end of 2007 the global cumulative capacity exceeded 9 GWp. The European Union contributes to around 50 % of the global cumulative capacity.

PV market deployment is to a large extent dependent on the political framework of any given country. Support mechanisms are denned in national laws. The introduction, modification or fading out of such support schemes can have profound consequences on PV industries. PV Market forecasts therefore depend on a deep understanding of the political framework.

Future Development of the Market

An annual growth rate in excess of 30 percent is anticipated for the coming years.

European Photovoltaic Industry Association has derived 2 representative scenarios for the future development of the PV industry.

The Pessimistic scenario: This scenario is based on the assumptions of a 'business as usual' scenario which does not assume any major enforcement of support mechanisms.

The Policy driven scenario: In this scenario, EPIA expects the follow up and/or introduction of support mechanisms, namely feed-in tariffs, in a large number of countries.

Current developments of European Energy Policy and forecasts on prospective legislation: In January 2007 the European Commission has issued a Communication proposing a comprehensive new Energy Policy for Europe aiming at combating climate change and ensuring security of energy supply in Europe, while boosting its competitiveness. The new strategy includes a legally binding target of a 20% share of renewable energy in European overall energy mix by 2010.

New Renewable Energy Legislation under preparation

The European Commission is working on a Proposal for a new framework Directive for the promotion of renewable energy energy sources. It is expected tht this Directive will impose on Member States the obligation to have a certain amount of internal consumption of energy supplied through renewable energy sources by 2020. The final target of this Directive will be to have 20% of European energy consumption supplied through renewable energy sources by 2020.

Countries

The market for solar panels contains countries in Europe (Germany, Spain, Italy, Greece, France, Portugal) and also USA, China, Japan, South Korea, India.

Europe was the largest regional market for solar photovoltaics (PV) in 2006. The European Major PV markets of Germany, Spain, Italy, Portugal, France and Greece accounted for 1,125 megawatts of PV demand. Dominant among this group was Germany at 968 megawatts in 2006, whose size made it by far the largest in the world. In this market, private individuals in residential applications accounted for 41% of the market. There was a downward trend in system sizes as the share of large PV projects of MW scale fell, mainly due to changing economics for ground-mounted systems and for the customer segment of Investor Groups. The share of thin films in ground-mounted installations grew strongly, with a single manufacturer as the main beneficiary.

Spain secured second place among the European markets as it rapidly grew to 110 megawatts in 2006 from 35 megawatts a year earlier. The Community of Navarra was the largest regional market.

Revisions to feed-in tariff programs during 2006 and early 2007 have provided the platform for rapid demand growth in Spain and Italy, which are now categorized as the "second tier" Major European PV markets. France, Greece, and Portugal remain at an earlier stage of market development, each with their own constraints over their future growth, which mean that these countries will remain third tier markets over the forecast period (2007-2011).

As for the United States and other countries there is a growing international demand. Growing markets include those where factors such as high electricity prices and subsidies or other incentives improve the cost-effectiveness of PV systems. These prices represent those for grid-connected customers.

Germany is expected to remain the market leader and even increase its market size considerably over the next years. The biggest growth is foreseen for the Rest Europe in particular in countries such as Spain, Italy, France and Greece. The USA will also be able to use its vast solar potential and will challenge Germany as the Number 1 PV country. PV development in Japan will, to a large extent, depend on the decision of the Japanese government to reintroduce, or not, a support program. Also the Rest of Asia, in particular India and South Korea, will face increasing demand for PV.

Market Segments

A. On-Grid (Grid-Connected) Customers

- Residential customers: houses, villages and small communities
 - Existing residential homes
 - New home constructions
 - Large buildings

On-Grid Sales Predominate: The markets for solar PV have undergone a dramatic shift in the last 5 years. Prior to 1999 the primarily market for PV was in off-grid applications. However now over 78% of the global market is for grid-connected applications where the power is fed into the electrical distribution network. The advantages of TF panels are that they are cheaper as usual monocrystalline or poly crystalline panels.

- Industrial customers
 - Big Factories using the roofs as a surface for installing solar panels.
 - Stables, farms and farm houses, using roofs for solar panels.
 - Big buildings (offices, halls) designed for using Solar Panels instead of regular windows.

B. Off- Grid Customers

- mid-size industrial:
 - Small Consumers of Electricity
 - Weather Stations
 - Semaphors
 - Water Pumping
 - Rural electrification

- Telecommunications

C. Specialized Producers of Electricity

Solar Farms will be the most important market segment. A 'solar farm' is a grid-connected solar power plant based on several subsystems, each with their own investor. The electricity produced is sold to the local energy utility companies for an attractive feed-in tariff, guaranteed by national laws.

International Targets for Photovoltaic Manufacture

As is in other developing technologies, a critical element in the development and growth of the solar PV industry is the setting of long-term growth targets for the industry. The following table gives examples of targets for PV in other countries.

Figure 1: Examples of National Targets for PV

A Suggested Marketing Strategy

Marketing efforts will be done with the contribution of two separate departments within company:

1. Marketing: Marketing Responsible and externalized consulting company
2. Sales: Sales Responsible

Marketing will have following responsibilities:

- Research and studies on global market: demand, competition, technologies, policies
- Analyze the international environment regarding solar photovoltaic products and technologies
- Identify market segments and choosing the most profitable segments for the company
- Assist in building business strategies and policies
- Know the needs of existing and future clients and collaborating with clients for suggesting the best concepts for using products and technologies
- Promote the usage of the products as a technology to be used in residential and industrial building sectors. Develop relationships with architects and building companies.
- Build and use relevant marketing mixes for different market segments
- Build and maintain the company's image and reputation.
- Develop manufacturer identity and brand.
- Establish the presence of the company on the Internet. Conceive E-marketing strategy, programs and campaigns, identify and use the e-marketing tools.
- Build and maintain the network with suppliers, clients, regulating authorities, professionals, ecologist organizations
- Organize the presence of the company to international seminars and conferences regarding PV products, technologies, green energy and social responsibility.
- Establish the network of sales offices and representatives in target countries.
- Develop social responsibility programs
- Supervise and assist the sales force. Build direct marketing campaigns.
- Coordinate with other departments of the company

Sales will have following responsibilities:

- Identify potential clients
- Establish the offer, communicate and negotiate the terms of the transactions
- Negotiate and sign the contracts
- Report sales, sales trends, market situation
- Manage the sales force: recruit select and train the sales representatives
- Manage the overseas sales representatives

Abstract: Online business is an easy way to make money, using the tools of internet sourcing and multinational purchasing. There are many business opportunity review sites on the Internet. The internet business opportunity is also used for global sourcing. The earning potential in an internet business is very high with little investment. To evaluate a business opportunity the first and foremost things to do is to search the internet to get views on the area of business exploration. A Google search will give a number of official forums for any business opportunity. It is also advisable to monitor the website traffic of the website of the business. Prediction market is "new Web tool", which is used to transform the idea pipelines inside their companies.

Key words: online business, e-commerce, business trent

Online Business

Hard work is the key to success in any business opportunity based on internet sourcing. For example, home business exists in music industry for creating and downloading websites to promote music. Internet business is also used extensively by multinational purchasing experts. The online business should be an easy way to understand and start with so that money can be made quickly. For example Adsense program of Google has been very successful as a online business, in which revenue is generated by registering clicks on the relevant ads displayed on the site, as it is presumed that the clicks usually lead to sales.

Email marketing and online Business

Email is a best mode of internet business marketing. An affiliate business opportunity should have an email address. An aggressive business strategy is very important to ensure building up of online business. The email list can be effectively used for directing the traffic to the business opportunity whenever an offer, post or a new article is received. 500 names in the site along with Ad sense Ads can bring more page views and clicks on the Ad sense Ads. When an online business is built, along with an email marketing, opt-in email list with more names will make a good impact on sales of affiliate program products represented by the business and is very useful for global sourcing.

5 Ways for brands and consumers cooperation

eMarketer has proposed 5 ways to make brands and consumers cooperation work:

- a) **Research:** Companies turn to the public to solve particular problems. For example, Goldsboro, a Canadian gold mining company, published its geological data and offered prize money to prospectors who submitted the best estimates of the value and location of the gold on the company's property.
- b) **Development:** By monitoring community forums and speaking directly with online opinion leaders, consumer brand manufacturers come up with ideas for new products and improvements and enhancements to existing products. For example, Dell Idea Storm is an online community where customers post their ideas on Dell products.

- c) Advertising: Major consumer brands such as American Apparel, Frito-Lay, L’Oreal, Sony and Toyota have used consumer-created ads. Frito-Lay, a division of PepsiCo, drew a lot of publicity when it invited people to create and shoot their own 30-second Doritos commercial for a chance to have it viewed during Super Bowl XLI in February 2007. More than 1,000 submissions were received.
- d) Marketing: Social shopping sites, blogs and Web sites with customer ratings and reviews are all venues for people to review and recommend products and describe how to use them. Caboodle allows retailers to have a profile and interact with site members. ThisNext, another social shopping site, invites Web retailers to submit unique products for community members to discover and promote.
- e) After-Sales Support: Apple and Dell are examples of consumer electronics manufacturers that host community forums on their sites where customers assist other customers with technical problems.

Trend over the next five years business

In a recent survey, Accenture asked more than 100 leaders in media and entertainment sectors from around the world to gauge their view of where the greatest opportunities will come from over the next five years. For the question “which sector along the media value chain is best positioned to take the advantage of growth in content opportunities?” 38% of respondents answer that it’s professional content owners. For the question “what will drive revenue growth in the next five years”, 62% views new platform soar new ways of delivery as the driver. Via Accenture

Which sector along the media value chain is best positioned to take advantage of growth in content opportunities?

What will drive revenue growth in the next five years?

Source: Beyond the hype, Accenture global content study, 2007

Where consumers prefer to buy products

According to Forrester, an overwhelming majority of consumers prefer purchasing products and services in a store. Next on the list: 13% prefer buying on the Web. The most significant difference across generations is that Gen X has the largest percentage of consumers who prefer to make purchases online.

In which of the following ways do you most prefer to buy a product or service?

Channel preferences for buying products or services by generation

Web roundup

Farecast sold!

Seattle PI reports that according to a source with knowledge of the situation, Farecast has been sold in a deal that values the Seattle online travel search startup at more than \$75 million. The buyer was not known but one natural choice is Expedia, asserted John Cook of Seattle PI. Last December, Farecast competitors SideStep and Kayak.com merged.

- a) Limeade: aims to improve employees' health and well being

Limeade today is unveiling a new Web service that it hopes will make corporate workplaces healthier, more productive and more fun. The idea is to radically transform the health assessment programs that corporations operate in order to reduce health care costs, making those programs easier to use and more engaging. At the same time, it has incorporated new questions about workplace issues and employee happiness into its offering.

- b) Zoomf: "genuine" [real estate] search engine aiming to give unbiased and complete results

Zoomf is a real estate search engine that aims to help consumers find property as simple and fast as possible to discover property to buy and let. Zoomf claims that it includes lots of easy to use features including maps so that users can see exactly where properties are located.

- c) Classified site, OLX, raised \$13.5M to compete with Craigslist

OLX allows you to meet others, express yourself, trade products, find jobs, apartments, and much more! According to TechCrunch, The idea behind OLX, in addition to becoming Craigslist for the rest of the world, is to improve on the technology of first generation classified sites. This means OLX tries to fill some missing key features [in traditional classified ad board] to really deliver a proper public service to communities everywhere.

- d) Jiffle™ makes scheduling appointments and meetings quick and simple

Jiffle is a online service that tries to accelerate the process of scheduling meetings. Jiffle's technology allows users to selectively share their Outlook calendar with their contacts and eliminate the time-

consuming back-and-forth process (seven e-mails/voicemails on average) required to set up meetings with colleagues and clients.

e) ModernFeed Wants to Be Web's Remote Control

ModernFeed.com, launched on April 7th, claims to be the Web's remote control for video content. Using framing and clearly expressed links to offsite content, ModernFeed has set out to aggregate virtually all licensed content on the Web, currently from over 500 sources, including ABC, NBC, CBS, Fox, HBO, Showtime, and other networks, plus news outlets such as the The New York Times, as well as niches such as the Boston Pops, the Waikiki Aquarium Channel, Whole Foods Market video and the Midwest Teen Sex Show.

f) Qitera: add the human touch to the intelligent web

Qitera is a next-generation information engine—a semantic web service that connects everything you know to everything you read. You either get the big picture and fresh insights on how everything is related or can organize, remix and search all the data dealing with the companies, business partners, friends or projects you track in a more productive way. Additionally, it lets you share your wisdom with your peers and publish to blogs, websites and cell phones.

g) GitHub: a “social network” for programmers

GitHub is a new hosted Git repository service that's being called a “social network” for programmers and with good reason. It also already has some high profile projects of its own on board: Ruby on Rails, Capistrano, Merb, Prototype and Scriptaculous, among others. Git decentralizes version control by giving each developer a local copy of the development history, and then changes are copied from repository to repository.

h) Edopter: helps to find out the next big trend

Edopter combines early adopter insight and worldwide buzz to predict the next big trend. edopter combines the insight of their users and the buzz building across the internet to track how popular trends are getting around the world. Unlike some other similar sites, you don't necessarily have to choose a side for a given topic, and then battle it out amongst users to prove who's right.

i) Summize: an opinion search engine

Summize is a new way to find and discover products, based upon the sentiments of millions of user reviews and blog discussions. Summize crawlers constantly scour the web to find the latest and most helpful opinions. Then, they crunch and summarize all these sentiments to produce the colorful Summize experience. According to Mashable!, Summize offers a prettier and more feature-rich tool for Twitter searching than its major competitor, Tweetscan.

j) DotHomes adds Google's StreetView to its real estate research

A few days ago Trulia added Google Street Views, and today, DotHomes adds Street Views to its real estate search site as well. Weeks after launching a US version of its real estate search site, DotHomes is moving to further integrate as many useful features into its service as quickly as possible. You'll find the Street view option included for most listings, along with the aerial view from Microsoft's Virtual Earth.

k) A real second life at Erepublik

Erepublik.com is a massive online multiplayer social strategy game a mix between a social network and a strategy game set in virtual version of the real world. At its core, Erepublik is a massive online multiplayer social strategy that aims to be intricate and accelerated enough “to attract a spectrum of both fanatical and casual gamers.” Players can be politicians, soldiers, entrepreneurs or journalists in different countries, and much of the environment is user generated. A key pitch of Erupblik is the time required to play the game: 14 minutes a day.

Conclusions:

There is not a single perfect business recipe which suits all. It varies from business to business and person to person depending upon various circumstances and needs. It is very to find a perfect online business to suit the needs of a business. It is necessary to examine and consider all aspects relating to an online business, on the products sold and training offered for business owners, by gathering necessary information.

TOWARDS AN ORGANIZATIONAL EXCELLENCE THROUGH COMMUNICATION

Cristache Nicoleta

Universitatea “Dunărea de Jos” Galați, Facultatea de Științe Economice, Galați, str.N.Bălcescu, nr. 59-61, cristache.nicoleta@yahoo.de

Susanu Irina

Universitatea “Dunărea de Jos” Galați, Facultatea de Științe Economice, Galați, str.N.Bălcescu, nr. 59-61, irisusanu@yahoo.com

Iancu Lorin

Universitatea din Oradea, ianculorin@yahoo.com

Abstract: The communication searches to take action in each of these concepts, helps to the interrelationship between the different categories of public from the internal organization of the company as well as with the external organization and influences. The organizations use communication in order to promote the interests, but a loyal and reliable message is that which answers to the public's needs and expectations. Thus, the main purpose is to search and realize continuously balance between the interests of each public category in order to know it better and to collaborate with it.

Key words: communication, organizational excellence, transparency

1. Introduction – The organizational excellence

The organizational excellence is a special practice in the modern companies' management and refers to their capacity and ability to apply a series of concepts in order to obtain some exceptional results:

- The trend towards creating value at the level of the company;
- The centering of the effort of the team members in order to satisfy the customer and to add value for the customer;
- A visionary management of the organization;
- The concern for innovation at the level of the organization;
- The continuous improvement of the company's performances;
- The concern from all those inside the organization for a corporative, coherent and sustained communication;
- The development and involvement of the human resources;
- The concern of the management team for an increase of the value understood by the employees The development of partnerships based on reciprocal or mutual advantages;
- The drawing into projects of social responsibility;
- Practising a management directed towards the future.

The communication searches to take action in each of these concepts, helps to the interrelationship between the different categories of public from the internal organization of the company as well as with the external organization and influences. The organizations use communication in order to promote the interests, but a loyal and reliable message is that which answers to the public's needs and expectations. Thus, the main purpose is to search and realize continuously balance between the interests of each public category in order to know it better and to collaborate with it.

Concerning the above-mentioned concepts, each organization must maintain a high and qualitative line of performance by providing a superior balance in order to create value for all the parts involved: shareholders, customers, employees, partners, suppliers, the external community etc. In this way, all the structures of the organization are implied on the one hand in the development of the loyalty of the parts that are interested in the organization, and on the other hand for a real economic increase. But in order to

administrate the potential conflicts between the different trained publics, the organization must use clear requests, expressed by each of them.

However, the organization must be aware of the fact that the final judge of the products quality or the offered services is the customer. Taking into consideration this perspective, the organization must take into consideration all the aspects that contribute to adding value for the customer. The value perceived by the customer represents the prospective evaluation from his part off all the advantages and of all the costs of an offer, as compared to other alternatives perceived or known by the customer. The customer's satisfaction is being associated with the way in which he perceives the level of accomplishment of the product characteristics or the offered service in comparison with what the customer expects.

In order to ensure the customers' loyalty it must be created a higher value for him. Considered from this perspective, there must be developed products and services highly different from those offered by the rivals and with a high degree of innovation, which can foresee and satisfy the needs expressed by the customer as well as the needs that the customer isn't able to perceive yet ("the unexpected quality" that delights and pleases the customer). The innovation must be understood as an important improvement of the products, services and/or processes, as well as under the form of creating new dimensions of the value for all the interested and involved parts. From a technical point of view, the innovation must be seen as being the adoption of a superior solution with the help of which certain aspects of a conflictual nature (on a technical level as well as on a managerial one) are solved without any compromises. The application of innovative ideas and solutions must not refer only to aspects of technical order, but must also be extended at the level of all the key processes of the organization. The innovation must be applied systematically, not at random.

In order to better manage the organization, the process of decision taking must be based on correct and reliable data and information that include the opinions of all the interested parts (shareholders, customers, employees, partners, suppliers etc.) The measurement of performances must arise from the needs and the development strategy of the business and must also include financial aspects as well as aspects connected to the business competitiveness in comparison with the competition. The information must be used as well as for the decisions connected to the current operations as well as for those connected to the continuous improvement process of the business. The gathered information and data must cover all the key processes of the business.

The behaviour of the managerial team contributes to the clarity and unity of the objectives of the organization, as well as a working environment in which the employees excel in. Furthermore, the organization leaders must ascertain and determine the direction of the action, create a working environment focused on the customer, clear and visible values, well-defined objectives and goals that are realistic and measurable. Practically speaking, all these aspects must balance the needs of all the interested parts.

Also, the organization leaders must create strategies and methods of work capable of leading the organization towards excellence, must stimulate the innovation and must support and encourage the development of the intellectual capital of the organization. At the same time they must motivate, inspire and encourage the employees in order to contribute to the business development, to be creative and to continuously improve and specialize.

The innovation is the result of a creative activity that leads to the elaboration of superior engineering or managerial solutions, capable of solving without any compromise a conflict of technical order, economic or mixed, that exists at a certain time between two or more systems that characterize the business. From the consequences point of view, the innovation process leads to the differentiation of the products or services as compared to those of the competition, ensures the present customer's loyalty and attracts the clientele of the competition and is able to increase the level of a business profit at very important values. The organization must be managed and administered in such a way that the innovation should become a component part of the organizational culture and integrated in the daily activities.

The organizational performance is maximized when the business is based on the knowledge dissemination, on an organizational culture oriented towards a permanent learning, on the opportunities identification, on the permanent reduction of the costs, on the processes optimization by using more and more performant methods and instruments, on the improvement of the daily activities by applying preventive solutions, not corrective ones. Attaining the higher levels of performance of the business implies the appliance of some mechanisms and organizational approaches in which the human potential of the organization is fully used. This thing depends upon the way in which are assured opportunities for the continuously improvement of the human resource and then for the effective application of the newly acquired knowledge.

The development and involvement of the human resource can result in the increase of the employees' satisfaction, the decrease of the personnel fluctuation, the harmonization of the organizational capabilities, and the improvement of the work environment for the innovation. Also, we must mention that the development of the human resource must not be directed only towards the realization of better products and services, but in the sense of the efficiency increase, auto-organization, reaction and adaptability capacity etc.

It is well-known the fact that success on a competitive globalized market requires a high quickness from the part of the organization – that is a capacity for a rapid change and a high flexibility. The organization must deal with the permanent reduction of the time interval necessary for the introduction on the market of a new product or service, as well as to answer as quickly and flexibly to the different requests of the customers'. The major improvements in these directions require and imply simplifications of the processes and activities, as well as the capacity of passing quickly from one type of process to another.

The communication activity implies fluxes of information between the organization and its publics, identifies the relevant themes for the audience, the efficient channels and establishes the right terms.⁸³⁷ During this stage the communication means can ensure the frame of efficient dialogue between the organization and the different type of public. In this way, certain organizations in the case of identifying certain deficiencies change the business behaviour by using the communication techniques specific for each public category. The employees who are multidisciplinary trained and authority authorized at the level of organization represent vital elements in order to have success in such an environment.

The different communication techniques that allow the obstacles surpassing that appear between the relationships between the employees represent the basis of the internal communication. These things must be understood as an instrument of strategic management of the company, irrespective of its size. The mission of internal communication represents the creation of the necessary conditions for a good realization of the general objectives of the company. Thus, the main aspects that are being followed are the following¹:

- the staff motivation ;
- the coherence of the actions ;
- the change of the behaviours and mentalities ;
- the improvement of the activities and productivity.

Moreover, success depends very much upon the way in which its employees are motivated to imply as much as they can in solving the daily tasks and in the unwinding of the projects of institutional development. Therefore, the staff motivation is tightly connected to the level of their satisfaction at the job or working place. Among other things, this means performant practices of work, flexible and thought for the particularity of each employee.

In a climate dominated by distrust towards the others, the organizations find it hard to put to the test the environment and social performances. If for a company being responsible is its main purpose, then it is not important that it should prove the fact that it is responsible. Yet, in the majority of cases, the companies consider that being socially responsible is just a way or mean to attain other goals. The companies are socially responsible just to be recognized as that they "do what it must be done". The social responsibility is being considered a strategy to prevent the risks and to create competitive advantages.

The corporatist social responsibility supposes taking into account the following aspects:

- The establishment of objectives that also take into account the interests of the co-interested groups – starting from the shareholders, employees, business partners , as well as suppliers , customers, creditors, dealers, ending up with consumers and community;
- The elaboration of a strategy of social involvement, strategy that is able to integrate on a long and medium term in the development strategy of the company and in the corporative communication strategy and the undertook actions to be integrated in the management and marketing objectives of the company.

Transparency is a condition of an efficient communication between the company and the co-interested groups. More than transparency in communication, credibility supposes an agreement between the statements and the actions of the company.

The interest on a long term of an organization and of its employees is better served by adopting an ethical approach in the business development, by taking measures for the environment protection from the action area of the organization and the public health, by preserving the resources and by ensuring the security of the population and the environment in the area of action. We must mention that the involvement in charity actions leads to the improvement of the organization image among the community.

In the present competitive environment, the orientation towards the future means first and foremost understanding the short and long term elements that affects the business and the outlets.

In this way there must be developed capabilities in order to anticipate the key factors and elements for ensuring the success on the market, such as:

- The customers' expectations;
- Opportunities for new business;
- Opportunities for new partnerships,
- The markets evolution;
- The technological developments,
- The community's expectations;
- The strategic movements of the competition;
- The legislation evolution etc.

The strategic objectives and the resource allocation must be adapted for these influences. The focalization towards the future also includes the development of the human resource, the development of the relationships with the suppliers, the creation of opportunities for innovation and the anticipation of public responsibility.

The organizational excellence implies the accomplishment of a balance between what represents the organization in the interior respectively: skills, managerial team, strategy, politics, marketing, personal management, resource management, processes and what the external public perceives: customer's satisfaction, employees' satisfaction, company's satisfaction, and business performances.

The supervision of these two categories and the pointing out of some discrepancies at their level generates unbalances or lacks of balances that affects the business performance and implicitly lead to difficulties in ensuring a competitive advantage on the market.

Also, the lack of an efficient and operative system of managing all the aspects that define the organization leads to significant internal losses, both of time and of material resources, human, financial and informational, and to difficulties in assuring a high added value at the level of the products and services offer.

An organization that takes possession of the concept and makes efficient communication actions expects three types of advantages: at the level of the brand management, obtaining notoriety and a good image on the market; at the level of human resources, respectively the recruitment and fidelity of the employees; at the marketing level, by investing in the specialized training of the future business partners. Gradually, the organizations become more and more conscious of the fact that through clear and sustained actions of communication they can influence the business environment in which they act and are involved.

Depending upon the management used, the organizations can choose a reactive or pro-active strategic alternative. Thus, in a reactive strategy the organization is going to react just in the moment in which it deals with a problem, trying to diminish the risks to which it is exposed on the market and in a pro-active position, it is going to search and create opportunities in order to prevent risks. The consequence will be obvious, and such an organization will stand out on the market by reducing the impact of its activities upon the community and in addition this strategic option will offer an extra value to its brands and products. In order to earn the consumers' trust, it is necessary that the whole / entire process of communication to be accomplished in both ways, to be transparent and, whenever it is possible, to imply in third organizations, such as ONGs, school institutions or governmental agencies.

To conclude, the organizations must constantly ensure that there is a balance between their actions and the wanted image. This agreement is created by: defining some coherent strategies for all the processes of the organization; the elaboration of certain criteria and references in scale that can lead to the appreciation of the steps and actions made by the employees and by the external public; reporting the performances and the

publication of reports in order to ensure transparency; consulting the co-interested groups; the involvement in programmes and actions that are in accordance with the interests and objectives of the organization and community in which it acts.

2. Organizational excellence through excellence in communication

Nowadays, communication can be mentioned as a strategic resource of an organization, therefore it is important that all the actions that are associated to this complex process to be planned, led by clear objectives, evaluated and standardized according to the general objectives of the organization.

The clear definition of the organization and the environment in which it acts are references for the orientation in the strategic management. These suggest the fact that the organizations must make strategic choices on long term and furthermore, to be able to be accomplished in the environments in which they act. In most of the strategic management theories the idea of environment is general and vaguely defined. The theory of communication helps the managers to give significance to this environment just because a great part of it is composed of publics with whom the managers are familiar with.

Also, the theorizers in strategic management distinguish two categories of environment: the economic environment or oriented towards objectives and the social environment or oriented towards institutions. The economic environment contains groups made up of consumers, competitors, suppliers and creditors. These groups supply the organization certain necessary resources and purchase or use its products and services. The social environment or institutional one is made up of groups that want to contribute to the establishment of a mission of the organization – such as the governments are, certain communities (communities, circles or groups), the co-interested groups, the employees and the activist groups. The attitude of certain managers and the lack of trusts of the public towards the corporative environment determine the specialists in communication to continuously take action to improve and protect the name and reputation of the organization. The managers must understand the necessity of conceiving organizational structures that should promote the information exchange, the dialogue and collaboration, this aspect being compulsory for no matter what organization that wants to deal with challenges regarding the management of the organization and its reputation. Through communication it is created value not only for the organization but also for the society in its totality. According to the organizational theory, an organization is efficient only if it manages to attain its proposed objectives. We must mention the fact that these do not function or work isolated, but in an environment made up and composed of numerous strategic groups.

The organizations develop a series of relationships inside and externally with different strategic partners or what represents for the specialists in public relationships co-interested groups or public groups. These categories of public have different interests towards the organization and try in this way to influence its mission and objectives.

The organizations are efficient only when they choose and attain objectives that follow the interests of the organization as well as the interests of the public categories from the environment. The communication departments build special relations with the public categories that can influence the organization or that can be influenced by its activities, thus supporting the organizations to become more and more efficient.

Although an organization that is on very good terms with these strategic groups will have to integrate in its mission their objectives, on a long term it will be capable of aiming its own objectives in a more efficient way than if it had chosen to ignore or not take into consideration the objectives of such a public category.

To conclude, excellence in communication helps effectively the organization to obtain profit, allowing it to sell products and services to some pleased customers, to obtain funds from investors or donors, to develop new products and to increase and multiply its sales.

Moreover, through a proactive communication strategy big sums of money can be saved up, that in other cases, could be spent by the companies in the case of conflicts with communities, or expensive processes, boycotts or for the training of new employees who replace those who leave their jobs. When the communication department helps the organizations improve and consolidate the relationships with the different public categories, it will offer value as well to the organization but to the society in its totality, too.

The organizations become socially responsible only when they take into consideration the co-interested groups' expectations and manage to put these interests at the same level as theirs. When the organizations

do not manage to do this thing and ignore or are against these interests, the different public categories organize in activist groups that have as aim to face and challenge the organization. The result will be the conflict and the communications bring benefice to the society by trying to create mechanisms of solving these possible conflicts.

Résumé.

Cette étude a eu pour but de faire une tour d'horizon du niveau et des formes d'implémentation des forces de vente dans les entreprises roumaines. On a utilisé une recherche directe parmi les entreprises, pour obtenir des informations spécifiques et, puis, le cas échant, on a réalisé une comparaison avec les informations concernant le niveau et les formes d'implémentation des forces de vente dans autres pays. L'étude a couvert une multitude des aspects (organisation, recrutement, motivation, évaluation de la force de vente) et a permis d'identifier quelques particularités intéressantes concernant l'utilisation de la force de vente dans les entreprises roumaines.

Mots-clés: force de vente, marketing, recherche de marketing, entreprises roumaines

Introduction

Dans une définition large, la force (ou les forces) de vente d'une entreprise est composée par le group des personnes qui représente l'entreprise et ont comme tache explicite et principale de vendre ou de faire vendre ses produits et services, par le contact direct avec les acheteurs potentiels (les prospects), les distributeurs et les prescripteurs.

Les vendeurs qui composent la force de vente peuvent avoir plusieurs appellations (agent commercial, agent de vente, représentant commercial, etc.), peuvent être sédentaires ou itinérants, peuvent être salariés de l'entreprise ou collaborateurs externes.

En Roumanie, on peut parler d'utilisation de la force de vente dans les dernières années, dans le système de l'économie de marché. C'est le principal motif pour lequel la problématique de la force de vente est relativement nouvelle et le nombre des études concernant ce sujet et limité. Etant donné l'importance du sujet, nous considérons que toute contribution scientifique est bienvenue.

Méthodologie de la recherche

La méthodologie de la recherche a compris deux parts : une revue de la littérature internationale qui a eu pour but de mettre en évidence les aspect théoriques qui pourrait être utilisé comme repère pour la situation de Roumanie et, la deuxième part, une recherche directe, sur un échantillon de 169 d'entreprises, dont les managers ont été sollicité de répondre a un questionnaire.

Les questionnaires ont été administrés dans la période mai - juillet 2007. Le questionnaire a été composé par 27 questions, dont 20 questions de contenu et 7 questions démographiques. Pour des raisons lies à la dimension maximale de l'article, on va présenter seulement les résultats les plus importantes.

Résultats obtenus

Normalement, la force de vente peut se positionner, par rapport de l'activité de marketing, de point de vue théorique et pratique, en une des modalités suivantes:

- La force de vente est situe en dehors de l'activité de marketing, étant considérée comme un group de personnes qui s'occupe des ventes et qui n'a que des liaisons tangentielles avec le marketing;

- La force de vente est située dans l'intérieur de l'activité de marketing, comme une composante du mix de marketing;
- La force de vente est située dans l'intérieur de l'activité de marketing, comme une composante du sous-mix de distribution;
- La force de vente est située dans l'intérieur de l'activité de marketing, comme une composante du sous-mix de communication;

Toutes les quatre modalités peuvent être utilisées en pratique, mais la théorie du marketing recommande de considérer la force de vente comme une composante du sous-mix de communication.

	Fréquence	Pourcent	Pourcent valide
La force de vente n'a aucune liaison avec l'activité de marketing			
30	17,8	19,0	
La force de vente est une composante du mix de marketing			
91	53,8	57,6	
La force de vente est une composante du sous-mix de distribution			
17	10,1	10,8	
La force de vente est une composante du sous-mix de communication			
20	11,8	12,7	
Total			
158	93,5	100,0	
Non-réponses			
11	6,5		
Total			
169	100,0		

Tableau nr. 1. Position de la force de vente par rapport à l'activité de marketing

On peut constater que, dans les entreprises roumaines, la force de vente est à l'honneur, plus que 50% des répondants considèrent que elle constitue la cinquième composante du mix de marketing. La théorie n'est pas trop respectée (12% seulement situent la force de vente dans la politique de communication), mais la pire situation (aucun lien entre la force de vente et le marketing de l'entreprise) survienne une fois sur cinq cas (19,0%).

La théorie met en évidence plusieurs objectifs accomplis par la force de vente (Zaharia, Cruceru, 2001):

- vendre
- identifier les marchés potentiels
- définir le profil des clients et leur localisation géographique
- récolter des informations concernant les clients et les concurrents
- négocier et conclure des contrats
- dérouler des activités de merchandising et de PLV
- accorder de la consultance technique et commerciale
- prester des services de marketing

Notre étude a identifié la fréquence avec laquelle ces objectifs sont considérés par les entreprises roumaines. Les résultats sont présentés dans le tableau suivant.

	Fréquence	%
Identification des marches potentielles	109	64,5
Vente	152	90,0
Définition du profil des clients et localisation géographique des clients	73	43,2
Collection des informations concernant les clients et les concurrents	102	60,4
Négociation et conclusion des contrats	116	68,7
Actions de merchandising	37	21,9
Consultance technique	58	34,3
Total	169	100,0

Tableau nr. 2. Objectifs de la force de vente dans les entreprises roumaines

Il est un peu surprenant que la force de vente est assez peu utilisée pour de objectifs directement liés a l'activité de marketing, comme la définition du profil des clients, la localisation géographique des clients ou la collection des informations concernant les clients et les concurrents.

Pour organiser l'activité de la force de vente on peut utiliser plusieurs critères. Les critères les plus utilisés sont le critère géographique, le critère des produits, le critère des clients et le critère fonctionnel (Demeure, 1990). Les éléments spécifiques des ces critères sont :

- dans le cas du critère géographique, le vendeur visite tous les clients et les prospects de son secteur, en les offrant toutes les produits.
- dans le cas du critère des produits, le vendeur visite tous les clients et les prospects de son secteur, en les offrant une seule gamme des produits.
- dans le cas du critère des clients, le vendeur visite un seul type des clients, en les offrant toutes les produits.
- dans le cas du critère fonctionnel, les membres de la force de vente sont spécialisés dans une étape du processus de vente (négociation du contrat, suivi de déroulement du contrat, services après-vente etc.)

Le critère idéal est celui qui permette la création des secteurs de vente équivalents en termes du volume de travail et du potentiel d'évolution. De même, les secteurs ainsi créés doivent permettre d'établir facilement les objectifs des vendeurs et d'implémenter un contrôle efficace de l'activité des agents commerciaux. Dans la plupart des cas, la force de vente d'une entreprise est organisée sur le critère géographique (Demeure, 1990).

L'étude démontre que, en Roumanie, seule une entreprise sur cinq utilise le critère géographique pour organiser la force de vente. La plupart des répondants déclarent que la force de vente est organisée sur le critère des clients. On peut soupçonner soit un manque de connaissance en ce qui concerne le contenu des critères d'organisation, soit une particularité qui doit être étudiée plus en profondeur.

	Fréquence	Pourcent	Pourcent valide
Critère géographique	35	20,7	21,6
Critère des clients	73	43,2	43,9
Critère des produits	32	18,9	19,6
Critère fonctionnel	24	14,2	14,9
Total	164	97,0	100,0
Non-réponses	5	3,0	
Total	169	100,0	

Tableau nr. 3. Critères d'organisation de la force de vente utilisés par les entreprises roumaines

Le processus de recrutement est essentiel pour le renouvellement de la force de vente. L'entreprise doit prendre en considération plusieurs sources de recrutement : les propres employés (des autres compartiments), les employés d'autres organisation (surtout, les concurrents et les clients), les institutions d'enseignement (lycées, universités, etc.), les agences de recrutement, les candidatures spontanées.

Notre étude a constaté que les entreprises de Roumanie n'accordent pas de confiance aux instituts d'enseignement, ni au recrutement des agents commerciaux de la concurrence. Par contre, les agences de recrutement et les relations personnelles (recrutement interne, recommandations) jouent un rôle plus important.

	Fréquence	%
Agences de recrutement	83	49,1
Institutions d'enseignement	28	16,6
Recrutement interne (autres départements de la firme)	71	42,0
Forces de vente des firmes concurrentes	37	21,9
Personnes recommandées par les agents commerciaux	75	44,4
Total	169	100,0

Tableau nr. 4. Sources de recrutement des agents commerciaux utilisées par les entreprises roumaines

Une étude réalisée parmi les managers des Etats Unies (Churchill Jr. et al, 1981) a démontré que les plus importantes aptitudes des agents commerciaux sont les suivants:

1. enthousiasme;
2. bonne organisation;
3. ambition;
4. force de persuasion;
5. expérience générale dans le domaine des ventes.

Pour les managers de Roumanie, les principales aptitudes sollicitées aux agents commerciaux sont présentées dans le tableau suivant. On peut voir que deux attributs (l'enthousiasme et la force de persuasion) mentionne par les managers américains sont présents aussi parmi les premiers cinq mentionne par les managers roumains.

<i>Attribut</i>	<i>Score</i>
<i>Force de persuasion</i>	<i>4,79</i>
<i>Connaissances du produit</i>	<i>4,75</i>
<i>Habilité de communiquer</i>	<i>4,64</i>
<i>Enthousiasme</i>	<i>4,52</i>
<i>Habilité de générer confiance</i>	<i>4,50</i>
<i>Energie</i>	<i>4,43</i>
<i>Engagement envers le client</i>	<i>4,29</i>
<i>Confiance en soi</i>	<i>4,24</i>
<i>Créativité pour résoudre les problèmes</i>	<i>4,23</i>
<i>Habilité d'écouter</i>	<i>4,21</i>
<i>Ténacité</i>	<i>4,20</i>
<i>Honnêteté</i>	<i>4,17</i>

<i>Optimisme</i>	4,12
<i>Flexibilité a la modification de la demande</i>	4,02
<i>Apparence agréable</i>	3,79
<i>Equilibre intérieur</i>	3,78

Tableau nr. 5. Importance attribuée aux différentes caractéristiques de la force de vente

Le système de rémunération de la force de vente a certaines particularités, par rapport à la rémunération des autres employés d'une entreprise. On utilise un ou – dans la plupart de cas – plusieurs des éléments suivants : le salaire fixe, le commission, les bonus, les primes, les avantages sociales.

Une étude réalisé aux Etats-Unis en 1989 (Kotler, 1997) prouve que dans 14% des cas la force de vente est rémunère par un salaire fixe, dans 19% des cas on utilise un commission seulement, dans 37% des cas la rémunération est composée par le salaire et le commission, dans 26% des cas – salaire fixe et primes, et dans 10% des cas – salaire fixe + commission + primes.

Dans les entreprises roumaines, le rôle principal en ce qui concerne la motivation de la force de vente est joue par la formule salaire fixe + commission (retrouvé dans 107 réponses – 63,3%), en temps que le salaire fixe este utilisé dans 50 des cas seulement (29,6%). Un rôle important semble a être joué par les primes (96 réponses – 56,8%), les bonus (90 réponses – 53,3%) et par autres avantages (assurances santé, contributions aux fonds des retraites, assistance au formation, voiture d'entreprise, etc.) qui sont présentes en 83 cas (49,1%).

On peut tirer la conclusion que les modalités de rémunérer la force de vente sont assez semblables en Roumanie et aux Etats-Unis. Il serra intéressant de faire une comparaison avec la situation des autres pays de l'Union Européenne.

	Fréquence	Pourcent
Concours de ventes	83	49,1
Convention annuelle des agents commerciaux	21	12,4
Voyage de stimulation	44	26,0
Primes aux catalogues	35	20,7
Promotion dans l'hierarchie de l'entreprise	108	63,9
Attribution des distinctions spéciales	40	23,7
Attribution des diplômes, certificats, médailles, coupes	26	15,4
Total	169	100,0

Tableau nr. 6. Méthodes de stimulation de la force de vente (réponse multiple)

Outre la rémunération, les membres de la force de vente bénéficient d'autres modalités de stimulation, présentées dans le tableau nr. 6. On peut constater que les plus utilisées sont les méthodes « dures », liées au bénéfices matérielles : les promesses de promotion dans l'hierarchie de l'entreprise (63,9%) et les concours de vente (49,1%). Les méthodes qui privilégient les avantages moraux (attribution des diplômes, certificats, médailles, coupes, organisation des conventions annuelles des agents commerciaux) semblent à ne pas être apprécié ni par les entreprises roumaines, ni par les agents commerciaux.

Conclusions

Les principales conclusions de cette étude sont les suivantes :

- La plupart des entreprises roumaines utilisent des forces de vente.
- Dans la majorité des entreprises, on accorde une grande importance aux forces de vente, celles-ci étant considérées comme une composante du mix de marketing.

- Malgré cette position, la force de vente est assez peu utilisée pour de objectifs directement liés a l'activité de marketing, comme la définition du profil des clients, la localisation géographique des clients ou la collection des informations concernant les clients et les concurrents.
- Le plus utilisée critère d'organisation de la force de vente est le critère des clients. Il s'agit d'une différence par rapport a ce qui se passe au niveau mondial, ou le critère géographique est le plus utilisé. Les explications restent a être trouvé par l'intermédiaire d'une prochaine recherche.
- Pour les managers de Roumanie, les principales aptitudes sollicitées aux agents commerciaux sont la force de persuasion, les connaissances du produit, la habilité de communiquer, l'enthousiasme et la habilité de générer confiance.

ABSTRACT: Consumer protection is one of the most controversially contemporary issue, which became more important in our country in the postaccession period. Beginning with the Romanian integration in the European Union in our country is underlined the relationship between the producers and the consumers for all economical fields, activities that are covered by the Consumer Code. The present paper analyses the problems relating the protection of the bakery products consumer.

KEYWORDS: Consumer protection, panification products, bakery products, hazard

Introduction

It was a pleasant surprise that not a long time ago in Commerce Publication „Economic Tribune” were published in purpose to sustain the campaign „I want a clean bread”, which regard a serial of future actions in Romanian consumer protection for milling and panification products, a field that cannot be ignored due to frequently mistakes and dangers that are hidden and if they are not broadcasted intensely are endangering the consumers health and safety. The plan of the above named campaign is focused in three main directions: consumer protection, authorities support and monitoring, and panification industry support. As a result of this action it will be appropriate to make a short analyze of consumer protection issue for panification and bakery products in our country, proposing in the same time solution for some unpredicted risks that appear day by day in some enterprises.

Beginning with Romanian integration in European Union in our country are underlined the relationships between the producers and the consumers for all economical fields, activities that are covered by the Consumer Code. The Romanian Consumer Code is based on French Consumer Code, on its bases is made its structure. This code is in conformity with Community aquis regarding the common policy for consumer protection, and its juridical terms are found in article 129A disposition from Tile XIV of Amsterdam Treat, which say: „The Community contributes to health, security and economical interest consumers’ protection, alongside with promoting the right for information and education.”

The Romanian industry of bakery products - between legislation and consumer protection

Under the sign of promotion policy for goods / services which are not harming the consumer's health and integrity, in the same time it should be taken in consideration the continuous concerning for quality improving of bakery products on the Romanian market. The problem of consumer protection, for bakery and panification products, should be a national one, and not under the concern of consumer protection organisms only, but even on Agriculture and Health Ministries, including the departments for food administration. The most frequently and the most intensely appreciated as week points of Romanian economical sector is focused on „cleanness and hygiene” and on alimentary additives used during fabrication process, which frequently are harming the human health, alongside with problems like raw

materials poor quality, all of them generating at the end a finite product by the poorest quality, improper for human consume.

The milling and bakery (panification) industry is a branch of Romanian economy well known for its development in the latest years. This extinction and this progress are viewed in the sentimental range that offers a large offer on the Romanian market. But as many other fields of Romanian economy are dealing with problems and insufficiencies, the panification proces is not without potentially events or dangers, witch are named in this analyze as hazards. With other words, the concerns in consumers' protection fields have to focus on the followings problems that are specific for this activity. Hazard, as defined in the Food Code, means a biological, chemical, or physical property that may cause an unacceptable consumer health risk. A food safety hazard is a biological, chemical, or physical property that may cause a food to be unsafe (**Codex Alimentarius Commission** of the Food and Agricultural Organization (FAO) of the United Nations. <http://www.codexalimentarius.net>, p. 44) .All of those could be grouped in three categories.

Biological Hazards

Foodborne biological hazards include bacterial, viral, and parasitic organisms. These organisms are commonly associated with humans and with raw products entering the food establishment. Many of these pathogens occur naturally in the environment where foods are grown. Most are killed or inactivated by adequate cooking and numbers are kept to a minimum by adequate cooling during distribution and storage.

Bacterial pathogens comprise the majority of reported foodborne disease outbreaks and cases. A certain level of the pathogens can be expected with some raw foods. Temperature abuse, such as improper hot or cold holding temperatures, can significantly magnify this number. Cooked food which has been subject to cross-contamination with pathogens often provides a fertile medium for their rapid and progressive growth. Enteric viruses can be foodborne, waterborne, or transmitted from a person or from animals. Unlike bacteria, a virus cannot multiply outside of a living cell.

Chemical Hazards

Chemical hazards in foods should be considered during a hazard analysis. Chemical contaminants may be naturally occurring or may be added during the processing of food. Harmful chemicals at very high levels have been associated with acute cases of foodborne illnesses and can be responsible for chronic illness at lower levels.

Physical Hazards

Illness and injury can result from hard foreign objects in food. These physical hazards can result from contamination and/or poor procedures at many points in the food chain from harvest to consumer, including those within the food establishment.

A closer lecture of Consume Code will give us information on some detailed information regarding Communitarian papers, which were absorbed by Romanian legislation, through a multitude of laws: Law no. 148 from 2000 regarding the promoting, Government Ordinance no. 130 from 2000 is regarding consumer protection, Law no. 245 from 2004 regarding products general safety. By example, in conformity with article 8 of Consume Code: „The economic enterprises are obligatory to commercials safe products/services, which are corresponding to prescribed or declared characteristics, a right attitude to consumers relationships and not to use commercial abusive practices.” This thing is available even for panification fabricatin proces. But between theory and practice is a huge step, impossible to be realized without public authorities' involvement, a set of preventive measures that will be able to eliminate or diminish at an acceptable level the identified hazard. These preventive measures are specifies stages during the entire production process:

- 1. Raw materials acquisition:** water, flour, yeast, salt, additives, and other alimentary components necessary for these bakery product production, and the acquisition will be made on the basis of safety certificate, named conformity certificate that will prove that the supplier accomplish the legal condition for comercialisation.

- 2. Raw materials supplying:** will be made in conformity with their characteristics, labeling demands, temperatures preserving and conform packing.

3. Raw materials preserving: is made in special places that respect the hygiene conditions and humidity / temperature conditions.

4. Dough preparation, yeast preparation, finite product formation till the final product maturity: it will be made in perfect hygiene of equipment, spaces and personnel.

5. Baking and cooling the pastry products are necessary to be done in perfect hygiene conditions and in optimal temperatures. It must avoid the use of unclean furniture and equipments.

6. Slicing the bread and packing the pastries is made in maximal hygienic conditions as much as space and personnel, as slicing and packing equipments.

7. Finite product correct labeling is made by respecting all necessary information for bread and pastries product, for a correct and complete consumer's information.

8. Finite product transport and distribution - is demanded a correct hygienic conditions for the transportation machines, and for the distribution personnel and magazines.

Examples of Records obtained during the operation of the plan:

a. Ingredients

- Supplier certification documenting compliance with establishment's specifications. Establishment audit records verifying supplier compliance.
- Storage temperature record for temperature-sensitive ingredients.
- Storage time records of limited shelf-life ingredients.

b. Preparation

- Records verifying the continued adequacy of the food preparation procedures.

c. Packaging

- Records indicating compliance with specifications of packaging materials.
- Records indicating compliance with sealing specifications.

d. Finished product

- Sufficient data and records to establish the efficacy of barriers in maintaining product safety.
- Sufficient data and records establishing the safe shelf-life of the product; if age of product can affect safety.

e. Storage and distribution

- Temperature records.
- Records showing no product shipped after shelf life date on temperature-sensitive products.

In order to eliminate the hazards that are presents in panification industry some correct measures and needed, alongside the production process. Even more, the ones who are uncharged with the responsibility of surveillance on food safety sector should take this responsibility very seriously and in an objective way, looking up at European standards, because these standards are contributing to our health day by day.

International marketing has a wide interest area comparing it with internal marketing. The enterprise that develops international marketing activities has to support some risks that are not common and usual for an enterprise that operates only on national level. The risk level is directly increasing with the investment level. Before the investment is done, the enterprise should understand that the risks that are taken in an international market are not the same than in the internal market. The criteria that are taken into consideration to evaluate this risk, are: political stability, attitude for foreign investments, inflation, balance of payment, economic development, monetary stability, legislation, infrastructure, available financial resources.

KEYWORDS: International marketing, international strategies, investments in external market

Introduction

International marketing has a larger area of interest than internal marketing, because it covers activities from a wider business area that are usually passing over national borders. During time, because the sum of money which are invested in production and in research are higher and higher, the trend is increasing in the area of international marketing, for a better covering of consumer demand all over the world. The level of investments that are necessary for an enterprise in order to cover a larger market quota in the international market has a direct influence on the operational structure of the international marketing strategy. So, there were found three situations which influence the international marketing environment:

1. *a lower investment level on global market*, which demands two modalities for approaching the market, indirect export market and licensing.
2. *an average level of investments on external market*, that use the followings: market entrance ways, direct export, franchise, local subsidies.
3. *a high level of investments on external market*, need access instruments like: business type joint venture, local manufacturing business subvention or acquisition of some external companies.

The enterprise that develops international marketing activities has to sustain some risks that are not common for an enterprise that use to operate on national level. The risk level is increasing proportionally with the level of investment. The enterprises that do not accomplish direct investments on the market will have the lowest risk and the lowest losses if they are in the situation of none succeeding on the market. This is the reason why the enterprises should consider the following major criteria in taking market decisions:

- a possible unfavorable economic conjuncture on internal market
- the avoiding of the intern competitiveness;
- the over- production and the avoiding of the storage of finite product;
- the product, through its characteristics and life cycle will demand the extension on the external market.

International trade: general conditions and characteristics

Before an investment is done, the enterprise should understand that the risks that must be taken into consideration in an international market are not the same than in the domestic market. The criteria's that are taken into consideration to evaluate the amplitude of those risks, are: political stability, attitude for foreign investments, inflation, balance of payment, economic development, monetary stability, legislation, infrastructure, available financial resources.

There are four main categories of elements that use to be traded internationally:

- **Goods:** this covers all types of physical goods, such as food, clothing, raw materials and machinery.
- **Services:** this covers areas like tourism, banking, financial services and telecommunications.
- **Intellectual property:** this covers trade and investment in ideas and creativity, copyright, industrial design, artists' rights, etc.
- **Foreign direct investment (FDI):** this is a company from one country which buys or establishes a company in another country. This is an alternative to trade and an important part of globalization.

The European Union trade policy works on two complementary levels:

- the “multilateral” level refers to the system of trading rules agreed by all World Trade Organisation member countries worldwide;
- the “bilateral and regional” level means trade between the European Union and individual trading partners or with groups of countries that form a single trading block in a particular region of the world (European Commission, Making globalisation work for everyone, The European Union and world trade, Luxembourg: Office for Official Publications of the European Communities, 2003, p. 5 – 7)

A fair and transparent rules-based system to govern world trade is just as important for developing countries as it is for industrialised ones. But as globalisation advances, the World Trade Organisation will inevitably have to update its rules. The European Union pressed successfully for the new round to include issues such as investment, competition, government procurement and measures to simplify trade procedures. The European Union also supports plans to improve World Trade Organisation rules on anti - subsidy measures and anti-dumping procedures.

Protecting the environment within a sustainable development, in an increasingly interdependent world, challenges such as climate change, the protection of the ozone layer and the disposal of toxic waste cannot be solved by one country or even by a group of countries acting alone and need a complex approach and a common strategy. The European Union has long argued that multilateral environmental agreements have to mesh smoothly with agreements in the international trading system, so they become mutually supportive.

Promoting trade and social development due to a cooperation between the World Trade Organisation and the International Labour Organisation (ILO) is made to ensure progress on the social aspects of globalisation, including labour standards.

The EU will encourage the world community to pursue this issue via the ILO, and it will work to make sure that the World Trade Organisation contributes constructively to this process.

The EU already includes social and environmental incentives in its trade relations with developing countries. It grants extra tariff reductions to countries that implement ILO conventions. The EU has been keen to promote a debate within the World Trade Organisation on issues of general public concern. Among these, consumer protection, and in particular food safety, is in the top of the European Unions priorities.

Quality and safety standards must be maintained at a high level. The World Trade Organisation rules already allow countries to take trade measures to protect the health and well-being of their citizens, provided the measures taken are scientifically justified. When scientific proof is not available, countries may take action provisionally on the basis of the precautionary principle, pending the availability of scientific evidence that is being sought. (European Commission, Making globalisation work for everyone, The European Union and world trade, *Europe on the move* series, Luxembourg: Office for Official Publications of the European Communities, 2003, pp. 20 – 21)

The modalities that are choosing for getting into an international market are strategic instruments like:

1. **Indirect export**, the production is made internally and the retailing externally through different modalities of distribution. The export is made indirectly when a buying company from another country offers in a direct way the product to other enterprise on that specified market. The second enterprise will take advantage from that process difference.

A more active modality for indirect export is by using an export company which is an independent organization that is uncharged with all export formalities for many others enterprises too, as an intermediary during the distribution process. The most usual services are: buying, transport, financing and negotiation process with the import trading.

2. **Direct export** means that the producing company is the one that is making the distribution. Even if it is not very expensive, this method offers a higher degree of control and a higher profit comparative with the situation when the intermediary is used.
3. **License utilization** needs a tax to be paid in exchange of trademark using. If license utilization is offering many advantages – low risks and reduced costs in purpose to increase the incomes, little control and long run problems will appear.
4. **Joint-venture** is a cooperation strategy, when a domestic company and a foreign one are joining together their forces. Sometimes this is the only modality for a foreign company to penetrate the market. This type of cooperation has a short life cycle and is functioning in a better way in the sectors where is necessary an adaptation to the local markets.
5. **Direct investments and producing abroad** is a method to get into an external market and to obtain high profits but with the highest risk. This method affords the feel immediately the changes on the local market are coming in an efficient way.

Direct investments need a real involvement into the international marketing strategy, with mutual advantages, for the host country and for the investor too. The factors that should be considered by the direct investors which may affect their decisions are: product, price, quality control, labour expenses, transportation costs, tariff barriers, clients, available capital, political stability, economical stability and market potential.

Conclusions

Strategic instruments implementation needs a close planning. Planning the international market actions is a continuous and a systematic capability to merge the company capacity with external market opportunities. It involves the following steps: definition of the companies objectives, a real analyze of the current position of the enterprise and the establishing of some plants that will accomplish the final business goals of the marketing strategy. Active companies that are placed in the international market should reconsider a more clearly way to achieve their goals and what should be really done to get them.

Abstract: The appearance in 2004 of the law nr. 212 of private health assurance created an alternative to social assurance from which any contributor can benefit. Putting into practice and developing the private health assurance system is an activity form which takes care of health, imposing the implementation of market relationships with all legal regulations characterizing it, being one of the possible ways of improving the health of the population from our country. The...for the market period of more health assurance forms proved to be the most adequate form of organizing the health system. The intervening concurrence in these relationships imposes that medical units offer quality services, determined both by the practice of performing investigation and treatment methods, and by the growth of quality and serving conditions.

Key words: market, private health assurance, medical services, population.

1. Introductions

The profound knowledge of the subject of health assurances, of common and specific aspects to social and private assurances is essential for the Romanian health system in the social-economical conditions characteristic of our country. The health assurances present a segment of the medical management, tightly linked to the economic sciences, studying assurances in general. Because of the interdisciplinary character of health assurances, these haven't constituted a research object for scientists until the present moment.

The improvement of health condition of the population is one of the most important things in every country's economy. In the countries of the UE the costs of the health system represent from 6 to 15% of the GDP and the population working in the health system represent from 5% to 10% the whole volume of work force (Silivestru, 2002). The numbers have a great importance for the services offered by the health system for producing, importing and exporting different goods of medical care.

In the same time, the health care has a great influence upon other domains of the country's economy. It is part of the nations' expenses, having relation to each social category, the health system having also a political connotation in every country. The assurances for payment of medical services represents a facultative voluntary system, supplementary to social health assurance, which covers the medical services in the conditions of organizing and functioning of social assurances (Besley, 1998).

The most countries from the UE practice the mixed type of assurance (social and private) and their experience proves that the private health assurances can be successful only if they are not applied as an alternative but they are supplementary or complementary to social assurances in case of illness. In these conditions the private health assurances assure rapid access to supplementary medical services to the population (Armean, 2005).

2. The market of private health services

The market of private medical services, estimated for approximately 200 millions of Euro yearly is represented in our country by some private clinics and hospitals. On the other hand, the market of private health assurances was estimated to approximately 10 millions of Euro last year, but the potential of growth is great, being able to reach 150 million of Euro until 2010 (Armean, 2005).

On the market of private health assurances in the present moment there are approximately 15 great companies, from which some have partnerships with private hospitals in order to offer exclusive products.

Although the market of private health assurances is just at the beginning, it represents an option for many companies from the most important cities and especially Bucharest. Initially they appeared as offer for the companies wanting to offer benefits for the management position, the situation has changed, and the offers are made to very many employees. The most important obstacles in front of the development of private health assurances are the incomplete legal frame and the level of fiscal deducibility.

Compared to other countries the number of life or asset assurances remains very small, but the statistical numbers show that the number of policies grows from year to year. In these conditions, the assurance companies have created all the possibilities to have health assurances, adapting the offers to the requests of the market, and generally to the individual needs of the client in particular.

The principal advantages of the private health assurances are the following (Minca, 2005):

- The existence of a national network of medical services providers
- Diversity and quality of covered medical services
- Covering pre-existing and severe affections of the assured, and also the period of pregnancy, birth and confinement.

The growth of quality in medical services, and especially that of the services offered in the private medical system is one of the key factors having a positive influence on the material resource economy and the growth of efficiency in the activity of medical units.

Since there are partnerships between providers of medical services and assurance companies and there is a regulated fiscal advantage of deducibility of 200 Euro/employee/year, the private health assurances are developing fast.

3. The perception of the population referring to private health assurances

The study of population perception about private health assurances coming to complete the social ones shows that it creates supplementary financial resources to take care of health and to grow the quality of medical services.

The research was an observational, descriptive study. In the study there were included 780 persons, being 18 years old or more, from urban and rural medium. The study was made in the period of October 2007-March 2008. Based on the study, there can be taken the following conclusions:

1. 98% of the questioned population is registered at a family doctor. Pondereaa of those who do not have a family doctor is 2%, and is relatively equally distributed between rural and urban. (fig.1)

Fig.1. Weighting of persons registered on the list of a family doctor

2. In the rural medium, those who do not live in the same town/village as the doctor is 31%, percentage almost equal to the national average number (29%). (fig.2)

Fig.2. Weighting of the persons not living in the same town/village as the doctor

3. A percentage of 78% of the questioned persons appealed to the family doctor in the last year. (fig.3)

Fig.3. Weighting of persons appealing to the family doctor

4. From the questioned persons 37% appealed to specialized clinics for medical services (fig. 4)

Fig.4. Weighting of persons appealing to specialized clinics for medical services

5. From the persons using medical services at specialized clinics, only 15% appealed to private services (fig.5)

Fig.5. Weighting of persons appealing to private specialized clinics

6. 5% of people who answered have a health assurance with a private firm, the majority not having a private assurance and not being interested to have one in the near future. The persons who have a private assurance are generally men 35-44 year old, from the urban medium, having university studies, having incomes above average.(fig.6)

Fig.6. Persons benefiting from private health assurance

7. 10% from those having no private health assurance intend to make one in the near future (three months) (fig.7)

Fig.7. Persons intending to make a private health assurance

8. Out of the reasons of not making a private health assurance we can name the following (fig.8):

- Lack of money
- Not trusting the assurance firms
- Lack of information
- Persons considering themselves healthy

Fig.8. Reasons why patients do not want a private health assurance

Remarkable is that besides social-demographical characteristics mentioned before as determining options for a private assurance, the fact of having worked abroad can also be associated to the categories who want or intend to make a private assurance.

4. Conclusions

The private health assurances represent a form of health care system activity which imposes the creation of market relations respecting all legal regulations characteristic to them.

The study of health care systems of developed countries proved the fact that the cooperation on the market of more forms of health assurance is the most adequate form of organizing the health care system.

A great part of the interviewed persons (78% of the persons) have appealed to the family doctor in the last year, 37% to specialized medical clinics. 5% of the questioned people has a form of private health assurance, most of them not having a private assurance and not intending to make one in the near future, the most important reason being related to financial motives.

The Romanian-American University, Bucharest, Management-Marketing Faculty, Bdul. Expoziției, Nr. 1B, Sector 1, București, cristina_neagoie2004@yahoo.com, Tel. 0722.223326

Abstract: In the actual Romanian social and economical environment, where for a large part of the people their income can barely fulfill their basic needs and where only 8% of the population can afford a holiday a year, social tourism is the only option to raise the number of tourists. The study of the social tourist services consumer behavior aims to shape a touristy profile of such a person.

The accessibility of the social tourism offers has been studied in this paper, through means of a market survey, basing on a questionnaire, being interviewed 211 persons from the Brăila county.

Among the main targets of the research, we mention: the determination of the degree/frequency of practicing tourism, generally, by the population of the Brăila county; the establishment of the Braila tourists' preferences for the practiced tourism form; the assessment of the tourists' options regarding the travels from the point of view of the season, the duration, the motivation and the chosen traveling destinations, generally; the determination of the degree of knowledge and of information as regards the social tourism offers, etc.

Tourism operators might find this study's results useful by adapting their offer according to the needs of their target consumer.

Key words: social tourism, motivation, market research

1. Initial research stages

In Romania's present economic-social context, where the incomes barely satisfy the basic needs for a big part of the population and under the circumstances where only 8% of the Romanians can afford one holiday per year, **the social tourism** is the sole solution of attracting into the touristic circuit an ever increasing number of people.

The economic activity of the touristic units finalizes into services designed for the market (domestic or external). As services' provider, the touristic company has permanent relations with the market; at the same time, it also intervenes as beneficiary (buyer) for the goods and services necessary for the organization and deployment of its own activity.

The special mobility of the market's phenomenons under the actual circumstances imposes to the touristic companies new ways of involvement into its mechanism, an increased reaction capacity towards the market's demands. In order to discover these demands and analyze them, in the social tourism, like in other fields as well, it is appealed to the market research.

The general goal of the research is to set the degree of accessibility of the social tourism offer, from the perspective of the *fee level, degree of awareness and means of information* on such offers at the level of people in Braila, and having as **objectives**:

1. setting the degree/frequency of tourist practices in general with respect to the population of Braila;
2. setting the preference of Braila tourists for the form of tourism they do;
3. assessing tourists' options for the stays from the point of view of the season, duration, motivation and traveling destinations, in general;
4. setting the degree of awareness and information related to the social tourism offers;

5. setting the percentage that measures the amount of such offers for consumption, as well as the preferred forms of social tourism;
6. setting the options of Braila tourists for the offer of social tourism governmental programs;
7. assessing the satisfaction degree of social tourism offers, including special programs, from the viewpoint of quality, accessibility (fee level), diversity and use;
8. setting the promotional means which the population deems appropriate for the social tourism offer in Romania.

The following hypotheses were set for the objectives that stand at the core of the research:

1. over half of the interviewed people declared that tourism is not among their options to spend their spare time (60% in the urban areas and 70% in the rural areas).
2. for most of those who chose tourism as a means to spend their holidays, this is done with a relatively low frequency (1-2 /year).
3. the form of tourism practiced by Braila tourists is 'on their own'(65%- 70%).
4. for the tourists in the urban area, the duration of stays is mainly short, the preferred season is usually summer, the main motivation is rest and recreation, and the frequent destination is the seaside.
5. for people residing in the countryside, the duration of the stays is average, the preferred season is mostly winter, the motivation is spa treatment and the main destination thermal resorts.
6. the level of awareness with respect to the social tourism offers is low, especially in the rural area (under 20%).
7. the number of persons who resort to, benefit from social tourism offers, respectively, is under 25%.
8. from among the persons who opt for the social tourism offer, most of them chose tickets through state social insurance (60%), and from among the social programs, the one at the seaside 'A week at the seaside' is preferred (over 50%).
9. the tourists' satisfaction level regarded to social tourism offers is low (under 30%).
10. the most appropriate means to promote (inform) the social tourism offer is for residents living in cities, the Internet, and for residents in the rural area, the local institutions (the city hall, the health system, the church).

With respect to **general collectivity**, it was set that it is represented by the persons for whom information is generalized, i.e. the population in Braila County (potential tourists).

The execution of the study also involves setting up the supervision unit and the survey unit, being represented by the persons who were interviewed for the study, **211 persons**, respectively.

The survey represents the **method to gather information**, based on the assisted fill in of a questionnaire made of 27 multiple choice questions, out of which the interviewed selected the variant that represented them to the highest degree. The questions are, most of them, closed. Only two of them required explanations (questions 18 and 16). The questionnaire contains 4 philter questions, 5 identification questions (at the end of the questionnaire) and 18 content questions.

In order to carry out the study, a **prior pilot survey** is necessary. This was executed on a number of 50 persons, who manifested discontent as to the formulation of questions from two points of view:

- they were not familiar with the term of 'social tourism' and asked for its definition or clarification through examples;
- the interviewed had certain difficulties with certain marketing-related terms (promotional techniques), that were subsequently eliminated. A simple and clear manner to ask questions was chosen.

The questionnaire was reformulated, with the respective additions and submitted to the said persons in order to be filled in.

2. Analysis of the accessibility degree of social tourism offers for the population

Study regarding the accessibility degree of social tourism offers from the viewpoint of fees, information and degree of awareness

As is already known, the offer degree of accessibility determines the market evolution through the number of consumers and the consumption intensity. In the tourism field, accessibility must be related to both the geographic position of the tourist offer (access roads, specific regulations etc.) and the level of prices and fees practiced.

Generally, the accessibility of the tourist offer is determined by the complex relations existing among the income levels, practiced prices, quality of tourist products and services, but also the manner to spread the issues related to each offer.

It should be considered here, especially in the case of social tourism offers, the concrete possibilities through which the tourist potential finds out, gets informed and documented with respect to these offers. That is why the aim is to make information as easy and handy as possible for all categories of tourists targeted by these special offers.

In this respect, we have analyzed the accessibility degree, considering these two categories of factors, depending on the market segmentation variable (income).

a) Means of information

Table 1. Answer distribution according to incomes and means of information

Incomes (RON)	Answering variants				Total
	Mass-media	Workplace	Through institutions	Other sources	
under 650	36	0	28	17	81
651– 850	0	3	15	6	24
851– 125	12	10	0	25	47
1.251– 1.650	15	9	0	0	24
1.651 – 1.850	21	0	0	0	21
over 1.850	4	0	0	10	14
Total	88	22	43	58	211

From the table data it can be noticed that, depending on the 'income' variable, which was set to best segment the market, the main information tool for the interviewed is the **mass-media** (*tv, radio, written press*), with a total of 88 answers (approximately **41%**). The following option is made of **the other** sources such as *relatives, friends, the Internet*. This option has a percentage of approximately **28%**, with 58 answers, due, probably, to the Internet, which, lately and especially for persons living in the urban area, has become a very important means of information.

Third within the information possibilities come **institutions** (*CNPAS, education institutions, the general practitioner*), holding **20%** (43 answers) of the total, this means of information acquiring a higher significance especially in the rural area, where the community (due to its dimensions, organization and lifestyle) is often more well-informed this way and less informed through the traditional means (practiced in the city). **The workplace** is less chosen by the interviewed persons, holding only **10.42%** of the answers.

From the viewpoint of distribution depending on the income, those in the first income category prefer **mass-media** information, those with an income between RON 650-850 get informed especially by means of **institutions**. The persons with income between RON 850-1250 and those with income over RON 1850, prefer **other information sources** (among which the Internet). Last, but not least, the persons with incomes between RON 12.5 and 16.5 mil., also prefer **mass-media** information.

b) Fee level

Table 2. Answer distribution according to incomes and fee level

Incomes (ROL)	Answer variants			Total
	Yes	No	I don't know	
under 650	37	12	32	81
651– 850	24	0	0	24
851– 125	28	6	13	47
1.251– 1.650	20	0	4	24
1.651 – 1.850	13	4	4	21
over 1.850	9	0	5	14
Total	131	22	58	211

With respect to the accessibility of social tourism offers, we may notice that they are considered suitable by most persons (131 answers), regardless of the income category.

It is important to notice the situation of the answers registered for the first income category, where we find the majority of them, the Method to collect affirmative information (37), but also the most unformed opinions („I don't know"-32 answers). This may be explained by the fact that persons in the first category are probably mostly retired, used to resorting to social tourism (through the territorial Retirement Houses) and who are well-familiar with the evolution of their fees, and the others may be persons under 18 who, going on vacation with the family, do not know these offers very well.

According to this study, we may **conclude** that the *fees* in the tourism sector are, to a large extent, deemed *accessible* by most tourists (real or potential), *the most suitable means to make them known and to promote them is mass-media*, that counted the highest number of answers, and *the degree of awareness related to such offers is higher* among persons with lower incomes. Therefore, in Braila **social tourism has a satisfactory degree of accessibility**, especially among the persons envisaged by it (target market).

If a **profile of the tourist service consumer** is to be made, both in general and in the case of tourist offers, we notice that, from among the people practicing a form of tourism, the majority are **married**, from the **urban** area, over 50, with an approximate income of **RON 650 /month**, from the category of employed persons (with average and higher education diplomas, for the general tourism offers) and **clerks with average education** followed by **retired** persons, for the social tourism offer.

It is obvious that the two consumer profiles are very much alike, especially with respect to the 'income' category, probably due to the fact that most population in the researched area complies with this income category (since the area has a low degree of economic development, a series of companies being totally or partially closed).

It's also clear that inclination toward tourism is manifested especially in the case of persons over 50, probably due to the fact that many young persons have found jobs in other countries (Italy, Spain), and when they come home with their savings, they are mainly directed towards real estate products and not tourist services.

The situation is synthetically presented in the following table, according to the information gathered during the research:

Table 3. Percentage distribution of persons who practice tourism and those who benefited from the special offer, depending on the tourist service consumer's profile

<i>Tourist service consumer's profile</i>	Persons practicing tourism, in general	Persons who benefited from the social tourism offer
Occupancy	Clerk with average education (23,02%) Employee with higher education (18,87%)	Clerk with average education (28.57%) Retired (19%)
Income	RON 650 (40%)	RON 650 (34.58%)
Marital status	Married (68.30%)	Married (79.69%)
Residence area	Urban (78%)	Urban (80%)
Area	51-60 (18.86%) Over 60 (16.98%)	51-60 (30.07%)

OBSERVATION: All categories with the highest percentage were represented, rendering the image of the consumer of such services.

If this profile of tourist service consumer is considered together with the collected results regarding the means deemed by the interviewed as the most suitable in order to promote social tourism (over 30% chose the written press), the conclusion is that the organization of promotion campaigns should also consider all these information items, and the promotional message should address exactly the envisaged persons (the target market), adjusted to them depending on the five identification criteria (occupation, income etc.) and through the appropriate means.

To conclude, upon setting the means to promote the social tourism offers, the research study should be considered, which, in certain situations, contradicts to a certain extent what was initially believed as to the perception, preference, degree and means of information with respect to such offers.

It is also worth noticing that the seaside has always been deemed as the first option for tourists, which proved to be wrong, since the preferred destination for people in the urban area is the mountain, whereas for those in the rural area, the thermal resorts. In this context, we recommend that these preferences should be considered when promoting tourist offers.

A very significant issue refers to the fact that the research indicates that the season preferred by people in the rural area is winter (as is natural, because of the agricultural works during the summer and which prevent them from leaving their homes), the promotion must adjust so as to encompass this aspect also.

Last, the Internet, increasingly used by those in the urban area in order to get informed, imposes itself as a means of tourist promotion.

This study emphasized certain issues, unknown until now, out of which we have only mentioned a few, that will be considered in the proposals regarding the efficient promotion of social tourism offers.

LE MARCHE MONDIAL DU VIN ET LES NOUVELLES ORIENTATIONS DU MARKETING

Epuran Gheorghe

Université de Bacau, Faculté de Sciences Economiques, gheorgh_e_pura@yahoo.fr, Tel : 0723612501

Le marché mondial du vin est caractérisé par un développement sans précédent en ce qui concerne la production, mais aussi l'aire géographique qu'il comprend. La surproduction qui a tendance à dégénérer en une crise est due premièrement à l'apparition de nouveaux acteurs sur ce marché, c'est-à-dire les pays du nouveau monde du vin: les Etats-Unis, le Chili, l'Afrique de Sud, l'Australie.

Dans ce contexte, les grands producteurs traditionnels de l'Europe sont soumis à une forte pression concurrentielle aussi bien sur leurs marchés qu'à l'extérieur.

Même si en matière d'image et de notoriété les vins de ces pays sont restés encore très connus, les pays du nouveau monde des vins ont réussi, par un marketing «à l'américain», à pénétrer en force sur plusieurs marchés, inclusivement sur les pays qui étaient pas traditionnellement consommateurs de vins (la Russie, la Chine, etc.).

Mots clés Marché, vin, offre, demande, marketing, distribution, marque

1. La production et la consommation de vin au niveau mondial

Si entre 1999-2003 le marché mondial du vin a enregistré une croissance insignifiante (OIV), c'est-à-dire +0,2%, dans l'intervalle 2004-2007, y compris dans les estimations pour 2008, cette croissance est arrivée à 6,4%, ce qui signifie une quantité d'approximativement 16 millions d'hectos (de 258,119 millions à 274,775 millions d'hectos).

Les «acteurs» principaux sur la scène de production de vin restent la France, l'Italie, l'Espagne, pays qui détiennent, en ordre, 18,6%, 22,5%, respectivement 15,6% de la production mondiale. Pour l'année 2008 on estime une stabilisation de la production au niveau de ceux-ci, ce qui se passera aussi dans le cas des Etats-Unis et de l'Australie, au niveau desquels on a enregistré une certaine croissance (6,3%, respectivement 7,3% entre 2004 et 2008). La croissance la plus spectaculaire de la production (+35,8%) a été enregistrée dans l'Afrique de Sud qui monte de trois échelons dans l'hierarchie mondiale des producteurs, de la X^e place à la VII^e place, devançant ainsi des pays tels l'Allemagne, le Chili et le Portugal.

A partir de 2004, le rythme moyen de croissance de la consommation de vin a été de 1% et on estime pendant cette année (2008) une consommation d'environ 237,5 millions d'hectos, ce qui signifie que les marchés du monde absorberont 31,6 bouteilles de vin, la croissance cumulée de la consommation dans l'intervalle 2003-2008 étant de 6,3% pour le vin tranquille et de 6% pour les vins effervescents dont la consommation pourra atteindre le niveau de 16 millions d'hectos en 2008.

2. L'analyse du marché mondial du vin: le chiffre d'affaires

En 2003, le chiffre d'affaires sur le marché du vin a été de 99,7 milliards de dollars, 7,7% de plus par rapport à l'année 1999. Entre 2003 et 2008 on estime une croissance de 14,7%, ce qui conduira à un chiffre d'affaires de 114,4 milliards de dollars.

Par une analyse simultanée, on constate que le chiffre d'affaires a crû 2,5 fois de plus que la consommation, ce décalage étant en fait l'expression de la croissance des prix de détail de 16,8% de plus.

Le plus grand marché pour le vin tranquille est celui des Etats-Unis, marché sur lequel le chiffre d'affaires a crû de 16,77 milliards de dollars en 2003 à 24,2 milliards de dollars (estimation) en 2008, sans y enregistrer aussi le plus grand volume de ventes (IV^e place sur le plan mondial).

En réplique, la France, le plus grand consommateur mondial en matière de volume, se trouve sur la II^e place en ce qui concerne le chiffre d'affaires, mais avec une régression en 2008 par rapport à 2003 (-5,8%), le chiffre d'affaires diminuant de 9,34 milliards de dollars (2003) à 8,8 milliards de dollars (les prévisions pour 2008).

A partir de 2003, le Royaume-Uni a devancé l'Allemagne en matière de vin tranquille, enregistrant un chiffre d'affaires de 7,6 milliards de dollars par rapport à l'Allemagne qui a enregistré 7,35 milliards de dollars. On estime qu'en 2008 les chiffres d'affaires atteindront le niveau de 9,06, respectivement de 8,07 milliards de dollars.

Concernant les quantités consommées, la situation des deux pays est paradoxale, l'Allemagne consommant 21,7 millions d'hectos par rapport au Royaume-Uni qui consomme 10,8 millions d'hectos, donc deux fois de moins.

La croissance du chiffre d'affaires sur le marché mondial du vin est stimulée premièrement par le vin à moins de 5 USD, la pondération de celui-ci évoluant de 17,5% en 2003 à 19,3% en 2008 et la cote de marché des vins à plus de 10 dollars croissant de 5,5% à 5,7% dans le même intervalle.

De ces données, on constate que le vin à moins de 5 USD détient à présent approximativement 75% de la cote de marché au niveau mondial, la quantité prévue pour l'année 2008 (165,9 millions d'hectos) étant en relatif stationnement pendant l'intervalle analysé.

3. L'analyse du marché en termes de volume: concentrations dans un monde changeant

Les marchés historiques ont encore la plus grande pondération concernant la consommation mondiale de vin. Ainsi, la France, l'Italie et l'Espagne détiennent à présent 31,4% au niveau mondial, ce qui signifie une consommation totale de plus de 70 millions d'hectos de vins. Relatif à la consommation per capita, la situation diffère. Ainsi, dans l'intervalle 1999-2008, l'Italie a enregistré une croissance de 58,8 litre per capita à 60,2 litres per capita (on envisage les habitants qui ont plus de 18 ans). En réplique, la France et l'Espagne enregistrent des diminutions de la consommation per capita. En France, la consommation per capita a diminué de 64,3 litres en 2003 à 58 litres à présent, la quantité totale consommée étant de 29,6 millions d'hectos. En Espagne on consomme à présent 30,1 litres per capita (de 33,8 en 2003), respectivement 9,8 millions d'hectos.

La croissance de la consommation sur le plan mondial est concentrée au niveau de trois pays: les Etats-Uni, le Royaume-Uni et l'Allemagne, ceux-ci attirant trois tiers de la croissance respective. Ainsi, d'une pondération de 25,4% de la consommation de vin tranquille détenue en 2003, respectivement 53,8 millions d'hectos, les trois pays ont enregistré une croissance de plus de 9 millions d'hectos, représentant environ 38% de la consommation mondiale de vin tranquille en 2008.

En Allemagne on consomme à présent plus de 40 litres per capita (vs. 38,5 en 2003). Au Royaume-Uni il y a une tendance évidente de croissance, la consommation per capita étant de 28 litres par rapport à 24,8 en 2003 et le volume absolu de 12,4 millions d'hectos.

La Russie, l'Asie et les pays scandinaves sont trois marchés qui présentent un intérêt particulier pour les producteurs et les distributeurs de vins. La Russie et les quatre pays scandinaves (la Suède, la Finlande, la Norvège et la Danemark) ont dépassé l'Espagne en matière de consommation. Les pays scandinaves, avantagés par les mesures fiscales favorables au vin (sauf la Danemark), telle la libéralisation de la distribution, enregistrent des progrès remarquables, les dernières données existantes et les prévisions indiquant une croissance de 21,2% entre 2003 et 2008. Dans la même situation se trouve aussi la Fédération Russe où les consommateurs adoptent d'une manière relativement simple les vins d'importation, la croissance dans l'intervalle 2003-2008 étant de 17%.

En Asie, les évolutions sur le marché du vin sont aussi ascendantes. Le plus grand consommateur asiatique, la Chine, enregistre régulièrement des croissances de la consommation (2,7% entre 2003 et 2008), rythme qui est trois fois plus grand comparativement à celui mondial.

En ce qui concerne les marchés d'exportation, l'Europe réalise 70% des exports avec cinq pays producteurs: la France, l'Italie, l'Espagne, l'Allemagne et le Portugal, même si les situations dans les pays respectifs sont contrastantes.

Ainsi, en 2003, la France a perdu 3,6% des exportations, mais en 2008 elle se trouve sur la première place ayant une cote de 19,5% du volume mondial des exportations de vins. L'Italie a connu une chute dramatique en 2003, quand elle a perdu 38% des exportations et l'Espagne a enregistré des croissances spectaculaires (+39,2%), ce qui lui a apporté une cote de 15% dans le volume des échanges mondiaux.

Les exportations de ces trois pays représentent plus de moitié de la valeur des échanges internationaux, dans le contexte où la France exporte 34% de la production, l'Espagne 26%, l'Italie 24%.

Au niveau mondial, les exportations de vin tranquille sont en croissance permanente. Ainsi, en 1999 les exportations mondiales ont été de 61 millions d'hectos, en 2003 de 70,5 millions d'hectos et en 2008 on estime une quantité de 79,7 millions d'hectos. Sur ce fond, en 2003 la consommation domestique représentait 66,4% de la consommation mondiale, c'est-à-dire 148,2 millions d'hectos, et on estime qu'elle arrivera à 152,14 hl en 2008, donc une croissance de 2,7%.

L'Allemagne, le Royaume-Uni et les Etats-Unis détiennent une cote impressionnante du volume des importations, respectivement 40%, et du point de vue de la valeur ces trois pays détiennent environ 48% du marché mondiale du vin.

En 2008 on estime que ces trois pays auront une cote de 45% de la croissance mondiale de la consommation du vin.

4. Orientations marketing sur le marché mondial du vin

Les principales orientations du marketing des producteurs et des distributeurs présents sur le marché mondial proviennent du dicton même imposé par la globalisation: *pensée globale, action locale*.

Etant donné leur célèbre ethnocentrisme, les Japonais dont la consommation actuelle dépasse à peu près 2 litres per capita préfèrent autre chose que le reste du monde, c'est-à-dire les vins d'autre couleur, à goût et arôme modifiés pour les mêmes dénominations commercialisées traditionnellement au niveau global. Les Chinois se laissent convaincus de renoncer partiellement aux boissons traditionnelles et de devenir buveurs de vins, la consommation per capita triplant pendant les derniers six ans, mais étant extrêmement réduit (*1,1 litres per capita en 2008*).

Grâce à l'intérêt particulier manifesté pour le problème de la vigne et du vin, la Chine deviendra, conformément aux données fournies par OIV, l'un des plus grands pouvoirs (*aussi*) dans ce domaine, mais sa caractéristique essentielle sera celle de consommateur gigantesque.

En Indes, le grand problème est le pouvoir d'achat très faible, mais ce pays reste un marché extrêmement attrayant pour les années à venir, ayant en vue la disponibilité des Indiens de consommer du vin, qui résulte des recherches de marketing et des orientations actuelles des investisseurs.

L'Australie et le Chili auront un ascendant puissant sur le marché mondial grâce aux concentrations économiques formées par fusions et acquisitions. Ainsi, en Australie, quatre grandes compagnies détiennent environ 60% du marché des vins et en Chili c'est une seule compagnie qui détient 40% de la production de vins.

Les stratégies de marketing dans le domaine des vins devront être pensées et appliquées dans le nouveau contexte, ayant en vue les aspects et les variables qui suivent:

a. Au niveau de la distribution:

- La partie la plus importante des ventes ne se fait plus dans le secteur de la restauration et de l'hôtellerie, mais dans le commerce de détail (source: OIV), ceci implique une nécessité d'adaptation des firmes.
- Le rôle stratégique des grossistes et négociants est dû à l'importance croissante des marques privées.

En Angleterre par exemple, 33 % des ventes de vins sont réalisées sous marque de distributeur, dont 45 % des marques privées sont françaises.

- La concurrence s'organise autour des compagnies multinationales.

b. Au niveau de la marque:

- La marque rend de la valeur, elle est un signal pour les consommateurs, distributeurs et détaillants repérant l'identité d'un produit unique, standardisant des qualités sensorielles.
- Qu'est-ce que le consommateur moyen tend à acheter? Le nom d'une firme, d'une variété ou le nom d'un terroir? On achète un vin de Bordeaux, de Sicile, de Toscane, de Malaga, de Porto ou on achète une **marque** ?

Dans le Nouveau Monde, l'approche du consommateur moyen diffère. Il achète une variété, une marque ou le nom d'une firme, pas nécessairement le nom d'une région.

Dans ce contexte, on constate deux approches stratégiques :

- une augmentation certaine de la concentration: les multinationales investissent beaucoup

Exemples en opposition

Dans une petite province du sud de l'Italie, 45 000 ha font vivre 30 000 entreprises. A l'opposé, preuve du phénomène de concentration, en Australie, les quatre plus grosses entreprises dominent 60 % du marché. Au Chili, Concha Y Toro domine un quart du marché.

- les fusions et les alliances stratégiques abondent.

Les fusions, acquisitions et alliances stratégiques sont très dynamiques partout dans le monde, fondant des structures financières solides.

En ce qui concerne les alliances stratégiques, celles-ci peuvent être: horizontales et verticales.

Elles sont passées pour:

- asseoir une présence internationale;
- investir dans la recherche marketing;
- maîtriser le marché;
- investir dans l'image de la marque;
- élargir le portefeuille;
- manager la distribution.

5. Quelles sont les conclusions marketing pour l'Europe?

a. Adaptation

Les entreprises européennes doivent faire face à des stratégies marketing offensives et des choix de vins simples pour les consommateurs (vins de cépages) mis en œuvre par les "nouveaux producteurs".

Il est fortement nécessaire de développer des stratégies de marketing adaptées à l'évolution du marché et aux attentes des "nouveaux consommateurs".

b. Des stratégies marketing offensives

La capacité de consommation des nouveaux membres de l'UE est supérieure à leur capacité de production, ce qui va ouvrir des débouchés. Il faudra des stratégies offensives (et agressives) de marketing pour s'y implanter.

c. Installer des filiales sur place

Même si les volumes sont modestes pour l'instant dans certains pays, il est important d'instaurer un mouvement d'affaires, d'y être présent. Par exemple, la Chine, l'Inde et le Japon sont des marchés naissants, au potentiel extraordinaire.

6. Conclusions générales

Conformément aux résolutions d'OIV, pour les producteurs et les distributeurs de vins du monde on impose les actions suivantes:

- une adaptation de l'offre à la demande, tant au niveau qualitatif qu'au niveau quantitatif.
- encourager le développement de la verticalité (producteur, distributeur, consommateur).

Instruments stratégiques intégrant les plantations, la conduite du vignoble, l'élaboration du vin, la définition de catégories de vins, le marketing et l'étiquetage, tout ceci en vue d'améliorer la compétitivité et la viabilité du secteur.

- le développement d'une « viticulture bidirectionnelle »

- l'une orientée vers la concurrence internationale, une politique offensive de marketing, avec déréglementation (rendement, étiquetage, pratiques œnologiques) fondée notamment sur des marques et sans pour autant perdre les atouts des indications géographiques;
- l'autre serait une viticulture de grande qualité, basée sur le terroir, avec un réglementation adaptée et plus spécifique.

PRACTICAL EXAMPLES CONCERNING APPLICATION OF THE Q FACTOR ANALYSIS FOR MARKETING DATA

Gabor Manuela Rozalia

„Petru Maior” University of Tg. Mureş, Faculty of Economic, Legal and Administrative Sciences ,
Rozalia_gabor@yahoo.com, 0742 760 430

The Q methodology or the Q factor analysis as it is named in foreign literature, it is a relatively new tool not only driven by its approach but especially driven by a recent discovery of its usefulness in those fields for which the psychometric knowledge of individuals have thorough implications. For marketing, consumers' preferences, opinions, attitudes are subjective and this is the reason why, a Q factor analysis outlines subjective structures or even subjectivity itself. Fields with applicability of the Q factor analysis are many but a better efficiency could be achieved for marketing data as well, where subjectivity plays a major role as a variable that provides important information about consumers.

Key words: Q methodology, marketing data, factor analysis, subjectivity

Introduction

The Q methodology provides a basis for the systematic study of subjectivity and this is a main feature that recommends it to all researchers interested in the quality aspects of human behaviour¹⁷¹ and that, has major importance in marketing, for any company producing goods or supplying services because, from the marketing research point of view, human behaviour both means inter-relationship with a product and the buying behaviour, a consumer's consumption respectively. The Q methodology not with a representative population sample, of consumers, but with a **typical sample of opinions**, and what is more important for the quality of research based on the Q methodology is these opinions should be gathered from that public that has an opinion to express concerning that issue.

Practical examples of applying the Q factor analysis for marketing data

Of the practical examples of applying this methodology, we will emphasize those related to marketing, mentioning once again that, using this methodology is highly useful in **fragmenting attitudes** in marketing research.

Most times, fragmentation in marketing is based either on consumers' demographic data (that are easy to gather and analyse by means of „well-known” methods) either through a direct observation of some „surface' behaviours.

For a marketing specialist, it is difficult not to notice (only with economic knowledge related to marketing) the observable surface of the consumption behaviour of people and for the fact that – using some tools strictly coming from a totally different profession, psychology – are not available, as a result he has to use some standard, phased, innovator tools, such as, the Q methodology, interface can provide it responses to a lot of questions that cannot be obtained with conventional methods. The Q methodology provides the opportunity of some thorough sampling of a consumer's psychic and moreover, it comprises the mathematical accuracy necessary for an objective data processing and its evaluation. In exchange, it has the **disadvantage** (being a very complex method) of being applied by people, experienced and talented specialists, having the skill in transposing some mathematical results into narrations and contextual approaches.

Hence, as Dragoş Iliescu mentioned in his paper, independent variables of psychographic nature¹⁷² that are signally subjective, under the circumstances and regardless the opposition of economists should be the basis of each approach of consumers' fragmentation. The author also considers that subjective, psychographic variables, as being causal, in contrast with demographic variables and the attitudinal ones

¹⁷¹ Iliescu, D. – Metodologia Q, Ed. Comunicare.ro, Bucureşti, 2005, p. 11

¹⁷² Iliescu, D. – Q Methodology Ed. Comunicare.ro, Bucharest, 2005, p. 197

that are descriptive. However, the practice in the field increasingly prefers the use of **psychographic fragmentations**.

The use of subjective variables in consumers' fragmentation is thus very important in marketing because fragmentation of attitudes varies (and has a higher importance) than **fragmentation of needs**.

In the foreign literature, the most standing study based on the Q methodology is that related to the **fragmentation of ATM's users** carried out in the United States of America in 1978 that had as direct consequences, the successful and wide introduction of ATMs and the development of these bank services (it should be mentioned the study was carried out as a necessity of the fact that though they were launched in 1972, the use of ATMs and implicitly the various services provided by them were not successful among the customers of the banks). Thus by means of it, research is entirely based on the Q methodology, two important segments of customers (factors): hasty depositors and interpersonal depositors.

It has been also used successfully in the **fragmentation of opinions related to advertising** aiming to identify groups with common attitudes in this respect.

Of **examples** below it may be easily noticed the diversity of fields and issues possibly to approach by means of this methodology:

- **Testing, identification and modification of the corporate communication factors on-line concerning the marketing of public relations**¹⁷³, identified factors being tested on 20 de communicators and 20 receivers of those who use on-line corporate communication.
- **Study concerning tracking down of priority educational needs within students in order to extend the fields of study**¹⁷⁴ that, by using the Q methodology has improved the implementation process of some fields of study in faculty (and led to tracking down some additional information that couldn't be gathered using conventional research methods), fields of study that were previously introduced in the educational process based on sampling the students' preferences using an e-mail sampling that, based on responses to questions, just set in percentage which are the most „requested” fields of study, without considering the motivations these fields of study are based on. Thus, the use of Q methodology could evaluate the students' current knowledge related to a certain topic and – this is the contribution of using the Q methodology– which are the students' abilities concerning the application of their knowledge.
- **Study concerning the perception of their work within lecturers teaching matters of study in the field agriculture**¹⁷⁵ that, by using 36 items that were describing various educational responsibilities of the professors, the respondents (university men who were teaching matters of study in the field of agriculture) were asked to sort the items in two stages, the first – professors were asked to sort the items based on their own *actual perceptions* related to what they like to their work - and another stage – sorting based on *their perceptions concerning the ideal manner of practicing their work in agricultural higher education*. Forty-six factors have resulted, the first three factors being related to the following types of professors: a *professor working as a trainer, mentor* with a variance of 25%, *academic professor* (14 %) and *educational mentor* (11 %), the results having implications for the professional development of university men. The Q methodology has been used to identify the personal points of view, beliefs, opinions or subjective opinions of university men in order to identify the general types or models of perceptions held by private groups, in that case, professors within the University of Agriculture in California.
- **Study concerning investigation of professor's attitudes in connection with the inclusion of disability students in the groups of students that attend a normal education and to explore the possible diferencies between professors' attitudes concerning inclusion of students,**

¹⁷⁵ Delnero, J., Montgomery, D. – Perceptions of work among California Agriculture teacher, Journal for Agricultural Education, Volume 42, Issue 2, 2001, p.56 - 67

pupils in the public and special education¹⁷⁶. Items included in the study were related to academic issues concerning inclusion of disability students in regular classes, social aspects and those related to the legal right of including disability students within the other students. Individuals included in the study were ten teachers teaching in the special education and in public education, six were involved in doctoral programs and other four in master programs. The three factors resulted cover 78 % of variance and included legality, environment and conservatism.

- **Emphasizing the social-behavioural–psychologic profile of internet users participating in online discussions about sociological changes, dissemination of ideas and social actions**¹⁷⁷ (these aspects are tracked from the social marketing developed by market leaders, aiming to know the profile of consumers reacting to such online discussions, by the firms concerned) that finally led to the identification of five profiles: *techno- optimistic, techno- realistic, information receiver, anti-policy opportunistic and techno- skeptic*.
- **Research of students’ attitudes concerning objectionable**¹⁷⁸ **advertising** (the study concerned referred to the advertising campaign in 1995 made to products –blue jeans– the Calvin Klein brand concerning pornography of children in advertisings) having as respondents, 39 students with age between 18 and 26 years that outlined the two types of consumers within students, respectively those who will not buy those products whose advertising is based on any kind of pornography and another one that, will take into consideration the brand no matter if product is made an objectionable or aggressive advertising.
- **Investigation study of self-descriptors identity of a group of ex-smokers**¹⁷⁹ resulting factors described by the author as: social independence and maturity, development and personal avoidance, hesitation and nostalgia versus disbelief, health and money.
- **Determination of usefulness concerning the use of Q methodology in order to locate and describe influences of subjectivity concerning ethics in clinical decisions taken in the middle of participants to decisions.**
- **The use of Q methodology in order to study the metaphors of the consumption process (or, found in the literature as *consumption as experience, consumption as integration, consumption as manner of play*) in case of mobile phone users**¹⁸⁰.
- **Tourists’ perceptions concerning a tourist destination as a starting point in the development of a new tourist product**¹⁸¹ that used as items in distributing the respondents, tourists, 44 pictures with possible attractions and activities from a tourist region resulting factors defined as: *outdoor explorations (52 %), boat and shore, observation of environment from the shore, experience of the tourist location concerned, social entertainment, personal experience*.
- **Study concerning perception, photograph and culture in tourism advertising within students**¹⁸² **in universities in Canada and China**, (the group of individuals was made of 27 Canadian students, English speakers, 27 Canadian students within a technical university, and 27 Chinese students) the study having as a starting point the idea that, the photograph of products and

tourist destinations is perceived differently by different cultural groups and as a result, they should be promoted differently according to their cultural perception, this issues leading to the making of commercials typical to any typical cultural group. The resulted factors: exotic adventure (specific to Canadian students, English speakers), isolation in nature (typical to technical educated students and Chinese students) and sea, water lovers (typical to Chinese students).

- **Study of customers' orientations, the use of methodology proves that, in the course of time, identification of these orientations was viable by means of this method.**¹⁸³

In Romania, the Q methodology was used in 2000 in a study concerning segmentation of alcohol beverage consumers, on a reference sample at national urban level resulting eight psychographic profiles typical for Romanian market. The Q –sort used 62 items and approached aspects related to the behaviour of consumption, buying, preferences, attitudes and expectations of consumers with emphasis on brandy and votca consumers.

Therefore, in conclusion, *valences of Q methodology are welcome in marketing segmentation, particularly in segmentations having consumers' psychography as a target. The Q methodology and the so versatile segmentation that it makes possible diminishes the chances of extracting some non-representative segments, moreover focusing strongly on qualitative aspects that really matter for investigated consumers.* Results strongly focused on psychography of this method can provide researchers and managerial decision makers in new and extraordinarily influent organizations, tools to coherently understand the consumers and their customers.

In the methodological approach of the Q-sort, important is the fact that it gets out purposeful psychographic segments, and does not depend on demographic variables but depends on the fact that individuals are grouped based on the similitudes and differencies as regards attitudes, reasons, needs and the needs it projects.

Conclusions

As a final conclusion, we can enumerate the **advantages and disadvantages of this methodology.**

ADVANTAGES	DISADVANTAGES
<ul style="list-style-type: none"> • COMPLEMENTING PROCESS TAKES PLACE IN A SHORT TIME • SYSTEMATIC MANNER WHERE PREFERENCES ARE CATEGORIZED • EASY TO IMPLEMENT • IT PROVIDES A MEANS OF THOROUGH STUDY OF SMALL POPULATION SAMPLES • IT CAN BE USED ALONG WITH EXPLORING RESEARCH • IT CATCHES EFFECTIVE SUBJECTIVITY BY MEANS OF SELF-REFERENCES • PARTICIPANTS SHOULD NOT BE SELECTED RANDOMLY • IT CAN BE MANAGED BY INTERNET (THERE IS A SITE ENTIRELY DEDICATED TO THIS METHOD (HTTP://QMETHOD.ORG, IN APPENDIX NO. 1 A PICTURE OF THE SITE CONCERNED 	<ul style="list-style-type: none"> • HIGH NUMBER OF CHOICES REQUIRED BY RESPONDENTS IN A RELATIVELY SHORT TIME. • A CERTAIN INDECISION AS REGARDS FOR EXAMPLE, THE NUMBER OF CARDS (ITEMS, STATEMENTS) INTRODUCED IN PROCESS.

Q FACTOR ANALYSIS (Q-METHODOLOGY) AS DATA ANALYSIS TECHNIQUE

Gabor Manuela Rozalia

„Petru Maior” University of Tg. Mureș, Faculty of Economic, Legal and Administrative Sciences, Rozalia_gabor@yahoo.com, 0742 760 430

Data analyses involves the use of some statistical methods. Q methodology or Q factor analysis as it is named in the foreign literature, is a relatively new tool not only as approach but particularly following the quite recent rediscovery of its usefulness in those fields where psychometric knowledge of individuals have thorough implications. For marketing, consumers' preferences, opinions, attitudes are subjective and this is the reason for which a Q factor analysis outlines subjective structures or even subjectivity itself. The purpose of Q factor analysis is to identify factors and based on them, several individuals can be compared, wherein variables are not grouped but respondents are discriminated among them. The paper shows the technical and methodological aspects of the Q factor analysis.

Key words: Q - methodology, data analyses, subjectivity

Presentation. Advantages of the method. Comparisons. Applicability

Q methodology or Q factor analysis as it is called in the foreign literature is a relatively new tool not only as approach (it was mentioned by *William Stephenson* in 1935 – Charles Spearman's last assistant, inventor of factor analysis – and the parent and advocate of this method) but particularly following the quite recent rediscovery of its usefulness in those fields for which psychometric knowledge of individuals has thorough implications and its results have a higher usefulness by far, compared to other tools that are more standing and easier to use by researchers. *Stephenson's attempt was based on the main idea that individuals never act in social life according as "objectivity" but according to the way they perceive this subjectivity - therefore, according to their own subjectivity*¹⁸⁵. Seventy years ago, the Q methodology proposed itself to use factor analysis as a quantitative analysis technique of some subjective data. For marketing, consumer's preferences, opinions, attitudes are subjective and therefore, a Q – sort outlines subjective structures or even subjectivity itself, *Stephenson's* concept being that of **effective subjectivity**. According to *Stephenson*, the **purpose**¹⁸⁶ of Q factor analysis is to *identify factors based on which several individuals can be compared, wherein variables are not grouped but respondents are discriminated among them*.

This paper will not detail the Q methodology (it is widely approached and sustained by many examples both in foreign literature and by Dragoș Iliescu's own experience in using this method described in the book with the same name), but will only mention the **features that distinguish** it (and recommend it) **as the R factor analysis**, conventional, and the **advantages that marketing research** would have will be outlined, and implicitly **market research if the factor analysis method would be used** (in various types of research).

*Q methodology provides a foundation for the systematic study of subjectivity and this is its main feature that recommends it to all researchers interested in qualitative aspects of human behaviour*¹⁸⁷ and that, in marketing has a major importance for any producer of goods or supplier of services because, from marketing research, human behaviour both means interrelationship with a product and with buying behaviour, a consumer's consumption respectively. The Q methodology does not operate with a type population sample, of consumers, but with a **type opinion sample**, and what is more important for the quality of research based on the Q methodology is these opinions should be gathered from that public that has an opinion to say in that matter.

¹⁸⁵ Iliescu, D. – Q Methodology, Ed. Comunicare.ro, Bucharest, 2005, p. 11

¹⁸⁶ Idem, p.82

¹⁸⁷ Iliescu, D. – Q Methodology, Ed. Comunicare.ro, Bucharest, 2005, p. 7

Fig. 1 - Q- sort for 32 items

(Source: **Kramer, B., Hegedus, P., Gravina, V.** - *Evaluating a Dairy Herd Improvement Project in Uruguay to Test and Explain Q Methodology*, Proceedings of the 19th Annual Conference Raleigh, North Carolina, USA, 2003, p. 347)

The principle of methodology consists in *presenting a person a set of statements related to a certain topic, and then he is asked to order them, as usual based on a continuous “agree”- “disagree”, this operation is called Q sorting* (in the foreign literature the most common name of the method is Q-sort), in fact, *statements being not factual expressions but, exclusive, opinion problems*, the topic concerned making ordering based on own preference, and thus implicitly based on its assigned significance from both approach of statement significance and relationship with these. Schematically a Q-sort with 32 items can be thus represented following its application within investigated respondents (**figure 1**)

At the same time, the Q factor analysis is a quantitative and qualitative research method¹⁸⁸. It is considered to be quantitative because it uses the factor analysis as a calculation method, and qualitative because of descriptive approaches that should be done for each factor tracked down.

Q methodology is signally synthetic (and not analytic as R factor analysis) as it does not break the whole in parts but keeps the parts up and evaluates the structure it is part of, a very important issue in marketing, as it is not important to know as thorough as possible, each consumer with his opinions, attitudes and preferences (in fact, a subversive issue for a firm) but to know as thorough as possible the segment of consumers it is part of, and hence those opinions, attitudes and preferences that are common. The basic principle of the R factor analysis is to explain the whole by its reduction into components (for instance, regression, multiple regression, variance analysis and so on) working based on the assumption that the whole is equal with the sum of components plus error. It is important for market survey, for marketing in general, for the study of consumer’s behaviour and factorized identification of variables but, identification of that vital factor will be much more effective (and this is the purpose of Q methodology) that group and segment the consumers, therefore we consider that, in marketing research, the two methods different as methodology (R factor analysis and Q factor analysis) should be used complementarily and not distinctly, and the results of such kind of analyses will be used complementarily, too.

If stages of Q methodology would be represented schematically, it would be presented as in **figure 2**.

¹⁸⁸ Kufeld, C. – A Q –methodological study investigating the identity self – descriptions of a group of ex-smokers, Dissertation Research Project, University of Luton, p. 19

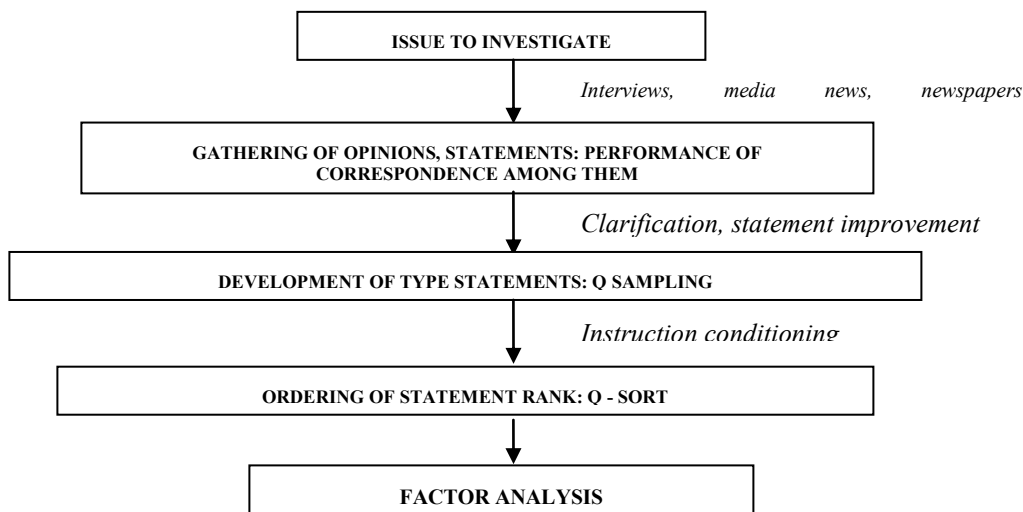

Fig. 2 – Stages of Q factor analysis

The major advantage of this method that recommends it to use, is it uses one of the most powerful statistic technique, with huge exploring valences: **factor analysis**, the approach of the method is that, *structures of subjectivity gathered from individuals are subject to a factor analysis and results in factors that only represent segments of subjectivity.*

Q methodology, based on the correlation of people and not variables has a significant importance for marketing data thanks to the **specific of market surveys and marketing in general, to make and segment the market namely to correlate people according to different variables.**

The main background of factorizing individuals and not variables, hence the entire methodology is the concept of shared opinion. It is not enough to know that a consumer evaluates the brands of a certain category of product based on price, image of simplicity and readiness to find them at the point of sale, but we should also set which of these three dimensions is more important and to what extent is more important. As a result, if we succeed to set that, by far, easiness with which the consumer finds the desired product at the point of sale is most important, this issue will require the generation of a marketing strategy focused on distribution and sale components. If on the contrary, we will set that price is most important, making of a marketing strategy based on perception of price, promotions and price elasticity will be required. **For marketing and market survey, the objective truth related to a product, the trade mark is not important because consumers never buy objectively but they buy or react positively to an advertising, a hitch-hike based on the way they perceive that product, advertising etc.**

For a better vizualization and comparison of the place concerning the Q methodology within the factor analysis methods, we will use **Dragoş Iliescu's** mentions in his paper about this aspect, those related to the *three dimensions* respectively (named "*modes*" in the literature) the **cube of covariations (respondents, variables, occasions)** emphasizing that, though the *factor analysis operates with three modes*¹⁸⁹, it factorizes only one (always considering one of them as being steady and the third as being the module providing a sufficient data rejoin) and quotes another author (**Cattell**) who structured the six types of factor analyses (**table 1**) used in various fields.

Technique	Factorized module	Remarked module	Constant module
O	Occasions	Variables	Respondents
P	Variables	Occasions	Respondents
Q	Respondents	Variables	Occasions
R	Variables	Respondents	Occasions

¹⁸⁹ Iliescu, D. – Q Methodology, Ed. Comunicare.ro, Bucharest, 2005, p. 76

S	Respondents	Occasions	Variables
T	Occasions	Respondents	Variables

Cube of covariations, detailed, according to Cattell

(Source: **Iliescu, D.** – *Q methodology*, Ed. Comunicare.ro, Bucharest, 2005, p. 76)

The above mentioned techniques are related two by two, for example, the R technique (most common) takes into consideration data gathered on the same occasion (steady module), from several individuals (remarked module), that analyse them in connection with involved variables (factorized module). In contrast with R, Q technique, that is its pair, though it has the same steady mode (data gathered on the same occasion) considers several variables (remarked module) and analyses them individually, from where they have been collected (factorized module). Thus, the data matrix used in the Q technique will have individuals on columns and variables on rows, exactly the opposite of data matrix in R.

As opposed to this procedure, in the Q factor analysis, each individual is approached as a different experimental case and represents a factorized entity. Thus, instead of distributing a high number of people with a low number of items to evaluate (R technique), the researcher distributes to a low number of people, a high number of items that should be evaluated (Q technique). Consequently individuals are factorized based on responses to variables, and not to variables based on responses given by individuals.

The Q factor analysis is ideal for that research where the purpose is development of a typology (either consumers or other types of individuals), some authors comparing the Q methodology, in this regard, with the **cluster analysis** when this is carried out on individuals, the analogy consists of the fact that the goal of both techniques is to identify profiles, ideal types, types of individuals that respond similarly to a certain set of variables.

The primary feature of the Q factor analysis is its focus on the correlation and analysis of similitudes among individuals.

As regards the factor design, this technique can be used to evaluate – and eventually to create – **typologies** (a very important issue in marketing). Moreover, except extremely simple designs, wherein each individual meets a single discrete category, the method reveals each individual’s affiliation to several typological factors, to various extents.

In the literature and practice, two types¹⁹⁰ of factor analysis are admitted, namely the **exploring factor analysis** – used to determine *the number or nature of factors responsible for covariations among variables* – and the **endorsing factor analysis** (it has to be mentioned that, one of the most common statistic software, SPSS, cannot operate this type of factor analysis, but only LISREL) – *opposed as methodology to the first one, starts from an assumption that is previous to analysis, set by the researcher, and states exactly which variables will be correlated to generate certain factors and which factors are correlated among them and to what extent.*

Technical aspects of Q factor analysis

As a conclusion to the aspects mentioned in the previous subsection we can state the Q factor analysis is that method that drives existing interrelations and similitudes between a number of respondents, in relation to the common variation on a certain topic, either it is their opinion about a certain product or topic, structure of personality or the psycho-attitudinal model.

Without detailing the mathematic-statistic aspects of the factor analysis methodology, in general, however, we will outline that one of the *main differences between R factor analysis and Q factor analysis*, from the technical point of view, is that, the first uses *analysis on main components* as calculation method, and the **Q methodology uses the method of Thurstone’s centroid analysis**, in his paper, Dragoş Iliescu thoroughly presents the centroid factor extraction algorithm in order to apply a Q-sort of 150 items at an organization in order to investigate the area of organizational psychology in a Romanian firm, correlation matrix comprises respondents included in Q-sort both on rows and columns.

¹⁹⁰ Iliescu, D. – *Q Methodology*, Ed. Comunicare.ro, Bucharest, 2005, p. 78 - 79

Also, related to technical aspects, **to determine the moment of extraction suspension**, the Q methodology uses **two rules**:

- Proper saturation
- Scree test on which scree plot is based

Another important technical aspect in factor analysis is that related to **factor rotation**, and in case of Q factor analysis, the X, Y, Z vectors represent extracted factors and points represent the questioned Q –sort respondents, rotation preferred in Q – sort being the **judgement rotation enabling the researcher to follow his theoretical assumptions, impressions, opinions, beliefs and temporary assumptions**.

Factor rotation in factor analysis used for marketing data and particularly for the Q methodology used in marketing is very important as it helps in setting those **clusters** (groups), **segments** that have attitudes, opinions, **totally** diferent attitudes, totally opposed among them, as it help us very much that, those groups (clusters) that in original centroid extraction seem to be a little neutral compared to other two clusters for instance, after factor rotation affiliation to one of the factors is completed. As a technical comment in carrying out the Q methodology,

1. extraction of factors and rotations should be done independently from the researcher’s working suppositions as regards operation. Then,
2. factor rotation should be determined by the *nature of data* that is available and the *purposes of investigation* that takes place.
3. as factors are extracted and rotated in the preferred manner, they provide the researcher information about similarities or differences of respondents (that are similar and how strong similarity is).

Technical aspects related to the **approach of factor significance** are also important and have characteristics in case of Q factor analysis. The similarity of respondents by using Q methodology reflects exclusively opinion similarities and certainly not demographic regularities what is much more important in order to know the consumer as regards marketing research.

The issue of using the Q methodology consists in measuring significant differencies in statements (items) i.e. to measure how different factor scores of Q-sort statements are, namely to practically set what the relationships among statements and various Q-sort factors (opinion segments, consumers’groups are. **Brown**, quoted by **Dragoş Iliescu**, called them (when he referred to assignment of consensus or differential statements), “*molecular suppositions of Q methodology* ” and represents the most simple manner of testing suppositions, available on Q factor analysis, to identify those statements that distinguish factors among them respectively.

The Q factor analysis assumes that, as a final stage of analysis and technically, the **average category score** for each factor is calculated by means of formula:

$$z_c = \frac{\sum_{i=1}^{nc} |z_i|}{n_c}$$

where z_i = Z score of statement
 c = category
 n_c = number of c category statements

There are **two types**¹⁹¹ of **Q factor analysis**, mentioned in foreign literature:

- **Non-structured Q – sort**, wherein variables are included. These variables are chosen without taking into consideration the basic structures, such items from different sources (or from only one source) are inclined to be representative for a single population of items or a single field, Kerlinger suggesting that basic items can come from measurements of personality and scale of attitudes.

¹⁹¹ Campbell, T.C. – Investigating structures underlying relationships when variables are not the focus: Q – technique and other techniques, paper presented at the Annual Meeting of the American Educational Research Association, San Francisco, April 1995

- **Structured Q – sort**, variables also come from a single field, but are selected to be representative for a certain particular theory issued by the researcher.

ENHANCEMENT OF THE SOCIAL POLICY IN ROMANIAN COMPANIES WITH INTERNATIONAL ACTIVITY BY IMPLEMENTING SOCIAL RESPONSIBILITY PRINCIPLES

Gangone Andreea-Daniela

Constantin Brâncoveanu University – Pitești, Faculty of Management Marketing in Economic Affairs, Str. Dorobanților, no. 14, bl. 51, sc. A, et. 3, ap. 15, Pitești, Argeș, andreeagangone@yahoo.com, 0348/415866

Asandei Mihaela

Constantin Brâncoveanu University – Pitești, Faculty of Management Marketing in Economic Affairs, Calea Bascovului, no. 2 A, masandei@yahoo.fr, 0248/211061

Today, the horizon of economic affairs is submitted to more and more pressures coming from different pressure groups, a very active one being the society on the whole. To stay competitive, contemporary organizations must face these pressures in an efficient and creative way, by integrating various ecological, ethical and social responsibilities in their organizational culture.

But, taking the new responsibilities must not jeopardize the organization's existence or efficiency; it must integrate the new responsibilities and respect some essential conditions by implementing a new and clearly-defined model of ecological, ethical and social responsibility that can establish the steps and the concrete measures needed to change their organizational culture.

Key words: organizational mission, social responsibility of the company, social audit

In the last decade, the conduit of international organizations, governments and local administrations as well as the conduit of national and international business environment may be synthetically defined by a more and more obvious concern regarding the future of humanity.

This concern was determined by the serious changes that market the history of humanity from an ecological and social point of view and concretized in a change of perspective regarding the essential goal of economic affairs, from directly obtaining a higher and higher yield to getting a superior quality for the quality of life, not only for the present generations but for the future generations.

The change of the fundamentally materialistic principles that have governed the world of economic affairs for centuries was made gradually, mainly in the XXth century, in close connection with the moral, ecological and social conscience of their representatives and the whole society.

Today, affairs are submitted to some pressures coming both from the market, from the control bodies, and from the society.

These pressures impose the reconsideration of the organizational values, principles actions and conduit in the terms of a large responsibility as compared to a more diversified variety of partners interested in their activities and results that could allow them get economic or other categories of results.

These changes represented the factors that led to the elaboration and implementation of some social policies in the economic organizations, by integrating various ethical, ecological and social responsibilities in their organizational culture and including in their strategic plans some categories of non-economic results.

To facilitate the measures taken by some Romanian organizations that want and can integrate ethical, ecological and social responsibilities in their organizational culture, we elaborated a model generated by ethical, ecological and social responsibilities that could be applied in the activity of the companies with national and/or international activity.

This model of social responsibility may be successfully applied, according to our opinion, to a large number of Romanian companies, in various fields of activity, due to the fact that it provides the steps to be taken and, at the same time, some concrete examples of principles and actions of ecological, ethical and social responsibility.

The application of this model would not be efficient unless companies that want to use it adapt it to the particularities of their activity and their environment, respecting, at the same time, the following steps:

Step 1 – Analysis of the economic, natural, legislative, social and cultural environment where the organization develops its activity, as well as the prognosis of its future evolutions.

The best method to identify the problems and the expectations of the environment where the organization operates is the combination between the survey (quantitative research) and focus groups or interviews that lead to the setting of the so-called agenda of the population.

This evaluation permits the organization to identify and understand the perspective needs of the society, taking into account the elaboration of the strategic objectives in order to obtain the support of the community where they operate.

Step 2 – Setting the common ecological, ethical and social values and principles that the owners of the organizational capital and the top management wish to support and promote, in correlation with the predicted evolutions of the organizational environment.

At this stage, they realize the general formulation of the organizational values and principles, at the level of the whole organization, as well as identifying the general principles that should govern the organization's relations with the environment where it operates.

Step 3 – Defining/redefining the general mission of the company and formulating the fundamental values of the organization, in the terms of some economic, ecological, ethical and social responsibilities that take into consideration the legal present and future interests and expectations of all partners interested in its activity.

Defining the mission of the organization leads to actions such as: elaborating a code of ethics, establishing the organization's commitment regarding environment protection, the society welfare, on the whole etc.

The main values of an organization responsible from an ecological, ethical and social point of view could be the following:

- open and reciprocal communication with all partners that the organization interacts with;
- respect and trust in relations with the employees, clients, business partners, public and society, on the whole;
- providing a healthy and safe working environment in conformity with the current legislation;
- respecting and surpassing the legislation regarding the current environment protection not to jeopardize the survival of future generations;
- providing integrity of the organizational actions by setting and spreading some ethical standards for the employees, partners and public;
- sustaining and solving various stressing social problems in order to increase quality of life for the mutual benefit of society and organization;
- respecting the European Union's ecological, ethical and social norms and principles in order to provide organizational competition on the great European market;

Step 4 – Spreading fundamental values and principles, first to the managers and then to the executing personnel.

Spreading organizational values and principles involves more than distributing a presentation brochure and should be realized by organizing some specific actions and events (such as organizing round tables with small groups of employees) meant to facilitate the approval of the new organizational values and principles by the organization's members.

Step 5 – Identifying the employees' perception regarding the organization's values and principles and evaluating the extent to which they were accepted and assimilated by them.

Evaluating the employees' perception can be made by organizing some debates between the managers or higher level and the employees of the other hierarchical levels, by applying a survey that permits the respondents' anonymity.

If the employees did not accepted/assimilated the organizational principles and values, the implementation of the ethical, ecological and social responsibility cannot continue. We must, therefore, restart the process by identifying the reasons of rejecting the values proposed by the employees.

If the reasons are pertinent, it means that the values were incorrectly established and the process must be restarted. If the reasons are formal/superficial, then the process of popularizing the organizational values and principles through new methods must be accepted by the employees.

Step 6 – *Elaborating some programs of ecological and social responsibility and implementing them by respecting the following principles in the development of the organization:*

<i>Principles</i>	<i>Content</i>	<i>Recommended actions</i>
P1 – European added value	It has the role to respond to some strictly local/regional needs and place them into a European context with the collaboration of other institutions with similar activities.	<ul style="list-style-type: none"> • developing some collaboration programs with other similar institutions in the European Union and/or in the country. • harmonizing the systems and the practices in the field with those in the European Union • supporting the management and marketing decisions on the basis of some practices responsible from an ecological, ethical and social point of view
P2 - cooperation	The employees' participation to courses and training stages leads to regional and European projects implementation, to the creation of European networks, making studies and comparative analyses regarding the quality of products and services.	<ul style="list-style-type: none"> • permanent/periodical organization of some study visits in the experienced countries • organization of courses or training stages of the personnel involved in the application of social, ethical and ecological responsibility principles • the students' support in the town where the company operates to apply various practice stages in various compartments of the company • the realization of regional and European cooperation projects in the company activity • making comparative analyses (by their own compartment and specialized neutral bodies) regarding the quality of products and services
P3 – natural environment protection	It will be made by implementing some concrete measures that could reduce the network water wastage, use the environmental-friendly materials and promoting various solutions with reduced impact upon the environment, getting performing equipments with low consumption of energy.	<ul style="list-style-type: none"> • knowing the impact that the company activities have upon the environment by using specific indicators: energy consumption and CO₂ emissions, fuel consumption, recycling degree, low network water wastage etc. • using materials with reduced negative impact upon the environment • purchasing performing equipments, with low energy consumption • monitoring fuel consumption by periodical check-ups of cars, equipments and installations • developing some programs of collecting and recycling wastage resulted from the activity development and the employees' involvement in these programs
	It is made by elaborating a Code of Business Ethics, by formulating some norms of behavior and setting s set of	<ul style="list-style-type: none"> • elaborating a Business Code of Ethics that could underline the fundamental ethical principles that will influence the actions and the decisions of the company employees • elaborating an Internal Regulation Code that emphasize the behavior norms accepted within the

<p>P4 – promoting an ethical behavior</p>	<p>indications that describe and regulate the practices accepted in the company and in its relations with the partners, at the level of managers and executing personnel.</p>	<p>company</p> <ul style="list-style-type: none"> • setting a Set of Indications describing real life situations with ethical character, able to influence the managers' efforts in the activity of adopting various ethical decisions • setting punishments for proven ethical behaviors but also some rewards for the employees that act in conformity with the ethical principles agreed by the company • appointing a person that could counsel the employees on ethical issues
<p>P5 – the employees' volunteer involvement</p>	<p>It is made by donations, actions of environment protection, recycling/ecology, programs of social assistance, support given to the disfavored persons, to the victims of domestic violence or to children.</p>	<ul style="list-style-type: none"> • developing some concrete volunteering campaigns for the employees, campaigns that could support the initiatives of some social or public institutions in choosing managers/employees • orienting 2% of the tax paid by every employee to the state towards specialized social institutions • collecting money donated by the employees on a continuous base (a small amount of money donated from the salary), be it with the occasion of religious or national holidays, sums that can be doubled/increased by the company and orienting them towards social causes that need financial support • realizing some projects that could support the disfavored people or the people with disabilities, by offering various tax deductions
<p>P6 – the employees' and the target public's ecological education</p>	<p>It is made by professional training programs of the personnel with the help of educational programs for pupils, students, teachers, local, regional or national authorities.</p>	<ul style="list-style-type: none"> • realizing annual professional training programs for the personnel that deals with the social responsibility initiatives • educational programs for target groups aiming at environment protection with reference to those components mainly affected by the company activity • eliminating or minimizing the employees' risks that jeopardize their health and work security, associated to the activities developed in the company
<p>P7 – involving the organization in supporting the social statute enhancement</p>	<p>It is made by identifying the stressing social problems and selecting those in which the company can and wishes to get involved.</p>	<ul style="list-style-type: none"> • social prognosis of the company environment to identify current social and potential causes • selecting those social causes that the organization must solve • selecting and training the personnel responsible with the initiatives of social responsibility • elaborating and implementing some social responsibility programs for every social cause selected by the organization • cooperation with other institutions in the same field of activity and/or national or supranational governmental institutions in the effort of enhancing the social statute

<p>P8 – promoting a positive image of the company within the community</p>	<p>It places the company on the local specialized market, then on the national one, it makes the clients be loyal to the products/services offered by the company, it improves the relations with the community (public authorities, clients, suppliers, competitors, public).</p>	<ul style="list-style-type: none"> • promoting in local media the company brand in a commercial (on a local TV station or a national one) or some presentation announcements in the local/central press • Informing the citizens about the company achievements through local/national media • promoting a collaboration system with the clients and suppliers and offering bonuses, facilities • applying a survey to see if, and to what extent the company is known and if the citizens know that the company adopted the social responsibility principles (after a period of time when this Program was promoted to the public and applied for at least 1 year) • participating at various social events organized by local institutions.
---	---	--

Directing principles for the organization activity

Step 7 – Involving the organization members in the process of implementation of the ethical, ecological and social responsibility programs in order to obtain their support, to build the team spirit and turn them loyal.

This stage implies an adequate training of the organization members with the help of the specialists inside or outside the organization, according to their degree of getting involved in the programs of social and ecological responsibility.

Also, along the process of implementing the ethical, ecological and social responsibility of the organization, the managers' role, as opinion trainers, is essential.

Step 8 – Involving the public, when there is the case, in the process of implementing organizational programs of ecological, ethical and social responsibility.

The motivation for which organizations must involve the public in their initiatives of ethical, ecological and social responsibilities lies in the fact that the public has similar responsibilities towards the society and the natural environment, but also that the results of these actions will be superior if they benefit of a large involvement.

Step 9 – Evaluating the results of the programs of ecological and social responsibility developing some specific audits.

In our vision, auditing the Reports of Ecological, Ethical and Social Responsibility must be made annually by the company specialists or, preferably, by independent companies specialized in audit. This process should include:

- examining the existent processes in order to identify the main partners and their expectations;
- analyzing the organization's motivations to get involved in the effort of enhancement of the social statute;
- interviewing the coordinators of the Ecological/Social Programs;
- analyzing justifying documents (meetings minutes, presentations, surveys and other documents that ensure the implementation of the Social Responsibility Program is real and the program contents is correlated with the activity of the company);
- quantifying the organization's inputs in the social responsibility programs from a financial point of view (allocated financial resources), from a material point of view (products, services and allocated facilities) and from the point of view of the resources allocated by the organization members (hours paid by the organization's employees);

- quantifying the outputs generated by the organization through the developed programs of social responsibility, respectively of the organization's benefits that may be represented by the absenteeism reduction, increasing the retention time, improving reputation etc.;
- reporting the performance indicators;
- evaluating the initiatives' impact of social responsibility developed within the organization after a certain period of time since they were ended.

As a result of the audit analysis, correcting measures will be taken, if there is the case, and enhancement modalities of future results will be proposed.

Step 10 – *Spreading the results of the audits of ecological, ethical and social responsibility to the members of the organization, to its partners and the public.*

This last stage is very important and pretty difficult to manage as it may lead to the idea, in the public's conception, that the company is expected to get boasted for its contribution to the society welfare.

Actually, this should not be the motivation of the organization's social and ecological involvement, but its full understanding that humanity goes on a wrong way that could lead to a collapse, and taking ethical, ecological and social responsibilities by contemporary companies, regardless of their dimensions, may invert this process.

That is why it is important for the companies to identify and keep into account the community real needs and that the communities grant them honesty, trust, patience.

On the other hand, it is fair that the company obtains a series of advantages in what the reputation of its efforts is regarded, that go beyond the law.

The most important aspect that Romanian companies must comprehend is that social responsibility cannot be achieved overnight, but it means their integration in a circuit of continuous development on a long term and that his process does not mean supplementary costs, but also modalities of enhancing competition.

In conclusion, the response to the contemporary managers' dilemmas lies finding the balance between economic and social performance. The economic organization must become the most important fan of a future viable from an economic, social and ecological point of view in the benefit of humanity.

This involves a real partnership between companies, governments, non-governmental organizations, local communities and international economic and social bodies, a partnership that must be subordinated to the principles of a harmonious development of human society as a whole.

STRATEGIES REGARDING THE TOURISTIC PRODUCTS AT SC INTER TOUR SRL BACAU

Gherasim Daniel

Universitatea George Bacovia, Bacau, Facultatea de Economia Afacerilor, Strada Pictor Aman, nr. 96, Bacau, gherasimdaniel@yahoo.com, tel/ fax 0234 516448

The Romania's geopolitical position reveals the necessity to proper evaluate the attributes of the area that means the natural, human and economic potential, to draw the policy strategies aiming to enlarge a regional or continental cooperation.

INTER TOUR SRL agency has been present on the market, as well as a regional one since 1994, trying to offer quality services and products at a competitive price for the clients. The agency established an important and fruitful collaboration with accommodation units from the area and from abroad. The marketing policy of the enterprise has as a nucleus, the marketing strategy, and as a realizing instrument, the marketing mix. Marketing mix elements are: the product, the price, the distribution and the promotion, which in turns, depend upon other factors.

Keywords: *tourism, marketing strategy, business tourism*

The European integration of the Romanian

At the level of the European Union, tourism represents a catalyzing factor in the relations between states and peoples, and a socio-economic development tool. The result of this process is the development of tourism in all the European countries, at the same time with the preservation of the environment and the increase of the services quality.

Within the plan containing the actions through which we try to realize an integration by means of tourism, and where there are general and specific measures, the harmonious development of the Romanian tourism is correlated with preserving the specific features of the unique geographical and historical area, situated at the border between the Orient and Western part, between the North and the South of the Europe. We also want to support the idea of a unilateral cooperation between and among the countries which pass through the transition period and those having a developed tourism potential and common standards (the construction standards, the technical standards and others) and the promotion of some common actions at the regional level. These are two aspects having a relevance into the present.

The expected results will be obtained at the end of a marketing analysis, synthesis and policy materialized into:

- A sustainable development of tourism planning leading to some clear strategies;
- A tight collaboration between the public and private sectors in order to build up common programs between the national tourism administrators, tour-operators and travel agencies;
- The intensification and the diversification of any form of cooperation.

The Romania's geopolitical position reveals the necessity to proper evaluate the attributes of the area that means the natural, human and economic potential, to draw the policy strategies aiming to enlarge a regional or continental cooperation.

According to the Tourism National Agency, the integration of Romania into the European Community has a positive impact upon this sector, the segment which could have a great profitability being the business tourism. This segment has witnessed an important development lately but up to now has not attracted big international events. The main reasons at this point could be the lack of some conference centers enabling the organization of some big events with thousands of participants, the deficit in infrastructure and the lack of an adequate promotion.

The biggest growth of the Romanian tourism will be registered by the segment dealing with the tourism of events, due to the accelerated growth of the Romanian business market. This aspects needs infrastructure investments and the existence of comfortable hotels.

According to the Tourism National Agency, business tourism will grow in a very short period of time with about 15-20% per year. The short time impact of the Romania adhering to the European Union upon the tourism industry stands in attracting some significant investments both for the hotel and leisure industry. Bucharest could become, during the next years an important destination for some events in the region. Timisoara, Cluj, Iasi, Brasov, Constanta are but some other major places for organizing such events.

The main advantages of adhering for tourism issue from the advantages to access European funds in order to train the human resources, to restore the historical and cultural assets and to improve the accommodation services quality.

At the same time the Romanian tourism will take a benefit from the building up of a new roads and railways infrastructure. Besides the investments and modernizing directions, the tourism sector will have to adept itself to the market competitiveness in the field.

It is necessary to understand that the fidelity of the clients is a very important element and at this point the staff fidelity towards their clients is also important.

By tourist company one may understand the society that sells one and many components of the tourist product. The main categories of firms producing and selling complete tourist products are known throughout the world, and nationally, under the name of tour operators and travel agencies.

Thus the tourism company market may be defined, when thinking of time and space at which the company reports itself, as a provider of services.

INTER TOUR SRL agency has been present on the market, as well as a regional one since 1994, trying to offer quality services and products at a competitive price for the clients. The agency established an important and fruitful collaboration with accommodation units from the area and from abroad.

The marketing mix represents the result of combining the marketing ingredients: product, price, distribution and promotional policy in an integrating system, for a certain period of time. All the above mentioned elements mix together in order to reach the designed objectives with a minimal effort.

The number of possible combinations that the tourist company takes into consideration is very big and among these one should keep in mind the combination corresponding to the resources as its objectives.

Thus a new destination for promotion will expend more in order to attract consumers ; a tour operator may be forced by the circumstances (a competitor which has reduced its price) to adopt a new price strategy; a tourist attraction will have to revise periodically the product as a response to the changes of the market structure; a travel agency can take the decision to enlarge or reduce the number of subsidiaries etc.

Thus, through these examples one may illustrate that the focus upon some different components of the marketing mix vary in time and for different activity sectors.

As a conclusion, the marketing policy of the enterprise has as a nucleus, the marketing strategy, and as a realizing instrument, the marketing mix. Marketing mix elements are: the product, the price , the distribution and the promotion, which in turns, depend upon other factors.

The strategies adopted by a tourism company referring to the dimensions, the structure and the evolution of the range of tourist products making the object of its own activity, reported permanently to the market demands and to the tendencies manifested by the competitors, are called tourist product policy.

There have been registered many definitions attributed to the concept of product. Kotler states that the product is “anything that can be offered to a market in order to attire its attention, acquisition, usage or consume and satisfies a desire or a necessity. It includes physical objects, services, persons, places, enterprises or ideas.(1)

Starting from the product definition and having in mind the elements that composes the marketing mix, one may state that the definition is also valid in the field of tourism, due to the large variety of tangible and intangible elements, respectfully the total amount of goods and services offered to the tourists by an enterprise in the field, or in other words, everything that tourists buy (transport, accommodation, food, leisure etc). From the point of view of the tourist, the tourist product covers the complete experience starting with leaving home, up to coming back travel. In figures, the tourist products are only limited by creativity.

Due to the component elements of the tourist product, respectfully tangible and intangible, within the whole product policy, the marketer should have in mind three levels of supply. According to the theory of Ph. Kotler these levels are:

- a) The essence of the product, which represents in fact what the client buys. It comprises the main advantages that the client identifies under the form of some personal necessities which will be satisfied by the respective product. The task of the marketer is to change the essence of the product (first level) into a tangible product (the following level).
- b) The tangible product also includes the characteristics, brand, style, quality and wrapping. The tangible tourist product comprises the elements of the supply, as they are presented into the brochure: week-end (2 nights) accommodation + breakfast at the price of 164 RON/person, room equipped with bathroom, TV set, TV cable, refrigerator, telephone at the Venus hotel – 2 stars – Slanic Moldova resort (2007 catalogue – INER TOUR SRL agency in Bacau).
- c) The developed product comprises all the services and the additional advantages, extrinsic to the product, which consumer receives and which may influence his decision to buy (delivery, post-sell service, securities etc)

The touristic product development comprises all the component elements of a global experience unique and attractive, supposing a series of advantages offered to the tourist from the very first moment of contact with the accommodation unit and up to the future visits. In this circumstance we have to deal with the opportunities of those offering tourist products and services to differentiate their own products from those offered by their competitors (example, the leisure unit in the proximity). This is the tangible element, but there also exist intangible elements of the developed touristic product, such as psychological advantages (escape from the routine, belonging to a elite), the quality of the delivered tourist activities (the hospitality of the hotel staff, the image of the respective product among its consumers).

In the literature of the domain, the developed tourist product supposes aspects linked to the accessibility (product price, the receiving tourist structure, the time table of the unit); atmosphere (the exterior aspect of the tourist unit, the quality of the decorations, comfort, serving etc); the inter-action between the client and the enterprise offering the services, and the inter-action among tourist consumers (is part of the tourist product).

As a conclusion the tangible product is made up of the first two levels, and the developed product is made up of the all three levels.

Strategies regarding the existent tourist product

As we have illustrated previously, the tourist product is said to be a combination of tangible and intangible elements , having the role to satisfy the needs of the tourist during his/her entire journey. The intangible elements have a main role, being represented by the tourist products and services through which the tangible elements are fulfilled (the tourist assets and the tourist infrastructure of a certain area.

The tourist activities being part of a tourist product are supplied by independent different enterprises with which the company signs agreements and collaborates: welcoming structures, food providers, air transport lines, leisure and treatment units, museums etc. Some additional services should also be provided: tourist assistance (guiding persons), information agents, middlemen for some special reservations, other activities having a special characteristic.

The role of INTER TOUR SRL agency is to manage and coordinate all these kind of activities being always very careful to the needs of the clients.

Elements contributing to realising a good tourist product are:

- a) natural components: geographical position, climate, relief, waters, vegetations, fauna reservations and natural parks, special attractions, such as some nature monuments;

From this point of view Bacau has a very good geographical position, in the very heart of Moldavia region, having a variety of relief (mountains, hills and plateaus and valleys becoming less important when going to the west part of the region. Natural reservations may be illustrated by “The Nemira Rocks”, “The Perchiului Hill near the town of Onesti etc.
- b) General components of the human existence in this area: culture, language, traditions, customs, folk elements, hospitality of the people etc. The cultural past is well illustrated in the area when mentioning the George Enescu’s composer memorial, the writer Costache Negri, the poets George Bacovia and Vasile Alecsandri, the science people Ion Borcea and Ion Ionescu de la Brad. There

are also some historical sights such as Precista church and Borzesti church dating from the middle ages.

- c) The general infrastructure: transport and communication roads, commercial network, water supply and the human concentrations etc.

Bacau region disposes of a good infrastructure being situated at the cross commercial roads coming from the south and going to the north and at the same of those going from the east to the west part of the country . There good connection to all the other parts of the country both on the railways and on national roads. Bacau town is crossed by the European Road E 85 and from here starts the national roads DN11 making a good connection through Ghimes-Faget path to DN12 towards Transilvania. There is an airport in the town of Bacau which is very busy nowadays and a very modern one.

- d) The tourist infrastructure is also very good in Bacau: ITER TOUR SRL being a leader of the market in the field, then ARA TOUR, ELI TOUR etc. There are all kind of tourist services present here: hotels, motels, chalets, agro-tourist units, villas, restaurants, coffee-bars, fast-foods units, leisure network, health resorts, hospitals and policlinics, and a well tourist information network.
- e) the human factor present in developing such tourist activities is also well represented at the level of Bacau area offering a high quality service to the clients.

The participation of the consumer in the delivery of the tourist service may increase the quality standards and may contribute to cost reducing fro the tourist products and services.

Tourist units managers try to impose the brand, which is a combination of characteristics and values aiming to attract more and more clients and to achieve a niche position on the market.

The identity of the brand makes considerable changes in the mind of a client linked to some values added to the product, values which may overpass its physical attributes: Here are some factors generating it:

1. the experience of the persons getting in touch with the brand;
2. the category of persons using it;
3. confidence in the brand;
4. the aspect of the brand;

The Brand plays an important role for the tourism product, because it offer the possibility to differentiate this product physically speaking, especially the hotel and food ones. Such elements such as architecture, design or physical characteristic (modern or traditional), the style of the services (formal or informal), position (central or outside the town) etc.

On a more and more competitive market and under the conditions of a permanent increase of tourism, the tourist destinations adopt more and more brand strategies in order to differentiate their identity and to create singularity for their product.

The way in which a firm is perceived by the consumer is important, leading to the concept of “image” and “identity” of the firm. The image of the firm refers to the impressions that potential consumers have when thinking about their organisation in general. It is significant for the tourism product consumer, assuring them about the quality of the respective products.

The identity of the firm is formed by the perceptions of the external audience referring to the enterprise (employees, services, promotional activities etc).

The basic components that define a tourist product, from a marketing point of view, may be grouped as a-corporate components, corporate components, communications regarding the product and the image of the product.

Due to the complex characteristic of the tourist product, the most important decision in tourist product planning should be the one referring to the product mix which must correspond to the identified business. Product mix represents the product portfolio which a firm offer on a market or other.

There five basic options for the product-market mix:

1. More markets with more products for each, respectively more markets and a set of products for each market (for example the tour operators which offer a large variety of service packages with more destinations or travel agencies offering a large set of vacations for different markets);

2. More markets and a single product for each of them (for example, hotel chain which offer accommodation in hotels of different categories according to the market segments);
3. More markets and a single product for all of them (example, a tour-operator launches for more travel agencies a single destination);
4. A single market for many products, respectively a tourist firm offer a set of products for a single market (example, a tour-operator which offer a variety of destinations for a single market);
5. A single market and a single product (a tourism firm offer a vacation package for a single destination, on a single market).

The decision of the tourist firm to offer one or many products (products mix) on one or many markets depends upon many factors:

- the forecast of the strong point and of the value of the consumers' demand on different markets;
- the competitive advantage upon the products or of their substitutes offered by the competitors;
- the identity of the enterprise, respectively the competence and its image on the reference market;

The starting point in analysing and planning a tourist product is represented by the consumer's demand analysis and of the supply of the competitors in relation with the firm capacity to offer a competitive product. The products which will have a sure success should be conceived taking into account the identification of specific necessities for the corresponding target market, based upon a good position compared to the competitors offers.

The tourist product position is the base of their management and represents the way in which the enterprise is situated by comparing it to the competitive firms and products on different markets.

The services package at SC Inter – Tour Bacau

In most cases one the same firm offer its clients not only one product but a range of products more or less homogeneous. Taking into consideration the common sense of the expression range of tourist products it will be understood an assembly of such products linked together by the fact that they address to the same category of clients, satisfy the same needs, are based upon the same resources, are sold through the same distribution net etc.

In tourism a range of products is constituted by an assembly of products which may be classified into product lines, each line being defined by a certain basic element materialized in a resort, a certain type of tourism (business, cultural, sport or balneary), in a certain type of transport (vehicle, rail-way, airlines or by sea), a certain type of accommodation (hotel, villas, private houses, camping etc).

Compared to the material range of products, the one linked to the tourism products has some particularities:

- If there is only one firm participating to the realising of the products set, then the constituted products are assured by the participation of several firms;
- From the point of view of the content the tourism products range is more heterogeneous, the products being part of a range, are different from the others because of their basic component (accommodation, transport, food etc)
- Passing from a product to another (or from a product to another (or from a range to another) it may be realized in a easier way, the travel agency being entitled to introduce or eliminate from the structure of its services whole categories of voyages without changing the amount of qualification of its staff, means of transport etc.

The development of large range of products permits to the firm to cover a large market area and to more clearly delimitate the main segments of customers to which it addresses.

It is also the case of Inter-Tour which has a large range of tourism services and covers two distinct markets, the domestic and the external one, being well represent from the point of view of the supply.

Within a range , one can find more product lines, one line signifying a homogeneous set of products and services, under the form of the raw material, manufacturing technologies and also under the aspect of coherence, the products and the services entering its structure being in tight connection one another.

Starting from these elements, the dimension of the range of services can be defined following these components;

- *the size of the range* which is given by the total number of product lines composing it, and in the case of the Inter-Tour firm this is very large comprising ten distinctive lines, among which some have a permanent character, and others such as social tourism or students camps depending on the programmes achieved by the corresponding ministry.
- *the variety of the range inside its structure* is given by the number of product lines contained and in the case of the firm this is very high for each product line. For example in the case of domestic outings Iter-Tour disposes 12 tourist directions, the tourist programme for the 2 days trips comprises 6 directions and the programmes of 3 days trips comprises 3 directions. In the case of some organised groups the firm assure on demand accomodation and transport for any other kind of route and licensed guiding persons.
- *The length of the range* represents the sum of all the service lines and in the case of the Inter Tour travel agency this range is large and it is valid from a period to another as the firm adapts its supply according to the existing demand which may differ from apeak period to the extraseason period.

The positioning of the services within the range

For any manager it is necessary to precisely determine the target markets, the objectives, the global strategies and also the particular market programs according to the offered services and products, to the level of the price, to the systems of distribution and promotion. Very utile when analyzing the business portfolio the firm is the pattern BCG (Boston Consulting Group- table 1), where the tourism products may be divided in:

- “stars” type having a market quotation high enough and a market rate in extension, having an influence upon the long term policy of the firm;
- “very productive one” type , for which the market quotation is very high and the market rate growth is reduced, very profitable at the moment, and being taken into account when constituting the investments funds supporting the products belonging to the first category (“stars”) and the third one (“dilemma”);
- “dilemma” type, having low market quotation, and the market growth rate is high, their future being not very secured and supporting them means big investment efforts;
- “mill stones” type having low market development rate and their market quotations should choose between abandoning them or re-launch them.

In the category of “stars” are situated the external trips with individual programs and other facilities due to the free visa circulation within the Schengen Space

In the category “very productive ones” are situated rest and treatment tickets having a good rate of sales throughout the year, being well appreciated by the clients because almost all the units offering such services are private ones.

In the category of the “dilemma” are situated the services offered by the agro cultural-tourism being in full extend but being almost inaccessible for the tourism agents , registering 5% of the turnover. The services for the New Year Night and for Christmas

In the category “Mill stones” there enters internal coach or train trips and the currency exchange services which do not bring benefits to the firm.

Table 1. BCG Pattern

Most tourist product offered to the firm's clients belong to the existing category, situated in their growth phase, maturity or decline. Fundamenting the strategies referring to the existing products supposes the analysis of their actual position and the evaluation of their future position.

The strategy of remaining for a long period as a market leader imposes to the Inter Tour SRL firm the use of its entire potential and advantages and a further more penetration, sustained by its 'Stars' products otherwise the decline may occur at any time. Practicing high prices correlated with the great demand of the market will enable the company to obtain a maximum profit which may constitute the investment support for the "Stars" products and the development of "Dilemma" ones

The diversification strategy comprising foreign destinations is very varied including hotels of 2-5 stars, coach or plane or even individually supported transportation, series of 7, 10, 12 or 14 nights (Turkey, Spain, Italy, Bulgaria, Croatia, Greece, Egypt, Malta, Thailand, Hawaii), 5-12 days (Budapest, Switzerland, France etc). For the business people or other individual people the travel agency offer accommodation for different destinations (e.g. Paris fro 35 EURO./person/day).

The Romanian tourists, especially those having over average incomes have a tendency to choose external offers as these ones become more and more comparable in price with the internal ones.

The quality exigencies of the tourists have started to grow and under the circumstances offered by the internal tourism which can not ameliorate the quality level of the services they choose the foreign destinations.

The information concerning the tourism activity and the kind of tourism services is taken from the so-called secondary sources such as: statistic catalogues, magazines and bulletins published by the national, tourism offices or other organisms, data banks of the professional unions and of the firms specialized in market research and from the records of the tourism firms.

Keywords: information, market research, questionnaire

The information concerning the tourism activity and the kind of tourism services is taken from the so-called *secondary sources* such as: statistic catalogues, magazines and bulletins published by the national, tourism offices or other organisms, data banks of the professional unions and of the firms specialized in market research and from the records of the tourism firms.

Besides the existing information concerning the tourist activity and the kind of tourist services, taken from the so-called *secondary sources* (statistic catalogues, magazines and bulletins published by the national, tourist offices or other organisms, data banks of the professional unions and of the firms specialized in market research, the records of the tourist firms – such as the reception book, the suggestions or complaints book – the video records – or other recorded sources giving information about tourists , old market researches etc.), in market researches one uses mainly the data gathered *directly*, as a consequence of the special observations, experiments or enquiries.

1. **The observation** is a method used for collecting information which supposes a survey done by certified persons, chosen by the company (guides, receptionists, market agents etc.), about the tourists behavior, in order to notice their reactions to different variations of the level of tourism services prices, taking into account the different categories of comfort classes, hotels and restaurants made at their disposal, the physical and social ambient assured during the trips, the accommodation, the entertainment facilities etc., using some specific methods (the tourism audit, the method of mysterious tourists, the mechanic observation etc.). Thus the resulting information is relatively objective (they are not influenced by the goodwill of the investigated subjects), eliminating at the same time the stress caused by the use of other methods.
2. **The experiment** supposes (in addition to the direct observation) the effective intervention of the operator upon some marketing variables (the quality of services, the advertisement formulas, the promotional techniques etc), in order to notice what happens to others (the demand level, the proper market quotation, the tourists satisfaction etc.), being realized within a *natural environment* (directly upon the tourism market) or in the *laboratory* (specially delimited spaces, in which some variables may be maintained under control).

Most of the experiments are made by the help of *tests*, the most common being:

- *Product tests*, through which one aims to identify the clients reaction to different tourism products of the company;
- *Name tests*, done in order to find out some associations that tourists could make between the name given to a tourism product (Futuroscope, Three Fir-Trees Chalet) and the image that it suggests;
- *Advertisement tests*, made in order to discover the way in which tourists understand the various advertisements and their impact upon the demand, the comments which they produce;

- *Market tests*, through which one may observe the reaction, on an extended scale, of the market when there is a change of some variables such as the marketing mix, etc.

The use of the experiment within the tourist marketing, although difficult and expensive, is very useful.

3. The **enquiry** represents best the most applied way to gather information in market researches, being based upon questionnaires containing sets of questions addressed (but very rarely) to all the potential customers of different kinds of tourism products (the case of exhaustible enquiries or global enquiries) or (in many cases) to a sample group of tourists (market survey).

Taking into account the *ways in which the links are realized* between those making the enquiries and the persons that are invited to draw up an answer we may exemplify:

- *Direct contact enquiries* or *face to face*, which, although they are the most expensive, give the advantage of being best checked, the interviewed person being offered further information and details, thus being brought to a stage in which they could give the most correct answers, such as:
 - *confidential answers* or *individual answers*, when every tourist may freely and independently formulate (without being disturbed by the presence of other persons), the answers he appreciate as correct;
 - *group answers*, which, from the desire to minimize the expenses, supposes to address the questions simultaneously to many subjects;
- *By mail*, used when the degree of dissipation into space of the targeted subjects is great and the collection of information is not so urgent, eliminating thus the stress of the direct enquiries and reducing the costs of realizing it (offering in exchange less further details for the more sophisticated questions);
- *By telephone*, recommended in such instances when the number of enquired people is relatively small, and the same is the quantity of questions, the latter method cumulating the advantages of the two preceding methods and also eliminating their disadvantages.
- *By computer terminals* etc.

The instrument through which the information is gathered in the case of enquiries is the **questionnaire**. In order to be very efficient the questionnaire must be not very long but not very short, its dimension being very important in collecting the results. Its dimension is measured taking into account the quantity of the needed information. The questions must be well drawn up having intuition and ability in order to cover all the necessary information. At the same there must be no difficulty in giving the answer, the terms used should be simple and clear, the language and the vocabulary should be accessible to the public.

Before being applied the questionnaire should be *pre-tested*, to check if their able to catch the interest and the desire for collaboration from the part of the interviewed persons. If the questions are too easy to be understood they could lead to some ordinary answers (repeatable to all the persons), or they must lead to a refusal from the part of the interviewed person or some situations may occur when the answers might be incomplete and deliberately vague etc.

In order to avoid *errors*, questionnaires should not contain questions that are usually practiced by the specialists in marketing (as for example: "Which is the ratio of the elasticity of the demand in the case of the services practiced by your hotel during the holiday period taking into consideration your incomes?"). Such kind of questions are not very clear. There are others containing contradictory ideas such as: " Are you intending to travel to Bucovina this year in order to have the Holy Communion to the Moldovita Monastery?" At such kind of question an anti-god person, but being a fresco lover, would answer "Yes" thinking of going there not for a religious purpose but for his desire to admire the mural paintings. One must avoid drawing up question that might force the memory or the capacity of judging of the interviewed person such as: "How many times you have used our restaurant services during the last 12 years?" Undelicate questions should also be avoided as in the example: " Are you an alcohol edict?" etc.

As in all other situations, the questions that might be present in a questionnaire are:

- *Open questions*, to which one might receive an indefinite number of answers ("Which are your favourite entertainment resorts where you usually spend your holidays?");

- *Half-opened questions*, when the subject will choose a single option for the answer from among other possibilities ("Can you exemplify in which of the following tourism resorts have you spent your last vacation: 1-Mangalia; 2-Eforie Sud; 3-Neptun; 4-Mamaia; 5-Navodari.).

Another important thing for a questionnaire is its body and shape. It is recommended that it contains a *preliminary section*, in which the subjects be informed, briefly, about the scope of the questionnaire. They should understand very clearly that the questionnaire aims to improve the existing services and facilities for the complete satisfaction of the clients. The second part of the questionnaire should contain a *list of questions* (closed ones, opened ones, and half-opened ones). The question should follow a logical course. There should be enough gaps after each questions in order to cover the necessity of space to draw up the answer. A questionnaire will be easily accepted if the number of questions, closed or half-closed, is larger because the subjects often find difficult to draw up by themselves the answer. A questionnaire will be easier to be accepted by the addressed subject if this one has a larger number of questions for which the alternatives for an answer is large (closed or half-closed). People find it difficult in drawing up the answers all by themselves. It is easier for them to select the appropriate answer among others. The last part of the questionnaire should be reserved to *systemize the resulting information* contained in the second part, in order to be easier analyzed in future.

In many situations, the alternatives for the answers suggested by the questionnaire may embody *an evaluation scale of the attitudes*. For example, if the enquired person is asked to evaluate the qualitative level of the entertainment services that a tourism company offered him, such a thing may be illustrated as in the scale presented in Example 1.

Very high I-----I-----I-----I-----I-----I Very low

Example 1. *The attitudes scale*

Between the maximum and minimum limits, the subjects of the enquiry may indicate, according to their appreciations, any intermediate level.

For example, if the managers of a hotel **H**, from a Romanian Black-Sea resort want to make a market research to see if the creation of a swimming pool is needed, the questionnaire could be as in Table 1.

Example of questionnaire

Dear client,

The Hotel **H** in Neptun is going to build up a modern swimming pool that will be made at your disposal during the period you will be our guest. In order to take this decision, your opinions about this project would be very useful to us as they will be expressed in the following questionnaire.

Please round up the answer you consider being in conformity with you opinions.

We kindly thank you for your collaboration.

1. Do you usually spend your vacation period at the Romania sea-side?

Yes / No

2. Do you agree with Neptun Resort?

Yes / No

3. Are you familiar with our hotel?

Yes / No

4. Having in mind our present facilities would you agree to become our client?

Yes / No

5. In order to make up your decision of becoming our client in future, would you consider that the creation of a swimming pool would much influence this decision?

Yes / No

6. If you really want the swimming pool, are you willing to pay an extra fee in order to use it?

Yes / No

7. If "Yes" could you specify the limits growth for the accepted tariffs?

Maximum level%

Minimum%

This space should not be completed by you!

The client **is interested** in the idea of the new swimming pool.

The client **is not interested** in the idea of the new swimming pool.

The enquired subject **is not our potential client**.

Table 1.

The enquiries in tourism are attributed the advantage that people in general are willing to talk with pleasure about vacation and different ways of spending free time.

THE STAGES OF THE RESEARCH

As any other research, the market research in tourism supposes to go through some stages, such as:

- Formulating the theme and the work hypotheses;
- Fixing a work schedule;
- Gathering the information;
- Analyzing the information;
- Exposing the results.

1. Formulating the research theme and the work hypotheses is the stage starting the market research.

As much as the *theme of the research* is concerned, it should be chosen and formulated very careful because the utility of the study depends on it and also the effort in doing it. As a consequence the theme should not be very large, in order to convey to the dissipation of forces and to enlarge the costs of the research. At the same time it should not be very small in order to have the potential to cover all the aspects of the research. Elements that may be of real interest should not be omitted. Frequently the elaboration of the theme need some previous analyses.

Formulating the hypotheses should be accomplished with great care because on its quality lies the success or the failure of the research.

2. Fixing the work schedule constitutes a major stage, essential in realizing the whole research. Inside its framework, there exist, very well determined, the moments showing the start and the end of the actions necessary for the entire research and at the same time for each stage of it. There are also mentioned the intermediate stages. The stages of the research should follow a *chronological order* and there are stages that could be ruled *simultaneously* making use of the specific methods of the operational research and those based upon the CPM (the criticizing way) or PERT method.

3. Gathering the information is the stage in which, using the sources, the instruments and the investigation methods presented in the previous sub-chapter, the operators find the necessary, informational support in order to be informed about the aimed aspects of the research, the relevance of the conclusions being important in taking the final decisions.

4. Analyzing the information may be achieved using a series of *description methods*, that means a simple selection of the answers formulated in the questionnaires (or of the data resulting from other sources), in determining some central values of the investigated collectivities (medium, median ones etc.), of the

dispersion indicators (distance type, deviation), in the computation of some indicators and structure values etc., or in some *causal models*, which are in the position to render some relation of determination and subordination that exist among the marketing variables.

5. **Presenting the results** is a stage in which the gathered information is presenting under the form of the conclusions.

Very important for the good execution of the research is the **control**, a device that needs responsibility in its application. Thus there will exist a good information and a precise information and there will be a good image reflecting the costs.

Abstract: The purchase process is a decision-making process under risk. The selection of one brand over all other brands is a process of optimizing the consumer's utility. This optimization is done under uncertainty, since the buyer does not have perfect information. According to this process, buyers must always choose between making an immediate decision (to buy or not to buy) or delaying this decision to seek additional information, and thus reduce the decision risk. To purchase a product or a brand, buyers need a certain level of information; pre-purchase information-seeking activities depend on four factors: two factors are purchase-situation related, and the two other factors relate to the type of product and market.

Key words: purchase decision, uncertainty, advertising, pre-purchase information-seeking

1. INTRODUCTION

Needs and motivations are the starting points of purchase decisions. For a purchase to take place, buyers must experience sufficiently positive attitudes toward the product and the brand and consciously felt needs. When all the elements of the marketing program are properly designed, a buyer will include the advertised brand in his or her evoked set of brands, which is all the brands that are considered for purchase. These elements of the marketing program include designing the product to have the attributes buyers seek, ensuring that the product is available at conveniently located retail stores, and setting a price that buyers perceive as reasonable. This article describes the process buyers follow to select a brand from within their evoked set. Emphasis is put on elements of the process that advertisers can influence through a well-designed communication program.

2. THE PURCHASE DECISION PROCESS

Social scientists develop many sophisticated theories of consumer behaviour. They give a variety of theoretical models to explain the sequence of behaviours involved in making a purchase decision. The first task in promoting any new product is to create awareness – perception – that the product exists. The second is to provide enough information – learning – about the product for the prospective customer to make an informed decision. Finally, the marketer wants to be persuasive enough to stimulate the customer's desire – motivation – to satisfy his or her needs or wants by purchasing and repurchasing the product. These three personal processes of consumer behaviour – perception, learning, and motivation – are extremely important to advertisers (Arens & Bovée, 2005).

Most purchases imply the decision to buy a product or service. This purchase decision process includes:

1. A goal to be reached (i.e., lessening the tension created by an unsatisfied need or desire).
2. A number of alternatives (i.e., competing products and brands). Products and brands are perceived, evaluated, and compared on the basis of their distinctive attributes and on their ability to satisfy a set of needs. These alternatives also include the non-purchase decision.
3. Some evaluation criteria for choosing the “best” alternative.

4. A state of doubt, arising from the impossibility of possessing all relevant information on the different products and brands. Buyers are also uncertain about how well a given product or brand will satisfy their needs and desires.

When they buy a specific brand, buyers have expectations. This notion of expectation is intimately related to any purchase decision. A consumer who buys a product has developed definite expectations about the consumption of this product. Consumers buy a certain brand because it is preferable to competing brands; they have implicitly or explicitly anticipated that the selected brand will yield more satisfaction than the other brands and that it will respond more appropriately to the relevant set of felt needs. Hence, the amount of satisfaction consumers anticipate they will receive from a certain brand constitutes the *expectations* raised by the selected brand. An overview of consumers' purchase decision process is shown in Figure 1 (Darmon&Laroche, 1991).

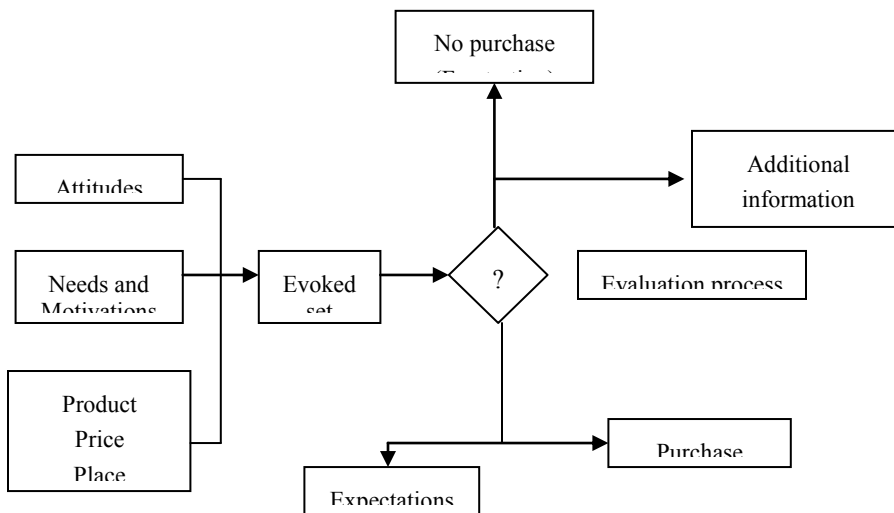

Figure 1. The Purchase Decision Process

The Purchase Decision: An Optimization Process

A purchase decision can be considered as an optimization process through which buyers seek the product or the brand that will yield the greatest satisfaction. In order to find which brand will produce the highest utility, buyers compare these brands along attributes they consider as important. The choice process can be considered as the search for the most satisfying trade-off among brands that possess desirable attributes at different levels.

Assume that a buyer judges – wrongly or rightly – that all the brands of one product on the market have exactly the same level of a given attribute. This attribute does not enable the consumer to differentiate among different brands, since it is present in all of them. This attribute is called an *inherent* attribute. Obviously, in this case, to choose a brand, one would have to compare the different brands along other important attributes. For example, a buyer may perhaps think that all the umbrellas on the market are waterproof, whether or not this opinion is technically well-founded. The consumer who perceives this as a fact cannot use the water-resistance attribute to compare umbrellas, since all the brands are perceived as being equal on this attribute.

A corollary of this observation is that brand comparison is possible only when a consumer considers those attributes on which some differences among brands can be perceived. These attributes are *distinctive* brand attributes. Consumers can compare different brands of umbrellas by their colour, style, or durability if they think these characteristics vary from one brand to another.

The Purchase Decision: A Decision Under Uncertainty

A buyer who experiences the psychological tension caused by an unsatisfied need or desire faces a series of decision problems: What product should I buy? Which brand should I choose? These decisions may be described within decision making under uncertainty framework.

As was shown before, consumers run a certain risk in making a decision based on present information because this imperfect information does not enable them to predict exactly which product will procure the maximum satisfaction sought nor which brand really has the qualities desired (or that should be desired).

A certain number of costs are related to the risks taken by buyers. These costs are, for example, financial losses (if the product does not adequately satisfy all or part of a consumer's need as it was hoped it would). The costs may also be physical (if, for instance, the realization of the risk endangers the consumer's life) or psycho-sociological (if a wrong purchase jeopardizes a consumer's reputation in one of his social groups, for example). These costs are essentially associated with a fast decision (hence with a limited amount of information). They decrease with time, because time has been used by the buyer to gather additional information, thus reducing the risk involved in the purchase.

However, when the buyer waits until more information is gathered before making a decision, costs associated with a delay decision are incurred. This time, two types of cost are involved. First, there are *psychological opportunity* costs experienced by consumers who are deprived of the product they need and are consequently in a state of psychological tension. As time elapses, this psychological tension becomes more acute and eventually develops into a state of frustration. Second, buyers experience costs associated with the information-gathering effort. They must invest time and energy to visit several retailers, seek out and read advertisements, or inquire for other opinions about the best product to buy. These *delayed decision* costs considerably increase as time elapses. The buyer must seek information until it is felt (at least intuitively) that a search for additional information will bring about more costs than benefits.

Advertising Implications of the Purchase Decision Process

This view of the role of additional information in consumer purchase decision has implications for advertising. An advertisement reaching a potential buyer while the buyer is seeking information will have a greater impact, since the buyer is spared the time and effort needed to seek out this information himself and is less likely to turn to competing brand advertisements to obtain the additional information. In other words, buyers are generally more responsive to different brand advertisements while they are seeking information on these brands. This is why they become a choice target for the advertiser, provided the advertiser can identify and locate them. The strategy that consists of asking consumers to return a coupon at the bottom of a print advertisement is often devised along these principles. Thus, a consumer who is interested and is in an information-gathering stage is asked to return a coupon in order to obtain more information on the product or the brand. Then the advertiser takes advantage of the consumer's having identified him or herself to send a series of informative (and persuasive) messages or to send a salesperson who will try to conclude a sale. This strategy is currently used by life-insurance companies.

A second series of implications that this analysis of the buyer decision process has for advertising is that an advertiser must reduce the buyer's uncertainty about the *distinctive* attributes of the brand. Because a buyer takes only these attributes into consideration when comparing and evaluating brands, an advertiser normally tries to give positive information about the brand's performance on the distinctive attributes. An advertisement about the inherent attributes of a brand is bound to be ineffective. At best, it will be primary advertising for the whole product class, which will also promote the competing brands. This is why an advertiser must know which attributes of the relevant product category are perceived as inherent by the buyer, and what are the distinctive attributes on which the advertising effort should be concentrated.

After purchasing the product, the consumer will experience some level of satisfaction or dissatisfaction. The marketer's job does not end when the product is bought but continues into the post-purchase period. A distinction must be drawn between the post-purchase feelings, which are essentially experienced during the period of relative uncertainty about the actual instrumental value of the purchased product, and which concern the occasional important and costly purchase; and between the post-usage feelings, when the consumer has evaluated the degree to which a product has met expectations.

3.THE DYNAMICS OF PURCHASE BEHAVIOUR

The Determinants of Purchase Information-Seeking Activities

As we have seen, the buyer behaviour is not static; rather, buyer behaviour and the information acquisition process can be viewed as a continuous system. To purchase a product or a brand, buyers need a certain level of information about the characteristics and the probable performance of various brands on the market. Pre-purchase information-seeking activities depend on four factors that have an important time dimension (Figure 2). Two factors are purchase-situation related; the urgency of the purchase situation and the level of information the buyer has acquired by the time of the purchase decision. The two other factors relate to the type of product and market: the length and regularity of the purchase cycle for a particular product type and the risk perceived by consumers in the purchase situation (Darmon&Laroche, 1991).

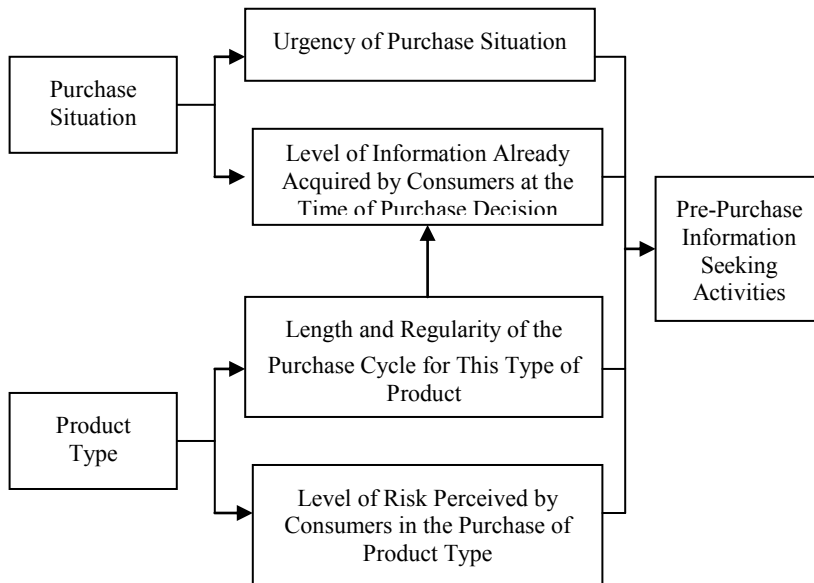

Figure 2. The Determinants of Pre-Purchase Information-Seeking Activities

Urgency of the Purchase Situation. The urgency of the purchase situation affects the quantity and quality of information that a buyer has time to acquire before making a purchase decision. For instance, a consumer who is suffering a severe migraine may go to the nearest drugstore to buy a pain reliever, and thus is acting under great time pressure. Because of this hasty decision, the consumer probably will not buy the same brand he might have if he was seeking a pain reliever for some future headache.

Level of Information Already Acquired. Depending on the extent of market information, a buyer's decision process has differing levels of complexity. A product's characteristic in relation to an individual's past experience determines the level of complexity of the decision process. Three possible cases can be identified: the consumer is familiar with a product category and knows the characteristics of competing brands (*routinized response behaviour*); the consumer knows the product category well but not the particular brand (*limited problem solving*); the consumer does not know either the product category or the brand (*extensive problem solving*). The level of information already acquired is directly affected by the length of the purchase cycle, because the rate of information forgetting depends on how frequently a product is purchased.

Length and Regularity of the Purchase Cycle. Purchase situations related to certain needs and wants occur at various frequencies and paces. Frequency is linked to the type of product and market. Based on the regularity and length of the purchase cycle, three types of markets can be identified: *short purchase cycle markets* are characterized by routine purchase decision processes or by limited problem solving when a new brand is introduced on the market (coffee, sugar, bread, soft drinks, canned vegetables, and household and beauty care products fall into this category); *irregular purchase cycle markets* are characterized by products that are purchased more or less regularly (desserts, cookies, cake mixes, aperitif wines, and deluxe food products); *long or unpredictable purchase cycle markets* include all durable goods, such as cars,

household appliances, and furniture (products for which occasions of purchase cannot be predicted, which most consumers buy only occasionally).

Level of Perceived Risk. In general, the nature of the risk – physical, financial, and/or psychological – as well as the level of the risk depend on the kind of purchase contemplated. Buying a candy bar typically does not involve the same level of risk as buying an expensive second-hand sports car. When buyers perceive a high risk in a purchase situation, they will generally require more information about the brand and the product class before making a decision. The relationship between the size of the risk and the consumer's information research depends, in turn, on the consumer's attitude toward risk.

Brand Loyalty and Brand Switching

The information a buyer has already acquired, the urgency of the purchase, the type of product, and the risk involved interact with one another and determine a buyer's level of pre-purchase information-seeking activities. Once evaluated, this information is used to implicitly rank-order the different brands in the evoked set, and other conditions permitting, the most preferred brand will be purchased.

But for how long will this brand remain the most preferred? Is a buyer likely to switch to another brand at the next purchase? Learning theory may help answer these questions. According to psychologists, learning is the behavioural change resulting from previous behaviour in similar situations. Learning theories postulate a state of tension as soon as a need is felt by an individual, in response to a stimulus in the environment (such as products or ads), which calls for the subject's response (a purchase decision). If the behaviour is rewarded by satisfaction and, by tension reduction, it is repeated when the need occurs again.

Learning is more likely to take place in short purchase cycle and routinized response behaviour situations (Blackwell et al, 2000). During the short time lag between two consecutive purchase occasions, only a fraction of information has been forgotten, and a substantial amount of additional information has been gained through using the selected brand. At the next purchase occasion, a buyer does not need and generally does not deliberately seek additional information. If the previously selected brand resulted in a positive experience, this buyer remains loyal to the brand with no further reassessment of purchase alternatives. Otherwise, if the preceding purchase has led to a negative evaluation of the brand, or if the buyer has been exposed to and accepted new information that changed the order of the brands, then the conditions for *brand switching* are met. The buyer will try the new, most positively evaluated brand at time of the next purchase.

CONCLUSIONS

Because buyers must act on the basis of incomplete information, they automatically and consciously incur a risk in every purchase and non-purchase decision. The size of the risk buyers perceive depends on the importance of the particular purchase and on the quantity of relevant information about the product category and the competing brands. A purchase decision can be considered as an optimization process through which buyers seek the product or the brand that will yield the greatest satisfaction. The choice process can be considered as the search for the most satisfying trade-off among brands that possess desirable attributes at different levels.

Once a purchase is completed, the buyer expects the products or services to provide the satisfaction he or she was seeking and that motivated the purchase. For goods with a short consumption cycle, consumers can judge if the product meets their expectations by using it immediately. But with durable products with long consumption cycles, consumers cannot tell immediately whether the product will meet their expectations. Therefore, a distinction must be drawn between the post-purchase feelings, and the post-usage feelings.

Buyer behaviour and the information acquisition process can be viewed as a continuous system. Pre-purchase information-seeking activities depend on four factors that have an important time dimension: the urgency of the purchase situation; the level of information the buyer has acquired; the length and regularity of the purchase cycle for a particular product type and the risk perceived by consumers in the purchase situation.

Consumers run a certain risk in making a decision based on present information because this imperfect information does not enable them to predict exactly which product will procure the maximum satisfaction sought nor which brand really has the qualities desired. Thus, buyers are generally more responsive to

different brand advertisements while they are seeking information on these brands. This is why they become a choice target for the advertiser, provided the advertiser can identify and locate them.

STRATEGIC JAPANESE BUSINESS VISIONS – POSSIBLE TRANSPONES IN PUBLIC SERVICES

Grigorescu Adriana

National School of Political Studies and Public Administration Bucharest, Faculty of Public Administration, 6,Povernei Street, Sector 1, Bucharest, adrianag@snsps.ro; adrianag4488@yahoo.com, +040213180897;+040213180898 extention 1142

Abstract : Frequently, the „Japanese miracle” was a subject of discussion. The book „The Strategist Brain Power – The Business Art in Japan”, by Kenichi Ohmae (Japan, 1975) when the business environment was confronted with serious problems. The book brings, also in Romania (1998), a number of tools that can be used by businessmen in working out strategies ment to lead to performance. Even if the author is declaring himself „an enemy of governments and bureaucrats, and a great supporter of entrepreneurial initiative and private companies”, we believe that the use of the strategist’s comprehenshion can be „a very powerful weapon, comparable with the laser” for the eradication of some problems in the public services sector. The paper aims at transposing some strategic schemes used in business, in public services, especially by the idea of extent of freedom versus constraints.

Key words: strategic vision, Japanese business, transposition, public services

Introduction

„The Japanese miracle” is, lately a subject that many company managers discuss. This is mainly due to the fact, utterly unexpected, determined by the way the Japanese companies have approched and conquered the European and American markets. The surprise comes from the fact that the management and marketing have their roots in America, and those that „take advantage” of them are the Japanese companies.

The Japanese business environment witnessed natural convulsions after the Secound World War. So, they were known as a nation of „imitators” as they made all by „copying” the American patterns. This situation was determined by the appreciation given to those proposing copying as solution, and disfavour incurred by those that ventured their own original ideas.

The book, that we propose as a start for a model, came out in Japan, in 1975, when the business environment was confronted with serious problems. These were the results of the oil crisis and of the general image. Under these circumstances Kenichi Ohmae has the courage to propose in his book „The Strategist Brain Power – The Business Art in Japan”, the use of man’s brain power as a main weapon to fight with, in business. The ideas submitted by him were well received by the young managers, and the book has become one of the reference books in the area of business management. This was afterwards, published in the USA, and in 1998, it was published also in Romania.

The author states, quite from the beginning of the book, that in Japan there is no powerful economic school – the magic stays in the fact that remarkable strategists have a low formal education, probably they have not even the curiosity to read an expert book, but have an exceptional capability to intuit the evolution of the interaction between the company – clients – competitors.

Basic elements of strategic thinking Two of the obstacles that have to be fought against, from the Japanese point of view, are:

- the access to positions of strategist or executive manager at an early age so that enough enthusiasm to be left to design bold and innovative strategies;
- accept the intuition and perspicacity as main elements for planning success strategies.

Although the author defines himself as „a declared enemy of governments and bureaucrats, and a great supporter of entrepreneurship and private companies”, we consider that the use of strategist’s brain power can become „ a very powerful weapon, comparable with the laser” for the eradication of some problems of the public services sector.

Kenichi Ohmae begins his work explaining the different kinds of thinking and especially pointing out the specific elements of the strategic thinking. Three types of thinking process are shown in figure 1. 1.¹⁹²

The author considers the analysis as the starting point for any strategic thinking process. The first thinking type is that based on mechanical systems of reorganizing elements. This is the type particularly used in the

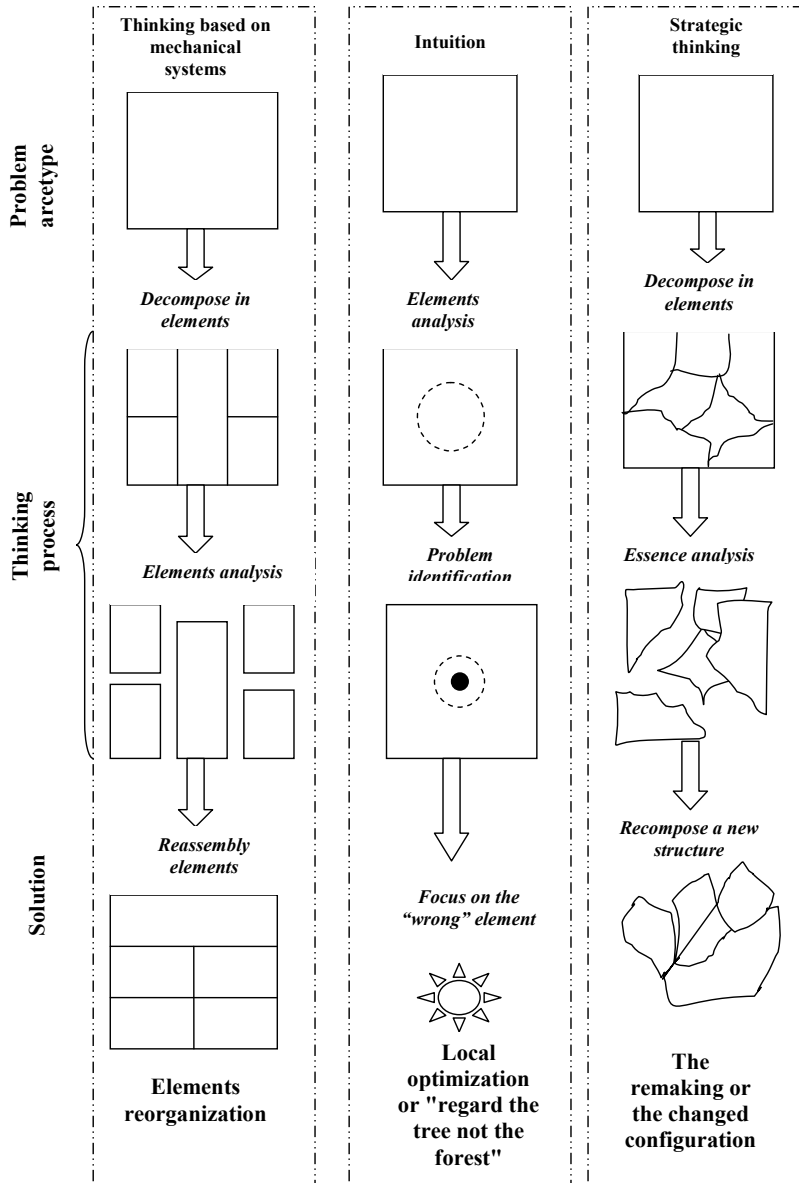

Fig.1.Types of thinking process

public sector, due to the existence and necessity to maintain a certain level of bureaucracy, the natural sluggishness against the total changes.

¹⁹² Undertake of Fig.1-1 Three types of thinking process, Kenichi Ohmae, Inteligența strategului – Arta afacerilor în Japonia (The Strategist Brain Power- Business Art in Japan), Editura Teora, București, 1998, pg. 20, with our supplements

The second type of the shown thinking process uses the intuition as the central mood in the identification of the problem and defining the solution. Although we consider this type of thinking very useful and profitable for business, it can't be successfully used in the public sector as it induces a too high level of risk. The risk is not typical for the public administrative structures. These have as an aim, among others, particularly the protection against risks and the distinctive element of the domain is the stability and the absence or limitation at a low level of potential risks.

The strategic thinking proposed by Kenichi Ohmae starts in identifying the elements forming the studied unit and settling their characteristics, by the strategist. Using the imagination, intuition and the perspicacity of the strategist, this will have to build up a new entity out of the components that he has in hand. With no limitations, he can give up elements that he considers unnecessary in the new structure, or he can bring in new elements.

Regarding the public sector we consider that such an approach could be a reforming variant. In support of this proposal is the up to now experience, focused on partial changes, many welcome and with an important positive impact, but it is regarded that a reform is needed, also that a large number of components has to be dealt with the reformation process and that there is the opposition to change shown by the older public servants in the system, situation similar to that in the Japanese business environment, at the time of launching the theory of „the strategist brain power” impact.

In this way, an interdisciplinary group can be organized, both with experienced and especially young persons, strategists of the business environment, other categories that can allow the follow up of a strategic thinking process in the design of a strategy for the public sector and especially for the public services.

In figure 2¹⁹³ the stages that has to be followed in a strategic thinking process are shown. One can see that there is the possibility of a „short circuit” that shortens the process to three stages. It is true that, the use of the shortcut is welcome, but it will not reach the proposed results as it gives up the core of the problem.

Kenichi Ohmae proposes, in the above mentioned work, four types of strategies, starting from the main objective of a company, that of getting an advantage against the competition. The author points out that „the strategy,, has, as the only aim, to place the company in a higher position in comparison with the competition, and not to solve internal operational, managerial etc. matters of the company.

¹⁹³ version of the figures 1-2 Problem restrict, pg.24 and 1-3 Steps of strategic thinking with pg.26, Kenichi Ohmae, *Inteligența strategului – Arta afacerilor în Japonia (The Strategist Brain Power- Business Art in Japan)*, Editura Teora, București, 1998, with our supplements.

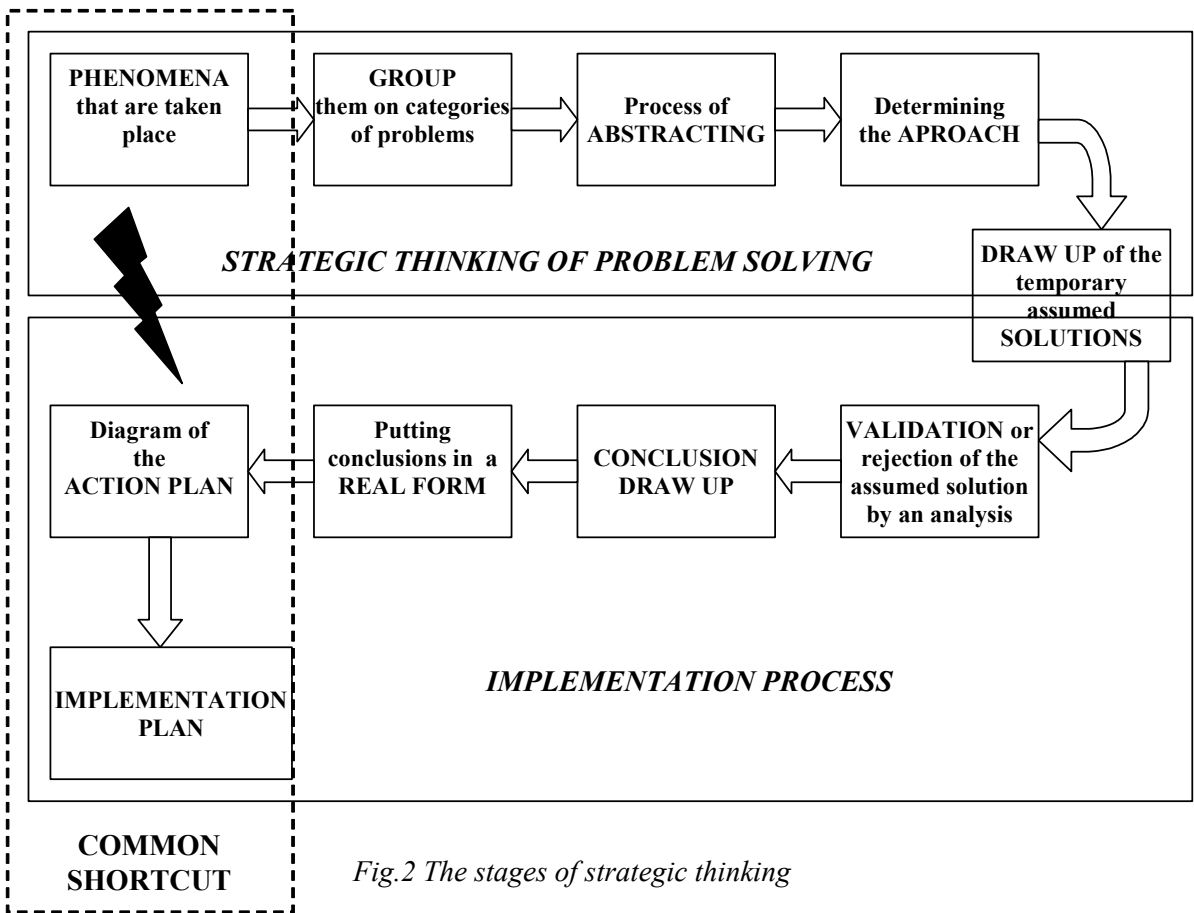

Fig.2 The stages of strategic thinking

He differentiates the company power in the relative and absolute one. The relative power can be low (the inner weaknesses) for a time period as against the absolute power, which is hold as against the competition and whose diminuation can bring about even the company disappearance.

Strategies types

For a better understanding of the differences, the author uses the following comparison : „the difference is equivalent to that which exists between the participation to a battle and the follow of an antifat treatment”.

The four proposed types of strategies, according to tabelle 1 can be grouped in two categories, namely : compete intelligently and avoid to compete.

Table 1

	<i>Business or offered product</i>	
	<i>Old/Existent</i>	<i>New/Creative</i>
<i>Compete</i>	<i>KFS</i> <i>Intensify the functional differences</i>	<i>Agresive initiatives</i> <i>Successive questions as „Why?”</i>
<i>Avoid competition</i>	<i>Relative superiority</i> <i>Exploit the competition weaknesses</i>	<i>Strategic degree of freedom</i> <i>Maximise the beneficiar’s adventageus</i>

The first strategy – this strategy is based on the identification of the key-factors of success and the concentration of the resources in a certain area that gives the possibility to bring about a strategic advantage, as against the competition – the key factors of success KFS strategy.

The second strategy - under the conditions of a very stable and powerful competition, the strategy is that of overthrowing the rules of the game so that to obtain a competitive advantage – the Strategy of the aggressive initiative.

The third strategy – in the absence of an absolute competitive advantage, one can use the relative advantage against the competitors.

The fourth strategy – under the context of a powerful competition, one can find solutions that position the company on favourable places by launching new products, by new markets approach or by creation of new markets – The strategy based on freedom extent.

Opposite the proposed strategies to the business environment, the skeptics could invoke the lack of competition in the public sector and thus their lack of appropriation. In the case we come back to the comparison made by Ohmae, an approach of the type: „antifrat treatment” in the public services, for sure can allow obtaining results in a short time. If the „battle” in the business environment is with the competition, in the public sector we think that it is a two-level battle.

Thus, a first level is that of fighting the system that has to be replaced, reason for which the process is very difficult, because of the immateriality of the counter party. The time is a constraint as it works against the actual structures and on the part of the former system positive recollection.

A second level is determined by the appearance and evolution of the private sector as an alternative to the public services. This performs a bigger and bigger pressure.

The four proposed methods have two general objectives:

- (1) to offer the company a competitive advantage, difficult to obtain by the competitors;
- (2) to allow its consolidation and expansion.

The KFS strategy. Regarding the first type of strategy, that of the key-factors, there is the need to firstly identify them. In table 2 we propose the key-factors for services and point out the way how these vary, depending on the sector.

Table 2

<i>Key factor for...</i>	<i>Types of private / public services</i>		
	<i>...profit increase (price decrease.....)</i>	<i>...increase of market share (...increase the number of beneficiaries)</i>	<i>...increase of customer satisfaction (...increase of citizen satisfaction)</i>
<i>Raw materials</i>	<i>public light</i>		
<i>Capacity of the offered services</i>		<i>health, social assistance, education services</i>	<i>sanitation services</i>
<i>Production technology</i>		<i>health, sanitation services</i>	<i>health services</i>
<i>Services quality</i>		<i>social assistance</i>	<i>health, sanitation, education services</i>
<i>Range of offered services</i>		<i>health, social assistance services</i>	<i>health, sanitation services</i>
<i>Personnel quality</i>	<i>social assistance</i>		<i>health, education services</i>
<i>Personnel number</i>		<i>social assistance, sanitation, education services</i>	<i>health services</i>

<i>Distribution network</i>		<i>health, social assistance, education services</i>	<i>sanitation services</i>
-----------------------------	--	--	----------------------------

The profit and market share increase are the objectives of private service companies . These parameters are not interesting for the public services and we considered necessary that they can be replaced by the decrease of the price and, respectively, the increase of the number of beneficiaries. We put, together with these, the increase of the service consumer satisfaction, namely that of the citizen, as for the public services this being the main grievance. One can notice , regarding the shown examples, that for different types of services, the key-factors differ depending on and because of the objective in view.

The strategist has the role to identify the key-factors for the activity area, in study, and has to take into account the whole process for finding all of them. After the key-factors identification it is necessary that the strategist to accept the responsibility of their use, in view of getting the competitive advantages.

The strategy of the aggressive initiative. This type of strategy is based on the questioning performed by the strategist, of different executives, about the way the company works, in view of identifying the strangling, rigid zones that bring about the processes blocking or slowing. The questioning is based on the question „Why,„. Using this method it can be identified the zones which has to be unblocked by radical initiatives. This the reason of the strategy name.

We consider that this type of strategy can be used, with success for the modernization of the public services. It is true that the process of questioning is performed with difficulty, because of the reserve of the decision factors from the public administration system. It is possible even to determine an aggressive position among them, if there is no prior explanation of the aim of the questioning. We can't deny the fact that, the method itself has an aggressive component determined, on one hand, by the pressure of the questions and, by the other hand , the radical solutions that are to be proposed by the strategist.

The relative superiority strategy. It is based on the creation of a relative competitive advantage that places the company on a favourable position in the market. This can be achieved by using of certain low price policies, that have as a base different reasons , of the compatibility with products or services placed up- or downstream, the homogeneity of services etc.

This type of strategy can be applied in public services with greater difficulty and less spectacular outcome, due to the constraints that the public sector has to meet.

The strategy based on freedom extent. The exploration of the freedom extent to build up a strategy for the studied organization, is related to the components on which one can act and the restrictions that should be taken into consideration. The identification of the strategic freedom extent (SFE) is the first stage of the process of drawing up the strategy, the second one being the superpositioning of this assumed freedom extent over the constraints.

In the business environment the constraints come, mainly, from the part of their role and place in the aggregate of services, specific regulation, dependence on the local or central administrative authority etc. The competition, in this case, is not without importance, but it does not exercise a major pressure. On the basis of the strategic freedom extent (SFE) one can establish the sore points on which the strategist should focus.

Conclusions

The secret of the strategic vision is represented, in Kenichi Ohmae's opinion, by some landmarks :

- The dihotomic thinking „all or nothing”;
- Flexibility of thinking;
- The importance of the key-factors;
- The analysis as the starting point in working out strategies;
- Attitude as an element of change .

„In Japan and the West, there have been big companies that failed entirely in the business world. Although, I don't know a company that couldn't change the direction of action before to be too late. In each instance

that I studied, at one moment , the management lost sight of the range of alternatives in their hand , making, by an ever narrower mental vision, for their own destruction”¹⁹⁴ .

We consider that, this judgment comes to endorse the hypothesis that we express, to take over the proposed strategies types and transpose them in the designing of the public services, by using the strategists brain power, with the aim of solving, in a creative manner the problems that face them.

„For the military strategist, the key to success stays in the establishment of how much he has to study for reaching an ideal strategy and to determine the point where the perfection becomes duty. If the strategist is determined to eradicate even the smallest imperfection of his strategy, his officers would have the need of perfect information and unlimited time to achieve such a strategy”¹⁹⁵

These judgments of Kenichi Ohmae from the work „The Strategist Brain Power „, propose to us to think over the aspects that can be taken over from the military technique, this being the one that has established and used frequently the strategy concept, and, on the other hand, to waste no time searching for the perfect solution.

If it is advanced that in business a weak business plan is more than no plan. We consider that we can extend this principle to the strategies level, saying that the lack of a strategy is more unprofitable than the existence of an improvable one.

We judge as a future challenge the possibility to test putting in operation the aggressive initiative strategy and the strategy based on the freedom extent, that we consider convenient to the public sector and possibly, the key-factors strategy, that can be adapted, but for which we have reserves regarding the possible outcome.

An ecotourism certification system must create a demand for its services among travel intermediaries and tourists as well as among tourism providers, in order to be successful. As one of the recent certification program, and focusing on multifaceted, worldwide industry, successful marketing will require sustained and dedicated support from a wide variety of stakeholders. This paper provides recommendations for promoting and marketing Romanian ecotourism certification program in order to increase consumer demand for certification and to grow the supply of certified ecotourism businesses.

Key words: Ecotourism, certification, marketing

Introduction

Certification, a voluntary procedure that sets, assesses monitors and gives written assurance that a business, product, process, service, or management system conforms to requirements, is growing rapidly throughout the world. It is commonly used in many professional sectors from academia and nursing to financial investments. Tourism, as the biggest industry in the world, is no unfamiliar to green certification programs which create and monitor sustainability using criteria and standards assessing ecological, economical, and socio-cultural responsibility. To be sustainable in their goals, green certification programs in general, and ecotourism certification program in particular must involve a variety of stakeholders. Education, outreach, promotion, and marketing are not only necessary, but critical.

Necessity and opportunity of ecotourism certification promotion

The topic of defining an obvious ecotourism certification product in order to reduce confusion among users is an essential one that must be addressed to carry out a successful marketing campaign. This is a number one priority and challenge. Secondly, in order to be really successful and produce a “sea change” within the industry – i.e., to develop industry-wide practices in the name of sustainability – certification programs must involve a significant number of service providers as well as consumers of all types.

The first stage is to work with suppliers. Certification proposers must persuade an important group of tourism providers that becoming certified is in their advantage: that it will diminish costs, enhance marketability of a product, reduce risks, and improve company image. They must go out and sell these virtues to a wide range of businesses within the industry. While at first it’s not too complicated to find businesses who split environmental and social responsibility values, to step forward to be the first to go through the certification process, this is not enough. Certification programs must draw businesses that are eager to consider certification but are not sure that it will be worth their time and money to go through the process. Once they do so, a certain momentum develops and the growth of certified products takes on a life of its own.

The second stage is to create sufficient demand among customers and intermediaries to produce a market for increasing numbers of certified products. Customer surveys show a deliquescent interest on the part of tourists in patronizing ecotourism suppliers, but to date, this interest not often translates into actual demand for ecotourism certification programs. The challenge, therefore, becomes a “chicken and egg” issue. For producers to go through the process of becoming certified, they want to be guaranteed that there is consumer demand. Also, a wide range of customers are not likely to pay for certification and are not acquire certified goods, unless there is an enough supply and alternatives to choose from. As a result, novel

certifying organization must keep a balancing act: convincing producers to sign on and become certified even before a conscious and involved market exists, while also rising awareness and marketing certified products even before there are many available.

Other issue that many green certified products and services face is that the label of the certification program is not well understood or easily recognized. Ecotourism certification, which integrates environmental and social standards, is complicated. While many environmental criteria can be evaluated by measuring performance measures or through development of environmental management systems, social and cultural criteria and their assessment are considered uncertain and unreliable.

In adding to the equivoque about what ecotourism certification labels mean, consumers and tourism providers are justifiably confused by the propagation of programs around the world. Each ecotourism certification programs has its own criteria, and often going beyond markets. Without rigorous assessment of the criteria and processes used by each one to evaluate and certify tourism providers, consumers presently have modest assurance that they will receive the services they are looking for. A response to this will be the foundation of the Sustainable Tourism Stewardship Council, a projected international accreditation organization for ecotourism certification programs which will establish and monitor international standards, as well as promoting awareness of ecotourism certification around the world.

Recommendations in marketing Romanian ecotourism certification program

Ecotourism must be developed in Romania because has an attractive natural and rural environment, a potential good business, a high necessitate for nature conservation, a niche tourism capable to bring an affirmative destination image and a growing incoming flow of tourists. Ecotourism is a tool to connected socio-economical value to nature, a tool to sustain local communities, a tool to communicate environmental values and nature conservation to local people and tourists.

Theoretical ideas can meet practical requirements and expectations by elaborating a high quality ecotourism products and communicating to the international market, setting up nature conservation method connected to ecotourism, stimulating socio-economical of local communities, rising a high nature interpretation component and high environmental standards. Ecotourism certification system in Romania is planned as a guiding system: to give credits for best practices. It is based on the international experience like Nature and Ecotourism Accreditation Program (Australia Ecotourism Associations) and Nature's Best (Swedish Ecotourism Association) (Jonasson, 2007) and adapted to the Romanian circumstances. The ecotourism certification system in Romania covers eco-destinations, tours organized by tour-operators or guides, small scale accommodations.

Methods for Ensuring Credibility

Property examinations and audits for new and continuing members are keys to guarantee credibility of the certification program. All new properties should go through an initial on-site inspection in order to obtain certification. These inspections should be kept anonymous and all results should be pending from the property management until the end of inspection. Examinations should be conducted by independent experts of ecotourism and sustainable tourism. It is recommended that more than one specialist should examine each property in order to make the audit less biased. Different inspectors should be in charge of assessing separate standard, based on their field of expertise. For example, criteria of environmental infrastructure should be assessed by a proper expert, while an expert in a different field may be more appropriate to address social and cultural standards. Separating examination responsibilities according to area of expertise will bring more credibility to the inspection process.

The certification criteria and the examination process should be made very clear to both providers and consumers. This can be realized by adding the certification standards and details of the examination process on the certification program's website, and distributing them to providers, who should also share them with customers. If the certification system is affiliated to an organization, details of the criteria and examination process should be sent to all members through either email or a newsletter annually in order to reduce consumer confusion. Credibility in the certification program can also be achieved through alliances with compatible organizations that actively show support for the program. Partnerships with business and organizations that are already well-known and respected by consumers and providers are keys to increasing the visibility of the program.

Marketing Strategies

Romanian ecotourism certification promoters should hire a public relations person once the program is running and there is an adequate amount and diversity of certified products and businesses. They extend positive contacts with the media, are present to conferences, create promotional and advertising materials, and develop marketing and outreach partnerships with other businesses. The results are seen in wide name recognition.

Concentrating on a niche consumer market is appropriate for new programs trying to gain buy-in. As an example, the Romanian ecotourism certification system can begin by concentrating on the educational tourism market. Originally targeting groups that are already eager to participate makes the most sense as a consumer marketing strategy.

Marketing to Consumers

Marketing to those to make distribution - travel agents and tour operators - is a plan to help marketing The Romanian certification program. Suppliers who have confirmed interest in social and environmental responsibility should be courted and educated. Educational travel associations, while not creator of volume, are likely to share sustainability values and would be good marketing targets to start with.

Marketing success can be guaranteed by making relationships with intermediaries such as travel agents. Even as the role of travel agents has reduced with the increase of the Internet, there are still many tourists who consult with travel professionals before making bookings. Business tourists, especially, are likely to work with corporate tourism departments and agencies. It will be significant for ecotourism certification systems to present themselves to the main travel agencies and to promote the advantages of using certified businesses. Information about ecotourism should also be provided.

Romanian ecotourism certification programs could propose discounts or other benefits to regular customers of certified businesses and to members of collaborator association. The ecotourism movement must generate affinity groups and involve them in dialogue on subjects relevant to local concerns in order to get their buy-in.

Marketing to Providers

The Romanian ecotourism certification program should provide more than just a seal of approval to participating small scale accommodations, tours, and attractions. Offering technological assistance to participating small scale accommodations is necessary for program recruitment. This can be realized through an on-site examination of the property and can be coupled with the auditing process. Supplying an evaluation of environmental management and infrastructure and a list of suggestion for improvement and ways to fulfill them after examination will give providers more incentive to join the ecotourism certification program.

The certification program should furnish a resource guide to all participating small scale accommodations, tours, and attractions. The guide should be a collected database of relevant ecological information to support managers faced with the challenges of implementing environmental programs at their lodges. The guide should include a wide range of environmentally friendly product vendors.

Marketing messages that support provider recruitment are those that link better ecological management with improved resource efficiency and reduced costs. For those small accommodations scale, attractions and tours that are already ecological-efficient, messages that promote achieved market share from environmentally conscious tourists and greater marketing through program participation are common. Still, because the latter benefits have not been knowledgeable at this point in the evolution of ecotourism certification, they should be considered as marketing messages for the longer term. As an alternative, marketing messages should comprise and stress the value of technological assistance and informational resources for “greening” of providers’ business.

When promoting to Small and Medium Enterprises (SME), technological assistance oriented towards growing efficiency and reducing costs are especially important. In order to furnish these businesses with reduced cost methods and strategies for increasing their sustainability, they should also be trained to monitor energy and management costs and savings in order to reduce overhead expenses.

It is suggested that members of Romanian ecotourism certification program to be the providers instead of the consumers. These providers can have advantages such as support with promotion, marketing, advertising, and booking. These advantages are especially attractive to small scale accommodations because they often cannot afford to market sufficiently on their own. Through participation to an ecotourism certification program that dynamically marketing accommodations, tours and attractions to consumers; therefore, these are more likely to want to participate.

Furthermore, building a referral program that keeps record of small scale accommodations customers and refers them to others in the program will encourage provider buy-in. Once a certification program is properly appreciated and used, less marketing to tourism providers will be needed as businesses will want to become certified for the image value as well as increased patronage.

Marketing Tools

The commercialization or give-away of a guidebook or directory featuring certified Romanian small accommodations, tours and attractions can increase consumer buy-in. The directory should be distributed to travel agencies, tour operators, and travelers alike. It should give common information about the Romanian ecotourism certification program, certified businesses and their sustainability ratings, maps, photos, and background information on tourism and its impacts. The ecotourism certification programs should consider make a magazine or newsletter that promotes an ecological message as well as one of high service and quality of certified providers.

Constructing a website directed at consumers will aid the program. This site should contain clear information on the criteria and examination process of the Romanian ecotourism certification program in order to decrease customer confusion, and it should contain a section for making online reservations at the certified small scale accommodations. The site should also include information on all participate small scale accommodations, tours and attractions for greater customer comprehension.

It is important to make relationships with general and travel and tourism media to guarantee improved exposure and marketing value. Ecotourism certification programs should involve public relations staff to enhance and constantly maintain personal relationships with key media players. Romanian ecotourism certification will persuade reporters to visit the small scale accommodations and provides them with lots of information and resources to facilitate their investigations. It is recommended to send efficient information about properties and the program to travel and tourism trade media through e-mails; should focus on significant media channels, build a database to store contacts in, and supply reporters with updated and newsworthy information.

It is also recommended that Romanian ecotourism certification system practitioners to take part at conferences, trade shows and gatherings of interest to the travel community and industry, as well as to meetings with environmentally and socially responsible or sustainability audiences.

A low-cost method to marketing the program to tourists is to distribute an informational catalog listing certified small scale accommodations, tours and attractions at tourism information centers. In order to boost interest and support for ecotourism, the catalog should also raise awareness about tourism's impacts, problems and solutions. It should explain what tourists can do to minimize negative impacts of tourism and support communities and natural systems. Obvious, one of the options is to look for and support certified providers. Another option is to share the message of ecotourism with friends, family and work colleagues.

In order to be successful and to be attractive for customers, promoters of Romanian ecotourism program should create and sell a brand. This brand involves consistency and a certain level of quality and service. Consistency must be preserved between all certified ecotourism providers in order to certification program sell its name as a valued brand. Name recognition and use the brand as a marketing tool take many years to develop.

Partnerships and Alliances

The Romanian ecotourism certification should form alliances with well-known travel agencies and operators which will assure that small scale accommodations, tours, attractions that are members of the program with be appropriately promoted in the travel and tourism industry. Partnerships can imply bigger commissions to travel businesses and agents when they book customers into certified accommodations or

with certified inbound agents. They imply common promotion in advertising materials as well as on websites, and collaboration at trade shows, conferences and other forums.

It is also recommended alliances with a variety of other businesses such as certified providers, which can be used for common advertising and to build powerful relations and connections between the certification program and the providers. Customer-oriented campaigns co-sponsored by certified businesses and other tourism and travel providers - airlines looking to express environmental responsibility; credit card companies; internet sites, travel and tourism intermediaries (tour operators and travel agents); magazines other publications with social and environmental responsibility missions; financial institutions with similar missions; government bodies interested in environment and tourism; and other certification programs - can have larger exposure than campaigns organized and implemented solely by certification practitioners. And, costs of such campaigns can be divided among those implied. Proper partners for Romanian ecotourism certification program are providers of goods and services that supply energy and water efficiency, reduce waste, and produce or sell environmentally sound products (e.g. soaps and cleansers, organic food, compact fluorescent light bulbs, etc.).

Abstract: The business portfolio analysis represents an analytical approach by means of which managers have the possibility to view the corporation as a set of strategic business units that must be managed in a profitable way. Also, by taking into account features specific to the area in which the company operates, by taking into account the competitive advantage and the modalities of earmarking financial resources thereof, the business portfolio analysis provides managers the opportunity to approach companies from a different point of view and to pay increased attention to all activities that need to be undertaken.

The present paper aims at presenting from a conceptual standpoint the Hofer method of business portfolio analysis, its strategic consequences and the characteristic advantages and disadvantages. Moreover, the paper will emphasize the importance and part that the business portfolio analysis holds within a company.

Key words: business portfolio, strategic business units, strategic planning

A fundamental question that managers must answer each time is: In what direction must the company go? The strategy implemented by a company must be elaborated so that it considers all market opportunities and neutralizes current threats or foreseen threats. At the same time the company must value its strong points, by referring to the competition. On the basis of these features specific to an ideal strategy and by considering current options that companies may resort to, one may assert that the salient features of the strategy selection process are its difficulty and complexity.

Over time, a series of methods have been created with a view to support the strategy assessment and selection process. Of these, the methods corresponding to business portfolio analysis stands out. The analysis methods of the business portfolio analysis are used in order to identify and examine the various strategic alternatives that must be approached at corporate level.

The business portfolio planning offers three potential benefits. The first resides in the fact that it encourages the promotion of competitive analysis at the level of strategic business units, by means of comparative assessments thereof, resulting in a series of viable strategies focused on benefits yielded by corporate diversity. The second benefit supports the selective earmarking of financial resources by means of identification of strategic issues and by means of adoption of a standardized and objective negotiation process thereof. Thus, the force mix inside a company will be much better directed. The third benefit derives from the opinion of several experts who assert that this manner of approaching the business portfolio that focuses on a host of analysis methods that help reduce risks, increases concentration and involvement, as far as identification and implementation of strategies at corporate level is concerned.

Correlated to visual approach that is based on a series of graphic representations, the business portfolio analysis corresponding to a company is consolidated by the comparative assessment procedure of market shares, rates of market increase, market attractiveness, competitive position and life cycle of products/markets, specific to each strategic business unit. This business portfolio analysis must become routine activity undertaken by the company, through its carrying out on a regular basis, so that decisions of earmarking of financial resources may be monitored, updated and modified with a view to accomplishing

corporate objectives, correlated to the process of generation thereof carried out in an efficient way by each strategic business unit¹⁹⁶.

After identifying business portfolio strategies, the next step is taken; it involves the outlining of strategies specific to the level of strategic business units. The basic decisions, that involve the earmarking of corporate resources together with the general approach, by means of which a strategic business unit will be managed, does not complete the strategic analysis process and the selection of the viable strategic alternative. Consequently, each strategic business unit must examine and select a certain type of strategy that in the end should lead to the meeting of long-term strategic objectives¹⁹⁷.

A significant contribution in the field of strategic business portfolio analysis specific to a company belongs to Charles W. Hofer. Over time, he undertook a series of research studies showing that the stage of the life cycle of a product represents a factor that influences to a greater or smaller extent the success of a strategy. Also, he was unsatisfied with the G.E. method, developed by the McKinsey & Company consultancy company and by the General Electric company, which did not stated clearly the position of strategic business units which have recently penetrated the market and which presented a high development potential in the future. Consequently, he proposed a new assessment matrix of business portfolio of the company, organised into 15 quadrants. The specialty literature mentions in under the name of "Hofer Matrix" or "Product/Market Evolution Matrix" and is quite similar to the Arthur D. Little matrix. Picture 1 displays the present matrix where strategic business units are graphically represented according to two basic indicators: competitive position on the market and the stage corresponding to the product/market evolution.

As in the case of the other approaches, Hofer matrix implies the division of the company into strategic business units. The next step resides in assessing the competitive position of business units, by using techniques similar to those used by the McKinsey matrix. The position occupied by each strategic business unit is graphically represented by using the two axes of the matrix. Thus, on the vertical axis (Ox) the competitive position of strategic business units is set and on the vertical axis (Oy) the stage of the life cycle specific to the market where these operate is set.

Further on, strategic business units are outlined, from a graphical point of view, under the form of circles. The size of each circle is proportional to the size of the market where the strategic business unit carries out its activity (measured on the basis of total income resulted on the mentioned markets), while the hatched areas, inside the circle, represent the market shares held by the strategic business units.

The power of the Hofer matrix resides in the fact that it may outline the distribution of strategic business units during stages specific to life cycle of the market (industry). Similar to the McKinsey matrix, the present matrix offers the company the possibility to make a diagnosis regarding the portfolio, in order to establish if it exhibits a balanced or unbalanced structure. A balanced portfolio should be composed of strategic business units of the type corresponding to "Stars" and to "Cash Cows" and to a few "Question Marks", which have recently penetrated the market or which are about to become "Stars". Of course, in practice, most of the companies will have portfolios whole salient feature will be the unbalance.

Strategic consequences

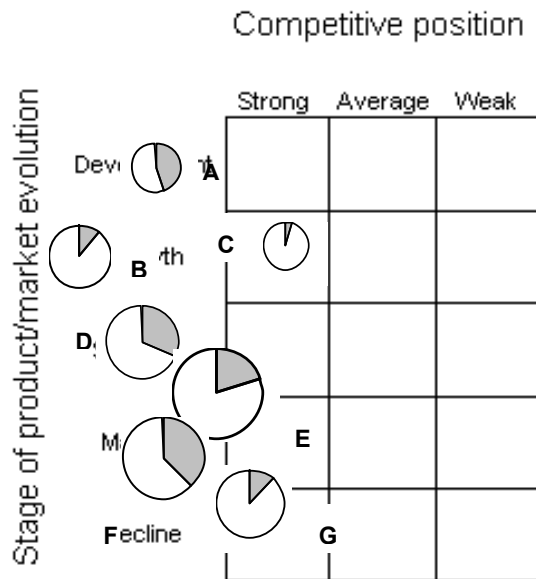

The strategic consequences of this analysis focus on the various stages of life cycle when strategic business units are not covered. Thus, similar to the other methods of business portfolio analysis, the Hofer matrix also suggests that each position held by a strategic business unit indicates the selection of a strategic alternative¹⁹⁸. According to picture 1, suggested strategies are as follows:

Picture 1 – Hofer Matrix

¹⁹⁶ Armstrong, J. Scott; Brodie, Roderick J. - Effects of Portfolio Planning Methods on Decision Making: Experimental Results, International Journal of Research in Marketing, 11, 1994, 73-84, North-Holland, p. 2

¹⁹⁷ Wensley, Robin - Making better decisions: The challenge of marketing strategy techniques - A comment on "Effects of portfolio planning methods on decision making: Experimental results" by Armstrong and Brodie, International Journal of Research in Marketing. Amsterdam: Jan 1994. Vol. 11, Iss. 1, p. 86

¹⁹⁸ Byars, Lloyd L. - Strategic management: formulation and implementation: concepts and cases, 3rd Edition, Harper Collins, New York, 1991, p.133

Source: Wheelen, Thomas L.; Hunger, J. David - Strategic management and business policy: concepts and cases, 10th Edition, Pearson/Prentice Hall, Upper Saddle River, 2006, p.304

1. Strategic business unit "A" seems to be a potential "Star". It holds a large market share, it is in the stage of life cycle development and has a strong competitive position on the market. As such, unit "A" represents a potential candidate in the competition for corporate resource competition.
2. Unit "B" is very similar to unit "A". Nevertheless, investments in unit "B" must take into account the fact that although it has a strong market position, its market share is quite small. Consequently, the cause for which market share has such a small value must be identified. Furthermore, a strategy that may contribute to the increase of market share must be developed, thus accounting for the future necessary investment.
3. Unit "C" has a small market share, its salient feature resides in the fact that it holds a competitively weak position and it entered a small market whose development is underway. A strategy that may increase the market share and develop the competitive position must be elaborated so that the future investments be accounted for. For the unit "C" a strategy residing in the elimination from the market must be applied, so that the investment for the first two units may be favoured.
4. Unit "D" is characterised by a strong competitive position on the market and it holds a large market share. In this case, it is recommended that investments be made with a view to maintaining the current position on the market. On the long run, it will become a "Cash Cow".
5. Unit "E" together with unit "F" are included into the "Cash Cow" category and they should be capitalized on because of great cash flows that they generate.
6. Unit "G" is included into the "Dogs" category and the management thereof is recommended, with a view to generating short-term cash flows in as much as it is possible. Nevertheless, on the long term the strategy of limitation or liquidation on the market must be selected.

Taking into account that the structure of business portfolio varies from company to company and that they may take multiple forms of graphic expression, Hofer suggested that the majority of business portfolio strategies specific to companies represent variations of one of the three characteristic situations of an ideal portfolio¹⁹⁹. The three situations specific to a portfolio having an ideal structure are as follows:

¹⁹⁹ Pearce, John A., II; Robinson, Richard B., Jr. - Strategic management: strategy formulation and implementation, 2nd Edition, Irwin, Homewood, 1985, p. 253

- a) Developing portfolio
- b) Profitable portfolio
- c) Balanced portfolio

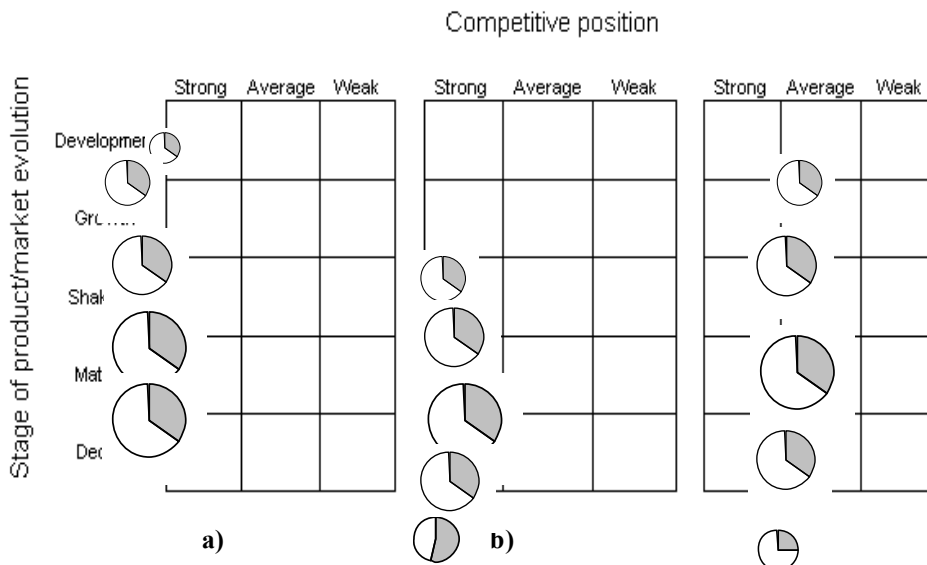

Picture 2 exhibits the three ideal situations and by means thereof several distinct objectives are outlined, objectives that a company may set with a view to meeting them by means of strategic earmarking of financial resources.

Strengths and weaknesses of the Hofer method

The main strengths of the matrix resides in the fact that it provides an image regarding the manner of distribution of the businesses undertaken by a company during specific stages of a life cycle. The company may predict how the present portfolio will develop in the future and it may also act in real time in order to guarantee that his portfolio is in a balanced condition.

Another advantage of the present matrix is that it manages to divert the management’s attention from the corporate level and focus on potential strategies specific to the strategic business unit. According to specialty literature, the market life cycle represents one of the main factors that contribute to the adoption of strategic decisions at the level of the strategic business unit. Therefore, following the use of the Hofer matrix, the corporate management may identify strategic procedures that must be integrated and implemented at the level of strategic business units.

Picture 2 – Three ideal types of business portfolios

Source: Byars, Lloyd L. - *Strategic management. formulation and implementation: concepts and cases*, 3rd Edition, Harper Collins, New York, 1991, p.134

The disadvantage of the matrix resides in the fact that it does not focus on all the relevant factors that influence the level of attractiveness of a market. According to the McKinsey matrix, the present model illustrates as well the fact that the stage of the market life cycle is very important, but this element must not be deemed as being the only and the main influence factor of the level of market attractiveness. Therefore, there are other significant factors that may exert influence over the company’s portfolio, without being dependent on the stage in which the market evolution is found.

Taking into consideration the above mentioned, we must emphasize the fact that the restriction of the portfolio analysis to a single method, is not a very wise decision. Each method presents a series of advantages and disadvantages and each of them tries to offer, at one time, a diagnostic of the business portfolio specific to a company²⁰⁰.

²⁰⁰ Haspeslagh, Philippe - Portfolio Planning: Uses and Limits, Harvard Business Review. Boston: Jan/Feb 1982. Vol. 60, Iss. 1; p. 60

The methods of analysis of the business portfolio facilitate the debate and outline of the competitive positions of the company and also contribute to the generation of a series of questions related to the way in which the allotment of its actual resources contribute to the achievement of success and vitality on long term. At the same time, these methods, besides the fact that they help the managers to control the allotment of resources and suggest realistic objectives for every strategic business unit, also offer the possibility to use the strategic units as indispensable resources in the process of achievement of the objectives established at a corporate level²⁰¹.

In conclusion, it is recommended the combined use of a large variety of methods of analysis of the business portfolio, by the managers from a corporate level, because, in this way they will understand much better the whole market mix included in the custody account analysis, the strategic position held by every strategic business unit, within a market, the performance potential of the portfolio as well as the financial aspects related to the process of allotment of resources, for the business units within the portfolio. It should also be mentioned that the methods of analysis of the business portfolio are not instruments, which offer accurate answers, in spite of the appearances created by the stage of analysis, in which the strategic business units are represented graphically and with austerity. Nevertheless, their main virtue is simplicity, since these underlie the need to further research.

THE TOURISM DESTINATION MARKETING – A MANDATORY COURSE FOR THE STUDENTS OF TOURISM

Ispas Ana

Universitatea Transilvania din Braşov, Facultatea de Ştiinţe Economice, Str. Colina Universităţii nr. 1, ispasana@unitbv.ro, tel: 0722133054

Abstract: In higher education it is important that the sometimes unfashionable public sector is included in programs. Tourism is a relatively new academic discipline. The study of tourism as a focal subject has sometimes been treated with derision in academic circles, perhaps because of its novelty, perhaps because of its superficial fragmentation, perhaps because it cuts across established disciplines. Tourism destination marketing is now widely recognized as an essential component in the management of destinations, an integral part of developing and retaining a particular location's popularity. This paper focuses to understand that the Tourism Destination Marketing is a mandatory course for the students of tourism.

Key Words: destination, marketing, organisation, skills, tourism

Introduction

The term Tourism refers to the phenomena and relationships arising from the travel and stay of people away from their normal home environments for a variety of purposes. The tourism sector is one of the largest and fastest growing sectors of the global economy. Although there is a core of recognised course titles, it is also a developing area of study with a great deal of innovation and diversity. This sector is characterised by a breadth of subject matter ranging from the Natural Sciences, through Business Management, to aspects of Geography and Cultural Studies. Despite this diversity, there are many areas of common knowledge and understanding.

Tourism is still a very specific sector, so specific knowledge about the sector is required. For the workforce, however, there are still general and basic skill needs for everybody. For example, lack of knowledge of foreign languages has been recently recognized by national tourism organizations of some European countries as a lasting problem and even as a competitive disadvantage. Entrepreneurship – a concept still vaguely defined – is taken more actively on board by education providers who are working on this notion and thinking of implementing this even at the compulsory school level [CEDEFOP, 2005].

There are also specific skill needs defined by labour category. At management level, these are rather transversal skills; hence tourism managers often have an educational background in accountancy, marketing, law, economics, etc. Nevertheless, managers are expected to possess the following skills and competences: computer skills, business and strategic planning, strategic alliances, management skills, management through visions and values, yield management, accounting, product development, innovation, human resource management, destination management, project management, management skills to cope with globalization influences, change management, marketing and sales skills [EC, 2001].

Most tourism activities take place at destinations, and so the destination forms a pillar in any modelling of the tourism “system” [Leiper, 1990]. It has even been suggested that destinations have emerged as “the fundamental unit of analysis in tourism” [WTO, 2002]. Given the prominent place of destinations in the tourism system it is surprising there have been few texts to date that have focused on the operations of Destination Marketing Organisations (DMOs). Tourism has been around, in an organised form at least, since the late 19th century, and for most of that time DMOs have played an active role in the development of tourism worldwide. However, texts concerned with destination planning, marketing and management have only emerged in earnest since the 1990s [Pike, 2004]. An understanding of the nature of DMO operations and challenges should not only be a prerequisite for those seeking a career in destination marketing, but should also be regarded as essential for those who will become active stakeholders of such organisations. As future managers in tourism, students will almost definitely interact with DMOs at national, regional and/or local levels during their career.

Literature review

Tourism

Tourism is a word that is so often used in everyday language. All of us have been somewhere on holiday, know someone working in hospitality, travel or tourism. So it is a surprise for many students to learn that there is no universally accepted definition of tourism. Instead, there have been almost as many different definitions as there are researchers. It has even been suggested that defining tourism is almost conceptually impossible. Complications arise from the multidisciplinary nature of tourism research, the ambiguity of what constitutes a “tourist” and “tourism business” and overlaps with the concepts of travel, hospitality and leisure.

The World Tourism Organisation (WTO) defines tourism as “the activities of persons travelling to and staying in places outside their usual environment for not more than one consecutive year for leisure, business and other purposes not related to the exercise of an activity remunerated from within the place visited” [WTO, 2004].

Most tourism texts offer a different definition. The definition used will also depend on the purpose for which it is to be applied, which is commonly to define markets and analyse statistics. For DMOs these include for example reports that seek to [Pike, 2004]:

- promote the economic and social benefits of tourism to a community in a bid to enlist government funds for destination promotion
- promote the scale and growth of tourism in a business investment prospectus
- highlight potentially negative environmental impacts at a proposed development site
- report negative socio-cultural impacts at a destination.

Destination

Destinations are places that attract visitors for a temporary stay, and range from continents to countries to states and provinces to cities to villages to purpose built resort areas [Pike, 2004]. At the foundation level destinations are essentially communities based on local government boundaries. The WTO offered the following working definition of a “local tourism destination”: A local tourism destination is a physical space in which a visitor spends at least one overnight. It includes tourism products such as support services and attractions, and tourism resources within one day’s return travel time. It has physical and administrative boundaries defining its management, and images and perceptions defining its market competitiveness. Local destinations incorporate various stakeholders often including a host community and can nest and network to form larger destinations.

Tourists travel to destinations. Destinations are places with some form of actual or perceived boundary, such as the physical boundary of an island, political boundaries, or even market-created boundaries [Kotler *et al.*, 2006]. Destinations may not welcome tourists uniformly. Due to location, climate, limited resources, size, and cultural heritage, some places have few economic choices other than to participate in tourism. The desire to become a recognised destination presents a difficult marketing challenge.

Tourism destination marketing

Destination marketing is an integral part of developing and retaining a particular location’s popularity. Too often, however, tourism planners focus only on destination developments without paying attention to retaining and preserving the attributes that attracted travelers to the destination in the first place [Kotler *et al.*, 2006].

Wahab *et al.* [cit. in Pike, 2004] offered the following definition of tourism destination marketing: the management process through which the National Tourist Organisations and/or tourist enterprises identify their selected tourists, actual and potential, communicate with them to ascertain and influence their wishes, needs, motivations, likes and dislikes, on local, regional, national and international levels, and to formulate and adapt their tourist products accordingly in view of achieving optimal tourist satisfaction thereby fulfilling their objectives.

Destination marketing organisations

A destination marketing organisation is any organisation, at any level, which is responsible for the marketing of identifiable destination. This therefore excludes separate government departments that are responsible for planning and policy.

The WTO introduced the term national tourism administration (NTA) as “authorities in the central state administration, or other official organisation, in charge of tourism development at the national level”. The term NTA was used to reflect the new concept of tourism management at national level and to stress that the majority of countries are moving away from the traditional system, where the national tourist organisation is essentially a central publicity body, to the newer concept of a national tourism administration which sees promotion and marketing as one of many functions.

Destination marketing organisations (DMOs) are concerned with the selling of places, a field of study that has only relatively recently attracted significant research attention. Contributions have included: destination planning and management [Godfrey & Clarke, 2000; Howie, 2003; Laws, 1995; Lickorish, 1992; WTO, 1994, cit. in Pike, 2004], urban destinations [Page, 1995], case studies of “tourist organisations” [Pearce, 1992], destination marketing [Ashworth & Goodal, 1995; Heath & Wall, 1992; Nykiel & Jascolt, 1998], the promotion of places [Ashworth & Voogd, 1990; Gold & Ward, 1994; Avraham & Ketter, 2008], destination branding [Morgan *et al.*, 2004] and destination crisis marketing [Bierman, 2003, cit. in Pike, 2004].

A growing number of academic conferences have also featured the destination marketing theme in recent years. The 1993 Association Internationale D’Experts Scientifiques du Tourisme (AIEST) conference addressed the issue of the competitiveness of long haul destinations [Pike, 2004]. In 1996 the Fundacion Cavanilles for Advanced Studies in Tourism organised the Second International Forum on Tourism, themed “the future of traditional tourist destinations” [Buhalis & Cooper, 1998]. In 1998 the 48th congress of the AIEST focused on “Destination marketing – scopes and limitations” [Pike, 2004]. In 2007, two conferences was focused in this area: UNWTO Conference “Creating competitive advantage for your destination” – Budapest, 9 february and 2007 Advances in Tourism Marketing Conference “Destination and Event Marketing Managing Networks”, hosted by the University of Valencia.

There has also been a wealth of material related to destination marketing published in academic tourism journals. In this respect, aspects as DMOs – roles and structure, destination branding, destination positioning, destination image and destination marketing are among the most important issues for the tourism industry and require to introduce this course (Tourism Destination Marketing) in the curricula for Master degree in tourism. This allows students to gain an understanding of the roles and structures of tourism organisations at all levels... what is critical is that students have a thorough understanding of issues of globalizations, the public and private sector structures and policies that are in place to both capitalize and protect nations from its effects and are equipped to enter the work force at a senior level “surprise free” in terms of such issues [Fayos-Sola, 2002].

The objectives and descriptors of course

The aim of this course is to provide the student with a general framework of the principles of tourism destination marketing. Tourism and moreover Business tourism does not exist in a vacuum. It can only function if it shares, cooperates and dialogues effectively with many other sectors of society and economy. The course also explains that marketing of destinations should balance the strategic objectives of all stakeholders as well the sustainability of local resources. Destinations need to differentiate their products and develop partnerships between the public and private sector in order to co-ordinate delivery. Destination marketing must lead to the optimisation of tourism impacts and the achievement of the strategic objectives for all stakeholders. Taking advantage of new technologies and the internet also enables destinations to enhance their competitiveness by increasing their visibility, reducing costs and enhancing local co-operation.

Following main issues are dealt with in this course:

1. Introducing destinations and destinations marketing
2. Destinations – an amalgam of tourism services and experiences
3. The importance and the critical roles played by the DMO (Destination Management Organization) in the tourism policy development and implementation.

4. The strategic purpose of destinations and their management and marketing
5. Main markets and destination choice
6. Types of destinations, target markets and marketing strategies required
7. Marketing research: identifying market segments for destination products
8. Marketing destinations: strategies and practices
9. Destination marketing mix: formulating the destination product, pricing the destination, distributing tourism destinations, promoting the destination.
10. Destination Branding
11. Destination Image
12. Destination positioning in the marketplace.

The core purpose of DMOs is enhancing sustained destination competitiveness. A major element in striving for competitive advantage in the crowded tourism markets is the development and implementation of tourism strategies, since destinations endowed with natural attractions have been forced into competition with places that have developed attractive built environments. To achieve competitiveness the four main goals are enhancing destination image, increasing industry profitability, reducing seasonality and ensuring long term funding.

The primary responsibility of DMOs is destination marketing. The three other important responsibilities are industry coordination, monitoring services and quality standards, and fostering community relations.

A market orientation dictates outward-inward market-organisation thinking [Pike, 2004]. In tourism this means firstly anticipating travellers' needs, and then developing products and services to meet these. Adopting this approach in destination marketing is problematic. Instead, DMOs generally use inward-outward thinking by attempting to find markets that will be interested in a destination's existing products. A DMO must somehow showcase the destination in a way that offers benefits sought by travellers, represents the interests of tourism suppliers, and does not commodify residents' sense of place.

The generally accepted steps in destination marketing planning are: a situation analysis, incorporated a resource audit, environmental analysis and competitive positioning analysis; development of goals and strategy; an action plan, and measures of performance. Integrated Marketing Communication (IMC) represents a relatively new approach to marketing. Key tenets of IMC are the development of profitable customer relationship, a cross-functional process and purposeful dialogue and message synergy.

The responsibilities of destination brand management should not rest solely with the DMO. Ideally, what is required is an understanding by all stakeholders of what the brand identity is, what the brand image is, and what the brand positioning strategy is.

It has been suggested that the future of marketing will be a battle of the brands, and that in tourism, destinations are emerging as the world's biggest brands. The process of branding tourism destinations is a more complex undertaking than for most consumer goods and services. The purpose of a brand is to establish a distinctive and memorable identity in the market place that represents a source of value for the consumer. For DMOs, the value of strong consumer based brand equity lies in the opportunity to minimise destination switching through a differentiated value proposition and increased loyalty. The fundamental challenge for DMOs is to somehow develop a brand identity that encapsulates the essence or spirit of a multi-attributed destination representative of a group of sellers as well as a host community.

A destination brand manifests as an image (or lack of) in the mind of the consumer, which may be quite different to the self-image intended in the brand identity. Tourism marketing is generally concerned with the selling of dreams, since expectations of an intangible tourism service can only be realised after travel. The images held by consumers therefore play a critical role in their decision-making. Since tourism services can only compete via images, it is imperative marketers understand that "perception is reality". The brand image of the destination may or may not be quite different to the brand identity intended by the DMO.

Branding is perhaps the most powerful marketing weapon available to contemporary destination marketers confronted by tourists who are increasingly seeking lifestyle fulfilment and experience rather than recognising differentiation in the more tangible elements of the destination product such as accommodation and attractions [Morgan *et al.*, 2007]. Most destinations have superb five-star resorts and attractions, every country claims a unique culture, landscape and heritage, each place describes itself as having the friendliest

people, and high standards of customer service and facilities are now expected. As a result, the need for destinations to create a unique identity – to differentiate themselves from their competitors – is more critical than ever.

Conclusion

Tourism destinations are probably one of the most difficult “products” to market, involving large numbers of stakeholders and a brand image over which a destination marketing manager typically has very little control. The diversity and complexity of tourism destinations is well documented and this makes brand development very difficult for national, regional and local tourism organisations. Destination branding necessarily involves the focused attention of all tourism-related organisations in a destination, and this can create major challenges in getting all stakeholders to develop a coherent theme for the destination brand.

Only those destinations that have a clear market position and appealing attractions will remain at the top of consumer minds when they book their holidays. In the highly competitive and dynamic global tourism environment, there is a need to develop a clear identity, or “brand” based on reality, while also reflecting the core strengths and “personality” of its product. In this crowded marketplace, building and maintaining brand value is the key to business success and, as a result, brand management is quickly shifting from a peripheral marketing concern to the core business strategy.

This is a reason for including The Tourism Destination Marketing in curricula for the students in the field of tourism.

Tourism is one of the few phenomena that have stood out in the contemporary age, its spectacular development being a common feature of the 20th and 21st centuries.

Internationally, tourism has become a business worth billions of dollars, with many national economies depending on it. In the developed countries, it grows annually faster than the normal growth of the economy. The income from tourism reaches (and even exceeds) 30% of the GDP.

Cultural tourism has always been present, but in the last few decades it tends to become an industry, along side: mountain, spa, spelunking, pilgrimage, and cruise, institutional, religious and literary tourism. Actually, there are many forms of tourism for almost each activity area; thus, the spectrum of cultural tourism is the most varied and diverse.

Key words: cultural tourism, tourism offer, tourism demand, journey

1. Cultural tourism – particularities, concepts

Tourism, nowadays, has become an activity as important as any other activity in the key sectors in the world economy (industry, agriculture, trade). The tourism phenomenon is extremely hard to limit, because, as any other human activity, it falls under the incidence of interdisciplinary study, involving economists, geographers, psychologists and sociologists. The first records concerning the preoccupation to travel are from the Antiquity in the writings of the geographer Strabo (64/63 B.C. to 19/21 A.D.). The descriptions left by Marco Polo, a Venetian merchant (15th of September 1254 to 8th January 1324, who made himself known through his stories about a trip to China) through his Asian travels, the ones belonging to Arthur Young (actor, 2nd of September 1898 Bristol, England to 24th of February 1959) or, closer to us the ones belonging to Henri Monfreid (1879 to 1974, adventurer and legendary writer) have in a way guided the future preoccupations regarding the practice of travel.

Looked upon as a social-economic creator of important benefits, tourism was defined in ways of the most different sort: “the art of traveling for the personal pleasure” (M. Peyromarrie Debord (28th of December 1931 to 30th of November 1994), writer and director); “the activity in your free time which consists of traveling and living far from your home, for entertainment, rest, enrichment of experience and culture, for knowing new human aspects and unknown landscapes” (Jan Medeciri); “phenomenon of our time, based on the growing necessity to improve health and change the environment you live in, emphasis on feelings for the beauty of nature as a result of trade development, industry and the improvement of means of transport” (Guy Freuler); “the sum of non- lucrative activities done by man outside his area of residence” (Lavaille Nizerolle); the exchange of an economic value (money) with a cultural, esthetic and recreational value” (Marc Boyer); “the set of relations and phenomena which result in the movement and the staying of people outside their residence” (E. Hunziker); “the local reunion of four elements that must be analyzed in an inter-relation: the tourists, the natives, the influx and the territories”.

On the international level, tourism has become a billion dollar business, with many national economies which depend on it. In the developed countries, it grows annually faster than the normal growth of the economy. The income from tourism reaches (and even exceeds) 30% of the GDP.

Cultural tourism represents a modern way of spending your holiday, a way in full expansion. Such vacations, known under the generic title of “tours, cities and culture” hold in the western countries an important share in the way destinations are structured: 51% in Italy, 45% in France, 46% in Holland, 31% in Germany, 23% in England.

Tourism is an act of culture, as the tourist accumulates, along his journey, a good amount of knowledge from the most varied domains. That is, the degree of culture and civilization decisively influences the quality and the attractiveness of the tourism product that is being offered.

Cultural tourism focuses on visiting sites of historic patrimony (archeological vestige, monuments, castles, religious edifices, urban and rural sites, parks and gardens), visiting museums, taking part in cultural events (concerts, music festivals, dance, film, folklore, traditional celebrations, expositions and fairs), industrial and technical tourism (the visiting of industrial and economic sites, constructions, modern or traditional building complexes).

Through its nature, cultural tourism, interacts with other forms of tourism, it integrates with urban, recreational and business tourism.

The consumption of tourism covers cities, well-known for the organization of cultural and international outpourings (world-wide or regional). Cities in this category are: Cannes, Monte Carlo, Venice, Las Vegas, London, Braşov. Cities for pilgrimage, situated in various parts of the world which head for a great influx of people annually or periodically, on the basis of a calendar, with the occasion of religious celebration (Lourdes with its famous Grotto of Miracles, Chartre, Aaras, Argenteuil (France), Mecca, Medina, Fatima – Saudi Arabia, Jerusalem - Israel, Amalfi – Italy, Anaya – Lebanon, Czestochowa – Poland, Montserrat – Spain, Cochabamba – Bolivia, Beauraing – Belgium, St. Anne of Beaupre – Canada, Santos Lugares – Argentina, Efes – Turkey).

One of the new forms of international tourism is the one linked to the knowledge of cultural values of international importance. The greatest fluency of this type of tourism is recorded in Europe, Especially towards Italy, France, Belgium, Germany, and also as towards capital cities.

2. The tourism market of cultural tourism

2.1 The offer for cultural tourism

Cultural tourism, as a trip in time, is present especially in countries where culture points out the conservative values of their cultural-historical traditions, but also in environments which are developing their national self-awareness, but mostly among the minorities in a country fighting against cultural assimilation.

The cultural resources hold a key place in the context of the anthropic ones, given the fascination and the attractiveness which they have on people who wish to see and hear them, to entirely feel the reality, to actually perceive and finally to understand them as if they were their second nature.

The following list suggests coverage of the types of cultural tourism, even though it can be said that culture is everything that we are and everything that we do, with the exception of telling apart the different activities:

- Heritable sites (archeological site, towers, monuments, museums),
- Cultural centers (theatres, concert halls),
- Visual art (galleries, sculpture parks, photography museums, architecture),
- Festivals, special events (music festivals, sporting events, carnivals),
- Rural environment (villages, farms, national parks, eco-museums),
- Native communities and traditions (tribal societies, ethnic groups, minority groups),
- Arts and crafts (textile, pottery, painting, sculpture),
- Language (teaching and practices),

- Gastronomy (wine tasting, food tasting, cooking classes),
- Industry and commerce (mines, distilleries),
- Modern popular culture (popular music, shopping, fashion, media, design, technology),
- Interest for special activities (painting, photography, knitting).

Like other forms of tourism, cultural tourism has become a part of many national economies (Turkey, Greece, Spain, Portugal, France and Italy) and it plays a major role in:

- the development of the economy
- understanding between people of different origins
- promotion of peace
- mutual understanding of their fellow countryman and as such, the understanding of people everywhere

Cultural tourism has always been present, but in the last few decades it tends to become an industry, along side: mountain, spa, spelunking, pilgrimage, and cruise, institutional, religious and literary tourism. Actually, there are as many forms of tourism as there are things to do, in which case the spectrum of cultural tourism is the most varied and diverse. Nowadays there are talks of literary, urban, rural, religious and architectonic tourism, following a physicist, writer, painter, sculptor, musician, etc.

2.2. Demand and consumption of tourism

Typical for the demand of tourism and services is the high degree of mobility, with relatively rapid changes, at a structural and quantitative level, changes that were observed under a range of unbiased and subjective factors as well.

The dynamics of tourism demand can be noticed through frequent oscillations, sometimes even sudden and unexpected, which are mainly due to the fact that motivations are liable, as well as other endogenous (on a personal and social level) and exogenous (political, natural) factors

Among the factors that influence the demand of tourism are the cultural ones: the level of education, the cultural differences between the place where the tourist originates and the place he visits, the respect which the tourist shows toward other cultural values. The consumers that have a high degree of education and learning are braver, and more willing to acquire new knowledge and new contacts, are more voluble and more mobile. They want to have a direct contact with what they know only theoretically, to get in touch with original and specific ways of life, that are different from their own.

3. A survey concerning the “consumption” of culture through tourism in Timișoara

3.1 Drawing up a questionnaire concerning the “consumption” of culture through tourism

The questionnaire focuses on tourism, as an important part of the behavior linked to cultural consumption. During the research we have used questions concerning:

- the place the last holiday was spent;
- how the interviewees prepared themselves for the trip;
- “e-culture” and the new communication technologies;
- the activities they had while they were away, including cultural activities;
- cultural consuming tourism behavior in regards to: opera, theatre, cinema, concerts.

The point of this research is not to establish a social and cultural “class”, to label, but only to present data containing the peoples’ tendencies regarding culture and the ways it is being done in Timișoara. The questionnaire is there to see, in the case of cultural consumption, to what extent elements of cultural nature are included, with the establishment of a consumer profile.

This questionnaire must be looked upon only under the “umbrella” of a measuring purpose and has the following characteristics:

- the sample is composed of regular people from Timișoara over 18 years old
- the targeted amount is composed of 100 random subjects;

- the sample is not an accurate one and has two overlapped stages
- the interviewing is done in various public places and in places that have cultural logistics, the questionnaire is performed individually

3.2. Questionnaire interpretation

The survey has been carried out on 100 people with interest toward the profile of the person as well as the different forms of consumption that a person has, accordingly the consumption of culture through tourism. In the follow up we will see the frequency of answers to relevant questions as well as the relevant correlation between them.

Out of the total of **100 people** that have answered the questionnaire, 61% were male and 39% female.

Regarding the assigning of **age category** that 40% of the people on which the survey was carried upon are between 35 and 44 years old, followed by the people with ages between 25 and 34 which represent 31%. It can be seen that the lowest percentage represents the people with ages from 45 to 55 years old. This assessment has an impact on the level of income and also on a certain type of consumption. As an example some of them have certain studies and do not have a certain income.

It can be observed, that a majority of 54% travel at least once a year, followed by those who travel more than once a year. A very small percentage is represented by those who travel rarely or do not travel at all, 3%.

Contrary to the image of the last years that implies the presence of a mass exodus in the holiday months, a high percentage of the people that were questioned, spent their holiday in the country. As a whole, they visited a place in the country (the sea or the mountains), their relatives or the countryside. As one can notice an added percentage of 77% of the questioned people spent their holiday in the country, and 71% of these people were at their tourist destination.

When asked “**from where did you get the tip for the destination of your last holiday**”, one can plainly see that the new technologies are leading in terms of percentages. The internet is leading as source of information, followed by information received from friends, acquaintances and then the information from tourist agencies. The information received from friends and acquaintances have a higher degree of credibility, because they offer information about their own personal experiences. As it can be seen the promotion of tourist destinations is advised to be done over the internet (23%) and fliers (16%).

A tendency can be seen which is typical for the last few years is that of traveling on your own (using personal means of transport, train, choosing the route). Out of the people questioned, 61% stated that they prefer to travel on their own, and not to resort to tourist agencies (airplane tickets bought from an agency, reservations). The distributions of the percentages can be seen showing that travelers that turn to an agency represent 39%.

The preferred period for a holiday that results from this survey is the 3rd trimester, July-September, 53% out of the people questioned, followed by the 2nd trimester, April-June, 26%. The preference for the hot season can be seen.

The restaurant, entertainment and shopping remain the preferred holiday hobbies. A third prefers both theatre performances and cinema. It can be seen that the internet has become indispensable even during holidays. Shopping has a calming effect and is even a stress dispelling activity. (Chart 1)

We can plainly see an interest towards archeological sites and spiritual sites. The percentage of people that visit museums is pretty low compared to the sites mentioned. The fact that the population in Romania, spends their holiday in Romania, combined with the fact that during the holidays there are relatively few trips to the museums, indicate the fact that the museums in Romania, that are usually under each county's board of administration, are not orientated towards the visitor through techniques of cultural marketing.

The preferred cultural activities in Romania, in an inverted order are: local events, shows/ music concerts, museums and expositions, cinema, theatre. In Chart 2, one can plainly see that in the category of sightseeing spots, the preferred destination are archeological sites, castles, churches and monasteries.

Chart.1 Preferred activities during holidays

Chart. 2 Visited cultural destinations

The level of income with the highest percentage is the one between 1001-1500 RON, 34% out of the people questioned, followed by the people with a higher income, between 1501-2000 RON, 29%. There were some that consider their income private information and did not answer.

In average, a family spends 35 RON/month on culture. Out the people that were questioned, most of them spend 10-30 RON/month, at 49%, followed closely by those that stated that they only spend 10 RON/month on culture.

The majority of the people questioned have followed higher education system, 41%, followed by those who have a post high school graduate school, 37%, fi this means that the people in the sample have an educational level from medium to high, a fact that is essential in this survey about culture consumption. A high level of education automatically implies a high consumption of culture. A percentage of 22% have only a high school as an education.

One can observe that restaurants, shows and festivals are topping the consumer preferences. These types of activities can be practiced without any travel, and can be done in their own city, which explains the high number of people who perform these activities. The other activities imply travel and an extra usage of time and money.

In the category of activities with consumption of information and with that, culture are the ones that include the use in a way or another of the internet, like reading the press on-line, looking for different information as well as communicating via e-mail. Watching TV shows has lower numbers, mainly news and documentaries are watched, followed by entertainment. It can be plainly seen that TV has lost ground compared to the internet.

Out of the answers of the questioned, it can be seen in the following diagram, that the main books that are being read are love stories, followed by philosophy with over 50% of the interviewees and at almost the same level are those who listen to foreign pop music. Also, people listen to folk music, followed by rock music, 40% of the interviewees.

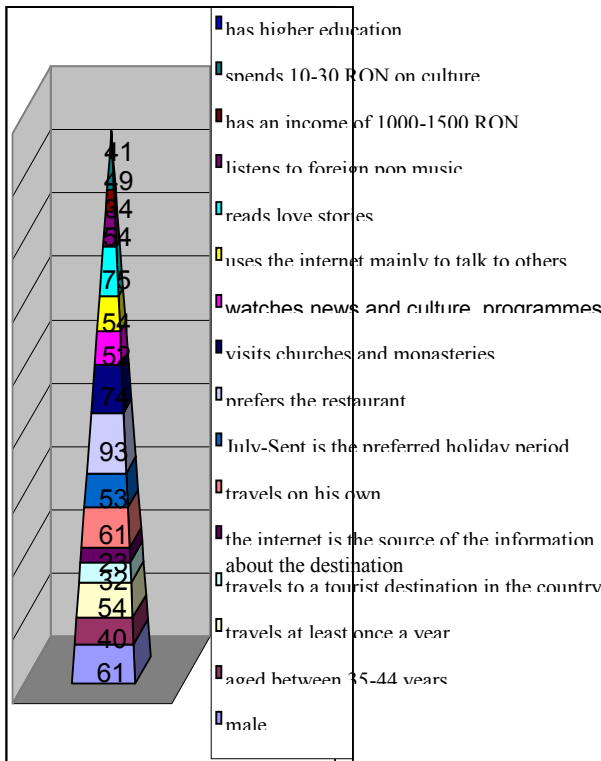

Next, in Chart 4, we have the profile of the interviewees which is a result of the maximum frequency of answers from the survey. This profile does not fully match any person in particular, only the fact that a person that was questioned can acquire the most characteristics from the ones mentioned.

3.3 Conclusions

The two types of activities inter-condition themselves, and so, tourism is an act of culture, because the tourist accumulates, during his journey, quite a large amount of knowledge from the most varied domains. In other words, the degree of culture and civilization decisively influences the quality and the attractiveness of the product on offer.

The demand for tourism is not characterized by periodic consumption of the same product, the same tourist destination, and this is even true for tourist products with cultural elements, a destination of cultural nature once consumed, does not have the same enthusiasm and interest as before. On the tourist market, we can identify a great diversity of products and tourist destinations in a constant competition, the tourists have the possibility to benefit from these offers all year round. The two types of activities can work together in the promotion department; this means a greater coverage between cultural institutions and those that provide services to tourists.

Chart 4. Profile of the interviewees after the maximum frequency

From a strategic point of view, there are two types of ways to raise culture consumption. The first would be the extension of consumption vertically, which would lead to the fact that people that attend a cultural event at least once will a number of times. This implies a redistribution of people inside the category of people that go to the theater, the opera or read books. The second strategy would be the extension of horizontal consumption, which means ways of transforming those who do not take part in these kinds of activities, in culture consumers. The two strategies have different objectives and steps to follow. Thus, to raise vertical cultural consumption, it is necessary to act especially in diversifying the offer of shows of

these institutions (different shows, bringing shows from abroad, bringing famous artists in the country). This is already happening, so we can say that there is a degree of saturation of the demand/offer ratio. Horizontal extension is the way this growth can occur.

To raise horizontal consumption (attracting new people) there is a need, especially for educational and institutional partnerships, with educational institutions and so steps will be taken in that direction. Educational steps imply setting long term goals which permit the “education of the public” via this type of culture consumption. These actions can be initiated by professional associations, as well as promoting opera consumption in schools, high schools, colleges through group participation in which the professors in these schools should be involved, the introduction in the school schedules of cultural education classes where these shows can be watched.

The article refers to marketing challenges for Romanian higher education organizations in the context of European Union integration. It underlines the importance of the EU directives related to education, to lifelong learning, to development of information society and knowledge-based society, of the Bologna Process, of the role of the national educational policy and strategies. It sheds light on the importance of marketing awareness of higher education institutes, on their role of contributing to the development of the knowledge-based society and knowledge-based economy, on their main objective of educating the students to become well-trained and competitive human resources. It presents the results of a research made among students about their needs, attitudes, perceptions related to higher education and higher education organizations, and how they define the Christian character of higher education organizations.

Keywords: marketing in higher education, information society, knowledge-based society, knowledge-based economy, e-learning, lifelong learning

Marketing challenges in Romanian higher education in the context of EU-accession

After 1989 appeared different private universities, Christian universities in Romania, besides the public (state-owned) ones. At national level there existed tendencies of reforming the national educational system at all levels (from the elementary school to higher education) in order to make it EU conform, to develop its efficiency and effectiveness, to assure the quality of education.

The Ministry of Education and Research (Ministerul Educației și Cercetării) is in charge in Romania of implementing the educational policy of the Government, of creating and implementing the development strategies related to the field of education and research, of assuring the quality of education, of organizing, managing and financing the public educational system, taking in view the strategy regarding the development of information society. The Ministry of Education and Research developed the „Post-accession Strategy 2007-2013” (Strategie Postaderare 2007-2013), underlining those fields of education and research which represent priorities from the developments points of view, and enumerating those programs which must be implemented in order to facilitate these developments.

The national priorities - related to education and research - are the following:

- To assure the equal opportunities, to increase the level of participation in education;
- To develop the compulsory education;
- To decentralize and assure the autonomy of undergraduate educational system;
- To assure the economical competitiveness based on research and innovation;
- To modernize the rural educational system;

²⁰² This article is part of the results of a research project from 2006/2007, financed by Sapientia Foundation, Institute of Research Programs, the other members of the research-team were: Dr. Béres Csaba, Gáj Blanka, Újvárossy Orsolya

- To develop the institutional perspective of lifelong learning;
- To harmonize the Romanian educational, research and innovation system with the objectives and directives of EU;
- To improve the quality of education and research, in order to train creative human resources.

The expected results are the following:

- Improvement of the quality of the educational process;
- Decentralized undergraduate educational system;
- Increased efficiency of administrative and educational management at all levels of education;
- Decreasing the gap between the infrastructure and educational staff of urban and rural educational organizations;
- Relevant curriculum from the point of view of local and labour force market needs and demands;
- Promotion of coherences between different educational and training degrees;
- Improvement of qualification and performances of educational staff;
- Increased performances of pupils and students, which can be tested at national and international competitions;
- Intensified social acceptance of graduated students;
- Motivation for transnational initiatives on the labour market;
- Improved competencies in getting European Union funds;
- International cooperation in the domain of education and research;
- Development of international partnerships at the levels of European standards;
- Facilitated partnerships between the private and public sector, in order to create cooperation between research institutes, universities and companies, especially regarding developed technologies.

The Law of Higher Education in Romania – which regulates the activities, rights, obligations, structure, management aspects related to educational and administrative staff, aspects related to students of Romanian universities – is under revision.

The implementation of the objectives, strategies, actions of the Bologna Process represents a great challenge for Romanian higher educational organizations. The main objective of the Bologna Declaration (19th June 1999) is to create the “Europe of knowledge”, which develops the intellectual, scientific, technical and cultural base of the political and economical integration, and which contributes to the development of knowledge based society. The purpose of it is to develop a common, transparent and easily comparable European educational system, with two main levels, the undergraduate level and the graduate level (master and PhD). On both levels students should follow their courses for at minimum one semester at a university from another country. For this reason became priorities: to develop and extend the European credit system in the European higher educational organizations, and to implement lifelong learning systems.

The gradual educational model creates a lot of management problems for educational organizations from Romania, which need special competencies, and of course the dedication and motivation of the (top) management in order to be solved. Educational organizations should improve their management, their internal marketing and internal communication, which facilitate the achievement of efficiency demands, too.

The European Union in the Lisbon Strategy (2000) expressed its objective that by 2010 Europe should develop its information society, which will help the European economy to become a competitive one. In order to achieve this goal educational organizations, and specifically higher educational organizations play an important role, because through their educational, research, social etc. functions they can contribute to a great extent to the goals of the eEurope Plan, to the development of the knowledge-based society and knowledge-based economy, to the development of trans-European scientific communication network, to the modernization of the European social model.

Lifelong learning is one of those trends which characterize our society. Organizations make efforts to develop, train, motivate their human resources, because the knowledge, experience and skills of employees are one of those (or most) important factors which assure the achievement of organizational goals. On the human resource market the tendency is for the human resource to get more information, more knowledge, to face the changes in professional environment and general environment, to become more competitive. This can be an opportunity for higher educational organizations, because they can diversify their service portfolio and offer training programs, courses for human resources, and they can offer these courses with highly personalization, taking in view the specific needs of individual organizations. Educational organizations could have the role of developing the lifelong learning consciousness and culture.

The basic document of the continuous learning process „A Memorandum on Lifelong Learning" was finalized in 2000 by human resources professionals.

The European Council concluded in Lisbon in 2000 that Europe have arrived in a new era, the era of knowledge, which has important impact on the cultural, economical, social environment, and generates changes in the way of learning, working, and everyday life, as a result persons need to learn methods which can help them to adapt easily to and to face these changes.

The European Committee developed a strategy related to the development of human resources, underlining that the learning process is based on broadening one's horizons, on extending one's knowledge, on continuous development of skills and competencies.

The main objectives of the European Union are the following: assuring the harmonization of and strengthening the relations between higher educational systems, creating the European social and educational space, developing common European standards, which facilitate the mobility of students and professors. The Socrates and Leonardo Programs and the European Social Fund were developed in order to help the achievement of these goals.

Because Romania became member of the European Union, it must adopt the lifelong learning strategy, which is not a problem, because the Romanian educational system's characteristics predestinate it to do so. The challenges are in the field of assuring proper management, institutional system, qualitative and practical educational materials and tools.

The development of the information society gave birth to new educational methods, which differ from the traditional ones. E-learning is one of these, when the Internet technology serves educational purposes, becomes an educational tool. The European Union's main development direction in the "Key to knowledge-based Europe" Program refers to e-learning, based on informational and communication technologies, underlining four directions:

- *Infrastructure*: equipment of schools, research centers, educational centers with multimedia computers;
- *Education, training at all levels*: creating educational models based on information and communication technology, assuring the training of teachers, professors in using information and communication technology;
- *Development*: development of the educational multimedia industry – development of services and products of high quality and good content;
- *Networks*: connection of virtual educational spaces – supporting network cooperation.

The Romanian higher educational organizations should face the challenges of e-learning, and should try to overcome the barriers in mass spreading of it (for example: Internet access, Internet using culture, information and communication infrastructure etc.).

Marketing in higher education organizations

Nowadays different Romanian higher education organizations realize that it becomes more and more important to be aware of the importance of marketing concept, marketing orientation, social marketing orientation. Marketing in higher education means the use of marketing tools, methods, techniques, through which the higher education organizations can search the needs and expectations of their "clients", and offer educational and other services which satisfy these demands, taking in view the expectations, trends, changes of the labour market, and of course the long-term interests of the whole society.

More and more Romanian higher education organizations become aware that they must become an organization which offers educational and other services in a way that assures the satisfaction of their “clients”, first of all their students, and of course their parents, teachers, professors, too. As a result they must become marketing oriented, in order to be capable to manage their resources, competencies and marketing network in a more efficient way than their competitors, to be able to attract and maintain their students for the undergraduate and graduate courses. The main function of public education is to prepare the student to participate in social life, and the role of higher education is to educate the students to become a well-trained and competitive human resource. But in a highly changing environment the competition between higher educational organizations increases. As a result it becomes more and more important for higher educational organizations to search the satisfaction degree of the students with the different services of the university. They should monitor how their graduates can integrate in the labour market, how employers evaluate the competencies and knowledge of the students.

They must make efforts to create a good image of their organization and their services, to continuously improve the quality of their services, to attract new students, and to convince their actual students to continue their graduate studies (e.g. master, PhD and other training courses) in the similar organization, as a natural solution for the challenge of lifelong learning trend, and to convince their students to recommend these services for their colleagues, friends, relatives, too.

Market segmentation is important for higher educational organizations, because they must choose segments which can be served profitably for a long term period. They must understand that complementary to the theoretical knowledge, they must develop the practical skills of the students, too, because only in this way their graduates will become highly appreciated employees.

To be successful a higher educational organization should offer for its students different services for spending their spare-time, for entertainment, and related to culture. Through a good student-teacher relationship, or friendship between students the universities can become more attractive.

Higher educational organizations must take in consideration the institutional, local, regional, national traditions, practices, cultural and social characteristics, the needs and interests of different stakeholders.

Romania is full member of the European Union, and besides the openness to values of other cultures, it is important to preserve the national and ethnical values, too. In the Common European Higher Education Space it is a priority to make efforts to protect and maintain national and ethnical traditions and values.

Higher education organizations can become catalysts of regional consciousness and regional development processes, motivators of technological development and innovation, can intensify the cultural consciousness and development of competencies and skills, can intermediate cooperation between educational organizations, research institutes and companies, can facilitate the harvest of the knowledge capital, intellectual capital in the economical-social environment.

The role of the higher education organizations in distant-learning and e-learning is intensifying, and for this reason becomes necessary to achieve improvements in utilizing information and communication technologies. The pedagogical aspects should get a higher importance in the development of information and communication infrastructure, and in the creation of educational products and services based on multimedia.

Higher education organizations are offering services, and it is important for them to develop appropriate marketing mix (product, price, place, promotion, process, personnel, and physical evidence), taking in view the specific characters of the educational and related services.

Christian aspects in higher education organizations

From this point of view we can define the functions of a Christian educational organization: to educate in the spirit of evangelical morality, which must penetrate education in the professional field, to facilitate the development of intellectual, psychological, moral competencies of the pupils and students. Another objective is to create a Christian community of pupils, students which catalyses the intensification of students' faith in God, offering a frame for spiritual, intellectual, moral standards, in order to promote Christian values through the educational process. Education should cover besides the professional education the Christian education of the Bible, to promote the love of God for other people, to learn what is good and true, to develop wisdom and responsibility.

Those education organizations are successful, which can create a pleasant Christian atmosphere, where students and teachers, other administrative employees can follow similar values, objectives. Teachers have an important role in education in Christian spirit, because they become a model for students, they can motivate the students with their value system to follow spiritual, moral values.

The short interviews made with students from different faculties show what students think about Christian values, what are their attitudes toward these values, what Christian character of university means for them. The results show that students appreciate those religious values and special events organized by the education organizations, which are related to religious education and faith, but they are reluctant to religious excesses.

Marketing research regarding higher education organizations

The main objective of the marketing research project was to find information related to the satisfaction degree of the students with higher education organizations' services, to their perception about the Christian character of the universities, to reasons for choosing a university for their studies, to preferred information and communication channels.

The results show that students use different information and communication channels to obtain information about universities and their offers, and they use both online and offline information and communication channels.

Students mentioned as reasons for choosing a specific university for their studies as following: the language of studying, the level of educational costs, and the closeness to their home.

Students are concerned with the issues related to: quality of education, different administrative problems, difficulty of obtaining a degree, educational infrastructure, recognition by employers of their degree, problems in finding a good job in their domain etc.

Students generally analyze the offers of different competitors in the higher education industry, and can perceive the differences between competitors.

Conclusions

As a conclusion we can mention, that it is important for higher education organizations to do systematically marketing research to get information about their customers, competitors and marketing environment, and to develop an efficient and effective marketing-mix in order to attract and maintain their customers. The main challenges for the Romanian higher education organizations can be summarized as follows: the changes generated by governmental reforms, European Union integration, changes of legal environment, increased autonomy, the dilemma of mass-education versus elite education, reduced financial resources, needed improvements in management know-how, intensification of competition etc. The trends of the demographical, economical, cultural, social, legal, institutional, informational, technological segments of the marketing environment of higher education organizations have impact on the marketing in higher education. Based on their competencies and taking in view the mentioned challenges higher education organizations should harvest the opportunities and avoid the threats, in order to be able to face the increasing competition.

PUBLIC DIPLOMACY AND ITS ROLE IN BUILDING A NATION'S COMPETITIVE IDENTITY

Macovei Iustina

Governments use two main means of communication, depending on their partner of dialogue: traditional diplomacy (in their communication with other governments) and public diplomacy (for the communication with the population of other countries). In this article I will analyze both the concept of public diplomacy from a theoretical approach – the way it is defined and its meanings in different countries-, and its potential contribution to building a nation's competitive identity. A special attention will be given to the Romanian public diplomacy activities, the funds allocated to those activities and their efficiency.

Key words: competitive identity of a nation, public diplomacy, propaganda, brand.

Introduction – public diplomacy definitions

The term of public diplomacy was used for the first time in 1965 by Dean Edmund Gullion from the Fletcher School of Law and Diplomacy at Tufts University, according to a Library of Congress study of U.S. international and cultural programs and activities. It was created with the establishment at Fletcher of the Edward R. Murrow Center for Public Diplomacy. In one of its earlier brochures, this center defines public diplomacy as follows: "Public diplomacy . . . deals with the influence of public attitudes on the formation and execution of foreign policies. It encompasses dimensions of international relations beyond traditional diplomacy; the cultivation by governments of public opinion in other countries; the interaction of private groups and interests in one country with those of another; the reporting of foreign affairs and its impact on policy; communication between those whose job is communication, as between diplomats and foreign correspondents; and the processes of inter-cultural communications" (<http://www.publicdiplomacy.org>).

From the beginning of its use as a term and until today, public diplomacy has often been considered a synonym of the propaganda and the differentiation between these two terms was rather hard to be made. Some authors consider that the main differentiation between them can be made by the political system of the country as a source of true information (Aoyama, 2007). Thus, unlike propaganda from totalitarian regimes, the information transmitted from the governments of democratic regimes is reviewed and argued by different domestic factors – such as media, social groups -. Based on this verification mechanism, credibility and trust in the transmitted information increase.

At present, the "public diplomacy" term is defined differently from one country to another.

In the US, according to U.S. Department of State, in the Dictionary of International Relations Terms, 1987, public diplomacy "refers to government-sponsored programs intended to inform or influence public opinion in other countries; its chief instruments are publications, motion pictures, cultural exchanges, radio and television." More recently, in 2004, in a CRS (Congressional Research Service) report for the American Congress, public diplomacy is defined as "the promotion of American interests, culture and policies by informing and influencing foreign populations. (...) Public diplomacy activities include international nonmilitary broadcasting, education and cultural exchanges, and international information programs." (Epstein, 2004)

In UK, authorities are thinking of a new definition for public diplomacy, rather than just creating positive perceptions. Thus, it seems that a better definition would be "work aiming to inform and engage individuals and organizations overseas, in order to improve understanding of and influence for the United Kingdom in a manner consistent with governmental medium and long term goals". It is also said that "this definition must be understood within the context of the continuing guarantee of complete editorial independence for the BBC World Service and day-to-day operational independence for the British Council".

In other countries – such as **France** and **Germany** -, I have not been able to find on their Foreign Affairs Ministries a department/directorate that has in its name the term “public diplomacy” and also no definition of this term.

In **Romania**, although there is a department of public diplomacy within the Ministry of Foreign Affairs (that has as responsibilities: organizing public diplomacy events for the central offices of the Ministry and offering logistics support for the public diplomacy activities organized by the diplomatic missions of Romania abroad), I could not identify a definition of “public diplomacy”. Still, there is a reference in a normative act (Norm 21/2005) that mentions as public diplomacy activities: seminars, courses, sessions, meetings etc. I consider that in Romania there is a need for both a clear definition of “public diplomacy”, after the American model, but also for a strategy, a program and a practical action plan in this area.

Public diplomacy and its role in building the competitive identity of a nation

The competitive identity of a nation is a new concept in the specialized literature and it is defined as “the synthesis of brand management with public diplomacy and with trade, investment, tourism and export promotion” (Anholt, 2007). This brand management is an attribute of the institution that coordinates unitarily the entire effort of building a nation’s competitive identity. This institution can differ from one country to another, but, most often, it is the Ministry of Foreign Affairs, the Prime Minister or the Presidency.

There have been identified six main communication channels for the competitive identity of a nation: tourism, people, culture, investments, policies and product/services brands. Beyond these, I have identified two more elements that I believe they should be approached separately, in addition to the mentioned six, due to their major importance for the national identity.

Although it is not unanimously agreed, some authors consider public diplomacy to be synonymous with a nation’s competitive identity. The main thing, though, that nobody questions, is the vital importance that public diplomacy can have, when well realized, in building a nation’s competitive identity.

In the context of the present article, public diplomacy is regarded as a means of communicating efficiently abroad both the policies of the government and the achievements in different sectors (economic, financial, touristic etc). In the same time, for the public diplomacy to be efficient in building a competitive identity, it is essential to be coordinated with the activity of other institutions with responsibilities in this field.

In the following pages I will analyze the Romanian public diplomacy activities and their efficiency, starting from the available researches about our country’s image in ten European countries (France, Italy, Germany, UK, Hungary, Spain, Denmark, Finland, Sweden and Norway). These researches were conducted during the period between the end of 2005 and the beginning of 2006. My analysis takes into consideration the ten main spontaneous associations made with Romania (as a country or as a touristic destination) and it starts from the general premise that spontaneous associations with a country are made or should be made, in a great extent, as a consequence of public diplomacy activities.

The analysis shows, as you can see in the following table, that, 17 years after the maximum visibility moment for Romania – the 1989 Revolution – and one year before becoming an EU member state, our country was still perceived as an East – European country, poor, cheap, associated with criminality, and, as famous personalities it has Dracula and Ceausescu. The most famous region in Romania is Transylvania (I assume that it is due to its association with Dracula – its place of origin).

Table 1

Source: Market researches on tourism development from the countries mentioned in the table in Romania (dated between December 2005 – March 2006) <http://www.mturism.ro/index.php?id=48>

During the time interval from end of 2005 until beginning of 2006 and in the period right after (starting from January 2005), the efforts of Romanian public diplomacy in the ten European countries considered in the analysis focused especially on a clear set of activities:

- Varnishing of expositions (mostly painting and photo, but also sculpture, handicraft etc);
- Concerts of piano, violin etc;
- Poetry performances;
- Book presentation;
- Presentation/ projection of Romanian movies on certain occasions;
- Participations of the members of the embassy to different events (seminars/conferences/ round tables).

In a smaller extent, there were also other activities:

- Participation in fairs, festivals etc with a national stand;
- Organizing folk music concerts, Romanian food dinners, fashion shows;
- Distributing promotional materials about Romania;
- Articles and interviews in newspapers or on TV;
- Meetings with business communities from other countries etc.

All these activities, developed by the Romanian diplomatic missions abroad and the Romanian Cultural Institute, were oriented mainly on the cultural side and less on pragmatic elements. To the same conclusion leads the analysis of the public diplomacy activities financed through a legal act (government decision - HG), these being oriented especially on a few major events (as you can see in the table below).

Table 2

Public diplomacy activities and cultural events organized during the period 2005 – 2008

10	TOTAL		1.015.370.000			

Source: Official Journal of Romania, period between 2005 – 2008.

By correlating the two tables, it can be easily drawn the conclusion that, at least at the horizon of the year 2006, the public diplomacy efforts have not succeeded in creating a favorable image of Romania abroad.

I consider that the main shortcoming for this situation is represented by the lack of a public diplomacy strategy that should set a series of key objectives and clear priorities that, if followed constantly, should lead, during several years, to a significant improvement of European perception on Romania and, on long term, to building a competitive strategy of Romania.

I consider that the public diplomacy model necessary to be followed is a combination between the American one and the French one. Thus, in the American public diplomacy strategy from 2007 there are very clearly stated strategic objectives, strategic audiences, priorities, necessary resources, but also an action plan for reaching the strategic objective. Among the priorities of the persons working in the public diplomacy field identified in this strategy are: interviews and appearances on foreign media, increase use of new technologies, including creative use of the Internet to highlight American policies and programs (U.S. National Strategy for Public Diplomacy and Strategic Communication).

From the French model I consider that we should borrow the interest for promotion activities with the help of radio and TV channels with international broadcasting (for France – TV5 and radio RFI). Romania should make a better and more efficient use of TVR International and Radio Romania International.

These are only a few suggestions about the way public diplomacy can lead to building a competitive identity of Romania. But, in the same time, efforts will remain effect less lacking a unitary coordination of all the institutions with responsibilities in this area, in the absence of an efficient inter-institutional communication and without a consistent message transmitted by all these institutions.

THE EFFICIENCY OF APPLYING HACCP SYSTEM IN MILK INDUSTRIE. CASE STUDY. S.C.COVALACT S.A. FOR THE PRODUCT “CONSUMER MILK 1.8%”

Madar Anca

“Transilvania”University of Brasov, Romania

Neacsu Andreea

“Transilvania”University of Brasov, Romania

Food safety – in fact consumer safety for the physical, chemical and biological risks transmitted through food products – in the globalization era that we are living in currently, has a bigger and bigger importance through: the changed/changing way of living, socio-economic causes, demographic objectives, the growing degree of pollution of the environment that we are living in, the discovery and knowing a larger area of food transmitted microorganisms, as well as through the growing sensibility of mankind towards various food components.

From this point of view, the core of the modern food hygiene has been moved from the classical hygiene and its prevention and control, towards a critical and systematic analysis of the whole food chain through a risk management situated in a system optics, based on preventing probable risks.

HACCP is defined by Codex Alimentarius as: a system that defines evaluates and controls important risks from the food safety point of view.

The aim of the paper is to follow the way in which the modern system of quality assurance (in the present situation the HACCP system) can contribute to the production of a food product (in this paper consumption milk 1.8%) in maximum security conditions as well as the rebuilding of the consumer's trust in the product of a nutritional, biological quality, which is almost unique.

On the basis of hazard analysis done by the HACCP team, at the factory of dairy products S.C.COVALACT S.A. taking into account only the fabrication flux of the milk consumption 1.8%, 4 critical control points have been identified: 3 critical biological points and a chemical one.

Key words: *food safety, biological risks, Critical Control Point, Codex Alimentarius*

Introduction

Food safety – in fact consumer safety from the physical, chemical and biological risks transmitted through food products – in the globalization era that we are living in currently, has a bigger and bigger importance through: the changed/changing way of living, socio-economic causes, demographic objectives, the growing degree of pollution of the environment that we are living in, the discovery and knowing a larger area of food transmitted microorganisms, as well as through the growing sensibility of mankind towards various food components.

From this point of view, the problem of modern food hygiene has been moved from the classical hygiene and its prevention and control, towards a critical and systematic analysis of the whole food chain through a risk management situated in a system optics, based on preventing probable risks. Thus producers, processors and food dealers have to take on a bigger responsibility concerning food safety, hygienic-sanitary problems, and due to the complexity of the issues which can appear it is highly necessary to have a better and more efficient collaboration between authorities, the food industry and consumers. All of this requires a precise and scientifically grounded risk-prevention activity, a better communication between the agents involved in this activity, as well as training and professional teaching of those involved in the production-processing-commercializing chain, of food products.

Part I. Theoretical study

1. The HACCP system

Over the last decades, control in producing and processing food products has been more and more oriented towards keeping the technological and processing processes under control. The control is essentially oriented towards the technological processes, and not towards the final product. Through a technological flow kept under a watchful eye, along with preventive-predictive measures, perfect products will appear, following a perfect technological flow.

The concept of Hazard Analysis in Critical Control Point-system-HACCP was presented for the first time in 1971. The guide lines for this system application were adopted in 1993, on the XX th session of Codex Alimentarius Commission. HACCP is defined by the Codex Alimentarius as: *a system that defines, evaluates and controls important risks from the food-safety point of view.*

Towards the successful implementation of the HACCP system, each unit's management has to designate its own HACCP team, to make its employees aware of the benefits and costs of HACCP. The benefits, besides food safety (basic principle) are represented by a better usage of material resources and on-time solution of problems.

The HACCP system in the food chain can be applied "from the farm through to the consumer's table". The HACCP system outlines the responsibility and control applied to the level of the food industry. Assuring this safety at company level has led to a new perspective from the processors concerning the assurance of food safety and on the importance of the necessity to implement the HACCP systems.

The FAO/WHO Codex Alimentarius Commission has established the 7 principles of HACCP. These principles represent a systematic approach of the things desired concerning the safety of food products.

The seven principles are:

1. Identifying and evaluating the risks associated with obtaining, adapting, manipulating, storage, distributing, cooking and consumption of food products. In the food industry it is used the brainstorming method, based on the theoretical and practical knowledge and on the experience of a multi-disciplinary team from the unit. A complete risk analysis represents the key to drafting an efficient HACCP plan.

2. Determining the critical points of control through which identified risks can be held under control. A critical point of control is a process, a stage or a phase of the fabrication, storage or distribution process, which can be held under control, and which is essential to the prevention, elimination or reduction to an acceptable level of the risk that the food product can represent for the health of the consumer. A very complete and correct identification of the critical points of control are essential for the control of the food-safety risks.

3. Establishing the critical limits which must be respected in every critical point of control. Critical limits are those values that separate the acceptable from the unacceptable. A critical limit is a maximal and/or minimal value at which a biological, chemical or physical parameter has to be controlled at each PCC, to prevent, eliminate or reduce to an acceptable level the apparition of a risk on the cleanness of a food product.

4. Establishing the monitoring procedures for the critical points of control. Monitoring represents the chain of observation and measurements, which demonstrate the keeping under control of the PCC, and which gives important data towards the later verifications. In every place where control is necessary, an efficient monitoring system has to be put into place.

5. Establishing the corrective actions (measures), applicable in case a deviation from the critical limits is detected. Each monitoring activity of the PCC requires the establishment of corrective actions, which will be applied when a deviation from the critical limits is detected following the monitoring of the critical points of control.

6. Establishing the procedures through which it is verified if the HACCP system is functioning correctly. The purpose of verification is to confirm, based on documents, that the HACCP plan is applied like it was designed to. The HACCP team will establish those procedures which offer the assurance that the HACCP system functioning correctly.

7. Organizing an efficient system to keep records, which make up the HACCP documentation. The HACCP team has the obligation to create an efficient precise registering system of the entire documentation for the application of the HACCP system in the unit. Written records are kept and they document every action taken in the HACCP system.

2. Milk as a food product

Through its' composition, milk can be considered the most complex and complete natural cocktail.

The nourishing substances in milk are considered to be of the most valuable, both from the point of view of their composition and for their rapid and almost complete absorption through the intestinal wall. One liter of milk contains approximately 32 grams of protein (the equivalent of 4-5 eggs), 32 g of lipids (32 g of butter), 47 g lactose, vitamins, natural salt and enzymes. As a nourishing value, one liter of milk is the equivalent of: 400 g of pork, 700 g of veal, 600 grams of beef, 500 g of fish meat, 2600 g of cabbage and 1400 g of apples. The caloric value of milk is 680-900 kcal/l. The biological value of proteins is high, with a high assimilation degree: 96%. The milk fat, unlike other animal fats, protects the vascular endothelium. Lactose suffers conditioning processes under the action of microorganisms, which can lead to numerous dairy products. It is slowly used by the organism and thus it does not affect diabetics and those with heart diseases. The galactose resulting from the conditioning of lactose is used by the nervous system, contributing to the development of the intellect.

Microelements in milk: calcium, phosphorus, potassium, magnesium and iron offer a great deal of the daily necessary of the organism, milk and dairy products being the most important calcium resources to the organism.

Milk cannot be offered to the public until a thermal treatment, because of its' reduced time of preservation, on the one hand, and because it could transmit pathogen germs to the consumer on the other.

Part II. Case study

1. The purpose of the paper.

At the time in which the people nutriment/food in developed and developing countries is dominated by artificial products, due to an intense industrialized processing, in which few raw material characteristics are kept, the influence of food products on human health has acquired a certain importance

Besides of this artificial products it has been noticed a predominance of unhealthy foods products (as fast food) in the consumers meals, which has no resemblance to the natural and healthy food which existed in the past.

This led to the aim of the paper, to follow the way in which the modern systems of quality assurance (in the present situation: HACCP system) can contribute to the production of a food product (in this paper: consumption milk 1.8%), in maximum security conditions as well as the rebuilding of the consumer's trust in this product (in this case: milk) of a nutritional, biological quality, which is almost unique.

It is necessary to follow, through the HACCP system, the food chain, from the milk production as raw material milk to the consumer, underlying the key control issues of this chain through which product traceability can be achieved and a guarantee to the consumer can be given that the consumed milk is safe.

The influence of the environment factors, of the biological chemical, physical risks that can appear in the consumption milk 1,8% will be observed, as well as the way in which the control of these associate risks was proposed and realized and the corrective measures applied in case the risks appear.

The place of the study development is S.C. Covalact S.A., residing in Sfantu Gheorghe City, Covasna county. At present, the company collects milk from 6 counties. The milk collection is carried out with 23 specialized means of transportation and other various different vehicles without milk cooling equipment.

The Company management is currently developing a strategy of consolidation and a progress to a new stage towards quality assurance of products according to European standards and legislation.

The sale of the products takes place both in Covasna county and outside of Covasna County, especially on the market of the Bucharest (approximately 1/3 of sales), but also in Brasov, Constanta, Prahova, Dambovita, Bacau, Valcea, Sibiu, Mures, Buzau).

2. The application of the HACCP system in the dairy products factory S.C. COVALACT S.A., for the consumption milk 1.8% product.

The milk and dairy products are very numerous and for each type of product a separate HACCP plan is made. Next, in the following, the HACCP plan, elaborated for consumption milk 1.8% shall be presented in table nr.1.

2.1. Product description

Table nr.1: Product description

1. Name of the product	1. Consumption milk 1.8%
2. Using way	2. For consuming, or after boiling; or as row material for other dairy products producing, or with milk addition.
3. Characteristics of the product	3. <i>Sensorial properties:</i> white-yellow color, homogeneous liquid, with no visible and sediment impurities, fluid, nice and sweet taste and smell, characteristic to milk, with a small taste of boiling, without any peculiar taste and smell. <i>Physical-chemical properties:</i> 1.8% fat, 15-21 degrees Thörner acidity, 1.029 density, 8.5% unfit dry substance, 3.2% proteins. <i>Microbiological properties:</i> TNG (total number of germs) max. 300.000/ml., coliforme bacteria max. 10/ml., Escherichia coli 1/ml. max.
4. Packaging	4. Polyethylene bags with a 1 l. capacity.
5. Validity period	5. Two days maximum, if it is continually kept at a temperature of 2-4 C°
6. Marketing	6. Bags put in plastic cases, stacked or not.
7. Labeling	7. Labeling through printing the producer's name on the bags (address, tel./fax), the name of the product, the net quantity, the percentage of fat, the limit term of consumption, the storage and transport conditions, the thermal treatment procedure, mention regarding the batch identification.

2.2. The flow diagram

The technology to obtain pasteurized consumption milk comprises several procedures, as follows:

- Qualitative reception, through the examination of milk, from sensorial point of view, physical-chemically and microbiological. Along with the reception the sorting of the milk is made.
- Quantitatively reception: gravimetrically or volumetrically.
- The cooling of the milk is made at 2-4 C°, and the temporary storage is made in vertical or horizontal isothermal tanks to maintain the milk at a low temperature until the next procedure.
- Cleaning the milk is made through filtering, or more correctly through spinning.
- The normalization of milk is made with the purpose of getting the fat content at a constant value depending on the demands and the legislation in force. The normalization can be made in two ways: by increasing the fat content, by decreasing the fat content. Usually, to normalize milk, creamed milk is used, obtained through separating the fat from the integral milk.

- The homogenizing of milk, (only if it is desired), is made with the purpose of stabilizing the fat emulsion, caused by the reduction in diameter of the fat cells. During the homogenization new fat cells are formed.
- The Pasteurization of milk has to assure the almost complete destruction of the ordinary micro flora and the complete destruction of the pathogen one. Care is taken of the time-temperature relation, and in preventing the sensorial and physical-chemical changes. We can use: low Pasteurization (63-65 C°/30 minutes), high temperature Pasteurization, or HTST (72 C°/15 minutes), instantaneous Pasteurization, flash, (75 C° and sudden cooling at 10 C°)
- Deodorization, in the same time as Pasteurization.
- Packaging of consumption milk, in various packages, depending on the request.
- Storage of the packaged consumption milk at 2-4 C°

In case a larger period of storage for the consumption milk is desired, instead of Pasteurizing, sterilizing the milk can be made.

Flow diagram

2.3. Identification and estimation of the risks, the establishment of the CCP and of preventive, corrective measures

Table nr.2: Identification and estimation of the risks, the establishment of the CCP and of preventive, corrective measures

<i>The phase of the process</i>	<i>Potential risk</i>	<i>It is significant risk</i>	<i>The justification of the decision</i>	<i>Preventive measures</i>	<i>It is a CCP?</i>
Milk raw material	C: residuum, pesticides, medicines F: heterogeneous bodies B: pathogens germs	C: No F: No B: Yes	C: Non – respecting by farmers of the stipulations, utilization of pesticides, medicines, etc. In the next point are determined these substances. F: Unhygienic milking, pollution with straws, etc. By filtration the risk is eliminated. B: Contaminated milk from the source. Table nr.3: The description of CCP and corrective measures

Process Stage	CCP Identification	CCP Description	Critical Limits	Monitories methods	Corrective measures	Accounts	Verification methods
Qualitative and quantitative reception	1C	C: The presence of pesticide residuum in milk, antibiotics, medicines, hormones, mycotoxines	C: The absence, or exceeding the maximum limits allowed by the present regulations for these substances	C: written accounts at farms' levels, regarding the way these substances are being used; gathering fodder, milk, urine proofs/tests, etc., analyze forms for the farmer	C: HACCP application at farms' levels. No utilization of polluting fodders. Eliminating the suppliers with positive detecting tests. Repealing milk with positive reaction	C: Plan HACCP presentation farms by the suppliers, respectively analyze forms. Everyday slip monitoring routes	C: Every three months, the person responsible for collecting centers verifies the existence of registering from farms, slip monitoring routes
	1B	B: Unacceptable number of microorganisms of somatic cells.	B: TNG under 1million, somatic cells under 4 thousands	B: Quick tests of determining TNG, somatic cells (Lactoscope)	B: Repealing of inadequate milk, processing acceptable milk in different sorts of cheese with long fermentation (over 2 months).	B: Evidence form control sample milk of prime substance. Slip of the results of analysis for each route	B: Everyday determinations are made for each route, regarding TNG, somatic cells.
Pasteurization 72 ⁰ C/15 seconds.	2B	B: Passing of raw milk, pre warmed through the pasteurization machine, without touching the desired parameters.	B: Temperature: 72 ⁰ C, prescribed time 15 seconds.	B: The registering continues on thermogram of temperature and time exposing. Putting down on the monitoring slip of temperatures from hour to hour. The verification of the recirculation head functioning, and putting down on the monitoring slip.	B: The assurance of good functioning of the pasteurization machine. The elimination of expired milk without a proper pasteurization, or products made out of this milk from human consumption.	B: Slip of monitoring the pasteurization temperature Thermograms.	B: From hour to hour the pasteurization temperature is put down, the recirculation head function, thermograms are weekly verified, and the slip of monitoring the recirculation head and temperatures. It is dated sealed and signed. Temperatures are

							weekly verified
Final depositing	3B	B: Depositing bags in boxes, cooling for avoidance multiplication pathogenic residual agents	B: temperature 2-4°C, maximum time for depositing 48 hours.	B: Thermographs with an alarm signal, at deviation the adjustment of the ice machine is manually turned on. The deviations, are to be noted in the slip of storage monitoring.	B: The temperature adjustment at the desired one, time exposing verification at high temperature of the product, verification of products' temperature. Elimination of inadequate products from human consumption	B: The monitoring storage slip. Thermographs.	B: Thermographs are checked monthly, the monitoring ice storage slips

Part III. Conclusions

On the basis of hazard analysis done by the HACCP team, at the factory of dairy products S.C. COVALACT S.A., taking into account only the fabrication flux of the milk consumption 1.8%, 4 critical control points have been identified: 3 critical biological points and a chemical one.

The monitoring of these CCP is done with the help of some specific monitoring slips (slip n1-14), conceived by the HACCP team of the factory. The monitoring temperature (pasteurization, intermediary storage, final storage) is triple accomplished: by reading on the external monitor of the thermometers, written and signed monitoring slips, registering automatically the data on the computer, and at the pasteurization machine the thermogram appears.

The whole direction followed by the milk admitted in the factory is monitoring, being very easy to realize the products' traceability: a monitoring slip of milk prime substance of the routes, a slip of the monitoring milk pasteurization, a slip of monitoring lot milk intermediary deposited, a slip of monitoring charges of milk consumption 1.8% fabrications, a slip of temperature monitoring of depositing milk consumption 1.8%.

The hygiene is maintained under control by completing a monitoring slip of the washings, respectively by completing a slip of verified washings and delivering exchange and once a week the whole process of hygiene is being controlled by completing a control slip of Hygiene and Disinfection.

On the basis of the monitoring slips the following **conclusions** can be done:

- Although the unity equipped its majority of centers with cooling tanks, a high percentage from milk prime substance, arrives at the factory with a pretty high bacterial load. This percentage has the tendency to increase in the warm period of the year and to decrease in the cold one. Milk collecting is done once a day.
- A high percentage from the milk prime substance is infected with inhibited substances (antibiotics), varying according to the period of the year (high in spring and autumn). The unity is being equipped with detecting apparatus of these substances. With all the unity's efforts to explain to producers about this, the percentage has no tendency of decreasing.
- The cooling point of milk from collecting centers varies a lot, which shows a continuation of addition practice of water by producers, in the scope of obtaining high profits. This thing is being done in spite of the thing that the price of the milk prime substance, paid by the unity it depends on the parameters: protein, fat, cooling point, acidity, density.
- The factory's personnel knows and respects the rules of good Practice of Work, their teaching is being monitoring through specific slips (the slip of evidence of teachings).
- CCP monitoring leads to risk elimination associated to the fabrication of this product, non-appearing denunciations, or turnings of the product, linked to its fabrication, depositing and commercialization.

Part IV. Recommendations

On the conclusions' basis the following **recommendations** can be done:

- the intensification and efficiency of teaching – conscientiousness of producers, according to milk cooling immediately after its obtaining; non-adding water in milk taking into account the fact that, the gains from quantity are lost at quality; milk delivery to collecting centers twice a day; respect of milk hygienic; non-delivery of milk from animals being under treatment, respect the waiting period.
- Insisting on solving the liberation problem of medicines without recipes, informing the collecting centers regarding the present treatments by the doctor.
- Equipping all the centers of milk collecting with cooling tanks.
- Equipping all cars which transport milk with cooling apparatus, to respect the conditions of milk transporting.

COMPARATIVE ADVERTISING

Marcu Mihaela

Transilvania University of Brasov, Faculty of Economic Sciences, Adress: Colina Universităţii, Corp A, Etaj III, Brasov, Romania, E-mail: mihaelamarcu@unitbv.ro, Telephone number: 0745832906

Abstract. Using comparative advertising a company compares its brand, directly or not, to one or several brands. The comparison must be loyal, truthful, undeceiving and objective.

At the European Union level the comparative advertising was accepted through 97/55/CE Directive and defines comparative advertising as the one which identifies, explicitly or not, a competitor or the goods or services that it offers.

Comparative advertising generated a lot of law suits between competitor companies starting with imitating the features presented in an ad (the law suit between Lever and Procter & Gamble companies concerning the use of "whiteness" theme in laundry detergent ads) until price comparisons (the law suit between Carrefour and Leclerc related to online comparison of their products` prices).

Key words: comparative advertising, law, advertising investments

Comparative advertising is an advertising argumentation technique where the advertising message is about making comparisons (necessarily objective) about features (quality, price, delivery terms, services and others) of a company's products as compared to the products of the same type belonging to one/several competitors. Therefore, companies pursue in getting immediate advantages, at least by deflecting attention of some of the buyers towards their brands.

Comparative advertising puts together face to face the advertised product and one or several of the competitors' products (direct comparative advertising) or a general product whose brand has not been revealed (indirect comparative advertising).

For example, in France, comparative advertising was authorized in 1992. It applies to some similar products and services using the same sales conditions (to maintain objectiveness, the comparison is made only between the material elements of the two competitive offers). Before it is broadcast, the comparative message must be made known to the opposite party in due time to be eventually cancelled. The comparison must be loyal, truthful, undeceiving and objective.

Comparative advertising has both advantages and disadvantages for the companies/institutions that use it. Here are the advantages of the comparative advertising: the message and the brand are better kept in mind, detailed and explicit information reduces confusion, improves the product's perception, gives trustworthy, the buying intentions increase, it promotes competition etc. This kind of advertising is oriented towards the consumer because it advertises not only a product but it also insures the consumers to be well informed. The disadvantages of negative advertising include: decrease of the compared brands' fame (mainly through price comparisons), high promotion costs (the companies whose products are put in a bad light are forced to reply by developing new advertising campaigns insuring a good positioning of products and reducing the negative advertising's effects and which are a lot more expensive), increase of law suits number between different companies due to this type of advertising etc.

Law pertaining to comparative advertising

At the European Union level the comparative advertising was accepted through 1997 Directive which added this issue to the provisions in matters of deceiving advertising referred to in a Directive from 1984 (84/450 Directive).

Therefore, 97/55/CE Directive allows comparative advertising according to certain conditions, and the EU member states which forbade any form of products/services advertising as compared to the competitors', had to change their law in order to approve of this type of advertising.

The Directive defines comparative advertising as "the one which identifies, explicitly or not, a competitor or the goods or services it offers."

The Directive establishes the conditions according to which comparative advertising can be made. Therefore it is allowed under the following conditions:

- if it is not deceiving;
- if goods or services having the same scope or destination are compared to;
- if one or several fundamental, pertinent, verifiable and representative features are compared to, in an objective manner, among which the price also can be included, which belong to some goods or services;
- if confusion is not created on the market between that who promotes himself and a competitor or between commercial brands, commercial names or other distinctive signs, goods or services belonging to that who promotes himself and those of a competitor;
- if a competitor's commercial brands, commercial names, other distinctive signs, goods, services, activities or circumstances are not discredited or denigrated;
- if products having the same indication, in case of products with geographical indication, are compared to in each case;
- if a certain commercial brand's fame, commercial name or other distinctive signs belonging to a competitor or the geographical indication of a certain competitor's product are not incorrectly taken advantage of;
- if goods or services are not presented as imitation or remaking of certain goods or services bearing a commercial brand or a protected commercial name;
- the comparisons referring to a special offer must clearly indicate and in a straightforward manner the offer's ending date or, if case may be, if the special offer refers to the available stock of goods and services and if the offer has not yet started, the starting period when the special price will be applied or other particular conditions.

These provisions are contained by the Romanian Law no. 148 from July 26th 2000 related to advertising, amended by the Decision no. 17/2003 related to amendment of art. 8 letter e) of Law no. 148/2000 related to advertising.

Law suits generated by comparative advertising

The first dispute over the laundry detergents' whiteness comparison took place at the end of the 60's between Lever and Procter & Gamble companies. Lever complained at the Trade Court from Paris that Procter & Gamble were constantly imitating their whiteness comparison theme and thus they were disloyal competitors. The Court of Appeals from Paris rejected the charges on the grounds that the idea must come from the affected company if it was to talk about infringement of the competitiveness' principles and the "whiteness" theme has been long time used.

Detergents, tins, soaps are just a few of the anonymous landmarks whose sole reason to exist is to put their features in a most favourable light possible. This communication solution must be carefully treated though out of two big reasons. One of them is to keep the message pertinent. This case mostly appears when the communicated benefit is a general thing for this category, almost all detergent ads resort to the same landmarks/techniques (laundry's whiteness, quantity of laundry washed, price) and at a certain point the landmarks become vague and relative which can lead consumers to confusion. The other reason is the vulnerability of such an approach: the others competitors may react and offer a better product.

According to law, the advertising message used in comparative advertising must be neutral. The comparison must not put a competitor or its products in a false light. For example, the ad saying that "Renault sells twice more cars in Germany than Volkswagen in France" was forbidden. Even if figures showed that this was true, the ad was considered illegal. The Great Court from Paris found that the advertising message was not objective because it made people understand that this was due to the inferior quality of the German competitor manufacturer's cars.

In France, Carrefour made a complaint against its competitor Leclerc who was doing illegal advertising on www.queistlemoincher.com (translation from French: „who is cheaper“). On this webpage the prices of 3.500 products sold in the two distribution networks were being compared to, "in order to restore the truth regarding real prices", as stated on the site. Except Carrefour, the comparisons also included Auchan,

Intermarché retailers but not Lidl which actually had the lowest prices. The Court decided to close up the site, judging on the lack of objectiveness in prices comparison, since the information could not be verified concerning parameters retained for the company.

Case study: Romania's dish detergent market

The dish detergent market keeps increasing every year, mainly due to a consumption increase. In terms of marketing this means a great deal of loyalty and trust that consumers show for the brands they use and at the same time, a proof of a growing steady market. The main players from this category have an extremely quick launch rhythm for which reason they focus their advertising on easily accessible environments to consumers. The most important detergent brands are: Fairy (belonging to Procter&Gamble Company), Pur (Henkel) and Axion (Colgate-Palmolive). The rough competitiveness between the three companies generates important advertising investments (table 1).

Brand	Insertions no.	Euro
Fairy	7.066	17.012.949
Pur	4.264	9.166.727
Axion	4.386	8.869.670

Table 1 - Most advertised dish detergent brands (2007) (television, press and radio) Source: Alfa Cont Mediawatch

The ad is the key of success in this category, the pile of cleaned shiny dishes attracting buyers in search of more advanced products. The dish detergent ads are an example of indirect comparative advertising promoted on Romanian TV channels. Therefore, one of the most efficient methods of advertising was showed in a demonstration in August 2005 when Fairy proved to be a better detergent than Pur, when one 500 ml bottle of detergent washed 8.734 dishes. The results of this outdoors demonstration were subsequently advertised via all available communication channels.

Fig. 1 - Dish detergent advertising gross* volume (television, radio and press)

** Monitoring according to advertising costs*

Source: Alfa Cont Mediawatch

In the first two months of 2008, the television, press and radio advertising costs for all dish detergent brands registered a total gross amount of 5,6 million euros (counted as per list tariffs), according to Alfa Cont monitoring. The consumption is 73% higher than in the same period last year. And the number of advertising insertions increased with 43% reaching 2.130. Last year, the total gross costs incurred for television, press and radio advertising of all dish detergent brands reached 43,12 million euros (counted as per list tariffs) (fig. 1). As a net value, the budget may be around 10 million euros. As compared to 2006,

the gross volume increased with 80%. There were 20.079 television, press and radio advertising insertions, namely a 50% increase (fig. 2).

Fig. 2 – The number of insertions* for dish detergent (television, radio and press)

** Monitoring according to advertising costs*

Source: Alfa Cont Mediawatch

Due to the rough competitiveness between the three brands, advertising companies resorted to radio too. Television remains the main dish detergent brands' advertising support.

MARKETING'S TALE ON THE WEB

Mastacan Angela-Mihaela

Universitatea „George Bacovia” din Bacau, Facultatea de Economia Afacerilor, Str. Pictor Aman, nr.96, Bacau, Tel 0234562600/102, mihaela.mastacan@yahoo.com

Although the Internet's early burst of youthful exuberance is over, the steady march to maturity is only beginning. The Internet and digital technology will continue their inexorable penetration into all aspects of life and business. Also, they had changed how marketing is done. While the underlying principles of marketing remain the same, digital technologies provide new ways to improve the efficiency and effectiveness of strategic marketing activities.

Keyword: Internet, e-marketing, e-world, consumer

Is it hypnosis? Seduction? Simple amnesia? We mustn't let dot-com techno-bubble dazzle into forgetting every business lesson learned the hard way. There are no magic marketing bullets offline; there aren't any online either. To be successful online means to approach the Web the same way as approaching the offline business - with an awareness of business fundamentals, a combination of marketing techniques, and an incredible focus on customers.

Marketing has pretty much been around forever in one form or another. Since the day when humans first started trading whatever it was that they first traded, marketing was there. Marketing was the stories they used to convince other humans to trade. Humans have come a long way since then and marketing has too. The methods of marketing have changed and improved, and we've become a lot more efficient at telling our stories and getting our marketing messages out there. E-Marketing is the product of the meeting between modern communication technologies and the age-old marketing principles that humans have always applied.

Today's marketers must embrace continual change and the online opportunities and challenges that constantly come with it. The digital impact affects every element of both the overall marketing mix and communications mix. A host of new e-tools have been added to the marketer's armoury, including websites, micro-sites, i-TV, i-kiosks etc. The customer doesn't care about the challenges this poses to the marketers; he just wants to be recognized, remembered and dealt with quickly, pleasantly and personally.

Today there are, according to the Chartered Institute of Marketing, two types of company that use e-marketing:

16. An on-line company (for example Amazon) or online arm of an offline company which wants to encourage customers to visit their website or a particular promotion on the website. In a sense the Internet is the firm and the only way that customers interact with the company is through the Internet.
17. An offline company using the Internet to build its brand message, but not necessarily to encourage on-line transaction (although that can be incorporated too if necessary). Such firms use the Web as another form of advertising and the website is usually just for information purpose rather than transactional.

e-Marketing continues to grow rapidly. e-Marketing is simply marketing online: identifying, anticipating and satisfying consumer needs online. This implies keeping close to customers, forming relationships with them and keeping them happy online. In reality, e-marketing integrates online and offline activities as required by the market, since some shoppers browse online and shop offline.

e-Marketing can help marketers to achieve many objectives, from increasing sales to getting closer to customers and listening to them, to adding extra service and added value; to gaining efficiencies and saving money; to strengthening the brand as it moves from visual orientation to an interactive and experiential orientation. These five objectives or benefits can be summarized as follows:

- Sell. Just about anything can be sold online, from cars to kidneys. Some major B2B companies only buy online, so online selling is compulsory for their suppliers.

- Serve (added value). The company must find answers to the following questions: How can I help my customer? What information is of use to them? Are there any integrated services that they would like?
- Save. Web sites can save vast overheads of physical presence. Fully integrated web-sites can save a lot more. When the “sell-side” (customer-facing website) is seamlessly linked to both the “inside” (production, order processing and finance) and the “buy side” (raw material procurement and supply chain management), huge efficiency gains are enjoyed as an incoming order updates sales records, production records, supply records and suppliers simultaneously. This way, customers are given accurate delivery schedules.
- Speak (listening to customers). For too long marketers have been separated from customers by middlemen: distributors, retailers, ad agencies and market researchers. At last, marketers can speak, listen and watch customers in a new way. In addition to engaging in a dynamic one-to-one dialogue with customers, marketers can watch discussion rooms, chat rooms and bulletin boards’ customers swap ideas, tips, suggestions and criticisms am the brand. It’s a marketer dream.
- Sizzle (exciting branding). Web sites provide a wonderful opportunity to re-evaluate and sometimes reinvigorate the brand. The “sizzle” is the Web site magic that adds to the brand. It’s the overall impression delivered by the web-sites – the scintillating experience, dynamic engagement or plain old warm feeling left after a visit. Sadly, many sites don’t do this. Instead, they damage the brand with slow responses, slow downloading and out-of-date content. Web sites require resources to service the site, update content and answer e-mails, as well as to create engaging online interactions.

Many websites damage their brands with broken links, dead ends, out-of-date content and impossible navigation. Many sites skip the cardinal rule of asking customers what they would like on a website. Then, having created the site, the webmasters forget to check whether they have got it right. Regular reviews or audits should not be devoted to reviewing the latest technology, but rather they should be focused on customers’ reviews.

Excellent e-marketing essentially implies a relentless attention to detail. Constant testing and monitoring are essential. Creativity also helps, but the main downfall of e-marketing is lack of attention to detail and lack of testing. Many sites do not carry out sufficient research. Researching websites can be a five-stage process:

1. Concept testing. This includes customer research: What motivators or buttons to press and what barriers stop them from buying? What are the critical calls to action?
2. Competitor site testing. This is easy to do as the research panel visits competitor sites and cherry-picks the best bits and identifies the worst bits to avoid.
3. Interface usability testing. How easy is for the users to move around the site? Do they recognize the key calls to action? Can they easily find what they need?
4. User profiling. Once the site is launched, e-marketers need to know who is visiting the site. Are they the right profile? What is their profile? This can be delicate, as too many questions can be off-putting for visitors.
5. User satisfaction feed-back. This requires a highly skilled approach.

e-Marketing is moving on. Standards are improving. There is a lesson to learn from the dot com disasters. Why did so many of the dotcoms fail?

Many of them were product orientated (as opposed to marketing orientated), as demonstrated by Web sites that were effectively “complex product catalogues” with confusing navigation and almost impossible purchasing procedures. Many failed dotcoms simply didn’t have a real, valuable proposition to their customers. Many of them were technology driven - clever Web technology tacked on to a web site without fully considering how, first, this could really help a customer and, second, how to promote this as an attractive proposition. Fundamentally, many of them were imply bad ideas in the first place. They had no real market need. They failed to create a niche. Of the few that did have useful value propositions, many of them had no marketing experience or wise management experience with disciplined approaches to cost

control, cash flow and profit generation. Several owners were more focused on the stock market than on their customers – a recipe for inevitable failure.

We have learned valuable lessons from the failures. The Internet will not be a revolution that replaces existing marketing. Rather, it will be a channel and a set of methods to improve the efficiency and productivity of marketing. Digital technology will improve how we design, communicate, promote, price and distribute our products. In many companies the Internet will transform how marketing is done.

However, the experience of early days of the Internet shows us that a focus on digital technology alone is risky. Evidence points to the failed assumptions about how the Internet will change business.

The early exponential growth rate of the Internet led many to assume that the trend could only continue and transform the economy. On-line retailers assumed that everyone would buy everything over the Internet. Dotcoms believed that a clever domain name, a few product pictures and a flashy banner ad were enough to generate an unending stream of orders. Many also assumed that companies would abandon old buying and selling processes to move to pure information-mediated business-to-business exchanges.

Internet companies assumed that balancing revenues and costs was no longer important. Indeed, some companies even bragged about not having profits. Companies ignored fundamental business principles as they flipped from strategy to strategy. Companies assumed that being fast and first were all that mattered.

Although the Internet's early burst of youthful exuberance is over, the steady march to maturity is only beginning. The Internet and digital technology will continue their inexorable penetration into all aspects of life and business. Companies will connect digitally to their customers with increasing frequency. Although the specific details are unpredictable digital technology will inevitably accelerate, intensify and reduce the cost of marketing activities. What is important is that marketing managers use a good methodology to understand their customers and guide their companies toward serving those customers better. At the same time, marketing managers will help guide the company's customers toward better utilization of the company's product and services. Throughout all the change, the issues of digital marketing are the same: how companies can create value for their customers that, in turn, create value for their shareholders.

The world of sales and marketing is changing all the time. Business in general and certainly marketing in particular has become more affected by and dependent upon technology. Those firms that are not fully aware of technological advances and developments will fall behind in the commercial race and will probably cease trading. Marketing means staying ahead of the competition and this means acquiring skills to use new technologies. Marketing needs an understanding of the use of technology.

Abstract: This paper contains a few basic notions concerning the theory of benchmarking and its marketing applicability.

Key words: benchmarking, marketing benchmarking, continuous assessment process

INTRODUCTION

Benchmarking is a theory that was developed in the USA and which became one of the most performing managerial tools in the '90s.

Benchmarking is a modern management method, which has as purpose to increase the performances of a company through environment observation and by establishing the performances which have to be equaled.

The benchmarking concept is defined in the following ways:

- -the first definition presents benchmarking as being „the process of measuring and comparing the performances of a business with similar processes extent within the main organizations in order to obtain information which will help the organization to identify and implement improvements ”-Benson, 1998
- -according to the second definition benchmarking is “the continuous process of measuring products, services and business methods belonging to your own company, in comparison to the ones of the most powerful competitors and of those companies which are know as being industry leaders ”

Gerald Balm defines benchmarking in the following way:

“The continuous action of comparing a process, a product or a service with a similar activity, known as being the best in that field, with the purpose of establishing ambitious but real improvement objectives and actions so as to become and keep the number one position among the best within a reasonable period of time”.

Xerox:

“It is a continuous search process for new ideas, methods and practices, for processes and for adjustment of these practices; or the adaptation of some good ideas and their real life application so as to become the first among the best.”

Robert Camp:

“Benchmarking is the continuous assessment process of our products, services and methods in comparison to those of our most serious competitors or of an enterprise recognized as being the leader in their field.”

As its definition points out, benchmarking compels an organization to focus its attention from the internal environment to the external one, thus trying to compare its own performances with the ones of the best companies.

MATERIALS AND METHODS

When you want to know precisely what position you hold on the market, who is the best in your domain and which is their level or you desire to find out about the new methods they use and what processes made them so efficient, benchmarking is the best method available.

There are two types of benchmarking: competitive and cooperative. The first one uses the competitors' analysis, more precisely it includes a research study of the best entrepreneurs in a certain domain. The

second one implies observation of multinational company subsidiaries in different countries. Regardless the type of benchmarking used, with the help of the benchmarking data base it will be easy to determine how the leader in a certain domain has managed to obtain that level of performance. Even though the stages of the process can vary from one company to another, there are six steps that are applicable in all situations: a) taking a decision concerning the process on which we can apply the benchmarking theory; b) understanding of current achievements; c) plan making; d) competitors' analysis; e) learning form the gathered information; f) utilization of inquiry findings. The process must start with the identification of problematical areas that you want to observe in your business; for example: customer services quality. Then you must identify the number one companies in this domain. It is advisable to choose those which are part of your group. Afterwards you have to make an analysis of rival companies. How do you do that? You have to observe each step they make, pay attention to aspects concerning sales, customer services, and conflict management. All the discovered information must be compared with the situation extent in your company. Thus, taking into consideration data offered by reports, you can state precisely your position on the market and find out how good you are in comparison with rival companies. However one thing is certain: all the results obtained from a complete benchmarking system allow the administration of a company to devise and project plans concerning the endorsement of the best practices in order to obtain notable performances.

The reasons for carrying out benchmarking are the following:

- it can be used in order to find out the domain in which the company can equal the best
- it helps to identify the strengths and weaknesses which are transformed into increasing opportunities
- other's experience as leaders represents the starting point
- it helps to justify and hierarchic differentiate the cost of resources needed for improvements
- it allows the company to maintain its competitiveness and to achieve a complete satisfaction of customer needs

Benchmarking must be a continuous process because markets are in a perpetual change. Therefore, leaders in all activity domains grow stronger as time passes by. Only those companies that follow by the book the rules of benchmarking will be able to obtain notable performances. In an environment in which change is a common feature, the companies which do no take into consideration this element are destined to bankruptcy.

A question that is often brought up is the one referring to the reason why should an organization imply itself in benchmarking. The easiest answer is that the company must preserve its competitiveness on the market. Benchmarking determines the organization to better understand the competitor's environment and the needs of their own clients.

There are people who claim that marketing activity cannot be subjected to benchmarking, because they do not consider marketing an independent process. Some marketers consider that the production activity, the logistics and the invoice department are compatible with this approach. These claim that marketing is a creation activity, an artistic exercise that can be compared to painting or song writing. How can you subject to benchmarking Van Gogh or Strauss? It is their opinion that the creation process cannot be reduced to a total amount of subordinate processes; it cannot be measured in terms of time, costs or resources. Nevertheless, this opinion loses ground in front of several scientific approaches. Marketing is the science of creating and sustaining assets intangible as brand, customer relationships and data base. Marketing has a direct influence on the income, generating a faster cash flow, a higher speed of recovering investments; it increases brand fame; it enforces the customer's brand loyalty.

The benchmarking process is similar to the study of war tactics. However the market itself can be compared to a battle filed where companies struggle to obtain the first place. First of all you have to keep an eye on the activities of your rival companies and you have to monitor aspects like customer service, the aptitude level for sales, conflict management, etc. Then you must compare them with the situation extent in your business. Even more, the fact that you have at your disposal clear reports and measurable factors, enables you to easily sketch a profile that will point out how good or bad you are in comparison with your competitors. Thus, it is necessary to always monitor production, promotion, services and methods implied in this process.

There are four essential steps in benchmarking:

- Having a good knowledge of your own actions: the company has to subject itself to an auto SWOT analyses, because only if the company knows its strengths and weaknesses it will be able to identify which operation to reinforce and which to redraw from the market.
- Knowing your competitors and the leaders in a certain activity filed. It is important to realize that only the comparison with the best and the understanding of the best practices will assure a superior position on the market.
- Incorporation of the best methods; the company must search for the best methods where they exist and must not hesitate when it comes to imitate and incorporate them in the internal operation. As Lauren Maruani, manger of The Institute for Industrial Strategies, in Paris, points out benchmarking is a theory that contradicts all the ideas that were delivered to us starting from primary school, such as the interdiction to copy from you classmates. Furthermore benchmarking has as main objective to copy from the best “students”.
- Winning supremacy: when the best methods have been applied in a correct manner, then this situation will certainly lead to supremacy on the market.

In sharp contrast with the traditional methods of extrapolation future objectives to past achievements, benchmarking allows to establish aims by taking in consideration the external information. After the employees find out the external information they will be motivated to achieve the aims and the objectives. It will not be easy to point out that an objective is difficult to achieve especially when it can be proved that another company has already achieved it. Another argument concerns the efficiency of benchmarking implementation, which is felt at the level of costs and time. Nevertheless, because the process implies more imitation and adjustment than pure invention, your money and time will be saved. Benchmarking is also the tool that helps companies to develop their strengths and reduce their weaknesses. Moreover the process identifies the discrepancy extent between the present performance and the best practices, but also identifies the way in which these practices have been reached. It is obvious that in order to obtain this improvement a set of actions has to be implemented. It is important to know that it is not necessary to identify the best practice in the world in order to have a successful benchmarking. In conclusion benchmarking is neither a strategy nor a philosophy; it is a tool used for developing a company.

CONCLUSIONS

If we draw a comparison between marketing research and benchmarking, we can distinguish the following complexions: in marketing the research has as objective to analyze markets, their segmentation and products impact, while in the case of benchmarking the purpose is to analyze the actions of the best companies in a certain domain (direct approach). Another difference refers to the researched object: marketing tries to find out the customers’ needs while benchmarking studies the methods that correspond to the customers’ needs.

In conclusion:

- Marketing can be benchmarked.
- Marketing should be benchmarked.
- Benchmarking marketing is an effective way to build and protect shareholder value.

Abstract: In most companies, there is ongoing conflict between managers in charge of covering costs (finance and accounting) and managers in charge of satisfying customers (marketing and sales). Accounting journals warn against prices that fail to cover full costs, while marketing journals argue that customer willingness-to-pay must be the sole driver of prices. The conflict between these views wastes company resources and leads to pricing decisions that are imperfect compromises. Profitable pricing involves an integration of costs and customer value. To achieve that integration, however, both need to let go of misleading ideas and form a common vision of what drives profitability.

Key words: decision, pricing, cost.

Introduction

Costs should never determine price, but costs do play a critical role in formulating a pricing strategy. Pricing decisions are inexorably tied to decisions about sales levels, and sales involve costs of production, marketing, and administration. It is true that how much buyers will pay is unrelated to the seller's cost, but it is also true that a seller's decisions about which products to produce and in what quantities depend critically on their cost of production.

The mistake that cost-plus pricers make is not that they consider costs in their pricing, but that they select the quantities they will sell and the buyers they will serve before identifying the prices they can charge. They then try to impose cost-based prices that may be either more or less than what buyers will pay. In contrast, effective pricers make their decisions in exactly the opposite order. They first evaluate what buyers can be convinced to pay and only then choose quantities to produce and markets to serve.

Consequently, costs affect the prices they charge. A low-cost producer can charge lower prices and sell more because it can profitably use low prices to attract more price-sensitive buyers. A higher-cost producer, on the other hand, cannot afford to underbid low-cost producers for the patronage of more price-sensitive buyers; it must target those buyers willing to pay a premium price. Similarly, changes in costs should cause producers to change their prices, not because that changes what buyers will pay, but because it changes the quantities that the firm can profitably supply and the buyers it can profitably serve. When the cost of jet fuel rises, most airlines are not naive enough to try passing on the fuel cost through a cost-plus formula while maintaining their previous schedules. But some airlines do raise their average revenue per mile. They do so by reducing the number of flights they offer in order to fill the remaining planes with more full-fare passengers. To make room for those passengers, they eliminate or reduce some discount fares.

Thus the cost increase for jet fuel affects the mix of prices offered, increasing the average price charged. However, that is the result of a strategic decision to reduce the number of flights and change the mix of passengers served, not of an attempt to charge higher prices for the same service to the same people. Such decisions about quantities to sell and buyers to serve are an important part of pricing strategy for all firms and the most important part for many.

In this chapter, we discuss how a proper understanding of costs enables one to make those decisions correctly. First, however, a word of encouragement: Understanding costs is probably the most challenging aspect of pricing. You will probably not master these concepts on first reading this chapter. Your goal should be simply to understand the issues involved and the techniques for dealing with them. Mastery of the techniques will come with practice.

Determining relevant costs

One cannot price effectively without understanding costs. To understand one's costs is not simply to know their amounts. Even the least effective pricers, those who mechanically apply cost-plus formulas, know how much they spend on labor, raw materials, and overhead. Managers who really understand their costs know more than cost levels; they know how their costs will change with the changes in sales that result from pricing decisions.

Not all costs are relevant for every pricing decision. A first step in pricing is to identify the relevant costs: those that actually determine the profit impact of the pricing decision. Our purpose in this section is to set forth the guidelines for identifying the relevant costs once they are measured. In principle, identifying the relevant costs for pricing decisions is actually fairly straightforward.

They are the costs that are incremental (not average) and avoidable (not sunk).

In practice, identifying costs that meet those criteria can be difficult. Consequently, we will explain each distinction in detail and illustrate it in the context of a practical pricing problem.

Why Incremental Costs?

Pricing decisions affect whether a company will sell less of the product at a higher price or more of the product at a lower price. In either scenario, some costs remain the same (in total). Consequently, those costs do not affect the relative profitability of one price versus another. Only costs that rise or fall (in total) when prices change affects the relative profitability of different pricing strategies. We call these costs incremental because they represent the increment to costs (positive or negative) that results from the pricing decision.

Incremental costs are the costs associated with changes in pricing and sales. The distinction between incremental and nonincremental costs parallels closely, but not exactly, the more familiar distinction between variable and fixed costs. Variable costs, such as the costs of raw materials in a manufacturing process, are costs of doing business. Since pricing decisions affect the amount of business that a company does, variable costs are always incremental for pricing. In contrast, fixed costs, such as those for product design, advertising, and overhead, are costs of being in business. They are incremental when deciding whether a price will generate enough revenue to justify being in the business of selling a particular type of product or serving a particular type of customer. Since fixed costs are not affected by how much a company actually sells, most are not incremental when management must decide what price level to set for maximum profit. Some fixed costs, however, are incremental for pricing decisions, and they must be appropriately identified. Incremental fixed costs are those that directly result from implementing a price change or from offering a version of the product at a different price level.

For example, the fixed cost for a restaurant to print menus with new prices or for a public utility to gain regulatory approval of a rate increase would be incremental when deciding whether to make those changes. The fixed cost for an airline to advertise a new discount service or to upgrade its planes' interiors to offer a premium-priced service would be incremental when deciding whether to offer products at those price levels.

Why Avoidable Costs?

The hardest principle for many business decision makers to accept is that only avoidable costs are relevant for pricing. Avoidable costs are those that either have not yet been incurred or can be reversed. The costs of selling a product, delivering it to the customer, and replacing the sold item in inventory are avoidable, as is the rental cost of buildings and equipment that are not covered by a long-term lease. The opposite of avoidable costs are sunk costs—those costs that a company is irreversibly committed to bear. For example, a company's past expenditures on research and development are sunk costs since they cannot be changed regardless of any decisions made in the present. The rent on buildings and equipment within the term of a current lease is sunk, except to the extent that the firm can avoid the expense by subletting the property.

The cost of assets that a firm owns may or may not be sunk. If an asset can be sold for an amount equal to its purchase price times the percentage of its remaining useful life, then none of its cost is sunk since the cost can be entirely recovered through resale. Popular models of commercial airplanes often retain their value in this way, making avoidable the entire cost of their continued use. If an asset has no resale value, then its cost is entirely sunk even though it may have much useful life remaining. A neon sign depicting a

company's corporate logo may have much useful life remaining, but its cost is entirely sunk since no other company would care to buy it. Frequently, the cost of assets is partially avoidable and partially sunk. For example, a new truck could be resold for a substantial portion of its purchase price but would lose some market value immediately after purchase. The portion of the new price that could not be recaptured is sunk and should not be considered in pricing decisions. Only depreciation of the resale value of the truck is an avoidable cost of using it.

From a practical standpoint, the easiest way to identify the avoidable cost is to recognize that it is the future cost, not the historical cost, associated with making a sale. What, for example, is the cost for an oil company to sell a gallon of gasoline at one of its company-owned stations? One might be inclined to say that it is the cost of the oil used to make the gasoline plus the cost of refining and distribution. Unfortunately, that view could lead refiners to make some costly pricing mistakes. Most oil company managers realize that the relevant cost for pricing gasoline is not the historical cost of producing a gallon of gasoline, but rather the future cost of replacing the inventory when sales are made. Even LIFO (last-in, first-out) accounting can be misleading for companies that are drawing down large inventories. To account accurately for the effect of a sale on profitability, managers need to adopt NIFO (next-in, first-out) accounting for managerial decision making.

The distinction between the historical cost of acquisition and the future cost of replacement is merely academic when supply costs are stable. It becomes very practical when costs rise or fall. When the price of crude oil rises, companies quickly raise prices, long before any gasoline made from the more expensive crude reaches the pump. Politicians and consumer advocates label this practice price gouging, since companies with large inventories of gasoline increase their reported profits by selling their gasoline at higher prices than they paid to produce it. So what is the real incremental cost to the company of selling a gallon of gasoline?

Each gallon of gasoline sold requires the purchase of crude oil at the new, higher price for the company to maintain its gasoline inventory. If that price is not covered by revenue from sales of gasoline, the company suffers reduced cash flow from every sale. Even though the sales appear profitable from a historical cost standpoint, the company must add to its working capital (by borrowing money or by retaining a larger portion of its earnings) to pay the new, higher cost of crude oil. Consequently the real "cash" cost of making a sale rises immediately by an amount equal to the increase in the replacement cost of crude oil.

What happens when crude oil prices decline? If a company with large inventories held its prices high until all inventories were sold, it would be undercut by any company with smaller inventories that could profitably take advantage of the lower cost of crude oil to gain market share. The company would see its sales, profits, and cash flow decline. Again, the intelligent company bases its prices on the replacement cost, not the historical cost, of its inventory. In historical terms, it reports a loss. However, that loss corresponds to an equal reduction in the cost of replacing its inventories with cheaper crude oil. Since the company simply reduces its operating capital by the amount of the reported loss, its cash flow remains unaffected.

Unfortunately, even level-headed businesspeople often let sunk costs sneak into their decision making, resulting in pricing mistakes that squander profits.

Abstract: In most companies, there is ongoing conflict between managers in charge of covering costs (finance and accounting) and managers in charge of satisfying customers (marketing and sales). Accounting journals warn against prices that fail to cover full costs, while marketing journals argue that customer willingness-to-pay must be the sole driver of prices. The conflict between these views wastes company resources and leads to pricing decisions that are imperfect compromises. Profitable pricing involves an integration of costs and customer value. To achieve that integration, however, both need to let go of misleading ideas and form a common vision of what drives profitability.

Key words: decision, pricing, cost.

Introduction:

The third of the five Cs of value-marketing strategies asks managers to communicate the value delivery of their offerings to their target customers.

Distribution strategy

In developing channel strategy, managers have two options to communicate value to their target customers:

"Push" strategies. The focus of communication is on the supplier's next immediate customer. Push strategies are aimed at propelling the supplier's offerings through the channel. For example, some manufacturers of over-the-counter (OTC) drugs and automotive paints do not promote these products directly to ultimate consumers. Instead, they focus on the retailer or auto-repair shops, expecting these channel firms to make the sale to the consumer. Channel firms that carry a variety of competing products may favor push strategies because they permit promoting products that are most profitable to the channel firm (the channel firm's customers frequently do not have strong preconceived preferences). Suppliers often find push strategies less expensive to implement.

"Pull" strategies. The focus of communication is on the end customer or a channel member closer to the end customer. Such strategies are aimed at pulling the supplier's offering through the distribution channel. For example, Intel maintains brand preference by advertising its chips to end consumers with the "Intel Inside®" campaign. The intent is to create a preference for computers with its chips-causing retailers to favor Intel-based computers. Channel members benefit from pull strategies when customers are "presold" for particular brands. Suppliers gain some control over channel firms because it is more difficult for channel firms to switch customers to competing brands.

Push strategies depend on channel intermediaries to carry the value message through the rest of the channel. Pull strategies "presell" the offering to the target customers, who then go to channel intermediaries with brand-specific demands.

Push strategies are essential when the supplier's product and its differential value are not apparent to target customers, or when its value delivery cannot be easily made salient to target customers. For example, most automobile buyers are unaware of the specific machine tools used in the manufacture of their automobile or of the specific brand of paint that covers it. For machinetool suppliers or automotive-paint manufacturers, convincing manufacturer that their products can make automobiles better or cheaper is more effective than trying to convince consumers to buy vehicles manufactured with a specific brand of machine tool or utilizing a particular paint. The main drawback to push strategies is they depend on the

distribution channel to convey the value message to ultimate consumers. In some cases, push strategies may require managers to invest in developing the value-marketing skills of the entire distribution channel or risk having the channel not convey the value theme.

Pull strategies carry the value message directly to target customers. A pull strategy often gives a supplier greater control in communicating value to target customers. Further, pull strategies are often favored by channel intermediaries because they often create "presold" customers, thus reducing the marketing effort required by channel firms. More-exclusive retailers who compete with low-price outlets often prefer suppliers who invest in building brand image. Also, effective pull strategies can provide suppliers insurance against channel intermediaries who try to opportunistically sell competing offerings—customers arrive at the channel firm with strong brand preference.

The choice between "push" and "pull" is usually difficult. Push strategies require both costly incentives for the retail channel partners and limited distribution. In introductory and growth markets, channel intermediaries must invest substantial resources in targeting potential customers and communicating value in return for uncertain sales that may occur considerably later. As a result, suppliers have to share a large portion of their sales price with channel firms as an incentive for the selling effort. In addition, when sales are uncertain or do not follow quickly, manufacturers generally must pay high fees for promotional efforts, such as cooperative advertising and in-store demonstrations.

Given these costs, it would seem that a pull strategy might be preferable, but there are three strong considerations recommending the push approach.

1. *The costs are large* *variable-being* proportionate to the amount of sales and the number of retail distribution outlets. This is a big advantage for a product that is starting out small. The cost of an effective advertising campaign could be prohibitive.
2. *The retailers have pretargeted the market.* In markets where demand is diffuse—few people are potential purchasers—the retailer (who may be a catalog or e-commerce company) has already identified them. Either the target consumers already know where to buy or retailers own a highly coveted customer list. For sales of scuba equipment, aids to the physically impaired and to people interested in do-it-yourself home repair, no advertising outlets exist to reach a majority of the potential buyers. All of the potential purchasers, however, will eventually need to visit a retailer or web site, or read a catalog which, given an adequate incentive, can promote the product.
3. *The retailers or others in the chain "augment" the product.* Few people would pay the prices for Mary Kay cosmetics if they were available on a rack in a drug store. The value is in the Mary Kay experience of being "made up" in the privacy of home. Mary Kay creates that experience with a team of independent distributors who are motivated by, among other things, high margins.
4. *Pull strategies require sophisticated marketing,* expertise that a firm may lack. Managers must know not only who might buy their product, but also understand why. They must connect their offerings to benefits and offerings that these target customers find salient, which may be difficult when channel firms augment the offering in a way that hides the supplier's components, and they must create messages that can be indirectly communicated convincingly in limited space or time.

Still, in most mature mass markets, pull strategies are preferred. They are cost-effective for high-volume, mass-marketed products, and they give the seller control over the message. Moreover, the mass-market channel partners like Wal-Mart, grocery chains, and drugstores prefer pull strategies despite lower margins. They make their money-moving inventory efficiently, not by selling. Moreover, a pull strategy creates a stronger brand identity that increases loyalty.

Pull strategies are an effective counter to brand competition for channel attention. When multiple brand competitors are competing for the same customers, opportunistic channel firms will play them against each other to extract higher margins and fees. Brands that are large enough to support the cost of a pull strategy can undermine the opportunist's ability to do this. Because customers are presold on the supplier's brand, an attempt to switch them to a competing product is more difficult.

Pharmaceutical manufacturers, which traditionally used only push strategies, have in the United States adopted the pull approach for some products. Managed-care practices have encouraged substitution of branded pharmaceuticals with generic products and have discouraged prescribing "quality-of-life" drugs—such as nonsedating antihistamines and drugs for treatment of erectile dysfunction—that have no effect on overall health. The pull strategy educates patients to ask for these drugs by brand name.

Even some suppliers of materials that are not apparent in the finished good have developed "branded ingredient" pull strategies. W. L. Gore, Inc., uses such a strategy to promote Gore-Tex™ apparel, even though W. L. Gore does not manufacture apparel. Similar strategies have been developed by Du Pont (Stainmaster carpet), Intel ("Intel Inside"), and G. D. Searle (NutraSweet in foods and beverages). Branded-ingredient strategies are a special type of pull communication strategy in which a component not immediately transparent to the end user can be linked to benefits and value the target customer highly desires.

The selection of the appropriate channel communication strategy (push or pull) has a strong impact on successful pricing-strategy implementation. This impact is manifested in the ability of suppliers to communicate their value delivery to target customers.

The organizations multidimensional problems can be reduced to an approaching in one dimension. The reductionism that is a heir of the Descartes' system is opposed to the concept of global system, understood as a result of a systemic reflection.

Some other thinkers are placed in the same context , like the biologist P.A. Weiss who asserted that not always "one plus one is two", according to a system parts' complementariness. R.A. Ackoff proposes a radical change within us regarding the thinking modules and our ways of understanding the reality. Paul Valery, by analyzing the method of Leonardo da Vinci, proposed a more suggestive method of environmental perception: the one who represents a tree must also represents the sky and the earth for seeing and keeping it. It is an almost sensitive logic, but also unknown.

The knowledge object must be perceived as an inserted, active force that is sunk in a greater whole. This global vision will allow us to approach the organization as a system, the interactions between actors as within a competing system

We must admit that everything is changing. There are fields within which the Taylor's spirit influences the decision makers' behavior (the management control, the budgets) where every deviation from normality is considered an anomaly.

The wish for order and for the achievement of that was forecast is found at every manager. Disorder and objectives missing are difficultly accepted. Every thing is perfect, only there is a "but".

This "but" is determined by the many competing and social instabilities that must be taken into account and that are making from the change the living rule of every organization. The society can be changed by decrees and laws. Every organization must develop a culture of changing , if not it is unable to face the crises created by internal and external factors.

The developing of the (strategic, organizing, sizing etc.) culture of changing makes from the change a normal variable of the company decision making process.

By vulnerability we understand the possibility of being attacked or hurt. In this sense, every company is vulnerable because its success depends on its field competitors attitude and on its environmental change adapting capacity. The idea of vulnerability is analyzed in risk terms and is the main appreciating criterion of every strategy. The strategic vulnerability regards the firm position in its competing environment:

"When a company realizes its diagnostic regarding the forces that are influencing the competition in its field and their deep causes, it is in measure to identify its forces and weaknesses in relation to the rest of its sector. At strategic level, the forces and weaknesses that are identified are regarding the firm position related to the identified causes of each force of the competition. What is the firm situation related to the products that must be substituted , related to the entrance barrier, in facing the established competitors.

Push strategies are essential when the supplier's product and its differential value are not apparent to target customers, or when its value delivery cannot be easily made salient to target customers. For example, most automobile buyers are unaware of the specific machine tools used in the manufacture of their automobile or of the specific brand of paint that covers it. For machinetool suppliers or automotive-paint manufacturers, convincing manufacturer that their products can make automobiles better or cheaper is more effective than trying to convince consumers to buy vehicles manufactured with a specific brand of machine tool or utilizing a particular paint. The main drawback to push strategies is they depend on the distribution channel to convey the value message to ultimate consumers. In some cases, push strategies may require managers to invest in developing the value-marketing skills of the entire distribution channel or risk having the channel not convey the value theme.

Pull strategies carry the value message directly to target customers. A pull strategy often gives a supplier greater control in communicating value to target customers. Further, pull strategies are often favored by channel intermediaries because they often create "presold" customers, thus reducing the marketing effort required by channel firms. More-exclusive retailers who compete with low-price outlets often prefer suppliers who invest in building brand image. Also, effective pull strategies can provide suppliers insurance against channel intermediaries who try to opportunistically sell competing offerings—customers arrive at the channel firm with strong brand preference.

The choice between "push" and "pull" is usually difficult. Push strategies require both costly incentives for the retail channel partners and limited distribution. In introductory and growth markets, channel intermediaries must invest substantial resources in targeting potential customers and communicating value in return for uncertain sales that may occur considerably later. As a result, suppliers have to share a large portion of their sales price with channel firms as an incentive for the selling effort. In addition, when sales are uncertain or do not follow quickly, manufacturers generally must pay high fees for promotional efforts, such as cooperative advertising and in-store demonstrations.

Given these costs, it would seem that a pull strategy might be preferable, but there are three strong considerations recommending the push approach.

Conclusion

In markets where demand is diffuse—few people are potential purchasers—the retailer (who may be a catalog or e-commerce company) has already identified them. Either the target consumers already know where to buy or retailers own a highly coveted customer list. For sales of scuba equipment, aids to the physically impaired and to people interested in do-it-yourself home repair, no advertising outlets exist to reach a majority of the potential buyers. All of the potential purchasers, however, will eventually need to visit a retailer or web site, or read a catalog which, given an adequate incentive, can promote the product.

An efficient strategy regarding the competition involves offensive or defensive actions that aim to place the company into a supportable situation related to the five forces of the competition.

As an outcome, the company management must permanently appreciate the firm vulnerability degree and evaluate the resulting risk and everything related to the life expectation and the profitability expectation as these ones are defined in its objectives.

Customer satisfaction, one of the central marketing objectives, is closely linked to customer loyalty, the likelihood of recommendation to others, cross-buying behavior, up-grading and lower price sensitivity.

Price satisfaction is a complex construct consisting of several dimensions, i.e. price-quality ratio, price fairness, price transparency, price reliability and relative price. These dimensions constitute the determinants of price satisfaction, and consequently their satisfaction and relative importance should therefore be measured continuously.

Prices, Banking, Customer satisfaction

The purpose of this paper is to explore the dimensionality of price satisfaction. It argues that price satisfaction is composed of several dimensions (price transparency, price-quality ratio, relative price, price confidence, price reliability, and price fairness) and that companies should consider these dimensions when monitoring customer satisfaction.

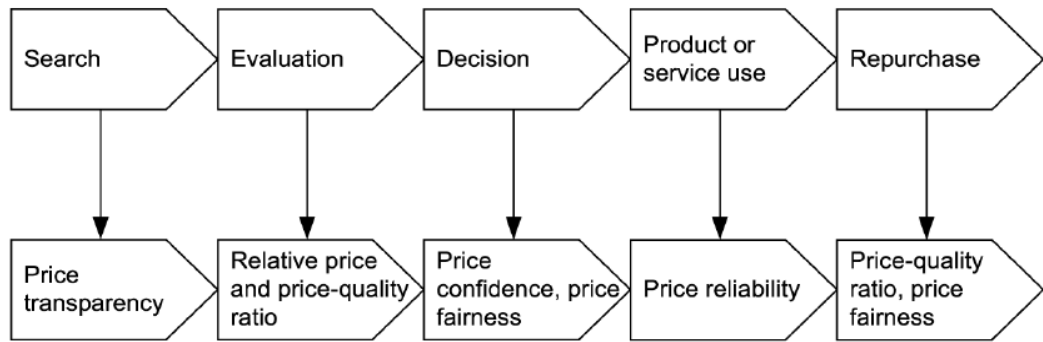

Money-back guarantees, fixed prices (e.g. everyday low prices), honest pricing (i.e. price fairness) and customer advocacy (e.g. giving the customers open, honest and complete information on products and complex fee structures to finding the best product for them) are some of the tools aiming at increasing satisfaction with pricing policy and with the company's offer.

Buyer perception and processing of price information is of central and continuous interest to marketing researchers and practitioners. One research stream assumes that customers hold an internal reference price which serves as a standard against which newly encoded prices are compared

A nominal price is meaningful to the consumer only after an evaluation (e.g. as “inexpensive” or “expensive”), and such evaluations are the result of a comparison of the price with a prior standard, i.e. the internal reference price.

Companies that deliver higher value to the customers are more likely to satisfy them and to increase their loyalty. Customer value can be defined as “a consumer's overall assessment of the utility of a product based on perception of what is received and what is given”, thus there is a “get” and a “give” component in the equation. Whereas the “get-component” (i.e. quality) is much researched and well understood, little is known about the “give-component.” In order to satisfy customers, their needs with respect not only to the product (i.e. the get-component) but also to the give-component (i.e. the price) should be understood and satisfied. In German customer satisfaction research, some scholars have recently suggested that price satisfaction should be considered as a multidimensional construct and that several dimensions influence overall satisfaction with price and, in turn, customer satisfaction and its behavioral outcomes. They argue that from the customers' point of view, price problems and, in turn, price needs are very complex within the different stages of the decision making process, requiring therefore a more differentiated examination. Diller (1997, 2000) refers to the different stages of consumers' decision making processes in order to analyze which price dimensions affect global price satisfaction within the respective stages. From the customer's point of view, price problems will differ within the different stages (Figure 1). In the search phase, customers need information on the quality and price of the offers. Customers will experience search costs.

Phases in the decision process

Customer needs related to pricing

Source: Adapted from Diller (1997)

Therefore, price transparency will be an important dimension. When offers are compared and evaluated, the level of the price and the price-quality ratio, as well as price fairness of the offers, will be important. After purchase, customers will compare the price paid with the expected price, especially when the price is known only after consumption, as often occurs with services (e.g. consulting, telecommunication fees, banking fees). At this stage, price reliability (i.e. price promises are kept, price changes are communicated properly and promptly), hidden costs and price fairness will be important aspects of pricing policy. Diller (2000) arrives at five dimensions of price satisfaction (relative price, price-quality ratio, price transparency, price confidence and price reliability) which are supplemented by Matzler (2003) with price fairness as a separate dimension. These six dimensions are described below. However, customers do not form price expectations towards all these dimensions in every consumption situation. The number and complexity of price expectations depend primarily on the customers' price interest.

This price interest is determined by several factors, e.g. factors that influence price sensitivity and product or brand involvement. Involvement has an impact on whether the customer exerts a great amount of cognitive effort in thinking about the product or service. In the context of satisfaction, low involvement will result in limited information processing with little formal search and evaluation. As a result, only a few price dimensions will be relevant. When customers feel a high purchase risk, they will make complex purchase decisions. In that case, more price expectations will be relevant, when compared to limited decision-making or inertia decision-making.

Price transparency

Increasing access to information, access to more alternatives, more simplified transactions, increasing communication between customers and a general distrust and resentment among customers are five trends that increase customer power. As a consequence, customers will increasingly demand open, honest and complete information on products and prices. Thus, price transparency can be considered as an important aspect of pricing policy. Price transparency exists when the customer can easily get a clear, comprehensive, current and effortless overview about a company's quoted prices. As a consequence of a high price transparency, customers' search and evaluation costs will diminish, which should lead to higher price satisfaction. Several companies have installed software-based advisors which help the customers get all the product- and price-related information they need for their buying decisions. In the banking industry, some innovative credit unions have experimented with web-based tools that help customers to select mortgages, loan programs, deposit accounts, etc. These programs aim to give open, honest and complete information on products and prices and, as a consequence, to build trust, and their experience shows that these programs are highly effective at increasing satisfaction, trust and sales.

Price-quality ratio

Consumers describe value to a product or service subject to their perception of two factors: perceived price and perceived quality, or, in other words, the price-quality ratio. If perceived quality exceeds perceived costs, customer value is high, if cost exceeds quality, customer value is low. In the literature, several definitions of customer value exist. One of the most widely used definitions stems from Zeithaml (1988). She defines perceived value as “the consumer’s overall assessment of the utility of a product based on perceptions of what is received and what is given” (Zeithaml, 1988) and Monroe (1990) argues that “Buyers’ perceptions of value represent a trade-off between the quality of benefits they perceive in the product relative to the sacrifice they perceive by paying the price.” These definitions have in common that they see customer value as a multi-dimensional construct which includes monetary and non-monetary components such as psychological effort, search costs and time. The central role of customer value as a purchasing determinant as well as in post-purchasing processes is well recognized, and the relative impact of quality and price on customer value has been the focus of several theoretical and empirical studies.

Perceived performance has a stronger impact on satisfaction when there is price-performance consistency, whereas price has a greater impact when there is a price-performance inconsistency. In any case, a favorable price-quality ratio (i.e. high customer value) will enhance customer satisfaction and in turn loyalty. Hence the perceived price-quality ratio has a direct influence on price perceptions and, in turn, on price satisfaction. When the price-quality ratio is favorable, customers will be satisfied with the price.

Relative price

If customers have price comparisons available during the decision-making process, they will compare the price of the product or service with that of the competitor, and the outcome of this comparison process will directly influence price satisfaction. The price of the product compared to that of the competitors is labeled here as relative price. The importance of relative prices is well recognized in theory as well as in practice. A vast body of literature studies the effects of price comparison and the effects of comparative price claims on consumers’ perceptions of a comparatively priced product’s pricing and value. It can be expected that the relative price of an offer directly influences satisfaction with the price and, as a consequence, satisfaction with the offer.

Price confidence

Price confidence addresses the question to what extent the consumer believes that an offered price is currently favorable. The more confidence customers have in the superiority of an offer, the higher the satisfaction with price will be. Obviously, price confidence is related to price transparency, price-quality ratio and the relative price, as customers will be confident only if they are able to evaluate an offer (which requires transparency of price and quality) and if this offer is favorable. The customers do not always process price information actively and extensively. Their price confidence might be a rather subjective perception than a result of extensive information processing. Therefore, it can be understood as a separate dimension of price satisfaction.

Price reliability

Whereas price confidence refers to the consumers’ belief that a price is favorable, price reliability can be understood as fulfillment of raised price expectations and the prevention of negative surprises. Customers will perceive high price reliability if there are no hidden costs, if prices do not change unexpectedly. If prices change, customers should be informed properly and in a timely manner, in order to build trust and maintain a long-term relationship. Studies show that practices like demand-based pricing, such as dynamic pricing, are generally considered unfair by consumers, and that they are harmful to trust building. In many industries (e.g. cell-phone operators, rental car companies) hidden pricing is a common practice and it is generally assumed that such tactics are a good idea. Companies announce a “low” price while hiding various charges in the fine print. In the long run, however, such practices are harmful, not only for the customers who are frustrated when they find out what the product or service really costs, but also to the whole industry as they induce unfair price competition.

Price fairness

In the literature it has been found that perceived price fairness or unfairness is one psychological factor that has an important influence on consumers' reaction to prices. Consumers are not willing to pay a price that is perceived as unfair. Consumer reactions can result in boycotts, civil actions or in lower sales. Two aspects of price fairness can be differentiated:

- price-quality ratio as it is perceived by the customer; and
- the correlation of a product's real price and its socially accepted price or the price of a comparative other party .

A company that puts the customer at a disadvantage – e.g. because of its own position of power or the emergency situation the customer might be in – offends against social norms. Such behavior is considered to be unfair. In our context, the price-quality ratio has been considered to be a separate dimension of price satisfaction. Therefore, we limit the discussion on price fairness to this second aspect. What consumers perceive as a socially acceptable price depends on several factors. Consumers form judgments by comparing their investments (e.g. price paid) to the benefits (quality) they receive. Buyers seem to compare their gains to the gains of the exchange partner. If customers think that the seller earns exceptionally high profits the exchange will be perceived as unfair. Moreover, buyers perceive an exchange as unfair if they discover that other buyers who are in an exchange relationship with the same seller got a lower price for the same product.

The latest studies found that price-quality ratio and price fairness were more important to customers than relative price. This means that a bank should focus more on delivering the right quality at the right price and on treating the customers fairly than on focusing on competitors' prices. It is also interesting to note that the relative importance of the dimensions as drivers of overall price satisfaction, word-of-mouth and switching intentions differ, which means that dissatisfaction with a specific price dimension can lead to dissatisfaction with the overall price (e.g. price fairness) but not necessarily to a termination of the relationship. Overall, treatment of price satisfaction as a multi-dimensional construct seems to be an interesting and necessary extension of the existing customer satisfaction and price reality.

Abstract: In our days society confronts itself with an important series of transformations, in what involves the manner in which organizations can communicate with their target public. We can discuss about radical changes that appear in the way of transmitting messages to the stakeholders, taking into account the importance and the role of public relations, especially of marketing events concomitant with lowering of the advertising power. In Europe, a larger number of companies are starting to implement activities of marketing events. The Marketing of events has an impact on the environment in which the company is developing: the internal public of the company (employees, the management team, shareholders) but also on the external public of the company (contractors, clients, competitors, state organizations, the press, nongovernmental organizations).

Key words: marketing communication, public relations, events,

The appearance and evolution of marketing events

It can be said on a good motivation that the events appeared at the same time with the forming of tribes, and even if they were preparing to hunt, to fight, to celebrate different occasions, they evolved and expanded together with humanity.

In what involves the public communication we have as historic reference points from the times of Greece and Ancient Rome when the sports and cultural events were used in political purposes, at which assisted over 50 thousands people at the Colosseum and 250 thousands at Circus Maximus, the product being the offering of amusement to the mass of people, but the objective was to attract the votes and sympathy of the people. So the Roman emperors offered the crowd “panem et circenses” upgrading the ludic need to the rank of primary need; with an old tradition of 2000 years in China, the Dragon Boat festival, which commemorates the poet and minister of the state Chu, from the first feudal dynasty of China, Qu Yuan (340 – 278 B.C.), but it represents at the same time a chance for the Chinese people to chase away the diseases and to strengthen their bodies, it is celebrated every year on the fifth day of the fifth month, and it still remained even in our days one of the most important festivals. The races represent the most exciting parts of the festival, the boats were painted in lively colors and they are called dragon boats because the front sides as well as the back side have the shape of a traditional Chinese dragon. The festival is celebrated in China, Hong Kong, Macao, Taiwan but also in some minorities from China settled in Japan, Great Britain, Vietnam that continue this tradition, in the last 25 years the dragon boat races have been adopted also in countries from Europe, North America, Australia or Africa becoming in this way an international sport extremely popular, the number of those who assist at this festival reaching often 50

million people.

In what involves fairs, conferences, exhibitions positions, a vital role was played by the commercial and artisan's associations, which provided the structures that lead to such events. It can be stated that these organizations had helped in the evolution of fairs, conferences and expositions. Even from Middle Age and the employment system in Europe, the associations gave the people a reason to come together having common interests and goals.

The sociologist Ferdinand Tonnies described the preindustrial society called *Gemeinschaft* – community, as being a type of organization in which people were connected through a series of social unity factors, like relative relations, traditions or friendship. In other words, the associations are incubators for any type of events, serving to the countless purposes for which these associations exist. Among their functions there can be underlined the following:

1. for establishing the industrial standards; for influencing the legislative and political businesses
2. the improvement of the relation between employers and employees
3. the building up of some scientific knowledge by publishing books and articles; the dissemination of general information
4. the defining of industries and professions through demography, the involvement of them in events; the possibility of having a bigger power during the process of purchasing products, services
5. the creation and maintenance of social relations; the carrying out of some public services
6. the professional development and growth of members; education and trainings
7. the development of some public positive relations; the delivery of opportunities for groups to travel; the achievement of some industrial and professional fairs;
8. the implementation of some amusement programs, the building of networks and interaction between people who have the same interests.

These are just a few of the functions that associations can have, they had a bigger role defining and identifying marketing events as being a self standing profession. Associations consider their proper events as being the critical function because of the gathering of members at that specific event and which can personify in this manner the corporatist culture, because the competition for the members' money and time are to important to consider it otherwise. Marketing events were transformed from an ad hoc organization into a scientific discipline on which the association's existence itself depends. The association's community has also guided other types of innovative and creative events to draw participants and the recognition from the public.

Corporatist meetings, civil celebrations, religious feasts, reunions, sport events, fund raising balls, scientific and technical symposiums, the launching of some new products, services, parades, awarding of prizes and official dinners – all have benefited from the principles of marketing event.

The Definition of Marketing Events

The communication in marketing represents a relatively new concept, appeared in the last decades of the twentieth century, as a consequence of the spectacular evolution which the marketing has encountered in this period. The novelty of the concept, as an extremely complex character of reports which are established in the framework of the marketing communication system, have made it possible so far the fact that it has not been reached a consensus of opinions, specialists have different points of view regarding its content.

From a etymological point of view, the noun “communication” derives from the Latin word “comunicatio”, which means sharing, conversation; likewise, the verb to communicate derives from the Latin word “comunico”, meaning to make common, to share with somebody, to be in connection with.

Therefore, communication – defined in the Romanian Explanatory Dictionary (DEX) as being the action of communicating its result – represents the approach of making something common, of sharing ideas, thoughts, information, attitudes. This presumes that the transmitter and the receiver of the message must be found on a common ground, so that between them there is established a real connection, with double sense. The communication efficiency is conditioned by the understanding of the transmitted message and by the receiver's adoption of the attitude wanted by the transmitter as an answer to the message.

Congruent to the Romanian Explanatory Dictionary (DEX) - the events are important happenings, acts of great significance. The Dictionary of Marketing Integrated Communication defines the media event – as being the type of event in which the communication initiative belongs to the public relations that mainly resort to publicity, also including here the possibilities to take photographs, to film; and the press event – action designed to create opportunities of photographing the object of the meeting.

The Terminology Glossary M.I.C.E. defines the event as being “(a) portion(s) of a meeting”, “a component of a meeting” and “meeting” as “a general term indicating the coming together of a number of people in one place, to confer or carry out a particular activity. Can be an adhoc basis or according to a set pattern”, “a general term indicating the gathering of a number of people in one place, to carry out and finalize a specific activity. It can be adhoc or planned, ”Therefore, the English term “meeting” is used in a generic sense as the Romanian word “event”.

As a conclusion I can say that marketing events can be defined as a modulus through which different governmental organizations, non-governmental, profit and nonprofit can use the communication through event to transmit a message to the external public, represented by the shareholders but also to the internal public, represented by the employees.

There are both strong and weak points of the communication through events:

- - amongst the strong points we can count : the circulation of messages to other market segments besides the ordinary customers like opinion leaders, being more credible than the communication through traditional publicity, having many times lower costs;
- - and as weak points, we can underline the absence of control of how the average of the specific event will be covered and it is really difficult to measure its impact.

Either if we are talking about a conference, or an agreement, banquet, the launching/re-launching of a product/service, exhibition, fair, meetings, or various occasions there are three essential elements for the success of any event:

The three E-s of Marketing Events are:

- a) Entertainment
- b) Excitement
- c) Enterprise

Entertainment – amusement is, nowadays, available everywhere in our society. A few years ago, people had to make a big effort to participate in sport competitions, to go to the theatres, cinema, having to leave home so that they could take part in that event. But now they are fed up with the methods of conventional entertainment that they own of in their houses, like: television, internet, radio. For being successful, the event that you want to promote has to be different, unique and it has to address especially to the target segment, so that those people would be determined to leave their houses.

Excitement – delight, it could seem intangible, but it is real, being a key element for an unforgettable event. The delight can be generated by the main element of attraction of that specific event: the famous music band, the fabulous party. Many marketers miss the opportunity to promise the delight for that specific event, for its promotion. The delight could mean the launching of a new brand and logo at a sale fair or at a company’s anniversary.

Enterprise – enterprising, being defined by the Webster’s Unabridged Dictionary as a person who is “prepared to assume risks or to try something unique, to have energy and initiative”.

The place and role of Marketing Events

Taking into consideration the fact that the advertising volume coincided with a decrease of its efficiency, and all studies about advertising efficiency have reached the same conclusion: with the existence of a larger quantity of advertising in a given environment, we have an increase in the inefficiency in each ad. The studies show that not only the volume of advertising has increased, but also the advertising costs, that have increased faster. It resulted that a high volume reduces efficacy, and the increasing costs reduce the advertising efficiency. Advertising is perceived as being something imposed by the potential buyer, in comparison with the Public Relation actions that are much more credible and less expensive, being able to easily reach towards the targeted audience, so that the brands could be built-up.

Events represent a section of Public Relations, being one of the ways through which a profit or non profit

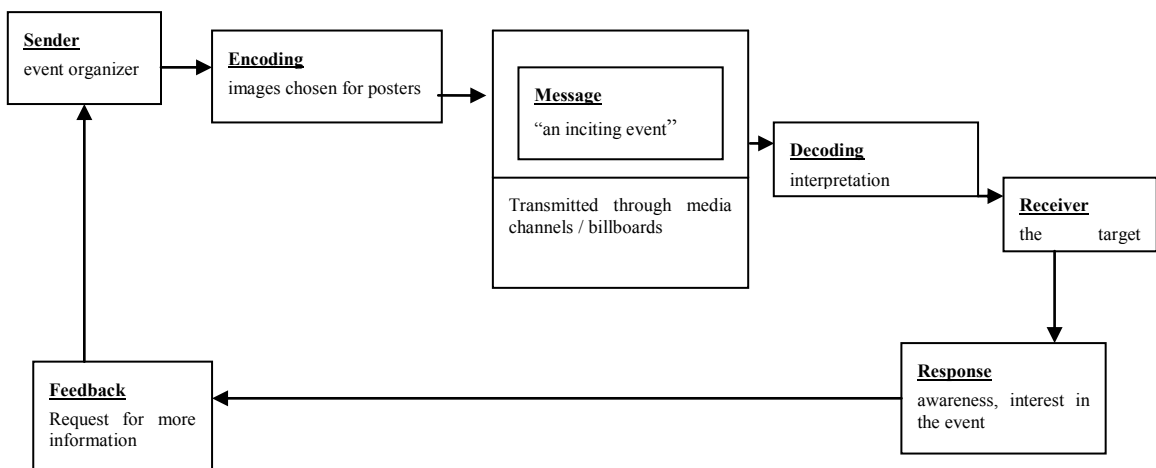

organization can communicate especially with the stakeholders and in general with the open public. Public Relations are essential in nowadays complex world for facilitating the communication and the agreement. They involve research, analyses, political adoption, programming, communication and feedback from a diverse public category. To Public Relations are given the following definitions, the most used are underlined below:

An event can be transformed into a communication environment only in the proportion in which it is exploited by the organization in promotional purposes. In the internal or external environment of any organizations there are many opportunities which the marketing managers should accordingly know to turn to account the objectives in concordance with the global strategy of marketing, tool. In what involves the achievement of communicational objectives, the organization can orientate itself to the usage of promotional event, having the possibility to choose, between multiple alternatives which the technique offers, that or those which are the best integrated in its communicational strategy. Practically, the efforts of such nature ca be pointed either in the exploitation sense of the existing events, or in the purpose of creating special events, where the advantage consists of the fact that the created event represents a perfect support adapted to the communication objectives, capable of transmitting the best conditions of the wanted message to the aimed targets, at the same time, the unique character of the event concedes originality, increasing in this manner the public impact.

The event audience must be a part of the market segment of that specific brand. The event must possess in the wanted image and also it must be capable to create the desired effects within the market segment. An "ideal" event is the one that:

- a) Its audience is formed by the market segment to which the organization addresses
- b) Generates favorable attention
- c) It is unique but it is not sponsored by many other organizations so that the brand imagine could be a distinctive one, many times the organizations that have a financial power prefer to be the main sponsor of the event
- d) That supports the marketing activities of the organization and brand
- e) Which reflects or increases the image of the organization and brand

In what involves the communication process with the help of the events there can be noticed the following formula:

The Communication System

[from Fill C. Marketing Communications: Contexts, Strategies and Applications; Pearson Education; 2003]

In general the organizations that want to communicate through event follow the achievement of the next objectives:

1. The identification with a market segment: the customers being segmented from the geographical point of view, demographic, psychographic or behavioral point of view, depending on the event.
2. The increasing of a company or brand's notoriety: events patronage offering the possibility of exposure in what involves the brand or organization.
3. To create or to strengthen the customer's perception about a brand, but also to enlarge the dimensions of the organization's image: the improvement of perceptions that the organization is pleasant and impressive.
4. To involve themselves in the community and country's social problems where the organization has its business, through the organization of balls for fund raising.
5. To cheer up the important clients and to remunerate the employees, through the organization of events, like parties where the employees should be awarded with different awards consisting in products or services.
6. To allow the merchandising and promotional opportunities usage when an event takes place.

The people who receive the information and buy products/services migrate, nowadays, from traditional to on-line media; a greater number of them are accessing the desired news from specialized sites and from mobile devices, anywhere and anytime. The fast adopting of new technologies affects – and transform – manufacturing, distribution and consume, but to optimize on-line channels is necessary to act objectively, and to found the decisions on performance key indicators. In the process of adapting to these market changes, the marketers have the opportunity to reach a different audience through on-line and mobile instruments. This approach based on real data, facilitated by web analysis, helps companies to focus the efforts and to have success with the new offer versions.

Keywords: digital marketing, blog, mobile marketing, interactive television

1. General considerations about digital marketing

Digital Marketing promotes products and services using digital distribution channels to reach consumers in a manner relevant, personal and cost-effective. Digital marketing includes many of the techniques and practices contained within the category of Internet Marketing. More, it extends beyond this by including other channels with which to reach people that do not require the use of the Internet. As a result of this non-reliance on the Internet, the field of digital marketing includes a whole host of elements such as: mobile phones, SMS and MMS, display and banner ads, digital outdoor. In our present days, digital marketing covers more of traditional marketing areas such as Direct Marketing by providing the same method of communicating with an audience but in a digital way. This marketing method is more effective when a marketer combines multiple channels in the message campaigns.

There are two different forms of digital marketing, each of which has its pros and cons, the most important of them being shown in the next table (Table no. 1) (<http://en.wikipedia.org/wiki>).

***Pull** digital marketing involves the user having to seek out and directly grab (or pull) the content while push digital marketing involve both the marketer (creator of the message) as well as the recipients (the user), the marketer having to send (push) the messages to the users (subscribers) in order for the message to be received.*

Advantages and disadvantages of the digital marketing

Table no. 1

	<i>Pull digital marketing</i>	<i>Push digital marketing</i>
<i>Pros:</i>	<ul style="list-style-type: none"> • No restrictions in terms of type of content or size as the user determine what they want. • No technology required to send the content, only to store/display it. • No regulations or opt-in process required. 	<ul style="list-style-type: none"> • Can be personalized -- messages received can be highly targeted and specific to selected criteria – like a special offer for females, 21 years old or over and living in California. • Detailed tracking and reporting – marketers can see not only how many people saw their message but also specific information about each user such as their name as well as demographic and psychographic data. • High Return on Investment (ROI) possible – if executed the right way, push messaging can help drive new revenue as well as brand reinforcement.
<i>Cons:</i>	<ul style="list-style-type: none"> • Considerable marketing effort required for users to find the message/content. • Limited tracking capabilities – only total downloads, page views, etc. • No personalization – content is received and viewed the same across all audiences 	<ul style="list-style-type: none"> • Compliance issue – each push messaging technology has its own set of regulations, from minor (RSS) to heavily controlled (email and text messaging) • Requires mechanism to deliver content – the marketer has to use an application to send the message, from an email marketing system to RSS feeders. • Delivery can be blocked – if the marketer does not follow the regulations set forth by each push message type, the content can be refused or rejected before getting to the intended recipient.

Each of the two types of digital marketing mentioned above leads to different variants. Within *pull marketing* category, blog marketing, advertising and personal interactive television and smart ads are worth mentioning, whereas mobile marketing, text messaging marketing, multimedia marketing and broadcasting of the latest news go into the *push marketing* category.

1. PULL Digital Marketing

1.1. Blog marketing

This activity refers to the fact that certain people, who have gained enough experience or researchers choose to make their study, ideas, thoughts, reactions and dilemmas public, by writing either a weblog accessible to everybody or one with restricted access, set for confidential issues.

A blog is a web page with a frequent set of posts on a subject or a variety of subjects, which, more often than not, contains links to other Internet sites. They are organised in a reversed chronological order, the latest one coming first on the page.

The best blog audience is, in fact, the very makers of such diaries. Besides the fact that they are interested in what the others write, pointing that thing out in their own blogs, they also refer to those posts. The number of bloggers is steadily rising, since software devices come to be more and more accessible. On-line blogs have witnessed an important evolution lately, up to 72 millions, according to a Technocrati study, the Internet search engine specialized in blogs.

In March 2005 there were almost 8 million blogs, whereas in March 2007 their number increased ninefold, up to 72 million on-line bloggers. Nowadays, 120,000 blogs are designed daily, as compared to 25,000 in 2005. (www.hotnews.ro).

As to the business field, one can benefit from using blogs so as to transmit information on supply and demand. As a result, both clients and immediate feedback can be won. New methods of efficient marketing include the making up of some “viral” companies, focused on the customer’s needs, as well as challenging programs and competitions, which are meant to help them disseminate further information. Specialists claim the management of a company can learn a lot by reading blogs. Thus, they can have feedback information as to what their customers and noncustomers think about the business they run.

We honestly believe that blogging can help each core fragment of what makes up a successful and viable company. The core needs for any business are as follows: decent ideas; a great product; visibility; a well-trained team of people who work hard to make the company succeed

1.2. Advertising and Personal Interactive Television

The boost in high frequency band satellite television and IPTV, the fact that broadcasting mobile services will be the next important trend in mobile communication and the growing popularity of peer-to-peer sharing of video files, lead to the advent of new advertising patterns, highly competing with the classical video (Roxana Onea, www.comunic.ro).

Thus, television is becoming a more and more personalized environment, allowing a clear perception of the customers' preferences. As users have more and more control over the type of advertising they want to watch, their opinions will be of uppermost importance, thanks to technology. The main reason for which television channels should broaden their horizon provided they want to stay relevant for advertisers is the customers' possibility to choose more and more from what they want to watch, the time of their watching and the device the chosen program would be on.

Specialists in advertising wish the relationship between them and television channels would change, given the new content broadcasting policy, fighting for the viewer and demand services which allow the viewer to skip advertisements. As the content already including advertisements targets mobile phones, brands and entertainment providers have started to appreciate the value of a complex multimedia advertisement within programs.

Another possible business pattern can be the use of these demand services as a means to manage a research on a far away market in order to check people's interest in new products, a very quick and cost effective way to get the right feedback from would-be customers.

On the other hand, integrating interactivity offered by SMS service within television programs outside peak hours can lead to significant profits coming from the viewers who pay while sending messages from their mobile phones, since they want to have fun, personalize products, get access to games and socialize.

Digital interactive television services developed unevenly during the last year. In some countries, their diffusion rate went beyond 90% by the end of June 2007. Most of the EU members handed in National Plans to the European Commission, shifting from analogical broadcasting to the digital one, having the year 2012 as deadline, some others established terms later than 2012. And still, there are also member states which have not yet handed in the National Plan concerning the shift from analogical to digital television to the European Commission. (www.euractiv.ro).

"U" is the first interactive television in Romania and, besides Unite – clubbing and events brand – and www.utv.ro it is part of the New Trend Media Company, belonging to the UTI Group. "U" first broadcast in Romania on the 9th of April 2005. The strong points of the U brand are: attitude, quality music – Romanian and international hits, dynamism, innovation, and, last but not least, "U" stands for fun. The target audience of this channel is the 15-29, up to 35 year olds. (www.hotnews.ro).

1.3. Smart advertisements on the web

In order to back a marketing system based on Internet, the pay-per-click network (PPC) was brought into play, and the one developed by Google is a good case in point. The text models on the right side of the main slide of the application entail two changes in the traditional relationship between editors and advertisers: the latter pay only when advertisements are on and the viewers click on them; the paid research networks draw a distinction between advertisers and editors (advertisers no longer get space on the editor's site in exchange of payment for key words).

For a better knowledge of its public the advertisements on Internet (based on software) can contain further information on: the targeted public, the money advertising companies are willing to spend to get to that audience rate (including the cost of each click), which sites are accepted and which ones are banned etc.

2. PUSH Digital Marketing

2.1. Mobile marketing

On a well-developed market, operators have to face the pressure of finding new opportunities for earnings drift, so mobile marketing could be the very solution.

Since entertainment and advertising business are overlapping more and more, the idea that brand marketing should be budgeted for purchasing mobile content has gained ground lately (Roxana Onea, www.comunic.ro). Advertisers have to find new ways of making their brands and messages known to a public whose expectations are higher and higher, thanks to a boost in information. The old-fashioned pattern, which meant direct coverage to its customers no longer, seems efficient, while advertising agencies are interested in entertaining their customers with a challenging content. At the same time, mobile services providers are, more often than not, concerned with drawing into more and more customers, all paying for their content. It will all be each brand's concern to create catchy advertising content which subscribers would like to save, send to friends all over again, turning it into something vital.

Mobile marketing offers an important means for building up cooperation relationships, since specialists in mobile marketing use SMS text messages and MMS multimedia messages to get to their users by means of one of the most personal devices, namely the mobile phone. One can notice this trend both among the newcomers on the market, but also among the already existing companies, which add voice options to computer devices. America Online, Apple, Google, Microsoft or Yahoo has added voice services to instant messaging users. E-Bay purchased the pioneer in IP-Skype phoning for 2.6 billion dollars. More than that, Skype, whose technology allows vocal calls for prices representing a small fraction of traditional services costs, has also added video calls to its services.

Mobile phones have endless uses within the current socio-economical background, thanks to their technical advantages, while their providers incorporate as much entertainment, commercial and media options in their devices. Here are some of the main aspects defining the various uses of mobile phones:

**** Informing and entertaining***

The best thing about mobile marketing is that, unlike mail and e-mail, people tend to read messages from their mobile phones: 94% of messages are usually read, within an hour from their receiving, according to WIN, a mobile phone messaging service provider. One of the first ways in which mobile phones are used by the specialists in marketing is with the "ambush" type of advertising, street advertising, since the users passing by posters in the street, for example, will get messages on certain events and advertising activities. Mobile phones have also started to be a means of entertainment generated by the specialists in advertising.

Nowadays, advertising campaigns on mobile phones have only come into existence, usually asking their users to send a text message to a number code. In exchange for that, they get information on products, free content or the chance of winning some prizes.

**** Commercial communication***

Mobile phones have already been widely used by companies for commercial communication or advertising mechanisms. The latter encourage users to send SMS messages or offer call tones and music in exchange of sending through SMS the codes from various product packs (coffee, chocolate, toothpaste). Campaigns are sometimes integrated, besides advertising on classical screens, in a well-thought system encouraging the use and usage of 3G mobile phones. Consequently, mobile phones should become a means of showing loyalty to their clients at a larger scale, a means of buying and paying (www.mobiledigit.ro).

The fidelity card, given out when subscribing to a loyalty program can easily be replaced by the mobile phone, with great benefits for both company and user. The necessary information about the buyer's behaviour and the things purchased is collected at each card use.

Mobile ticketing is a new form of electronic commerce, which allows customers to buy, book, get and check tickets no matter the time or the place. By mobile ticketing, mobile phones become an access ticket. Potential applications include: events (concert, theatre and museum), transport, gym access etc. Mobile payment represents that type of payment by using the mobile phone at the outlet store instead of credit or debit cards. This system allows for flexibility and easy use. Electronic vouchers can be used for special

offers, catchy promotions, discounts or other such things a printed voucher stands for. Electronic vouchers are distributed through Internet, e-mail or SMS and can be printed at home or just saved on the phone.

*** Partnership with mobile television**

The emphasis placed on communication shows that mobile content industry and the broadcasting one are well aware of the importance of new platforms, such as mobile television and IPTV. Content makers and the ones that broadcast it need to find out how to better “sell” their product. Both industries consented to the idea that a content especially made for mobiles is to be preferred. South Korea and Japan are among the first countries which adopted mobile television, but the European and North American markets are not far behind (<http://news.softpedia.com>).

2.2. Text messaging marketing

Text messaging is an efficient means for television, since it promotes interactivity and creates addiction. Thus, text messaging campaigns gain more and more ground: they are used in live sports events, films, breaking news etc. Such campaigns are backed by marketing agencies since, on condition they are well made, they give television channels key elements concerning the targeted audience, vital for the already adopted strategies. Moreover, these campaigns are important for the wireless operators, since respondents pay a small attendance fee to take part in such campaigns, while operators get a high percentage of that fee (Roxana Onea, www.comunic.ro).

In this field one can also notice the expansion in the services provided through the advent and more frequent use of multimedia messaging, especially for video content broadcasting. Since messaging campaigns become more and more popular, their supporters believe that this expansion to the premium range can become an efficient marketing tool and a potential profit generator to the operator and providers of mobile content.

2.3. Multimedia messaging

This modern form of transmission of information allows offering services such as entertainment, news, sports events, video games, while also being a personalized marketing tool with immediate response, which facilitates communication with its customers. Based on the infrastructure of mobile phoning operators, multimedia messaging gets a positive feedback from its users, even if problems such as service knowledge, education, prices etc. can still arise.

Even if the service is appreciated, technical problems can still come out, meaning that a single format for marketing messages which can be sent to all its users cannot be yet developed, due to performance differences between mobile phones, since only some of them can receive both SMS and video messages. Moreover, many of those having phones with MMS options can't grade their phones to get MMS messages or simply don't want to access such messages. For this very reason, one cannot be certain that the messages created and transmitted by the marketers reach their users in a full format.

2.4. The broadcasting of recent news (RSS)

RSS technology (Really Simple Syndication) represents a format especially created to broadcast the latest news or reports. This means automatically following the changes within a site, its access being unnecessary if wanting to check if new information was introduced.

Nowadays, there are reading applications regarding flows of news in RSS format which let users know, at a specific time, if there is new information or news on the sites they selected beforehand. Thus, users can choose the sites they want to watch, and if those sites have the RSS option on (more and more sites are adopting it), by means of a small program, known as “agregator”, users can be alerted whenever their favourite sites come up with something new.

RSS technology brings forth a radical change in the way people can access information. If, so far, the user had to access information directly (search for a certain site and surf till he got the information needed), RSS technology allows for rapid spread of that news which is relevant and up-to-date. Some believe that RSS is the future trend in accessing information, since it has already raised a lot of questions concerning the future of traditional mass media.

As the market is under constant development, the business practices will help remove some obstacles, while others might need special measures from industrial companies and legislation in order to give their users, content providers and hardware industry some legal certitude.

The discovery and adoption of innovative methods in doing business is more and more obvious in Romania, its market is rapidly catching up with the lagging behind from a technological point of view, but success is finally assured thanks to the customers' desire to purchase such new devices or through such new devices.

MARKETING POLICIES CONCERNING THE TOURISM IN PROTECTED AREAS FROM ROMANIA

Muhcina Silvia

“Ovidius” University of Constanta, Romania, Faculty of Economic Sciences, E-mail address: muhcina@gmail.com

Botezat Elena

University of Oradea, Romania, Faculty of Economics, E-mail address: ebotezat@uoradea.ro

With its natural environmental attraction and the original cultural life, Romania may become an original product as tourism destination. Between its natural riches, Romania has various species of fauna and flora, many of them considered with unique and specially value, and that's why are protected through special measures. The areas where these species are located are considered protected areas and some of these can be considered as tourism destinations, and can be visited in condition of strict preservation of nature. Between other aspects, marketing must allow tourism organizations to create, promote and distribute these areas like sustainable products, in such a way that can generate profit and can satisfy tourists' needs, but in special conditions as to assure the natural environment' preservation.

Key words: marketing, policies, tourism, natural, area

Introduction

With a rich tourism potential, Romania can achieve a high level of economic development, and can be better known by tourists from different countries and cultures. But, length-ways time, the tourism practice demonstrated that tourism activities have several impacts in different way: natural impact, social and cultural impact, economic and politic impact. Through marketing instruments the market evolution can be better knew and it can be create the possibility of a good coordination of different stakeholders' efforts and interests: tourism services suppliers, tour-operators, travel agencies, local communities representatives, governmental tourism authorities. In the same time, marketing allow the appropriation of all these participants' interests: profit for economic organizations, environmental care from local communities point of view, a general tourism sustainable development from authorities point of view, a great satisfaction for a certain tourists category: the nature lovers, the persons which are preoccupied of nature and culture preservation.

1. Protected areas in Romania

Romania has several important natural resources that are considered as tourism attractions: The Romanian Black Sea Coast, The Danube Delta, The Carpathians Mountains, caves, rivers, lakes etc. Some of these important natural riches are included in to large sphere of protected areas.

The concept of protected area refers to an area of land and/or sea especially dedicated to the protection of biological diversity, and of natural associated cultural resources, and management through legal or other effective means (IUCN, 1994). Considering IUCN point of view, protected areas are defined by the management goals and not by management efficiency and refers to: Scientific research, Wilderness protection, Preservation of species and genetic diversity, Maintenance of environmental services, Protection of specific natural / cultural features, Tourism and recreation, Education, Sustainable use of resources from natural ecosystems, Maintenance of cultural and traditional attributes (IUCN, 1978). Considering the IUCN Classification from 1994, the principal protected areas categories are the fallowing (Ravenel and Redford, 2005, pp. 381-389): Strict Nature Reserve and Wilderness Area; National Park; Natural Monument; Habitat/Species Management Area; Protected Landscape / Seascape; Managed Resource Protected Area.

In Romania, from juridical point of view, the protected area are proclaim by The 462 Law from 18/07/2001 that approved The Governmental Ordinance 236/2000, referring to protected natural areas, natural habits, fauna and savage flora's preservation. Considering these law rules, the protected areas from Romania are: Scientific reservations; National parks; Natural monuments; Nature reserves; Natural parks; Biosphere

reserves; Wet zones of international importance; Natural sites of universal natural patrimony; Special area of preservation; Special area of avifauna preservation.

Because of the great importance of Romanian natural capital value, length-way time, it was necessary to implement some nature preservation measures. Today, The National Protected Areas Network includes 579 of protected areas (between 13 national parks) that represent 5,18% from Romanian territory (Nistoreanu, et al, 2003, p. 158). Three of them have an international recognized as Biosphere's Reserves, being included in MAB-UNESCO Program: Retezat, Pietrosul Rodnei and Danube Delta. Due to its value, the natural patrimony of The Danube Delta Biosphere Reserve is included in the international network of the biosphere reserves, in the framework of the program "Man and the biosphere" (1990), by declaring it as wet zone of international importance, especially as location of the water birds, Ramsar Convention (September 1991), as well as its including on the list of the world natural patrimony – Unesco (December 1991).

The total surface of national and natural parks, and the Biosphere reserves from Romania is 1.132.176 hectares, and are the following (MAPM, 2001): Balta Mică a Brăilei; Bucegi; Călimani; Ceahlău; Cheile Bicazului – Hășmaș; Cheile Nerei – Beușnița; Cozia; Delta Dunării; Domogled – Valea Cernei; Grădiștea Muncelului – Cioclovina; Munții Apuseni; Munții Măcinului; Piatra Craiului; Porțile de Fier; Retezat; Rodna; Semenic – Cheile Carașului. These areas offer the possibilities to practice tourism activities, but its necessary to be done in sustainable conditions, thinking to the future (preserving the natural patrimony, respecting people's traditional life and habits, rationally using the natural resources etc.).

Because of its characteristics, originality and unique aspect, The Danube Delta is an important destination for national and foreigner tourists, and the tourism activity in Delta is a problem with international impact.

2. Danube Delta, example of important protected area considered as tourism destination

Due to its high importance, to its unique natural patrimony, The Danube Delta is one of the most representative and valuable tourism zone from Romania.

The Danube Delta is one of the greatest wetlands of the Earth (and the second on the European continent). For more than 10.000 years, after crossing 2.860 km, the Danube has been building at its river mouth into the Black Sea, one of the most beautiful deltas in the world. The Delta covers an area of 4152 km², 82% being on the Romanian territory (3446 km²). The water and the land areas drawn up here, offer good life conditions for a large amount of plants and animal species. Here can be met the colonies of pelicans and cormorants, very specific to the Danube Delta, as well as a large amount of other species of aquatic birds living, or coming here for building their nests, or spending their winter. The Danube Delta has three branches, and more than 400 lakes. Oak and ash tree forests, the sand dunes, the beaches on the delta marine seacoasts provide a great diversity and spatial variety. The Danube Delta Biosphere Reserve (DDBR) has a total area of 580.000 ha. The junction between the Dobrogean hills and the wetlands of the river system marks the terrestrial limit of the reserve. From Chilia Branch to Capul Midia, The Danube Delta Biosphere Reserve includes several special physical – geographic units, and has various natural resources that can be considered as tourism attractions:

- The secular oak forest and Mediterranean lianas "Letea" and "Caraorman" Forests
- More than 5.500 flora and fauna species, of which more than 325 species are birds (almost of 1/3 from the total number of plant species that grow in Romania, the important colonies of pelicans and cormorants and a variety of other water birds, which reside in or visit the delta for breeding and wintering, a large number of fish, with species of both economic and ecological value)
- The traditional way of life and work of local people. They are living from fishing activities in small isolated communities, they are friendly and good guests
- The climate (a yearly medium temperature of 11 – 11,6 Celsius degrees, a low level of rainfalls (350 – 450 mm/year) and a long sunshine period (2300 – 2500 hours/year), which offers the possibility to carry on the tourism activity from spring until autumn.

The most practiced tourism forms in Danube Delta Biosphere Reserve are (Nistoreanu, et al, 2003, p. 161):

- The itinerary tourism, for visiting and knowing, in a short time (2-3 days trips), the Delta's beauties, the people and their habits and history
- The vacation and holiday tourism promoted in Delta's and on the deltaic Black Sea Coast localities, preferred especially by Romanian tourists because of natural conditions (in villages like Caraorman, Crişan, Sulina, Murighiol, Portiţa etc.
- The rural tourism and its particularly agro-tourism form, practiced in the fishermen's villages, that have picturesque houses, with the roof of reed
- The scientific tourism is organized going from the originality and value of natural resources, is less damage for environment and is practiced by small groups of tourists, especially scientists
- The balneal-therapy tourism, based on saprophelic mud from Murighiol, indicated for rheumatic disease
- The tourism for sport practicing, like fishing, hunting, nautical skiing etc.
- Other tourism forms, like foto-safari, bird watching, scuba-diving etc.

Because there are so many natural and ancient cultural attractions, the tourism products must be assembled and offered in such a way as to not create damages. In connection with Danube Delta, The Black Sea Coast offers great possibilities to practice sustainable tourism.

3. Decisions that can affect the sustainability of tourism destinations

Considered more and more attractive, the protected areas became interesting for tour-operators, which create several types of tourism products, going from different natural and cultural resources from these areas, considered as tourism attractions. But, an important problem that appeared in case of this tourism supply is how to assure sustainability. Even initially, the sustainability problem was understood more on micro-economic level (especially in case of agro-tourism suppliers, which offered for tourists the possibility to make a "green" vacation), now the preoccupations are concerning the sustainability for large areas or zones considered as tourism destinations. This fact involves a strong cooperation between tourism services suppliers, tour-operators, representatives of local communities and governmental authorities, as to create and offer sustainable products as tourism destinations.

The tourism development is determined by are some responsive factors, which whom decisions can affect the tourism destinations sustainability (Stănciulescu et al, pp. 5-7):

- In the faze of tourism zone arrangement, the central and local authorities have major responsibilities for sustainable tourism development. Those authorities can contribute to the increasing or decreasing of tourism activities, through the legal, financial or other tools, used to orientate and control of these activities (the limitation of the environmental damages, through resort's placement, the organization of transport, architecture, tourism equipments etc.). The local organizations which are involved in tourism arrangement projects, is responsive also for not affect the quality and the quantity of the environmental resources. The local population has an important opinion and must be consulted about the projects' opportunities
- In the faze of performing tourism activities, there are many major responsive factors: the local tourism services suppliers (accommodation, catering and food and beverages, transporters, entertainment services suppliers), which must evaluate the impact of their own activities to the environment and must develop with the help of authorities) a problem solving plan, the local authorities and governmental representatives (which must encourage the environmental protection actions and over taxed the organization which bring environmental damages), the tour-operators and travel agencies, that must promote the sustainable destinations and the tourists, which must become more preoccupied and responsive for environmental protection.

Considering the tourism product configuration, the sustainability problem concerns all the elements of product: the tourism attractions and the tourism services also. Defined by the management goals, the protected areas must be protected through special measures. To become and remain sustainable tourism destinations, these areas must be managed through special plans. The management plan of a natural protected area includes elements that refers to (Nistoreanu et al., pp. 136-138; Ravenel and Redford, 2005,

pp. 381-389): Resources inventory (natural and cultural resources, tourism and general infrastructure, transportation access means); Potential market's evaluation (obtaining information about tourists-target, there's country of origin, vacation's length, type of accommodation etc.); Services delivered (tourists preferences for different kind of accommodation, food, entertainment etc.); The environmental impact's analyze (natural, social, cultural, economic etc. impacts).

Generally, the most applied techniques of protected areas' administrations (which fallows to rationalize the visitors' waves), are (Nistoreanu et al., pp. 139-140):

- Limiting the tourists' number, when demand is greater than supply
- Dispersing the tourists in time and in space as to reduce the crowd and the environmental impact
- Limiting the tourists' waves among the seasons, especially when the animals are vulnerable
- Creating functional areas (for example, for camping, for riding the bicycles, for picnic etc.)
- Informing and educating visitors when they choose a vacation place or at the tourism destination place
- Introducing symbolic seasonally access payment, as to increase the tourism practices out side the full season.

4. Marketing actions for sustainable tourism in protected areas

The theoretical and practical marketing involvement in the case of tourism in protected areas, must consider some specific aspects, similarly to any other type of sustainable tourism (Middleton, Clarke, 2001, p. 336; Firth, p. 18), such as:

- Marketing strategic planning in tourism must consider and involve all important decision factors from tourism activity: the national authorities: governments, tourism departments, ministries or offices (because it must become a part of national sustainable development strategic plans), the local authorities (because they represent the local communities interests from tourism destination places), the tourism services suppliers, the tour-operators and the travel agencies. In this process, a very important role has the management of natural protected areas, because can legally encourage the tourism activities that are not destroy the natural equilibrium and that are contributing to the sustainable development of local communities, and block those activities that can create consistent damages (massive tourism infrastructures, that destroy the nature, considerable changes in local peoples' life, habits and culture etc.)
- In the process of market targeting, like in the generally process of tourism strategic planning (Stăncioiu et al, 2005, p. 45) must be evaluate the attraction elements of market segments, and considering that, marketers must select the most appropriate segments for sustainable tourism
- The strategic marketing approach must be realized going from a regional perspective, considering the tourism strategies and actions from the different neighboring districts from a country or for larger areas, even countries that have commune interests in these large protected areas (like Romania and Ukraine, in the case of Danube Delta, or great regions like Caribbean Region, Pacific Region etc.)
- The marketing researches, near other significant aspects, must allow the determination of the markets' dimension, the specific tourists segments, theirs' needs and the possibilities to be satisfied, the factors that influence the market evolution etc.
- In the process of international marketing communication, must be promoted the sustainable destinations for those small groups which are really admirers, love and respect nature, living-beings and traditional way of life
- To increase the tourism sustainability, the tour-operators can promote the "eco" tourism products (ecotour, ecotravel, ecovacation, ecoexpedition etc.)
- The tour-operators marketing activity must be conceived going from sustainability tourism products. In the process of tourism products assembling, the tour – operators must encourage those tourism services suppliers which are preoccupied of sustainable principle application in there's activities and collaborate with those suppliers which develop there's activity going

from sustainability criteria. An example of tour-operator preoccupied of tourism sustainability is German TUI Tour-operators, which incorporate environmental protection as management function in the organization process of its companies

- The accommodation services must be offered on specific structures (camping, guest-houses, chalets etc.), corresponding to the tourists demand
- The tour-operators must include, in to the product's assembly, some specific entertainment services and recreational activity services, such as: scoobadiving, cycling, skiing, studying nature, flora, fauna, speology, visits at ethno-museums, historic or cultural attraction etc.
- In the process of marketing communications must be supplied information about the these destinations areas, events and activities, to the tourists and to the experts in nature's preservation also, spread through specific marketing communications' techniques (advertising maps, brochures and catalogues, public relations activities, marketing events etc.)
- The price of those tourism products must indicates the originality and rarity of resources that are considered as tourism attractions
- The distribution of these products must be realized in sustainable principles conditions
- The tour-operators must collaborate with local communities representatives from tourism destinations as to include in tourism products those tourism attraction that can be preserved and rational administrated. When the damages and pollution are minimum, when is allowed on marginal areas for small groups that appreciate the nature, the tourism can increase the social and economic life of local communities, can offer working places for local people, can encourage the handicraft and manufacturing local industry (selling the fish products, objects of reeds, etc).

Conclusions

Developing the tourism marketing activity in natural protected areas allows to:

- Preserve the environment integrity
- Practice a healthy tourism
- Create and develop tourism products that are consummated without destroy the natural and cultural patrimony, the traditional way of life and habits and the social structure
- Orientate the tourists-segments who appreciate the sustainability of these tourism products to buy appropriate products, through marketing communication policy, through prices levels and distribution channels
- Coordinate the efforts of all participants in supply chain (products and services suppliers, tour-operators, travel agencies) as to increase the efficiency of all activity
- Create the possibility to integrate the interests and increase the cooperation between tourism agents, public authorities and local representatives from local tourism destination, as to develop and practice a kind of tourism that satisfy tourists' needs, preserve the resources and assure the efficiency of tourism organizations activity and, in the same time, encourage the local communities developments, on sustainable principles, as to keep the environmental health, to use rational the local resources.

Abstract

To be known on the market, to exist for the consumers and to influence their behavior, to be positioned from competitors, to have a distinctive image, the organizations must realize an efficient marketing communication policy. Included in the large sphere of communication tools, package is, in the same time, an important tangible element of the product, and also, one of the most visible mean that is used by the organizations to communicate with the public. In the marketing approach, together with label, the package of agro-alimentary products has multiple functions. The goal of this paper is to show some of different aspects concerning the importance of package for marketing communication process.

Key-words: agro-alimentary, marketing, communication, package, label

Introduction

The specific of agro-alimentary market requires a special marketing approach. The agro-alimentary marketing has some personal features, generated by various causes, such as: the high importance of natural and biological factors on agro-cultural production, sector, the seasonality of vegetal production, the specificity of demand for different agro-alimentary types of products, the low level of farmers' information concerning the international markets trends etc. Going from its functions, the objectives of agro-alimentary marketing approach can concern the following aspects: the agro-alimentary market research, the environmental analyze, the behavior study of agro-alimentary products' consumer, the elaboration of agro-alimentary marketing-mix, strategic planing, etc.

Between the constant preoccupations concerning the product policy formulation and implementation, the price policy and the distribution of the agro-alimentary products, one of the important preoccupations of marketers is the marketing communication activity with the different categories of publics.

1. The importance of agro-marketing communication policy

Into the large sphere of communication process, the marketing communication has a specific goal, following the marketing objectives' achievement.

As a permanently message source, the organization try to inform the publics, to sensitize the potential clients, to influence the consumers' behavior in a favorable meaning.

To create marketing communication strategy is a difficult process that has to be realized considering the organizational global strategy. Like in the case of any other organizations, the organizational suppliers of the agro-alimentary products are confronting with major decisions which are concerning different aspects, such as (Popescu, 2003, p. 174):

- The organizational long-term orientation

- The organization activity's definition
- The environmental connection of organization's activity
- The correlation between organization's resources and its activity.

Even for agro-alimentary organization, the communication strategy must be correlated to the organizational mission and goals, to the communicational targets, to media communication, the messages' contents and the process of resources' allotment.

The system of marketing communication of the organization involves several elements:

- The transmitter or the source of information (the enterprise)
- The message (the idea, the information)
- The channel that allows to spread the message (the support of the message)
- The receiver of the message (the consumers, the clients, the representatives of public authorities, the media etc.).

The process of communication is submit to various interferences, such as different barriers (culture, language etc.), filters, noise etc.

Through their contents, the messages that are manipulated by specific marketing communication tools, allow the enterprise to promote and to sell products, underline, support and promote the agro-alimentary brands, create a specific image of the organization.

As any other organization, on theirs turn, the suppliers of agro-alimentary products can use the fallowing marketing techniques (Popescu, 2003, p. 25):

- Promotional communication techniques, that are utilized in some planned marketing communication campaigns. This category of communication tools includes advertising, sales promotion, public relations, marketing events, sale's force and direct marketing. Considering the marketing goals, targets and message' content, in the communicational campaign can be used one single promotional tool or can be used a combination of promotional tools (promotional mix).
- Continuous communication techniques, such as brand, package or design, in to a process that involves the utilization of some stabile elements, that confers steady-fastness to message' content.

The promotional policy is important because has the role to communicate, to inform the customers about new or improved products, to educate consumers' tastes, to stimulate and drive the organizations' and peoples' demand.

The promotional tools that are used in agro-marketing are the fallowing:

- Advertising, important and impersonal form of communication about ideas, goods, services, an identified sponsor pays that. Advertising messages are usually transmitted through the fallowing supports: news-papers, magazines, television, radio, by direct mail, outdoor billboards, printed materials (flyers, calendars, catalogs etc.). The producers and the distributors of agro-alimentary products must respect the law frame, because these products have a direct influence on human health. To protect the consumers, in the majority of European countries, the fallowing procedures are considered abused and, in consequence, are forbidden: false indication about the products' nature, their prices, the quantity or the provenience of goods, advertising for unhealthy products, advertising through subliminal message, or transmitted to children etc. Generally, in the majority of European countries, advertising for alcohol and cigarettes is not allowed.
- Personal selling is a person-to-person type of communication in which the receiver provides immediate feedback to the source's message. The sales force has an important role in agro-alimentary marketing process, because it has two functions: on one hand, represent the "engine" of sales activity (the sales volume, the profit, the market share dimension etc., are depending on sales men activity), and on the other hand, the sales force has important responsibilities in marketing communication activity (through their behavior, through attitude and body-language, through theirs' communicational abilities etc., they represent the image of the organization)

- Sales promotion, a marketing activities assembly concerning the consumer purchasing stimulation (price-off deals, rebates, premiums, in-store displays, sampling, coupons, contests etc.). For consumers, in retailer network shops, one of the most used tools in the sales promotion of alimentary products is sampling, people being invite to taste different types of products (sausages, cheese, coffee etc.). The big wholesalers stimulate the merchants especially through discounts or advantageous prices for bigger quantities
- Public Relations, a promotional activity that aims to communicate a favorable image of the products or of the organizations, which offer them, and to promote goodwill. These activities are directed to some certain publics' categories: employees of the organization, mass media, opinion leaders, representatives of public authorities etc.
- Sponsoring, that means to give a material or financial support for non-profit activities or organizations (in sport, in education, in health system etc.)
- Trade shows and exhibition participation, important means to communicate about the offers, to negotiate future contracts, to promote products, to enter on new markets etc. The agro-alimentary suppliers can participate on general trade fairs or on specialized trade fairs (such as INDAGRA, in Romania).

In marketing specialists' opinion, the assembly of tools and techniques communication that are used by the organization in to the process of marketing communication, expresses the content of marketing communication mix (Balaure et al, 2005, p. 348).

2. Package, element of marketing communication

Important element of agro-alimentary product structure, package is, in the same time, an important and traditional communication tool used by the marketers, with a strong impact on the consumers. Invested with multiple functions, package assures a strong contact between consumers and products, and together with the label, communicate important information about products and the organizations that offer these products.

Because is one of the most visible communication way, package policy is very important for agro-alimentary organizations. Considered as a continuous marketing communication tool, package has the capacity to add a considerable value to the product through shape, design and graphics (Popescu, p. 166).

Today, through its communicational valences, the design of package is an important way to stimulate the products selling, and it' s considered in the marketing strategy grounding process.

Package is a material support that has the function to protect the product during the transportation, storage and handling processes. Its importance is considerable too for the protection of environment in the case of products that can affect, through theirs' characteristics, the integrity of the environment.

Considering the package destination, in practice are used the fallowing package types:

- Sales packages, that represent for consumers, sales unity on acquisition point
- Group packages, conceived as to unify a certain sales unity or to stuff the shelf from the sales points
- Transportation packages that facilitate the products handling and transportation and prevent products physical damages

The package has complex functions, such as:

- To protect the content in case of products transportation, storage, manipulation and utilization;
- To protect the environment from the possible novice actions that the production can cause it (chemical substances, medications etc.)
- To facilitate the products' storage and manipulation operations
- To facilitate the products' batching and stowing operations
- To stimulate the sale policy
- To promote the products, through messages communication free of charge action a.s.o.

The package communication function refers to product capacity of draw attention, to differentiate the product from competitors' similar products, to convince consumers to buy the product. In the same time, package informs consumers about the products through text's elements, expressive, trademark and brand personality. All these elements serve to identify the product, to guarantee the product quality, to make easier the product sales, especially in the case of self-service in supermarkets, to accelerate sales through a quick identification of package and product (Dubois, Jolibert, 1994).

From a historical point of view, the relationship between marketing and package develops in a different ways. Many years ago, package function have limited on keeping products in safe. Once with marketing concept evolution, the connection between marketing and package has become more complex, and marketing has a positive involvement even from research and product design process. Today, when package industry gets a significant position in national economies of developed countries, package's design has become an important way for sales stimulation, being considered in marketing strategy grounded process.

Because of its communicational impact, specialists considered that some package's attributions has transformed in secondary functions, such as (Popescu, 2003, p. 166):

- To draw the consumers' attention
- To convince the consumers regarding the advertising promises and the real quality of the product
- To build brand personality
- To increase the consumers' loyalty
- To educate the consumers regarding contents, product's composition, requirements in product's utilization a.s.o.
- To indicate the origin of the product (the place of manufacturing)
- To educate the consumer regarding the way of using products

Package adds value to the product through the nature of materials that are used to manufacture it and also through design.

Selecting a certain material for package realization process is influenced by different phenomena such as (Popescu, 2003. p. 167):

- Cultural environment evolution, especially the eco-orientation (now, are more and more used the materials that are bio-degradable,
- The existence of various alternatives of materials for manufacturing the packages
- The technique development
- The progress of logistics and supply chain a.s.o.

Considering the communication function of package, basic elements of package design are the following (Ingold, 1994):

- Shape
- Color
- Graphics
- The informational message

Through color, graphics, illustrations, text, the package communicates in a symbolic way. Using an appropriate design, from artistic and structural point of view, allows to obtaining a maximum valorization of package potential. To be successful, the package's promises and information must concordant to real quality of the product.

An alimentary product is characterized not only by its nutritional value, but also by the informational elements that allow to be recognized. Together with package, the label contributes to a good communication, because, generally, the first contact of customer with the agro-alimentary product is facilitate by the presence of informational elements that are wrote. The informational content of the label must be synthetic, accessible, and must offer sufficient information of the agro-alimentary product, to present it and to represent it in an adequate way (Diaconescu, 2005, p. 159).

A good design follows marketing specification's goals, and is appreciated from the point of view of these criteria and from sales' dimensions. In the same time, through shape, color and graphics, package is the ideal way to create a product's image.

Conclusions

To elaborate a successful marketing strategy, marketers must decide what image they wish to project on the product and its package, in to a unitary vision.

When image it is not clear or includes contradictory elements, the package will have more difficult tasks to transmit messages, the consumers are confused and the communication process will not be successfully. Very important also are the aspects that refers to the package's shape and the package's image, and also a significant role will have the analyze of what opportunities can be incorporated into package, as advantages for consumers.

The package has, also, an important role to brand positioning operation, because valorize the product, fundamentals and strengths the brand and consumer relationship.

Through its power of drawing attention on the product (especially in the case of self-service stores), through its effect to unleash buying decision, package is a real „dumb salesman” (Smith, 1994, pp. 470-471) of the products, and a basic marketing communication tool.

The agro-alimentary products are better positioned and knew through an adequate package, that associates a clear image of these products.

The consequences of bank consumers satisfaction refers to its implications on the bank's economic and social efficiency. This paper aim to demonstrate the link between consumer satisfaction and the social efficiency of the bank.

Key words: consumer satisfaction, social efficiency, services quality

The evaluation of the efficiency of a modern company requires, taking in consideration, among the economic efficiency, other forms of efficiency, such as the social one, also generated by a company through its activity.

The social efficiency refers to the results of the services activities from consumers' point of view and is concretized in the satisfaction degree of the needs, in the qualitative level of the services.

The internal efficiency (perceived and measured by the company) exerts a major influence on the external one (social efficiency, perceived by the consumer). According to Grönroos, perceiving a high level of the quality of the offered services, as an expression of the realized external efficiency, can be achieved only if a level of the internal efficiency, considered satisfying, was reached.

By turning to good the natural, human, material and financial resources, the banking services sector, generates, besides *the economical effects* – the economical results of the banking organizations and of economy on the whole – *social effects* – materialized in consumers' satisfaction degree and in the qualitative level which they ensure.

Starting from the fact that the majority of the evaluation models of the social efficiency in the services sector is based on the quality appreciation, respectively on the comparison between the service waited by the consumer and the service received, we can appreciate that the satisfaction level of the consumer concerning the service will represent, inherently, a very important component in measuring the social efficiency.

The evaluation of the services quality represents an important determinant of the value and of the consumers' satisfaction. Often, in specialty papers, a slightly confusion is created, between the appreciation of a service's quality and the consumer's satisfaction with the respective service, because both concepts aim at the benefits that the consumer receives, as a consequence of the relation that he has with the services executor.

As the social efficiency of services is difficult to express with the help of some quantitative indicators, the majority of the models which exist in the special literature refer to the measurement of the services quality and of consumers' satisfaction.

In actual conditions, in which the competition on banking services market is getting bitter and bitter, in order to increase the social efficiency of the offered services and in order to ensure the competitive advantage, the bank managers must develop systematic programs of quality evaluation and of measuring the consumers' satisfaction. For this they can appeal to specialty services offered by research companies and/or marketing consultancy.

Generally, the relation between the quality of the services, consumers' satisfaction and social efficiency, may be described as follows:

1. the actual performance of the service exceeds the consumer's expectations – in this case, the quality is evaluated as being very good, the consumers are very satisfied, and is recorded a superior level of the social efficiency;
2. the actual performance of the service is situated at the level of consumers' expectations – in this situation, the quality of the service is appreciated as being adequate, the consumers are satisfied, and the level of the social efficiency is acceptable;
3. the actual performance of the service is under the level of consumers' expectations – in which case, the quality of the service is evaluated as being inadequate, the consumers are dissatisfied, and the level of the social efficiency is reduced.

Consequently, the first and most important step that must be done is represented by the determination of the consumers' expectancies regarding the quality of the services. Those, in their turn, are influenced by the previous experience with the respective service, the external information received from the service's companies, oral communications resulted from personal sources, such as family, relatives, friends etc. and the personal exigencies of the consumers.

On the basis of the information concerning its consumer's expectancies, the service company will have to elaborate and respect standards regarding the quality of the services, to be favorably evaluated and to increase the chances of satisfying the clients.

Together with offering some quality services and with consumers' satisfaction, the efficient administration of the company's resources as well as the efficient communication with clients, contribute to ensure a high level of social efficiency.

Consequently, an increased importance for the services companies has the sensible management of human and financial resources and offering some quality services in order to obtain a high satisfaction level regarding the offered services which will inherently lead to forming the prestige among the consumers, achieving a solid reputation and the improvement of social efficiency.

The banking services come to answer some special needs more and more complex and refined, being developed a real industry which has the role of offering the needed ways so that the society benefits of all the advantages that offers the money possession. This is why the banking institutions must be preoccupied not only to ensure the economical efficiency of their activity, but also to ensure the social efficiency.

As the social efficiency of services is difficult to express with the help of some quantitative indicators, the majority of the models which exist in the special literature refer to the measurement of the services quality and of consumers' satisfaction. So long as the quality of the services is appreciated as being satisfying and the consumers are satisfied with the bank's services, the level of social efficiency is a superior one.

For collecting data regarding consumer satisfaction, a selective research among the CEC's costumers from Alba Iulia was organized on a sample of 338 persons, using a questionnaire of 21 questions. There were established 14 main objectives drawn from the purpose of the research, and several secondary objectives, derived from the main ones, based on 5 socio-economic and demographic criteria.

Within the developed selective research, the degree in which the consumers' expectations concerning the quality of the banking services offered by CEC S.A were fulfilled was measured with the help of a Likert scale:

The bank's services were as I've expected them to be.

Total agreement : Agreement : Indifferent : Disagreement : Total Disagreement

When processing the gathered information, to the levles of the scale was attached the following numerical values series, in order to calculate a medium score for the evaluation of the quality of these services:

+2 +1 0 -1 -2

As it can be noticed in the figure below, 47,35% from the total of the questioned subjects express their agreement with the affirmation concerning the fulfillment of the expectations, and 38,5% their total agreement. These results demonstrate that over 85% from the total of the sample received services as they expected.

The medium score obtained was 1,21 which indicates the fact that for the banking services provided by CEC S.A the services quality was as the clients expected to be.

Figure 1 The structure of the sample regarding the measure in which their expectations with the bank's services were fulfilled

As a rule, the consumers that favorably appreciate the quality of the services are, mostly the ones satisfied with those, as demonstrated by the data in the table below:

Table 1 The ensemble satisfaction depending on the degree of expectances fulfilment

Overall satisfaction	Expectations regarding the services				
	Total agreement	Agreement	Indifferent	Disagreement	Total Disagreement
<i>I'm very dissatisfied</i>	0	0	0	0	0
<i>I'm dissatisfied</i>	0	0	1	0	0
<i>None</i>	0	12	21	4	0
<i>I'm satisfied</i>	19	127	17	3	2
<i>I'm very satisfied</i>	111	21	0	0	0
Total	130	160	39	7	2

All very satisfied subjects expressed their total agreement and agreement with the affirmation concerning the fulfillment of the expectations; the same way acted the majority of those who were satisfied with the bank's services.

It must not be neglected the consumers' satisfaction impact on the social efficiency of the bank. As the social efficiency of services is difficult to express with the help of some quantitative indicators, the majority of the models which exist in the special literature refer to the measurement of the services quality and of consumers' satisfaction. A medium level of the consumers' ensemble satisfaction of 4,27 and a medium score of appreciation the quality of those of 1,21 demonstrated that the bank reached its objectives regarding the achievement of an adequate level of the social efficiency.

SUPPORTING TOURISTIC DEVELOPMENT OF GORJ COUNTY BY POSITIONAL PROMOTING POLICY

Neamțu Adina Claudia

“Constantin Brâncuși” University, Faculty of Economics, Republicii, no 1, Tg-Jiu, Gorj County, Romania, e-mail: adina.neamtu@utgjiu.ro, tel. 0724387488

Abstract: A special opportunity for the local travel agencies is represented by the development of the incoming activity, i. e. attracting Romanian and foreign tourists in Gorj. In this field, the touring operators have highlighted issues that sometimes occur in the relationship among touring agencies and accommodation units, the communication between them being sometimes faulty. In the future, using a unitary strategy at the level of the entire county, the accomplishment of an efficient communication and promotion is proposed to take place between the tourism operators and the Group for Local Tourism Promotion in order to coordinate actions at a local level. By this partnership there shall be created conditions to accomplish sophisticated tourist programs having as destination Gorj.

Keywords: objectives, direction for promoting, promotion projects, action plan

The Gorj tourism offer is still lacking the necessary diversity to make it attractive. For the Romanian tourism the profile services usually are thought to be hotel services (accommodation and food). For the foreign tourist services consumers the offer is a bit more diversified, but not enough to motivate them prolonging their stay in our country. The cause is that in Gorj, the tourism programs creators are rare and their combination possibilities are minimum.

As a consequence, **the purpose** of promoting the mountain tourism consists in the growth of the tourist circulation by enlarging the degree of addressability of the offer, as well as educating the tourists for protecting the surrounding environment.

1. General and specific objectives of the promotion

Within the field of communication and tourism promotion in Gorj, among the objectives that shall be followed, we quote:

- reconsidering the place of intern tourism within the Romanian tourism and the growth of the Gorj tourism products' attractiveness on the internal market;
- Encouraging the internal tourism circulation;
- The increase of the number of vacancies spent by Romanian people within the country;
- The increase of the percentage of the expenses for tourism within the country within the structure of the expenses budgets of the population;
- attracting as many consumer segments in the interior as well as outside the country, as well as adapting the promotional strategy to the specific of each market;
- regaining the markets lost after 1989 and penetrating new tourism markets;
- fidelity of the present tourist clientele;
- creating a suggestive image of the Gorj tourism, with respect to potential and social, cultural, psychological, specific to our people;
- suggestion an image of multilateral offer, able to satisfy a wide range of motivations a tourism preferences;
- communicating an image as exact as possible of the local tourism product, emphasizing the unique character of the tourism offer, reflected through a divers geography within a natural, unpolluted and clear environment as well as the multitude of the culture elements: folklore, monuments, customs, traditions;
- emphasizing the representative products of our tourism offer;

Specific objectives include:

- reorganization of the programs and promotional instruments for stimulating the interests of the tourists from Gorj;
- insurance of the wide access of the tourists at tourist destinations in Gorj through the promotion of an stimulant system of price facilities at the level of the tourist agents;
- consciousness through different promotional ways, at the level of the potential clientele, of the quality of the tourist local product and its competition, in comparison with similar products on the intern and international market;
- the growing of the local flux and the development of this in space, respectively the enlargement of the number of areas in Gorj with constant tourism, through the growing of the period of the tourism season;
- growing of the medium period of the holiday period, now positioned at a low level (1,9 days),
- the growth of the medium incomes/tourist and day/tourist.

2. Major directions for promotion within the development programs

In order to complete this primary objective, in medium time, a specific series of actions is necessary that the aim promoting new formulas of spending some active vacations, that should follow:

- attraction of some segments of the population for whom the activities practiced in fresh air are a hobby;
- stimulation of all categories of youth that could be interested to practice some sports activities with a general character;
- attraction of some categories of youth that might be interested in the custom of some new forms of sports activities, as well as cyclic tourism, paragliding, hang glider, river rafting etc.;
- opening of an tourism market in Gorj county through the attraction of the tourists form the south area of Romania;
- extension of the brand „Constantin Brâncuși” and more active orientation on the extern markets;
- stimulation of the business tourism as a significant source of incomes at local level
- Winning back the market for mountain tourism through a concerted promotion, also at local level for the realization of a reduced cost of the promotion actions and to accentuate the specifications of each area separately.

The promotion strategy of the native tourism will follow the communication of an image that will suggest the originality of the tourist products from Gorj, synthesizing the particularities about the tourism potential, the conception of arrangement, the possibilities of practicing tourism, and the sociological and cultural context. It is due to the attachment of the promotional strategy for the specific of each market (intern and extern) and at the characteristic of each segment of consumer, using the most adequate messages and instruments.

The promotional campaigns in the country will focus towards the participation at national and regional tourism fairs, with own stands of the county, as well as through the use of main newspapers, magazines and the most important TV and radio stations. There is also a specialty press that has a special role in the promotion activity, here we can mention: „România Turistică”, „România pitorească”, „Actualități în turism”, „Vacanțe România”, „Vacanțe și călătorii”, „Munții Carpați”, „Ziua Turistică”.

The thing we want to highlight is the fact that the advertising material used for the attendance at tourism fairs, many times, is not being edited in sufficient quantities and does not meet the quality or attractiveness level imposed by the tourism market. There is not enough presence of the audio-video advertising, its impact on the disclosure of the valuable tourism potential of Gorj and Oltenia could have a much more convincing effect, in conclusion, we highlight the fact that the usual “nice” promotion without an impact has a limited success.

In order to create an positive image of the rural tourism in the country and abroad we consider that the organization of some information programs and free presentations for the foreign and Romanian journalists

and partially subventioned for the representatives of the tourism agencies interested in selling tourism programs specific for Gorj.

It has to be taken in consideration also the emission (presentation) of some tapes with tourist movies, various promotional actions under the shield of the Tourism Ministry or collaboration with other institutions with representation abroad. These actions will take in consideration the preferences of the foreign tourists that come and also the needs expressed by the tourism agencies representatives interested in the tourist offer in Gorj.

The promotion of the tourism in Gorj, must take in consideration the following measures:

- differentiate stimulating of the interest of different categories of tourists to visit Gorj;
- encourage the proactive attitude of the tourist industry and the travels in our county, as well as the local communities from the promoted area for exploiting the tourist potential;
- growing the efficiency for the promotion of the tourism of Gorj;
- identifying and profound of the definition characteristic of the different tourist areas (areals) from Gorj and the structure/definition of the specific tourist products; establish the promotional message and the slogan/logo of each area;
- development of information centers, documentaries and tourist assistance at all important access points in the Gorj area;
- financial support of some promotional companies and by operators from the domain: tour operator, transport companies, hotels and structures;
- restoration, making actual and enriching the range of advertising material and making them available for the tourism consumers;
- tight and main collaboration with the National Authority for Tourism, and the tourism offices in order to promote the image of the offer in Gorj;
- rising the financial funds for advertising and promotion and spending in an efficient way, by eliminating inappropriate spending;
- diverse “hospitality” trips where journalists should attend that activate at publications and TV shows about tourism promotion;
- organizing as many shows and contest on TV, radio and in the specialty press having the subject the tourist Gorj as possible, with according awards that are free holidays and circuits;
- creating, exploration and permanent development of a complex database (for example a site on the Internet) regarding the events that took place in Gorj during a year and the projections about the events for the next year; the assurance of a high visibility and an intense traffic to this website;
- organizing through rotation, in as many tourist centers, area and areals, of some events, exhibitions, fairs to promote the image of the tourist product in Gorj;
- support the firms in Gorj for making advertising panels on the street dedicated to the promotion of tourist attraction of Gorj, in the main cities of the country;
- the government organs that organize international political events, commercial or image in the country or abroad, that have to ask consultancy for the professional medium;
- consulting the professional associates in order to establish the participation calendar at the tourism fairs and at the other specific manifestations (congress, conferences); eliminating those fairs that cannot determine a major interest and redirecting the funds to other manifestations;
- launching offers to host reunions and fairs in Gorj;
- realize an integrated very good system for access to tourist information of the foreign tourists that lead through Gorj.

In this context we have to remark the fact that it is absolutely necessary that the personnel that is in direct contact with the tourists (within the units that carry out services, or in tourism agencies) to detain knowledge about marketing, so that he can identify / intuition the motivations and the needs of different

tourist categories, to know to describe the product, to point out the advantages to influence in a positive and deciding buying decision ; to present communication abilities, to be amiable and responsible.

3. Projects and actions of tourist promotion

In order to promote and develop tourism, Gorj sets forth to carry on, along with the local administration and private partners, several actions both at a national and at an international level.

Setting up a tourism department within the institution

Starting from the first half of the year 2008, the European Integration and Development Strategies Department of the Center for Implementation, Monitoring and Evaluation of Economic and Social Strategies and Development of County (as envisaged) shall involve a tourism department, i.e. a **Local Group for Promoting Tourism**. The role of this Group (which shall necessarily have employees with studies and experience in the field) shall be to coordinate tourist promotion activities in county Gorj.

Public / private partnerships in order to organize local events to be promoted on a national and international level For the time being, there are the following possibilities of collaboration: among touring agencies and hotels, pensions, resting houses, restaurants; among touring agencies and local folklore ensembles; among touring agencies and local craftsmen; among touring agencies and the Mayor's Office of the Municipality Târgu-Jiu.

Editing information material (brochures, tourist maps) to include details about the local tourist objectives as well as posting on tourist maps, on illuminated panels in public areas. Such information material shall be published in partnership with local economic entities, with a view to promote local values alongside with tourist promotion. Information materials shall be distributed free of charge in hotel networks, restaurants, touring agencies, fuel distribution stations. Also, these publications shall represent the information support for locally promoting within the participation of the members of the *Group for Local Promotion* on the occasion of manifestations enabling to promote tourism at a national and international level.

Including county Gorj in the offer of tourist circuits to cover objectives in the northern part of Oltenia

Therefore, it is necessary that the Local Promotion Group collaborates with other institutions of the county public administration in order to define a unitary strategy of the tourism at the level of the Oltenia area. Also, it is necessary to consolidate the partnership relations among all tourist operators in the Oltenia area.

Organizing annual cultural events

This action sets forth the accomplishment of an annual calendar of the events (fairs, exhibitions, festivals, etc.) to be promoted in order to make permanent the carrying on at a certain periodicity of such manifestations.

Organizing events, conferences, seminars, training sessions with international participation

In the actual context, the „European town” concept shall be defined also by the participation of the Municipality Târgu-Jiu in projects, programs, international actions to provide for promotion and media, alongside with local development strategies. However, in order to accomplish this objective, it is necessary to endow reception structures with conference and seminar rooms, as well as the pertaining infrastructure, since business is one of the main objective of the tourists.

Participation of the local authorities alongside with private sector partners in national and international tourism fairs

The presence of the representatives of the local authorities in such events or the building promotion models to be accomplished in cooperation with local authorities results in creditworthiness, transparency and cooperation at a local level and, especially trust both in promotion itself, and in taking decisions as to holidays and / or business travels. Thus, to the extent of the financial possibilities, the decision factors in Gorj shall have to suggest the participation as well as financial and logistic support for the representatives of the local operators in national and international fairs, in order to promote the county at a level that is most representative thereto. Taking into account the strong competition on the international tourist market, we deem that it is absolutely necessary to participate with an own stand in as many fairs and exhibitions as possible, both within fairs, and within saloons that are specialized in tourist themes.

Installing road indicators to facilitate access to the main local tourist objectives and promoting main tourist routes

This action shall be applied in concordance with the one to elaborate information material, in order to create a unitary framework at a local level, as far as tourist objectives are concerned.

Arranging a county center of tourist information and local information centers in the localities that are tourist centers

Such centers shall make available to the visitors information and publicity material (guides, brochures, atlases, folders, prospectuses, maps, video tapes, CDs) concerning the tourist attractions (natural, cultural objectives, etc.), possible circuits as well as board and lodging possibilities, transportation, recreations, treatment in county Gorj. Such promotional materials shall be diversified, featuring a special graphic, artistic and informational quality and shall be offered free of charge. Creating a network of centers is intended for promoting tourism in the area by means of actions to support and inform tourists as to the places offered by Gorj and its neighborhood. Useful information shall be offered here for each traveler, no matter whether such traveler arrives by train, car or bus. The ultimate aim is to promote county Gorj as a gateway to Oltenia.

Accomplishing a operational electronic InfoTouch located on the street on grounds of a software application for tourist promotion

This pilot InfoTouch station shall be located at a maximum transit place, in the center of the town Târgu-Jiu, a place where the tourists flow is at its maximum. The station shall provide the information as requested by each tourist intending to visit the county Gorj, under genuine simple and maximum impact presentation conditions, concentrating all information that are necessary for the tourists.

Making available posting areas in the main offices of the public institutions and in specially endowed public places for enabling local promotion and tourist information activities to be carried on.

Facilitating the direct access from the Internet site of the County Council Gorj for sites that are intended for local promotion and tourism development purposes. This facility is part of the applied promotion strategies and is also the result of the partnership agreements to be concluded with tourism operators at a local level.

Ecology actions in area of the historical monuments and in the parks located within the territory of the tourist centers, especially Târgu-Jiu.

Supporting and stimulating touring operations in order to promote local tourism

Since there are no local touring agencies acknowledged as receiving agencies („ground operators”) by the national and European tourism companies, the local touring agencies (such as, among others, the great majority of the ones that are operative in Romania), carry out an outgoing activity (i. e. of sending local tourists in România and abroad), often delivering a retail activity for touring operators in Bucharest or other important cities in the country.

Making a data base structured according to all touring categories in Oltenia (mountaineering, rural, vine-yard, bathing, historical, ecumenical, cultural, educational, recreational, hunting and fishing, reservations and natural monuments, speleology, etc.) starting from a review of the actual infrastructure, in partnership with all institutions and individuals that are involved in tourist activities or activities related thereto.

Abstract: This paper identifies the major demographic trends and their implications for consumer market. It is important to know how will demographic change influence the tourism market in particular and how can the tourist industry adapt to these. The advancing ageing of society will result in far reaching changes, particularly on the demand side. To profitably seize the opportunities, managers must understand how senior markets evolve and adapt products and service offerings along multiple dimensions to meet the needs of senior consumers.

Key words: demographic change, senior tourism, travel behaviour, consumer market

Introduction

Demographic realities are substantially determined by economic and social circumstances and institutions. But they also influence those circumstances and institutions through a variety of potential channels. The microeconomic links between various demographic indicators and economic outcomes have been extensively studied. By contrast, the links that run from demographics to economics and that operate at the level of national economies are far less certain.

Demographic change is one of the important drivers for new trends in consumer behaviour in most European countries. Compared to other trends, demographic trends seem quite easy to identify and predict - estimated future development based on these developments therefore appears to be rather reliable.

The use of demographics in marketing studies has a relatively long history. While demographic change occurs slowly, marketers can begin to see indicators of potential change by identifying small trends that may suggest a larger shift over time. By paying close attention to these trends organizations can prepare their long-term marketing strategy to be ready when the shift becomes more apparent.

1. Demographic trends

The major demographic trends are the slowing of population and household growth, the aging of the population, and an increasing fragmentation of consumer markets. The major implication of these changes is that its emphasis must shift from production to market research and advertising targeted at smaller more diverse populations, as well as to more regional and local marketing.

Other important demographic trends are: rising educational level, a more colourful society due to migration, a changing role of women in society.

Demographic changes have implications for many facets of economic life, including work force structure, savings and investment, retirement incomes, health expenditures, and consumption of goods and services. The changes are even likely to have implications for the quantity of food consumed, the types of food consumed, and the ways in which food is consumed.

Due to dramatic demographic changes around the globe and the aging of the baby boomer market, companies in a range of sectors – including the consumer packaged goods, retail, financial service, healthcare, automotive, real estate and hotel and lodging businesses — will have to focus with ever greater savvy on serving the needs of a very different type of consumer: one that is age 50+ or older with shifting biological, psychological, social, and economic characteristics, needs, and expectations.

Global consumer product and service companies that start now to assess, adjust, and update their product offerings to best serve this evolving and increasingly influential age 50+ market will be far more likely to grow their consumer base and to reap great rewards. Those that ignore this massive demographic shift and its global impact are likely to miss a significant opportunity. Today the global population is aging and living longer due to improvements in health care and nutrition. Age 50+ consumers are a growing economic force that will transform multiple industries unlike any prior demographic shift in recent history. From healthcare to retail, from travel to financial services, and from entertainment to electronics, aging consumers are beginning to demand products and services tailored to their specific needs. Yet most companies continue to design for and advertise to the young. To capture value from the age 50+ market, managers will have to master new skills and lead the transformation of products and strategy to adapt to a changing marketplace. With increasing longevity there are already over half a billion age 50+ people in the world. The age 80+ subset of this population is the most rapidly growing segment.

The current consumer market has seen a wave of campaigns focused on youth, with little attention paid to the aging buyer. Older adults throughout the world have bemoaned the negative imagery associated with aging in the media and government. But as age 50+ numbers continue to grow, their influence in shaping markets will grow and transform media, manufacturing and retail alike. While the consumption preferences of age 50+ markets are difficult to characterize, aging consumers face specific patterns of change along several dimensions.

Aging is the most cross cutting challenge and opportunity facing society. Business has a profound role to play in developing innovative products and services that will support the longevity revolution. Clearly the boomers are driving the agenda that ultimately will serve every maturing generation.

The practice offers research, training, program assessments, creative strategy and insider intelligence on how to effectively reach, connect with and motivate the men and women of the boomer generation.

For young, affluent shoppers, that retailer may be on the World Wide Web; for seniors, it may be the corner store that offers free delivery.

Each generational group is influenced by the values and deep-rooted ideals that shape their demographic "type class." Understanding the motivational drivers of each of these groups provides manufacturers and retailers with the necessary clues and insight into what these consumers buy and where they shop. Consumer information not only facilitates an educated targeted marketing strategy, but also provides the competitive edge necessary to ensure optimal product potential. As we move into the next century, more shoppers will expect a shopping environment constructed to meet their individual needs. Having a more focused knowledge of the shopping public is one sure way for manufacturers and retailers to demonstrate that they care about their clientele — an effort that will undoubtedly be rewarded.

Since a majority of women are now in the labor force, much household buying is done by children and preteens, who also will create a large market for videogames, cosmetics, and microwave foods. The number of people who have time to shop will decline, so that much marketing may be done by telephone and microcomputer. Moreover, the fragmentation of purchasing behavior means that it will no longer be possible to reach an entire household with a single advertising message. Advertisers will have to study the demographic data carefully and base advertising strategies on what has come to be called "data base marketing," if they are to reach this highly fragmented consumer population.

In some countries the overall birthrate is declining while the average age of the population is growing. For a company targeting the youth market with sporting products this trend may suggest that in coming years they will see shrinkage in demand for their products within the youth market as the population of this market declines. On the other hand demographic data may signal to the company that another market, which they may not have previously targeted, may hold potential for new products. If it is predicted that the shift will occur over several years the marketer can slowly move into the new market by offering products geared toward older adults.

2. The implications of demographics change for tourism market

The growing number of senior citizens in the European Union, and other industrialized countries such as the USA and Japan, looks to become one of the major challenges for the tourism industry to grapple with in the new millennium. The present number of seniors (one third of the adult population in many European

countries, USA, Canada, Japan is aged 60- plus) and the growing of this proportion offers considerable economic incentive for tourism marketers to sharpen their focus older persons.

The population of Europe is becoming more middle-aged and this will inevitably change consumption patterns – attractions need to provide more facilities for older people as well as the traditional white – knuckles rides. As this largest segment of the population often has the most leisure time and disposable income, the customer group '50 years and up' is the segment that operators cannot afford to ignore. There is growing disparity in the distribution of time and money. As a result, a clear structural change is emerging in the long term: growing polarization of the population into two groups, people with high incomes or wealth and little leisure time on the one hand, people with little money and a relatively large amount of leisure time on the other hand.

Developments like these will have less effect on the volume of travel than its nature (frequency of travel, timing, destinations, combined business and private travel). Operators able to offer personalized and modular concepts which target increasingly specific customer needs and offer convenience and time savings could benefit from this trend. This creates positive prospects for organized travel, despite the many predictions of its demise.

Taking into account that this age group prefers domestic destinations, the shift in the demand structure caused by demographic aging will open new markets in particular for the regionally oriented smaller tourism companies as long as they meet the higher requirements of this age group concerning service quality and accessibility.

Older persons are attractive as consumers because they have: the financial means, time, a better education than in the past. They belong to a generation which has traveled and they are relatively healthy and know that activities like tourism and recreation contribute to a healthy life style.

Senior tourists differ in many ways: in age, health, economic status, tourism experience, cultural background but also have things in common. Research has shown that people do not change their travel behaviour just because they turn 60 or 65, or because they retire. In most cases they stick to the holiday patterns acquired till the middle of their life. This fact allows for predictions of the tourist behaviour of future senior generations.

There is also a trend towards a two-segment split in the senior market – tourists who want to enjoy new experiences and who spend a lot on tourism, and tourists who have a relatively small budget but who still want to travel. The tourist industry will accordingly have to develop target group specific packages for both groups, to a greater extent than it now does. The economy group in particular is a target group whose size means that it cannot be neglected. In future, marketing must increasingly be tailored to match the needs and desires of older people. In order to address the very heterogeneous target group of senior citizens successfully, thorough knowledge of their much differentiated motivations and lifestyles is needed, and this still needs to be gathered.

The new senior in five or fifteen years time will be different from the present senior when it comes to travel behaviour. While senior travelers today are already relatively active, the new senior generations to come are more than likely to surpass them. The effects of demographic change (more and bigger share of older people) and consumer behaviour patterns (stick to once learned travel patterns) will show up as: more senior trips with different preferences.

The ageing population and an increasing concern for health are likely to drive a growth in demand for health tourism products and spa services. There should also be growing interest in cultural tourism and specially designed programs for the older traveler. The increasingly ageing population requires the transport sector to reflect its specific needs.

It is generally true that estimating the future development of senior tourism is subject to great uncertainty. While the number and relative weight of senior citizens in the population structure can be predicted with relative certainty for the next few decades, it is not clear if and how the travel habits (frequency and destinations) of the older population will change in concrete terms. Another point which is still unclear is the medium term change in population. Motivations, attitudes and behaviour of future generations of senior citizens are still largely unknown territory, as is the assessment of their material situation.

The proportion of people over 60 will visibly rise not only in absolute numbers but also relatives to the total population. As a result of socio demographic development and the fact that the baby boomers from the post war period will become senior citizens within the next decades, growth in the senior tourism

market segment can be easily predicted on a quantity basis at least. Thus, the tourism industry will have to adjust a declining and aging guest potential. Older people will continue to be healthier and benefit from early retirement schemes and well financed pensions. However, the longer term there is likely to be a decline in the value of pensions and a rise in retirement ages as governments struggle to fund earlier generous pensions arrangements.

Identifiable potential in senior tourism would continue to gain importance if the growth in life expectancy outstrips the increase in lifetime working hours, so that the period for retirement is at least not decreased. Improvements in the state of health of older persons or greater technological and organizational convenience in travel may help activate the potential for tourism which can be expected from the demographics by 2050. One particular reason for believing that senior citizens will remain the principal source of growth for tourism in the foreseeable future is the fact that much of this market segment is still currently financially secure, so that there are substantial purchasing power resources available for tourism. After retirement, the time available also increases substantially.

Senior citizens appreciate travel as a way to keep physically and mentally fit and participate in social life. It is likely that senior citizens in particular will invest in future in maintaining their accustomed lifestyle. This could be associated with rising intensity of travel, which is presently still below average. Tourism operators have to start adjusting to the situation now and respond accordingly with their product design. Tourist product design and marketing must adapt to the fact that its customers are ageing. Together with the expected increase in frequency of travel by this age group, this should have a positive effect on senior tourism.

The development towards an older society with fewer children combined with a growing individualisation and new patterns of living together (or apart) may lead the tourism destinations and industry to wonder if there is a need to look for new segments to replace the old-fashioned family trip. Demographic change, such as the middle-ageing of the population together with new family and social structures (such as later marriages), is shaping consumption patterns, for example increasingly more home comforts' are demanded in camping and mobile home accommodation.

Social and demographic change also creates a challenge to workforce. In much of Europe, we have been witnessing a birth reduction during the last three decades. This is causing a reduction of young people, traditionally the main labour source for the hospitality and catering sector, as well as increased competition from other industries for the same people. If consumers are likely to be more diverse in the future then the industry itself will need to prepare for more diversity in its workforce at all levels.

Labour and competency shortages, together with new values and cultures, means the European tourism sector needs to rethink its approach to human resources and develop a new business model and to think in terms of human capital.

Conclusion

In view of coming changes, namely that there will be a demand for more customized and individualized products, particularly among the mature traveling public of Europe, the competence level will become a barrier. The reduction of young people as well as competition from other sectors is causing a diminishing labour pool. It is getting difficult to attract enough staff of the right quality.

Demographic trends will have important impacts on the future development in the new millennium. The fact the people are living longer, the fall in the number of young people, the increase in one parent households, more couples choosing not to have children or to delay having children all point to the fact the type of travel and tourism products and services will change radically.

KEY FACTORS IN TARGETING ONLINE CONSUMER

Negricea Costel Iliuță

Romanian-American University, Bucharest, Management Marketing Faculty, telephone: 0722567790, e-mail address: negricea@yahoo.com

Rațiu Monica Paula

Romanian-American University, Bucharest, Management Marketing Faculty, telephone: 0720891467, e-mail address: monicaratiu@hotmail.com

The online environment represents a new promise through which the organization may offer value to the consumer, to the partners or to his own staff. As offline environment the identification, involvement and keeping the online consumer, represents activities around the entire online activities are actually acting. The main activities for obtaining these goals are tied of the acknowledgements and understandings of activities that determine the intention of initiating an online action, embracing special online consumer behaviour and also the satisfaction and loyalty modalities of consumer through organization online offer.

Key Words: online customer satisfaction, online customer loyalty, perceived value

The global population reached at 6,67 billions, and around 1,3 billion of the total have already Internet access (says Internet World Stats, in March 31, 2008). The distance between different regions or countries is no longer a problem because with only one mouse click they become the same entity being able to use and receive equally same information in the same time. Internet is changing the way of socialization; the way of auto education, the way in which we are able to individualize each aspect of life.

In our day's business are done in a much-accelerated rhythm, the period given for taking any approvals is becoming smaller and smaller. New technologies are making possible the connection of two different persons from different countries in any moment and in the same time. The permanent connection 24 hours per day, 7 days of week to the global market have a strong influence in the approval of decisions that are taken in a short period of time, usual position change and priorities, trying the human limits in this way. The overstressing may have as an effect the impossibility of isolating things, which are very important for taking any decision from the information mixture, which are at our disposals (*isolations of the noise from the signal of what is important to know in order to make good decisions*). In addition, we have to consider the vulnerability increasing of e-civilization at cyber terrorism, informational pollution (information omissions, pornography, spam, aggressive media activities) and attracts with different informational viruses.²⁰³

Philip Kotler said the future is not fast; future already happened; unfortunately, it is not same for all firms, companies, economical sections or nations. The answers that we are looking for is actually the future of our organization is in the present time. For having acknowledgments of the realities is the same thing with knowing the future realities.

Nothing can stop us in collecting information. In a global economy, everything is faster and in continues process. The digital revolution imposed new markets ideas of economical organization side. Consumer's competition is stronger day by day, and metamorphosed in an omniscient person and the main purpose is how to gain these e-evolutions.

Various studies of online consumer behaviour are not bringing a unitary frame of components identification determined of achieving of different studies in the online user/consumer behaviour. There are

²⁰³ Negricea I.C., The challenges of the World Economy Cohesion Factor-The INTERNET: world reorganization, vulnerabilities, discrepancies and power discernment, Romanian Economic and Business Review, June 2006, p. 59

five major domains of interest for explaining the online consumer behaviour according to specialty literature²⁰⁴.

- individual/consumer characteristics - Internet knowledge, demographics, personality, value, lifestyle, attitude, consumer resources, behavioural characteristics (looking for product information, access location, duration, and frequency of usage), consumer psychological factors (flow, satisfaction, trust), motivation and experience;
- environmental influences - culture, social influence, peer influence, and mass media;
- product/service characteristics - product type, frequency of purchase, knowledge about the product, tangibility differentiation and price;
- medium characteristics - Web design, quality, ease of use, security and reliability;
- online merchant and intermediary characteristics - service quality, privacy and security control, brand/reputation, delivery/logistic, after sales services.

Many of these influence components are described in offline consumer behaviour studies being taken and adapted to the specific support environment which is Internet.

Online consumer behaviour return might be caused, in general, by confirmation and loyalty²⁰⁵. Online satisfaction, understood as the difference between expectations and the offered value perceived by consumer, represents a goal which in online environment, maybe more than offline environment, is based on trust. Online consumer's expectations for products, website design, services are starting to be formed before the actual online activities. These expectations are influenced by the attitudes and consumer intentions in online actions, and as we expect the information or acquisition online behaviour will be modified. If the consumer expectations will become real online experiences, we may speak about touching a satisfaction level which will have a lot of influence in consumer attitude towards site, towards the brand or the decision of buying the product.

There are various factors through the agency of online activity, and we name here: Privacy and Security, Impartiality and Credibility, Information Content and Organization of it, Web Page Design. A satisfied user is that user which will come back again to visit or to access the website will generate traffic and acquisitions, will promote the activity through the agency of the viral marketing communicating the perceived values and staning in the same time through his value system to other users. Initializing an online relation with the target market presume beyond website functional aspects, modification of consumer perception for the assumed risk of online activity, especially for the online transactions. The risk in online environment is aiming the personal information security and financial transactions, all the risks for products characteristics and consumed time for achieving the desired information and truthfulness in obtaining information.

The online consumer is being transformed through the agency of research and desires for searching and satisfaction of his own needs in an organization partner. There are various ways of interaction. The consumer has the opportunity to transmit his direct expectations to companies for obtaining as answer a promotional and personalized offer. The various forums, lists of discussions from the online environment represent a significant opportunity for obtaining objective impressions about products/services this being the main possibility for communicating with the target. Others useful instruments of the organization for offering value to online consumer are social shopping sites, blogs and Web sites with customer ratings and reviews. In their case, the information regarding consumer expectations interested for different products/services will be transmitted to the target consumers and in the same time the modalities of using the necessary information needed for the suppliers and the marketers for improving their offer.

In this case, the information regarding consumer behaviour received will be transmitted to the potential consumers which are being interested in different products-services and the online groups formed for a special product, idea or maybe activity might generate the completion of an information modality for using offering in the same time the necessary information to the sellers for improving the offer. All these aspects

²⁰⁴ Christy M. K. Cheung, Lei Zhu, Timothy Kwong, Gloria W.W. Chan, Moez Limayem, Online Consumer Behavior: A Review and Agenda for Future Research, 16th Bled eCommerce Conference, eTransformation, Bled, Slovenia, June 9 - 11, 2003, p 200.

²⁰⁵ Bhattacharjee, "An empirical analysis of the antecedents of electronic commerce service continuance," Decision support systems, vol. 32, no. 2, 2001a, pp. 201-214.

are instruments through which consumer desires are being transformed in offers being used for value delivery and online consumer satisfaction.

With a majority of users influenced by other customer ratings, marketers can both grow their loyalty with new and current customers by offering online customer feedback and ratings. As comparison shopping continues to grow in importance to online shoppers, marketers can increase the effectiveness of their search marketing campaign by strategically purchasing key search terms on major comparison shopping Web site.

A Web site that includes specialised content features, such as customer ratings and reviews, and provides the ability to compare the capabilities of similar products will keep customers satisfaction and return on the site. According to a study²⁰⁶ realised by Forrester Research during the third quarter of 2007, the majority of answers for the question of what do they need to find out in a Web site content, answered „user rating and reviews” (64%). Following answers were „special offers and coupons” (61%), „product or price comparison tools” (59%), „customers testimonials” (49%), „product video” (44%). Among important components of the online consumer which were also found during the same study answers were also the followings: ability to subscribe to e-mail, discussion boards or forums, ability to personalize the site, entertaining games.

Determine user’s requirements through site content and structure represents the first step for loyalty programmes. Even if we can speak about common aspects indifferent of the obtained profile of web site, the particularities are those that will make the difference. In is being proved that in case of online purchase seven out of ten consumers shop multiple Web sites to find the site offering the best offer²⁰⁷. These consumers want to feel they are getting the best value when buying online. This value includes, getting a good price, great service and a varied mix of product, plus a feeling that buying online saves them money. The price is the most important factor when rating the features impacting loyalty to merchant, consumers made it clear. According to Double Click Performing for four out of ten (42%) shoppers “price shop a product via comparison engines” while 48 percent of the online shoppers surveyed described their loyalty to merchants across channels (store, Web, catalogue) as “somewhat loyal to certain merchants based on a combination of good value, superior service and the right mix of product”. According to this it is essential though, that merchant recognize the opportunity to go beyond pure price and time saving benefits and improve their competitive advantage by focusing on customer service.

For being sure that users are repeat or loyal customers, marketers need to create an online experience that gives them a feeling that buying or informing online saves time and money. Free shipping, rebates/coupons, and clearance pricing (via an online outlet) rank high among promotional tactics that shoppers find important when deciding to go back to a Web site.

There are three main categories of costs from the online environment of embracing the consumer²⁰⁸: transaction costs, learning costs, and artificial or contractual costs. The transaction costs are involved in establishing a new relation with the provider and sometimes the end of such relation. Learning costs represents the effort taken by the client for choosing a new product instead of an old product well known by him. Artificial costs are those costs which appear after organization desired action: frequent flyer programs, repeat-purchase discounts, and “clickthrough” rewards.

A loyalty program hinges on the premise that it is cheaper and easier to keep a customer than to attract a new one. Trust, customer satisfaction, perceived value, and attitudinal commitment are separate components that combine to determine the online loyalty. Once you have a customer, building a relationship with him is critical. It’s through that relationship that a bond is created between consumer and retailer. It is less expensive and easier to hold an existing costumers even it is always grate to create or to generate new costumers.

A very important element when we are speaking about loyalty is the brand. Brand loyalty is defined as “a deeply held commitment to re-buy or re-patronize a preferred product/service consistently in the future, thereby causing repetitive same-brand or same brand-set purchasing, despite situational influences and

²⁰⁸ Klemperer, P. “Markets with Consumer Switching Costs,” *The Quarterly Journal of Economics* (102:2), 1987, pp.375-394.

marketing efforts are having the potential to cause switching behaviour.”²⁰⁹ One of the reasons brand is important is because it drives usage and correlates with market share. Despite the often heard remark, "our competition is just a click away," brand loyalty and habitual behaviour makes that statement factually less true than it seems logically or in the abstract.

Establishing a brand on the Internet is now more important than was until now. Without a well recognised brand the site will remain just one of the thousands of other websites that offer the same services on the Internet. Brands that are already well established offline face a similar problem online - consumers that were loyal customer's offline usually have very different (if any) loyalties online.

Online organisations philosophy on Internet is aiming at satisfying the various numbers of existing clients through loyalty programmes. Beyond all the benefits in having a stable number of clients, this philosophy has an important promotional component. When a client is satisfied by the relationship with the organisation will transmit further more this information to others consumers, which are very important taking into consideration the existing communication instruments.

A POSSIBLE MODEL TO BE USED IN DESCRIBING THE STANDARDIZATION - ADAPTATION STRATEGY IN INTERNATIONAL ADVERTISING

Nichifor Bogdan Vasile

Universitatea din Bacău, Facultatea de Științe Economice, Str. Spiru Haret nr. 8, bogdan.nichifor@ub.ro, tel. 0745587965

Abstract: Although there are various opinions about advertising standardization and adaptation alternatives and the influence factors of these strategies, we believe that is still necessary to identify and clarify the motivations and the factors supporting these alternatives. For better clarity, we suggest to categorize these factors in two broad categories: factors explaining the influence of general business environment and factors explaining the business motivations and practices of the organization. In other words, adaptation, standardization, and compromise as international advertising strategic alternatives appeared because of existence and simultaneous manifestation of the context factors and the motivation factors.

Key words: adaptation, standardization, equilibrium, contextual factors, motivational factors, advertising strategy, model.

Theoretical consideration

Marketing literature do not limits its interest in focusing on the strategic alternatives in international advertising, but it search models which could help the business area to better understand the problematic of advertising. Three models regarding standardization and adaptation in international advertising were developed in the last years (Harvey, 1993, Luxton, 2005, Papavassiliou, Stathakopoulos, 1997). Studying these models we conclude that there is more to say about these problematic. The next lines will describe a new describing model of international advertising.

Although there are a multitude of opinions related to strategic alternatives of adaptation/standardization in international advertising and the influences factor of such alternatives, we still can observe the necessity to better structure the motivations and factors invocated to promote one of the two mention strategic alternatives.

For a greater clarity we suggest that the factors of influences to be structured in two new categories: one category related to factors which explain the influences of macro and micro marketing environment over the organization, and its indirect or direct effect over the organization's objectives and strategies, and the other category related to organization's motivations to exploit the opportunities of the business environment. In other word, we could say that the standardization, adaptation or the combination of the first two strategies are the direct results of the simultaneous presence and manifestation of **contextual** and **motivational** factors.

Contextual factors are associated with the macro and micro environment and can be seen from two perspectives. First of such perspective is the one which stimulate the organization to adopt standardization strategy. There are various situations in which the international markets macro environments point towards standardization. Economic and cultural consistencies of the international markets, political, legislative and infrastructural similarities are the new realities of international business. These realities are generated by: the progress in communication technologies, the trend of globalization, the regional economic and political integration. The micro environment factors can point towards standardization too. The centralized management at the level of organization is one of the main factors which can be in favour of standardization strategy.

From the other perspective, the same factors presented above could orientate the organization toward adaptation strategy. Cultural, political, economic and infrastructural differences between international markets could be the other reality of business environment. These realities could be doubled by the

presence and manifestation of ethnocentrism and local nationalism. Over all that a decentralized management system at the organization level point definitively to adaptation strategy.

These two facets of organization environment could coexist and could manifest their influences in the same time. Both, homogeneity and ethnocentrism could be found in international markets. More over, even in the case of the same market we could identify the presence of these two opposite factors. Studies developed in Europe demonstrate that the economic, political and legislative similarity specific to EU does not necessarily generate a cultural homogeneity (Hans Hoeken et al, 2003).

The presence and manifestation of contextual factors in one of the two directions can be useful in explaining organization attraction toward an international strategy but is not sufficient. The consideration of motivational factors could bring more clarity to the logic of selecting international strategy.

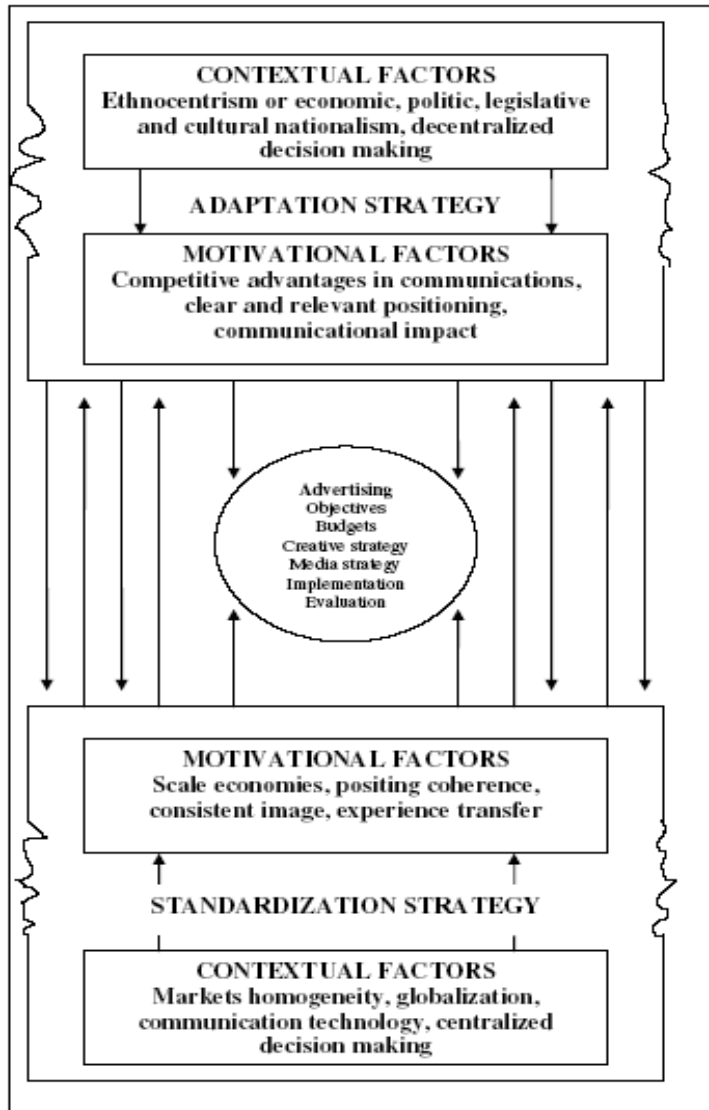

Motivational factors refer to those advantages associated with the presence and manifestation of the contextual factors and to interest of organization to make use of it. Scale economies, experiences transfer, coherent brand and institutional image, on the one hand, and communication impact, image and positioning relevance, on the other hand, are motivational factors associated with the standardization and adaptation strategies in international advertising. The management of each organization decides which of these two groups of opportunity or advantages could be more consistent with their own philosophy and objectives in international practices. In some situations, organizations from the same industry could see their international development in a different way, this leading to a different selection regarding possible strategies (Michel Laroche et al, 1999).

The developed model

Simultaneous consideration of the two mentioned categories of factors, contextual and motivational, added with the desire to take advantage of the attached advantages has as a logic result the selection of one of the strategies, standardization or adaptation. From the international marketing activity point of view, and international advertising too, contextual and motivational factors have the characteristic of mutual limitation. This mutual limitation, in its extreme form, is an ideal situation. In reality, for example, the context favorable to market homogeneity could coexist with the ethnocentrism. Making an analogy, we can say that the influences of the two kinds of factors are similar to the functionality of engine pistons which move one toward another. Their position is either predominant, either equal in the occupied space, neither of one being characterized by lack of presence. This vision is sustained by the consideration made in the lines above. From all these consideration a model can be developed. This model describes the form in which international advertising strategy could be analyzed as a result of manifestation of contextual and motivational factors. Figure 1 presents the graphic form of the model, in which there is equilibrium between the contextual and motivational factors.

Contextual and motivational factors interact, as we can see in figure 1, with the object of standardization-adaptation strategies – advertising. Advertising strategic alternatives are the result of the combined influences of the mentioned factors. In the first form of the model there is equilibrium of the influences, meaning that advertising and all its processes incorporate elements of standardization and adaptation. Objectives, budgets, creation and media decisions represent an equal moderation of the two strategic alternatives. Still, this is an ideal situation. In reality, as we mentioned before, context and motivation finally point in a preponderant way to one of two strategies. So it is all about predominance and not absolute dominance.

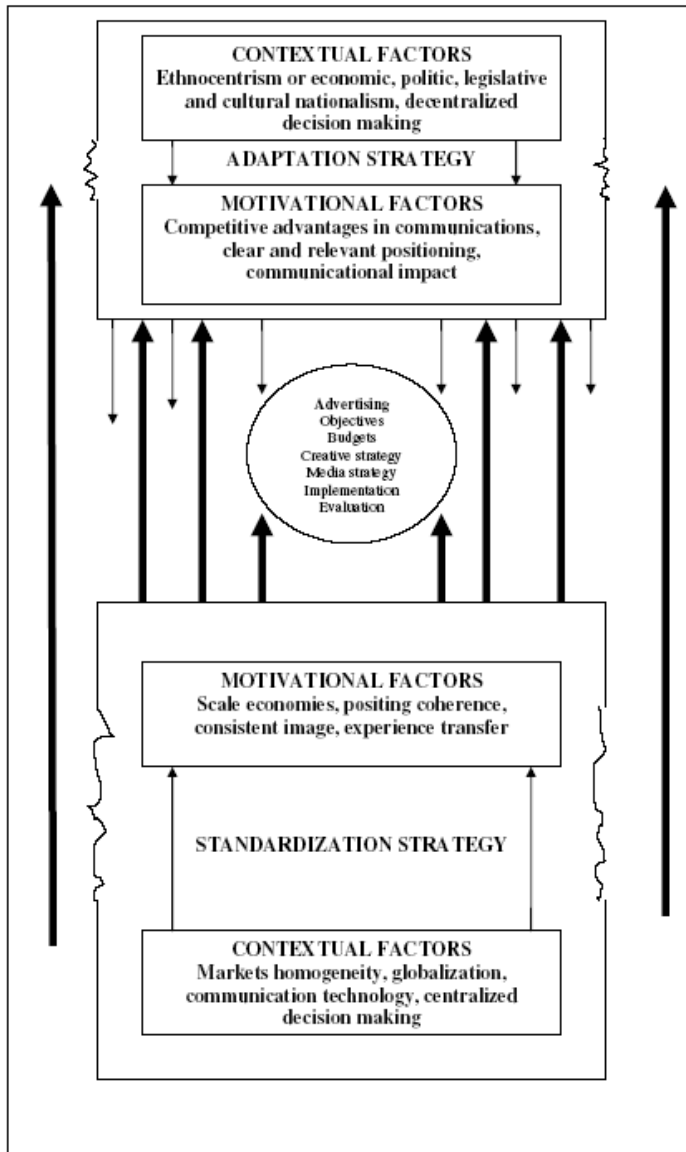

Figure 1 Advertising strategies in equilibrium stage

Figures 2 and 3 present the situations most frequently encountered in market conditions. First situation, presented in figure 2, is the one characterized by the strong presence of markets homogeneity. In this case the strategic alternative of standardization seems to be more feasible. More over, the scale economies, positioning and image international coherence as objectives of any organization transform in possible and realistic goals. However, in the same time, the international market environment could bring some limits to the standardization strategy. On the one hand, it is about some limits such as legislative differences between markets and, on the other, it is about self-imposed limits caused by the characteristics of the markets which can not be ignored, language for example. From a holistic point of view, standardization strategy with some “purity” in it is the one selected by the organization.

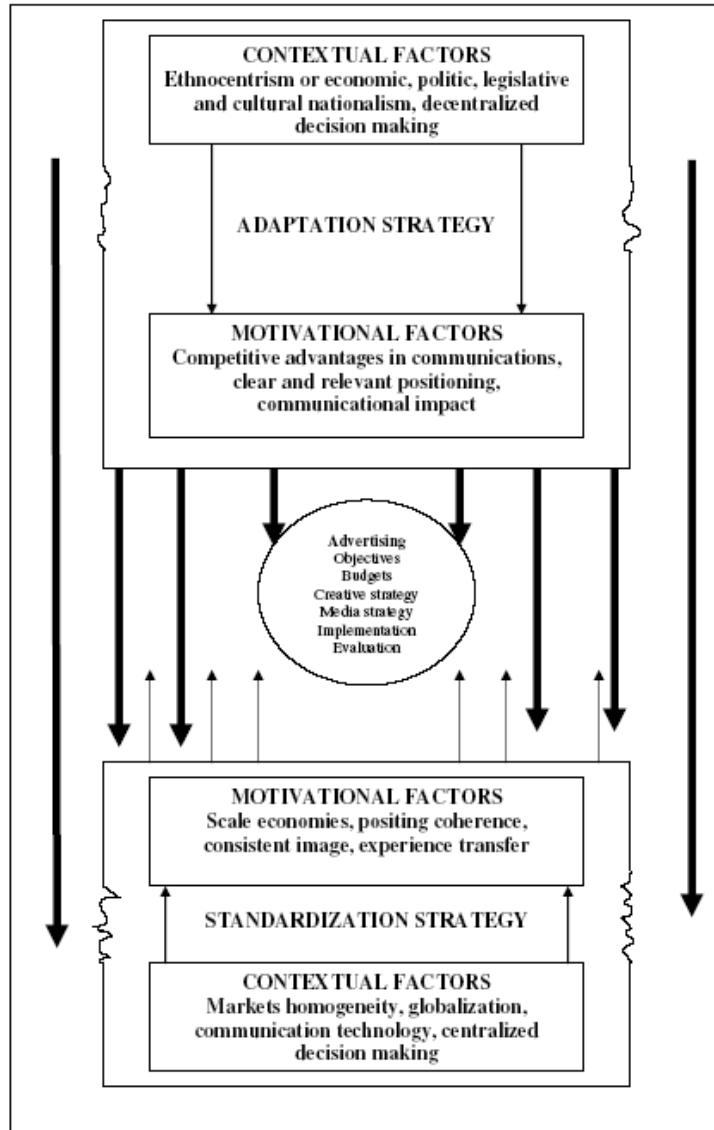

The second situation, presented in figure 3, is the one specific to the context when the markets are really different between them. Cultural, economic, competitive, demographic and social diversity are factors which come in the favor of adaptation strategy. Some objectives such as maximum communication impact could be better touched if the adaptation of advertising is put in action. In other word, it is opportune or motivating to use adaptation strategy in a context characterized by heterogeneity.

Figure 2 Advertising answer through standardization

In the same way as standardization strategy, the opportunity to use an adaptation strategy does not imply absolute forms of the last strategic alternative. Even when the communication context is one very heterogenic, it is impossible or undesired to adapt the whole process of advertising. For example, it would be odd to ignore media infrastructure similarities with effects over media costs even there are cultural differences between markets. A behavior opposed to one just described ignore the economic rationality, which is the base foundation of marketing and advertising processes. So, compared to standardization limited by objectively or subjectively reasons, the adaptation has some limits associated with the discretionary desires of the managers.

Figure 3 Advertising answer through adaptation

Discussions

As we can see watching at the three variants of the model, advertising constitute an object of standardization – adaptation strategy in international marketing. In some degree, advertising include both elements of standardization and adaptation. Environment characteristics and the opportunities of the markets will point every sub process of advertising toward one of the two strategic alternatives or to a combination of them. These combinations can be very diverse. Advertising objectives, for example, could have an international dimensions or a local dimension, creative strategy will have as foundation universal values or local particularities, budgets will be a reflection of importance given to local segment or transnational segments, the tactics will depend on the local and international infrastructure development, implementation will respond to the need of international coordination or will respect the local “rhythm” and evaluation will answer to necessity of impact and performance in local and international markets.

In the light of these considerations we say that it is possible that this model have some limits. These limits could be related to the fact that it is not developing in an analytical manner standardization and adaptation forms. But there are some arguments related to the heterogeneity of markets experiences and subjectively

opinions regarding the meaning of standardization and adaptation which can make difficult the process of analytical analyze of these strategies` forms. This model was developed with the scope of better describing the context and motivations which can stay at the foundation of strategy selection.

Résumé: L’orientation vers un marketing de relation n’est plus aujourd’hui une nouveauté pour le spécialiste. Même dans les conditions de la reconnaissance du moment et de la valeur des différentes orientations, comme le marketing relationnel, il y a une tendance au niveau de certains marchés (spécialement pour les marchés moins développés) de juger les affaires dans des termes de transaction et d’ignorer la relation entre les composants de la filière. Il est évident que, dans le contexte présent d’affaires, la relation à long terme n’est plus une opportunité comme les autres, mais une nécessité générée par le souhait d’être compétitif sur le marché.

Mots-clé: marketing relationnel, marché d’affaires, relation, processus.

Prémises:

Les entreprises ne cherchent pas seulement à améliorer leurs relations avec les partenaires, mais également à consolider les liens qui les unissent à la clientèle. Un client satisfait est à la base du développement d’un marché. En effet, les ventes de l’entreprise dépendent à tout moment de deux groupes: les nouveaux clients et les clients habituels.

Dans le passé, on avait souvent tendance à considérer qu’un client était acquis pour toujours, parce qu’il n’avait pas d’autres choix ou bien que les habitudes engendraient l’inertie.

Aujourd’hui, pour beaucoup d’entreprises et de nombreux marchés, le coût d’acquisition de nouveaux clients est élevé. Des nombreux marchés sont déjà saturés par une offre surabondante et il y a beaucoup de difficultés à trouver de nouveaux clients solvables. Aussi, les entreprises se retournent vers leurs clients acquis et réfléchissent sur l’intérêt de conserver et de développer leur chiffre d’affaires auprès d’une relation durable avec cette clientèle déjà acquise.

La théorie et la pratique du marketing ont imposé de nouvelles orientations, par la suite des modifications des conditions économique-sociales d’échange. Ayant en vue le degré de maturité de la société en général et des marchés, ces orientations du marketing ont pénétré dans la pratique quotidienne des entreprises. L’orientation vers un marketing de relation n’est plus aujourd’hui une nouveauté pour les spécialistes. Même dans ces conditions de la reconnaissance du moment et de la valeur des différentes orientations, comme le marketing relationnel, il y a une tendance au niveau de certains marchés (spécialement pour les marchés moins développés) de juger les affaires dans des termes de transaction et d’ignorer la relation entre les composants de la filière.

En plus, certains secteurs sont caractérisés par l’orientation vers la transaction, le marché immobilier étant le meilleur exemple pour souligner cette réalité (Lendrevie, Lindon, 2003). Mais, derrière la préférence vers une certaine forme de finaliser l’affaire, il est évident que dans le contexte présent d’affaires, la relation à long terme n’est plus une option parmi les autres, mais une nécessité qui attire vers elle les effets positifs de la stabilité et de l’intégration managériale, ayant des conséquences sur l’efficacité, la compétitivité et la prospérité de l’entreprise (Malaval, 1998).

Les entreprises engagées sur le B to B ont donc été les premières à comprendre l’importance cruciale qu’il y a à fidéliser ses clients, ne serait-ce que pour assurer leur simple survie. Un exemple caractéristique à cet égard est celui des équipementiers automobiles, souvent totalement dépendants de l’activité d’un seul client principal.

Dans ce contexte du développement du marketing relationnel comme orientation et comme démarche pratique de gestion de l'affaire, nous avons considéré intéressant de voir dans quelle mesure on trouve cette relation, sur une forme concrète, au niveau des marchés d'affaires. L'intérêt que l'on manifeste est lié à la réalité de l'économie roumaine; les entreprises roumaines sont, dans ce moment-là, en position de prouver leur compétitivité non seulement au niveau du marché interne, mais surtout dans le nouvel espace de l'économie européenne, caractérisé par la présence des organisations avec beaucoup d'expérience en marketing. Dans notre perspective, la relation, en tant que concept de marketing, peut être, à côté d'autres instruments ou moyens, une modalité par laquelle on peut atteindre l'objectif de la compétitivité de l'entreprise.

La relation sur les marchés d'affaires: analyse par la modélisation

Notre article a eu comme point de départ l'identification d'un modèle de la relation sur le marché d'affaires. Dans un article publié en 1987, dans *Le Journal de Marketing*, un nombre des spécialistes américains ont posé les bases d'un modèle qui surprend le processus du développement de la relation entre les partenaires de sur les marchés d'affaires. Plus tard, le modèle est développé et expliqué par les mêmes spécialistes. La figure 1 présente la forme graphique de ce modèle et aussi les explications synthétiques afférentes.

La compréhension de la manière dont ce modèle comprime l'essence d'une relation sur les marchés d'affaires rend nécessaire la présentation de chaque phase. En ce qui suit, on décrit la manière dans laquelle la relation apparaît, se développe, se renforce et, éventuellement, disparaît.

1. La phase de la prise de conscience

Dans cette étape, tantôt le client que le vendeur considèrent l'autre en tant que partenaire d'échange. Les campagnes publicitaires du vendeur et également les foires et les expositions constituent des éléments d'information du client. Dans le même temps, le vendeur peut collecter, du niveau du client, des informations concernant les standards du produit et le processus d'acquisition. Une telle phase peut se prolonger à l'infini ou bien les parties peuvent initier un processus d'interaction, commençant ainsi une nouvelle étape.

2. La phase de l'exploration

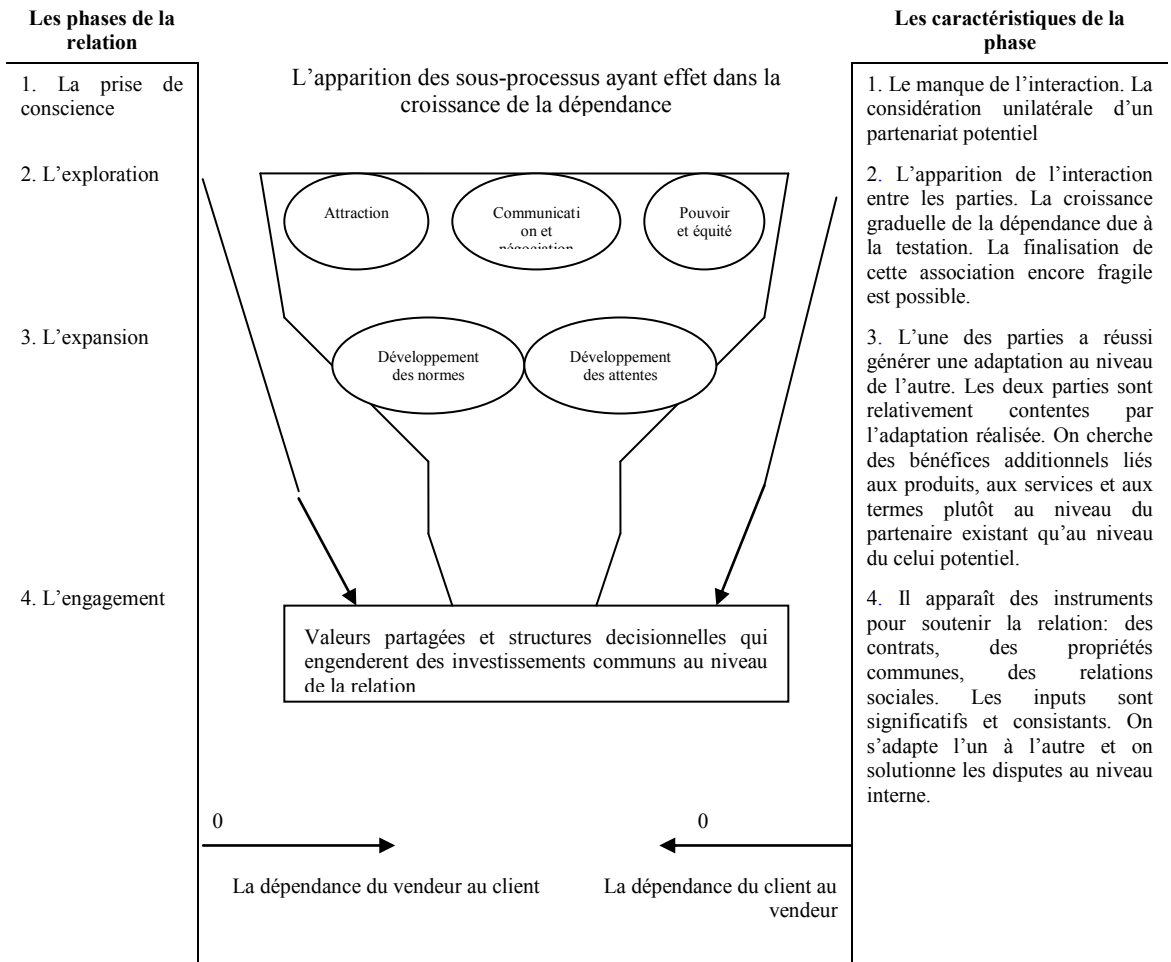

L'exploration suppose un processus de *testation réciproque* de la part de ceux qui l'on en est impliqué. Par exemple, le client pourrait participer aux séminaires professionnels organisés par le vendeur. En plus, dans cette étape on peut trouver même des acquisitions initiales. Mais, ces dernières se constituent dans des composants d'un processus de testation. Pendant l'exploration, les relations établies entre les parties sont encore fragiles, car l'on n'a pas suffisamment investi dans le processus d'échange. Pourtant, à ce niveau-là se déroulent autres cinq démarches qui ont le potentiel de soutenir le développement d'une vraie relation client-fournisseur.

2.1. L'attraction

L'attraction représente le degré dans lequel l'interaction entre le vendeur et le client produit des effets positifs au-delà d'un niveau minimum. Les effets positifs, qui ont une nature tangible ou intangible, résultent de l'association et peuvent avoir une forme économique mais également une forme sociale.

Par exemple, partager des expériences communes peut représenter, pour ceux qui sont impliqués directement dans la relation, un gain positif de nature sociale. A côté de ces effets de nature sociale, le client s'intéresse de la qualité, du savoir faire technologique, d'un prix équitable et des services logistiques. De l'autre côté, le fournisseur ou le vendeur est intéressé par des demandes constantes dans des marges acceptables et aussi de satisfaire des besoins supplémentaires au niveau de l'entreprise client. Bref, les deux parties sont intéressées par la diminution des coûts, des retards et des malentendus.

Figure 1. Le processus du développement de la relation sur les marchés d'affaires

Source: F.R. Dwyer, J.F. Tanner Jr. – Business Marketing, Connecting Strategy, Relationship and Learning, Mc-Graw Hill, 2003, p. 44.

2.2. La communication et la négociation

Dans le développement de la relation, la communication et la négociation représentent des processus par lesquelles les parties assument la distribution des obligations, des avantages et des coûts. Les parties qui se trouvent au début de la relation hésitent de préciser clairement les besoins, les préférences ou les objectifs.

Les objectifs sont traités d'une manière superficielle ou bien on les fait connaître sous une forme discrète, après avoir réalisé les premiers échanges. Jusqu'à l'apparition d'une atmosphère de confort et de familiarité, les parties tendent à transmettre les moindres informations sur elles. Les informations rendent nécessaire la réciprocité, pour que les partenariats à court terme se transforment dans des vraies relations productives.

Les théoriciens de l'école comportementale affirment qu'une relation subit des modifications profondes lors de l'intervention de la négociation. D'ailleurs, pour que les parties soient disposées à dépenser de l'énergie physique et psychique afin de résoudre un problème, elles doivent identifier des possibles avantages. Par exemple, un client qui demande la marchandise entre 3 et 4 heures du matin même si le fournisseur fait la livraison habituellement entre 4 et 5 heures du matin court un risque concernant le déroulement de la relation, celle-ci pouvant évoluer, mais également s'écrouler.

2.3. Le pouvoir et l'équité

Dans le processus d'échange, l'**adaptation** représente une condition essentielle dans le développement de la relation. Les concessions requises ou offertes dans le processus de la négociation résultent de l'usage équitable ou inéquitable du pouvoir.

On peut définir le pouvoir comme l'habileté d'une organisation, nommée Alpha, de déterminer une autre organisation, nommée Beta, d'engager des actions qu'elle n'aurait pas entreprises dans d'autres circonstances. Ce pouvoir dérive de la dépendance de l'organisation Beta face aux ressources de l'organisation Alpha et qu'elle ne pouvait pas les obtenir facilement d'autre part. Les ressources peuvent couvrir la forme du statut, du bénéfice économique, de l'expertise et des potentielles, „punitions” appliquées ou subies.

L'**équité** représente l'effet mérité ou généré par l'application correcte et exacte du pouvoir. L'impartialité et la correctitude caractérisent l'application juste du pouvoir. En contraste, l'application injuste du pouvoir suppose le contrôle des actions de l'autre contre sa volonté ou dans l'absence de la compréhension de l'action de sa part. L'exercice du pouvoir avec du succès offre la possibilité de passer d'une relation exploratoire vers une relation ayant des chances réelles d'expansion.

2.4. Le développement des normes

Les relations d'affaires sont destinées à assurer l'accomplissement des tâches et des objectifs établis pour chaque part. Les normes représentent des standards comportementaux des parties ou des guides à l'aide desquels les parties interagissent.

Certaines de ces normes existent a priori et caractérisent la phase d'exploration. Par exemple, le client et la force de vente partagent une série d'éléments lorsqu'ils se trouvent dans la phase de discuter les alternatives initiales de vente. Il est à préciser que ces éléments diffèrent en rapport avec la culture de provenance. Au fur et à mesure que la relation évolue, les normes comportementales sont ajustées aux participants. Pratiquement, ça signifie que les parties s'éduquent réciproquement en ce qui concerne l'utilisation du langage propre à chaque organisation et après ils établiront des rencontres régulières. Ils vont commencer à communiquer sur des chaînes automatiques et à organiser des procédures d'évaluation, de planification et de décision.

2.5. Le développement des attentes

Au fur et à mesure que les parties interagissent et explorent le potentiel du processus d'échange, on développe également des attentes. La principale composante de l'attente c'est la confiance, la certitude que la promesse ou le mot de l'autre est „sacré”, que celui-ci respectera ses obligations. La confiance dans l'organisation partenaire dérive du fait que l'on y attribue une attitude conséquente, honnête, responsable et empathique. On peut développer des attentes de ce genre par la suite de l'image promue par la communication formale de marketing de l'organisation partenaire.

Il faut chercher, outre l'exploration, ces expériences qui ont le rôle de „pousser” la relation plus loin. Il faut consolider la relation dans l'étape d'expansion, de manière que les conditions de l'engagement à long terme soient accomplies.

La phase de l'expansion

Au niveau de cette phase, on déplace la relation du niveau de la testation et de la vérification vers le niveau du développement des effets positifs et du but de l'échange. Le développement du portefeuille d'affaires, la vente croisée et la vente inverse sont des manifestations de cette phase. Par exemple, il est habitué, pour quelqu'un qui offre des services de marketing, d'offrir aussi d'autres services à ses clients, au-delà du cadre stricte de la première collaboration: services de courrierat, de distribution etc. D'ailleurs, il est possible que toute une série des services traditionnels de l'organisation soient repris par le fournisseur. L'essence de l'expansion consiste dans la croissance de la dépendance entre les participants au processus d'échange.

1. La phase de l'engagement

L'**engagement** représente le désir de maintenir ou de garder une relation importante et précieuse. On peut affirmer, par conséquent, que la phase de l'engagement est caractérisée par un échange significatif de

ressources entre les deux parties. Lorsqu'on croit dans l'efficacité de la future relation d'échange on tend à faire des investissements importants pour la garder. Certains clients pourraient faire appel à l'arbitrage d'une organisation spécialisée en même de résoudre les éventuelles divergences. Les clients et les vendeurs peuvent faire des transferts de la force du travail ayant comme but l'intégration de leurs intérêts dans le processus d'échange. L'engagement assure la survivance de la relation même dans le contexte des erreurs des parties ou dans les conditions de certaines tendances négatives du milieu d'affaires.

2. La dissolution

Au début de la relation chaque membre peut renoncer au partenariat sans engendrer des effets négatifs puissants. Au fur et à mesure que la dépendance s'accroît et que les coûts d'échange des parties s'élèvent, le problème de la fin de la relation se complique. La dissolution ou la finalisation d'une relation avancée dérive du vieillissement des ressources impliquées; cette réalité demande la recherche bilatérale des solutions.

Les recherches réalisées dans cette direction montrent que la dissolution représente un processus à plusieurs étapes, similaire à celui du développement de la relation. Les raisons de la dissolution sont liées à des divers événements dont les effets négatifs dépassent le désir de maintenir la relation d'affaires.

La présence d'un tel modèle dans la littérature de spécialité est très utile parce qu'on apporte des clarifications sur la manière dans laquelle le marché d'affaires définit les relations entre les partenaires d'échange. En plus, ce modèle décrit les étapes de l'établissement et de la consolidation de la relation et introduit un série de concepts opérationnels tels: *testation réciproque, adaptation, équité, confiance, engagement*.

Si, pour les théoriciens, le modèle présente de nouvelles voies de recherche des marchés d'affaires, pour les praticiens il offre un guide utile de la gestion efficace des relations d'affaires. Chaque étape décrite par ce modèle peut constituer une ressource dans le développement d'un instrumentaire spécifique de la conduite interrelationnelle.

Abstract: This paper highlights the importance of marketing information portals in a competitive and rough business environment. Every portal presented here can offer a large palette of latest news, accurate information, needed forecasts, analysis, reports, figures, or even unstructured data. The choice of every company can be difficult because the portals offers data from various business domains, the price depends on the amount or complexity of the necessary data and the specialized employees or the collaborators are well-trained. Moreover, the sites are friendly, and sometimes there is the possibility for the organizations to try a free trial. The companies, even if they are big corporations or small and medium enterprises, have now an extra-chance to survive on the market and even to be successful, due to these marketing information portals.

Keywords: marketing information portals, data basis, marketing research, secondary data

Being a successful company requires specialized employees, dedicated and talented managers on one hand and plenty of financial resources on the other hand. Being competitive isn't an easily to achieve standard. Every organization needs the latest news, the most accurate information and the best trained and loyal employees. In order to achieve all these, the organizations can conduct marketing research, that is quite expensive and limited or they can pay a sum of money in order to find out a lot of information about the market trends with its opportunities or by the contrary its threats, about the competition, or even about the needed employees. Reports, forecasts, analysis, graphs, figures or unstructured news – as articles – are needed by every company, no matter if they are big corporations, or SMEs, if they are offering financial services or high-technology products.

In this paper, eleven internet portals have been identified and analyzed from the content and presentation point of view. These are: Gartner, International Data Corporation, International Social Survey Programme, Secondary Data, Factiva, One Source Global Business Browser, Global Insight, Country Watch, Market Research Portal, Global Technology Forum and Economic and Social Data Service.

Gartner delivers information necessary to fundament day-to-day decisions specific to companies, according to the undergone activities. Amongst the domains that Gartner focuses on, the following can be named: client relationship management, business to business e-commerce, distribution channel management, business intelligence, telecommunications and IT.

Its specific portfolio of products and services comprises of the following:

Gartner Research – through this service Gartner provides IT professionals, companies in the technology field and the investment community with a series of analyses and reports. Research services represent the most profitable strategic business unit for Gartner, with a recorded growth in 2006 of 10 %.

²¹⁰ This paper is basing on the data gathered during the first phase of the research project: „Research regarding the development of an integrated, complex and interactive information system to assist the marketing decisions of the Romanian companies in order to raise the level of the competitiveness” – (CNMP Partnership Grant, no 91-066 / 18.09.2007, Coordinator: ASE Bucharest, 2007-2010, value 2.000.000 RON)

Gartner Consulting – represents the main activity of the company, its’ consultants offering support in fields directly connected with information technology, through direct measurements of investigated business efficiency. Gartner’s consulting team focuses on consulting projects on high-tech products and services management in the following fields of activity: IT, government services and business strategies.

Gartner Executive Programs – program destined for executive managers in companies focused on technology. At the end of 2006, Gartner’s executive program had a community of approximately 3150 executive managers. The advantages of the community consist in personal advice for each member from a personal consultant that responds to every specific need.

Gartner Events – organizes international symposiums addressed to IT professionals, twice a year, (in spring and autumn), in different locations. The symposium is enriched by an exposition which focuses on presentations and demonstrations of the latest technological solutions and products. Gartner organizes regional conferences in 65 countries, whose topics outline: outsourcing, client relationship management, and business intelligence and application integration. In 2006 Gartner organized 56 events with a total of 31.000 participants and generated revenues of 138.4 million dollars.

Gartner Publishing - In 2004, Harvard Business School Press (HBS Press) and Gartner have announced the publication of a series of books destined for senior executives. The partnership includes the publication of Gartner’s research reports, that include its own instruments and models developed over time, with the main focus on: client relationship management, web services, security, outsourcing and business intelligence.

International Data Corporation (IDC) is one of the biggest global suppliers of consultancy, research and event organizing in the field of information technology and telecommunication. IDC helps managers, IT professionals as well as investors in fundament strategic decisions and assisting the decisional process of adopting new technologies within a company. Over 900 analysts provide global, regional and local expertise, on technology, business opportunities, and forecasts in over 90 countries, at a global level. For 43 years IDC has been providing fundamental information to companies in order for them to reach their objectives.

The company’s portfolio of products and services include:

Research reports – these contain information related to market forecasts, competitive analyses and commercial profiles as well as information regarding consumer demands and purchase and consumption behavior. All these research reports are structured in two categories. The first category includes reports that can be accessed freely, online, while the second category includes a set of reports that can only be accessed after an online purchase process.

Multi-client studies – these studies have a high degree of specialization and offer in-depth analyses and recommendations to clients that ordered the research. The purpose of each research project differs from one case to the other, but nevertheless most projects involve extensive primary research as well as multivariate analysis of the technological progress and its degree of adoption.

Consulting - IDC offers strategic and tactic marketing services in order for the businesses in the IT field to support and implement market strategies. Multidisciplinary experts of IDC help companies in shaping and developing business strategies, developing new products and setting prices, defining and implementing marketing objectives, setting competitive forces as well as evaluating potential acquisitions.

Consultancy instruments in IT – IDC offers companies a set of instruments and solutions, built for optimizing decisions regarding the acquisition of new technologies that entered the market.

Organizing events – this service is aimed at IT merchants, consumer organizations and the financial community. Through these events, the three targeted audiences can meet in order to network and exchange information.

Executive consultancy group – offers executive managers in the IT field guidelines based on research instruments that can support their decisions specific for strategic and operational planning. IDC offers clients a series of statistical records, comparative analyses, case studies, success recipes and information regarding consumers in order to elaborate an efficient strategic planning, adapted to the client, using knowledge accumulated over many past experiences of other companies.

Subordinated to IDC are six companies that provide consultancy services to specific domains.

Energy Insights: provides executive managers in the energy industry with consultancy and research services, aiming to maximize the value of the business they run, through technology investments. Energy Insights offers through its specialists a package of relevant information both in IT and business management in general.

Financial Insights: offers consultancy and research services for the financial field. It covers retail and corporate banking markets, insurance markets, as well as capital markets, both globally and locally.

Global Retail Insights: focuses on assisting retail executive managers in order to obtain market success and to maintain competitive advantages, through technology investments. Global Retail Insights insures, through business focused research and strategies, a better collaboration between businesses and their suppliers, by obtaining better offers from suppliers and by enabling pertinent technology investment from businesses.

Government Insights: offers consultancy and research services in the government field in order to develop and implement strategies that lead to maximizing organizational performance as well as adopting new technologies that exist in the market.

Health Industry Insights: offers consultancy and research services to decision factors from the health system as well as to direct suppliers, in order to develop and implement strategies that lead to a maximization of organizational performance as well as new technology adoption.

Manufacturing Insights: provides to managers many pieces of relevant information for critical situations. Consultancy and research services follow closely the processes related to product design, development and distribution.

ISSP represents a continuous annual international program which includes an electronic database with marketing research reports focused on social issues.

ISSP was the result of the collaboration of Allgemeinen Bevölkerungsumfragen der Sozialwissenschaften (ALLBUS) of the Zentrum für Umfragen, Methoden, und Analysen (ZUMA) from Mannheim, Germania, and General Social Survey (GSS), part of National Opinion Research Center (NORC), University of Chicago. Both databases, ALLBUS and GSS reunite in their structure many time series studies. ALLBUS started in the early '80s and it is bi-annual, while GSS started in 1972.

The subjects that ISSP focuses annually are developed by a sub-committee that pre-tests these subjects in several countries. ISSP consultants focus on building questions that are relevant and representative across all the countries included in the research.

In the first year, 1984, there were data from four countries: Germany, United States, United Kingdom, and Australia. Nowadays, the data are collected and gathered from 43 countries. The strength of ISSP is represented by the electronic database that is structured as an archive of all the annual researches from 1985 since 2007. The information in this archive is structured in three parts – past research, present ongoing research and future research.

Secondarydata.com represents an electronic database that is owned and managed by Decision Analyst, Inc.; a company specialized on marketing research and marketing consultancy.

The database is in fact a library of free links to many marketing information resources and is structured in 6 distinct sections:

General Sources – offers free access to secondary data from 11 domains (corporate intelligence, demographic data – both global and local, economic data, general references and research, governmental information, statistic time series, international information – both global and for America, Europe, Middle East, Asia, Africa and Australia), public opinion, tutorials, industry information and Internet usage.

Marketing Resources – contains the best links in the following categories: advertising (advertising agencies, creative agencies, associations, journals, magazines, history, industry standards), professional associations, marketing careers, CRM – customer relationship management, database marketing, direct marketing, e-commerce, international marketing, marketing journals and magazines, marketing legislation, marketing strategy, media planning, online marketing, packaging, brands, trademarks and patents, sales promotion, sales management, retail, Public Relations.

Marketing Research – offers access to a vast network of information sources – professional associations, journals, magazines, tutorials. **Software** – offers access to free software useful to marketers: statistics

software, demographics, segmentation, and research reports. **Statistical Data** - this section offers links to statistic related sites – professional associations, web portals dedicated to statistical analysis, free statistical software, tutorials, and data mining. **Tutorials** – tutorials and trainings that cover a large array of subjects - data mining, database marketing, marketing research, media acquisition, packaging, retail, public relations.

Factiva Data Basis belongs to the group Dow Jones and it offers to the professional not only news and business information, but also useful instruments and services in order to adopt the best decisions. The executives, the marketers, the selling forces and other business people can check easily and understand at the same time the latest news, the market trends, and the challenges of their industry.

These four sections underline the information that is needed by companies from all the business domains:

- Discover the market tendencies and track the competition;
- Manage the reputation of your organization;
- Discover new companies and qualification prospects;
- Find out news from the business domain that you are interested in.

One Source Global Business Browser is designed for the big corporations from all over the world – more than 800 companies – and from all the business domains. Some of their clients are financial services companies, as: American Express, Citigroup, Deutsche Bank, high- technology organizations: Cisco, Motorola, IBM, Oracle, but also professional services firms PricewaterhouseCoopers, Deloitte & Touche, or big corporations, as Honeywell International or Gillette. This data basis offers its clients vital information for their businesses, in order to improve their marketing or financial activities, the public relations and the consultancy.

Combining the structured data (facts and figures) with those unstructured (news and articles) – gathered from the 2500 individual sources of this data basis- One Source creates a large platform of information that can be viewed, listed and exported to the work pages of the clients easily.

Global Insight is a private company that appeared after the fusion between two big economic and financial information organizations - DRI (Data Resources, Inc.) and WEFA (Wharton Econometric Forecasting Associates) - and the integration of the third one WMRC (World Markets Research Centre). With more than 3800 clients from various business areas, almost 600 specialized employees and 23 offices in 13 countries in North or South America, or Europe, Africa, Middle East and Asia, Global Insight gathers and tracks the latest news, it makes forecasts and analysis and it offers consultancy to its clients – private companies or governmental institutions.

Country Watch is an information supplier, needed by corporations, governmental agencies, schools, libraries or physical persons, which ask for latest data about all the countries from all over the world.

Country Wire assures daily news and articles gathered from regional information networks and it has an international coverage, by collaborating with international agencies, but also with local ones. The news is various, with cultural and political perspectives, so that the readers to create a whole image, because the portal has in its archive data from the past months or even years.

As the section Countrywatch Maps allows the visualization of thematic, physical or political maps, the section Countrywatch Data offers information about various subjects specific to different countries, in an interval of time.

Market Research Portal offers rich information from the marketing research domain, but the level of complexity and personalization of the data is quite low and this justifies why this information is free of charge. There are many sections for the clients and they are not only theoretical subjects, but also the results of some marketing research conducted by various companies. Through these two sections for gathering the CVs and publishing the available jobs, the portal helps those persons searching for a job, but it supports also the efforts of the companies searching for new employees.

The portal **Global Technology Forum (GTF)**, which belongs to the group Economist Intelligence Unit (EIU), is created in order to offer for free useful information to multinational companies, importers/exporters, financial or governmental institutions, public schools or to other groups directly interested in political and economical news all over the world.

The portal **Economic and Social Data Service (ESDS)** is a British service for data archiving and disseminating, being sponsored by Economic and Social Research Council and Joint Information Systems

Committee and basing on the collaboration between four centers of expertise, belonging to the universities: Essex and Manchester.

The offered information is from the following domains: economics, education, health, politics, industry, management, psychology, etc, and it is gathered from governmental agencies, international statistics agencies, market research companies, historical sources, but also from some research grants, conducted in the academic environment.

Internal marketing is a much debated subject in international economic literature, being the topic of many books, journals and conference proceedings; therefore it has become a strategic objective in the relationship marketing theory and practice. The term received in the last twenty years a vast number of definitions and this is the reason why our paper will present both a conceptual approach and a specific way in which internal marketing is applied in Romanian companies. The originality of the present research results from a non-financial approach of employees' motivation by implementing sport activities in their daily work schedule. The main results of the research highlight the need of integrating sports in the company's internal marketing programs with the aim of achieving employees' satisfaction, trust and loyalty.

Key words: internal marketing, non-financial motivation, sport activities, relationship marketing

The literature on internal marketing is considerable and growing rapidly (see for example; Berry 1981; Collins and Payne 1991; George 1977, 1990; Grönroos 1981, 1985; and Piercy 1995, 2000), yet there is little systematic work on how internal marketing actually works in practice.²¹¹

Internal marketing is a much debated subject in international economic literature, being the topic of many books, journals and conference proceedings; therefore it has become a strategic objective in the relationship marketing theory and practice. The term received in the last twenty years a vast number of definitions and this is the reason why the present paper will present both a conceptual approach and a specific way in which internal marketing is applied in Romanian companies.

Internal marketing has been defined (Berry and Parasuraman 1991) as the attraction, improvement and maintenance of company's employees in positions that ensure the maximum and efficient usage of their work capabilities and a motivation system that allows the satisfaction both of the material needs and the professional aspirations of the employee.²¹²

This concept has evolved from the original conceptualization of employee satisfaction/motivation by treating employees as customers and jobs as products (Sasser and Arbeit 1976; Berry 1981) for improving service quality, to customer orientation/market orientation and the use of marketing like approach and marketing like tools internally to motivate employees (Grönroos 1985), to the use of internal marketing for

²¹¹Pervaiz K Ahmed, Mohammed Rafiq, Noorizan Mat Saad, Internal marketing, organizational competencies, and business performance, American Marketing Association, Conference Proceedings, Chicago: 2002, Vol. 13, pg. 500

²¹²Cetina, I., Brandabur, R., Constantinescu, M., Marketingul serviciilor – teorie si aplicatii, Ed. Uranus, 2006, pg. 202

the implementation of external marketing programs (Piercy and Morgan 1991), and the extension of internal marketing to the implementation of any functional strategy (Rafiq and Ahmed 1993).

Since Berry (1981) first advocated treating employees as internal customers, this has become the central guiding principle for internal marketing in every company.²¹³ Later, Berry and Parasuraman emphasized (1991) the value of treating staff the way you would want them to treat customers. The assumption here is that this provides a climate for "effective marketing behavior". In one of his articles, David Ballantyne (2000) calls this "happy staff equals happy customers" logic.²¹⁴ The logic of this approach is a simple one – gaining employees' satisfaction will influence their loyalty and affective commitment towards companies and this is an essential condition in achieving customer satisfaction during critical episodes interaction. Having this argument we can make the scientific assumption that at the company's top management level there is a need of correlating the strategic objectives of raising customer loyalty with a greater level of employee's satisfaction. This is proved in the present paper by applying the results of a quantitative research which shows that the non-financial motivation may be considered as a favorable influence in creating a pleasant and, most of all, productive work environment.

A limitation of existing internal marketing research is that there is little agreement on what mix of policies can be used to effectively influence employees so that they are motivated and act in a customer oriented fashion. The originality of the present paper results from a qualitative approach of employees' motivation by implementing sport activities in their daily work schedule. The novelty results from the link which is suggest to exist between the corporate social responsibility of the company toward its employees and the economic benefits of a relationship marketing orientation.

Lately, this concept of sport activities practiced together by the organization employees has known a fast development. Be it a formal activity (conducted by the company's management) or an informal one (put in practice by the company's employees), sport has the power to relax the employees and to create the team spirit that every manager wants to find in his company.

Considering the recent appearance of this concept in Romania, there aren't many marketing researches to show its importance. That is why a detailed description for this concept as it is found in practice can lead to a future development of the theory.

Considering the conditions presented so far, this paper highlights the conclusions of a quantitative research regarding the process of implementing the sport activities within the organization, especially to determinate if this process is seen as a non-financial motivational instrument for the employees.

The research took place within 246 companies that activate on the Romanian market and which include sport within the activities for their employees. To collect the necessary information, a survey was used with a structured questionnaire.

The research objectives were the following: a) Identifying the opinion regarding the financial and non-financial motivation of the employees; b) Determining the type of organization for the sport activities within the company (formal or informal); c) Identifying the most played sports and the reasons for choosing these sports; d) Finding out if the sport activities can be included within the non-financial motivational elements; e) Identifying the percentage of companies that participate in competitions with their representative team; f) Determining the percentage of companies that motivate their employees to participate in competition that are specially organized for firms and identifying the most used elements of motivation in this situation; g) Determining the percentage of companies that reward the employees that have won a competition where they were representing the company and identifying the most used reward elements; h) Establishing the percentage of companies that have won at least one sport competition until now.

The information obtained from the research helped us realize what are the place and the role of sport activities within the company. We started with the hypothesis that, in Romania, most companies don't involve in a formal way in the sport activities practiced by their employees. This is rather the initiative of the employee, who wants to engage with his colleagues in other activities besides those work related.

²¹³ Ballantyne, D., Internal relationship marketing: a strategy for knowledge renewal, *The International Journal of Bank Marketing*, Bradford: 2000, Vol. 18, Iss. 6, pg. 274

²¹⁴ Ballantyne, D., op. cit.

From the research we could find out that, in practice, these two types of organization are equally found in the companies - formal 54% and informal 46%. At the international level, the trend is to have the organization of the sport activities in the responsibility of the company's management, who offers to the employee a relaxing work environment.

In close connection with the formalization of the sport activities organization is the percentage of companies that participate in sport competitions that are especially created for firms. Only 32% of the interviewed companies have participated at least once in such a competition. It is interesting to see if there is a statistical association between these two variables, in other words, to see if the formal/informal organization influences the percentage of companies that participate in sport competitions. As shown in Figure 1, the companies where the sport activities are formally organized are participating in a higher number to sport competitions that those companies where we find an informal organization. To verify the statistical association we used the Chi-square test and we discovered that there is a mild association (a value of 0.173 on a scale from 0 to 0.707).

Figure 1. The influence of formal/informal organization on the percentage of companies that participate in sport competitions

Considering the fact that the participation to sport activities represents a voluntary act, some employees must be motivated in participating. This is, of course, in the company's best interest because it leads to good morale for the employees and, therefore, to efficiency in the company. The research has shown that, in Romania, there are a higher number of companies that do not motivate their employees in participating in sport activities with their colleagues (54%). Naturally, this management decision is closely linked with the type of sport activities organization (formal or informal). Therefore, the company, whose management implicates itself in the organization of sport activities, also motivates its employees in taking part in these activities. Using the Chi-square test we could see that the association between these two variables is statistically significant.

The companies which took part in the research were asked the following question: what are the methods of motivation used to determine the employees to take part in sport activities? The most frequent answers were: bonuses (32.6%), product prices (25.6%), sport apparel (16.3%) and vacations (12.8%). The things change when we come across the rewards that the companies offer for those employees who have won in a sport competition representing the organization for which they work. There are a higher number of companies that reward such employees. The difference is not significant (51% as against 49%), but it can be positively interpreted with hope for the future.

Same as the motivation, the rewarding part is also influenced by the type of organization for the sport activities. As you can see in Figure 2, the companies that have a formal organization for the sport activities have, also, an efficient reward system for their employees. The most frequent ways of rewarding an

employee for winning a sport competition are: vacations (23.6%), bonuses (20.8%), product prices (17.9%) or diploma, trophies and medals (16%).

One of the frequently used indicators in evaluating the efficiency for the process of implementing the sport activities within the company is the number of sport competitions won. From the research emerges the fact that only 13% of the companies that have participated to sport competitions have won at least once. The companies must show interest in winning such competitions because of the free publicity that emerges from the media coverage of the sport event.

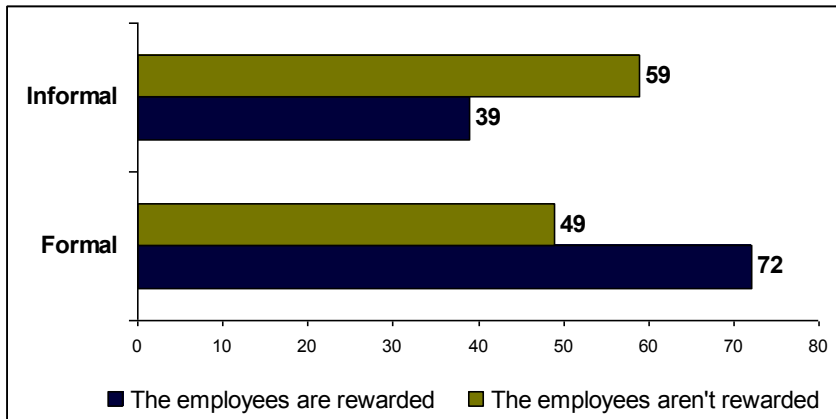

Figure 2. The type of sport activities organization influence on the decision to reward the employees that have won a sport competition

After determining which is the position of sport activities within the company, we shall see now what is the role of these activities. Generally, there a lot of reason for considering very important the role of sport activities practiced by the company’s employees: when taking part in sport activities, the employee is much more relaxed and his work will be more efficient; team sports can substitute the investment that the company must make in other types of teambuilding; the employee’s participation to sport event represents a promotional instrument for which the company doesn’t have to pay any money. Through this research, we wanted to find out if the company sees the implementation of sport activities as a non-financial instrument of motivation. Our hypothesis was confirmed by 83% of the respondents. Another research objective is concerning the most played sport by the employees. We can see from Figure 3 that soccer leads at a considerable distance, followed by tennis, basketball, fitness and ping-pong. The main motivation for putting soccer first is because this sport is a tradition in our country. This supremacy can also be explained by the numerous facilities for playing soccer: a growing number of sport courts, common sport apparel (doesn’t require major investments), and the fact that soccer is a sport that doesn’t require a long term training.

Figure 3. The most played sports by the employees

We notice the fact that the three most played sports in a company are all team sports. This is because one of the management's objectives for implementing sport activities within the company is to create team spirit (as shown in Figure 4, which indicates the reasons for choosing a certain type of sport for the employees).

Figure 4. The reasons for choosing a certain sport for the employees

A closer analysis of these reasons will show us that for the team sports the main reason is the development of team spirit and for individual sport is keeping in shape (body and mind) – a healthier employee is more efficient.

As a logical conclusion, the changing business environment of our days requires a dynamic adaptation of the Romanian organizations and a change in their corporate governance by making efforts to retain the most efficient employees with the aim of gaining their loyalty and devotion. This may be possible by establishing a set of integrated non-financial instruments of motivation, such as sport activities, which assures the “health” of company-employee relationship.

Abstract: *Usability is an attribute of any good product, just as its functionality. It refers mainly to the utility of a product for its intended users, as well as to its ease of use. And whilst a correct functionality is critical for the commercial success of any product, its value comes through the human needs that it fulfills, which is determined through various marketing research techniques. In parallel, the IT&C community has developed in the last two decades its own type of research, called usability testing, used mainly to evaluate interface ease of use and all usability problems associated with software products. This article aims at finding the right place for usability testing and usability professionals in the marketing community, as well as drawing a wider picture, from a marketing research perspective, on one of the most popular topics in IT&C community for the benefit of marketing scholars and professionals.*

Keywords: *usability, marketing, marketing research, computer human interaction, qualitative research.*

One of the general usability principle observes that „if people don't understand the functions of a given product, they will not use it; if it complicates their existence, as well they will not use it; and if they are current or potential customers they will only buy those products that are easy to use and that bring an obvious improvement to their lives” [14].

Usability is inherent in any product or service, just as well as functionality. And, whilst functionality defines what a specific product or service will (or is expected to) accomplish and a functionality test will try to determine whether its target performs according to its specifications (and expectations), accordingly a usability test is a tool used to identify how buyers will use the product or service to satisfy their needs and expectations. A correct functionality is critical, but not enough to ensure market success. Its value for customers comes from the needs it satisfies, as well as the degree of satisfaction they derive from it – and only if the satisfaction they get is at least equal to what they expect the product will be considered successful and they will continue to buy it and recommend it other people. And the satisfaction that people get after using a IT&C product is determined with usability testing.

The goal of usability testing is usually the improvement of the product under test. A secondary objective is the improvement of the design and manufacturing processes for that particular product, or other in the same line, and this is one of the reasons that usability testing professionals feel that this tool is different from marketing research, as these „focus on the investigation of marketing phenomena and not product improvement”[13]. Other objectives of usability testing include ease of use, acceptance of new or improved tools, portability or other interface problems between users and products or between the product under test and other items, with which it could or should come into contact.

Usability testing is usually performed with a small sample of respondents, which have to be part of the target customers of the product or service subjected to the test. These will be asked to perform typical product functions and to use it as they will in normal, daily activities, in a controlled environment, under the supervision of the test team, which will record everything they do during the testing, as well as everything they say. Not only will their test performance be analyzed, but their verbal assertions and body language will be subject to scrutiny after the test is completed. Data generated in this process are analyzed from both qualitative and quantitative perspectives and there are presented in a Usability Test Report,

together with all the data (test performance, verbal comments and body language) to decision makers, in order to get valuable information about product strengths and weaknesses. As a point of observation, qualitative data is very rich and complex and their analysis is usually a lengthy process, while quantitative data is usually more general in nature and is used only as an overview of the phenomena under scrutiny, as the samples used in usability testing are not representative for the consumer population of the product.

In general, in order to have a usable product, this has to be easy to use, its functionality easy to understand and easy to remember. In addition, it has to satisfy efficiently the need that it addresses, to allow for a quick update or correction anytime such an action is deemed necessary, to prevent proactively human errors and recover quickly from detrimental events, and to have an attractive design [12]. And, what is most important to keep in mind, is that users are those who determine all these product qualities that make up a usable product. Researchers alone, even experts in usability testing or a certain product's industry cannot establish, by themselves, whether a specific good is going to be perceived as usable or not.

In order to bring to market a usable product, usability testing has to be performed during its entire life cycle, starting with the design and implementation phases up to the last revision [8]. All the usability related attributes have to be considered at all times in a product's life cycle, and iterative designs and implementation phases are almost unavoidable, as they are needed to correct late usability problems identified in successive testing phases.

Usability testing is done using several different approaches, but all have a number of similar characteristics [15]:

- their scope is to increase the perceived usability for the intended users target of a certain product. This implies a significant improvement of product efficiency, starting with the design and development phases of product life cycle.
- the participants (sample) are selected from a targeted population segment. A typical test includes between 8 and 16 participants per sessions, but it has been argued that most significant data appears even with samples of five persons [19].
- the participants do real, common tasks and activities associated with the tested product. The activities tested must be the same activities expected by the real users of the tested product. This involves the fact that the testing must start with an exploratory research of the target segment in order to identify the uses of the tested product, the estimated frequency of those activities, their environment and trigger influences [18]. From this data test cases are derived, realistic and relevant for the tested product target population. These cases are translated into testing scenarios, which will guide participants (respondents) during tests. These must solve as many as possible utility problems, based on potential worrying issues of the producers and/or problems identified by the specialists in that domain.
- to observe, record, and analyze subjects' tasks performances. The whole activity of the subjects in the testing laboratory is recorded for subsequently comparisons and analyses. Analyses include both commentaries and the performances during the testing process. In some variants of usability testing, the participants are asked to verbalize their thoughts, including reasoning and observations during task performance.
- data resulted from the testing phase is analyzed using quantitative, psychological and behavioral techniques, in order to identify usability problems and, possibly, their potential solutions.
- the information resulted from usability tests is used to improve the qualities, the usability and the production process of the tested good. Thus, a utility test is considered closed only when the information resulted after its application is used in practice to improve the respective product or service.

Usability testing that by their very nature ensures high usability for all products they employ it, so both producers and customers will benefit greatly from their results [20]. Users gain satisfaction from products with a steep learning curve, which allows maximum ease of use. Producers and sellers gain by increased sales, brought on by improved customer satisfaction, on both products that have been subjected to usability testing and other company products, which will benefit from a better corporate image, increased customer awareness, scale economies in later life cycle stages, lower customer care costs, as well as a more focused and less extensive update process [17].

As a result, the customer are the first to notice the improvement of product usability and, in many cases, usability is a more significant factor in buying behavior than price, or even functionality [2]. Positive experiences with any kind of product or service are very important in customer loyalty, leading to significant increases in customer lifetime value, not only in regard to a certain product that benefited from usability testing input, but for all of those companies' products. The same stands true in reverse: negative usability experiences lead to loss of sales and a diminished company image, not only directly from those dissatisfied users, but from their friends and acquaintances as well, through word-of-mouth [3]. Longtime organizational success relies on customer loyalty and customer satisfaction and product usability is paramount for both.

Marketing research on the other hand, as the first function of marketing, is long established as a mandatory tool of competitive market success [1]. It aims at identifying threats and opportunities from outside the company, strength and weaknesses from within. The European Society for Opinion and Marketing Research (ESOMAR) defines marketing research a "a key element within the total field of marketing information, which links the consumer, customer and public to the marketer through information which is used to identify and define marketing opportunities and problems; to generate, refine and evaluate marketing actions. Marketing research specifies the information required to address these issues, design methods for collecting information, manages and implements the data collection process, analyses the results and communicates the findings and their implications" [7]. As it is easily observed from the usability testing description made in the previous pages, all these attributes can be easily attributed to usability testing, making it a textbook tool of marketing research.

In general, marketing research is employed to identify opportunities and problems and to generate and refine marketing actions, a distinction used to classify marketing research into problem identification research and problem-solving research.

Marketing research is usually separated in qualitative and quantitative. We argue that usability testing can be assimilated to qualitative marketing research, an assumption explicitly refuted by Jakob Nielsen, one of the leading figures of usability testing today [14]. Distinction between qualitative and quantitative analysis is usually based on the possibility of numerical analysis on data generated by marketing research [4]. The term qualitative research is loosely used to refer to research whose findings are not subject to quantification or quantitative analysis. More significant might be the fact that qualitative research is characterized by small samples, while quantitative research uses large, statistically significant samples of data. In essence, many managers are reluctant to base important strategy decisions on small-sample (qualitative) research, because it relies so greatly on the subjectivity and interpretation of the researcher [11].

Qualitative research encompasses a variety of methods that can be applied in a flexible manner, to enable participants to reflect upon and express their views or to observe their behaviour. It seeks to encapsulate the behaviour, experiences and feelings of participants (just like usability tests) in their own terms and context [10]. Qualitative research is based on a set of ideas and associated methods from the broad area of psychological sciences [5], used to gain access to individuals' subconscious and unconscious levels. So, while individuals may present a superficial explanation of events to themselves or others, these methods sought to dig deeper and penetrate the superficial. At the same time, qualitative research analysis aims to gain a holistic understanding of the world-view of individuals tested.

Qualitative research techniques are usually classified as direct, which assume that the purposes of the research process are disclosed to the participant or are obvious, given the nature of the interview, which consist mainly of focus groups and in-depth interviews, and indirect, where the purposes of the research are disguised from the participants, in order to obtain more "genuine" responses and reactions, which include observation, mystery shopper and ethnographic techniques.

The following table offers some of the main characteristics of usability testing, in the context of qualitative and quantitative marketing research attributes, as presented by Carmen Bălan in Cătoi et al (p.84) [4].

No.	Comparison criteria	Qualitative Marketing Research	Quantitative Marketing Research	Usability Testing
1	Research objective	Understanding of marketing phenomena, identification of motivation	Data quantification and extrapolation of data for the entire population surveyed.	Identify usability problems and how to eliminate them.
2	Sample size	Small	Large	Small
3	Amount of Information from each Respondent	Substantial	Varies	Substantial
4	Requirements for administration	Interviewer with special skills	Interviewer without special skills	No interviewer
5	Type of analysis	Subjective, interpretative	Statistical, numerical	Subjective, behavioral
6	Hardware	Audio & video recorders, pictures, discussion guides	Questionnaires, computers, printouts	Audio & video recorders, motion trackers, test cases
7	Degree of replicability	Low	High	Low
8	Researcher training	Psychology, sociology, social psychology, consumer behavior, marketing, marketing research	Statistics, decision models, decision support systems, computer programming, marketing, marketing research	Psychology, sociology, computer programming, decision support systems
9	Type of research	Exploratory	Descriptive or causal	Exploratory and causal
10	Data acquisition model	Unstructured	Structured	Unstructured

Table 1: Usability Testing characteristics in the context of Qualitative and Quantitative Marketing Research

As it can be observed from Table 1, third and last columns are almost identical, and we can conclude that a usability test matches most of the qualitative marketing research criteria. We must keep in mind that even some marketing research tools imply the lack of an interviewer, for instance surveys done using online or mailed questionnaires. In addition, some ethnical research techniques imply the use of test cases and scenarios, just like usability testing and the skills required from a researcher imply a mix of qualitative and quantitative analysis. And, what it is most important, the scope of marketing research is not limited to general information about phenomena [9], but goes into as much detail to uncover causes, predict patterns and discover solutions for all problems investigated.

At this point, qualitative researchers are count amongst their tools instruments such as in-depth interviews, focus groups, brainstorming sessions, mystery shopper, and customer observation. I believe it is time to pay serious attention to the newest arrival in this family – usability testing – a technique targeted to IT&C products, but which can be successfully employed in a large number of market research areas.

The changes which took place on an international level at the end of the XX-th century determined the amplification of the economic, social, political challenges which gave to be managed by the municipality according to the interests of the local communities, taking into consideration that the competition between the towns has become more and more powerful. Presently, the urban marketing has become a remarkable feature for the local economic development strategy and it is used for many economic and social objectives, but also for the creation of some positive image for the community, attracting companies, institutions, tourists, labour force representing “a measure by which one can conquer some profitable markets after analysing the potential needs and making for these an adequate offer”.

Key words: urban, marketing, tourism

Introduction

Starting from the premises that, in a broad sense, the urban strategy focuses on setting some objectives for the development of the towns from the perspective of the systematization and planning of new human settlements, beyond reporting to the general objectives of the economic-social development, of using the management instruments and techniques in managing the activities, it is necessary an analysis from the marketing perspective which should be argued by the fact that the town can be seen as a product having a life cycle, being more or less attractive for inhabitants, investors economic operators, visitors, etc.

Urban marketing

The changes which took place on an international level at the end of the XX-th century determined the amplification of the economic, social, political challenges which gave to be managed by the municipality according to the interests of the local communities, taking into consideration that the competition between the towns has become more and more powerful. In this context, urban marketing presupposes choosing some adequate ways to project and organize the towns in order to satisfy the needs of the target groups which are interested in the urban development. So, urban marketing aims at all the elements of the town as a system: - The town as a character – the strategies have to contribute to the growth of the attraction by creating some aesthetical values; - The town as an environment – building the basic infrastructure which should be compatible with the environment; - The town as a services supplier - the development of the basic services according to the requirements of the users; - The towns as a place for entertainment and recreation – providing the with town cultural attractions both for the inhabitants and for the visitors.[2]

The town also has some resources which to be used as efficiently and rational as possible, and have to meet the requirements of the inhabitants. On the other hand, the urban functioning can also be provided through a well-managed marketing process which should include many action stages, and set some aims and strategies referring to the relations between the economic, social and institutional environment, the level of the markets and the relation between the supply and the demand.

Presently, the urban marketing has become a remarkable feature for the local economic development strategy and it is used for many economic and social objectives, but also for the creation of some positive image for the community, attracting companies, institutions, tourists, labour force representing “a measure

by which one can conquer some profitable markets after analysing the potential needs and making for these an adequate offer”[2]. Besides the profitability criteria, the welfare of the urban communities has to be the main priority for the urban policy, the economic development representing an increase of the incomes of the inhabitants, but also a direct or indirect collecting source of the fiscal resources which can improve the public services and the quality of life. [1]

In order for the markets which are rapidly changing to be competitive, the communities have to set the local development strategies from the marketing perspective, being an indispensable element in the frame of the urban strategy, contributing to this vision and this leads to attracting new national and international companies, consolidating the infrastructure, developing the tourism, diversifying and improving the services. The development vision of the town represents the evolution settled according to the requirements and needs of the citizens, and it influences all the actions of the municipality contributing to the formation and promotion of the identity of the town as an attraction factor, segmentation and differentiation segment which increases and stimulates the competitiveness of the town. Urban marketing mainly comprises the following activities: - planning the adequate combination of features and community services; -offering some attractive incentives for the current and potential buyers, but also for the users of the goods and services; -delivering the products and services in the town in an efficient and accessible way;- promoting the values and the images of the place so that the potential user could be aware of the different advantages that the place offers [2].

The development vision of the town represents the evolution settled according to the requirements and needs of the citizens, and it influences all the actions of the municipality contributing to the formation and promotion of the identity of the town as an attraction factor, segmentation and differentiation segment which increases and stimulates the competitiveness of the town. The long term solution presupposes the improvement of four essential marketing factors, which are to be found in any community: - The warranty for the basic services supply and for the maintenance of the infrastructure for the benefit of the citizens companies and visitors; - Creating new attraction elements which should lead to an improvement of the life quality, should justify the help from the state and the existing companies and which should draw new investments, companies or inhabitants; - Promoting improved features and living conditions through a strict image and communication program; - Obtaining the support from the citizens, leaders, and existing institutions in order to become an attractive place for the new companies, investments and visitors.

So these marketing factors can influence the chances of the towns to attract and satisfy the five potential target markets: the manufacturers of goods and services; company headquarters and regional premises; foreign investments and export markets; hotel and accommodation industry and new inhabitants.

Strategic planning in urban marketing

The strategic market planning starts from the premises that the future is very uncertain. “The challenge” to which the community has to respond is to create a functional system that can absorb the shocks and adapt very quickly to the new evolutions and possibilities (the evolution of the industrial cycles, the frequent changes which happen in the global economic, political and technologic context and the decline of the urban space).

The traditional tasks of the state have passed through a strong process of changes, the public managers being confronted with the growth of the budget deficits, the increase of the public expenses, the reduction of the financial support from the central budget. Because of these, the municipalities are forced to adopt and apply some instruments and techniques which are specific for the business environment; this transformation takes place by creating some special organizational structures and carrying out some specific processes. Using the urban marketing as a part of the urban development strategy becomes an indispensable condition for the strategic objectives.

The communities are forced to re-conceive the premises for the future, to find out more about the clients, if they want to be successful in attracting and retaining the economic operators and the inhabitants, in exporting the own products, promoting the tourism and the investments. Each town assumes to be competitor in a competitions where there are many rivals and to improve the competitive competencies. The communities have to respond to the change, rather than to oppose the change and adapt to the forces of the market and not ignore them. [4]

The strategy of the urban marketing is considered to be part of the urban public policies, having this position from the beginning of the preoccupations regarding the development of this specific field of

marketing. This strategy can be complete only in a strong correlation with the ante- and post-implementation activities, the defining elements of the urban environment and the other sector public policies. Setting the marketing strategy is a sequential process which takes place in five steps: auditing, setting the vision, formulating the strategy, setting the operative plan, implementation and control. [5]

Elaborating a marketing strategy presupposes that the town and the community have identified the local economic profile, and have made up a certain vision of development and have defined the strategic objectives; the public funds are also guided to support the development of the identified competitive advantages; that the public investments validate the directions of development which are presented as a strategy. All these can be found in a dynamic pack of urban goods and services, for competitive prices and which aim at certain markets and which are promoted in order to gain those markets.[3]

The marketing mix in the town development strategy

As it has already been shown, the approach of the problems referring to the urban development from the marketing perspective is actual and convenient making thus possible the closeness to the requirements of the beneficiaries (residents and visitors) at the same time with the allocation of the resources. Urban marketing can be understood as an instrument of the economic development for a certain geographical region, this presupposing the identification and the particularization of a coherent methods of specific operational instruments.

From the internal forces which influence the structure of the marketing mix, the following stand out: the technical and the financial resources of the municipality, the organization, the coordination and control of the marketing activity, the organizational structure of the planning and implementation groups, the methods and the public management quality. It is essential the capacity of the municipality, as an organizing and coordinating institution, to define the role of each actor and its way of action in order to guide them to attain their purpose. The municipality perceives the characteristics and the changes of its environment concentrating, with the help of the marketing policy, to adapt its decisions as much as possible to the exigencies of the market, in order to increase its competitiveness degree.

Product policy

In the case of the exchange relation from the urban marketing, their objective is not a simple product, so in this case we can only discuss about the global problems which can be on one hand the geographic space which includes the infrastructure, the activities, the socio-economical context and on the other hand other important factors and characteristics which are specific for the community (the services that they offer, the infrastructure for certain positions etc.). Starting from the well-know typology for the tourism products, one can talk about the town as a complex tourism product, including the attraction, facilities etc., and the town as a host for some tourism events (cultural or sports events, etc.). The product of the urban marketing is a complex pack of goods and services proposed and offered by municipality, which generally contains information about the public services, investment offers, tourism and cultural activities etc. Planning and creating the urban products/goods is accomplished according to the market researches which have been carried out, to the internal competence of the community without omitting to meet the exigencies and the requirements of the demand. The towns are forced to adopt a market perspective which would refer to the product and its customers and to generate their own resources by selling their services and to diminish the costs, but not the quality of the services. The product represents a combination of the characteristics of the community, products, services, natural environment and resources. The urban settlements can be considered products as long as they provide for labour force, land, basic infrastructure for the economic activity, offer houses, commercial services, and entertainment activities which contribute to the social environment for its inhabitants. In the public sector, the town is seen as a common good which has to be developed according to some public policies and to an efficient public management. The product in the urban marketing may also represent the benefit which the community perceives after using the entire public policies. The problem of the urban marketing product results on the other hand from the intervention of the political factor in determining the public policies. The product policy of the town has to take into account some segments, and the establishment of the policy is a hard process which presupposes the harmonization of all interests which can resemble, can be complementary or competitive. The creation of the product contributes to the adaptation of the perception of the public on the town, this stage being a part of the process to modify the image of the town. The urban product has to sustain the town in the inter-urban

competition which takes place at an international level, pointing out the uniqueness of the local community.

Price policy

The price strategy is the municipality preoccupation to provide a certain position in relation with the other towns and to correlate it with the help of an adequate report with the costs that it generates. Among the elements of the mix, the price variable is marked by an extremely complex character determined by its specific way in which the supply and demand relation is reflected, by the relation with the urban product and the urban economic development strategies, the promotional role, and the effects on the other variables of the mix, its perception towards the market segments, etc. Generally speaking, the price refers to the value of the land used for building houses or to the costs which appear after finding new economic activities. The level of the price can be settled for all the types of goods and services offered by the town to its current or potential markets: accommodation, transport, cultural, educational, sports, entertainment activities, etc. The following factors exert a strong influence on the price policy: - the administrative decentralization and the relocation of the responsibilities from a central level (the municipalities experienced an increase in attributions, but did not benefit at the same time from the financial support from the central level); - the diminution of the financial transfers from a central level to a local level; - the national and international unstable economic climate; - the growth of the social problems (unemployment, criminality, mortality) which determines the costs growth and the allocation of the financial resources to the prejudice of the investments; - the imbalanced development of some areas from the urban region e.g.: the resources can be oriented to the outskirts in order to prevent or diminish the negative effects of the social problems; because of the existing imbalances one cannot create an equitable system of distribution of the costs for the urban product); - the economic and demographic structure of the town; the stage from the life cycle of the urban product; - the costs for the expansion for the urban region; the costs for the regeneration of the urban product. The price policy is almost dependent on the product policy. In the urban marketing the main problem is represented through the costs which are supported by the municipality/community (social, economic, ecological) in order to support a small price for the urban product or even its free delivery. Under these circumstances, setting an efficient price policy assures both the attraction of the community but also the balanced development of the global urban product (the avoidance of some differences generated by the financial support for some elements of the global product to the prejudice of other products).

Distribution policy

Distribution in urban marketing presupposes the development of some integrated marketing strategies which aim at all the markets from the local communities. These markets can be personalized as it follows: tourists (rest, business travels, participation in conventions, other purposes); the current and the potential inhabitants of the town; trade and industry (new businesses, industrial branches, business people which should offer new jobs and investments in the community); the export markets (target markets where the products will be traded, the service of the town). Starting from the conventional distribution system, the distribution channels from the urban marketing can be organized according to different types of complex distribution systems (marketing systems): - the vertical marketing system, which contains the municipality and one or more economic agents and one or more public institutions which act as a unitary body; - the horizontal marketing system which presupposes that two or more enterprises, public institutions from different branches of activity to reunite the material, financial and human resources (under the municipality control) in order to capitalize a market opportunity or to cover a market segment.

Most of the times, the distribution activity from the urban marketing presupposes some public-private partnerships between municipality and different specialized organizations from the marketing field or the economic development. Another important aspect of the distribution in the urban marketing is to create the necessary facilities in order to grow the degree of accessibility to and from the urban regions. From this point of view, distribution represents the reunion of all means of transport, communication, infrastructure which provide for the access to the urban facilities: transport (by air, ship or road) telecommunications (telephone, internet, television, postal services), the corresponding infrastructure, a network of agencies/institutions which should mediate the relation between municipality and the target segments.

Promotion policy

Generally speaking the visual elements of the town have to reflect the image which the town wishes to communicate. These elements have an essential role because they provide for the necessary circumstances for the relation between municipality and the “consumers” of urban products/services, and the constructions also contribute to the image, through their aspect. But the physical elements are not enough to form a brand. Concentrating the attention on the physical elements is easily to accomplish because the towns have focused their attention on the buildings, architecture and urban landscape. In spite of this, neither the image nor the attraction elements can compensate for certain deficiencies. The specialists in urban planning are interested in the urban design - the architecture of the buildings, the open spaces and the degree of use of the field, the streets and the circulation, the degree of cleanliness and the quality of the environment – as defining elements for the urban global product. Among the elements which contribute to the image of the city, there are: -

- *Events, festivals* – represent the most active and widely used elements for the image of a city. These elements contribute to the improvement of the perception of the image of the city, if this is, in its turn, is sustained by the distinctive features of the urban community (the architecture of the town, the functional delimitation, personalities from the cultural, scientific and sports life, symbols of the city, recreation and entertainment activities, etc.).
- *The policies of the municipality* – the way of setting and implementing these policies has a profound impact on the relation between municipality-community and the external environment. It is essential to have a good relation with the central government, the local community, the local, national and international institutions, the business community, mass-media and the other towns, in order to maintain a good image of the city.
- *Investments, living standard* – a clear and strict brand strategy will help the municipality to draw foreign investments, high qualifies personnel, financing for public projects etc. It is certain the fact that the placement of the private companies is determined by a series of factors, of which we mention: the quality of the living standard, the image of the local business community, the opportunities to diversify and develop the business, the education, the urban infrastructure, the quality of the environment.
- *Culture, historical vestiges* – the urban elements which carry the print of the historical evolution (monuments, public spaces, museums, statues) are attractive elements for tourists, investors, institutions, world-wide known personalities etc. They also can have a significant influence on the perception of the consumers of urban goods/services.

As a conclusion for the presented facts, one can assert that the tourism function of the urban settlements lies in two major components: the *urban management*, which refers to the activity of the public administration regarding the provision of the quality of life under the circumstances of accomplishing a urban, sustainable development and the *urban marketing* which includes the settlement and the development of the relations from the social, economic and institutional environment with the balance of the relation between the supply and the demand. So, the adoption of the marketing policies contributes to the growth of the quality of life in the urban centres with the help of some actions related to the preservation of the natural environment, the development of the entertainment areas, the reconstruction of some damaged sites and their reassignment for the use of the community, the rehabilitation of the historical centres, of the museums and the archaeological sites, the introduction of the museums and local sights in national and international tours, the development of the goods market and of the central trade areas, the increase of the cultural attraction and of the special events, and the promotion of the participation in economic and cultural exchanges on the international market.

The attractiveness of a tourist city is determined not only by the tourism heritage values or by the specific facilities, but also by a series of factors related to the growth of the quality of life, the vision towards the development of the city which contributes to the establishment of a favourable image abroad and is one of those factors which determine the economic and social success and also leads to the growth of the competitiveness. At the same time, the attractiveness of a tourist destination is connected both to the quality of the natural resources and of the services, but also to the aesthetic environment, the latter being understood as the personalization of the sights by the means of architecture and landscape art. If we refer to these aspects, one can say that the development of a coherent and uniform strategy for the urban tourism design which has as an objective the harmonious integration of the tourism in the assembly of the urban

functions constitutes a fundamental objective for the urban development strategy. Under these circumstances, the tourist urbanism, as a part of the general urban planning program for the territory and the towns, has to respond to the necessity of working out some adequate solutions of planning and organizing the town, thus creating the proper frame for the development of the tourism and its progress as a growth factor for the competitiveness of the towns.

THE IMPACT ANALYSIS REGARDING THE MARKETING ADVERTISING OVER THE GROUP DACIA

Paicu Claudia Elena

Academy of Economic Studies, Faculty of Economics, Romana Square, no. 6, sector 1, Bucuresti, e-mail: claudiapaicu@yahoo.com , tel. 0722 690 880

Abstract. Specialists consider that we live in a brand background. An invasion of consumers' minds occurred, to the most personal and intimate place in their minds. As a reaction to this aggressive form of advertising and mind invasion, people started to have a negative attitude towards commercials. People who work in advertising must be aware of this danger and have to be careful in the advertising campaigns not to bore, not to pollute, not to over inform. I present in this paper a new perspective of advertising, analyzing the effect of tradition, creativity and innovation in advertising. To support all these ideas I present a case study on the advertising campaign of Dacia, showing also the effects of these campaigns over the sales of Dacia.

Key words: advertising, creativity, innovation, tradition, impact analysis

Advertising – general characteristics

Nowadays specialists consider that we live in a brand background. They also say that a study has been done and according to its results a third from the world's revenues is in people's minds as brands. [Newman M.: Salturi Creative. 10 lecții de advertising efficient inspirate de Saatchi & Saatchi, p. 31] An invasion of consumers' minds occurred, to the most personal and intimate place in their minds. The consumer is daily assaulted by an enormous amount of commercials: from 1600 even to 3000 commercials.....this happens in the conditions in which the percentage of memorizing is very low, only about 1%. In figures this means only three or four messages a day, the rest being elapsed. The same specialists support the fact that printed information is doubled every four years, according to estimations, it will double every two years. [Newman M.: Salturi Creative. 10 lecții de advertising efficient inspirate de Saatchi & Saatchi, p.33] As a reaction to this aggressive form of advertising and mind invasion, people started to have a negative attitude towards commercials and brand promotion. From this point to consider advertising a form of contamination, despising commercials is a step away, very easy to complete. People who work in advertising must be aware of this danger, of the attitude consumers started to have towards commercials and have to be very careful in their promotion campaigns not to bore, not to pollute, not to over inform. Only being aware of this situation one can realize a quality advertisement, which is not a threat to the public's comfort and tranquility. Also, quality advertisement can spare huge amounts of money. Only those who are aware of this situation and start working by considering new approaches will succeed in creating efficient, quality advertisement.

Creativity, innovation and new things in advertising. Tradition and creativity in advertising.

In these conditions, creativity, innovation and new things become basic characteristics of advertising, without them a certain product cannot be promoted. Only by an original idea, a new and innovating concept, an advertising campaign can reach its goal. A successful formula combines tradition with creativity. [Bălănescu O.: Tradiție și inovație în publicitate, in Comunicare și Cultură: Aplicații interdisciplinare, coordonator Rogojinaru A. p. 50,] Tradition on one hand transmits a feeling of trust regarding the organization or the product advertised; tradition suggests longevity, reliability, stability, experience, characteristics that must exist in any commercial. Creativity completes the traditional element, offering novelty, innovation that the product needs in order to have access to the audience. Curiosity must be used, speculated to get the audience's attention as it is always interested in novelty.[Bălănescu O.: Tradiție și inovație în publicitate, in Comunicare și Cultură: Aplicații interdisciplinare, coordonator Rogojinaru A, p. 55]

Therefore, tradition assures continuity, safety and quality in time, as innovation and creativity maintain the product in trend, compatible with the modern society, constantly changing and searching for novelty.

Creativity and innovation bring tradition in present time, correlating the past with the present but also with the future. The best example of combining tradition with novelty, creativity and innovation is given by Dacia.

Dacia - general presentation

Dacia represents a 100% Romanian brand; [BusinessWeek, nr.29, p. 32] it is the Romanian traditional car. It sums up 40 years of history and tradition. Since it was founded, in the year 1966, Dacia has registered numerous and various transformations. The biggest change that drew to a lasting innovation of the entire range of products was in the year 1999, when Dacia becomes a Renault branch. Starting with 2004 Dacia proposes a range of new vehicles, with an unbeatable quality/ price ratio. Due to this original offer, the commercial success was beyond the initial expectation, and the sales are in a continuous growth: between the years 2003 and 2007, the sales tripled; in 2007, the sales of the aforementioned brand grew an additional 17% compared to the year 2006. Conceived to answer in the best way possible to customers' needs, on the new growing markets of the Renault group, Logan has already seduced a large part of the international market. In two years since it was launched, the new model of Dacia, Logan, has become known on four continents: Europe, America, Asia and Africa being commercialized in over forty countries. The success registered until now has determined a new growth of the production capacities. Produced at the moment in Romania, Russia, Columbia and Morocco, Logan shall be produced very soon in Iran, and starting with 2007, in India and Brazil. In Iran, Logan shall be assembled by two local constructors, Saipa and Iran Khodro. In India the agreement signed this year with Mahindra & Mahindra was aimed at elaborating a new version of Logan with the steering wheel on the right side. At the same time the plants in Mioveni and Moscow shall enhance the production capacities: the plant in Mioveni shall reach 350.000 units produced annually, compared with 200.000 at this moment, and the plant in Moscow shall reach 80.000 units per year compared to 60.000 at the moment.

The Dacia brand continues the strategy founded on an original business model "at a low price": all the decisions regarding the concept/ engineering, the production and commercialization have as a starting point, the value for the client. This way, all the costs are reduced if the following principle is respected: the client receives from his vehicle everything that he was looking for, but at a reasonable/ acceptable price. With a wide range, of affordable vehicles, modern, reliable and robust, Dacia presents itself as a generous and ingenious brand. Generous, because each of its products offers a record interior space at an affordable price. Ingenious, because with a rage of attractive vehicles at low price, Dacia has always known to anticipate the needs of practical customers. Dacia is a brand of the present or a brand that gets ahead of its competitors and turns into profit the opportunities offered by the market.

Starting with 2008, Dacia shall propose a range of five vehicles, Dacia Logan, Dacia Logan MCV, and two utilitarian vehicles Dacia Logan Van and Dacia Logan Pick-Up and the new Dacia Sandero. The positive responses for Sandero with the foreign specialized press, immediately after launching it at Genève were quick. On every market where it shall be available, Sandero shall be positions, in terms of price, in the segment of the small class, with an interior space situates nevertheless in the superior category of the compact sedan.

Among the competitors of Sandero is also Renault - Clio 3, with a price that varies between EUR 8.800 and 11.500, Skoda Fabia (EUR 8.000 to 13.500, Volkswagen Polo (EUR 8.500 - 16.000) or Peugeot 207 (EUR 10.500 - 12.500). In Germany, Dacia Sandero shall cost EUR 7.200, and in France a price of approximately EUR 8.000 is expected. Dacia officials have not yet made public the price on the Romanian market, but mentioned that it shall be comparable with the price of the Logan.

The advertising campaign of Dacia.

In time, Dacia has had several advertising campaigns, which proved to be successful. In general, the advertising campaigns for Dacia are a combination of tradition and novelty, creativity and innovation. The tradition stands up for the quality, in time, of Dacia and the innovation brings tradition and history into the present. As a result, we have a successful advertising campaign over the years.

By advertising campaigns the brand image is presented to the audience and also, the products - Dacia Solenza, Dacia Logan, and services - Dacia assistance and original pieces. Since 2002 Dacia have won some important prizes for some of its advertising campaigns in the press, outdoor, TV, and radio. These

prizes were obtained as the consequence of a fruitful collaboration with Graffiti BBDO Agency. Here are some examples of rewarded advertising campaigns:

Best Print

2002- AD'OR prize for the best print in auto vehicle category. As we can see, the print presents the elements that remained unchanged over the years, even though the aspect of the car (the image) suffered numerous changes in time, the three pedals – the same old car.

Refrigerator - Best Poster

2003 rewarded Dacia with an AD'OR prize for the best poster –Refrigerator- collateral category. Another successful ingredient: the combination between the old and the classical refrigerator and the idea of cold: the air conditioner; a combination between tradition, represented by the old refrigerator, and novelty, the air conditioner.

Iron Teeth – Best Print

2003 brought also international consecration by Dacia campaign Iron Teeth, winning the grand prize at print category, in Golden Beach Albena in Bulgaria. Innovation was the central idea for this campaign.

Try it and we'll see – Gold in the non-alimentary consume goods

2004 brought a new EFFIE prize: gold in the non-alimentary consume goods category for Dacia Solenza campaign- Try it and we'll see

The hitchhiker – Nominalization

2005 brought nominalization to best TV spot in auto vehicles category, the hitchhiker spot, Dacia assistance.

The hitchhiker - silver prize at diverse category

2005 Dacia won silver prize EFFIE at diverse category for Dacia Assistance campaign- for off brands. This campaign was really a simple one, which used humor as the main ingredient. As a result, the tv spots were original and transmitted a simple but clear message: whenever you need, Dacia Assistance is there for you...still, it will be much better if you don't need it!

Dacia Logan changes your life campaign – silver at durables category

2006 was a very successful year, the campaigns obtained two important prizes. Silver in EFFIE prizes for durables category, Dacia Logan changes your life campaign, the highest distinction awarded ever.

Logan ABS – Best Print

2006 also brought an AD'OR prize for the best print at auto vehicle category, Logan ABS.

Dacia Logan MCV – bronze for durables category

2007 brought the most recent prize for Dacia: bronze in EFFIE prizes for durables category, Dacia Logan MCV.

It is very important to mention that for four years Dacia managed to constantly obtain prizes for its campaigns, as a result of a successful combination of creativity and tradition. For all the EFFIE editions, until now, Graffiti BBDO and Dacia were rewarded for their campaigns. In 2004 gold for Dacia Solenza campaign, 2005 silver for Dacia Assistance, 2006 silver for Logan Diesel changes your life and in 2007 bronze for Logan MCV. EFFIE prizes mark the acknowledgement of marketing and communication efforts Dacia puts as a background of its image and performance and also the consequence of Graffiti BBDO Agency in building a constant platform for communication and strategy recognizing the new image, modern and successful of the producer.

The impact analysis regarding the advertising campaigns of Dacia

On the Romanian market, in time the sales have registered a spectacular growth, as a result of the well organized marketing campaigns: In the year 2004 was registered a sale of 22.833 units of Dacia Logan. With the success of Logan, Dacia accomplished a growth of sales of 38, 6% and consolidated its position as leader in Romania and also got a strong recognition on an international scale. In the year 2004 a total of 95.296 units of the brand Dacia were sold, a growth of 38, 6% compared to the year 2003, of which 80.013 units were sold in Romania. Dacia has reached as such a market quota of 46, 5%. In 2004, Dacia exported 15.283 vehicles, registering a growth of over 26, 2%. This success, in Romania as well as over the borders, is the result of an offer influenced by the successful launching of the Logan model and of the extremely good sales of the Solenza model. The growth release is based upon the commercial red that was totally reconstructed and that today is one of the most modern in Europe. (In the year 2007 in Romania, Dacia has over a hundred sale points, of which 17 were opened in 2007). A very important contribution was the complete product offer, from the Dacia Original Spare Parts to the maintenance and repair services, without forgiving the offers for finance. These results offered very good perspectives for the year 2005, aspect subsequently proven. The success of the Logan model gave the chance to the constructor Dacia to realise in 2005 one of the largest sales of the history of the brand. Dacia consolidated as a consequence its top position in Romania and received a powerful affirmation on four continents: Europe, America, Asia, Africa and over fourteen countries.

In 2005, Dacia exceeded all the sales plans so far, on the Romanian market, as well as on the international one. As a grand total, Dacia has delivered 163.899 vehicles of which:

- 113.276 units sold in Romania, Dacia reaching a market quota of 45%
- 50.623 vehicles exported, registering a growth of 210% compared to 2004. This result indicates a growth of over 70% compared to the 96.296 units sold in 2004.

In the year 2006, Dacia registered sales of 190.371 units, and in the year 2007 Dacia sold 230 164 vehicles, approximately 17% more than in 2006, of which 128.365 being exported, as presented on the table below:

Model	Logan berlina	Logan MCV	Logan Van	Total
Romania	76.785	18.164	6.850	101.799
International	64.801	63.078	486	128.365
Total	141.586	81.242	7.336	230.164

The number of sales for the year 2007

So, the sales of Dacia maintain a rising tendency, translated into a growth of 17% in 2007. In Romania, Dacia keeps the leader position with 101.799 vehicles sold in 2007. In the same year, two limited series of Logan enjoyed a large success: Logan ABS +, that proposes additional security equipments) and that represented between 20 to 25% of the sales of Dacia in the period lasting from April to December 2007) and the limited series Logan Kiss FM, with radio CD MP3, series dedicated to a younger public (and that represented, since the series was launched, in April, 2007, 16% of the Dacia sales).

In Western Europe the growth is even more important, of 67, 9%, due to the success registered by the model Dacia Logan MCV. In 2007, Dacia has registered a growth in sales in the Western Europe. The sales have grown with 73, 9% in France (32.684) and with 174, 8% in Germany (17.517), especially as consequence of the success of the model Logan MCV on the aforementioned markets. In Morocco, Dacia holds a second position immediately after Renault, with a market quota of 12, 4%, but on the Moroccan market Dacia Logan is the best sold model. Dacia continues to develop also in Ukraine, where the sales have reached in 2007 a level of 9.350 units, representing a growth of 58% as compared to the year 2006. Based upon the sales registered by Dacia in the year 2007 we can realise a classification:

Position	Country	Sold units (Logan)
1	Romania	101.799
2	France	32.684
3	Germany	17.517
4	Maroc	12.638
5	Ukraine	9.350
6	Algeria	9.090
7	Turkey	8.951
8	Spain	7.748
9	Italy	4.971
10	Bulgaria	3.014

Top of Dacia's sales in the year 2007

The year 2007 was an important year also due to the fact that the magazine "L'Automobile Magazine", February edition 2007, that placed the Logan model on the first place regarding quality and performance, "compact" class. The official guide "Quality/ Performance 2007" published by the French magazine, analyses over 120 models and over 31 different brands.

Regarding the sale points/ dealers, the brand Dacia beneficiates from a commercial network with a very good coverage in all the countries where it is present. In Romania, Dacia has over 100 sale points, of which 17 were opened only in 2007. On the other markets, the brand Dacia is supported by Renault, very compact network and that is working at a professional level. In Western Europe, the number of dealers that sell Dacia is larger than 1100. In France, two dealers have decided, in 2007, to create separate sale points for Dacia.

At the present time, Dacia is available on over fifty-one markets, from Europe to Africa, through Maghreb and Turkey. In March, the brand Dacia shall make its entrance in Portugal and in Scandinavia (Sweden, Netherlands, and Finland) until the end of 2008.

Negulescu Cristian

University of Piesti, Faculty of Economic Science

From '90s many researchers was interested in a new concept: market orientation. First academics, which studied this concept was Kohli and Jaworski (1990), Narver and Slater (1990). Beginning whit their theories, many others academics and practitioners show a growing interest for this concept and for how the implementation of this concept can improve the performance. Marketing literature contains many definitions of the concept some of them being divergent concerning whit what is market orientation and how could be implemented in the organization. This proves the complexity of the market orientation concept. Beginning from the most important researches from the field, through this article, we propose to emphasis the most important element that show the interdisciplinary and complexity of the concept.

Key wards: market orientation, marketing concept, interdisciplinary approach

Marketing and management researchers pointed out, beginning whit '90s, the benefits of implementation of a new business philosophy – market orientation. The concept was the topic for many researches from different economic fields, like as: marketing (Nerver and Slater, 1990), strategic management (Piercy, 1997), marketing management (Dozle and Wong, 1998), human resources strategic management (Atuahene- Gima, 1996), organizational culture (Harris and Ogbonna, 1999) and public sector (Stokes, 2002).

Even if, the concept has an interdisciplinary approach, all academics and managers started from the same point – market orientation is a business philosophy, which connects all the functional areas of the organization to environment in which operates and ensures long-term profitability.

Market orientation was defined in many ways, thus:

- 1.” We use market orientation for emphasize the implementation of marketing concept whitin the organization” (Kholi and Jaworski, 1990).
2. “Market orientation is a business philosophy which finally ensures superior value creation for the customer” (Narver and Slater,1990).
3. „We can say that a firm is market orientated when firm’s culture is governed by values which systematic ensure superior value creation for customer. Practically, this mean gathering the information about customers and competitors and using this information for building superior value for the customers” (S.Slater, 1994).
4. Market orientation is a source of building competitive advantage. If in the past it was considered that competitive advantage is the result of a higher power on the market, economy of scale or the diversity of products range, today it is considered that building and delivering superior value is the key of obtaining competitive advantage. Slater, through his researches, demonstrated that firms which have market orientate culture better manage to build and deliver superior value to the customers.
5. The newest approach of the concept refers to the market orientation from value chain point (Baker, 1999, Grunert, 2002, Simpson, 2001). Market orientation degree of one member from the chain could affect market orientation degree of the others members of the chain. The competitiveness of the entire chain in serving the customers depends on implication of all chain’s members in gathering the information about consumers needs and uses this information for building superior value.

6. In 1996, Tuominen and Moller, pointed out the necessity of an interdisciplinary approach to emphasize the complexity of the concept. They consider that there are many directions in approaching the market orientation, thus: market orientation as a business philosophy, market orientation as inter-functional coordination, market orientation as gathering the information about consumers and competitors and dissemination of the information to all functional areas, market orientation as source of organizational learning.

8. Quintana and Beeril (2001) and Hernandez (2002) emphasised that there are five directions in approaching the concept, thus: as business philosophy, as management process concerning whit the market information, as inter-functional coordination referring to dissemination of market information to all departments from the organization, as an organizational learning source and as a competitive strategy.

9. An extensive definition of the concept was developed by Lado (1998) who considers market orientation as a „competitive strategy that involves all functional areas and levels of the organization and embraces the different market participants”.

10. Because market orientation concept has been defined as an orientation of whole organization to meet consumers’ needs it could be considered as an antecedent of the paradigm of relational marketing. This is sustained by the definition of relational marketing developed by Reinares and Ponzoa (2004) who consider relational marketing as „different actions and initiatives developed by a business towards different agents (consumers, clients, distribution, shareholders, employees or others), or toward a determined group or segment of it, focused on obtaining their satisfaction by offering products and services adjusted to their needs and expectation, including the creation of stable relational channels, created for exchanging communication and value added.....”

11. Reinares Lara and Gutierrez de Mesa created a complex approach framework to analyse the concept, thus:

Different approaches	Characteristics
Market orientation as business philosophy	Market orientation is a business philosophy, which generate behaviours and actions. At the same time, this philosophy is a set of abilities and practices which transform this philosophy into strategies and effective behaviours within the organization
Market orientation from marketing point	This orientation refers to gathering of information about needs and desires of the consumers and about the evolution of the others factors of the environment. The information will be disseminated to all departments within the organization. Adaptation of all functional areas from the organization for meeting the consumer needs and for obtaining consumers loyalty.
Inter-functional coordination of information	Market orientation has five dimensions from this point of view: Customer orientation Competitors orientation Inter-functional coordination Long-term orientation Emphasising the benefits
Managerial approach	The managerial approach points out five dimensions: Organization that contemplates the definition of the structure and its processes The information system, which refers to gathering

	<p>the information, the dissemination of information in the organization and storage of the information.</p> <p>Planning of the environment and its alternatives</p> <p>Control of the external and internal elements and the analysis and control of the deviations among the results obtained and planned.</p> <p>Human resources management by objectives.</p>
Resources and capacities approach	<p>Market orientation improves some higher capacities to understand and satisfy clients, thus:</p> <p>Creation of superior value for customers</p> <p>Gathering information and its dissemination among the assembly of agents related to the business: clients, competitors, suppliers</p> <p>Give priority to response to change in the consumer needs and in the activities of competitors, taking advantage of opportunities and avoiding threats</p>

The relationship between market orientation and marketing concept

Because our purpose is to emphasise the complexity of the concept, we will try to explain the relationship between market orientation and marketing concept.

All approaches of market orientation presented in this article show that some researchers consider market orientation the result of implementation of marketing concept within the organization. So, from this point of view market orientation is a popular term used by marketing practitioners as an indicator of the extent to which a firm implements marketing concept. „A market oriented firm is presumed to have a superior market-sense and consumer-linking capabilities, and these capabilities are presumed to assure them higher profits in comparison with firms that are less market-oriented”(Pedro Reinares Lara and Emma Gutierrez de Mesa Vasquez, 2004).

Marketing concept, considered the basement of modern marketing, show that a firm obtains long-term profitability if identifies consumers needs and satisfies them better then competitors. The advocates of marketing concept argued concerning what the purpose of market concept – to obtain a satisfied consumer.

In the last decades, consider R. A. Heiens, marketing concept was just a controversial topic then a practice for managers. Beginning from the theory of marketing concept, researchers developed the theory of market orientation. As Kohli and Jawroski (1990) demonstrated, marketing concept is a business philosophy, while market orientation refers to implementation to this concept within the organization.

An important part of market orientation literature is dedicated to study the degree of implementation of marketing concept. According what marketing concept the most important element of market orientation is customer orientation. Even if, academics emphasis the importance of consumer orientation, in firms practice managers tend to focus their attention on competitors, so they are competitors oriented. This divergent focusing between academics and managers shows the lack of consensus concerning what what are the components of market orientation and the importance degree of each component.

On the other hand, some researchers consider that market orientation concept is broader then consumer orientation and includes some external factors which play an important part in shaping the consumers needs, for instance, the competitors or the government regulations. Conforming what this opinions, market orientation implies whole organization while marketing concept refers mostly to marketing activities and to marketing department.

From this analyze we can figure that market orientation is a complex concept which can be successful implement within the organization only if the organization operate compliance marketing concept. Also,

we can figure that an organization which operates compliance whit marketing concept is not necessary market oriented.

“In reality, no firms are 100% market orientated. Indeed, the theories on market orientation are idealistic and even then not without flaws (K. Gotthelf, 2005). We are not necessary agree whit the affirmation that market orientation theory is idealistic because many researches demonstrate the importance of market orientation for the long-term profitability and success, but we are agree that the analyzing of this concept don’t have to be “or-or” type. This mean that the firms aren’t only to types: market oriented and others. We consider that firms have different degrees of implementation of market orientation concept.

R. A. Heiens (2005) from University of Sought Carolina Aiken, developed a market orientation typology matrix to emphasis that firms can decide to focus primarily on either competitors or consumers. The proposed matrix includes four different approaches (degrees) to market orientation: customer focussed, marketing warriors, strategically integrated and strategically inept.

Firms which put the consumer first are considered “consumer preoccupied”. As we said, marketing concept promotes putting the interests of consumers first and because of this, consumer orientation is considered the most important element of market orientation. Firms which are consumer focus are interested in long-term business success and are not focus on short-term profits.

As we said, if academics consider consumer orientation the most important element of market orientation, managers are usually competitors oriented. Firms that focus on competitors in their markets analyses are considered “marketing warriors”. First, these “warriors” identify the target rivals, second they identify their own strengths and weaknesses and finally decide if will keep pace or will stay ahead of the rest of the field.

Heiens uses “strategically integrated” term for firms which are focus to the collection, dissemination, and use of both customer and competitor intelligence. In many researches is suggested that the key of success is a balance between the two perspectives, “and firms should seek to remain sufficiently flexible to shift resources between consumer and competitor emphasis as market condition change in short run”

“Strategically inept” is used for firms which fail to orient their strategic decision making to the market environment.

Even if this matrix clarifies that market orientation has different degrees, it is limited because takes to account only two element of market orientation – consumer and competitor orientation.

Conclusions:

Finally, we can figure that market orientation is a complex and interdisciplinary concept.

This concept has different approaches, thus:

1. as business philosophy,
2. as organizational culture,
3. as an organizational behaviour,
4. as a set of effective activities which implies – gathering market information, dissemination to this information to all functional areas within the organization and developing actions using market information;
5. as a practice which focuses activities within organization in three directions: consumers orientation, competitors orientation and inter-departmental coordination,
6. as a business practice which generates long-term profitability and success on the market;
7. as a process of implementation of marketing concept within the organization.

The implementation of this concept within the organization is a long and complex process which refers to all functional areas and all employees, and implies organizational culture change. Through this process the organization is connected to markets in which it operates and become more flexible developing the capacity of adaptation of the environmental changes.

Managers from market-orientated firms have long-term vision about business and are managing through inter-departmental teams. They have to establish a hierarchy of values within the organization, and place the consumer in the top of the hierarchy. They have to motivate the employees to determine them to put consumer first and to organize activities within the organization whit the purpose to explain to employees the importance of customer.

The implementation of market orientation takes time because organizational culture change is a long-term process and the implementation's success depends on the support of entire organization (all departments and all employees).

Market orientation is a concept which can be implemented by any type of firm – no matter the size or the industry in which organization operates.

OPTIMIZATION AND DEVELOPMENT OF RESOURCES ALLOCATED IN MARKETING

Pater Liana

Universitatea Tibiscus Timișoara, Facultatea de Științe Economice, Timișoara, str. Gh. Lazar nr. 34 ap. 54, lianapater@yahoo.com, 0723010061

A certain level of results can be obtained by means of several various combinations of resources. Each of these combinations will achieve a certain level of efficiency. Thus, variable resource ratios can be combined to create several efficient projects with the aim to solve the marketing issues by achieving the objective established. This is a fundamental concept for the system analysis as it offers the motivation for the search of several alternative projects even after a potential solution has been identified.

Advantages, resources, costs, income

For an active company, the offensive strategic alternatives elaborated, based on the marketing opportunities analysis, always define market penetration with existing or new products. Under these circumstances, the matters related to the optimum substantiation of development decisions are for the first time approached by the anticipated marketing.

A certain level of results can be obtained by means of several various combinations of resources. Each of these combinations will achieve a certain level of efficiency. Thus, variable resource ratios can be combined to create several efficient projects with the aim to solve the marketing issues by achieving the objective established. This is a fundamental concept for the system analysis as it offers the motivation for the search of several alternative projects even after a potential solution has been identified.

The choice of the final solution depends on the comparative advantages related to the use of resources and to their comparative cost, not to the intrinsic efficiency of an alternative.

A practical method for the optimization of development decisions is the **cost-advantage method**. In case of two resources, the most simple optimization model for the allocation of resources is given by the cost-advantage comparison method. The model can be further expanded by means of cost aggregation, in accordance with the various *marketing mixtures* analyzed. The cost-advantage comparison method is an analysis where both costs and advantages of certain action alternatives are determined in view to choose the right variant.

Advantages are defined as consequences associated to a result and they are expressed either in kind or in cash, or as psychological or sociological values, or as values of other elements with no quantitative character. The costs reflect the resources spent in cash for obtaining a certain result. The actions are considered as various combinations of resources used by decision-takers for certain purposes. The resources consist of labour personnel, materials, equipment and machines with various degrees of automation. In consequence, an action represents a decision variant for the use of resources in accordance with a certain allocation or modification of the existing resources, as for instance the equipment or the additional personnel.

Advantages can be measured even if they do not have a quantitative character. *The analysis can be done in three different ways:*

1. the advantage is considered as constant while the cost necessary to obtain the advantage is minimized;
2. the cost is kept constant while the achievable advantage is maximized;
3. the cost minimization and the advantage maximization are simultaneous.

Model of constant advantages

The relations cost-advantage can be analyzed through the constant production indifference curve and through the constant cost indifference curve. As in any cost-advantage analysis, a series of sub-models can be also used. The next example illustrates a general model and an approach method which uses sub-models.

A food-processing company can use various combinations of labour personnel and machines to produce, for instance, a new sort of *chocolate, packed in special boxes*, in accordance with the market requirements. In case the advantage is measured in terms of the quantity of goods manufactured and sold and the two resources are substitutable, numerous actions can be envisaged between (1) exclusive use of manual-mechanized labour and (2) flexible, almost complete automation, involving an extremely reduced labour capacity. Between these two limits, the two resources - man and machine, interact and influence each other in terms of efficiency. Each of these combinations can be represented as a point in Fig. 1. The point on the right side of the figure represents the action related to the use of 560 working hours/person and of 11 machines, the general advantage being given by the 400 units of the newly manufactured and sold products. If the number of machines is kept constant to 11 and the labour force is less used, namely 360, 220 or 70 working hours/person, the number of manufactured and sold products will be smaller, namely 320, 260 and 228 units. If both the number of machines and the size of labour force are different, for a given level of unity number, the use of labour force is larger when the number of machines is smaller and vice versa. Due to this substitution, a given level of unity number (advantages) can be obtained by means of various combinations of resources, workers and machines. Forecasting the levels of advantages to result from the various resource combinations can be done by means of the advantage model and the indifference curves.

The equal advantage curves which are in fact indifference curves describe the constant levels of the production sold (fig. 2). For instance, all the points on the upper curve in Fig. 2 constantly express the same number of 400 units. Fig. 2 also shows that the 400 units (also represented in Fig.1) can be achieved under various man/machine combinations. The curve that links all the points for which the advantage level is of 400 units is the indifference curve of the advantage equally expressed through the realization of 400 units.

The indifference curves describe sale levels much higher as they move away from the axe origin. Within each curve, the level of the results obtained is the same, irrespective of the structure of the efforts that generate them. However, the curves have higher general levels as they move right wise and they are made of larger combinations of efforts, workers and machines. This convexity of the indifference curves as compared to the origin of their axes and their hyperbolic tendency can be explained through the effort mix becoming less efficient, thus requiring greater efforts, as each of the curves reaches the extreme points.

Fig.1. Advantageous levels resulted from four combinations of labour personnel available and flexible automation equipment

Model of equal costs

The model of equal costs is necessary for reaching a decision concerning the choice of a resource combination. Within this model, the expenses indifference curves (see Fig. 3) are lines that express an equal constant level of resource-related costs, also known as iso-costs, because in any point on the curve, the expenses are always the same, irrespective of the two resources distribution method.

According to Fig. 3, one working hour is 20 USD worth, and one operating hour of each machine costs 800 USD. Thus, an amount of 16,000 USD would lead to the use of 20 machines and zero working

hour/person. An amount of 16,000 USD entirely spent for the labour personnel, with zero machines, would lead to the use of 800 working hour/person. All the other man-machine combinations that would mean 16,000 USD total expenses are situated on the 16,000 USD iso-cost line. The same, all the combinations that represent 12,000 USD expenses are situated on the 12,000 USD iso-cost line, so on and so forth. In fact, these iso-cost lines represent expenditure budget levels. The points on such a budget line represent all possible resource combinations as permitted by the respective total expenditure level.

*Fig. 2. Advantage indifference curve
(equal levels of unity number)*

Fig. 3 Iso-cost lines

Optimization of combined resources

The transposition of the model of equal advantage curves in Fig. 2 into the model of iso-cost lines in Fig.3 is rendered by Fig. 4.

Fig.4 shows the best combination of labour and equipment to be obtained with a certain expenditure budget. For instance, the equal advantage curve at the level of 260 units produced is tangent to the iso-cost line representing an amount of 12,000 USD expenses. As indifference curves do not intersect (expressing much higher levels as they move away from the axe origin), the other equal advantage curves that imply

levels higher than 260 units are not tangent to the 12,000 USD iso-cost line. On the advantage curves map, up to the 260 units level, the 12,000 USD iso-cost line crosses several equal advantage indifference curves (by constant numbers of product units) but touches only one line in a tangent point. This point represents the advantage created by an optimum resource combination, as this tangent point belongs to the highest equal advantage curve that can be reached with the 12,000 USD expenditure budget. This is the point where the slope of the iso-cost line is equal to the advantage curve slope. The point where the 260 unit equal advantage curve reaches the 12,000 USD iso-cost line shows the perfect man-machine combination achievable through the 12,000 USD expenditure budget, in view to produce the quantity of 260 de units. The two axes illustrate the action to produce the most advantageous result within the 12,000 USD expenditure budget, i.e. 260 units produced by 7.5 machine capacity units and 300 working hours/person.

Fig.4 expresses the resource combination that minimizes costs and provides a given level of advantages, for example the production of 260 units. The tangent point between the equal advantages curve of the 260 units and the iso-cost line of the 12,000 USD indicates in fact this combination of resources. The level of advantages, namely 260 units, cannot be obtained through a cheaper cost combination, because outside the iso-cost line that intersects the 260 units curve there are budgets with higher expenses. The cost-advantage analysis leads to determining the cheapest resource combination that can provide the relevant level of advantages. Fig.4 also shows how the achievable advantage is maximized when the cost is kept constant.

The highest advantage level generated by a given level of expenses is indicated by the tangent point of the iso-cost line to the highest reachable advantage curve. The tangent points in Fig.4 describe both the minimization of the costs providing the levels specified and the maximization of advantages vs. the given level of expenses. The joining of these tangent points is illustrated by Fig.5 under the form of a curve that represents both the costs and the advantages measured on the two axes.

Fig. 4 Equal advantage curves and iso-cost lines

This curve describes all the minimal costs for the advantages followed and all the maximized advantages for the specified expenses. For instance, the point determined by the coordinates shown in Fig.5 indicates the lowest cost for a 260 unity level and the highest advantage for a 12,000 USD expense, that corresponds to the action (see Fig.4) related to the use of 7.5 machine capacity units and 300 working hours/person.

Identification of revenues

The elaboration of the general strategy regarding the optimum combination of resources requires knowledge on the lower costs necessary to achieve each advantage level (or the highest advantage based on a given expenses) and also the identification of revenues corresponding to each product number level. If the price fixed for the products is of 50 USD per unit, and the company’s main objective is to maximize the profit, then the optimum advantage level can be determined as shown in Fig.5. This curve describes all the

minimal costs for the advantages followed and all the maximized advantages for the specified expenses. For instance, the point determined by the coordinates shown in Fig.5 indicates the lowest cost for a 260 unity level and the highest advantage for a 12,000 USD expense, that corresponds to the action (see Fig.4) related to the use of 7.5 machine capacity units and 300 working hours/person.

The revenues function is represented in Fig.6 as the cost and advantage curve. The revenues curve results from the multiplication by 50 USD of the respective number of products and it is a straight line. The vertical distance between the revenues curve and the cost and advantage combination curve represents the profit of the company. This profit is maximized in the point where the vertical distance is the largest. The dotted line in Fig.6 shows with approximation the position of the optimal advantage, i.e. the level of the production sold that maximizes the profit. The intersection between the dotted line and the cost and advantage curve represents that combination of costs and advantages which determines the maximum profit, as in the above-mentioned example, the 8,000 USD expense and the 228 units produced.

As this point is situated on the cost and advantage curve, it is at the same time a tangent point between the iso-cost curve (8,000 USD) and the equal advantage curve (228 units).

Fig. 5 Cost and advantage curve

Fig. 6. Determination of the product number maximizing the profit

In Fig.4, this te combination, i.e. an action that involves 5 machines and 200 hours/person. This is the strategy that maximizes the profit. The associated advantage level is of 228 units produced at a cost of 8,000 USD. The optimal profit can be determined in Fig.6 starting from the selling price of 50 USD per unit. As a

consequence, the 228 units will produce a profit of 11,400 USD. As the total cost is of 8,000 USD, the maximum gross profit will amount to 3,400 USD.

In recent decades, online marketing has been quickly overtaking the traditional means of marketing due to several reasons, such as: low costs, the growing number of internet users and the long lasting relationship developed with them, the effortless usage of the web and of the online marketing tools. Online marketing is done by those individuals or organizations which exchange ideas and offers by using computers, online networks and interactive media, in order to reach their marketing objectives.

The results of an exploratory research in terms of the consumers' exposure, their behavior in relationship with the specific campaigns oriented toward them and the future of the online and offline direct communication at the level of the pre-defined target segments are presented in a comparative manner: online versus offline direct communication tools.

Keywords: consumer behavior, direct communication, online marketing

Introduction

In recent decades, online marketing has been quickly overtaking the traditional means of marketing due to several reasons, such as: low costs, the growing number of internet users and the long lasting relationship developed with them, the effortless usage of the web and of the online marketing tools. **Online marketing** is done by those individuals or organizations which exchange ideas and offers by using computers, online networks and interactive media, in order to reach their marketing objectives.

According to eMarketer Inc., in China, 9 out of 10 youngsters are using the internet and the total number of internet users (any person who uses the internet from any location at least once per month) has reached 210 million people in 2007, being estimated that by 2012 it will reach 238.4 million persons. In the United States of America, using the internet has become a daily habit and the figures make it obvious: in 2007 there were 188.1 million internet users (accounting for 21% of the internet users worldwide) and in 2008, two-thirds of the population is projected to use the internet, getting to 71% of the American population by 2012 (216.9 million people). On the third position is Japan, with a total number of internet users of 89.1 million people in 2007 being estimated that by 2011 it will reach 95.4 million persons. The total number of internet users reached almost 53.24 million people, meaning 64.6% of Germany's population in 2007 and it is estimated to reach 73.2% of all Germany residents by 2012.

While in the United States and other developed countries, the internet audience is slowly increasing, there are regions of the world where the use of the internet is accelerated. Asia-Pacific region has reached 309 million users in January 2008, a growth of 14% as compared to 2007. As far as Europe's internet users are concerned, it increased by 6.8% from 2007 amounting 233 million users in January 2008. Even though the online population of Africa and Middle East reached only 40 million users, and 59 million in the Latin America region, the raise was substantial, 20% and respectively 16.6% in January 2008, as compared to 2007. The worldwide online population has reached 824 million users in January 2008, according to comScore Inc.

Even though at the beginning of the year 2007, Romania was placed last, as compared to the other countries of the European Union, from the point of view of internet's penetration rate, at the end of 2007, it gained ground over Poland and Bulgaria, which reached 29.6% and 30% internet penetration rate. In November 2007, Internet World Stats estimated Romania's population at 22.27 million people and out of

this population, 7 million were internet users (31.4% of the inhabitants). At the level of the European Union, there were 273.23 million internet users, almost 56%, out of 490.43 million Europeans.

It is important to know that in Romania, the net revenues from online marketing campaigns amounted 23 million dollars at the beginning of 2008, an increase of 66% as compared to last year. Even though the increase was of approximately 15.20 million dollars, the revenues from online are only 2.2% of the total media revenues. The highest share is taken by the TV (69.6%), followed by radio (9.6%), newspapers (8.2%), magazines (6.2%) and outdoor (4.2%).

In Hungary, the net revenues from online marketing campaigns reached 83 million dollars at the beginning of 2008, in Poland 170 million dollars, whereas in the United Kingdom it increased with 30.8% from December 2007, reaching 3400 million dollars, achieving 25% of all media revenues.

In order to design online marketing campaigns, individuals and organizations have a wide range of online marketing tools that they can choose from, but the most frequently employed are: online advertising, email marketing, e-commerce, search engine marketing, affiliate marketing, social networks and blog marketing, followed by viral marketing and web analytics.

In Romania, last year, only 58% of the companies had access to the internet, and only 24% of them owned a website. Taking into consideration the increasing number of internet users and customers, the low number of fraud cases, only 1.1% as compared to 3.4% in other countries, the Romanian ecommerce market is estimated to double.

Even though marketers have started questioning the efficiency of their online ads, the revenues from interactive advertising are projected to increase with 30.6%, from 45 billion dollars in 2007 to 147 billion dollars globally in 2012, estimates The Kelsey Group.

Research Methodology

There has been conducted an exploratory research project intended to achieve, as *major objectives*, full of meaningful information regarding consumers' exposure to the online and offline direct communication, their behavior in relation to the online and offline direct communication campaigns oriented towards them and the future of these campaigns at the level of pre-defined target segments.

A data collection instrument, which includes 23 questions, has been applied at the level of an investigated population consisting of undergraduates (seniors) and graduates (students enrolled in the Master Programs) of the Marketing Faculty from the Academy of Economic Studies, Bucharest. The investigated population has been defined by taking into consideration the following aspects:

- most significant characteristics of the open-to-online communication consumers are related to their education and income (specific assumptions: the higher their level of education and income, the higher their openness to online communication);
- three major segments of interest – from the perspective of direct communication – could have been defined: **“yellow”** consumers (undergraduate and not employed students), **“orange”** consumers (undergraduate but employed students) and **“green”** consumers (graduate and employed students). This research is intended to identify how “yellow” consumers become “green” consumers (by improving their education and financial status) having as a reference the transitional “orange” category.

After the data collection and questionnaires validation, a number of 75 respondents have been included in the research sample out of which: 20 were “green”, 18 “orange” and 37 “yellow” consumers.

Exposure to the online and offline direct communication tools

The first objective of the research has been approached by taking into consideration the respondents' exposure to a set of selected online and offline direct communication tools, frequently used in the market – mail deliveries, mail order catalogues, outbound phone calls, mobile messages, emails received and press direct response advertisements.

Mail deliveries represented the major direct communication tool used at the level of the sample, as 88 % of the respondents have received something by mail: from flyers and brochures to commercial letters or catalogues. This preeminent position is explained mostly by the significant increase of the printed

promotional materials delivered to consumers mainly by the major retailers and wholesalers present on the market.

4. Online / offline direct communication tools	5. Frequency	6. Percent
7. - mail deliveries	8. 66	9. 88.0
10. - mail order catalogues	11. 33	12. 44.0
13. - phone calls	14. 20	15. 26.7
16. - mobile messages	17. 49	18. 65.3
19. - emails	20. 60	21. 80.0
22. - press direct response ads	23. 64	24. 85.3

Table 1. Exposure to direct communication tools

Press direct response advertisements hold the second position due mainly to the sales promotion campaigns conducted (especially the contests asking participants to fill-in and send a reply device) while **emails** hold a significant position, as campaigns using online tools have increased both in frequency and budgets (a similar trend being lately noticeable for **mobile marketing**). The relatively reasonable costs may represent another support of the email and mobile marketing campaigns' growth. Mail order and telemarketing appeared less important in terms of respondents' exposure to their instruments – **catalogues** and **outbound telephone calls** – due mainly to the increased costs of the mail order and outbound telemarketing campaigns (both in terms of creation and delivery) and less significant return on investment in comparison with that of letterbox mailing and mobile marketing operations.

The analysis of the respondents' exposure to the different direct communication tools, in terms of the main market segments, has revealed that **“green” consumers** have been approached mostly by mail deliveries and emails, **“orange”** and **“yellow” consumers** by direct response advertisements and mail deliveries. The transition from the “yellow” to the “green” categories is illustrated by the specific results for the mail deliveries, outbound phone calls, mobile messages and emails registered for the “orange” consumers.

Those direct communication campaigns, to which the respondents have been exposed to, can be characterized, based on these results, as poorly targeted. The increased exposures to phone calls and emails of the “green” respondents and, respectively, to mobile messages of the “yellow” ones as well as the weights held by mail deliveries at the level of all three segments, suggest not more than a small-scale usage of empirical targeting procedures although the differences between these segments would have demanded a different approach.

1. Online / offline direct communication tools	2. Sample	3. Yellow	4. Orange	5. Green
6. - mail deliveries	7. 88.0	8. 81.1	9. 88.9	10. 100.0
11. - mail order catalogues	12. 44.0	13. 35.1	14. 61.1	15. 45.0
16. - phone calls	17. 26.7	18. 18.9	19. 27.8	20. 40.0
21. - mobile messages	22. 65.3	23. 70.3	24. 66.7	25. 55.0
26. - emails	27. 80.0	28. 75.7	29. 77.8	30. 90.0
31. - press direct response ads	32. 85.0	33. 89.0	34. 94.0	35. 70.0

	3	2	4	0
--	---	---	---	---

Table 2. Exposure to direct communication tools in terms of the main market segment (%)

Behavior determined by the online and offline direct communication tools

To a certain extent, the respondents’ behavior after the campaigns they have been exposed to is surprising – having as yardstick the average performances of the direct communication campaigns. Still, some of these (see Table 3) are to be explained by the nature of the sample, close enough to the description of the primary target of direct communication operations.

1. Type of reactions	2. Frequency	3. Percent
4. - mail order buying	5. 15	6. 20.0
7. - phone calls made	8. 26	9. 34.7
10. - websites visited	11. 31	12. 41.3
13. - e-commerce buying	14. 9	15. 12.0
16. - sending a coupon	17. 21	18. 28.0

Table 3. Reactions made using different communication tools

Generally, respondents have had a relatively reserved behavior specific for an attitude aiming to diminish the related risks to be encountered. *Visits* made to the local and foreign *websites* and the *phone calls made* may express their desire to get more information about the products and/or services promoted and to postpone the buying decision. *Coupons* sent may express the same intention to be well-informed but, in the same time, a wish for participating to promotional contests organized by different companies (mainly the FMCG). Relatively impressive weights are related to the *acquisitions* made by respondents through *mail* and *online*.

1. Type of reactions	2. Sample	3. Yellow	4. Orange	5. Green
6. - mail order buying	7. 20.0	8. 24.3	9. 11.1	10. 20.0
11. - phone calls made	12. 34.7	13. 32.4	14. 44.4	15. 30.0
16. - websites visited	17. 41.3	18. 29.7	19. 27.8	20. 75.0
21. - e-commerce buying	22. 12.0	23. 5.4	24. 0.0	25. 35.0
26. - sending a coupon	27. 28.0	28. 24.3	29. 16.7	30. 45.0

Table 4. Reactions made using different direct communication tools in terms of the market segment status (%)

From the perspective of the main market segments, the main conclusion states that *visits* made to the *local* and/or *foreign websites* is the common – if not the most important – reaction of all segments: “*green*” consumers visit websites and send coupons while “*orange*” and “*yellow*” consumers make phone calls and visit websites. Online buying is more frequently done by the “green” consumers while mail order buying appears to be done more by the “yellow” and “green” consumers and less by the “orange” ones.

Future expectations

Direct online and offline communication campaigns oriented toward these target segments will have to be planned, as the results of the survey suggest (obviously in the limits imposed by the exploratory research approach), considering the set of preferred sources and channels of information as well as the specific tools agreed by the consumers. In terms of the sources of information, respondents have mentioned as “preferred” sources the internet (specified by 65.3 % of the respondents), email (58.7 %), mail (52.0 %) and television (50.7 %) while daily (33.3 %) and periodical (30.7 %) press, mobile phone (26.7 %), outdoor advertising (25.3 %), radio (17.3 %) and telephone (9.3 %) hold more or less peripheral positions. These percentages support once more the ideas that, generally, consumers more open-to-direct online and offline communication are less interested in using television as an essential source of information and, respectively, level of education and incomes are among the variables to be considered in defining potential open-to-direct communications customers and targets of the specific campaigns.

If the respondents’ preferences indicate the internet, email, mail and television as appropriate communication media to be employed in developing direct communication campaigns, their attitudes toward the major specific tools suggest a potential interesting future for the mobile marketing campaigns and mail order operations:

- 69.3 % of the respondents are willing to receive **commercial SMS** and/or **MMS** on their mobile phones (out of which 42.3 % only SMS and 57.7 % both SMS and MMS); “yellow” consumers (75.7 %) and “green” consumers (65.0 %) are the most interested in receiving them;
- 49.3 % of the respondents are willing to receive **mail order catalogues**, “yellow” (56.8 %) and “orange” (55.5 %) consumers being more interested by comparison to the “green” consumers (only 30.0 %);
- **direct mail** (38.7 %) and **email** (36.0 %) hold less important positions in terms of the degree of interest, decreasing both from “yellow” to “green” consumers;
- **phone calls** are placed in a relatively peripheral position as less than one-third of the respondents are interested to receive more commercial calls;
- **online buying** seems to be more appealing for “green” consumers while **mail order buying** appears to be more attractive for “yellow” consumers, these two segments representing the major targets for the mail order and/or e-commerce campaigns;

1. Direct communication tools	2. Sample	3. Yellow	4. Orange	5. Green
6. - direct mail	7. 38.7	8. 45.9	9. 44.4	10. 20.0
11. - mail order catalogues	12. 49.3	13. 56.8	14. 55.5	15. 30.0
16. - mail order buying	17. 28.0	18. 35.1	19. 16.7	20. 25.0
21. - phone calls	22. 29.3	23. 32.4	24. 22.2	25. 30.0
26. - mobile messages	27. 69.3	28. 75.7	29. 61.1	30. 65.0
31. - emails	32. 36.0	33. 45.9	34. 27.8	35. 25.0
36. - online buying	37. 45.3	38. 48.7	39. 16.7	40. 65.0

Table 5. Expectations of respondents regarding the direct marketing tools to be used at the level of the sample in terms of the market segment status (expressed in percentages)

“Green” consumers should be approached through campaigns aiming to generate sales and to motivate them to buy – online or by mail – different products and/or services. Mobile marketing must be integrated among the direct and traditional marketing tools employed by the companies. “Yellow consumers” should be approached not only to persuade them to buy (both online and by mail) but also to provide the information to support their decision-making process. Mobile marketing instruments, mail order catalogues, direct mail and email marketing represent a package diverse enough to communicate effectively and sell to them. Finally, “orange” consumers express, based on the figures referring to the attitude towards the direct marketing tools, the transition from the “yellow” to “green” categories. More close to the yellow area (more students than graduates and having lower incomes), “orange” consumers are relatively open to get information, but less interested to buy.

In a permanent changing environment, the measurement and monitorisation of the performance of a company has become one of the key issues for its success. This fact increases the capacity of each company to adapt to the conditions of the environment, because only by a permanent monitorisation of the performance, a company can discover both its strenghts and its weaknesses and in time, it can react according to these.

This paper concentrates on the controlling and performance measurement of the distribution policy of a company. It analyses both the efficacy and efficiency of the distribution channels as well as the succes of the logistics activity.

Keywords: Controlling, marketing-controlling, distribution, distribution channels

1. Introduction

The main objective of the distribution policy is to assure the conduction of the products and services from the company to the final consumers. The first thing which a company has to do is to analyze the selected distributions channels to make sure that the products arrive at the target group (Esch, Herrmann, Sattler, 2008, pg. 321ff). The company must see which is the performance and the success of the selected distribution channel and in what way does this correspond to the customer's expectations. Secondly it must analyze the efficiency of the physical distribution and of the partners which have a role in the transportation of the products from the producers to the final consumer (Schögel, 2001, pg. 544-567.). Consequently, the controlling of distribution deals with the analysis of the distribution channels performance and with the logistics of the distribution.

A company has the possibility to transmit the products toward the consumers through many distribution channels. The distribution through more than one channel is named polidistribution and has several advantages (Kotler, 2002, pg. 129ff). First of all it reaches a higher degree of distribution and the products get into contact with more segments of customers. On the other hand the risk is reduced by the distribution on more channels and besides this, synergy effects can be obtained (Swoboda, 2001). For example, a company of soft drinks can deliver the products through retailers, through restaurants or bars or through automatic bars. For each of these distribution channels, the strategy and the operational measures are different. In spite of these, for a company is not enough to deliver the products through many distribution channels, but it also has to know which are the most important channels in order to develop them. On the other side, it is also important to find out the distribution channels, which are less efficient in order to reduce the costs with these or to give them up.

Besides the measurement of the performance of the distribution channel, it is important to check the efficiency of the subsidiaries or distribution units. The efficient distribution units which have good results must be developed, and the inefficient distribution units must be closed or the costs of them must be reduced. This should be done not only for the distribution channels, but also for the distribution units. The controlling of the company should monitor these units in order to be able to take measures in time. The way of evaluation and monitorization of the distribution channels can be observed in fig.1.

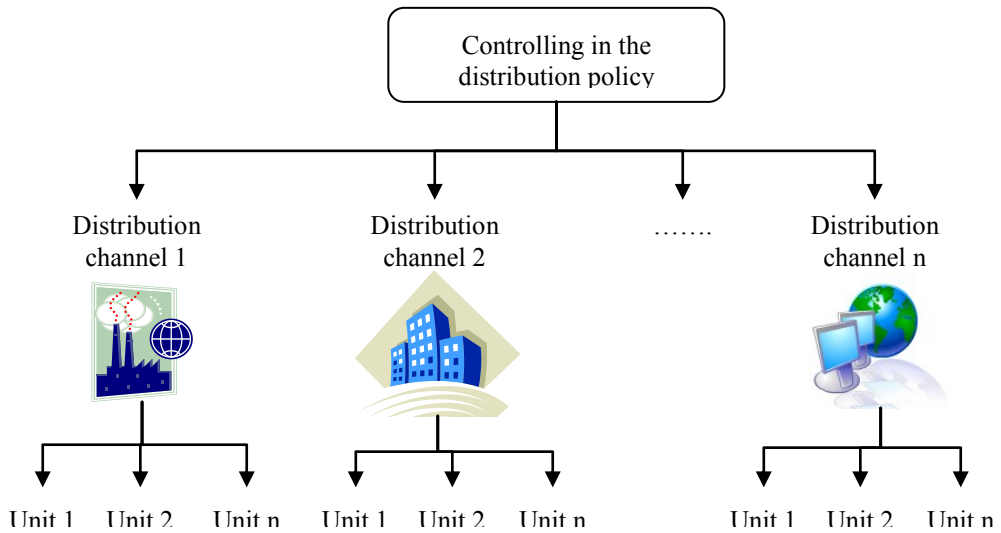

Fig. 1. Controlling in distribution channel.

2. The performance measurement of the distribution channels

First of all a company has to analyze the performance of a distribution channel. This can be done by the turnover or the profit obtained in a distribution channel, and also by the future potential of a distribution channel. For the analysis of the success of the distribution channels a restatement of the Boston Consulting Group Matrix can be used. So we have distribution channels which bring to the company the biggest amount of income. These distribution channels can grow or they can decrease. The growing distribution channels with a big turnover are called “stars”. They must be intensively promoted so that they should remain for the company in the future an important income source. The second category of distribution channels are decreasing and are called “cash cows”. This distribution channels must be kept, but the company must reduce the costs with these and has to make sure that there are also other alternatives for the distribution of the products. For example such distributions channels are neighborhoods shops and mini-markets. Besides this, there are also distribution channels which bring little incomes for a company. They can be of two types: increasing and decreasing. The increasing distribution channels, with small turnover are named “question marks” and have the possibility to become in the future stars. The new distribution channel which appeared on the market must be analyzed, tested and the company has to check the way it fits to the products of the company. In this consequence they must be promoted for becoming the future stars. An example of this type of distribution channel is e-commerce. The last category of distribution channel are the “poor dogs”. These are the distribution channel which bring to the company a small turnover and have few future potential. Depending on the possibility of relaunch, companies have to reduce the costs with these channels or give them up. The four types of distribution channels can be seen in fig.2.

Decreasing
distribution
channels

Fig. 2. The Boston Consulting Group Matrix for distribution channels.

Besides the financial importance of the distribution channels, the degree of distribution must be also measured. The degree of distribution measures the coverage of the market with the analyzed products. This can be calculated in two ways: The simple distribution degree measures the relation between the total number of units which sell the analyzed product and the total number of units which sell products from the analyzed product group. By this, it can be measured if the consumers have access to a certain product in comparison to the whole market potential. By adding a financial element, the turnover, the weighted distribution degree can be measured. The weighted distribution degree is calculated as the relation between the number of distribution units and the percentage of the turnover of this units to the whole channel and the total number of distribution units which sell products from the product group. By this indicator the importance of distribution channels with a higher turnover increases (Schögel, 2001, pg. 544-567).

$\text{Distribution degree} = \frac{D1}{D2}$ <p>D1 = total number of units which sell the analyzed product D2 = total number of units which sell products from the analyzed product group</p> $\text{Weighted distribution degree} = \frac{D1 * p}{D2}$ <p>D1 = total number of units which sell the analyzed product D2 = total number of units which sell products from the analyzed product group p = Relation between the sales of the distribution unit and the sales of all distribution units</p>
--

Fig. 3. Distribution degree

In order to characterize in a complete way the degree of distribution, both indicators must be calculated. Even a comparison of the two indicators can suggest the performance of the distribution channel. Thereby, if the degree of the weighted distribution degree is smaller than the simple degree of distribution than the performance of the distribution channel is diminished. Moreover, the analysis of the development of the distribution degree can indicate negative evolutions of the distribution of a certain product. Depending on the results of this indicators, the company can take measures regarding the distribution of a product.

3. The performance measurement of the distribution units

For each distribution channel a company should measure the efficiency of each distribution unit. Depending on the obtained results the company can determine the distribution units in which it should invest and the units where the costs should be reduced or the ones which should be eliminated completely. Keeping unprofitable units in the portfolio of a company, can lead to the lack of success for the whole company, by the high costs. An example for this is the shop chain “Karstadt” in Germany, which went in 2005 almost into bankruptcy, because of big costs caused by unprofitable units.

The performance of the distribution units can be measured with the help of quantitative and qualitative indicators. The quantitative performance measurement uses a series of indicators which refer to the financial aspects of the company, while qualitative indicators refer to the relation that the company has with the distribution unit and also with the location of this unit.

Indicators for the measurement of the performance of distribution units

Quantitative indicators	Qualitative indicators
Turnover	Satisfaction*
Profit	Power/ Negotiation power *
Costs	Cooperation degree *
Turnover/ m2	Conflict degree *
Profit/ m2	Communication and information*
Turnover/ Number employees	*between the company and the business unit
Profit/ Number employees	Number of passants
	Degree of vizibility and access
	Purchasing power in the region
	Rents/ m2

Fig. 4. Indicators for performance's measure of distribution unit:

Among the quantitative indicators a company should apply the turnover of the units, the profit of distribution unit and various types of costs in each unit as for instance transportation costs, storage costs and others. Besides these general indicators a company should use a series of specific indicators such as the turnover or the profit related to the surface (in square meters) of the unit or the number of employees. In order to stimulate the efficiency of the distribution units many companies make hitlists with the most profitable units. By these hitlists, the company increases the competition among distribution units, which can also lead to higher performances. Although all this indicators seem very simple and easy to use, they all have a very high importance for the analysis of the distribution channels and the distribution units.

Qualitative indicators used for the measurement of performance refer to the quality of the relation between the company and the distribution unit, either this units is owned by the company or not (Schögel, 2001, pg. 544-567). These indicators refer to several aspects regarding the satisfaction in the relation between the company and the distribution unit, in the distribution of power among the channel members, the cooperation or conflict degree, the exchange of information, flexibility etc. A high level of satisfaction leads to a better cooperation and communication in the channel, which can contribute to a better performance of the distribution unit. If the satisfaction with a supplier is very high, then his products will be more recommended to the customers, which will lead to a higher performance. A high conflict degree can influence in a negative way the relation and an eventually the efficiency of the distribution channel. The distribution of power between the supplier and distributor or between the parent company and the distribution unit has a very important role, for the fact that the most powerful will also have the power to take decisions for his advantage and the less powerful has to accept these decisions. Depending on the imposed decision, the performance of the distribution unit can be determined (Pelau, 2008). Consequently all these elements can influence in a direct or indirect way, the success of a distribution unit. All these elements can be measured with the help of interviews.

The second aspect regarding the quality of a distribution unit is the geo-marketing. The geo-marketing analyzes the quality and the advantages of the location of the distribution unit for its success and its performance. It analyzes the following aspects: passants number, degree of visibility and of access of the consumers, the buying power in the region, rent costs in the region and so on. A high number of passants and a high visibility degree can increase the number of customers. Moreover, a high purchasing power in the region, can lead to the growth of the sales value per customer. Both elements influence the performance

of the distribution unit. All these elements can lead to the increase of number of customers and their capacity of purchasing volume and influence the success and the performance of the distribution unit.

4. The controlling of the logistics processes

Besides the choice of an optimum distribution channel, it is also important to determine the efficiency of the logistic processes of the distribution. The logistic processes include the costs of the transportation of the products and costs of storage. The costs of the transportation are included in the final cost and therefore the final price of the product. The less the cost of logistics are, the higher the profit for this product will be. Although the costs are very important, one must not forget the fact that the main objective of logistics in distribution policy is to conduct the correct products in the required quantity and quality, to the right place and at the right time, in the right order at the lowest costs (Ehrmann, 2004, pg. 288).

Thereby, for measuring the efficiency of logistics, the company must measure and analyze several costs in order to determine the best way to transport the products. The most important aspects which must be analyzed is to see if the costs are correctly determined, if the transport and logistic costs respect the planned budget, if it respects the principle of minimum costs, if it respects logistics tasks and if there are taken into consideration the new tendencies in logistics and transportation area (Ehrmann, 2004, pg. 291).

One of the first aspects which has to be analyzed is the correct determination of the costs and types of costs. For this analysis, there are used method of controlling used in the price policy, as for instance, target costing, determination of the costs of the process, benchmarking and others. Because the distribution costs are included in the price of the product, it is essential to monitorize them. The company can make an internal analysis of the costs, but it can also do an external analysis by comparing its costs with the ones of the main competitors. Consequently the improvement potential can be achieved by an internal analysis of the costs of the company and it can also be inspired from the way of the working of the competitors (Möbus, 2000, pg. 301-308).

The principle of the minimal cost refers to the way of distribution which should fulfill the objectives of the logistics obtained by having the lowest costs. In this case, the company must take “make or buy” decisions. It should decide if a certain activity will be done by the company itself or if it should be externalized to a third company. Therefore the company must analyze all the possibilities. One method to analyze all this is the decision tree (Ehrmann, 2004, pg.290). For a logistic activity a decision tree looks like in fig 5.

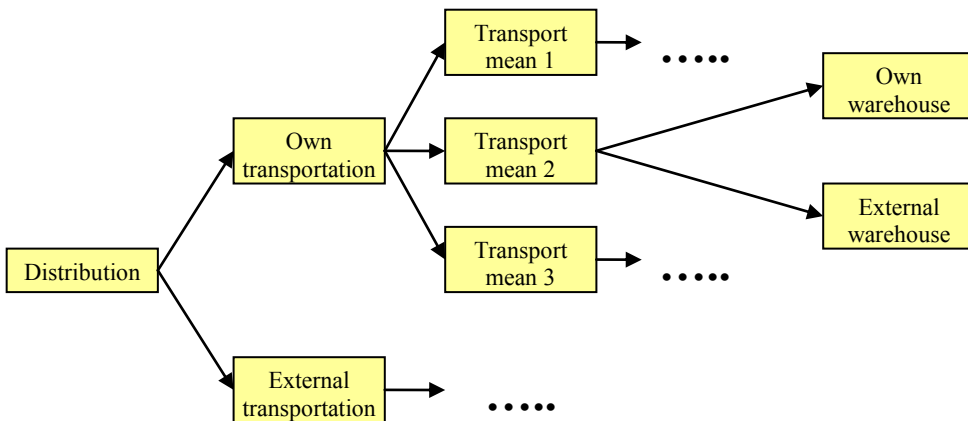

Fig. 5: Decision tree for logistic system.

In the development of an efficient logistic system, the easiest way to take decision is the decision tree. So the company can choose to transport itself the product or it can choose a company that offers transportation services. In both cases it can choose from various types of transportation means: by air, by sea, on the road with truck or with train. Other decision is the type of the warehouse for the products. It can choose between an own warehouse or a specialized company, which offers such services. All the paperwork (invoices and orders) can be done by the company itself or it can be externalized. These decisions are very complex and depend first of all on the type of products and the special conditions that must be respected. Of course controlling has also the assignment to search new methods of transport, storage or other thing of logistic.

The controlling of the distribution policy is very complex and has an important role for the success of the company. It has not only to check if the products arrive at the final consumers in a desired way, but it also has to analyze the costs of the logistics in order to reduce them as much as possible.

Abstract: A customer focus is widely seen as desirable and necessary to business success. This paper focuses on the obstacles that prevent firms from adopting and maintaining a customer focus. The authors suggest that the marketing concept is intrinsically difficult to implement. A failure to focus effectively on customer needs may be the normal state of affairs; it is not an aberration or a shortcoming peculiar to poorly run businesses. Only a deliberate effort on an ongoing basis can overcome the natural tendency to lose touch with customers.

Key words: marketing, entropy, customer, business

Customers behavior

Customers are always good.

Customer is king.

The customer is always right.

Always put your customers first.

After years of being indoctrinated with stuff like that, the title of this white paper may be dismissed as too insulting to ask or too obvious to answer. It's always been fair (even important) to ask "are you good TO your customers?" but never really been polite to ask "are our customers good FOR us?"

In various ways we have acted on the premise that some customers are better than others.

"Good" and "Bad" are not intrinsically logical enough – so we'll need definitions. Most marketers like to believe that if a customer buys more, he or she is worth more. That does work in 7 of 10 instances – but if we need a more watertight definition, we'll have to base it on profitability.

Good Customers ~ High profitability; Bad Customers ~ Low (or negative) profitability.

Marketing entropy

Before we start assuming that good and bad customers form nice clean and discrete silos, its useful to borrow the concept of entropy from thermodynamics.

Entropy is a measure of the disorder of a system. The theory goes that systems tend to go from a state of order (low entropy) to a state of maximum disorder (high entropy). Marketers will recognize the parallels with customers – whether it is in response to competitive actions or new products or price points, customers seem to be churning to a higher level of entropy.

Kaizen in marketing

Customer entropy underlines the need to run marketing programs with the intent of affecting continuous improvements (*kaizen*) to a company’s ultimate asset – its customer portfolio. Entropy also reminds us that it’s not enough to categorize customers as ‘good’ or ‘bad’ because that’s going to keep changing. It’s more critical for marketing to continually influence the specific aspects of customer behavior that makes them good (for example they buy a mix of products that offer higher margins) or bad (buy discount goods and/or tax the customer service process).

This kind of marketing process requires a dynamic view of customers – dynamic enough to respond to (and even pre-empt) ever changing customer behavior. But it needs to begin with two simple questions: How do you make money from customers? How do you lose it?

The profit waterfall

How you make and lose money from customers helps you create a profit waterfall. The profit waterfall goes further and identifies the specific aspects of customer behavior that are most critical (profitable) to impact. It purposefully motivates the marketing team to look beyond top-line growth.

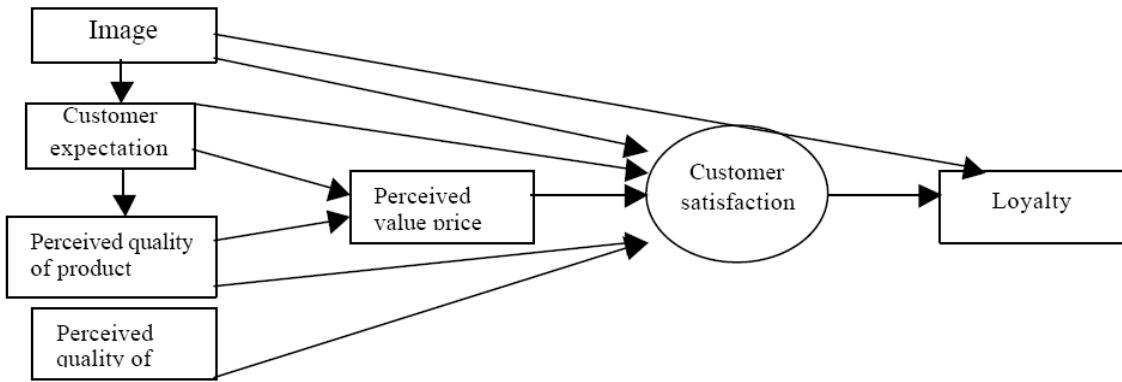

The adjoining chart illustrating the profit waterfall for an insurance company pretty much sets up what the marketing team needs to pursue: acquire customers with multiple riders with their first policy and lower likelihood of lapsing or surrender; up-sell riders and policies to existing customers.

Policy Type/Event Triggers	Full Life Linked	Full Life Non Linked	Term Life Linked	Term Life Non Linked	Term Others	Color codes Neutral Positive Strong Positive Negative
Initial Riders	Y	Y	Y	Y	Y	
Add-on Riders	Y	Y	Y	Y	Y	
Lapsing	N	Y	N	Y	Y	
Revival	N	Y	N	Y	?	
Surrender b4 full prem.	Y	Y	Y	Y	N	
Surrender aft full prem.	Y	Y	Y	Y	N	
Additional Policies	Y	Y	Y	Y	Y	
Renewal	N	N	N	N	Y	
Claims Approved	Y	Y	Y	Y	Y	
Claims Rejected	Y	Y	Y	Y	Y	

Profit waterfall for an insurance company

Customer satisfaction measurement models

Customer satisfaction model is a complete path model, which can be depicted in a path diagram to analyse a set of relationships between variables. It differs from simple path analysis in that all variables are latent variables measured by multiple indicators, which have associated error terms in addition to the residual error factor associated with the latent variable, a good examples on these models are the European customer satisfaction index model, which is an economic indicator, represents in next figure.

The European Customer Satisfaction Framework

Many researchers from various disciplines have used Linear Structural Relationship as a tool for analysing customer satisfaction models. The general and formal model of customer satisfaction can be written as a series of equations represented by three matrix equations Jöreskog (1973):

1. $\eta(m \times 1) = B(m \times m) * \eta(m \times 1) + \Gamma(m \times n) * \xi(n \times 1) + \zeta(m \times 1)$
2. $y(p \times 1) = \Lambda y(p \times m) * \eta(m \times 1) + e(p \times 1)$
3. $x(q \times 1) = \Lambda x(q \times n) * \xi(n \times 1) + \delta(q \times 1)$

The structural equation models given in (1-3) have two parts; the first part is structural model (1) that represents a linear system for the inner relations between the unobserved inner variables. The second part is the measurement model (2) and (3) that represents the outer relation between observed and unobserved or latent and manifest variables.

The structural equation model (1) refers to relations among exogenous variables (i.e; a variables that is not caused by another variable in the model), and endogenous variables (i.e; a variables that is caused by one or more variable in the model). The inner variables in this equation, η which is a vector of latent endogenous variables, and ξ which is a vector of latent exogenous variables are related by a structural relation. The parameters, B is a matrix of coefficients of the effects of endogenous on endogenous variables, and Γ is a matrix of coefficients of the effects of exogenous variables (ξ 's) on equations.

Concentration on customer

There is a principle of reciprocity in business that is extremely powerful. It simply says that, "If you do something nice for someone else, they will feel obligated to do something nice for you."

Companies should always be looking for opportunities to go the extra mile, to do more than they are paid for, to put in more than they take out. By extending themselves, they improve their positioning in the customer's mind and increasingly differentiate themselves and their company from their competitors who are after the same business.

The key to keeping customers is satisfaction. Total quality management has been defined as, "Finding out what the customer wants and then giving it to him or her." There is no mystery to it. The reason companies lose customers is because they have failed to identify exactly why it is that the customers buy in the first place. Then, they have failed to continue giving to the customer for the duration of their relationship.

A customer can be the most valuable single asset that a company has. Giving committed service to your customers, in such a way that you keep them for life, is one of the smartest and most profitable things that you could ever do. When you do this, your future success in selling and in business are assured.

Conclusions:

The term marketing entropy summarizes this perspective and is apparent on two fronts. First, the firm as a whole will always be in the process of losing touch with its customers. Second, the marketing function will

always be in the process of losing touch with other important functions such as R&D and manufacturing. To implement the marketing concept requires that both of these problems be overcome.

The contribution of this paper is to suggest a partial remedy for these problems. In a customer visit program, a firm organizes managers into cross-functional teams and sends them out to visit customers personally. The immediate goal is the acquisition of information on customer needs to ultimately bring about a greater sensitivity to and awareness of customer perspectives.

MARKETING ENVIRONMENT - PARTICULARITIES OF AUTOMOBILES MANUFACTURERS

Petrescu Nicolae-Daniel

Academia de Studii Economice Bucuresti, Scoala Doctorala, Domeniu Marketing, Str. Nicolae Titulescu, Nr 17, bl. 15ab, sc. b, ap. 5, Craiova, Dolj, ndpetrescu@gmail.com, 0741521761

Petrescu Mariana

Universitatea din Craiova, Facultatea de Economie si Administrarea Afacerilor, Master Managementul si Dezvoltarea Resurselor Umane, Str. Nicolae Titulescu, Nr 17, bl. 15ab, sc. b, ap. 5, Craiova, Dolj, mariana_petrescu@yahoo.com, 0724482330

In the marketing concept an important place is occupied by the environment where organizations are developing their activities. Technology occupies the most important place in automobile manufactures industry, and we can even says that if you have not a product in compliance with technology development you disappear or you will be buy by which is most adapted to "new". For the automobiles manufacturers the globalizations means the fusion between important companies like Renault-Nissan group or Daimler-Chrysler group (that functioned till recently) Philip Kotler defines the internal marketing environment "The actors around the organization that influence the capacity to serve the customers: the organization itself, the marketing intermediaries, customers markets and public categories."

Cuvinte cheie: marketing, enviroment, technology , globalizations

In the marketing concept an important place is occupied by the environment where organizations are developing their activities.

At the beginning of the third millennium an important change rate is recorded, the companies must observe that the marketing environment is changed in just a few years The economic environment of our times is shaped by two great forces: *globalizations* and *technology*.

For the automobiles manufacturers the globalizations means the fusion between important companies like Renault-Nissan group or Daimler-Chrysler group (that functioned till recently), therewith the globalization also means the buying of smaller brands by the bigger once, as Renault done with our traditional car manufacturer from Pitesti, Dacia Automobile. For the example we can talk of one of the most success car manufactures of the moment the Volkswagen group, which own the following brands Skoda, Seat, Audi, but also the luxury sport car Lamborghini.

The best response to the globalization effects comes from Asia cars manufacturers, for example Toyota was the biggest manufacturer of year 2008, modifying the tradition of the first place where the American giant General Motors was situated not very long time ago. Even the Asian manufacturers have moments when they were in the time of collapse, the Korean car manufacturers in the recent period becomes bigger, Hyundai become one of the great manufacturer of the world the own another important brand KIA.. Hyundai is struggle with American brands on their own territory in US, (they have there plants). Not the same thing we can talk about Daewoo Korean brand witch can be considered "a Korean disaster" as Jack Trout said in his book "*Diferentiaza-te sau mori*".

Daewoo was the second conglomerate in South Korea, from his size. The company was involved in no less than twenty five activities (automobiles, telecommunications, pc, hotels, electronics, shipyards, constructions, security systems, armament, etc).

This is the worst example of economic grow, because the *chaebol* expansion (Korean jokes saying that the chaebol specification is: "from needles to satellites") was based on government backing who also was based on financial institutes who give funds to this desires of expansion. With 50 billions of debt it is no a wander that the company was put for sale. One of the most profitable parts of the company the car manufacturer was bought by the America giant General Motors, wearing now the Daewoo brand for Asia market and Chevrolet brand for the other markets of the world. However GM decided to buy only the plans

from Korea the other once letting them to utilize the Daewoo brand and give the components to carry on their business. The Daewoo plant from Craiova was bought by Ford in the spring of 2008.

Technology occupies the most important place in automobile manufactures industry, and we can even say that if you have not a product in compliance with technology development you disappear or you will be buy by which is most adapted to “new”

An example of last generation technology is the last generation of Volkswagen group TFSI engines, which have the most reduce carburant consume at this time.

It is also important to mention that the devise of Audi factories is “Progress by technology Discover your Audi model “or “Your progress is our motivation”

Audi definition for “Progress by technology “is: “technological innovation is experience in this domain – and a permanent search and attempt of find and implement new and revolutionary technologies. A belief which involve sportive, perspective reflection and high quality and which is find again in each car how have Audi logotype. Also Audi group says, “Words and imagines can not equal the intensive experience of “Progress by technology “, “the real pleasure of driving an Audi. Have a pleasant time in choosing your own Audi!”

Also in development and technology market growing strategy, Audi have devices *your dynamism is our passion – The dynamism is a factor of our progress –in this way the innovations in development of engine are very important. Our absolute performance may be better observed at Le Mans 24 Hours racings. After many victories obtained in this completion with motor engine FSI technology, we succeed in making another big salt by equipage for first time a racing car with a diesel engine (TDI).*

Audi also declare Our innovation spirit is Your advantage- *However good are already our products, we constantly make efforts to make them better Quattro, the integral traction Quattro, Audi Space Frame ASF and the magnetic suspense system which have adapted are all products of this approach. This entire are create for one single tendency –which you can live by driving the real “Progress in technology”.*

Also technology means progress and progress means unless pollution- *The cleanest Diesel in the World; In the middle of the 2008 year, Audi will start the cleanest turbo diesel engine in the world. The new TDI propellers will use the last common rail generation, with*

Injectors and 2000 baric injection pressure a recalculation system very efficient and optimize extra felling. For the first time in the world, for a good manage of burning process, were put on sensors in burning room. The new Diesel versions, witch will respect Euro 5 norms above it will be enforce, will have a reduction of nitrogen oxide emission with 90%.

In 2/07 Audi Magazine, to accentuate the top of the range of technology involve in its automobiles, Audi make compare in time between the best planes of the time and his products.

In '30 years compare is Audi Imperator and Junkers, the parallel auto-air in '80 years put face to face Audi 100 and Boeing 707, in '80 Audi quarto fight with F-18 Hornet, and in our days Audi A8 is placed near Learjet -45 XR.

Those are only few ideas about technology that Audi try to use to promote his products, and we can say they succeed to do this thing, Audi has in this moment Mercedes and BMW the main competitors on the European market and also Romania, let's remained our self that in '70-'80 years Audi was not a high class automobile how it is in the present days, its main competitors were Fiat, Renault, Peugeot, Citroen and Opel.

The technology, changes and progress are presented by Mercedes in his start promotion of his new A class: *FOLLOW YOUR OWN WAY –Each generation is different. Each generation has her own dreams and wishes .The tendency for our days is respect no tendency. People wishes to follow their own way. For this people we built an automobile: A class.*

Toyota company also, which became the biggest car manufacture in the world put the accent on innovation, improvement and car technology improvement, as senior manager Takeshi Yoshida says: ”The capacity of currently acquire and apply new knowledge for evolution and innovation is the lead force in finding the excellence.

We can say that without adapting yourself at environmental changes and applying the new technology development ...safety, environmental pollution, lower user and service costs, quality and reliability you can not survive on the market and then you will disappear.

Philip Kotler defines the internal marketing environment “The actors around the organization that influence the capacity to serve the customers: the organization itself, the marketing intermediaries, customers markets and public categories.”

Marketing managers must create relations with clients by creating the value and customer satisfaction. For realizing a good marketing activity it must by accomplish a good communication and interdependence between different departments of company, customers, intermediaries, concurrency and those witch formatted the network of value.

For creating the marketing plans the marketing managers must take in consideration other groups from the company (the top management, the finances, the accounting department, the development-research department, the logistics and production or exploitation department). The top management establishes the strategies, the policies, and the objectives and firms mission. The finances department of automobile firm is concerned with finding the most advantage source of finance for development some new projects. The account department has to calculate the incomes and the costs in order to establish how the marketing department accomplishes its role. The logistics departments establish materials, subsets, utilities supply in order to create competitive products. The production department have an important role in create high quality automobile witch will be sell then using the strategies establish by the marketing department.

The supplier

The suppliers are an important part of firm global system. The suppliers supply all that the firm needs to manufacture automobile (parts supply, landmarks, subsets, projects, software, utilities). The problems with suppliers can severe affect firm’s activity and also the marketing department. Because the automobile production is very complex is important to study every time the level of supply resources, the strikes and scarcity periods. This entire situation can influence in the short or medium run sales activity. Is a necessary to monitor prices tendency of products and services delivered. The appreciation of products and services used in automobile production cause the appreciation of final products prices and this cause selling depreciation.

The intermediaries

The intermediaries help firm to promote its automobile, to sell automobile and to distribute its products to final customers. The special intermediaries for automobile domain are firms witch resell cars, marketing services agencies and financial intermediaries. Automobiles dealers and distribution channels help company to find its customers and sell the products to the final customers. The selection of business partners help automobiles promotion, distribution and selling, is not an easy thing because it had to accomplish some demands and standards.

Marketing services agencies are firms specialized in marketing research, publicity agencies, firms specialized in marketing consulting witch help automobile company to manage products to proper markets and promote products.

The category of financial intermediaries takes banks, credit companies, assurance societies, and other kinds of companies witch are associated with automobile buying and selling. Now days we can say that automobile market can not function without financial intermediaries. An conclusive example for Romanian market in Renault company witch development its own financial intermediaries firm RCI leasing, witch contribute to credit its automobile and also establish partnership to other intermediaries firms (BRD)

The customers

The automobile organization had to study five types of markets for developing its business in good condition.

The consumer market –is compose by individuals, families, households which buys automobiles for them own use.

The business markets (organizational)-buy automobile for other processing for example auto tuning firms and we can specify the partnership between Mercedes and tuning firm Brabus.

The reselling markets –buy automobile witch will be than resell with later profit, on this market we can include firms or private persons witch buy and resell later, automobiles limited or collection editions.

The governmental markets are composing by governmental agency which buy automobile for producing public services.

The international markets are represented by all these markets, all markets placed on other countries territory.

Each of these markets has their own particularities which are indicate to be study by the sellers.

The competitors

In order to succeed the automobiles firm had to deliver value and more satisfaction than its competitors, for this reason the marketers had to adapt themselves to customers needs and requires. Is important to obtain a concurrencies advantage by placing the penetrate market automobile in customer mind. "Chevrolet is one of the most promote products in the world. In last years General Motors spent 178 million dollars for promote Chevrolet brand in United States. This sum of money equate to 487 000 dollars spent on day or 2000 dollars on hour."(Al Ries, Jack Trout, Pozitionarea lupta pentru un loc in mintea ta, pag.29)

We can not speak about optimal concurrencies marketing strategy for all the competitors. The important companies use strategy witch small company can not afford.

Jack Trout in his book "*Trout despre strategie*" presents different aspects of Leader positions:

"Leader position in selling, Toyota Camry is the best sold car in America. But also other companies can pretend that they have the Leader position in selling, if calculate the spellings in different ways. For example Chrysler Dodge Caravan is the best sell van. Ford Explorer is the best sell all terrain vehicles. This approach function because people buy what other people buy. (Jack Trout, Trout despre strategie)

"Leader position in technology. Some company witch have a long history of technological realization can use this leader position aspect for making the difference. (Jack Trout, Trout despre strategie pag.53)

"Leader position in what means performance. Some companies have very big performances even if they do not sell very well. (Jack Trout, Trout despre strategie pag.53)

We can affirm that exist victorious strategy and also strategy which do not have the best result, and not always a bigger car manufacturer will has a better strategy than a smaller car manufacturer.

Public Categories

In marketing environment are included also different public categories. Public category – "*Any group that have an effective interest or potential in capacity of one organization to fulfill objectives or an effective or potential impact over this capacity*" (Kotler, Amstrong - Principiile Marketingului Editia a-III-a, pag 161)

Public categories that influence organizations from auto domain are:

Financial groups which influence the obtaining of found; here are entering banks, investment organizations and shareholder.

Media groups, which are formed by magazines, newspapers, TV, radio, which make ideas, comments and news about auto industry.

The civically groups they can contest the marketing decisions of auto manufacturers. In this part enters consumers organizations, ecologists etc.

General public must be taken in care by the auto manufacturer because the attitude of public will influence the organization image.

Local public groups are represented by community, the bigger car manufacturers have managers to communicate with community for sustaining some causes of company.

Internal public groups are formed by employers, managers, board administrators. The firms make internal notes because when internal groups are informed a motivated, and have a good opinion about the company, will be very good for the company.

EVOLUTION OF AUTOMOBILES MARKET

Petrescu Nicolae-Daniel

Academia de Studii Economice Bucuresti, Scoala Doctorala, Domeniu Marketing, Str. Nicolae Titulescu, Nr 17, bl. I5ab, sc. b, ap. 5, Craiova, Dolj, ndpetrescu@gmail.com, 0741521761

Petrescu Mariana

Universitatea din Craiova, Facultatea de Economie si Administrarea Afacerilor, Master Managementul si Dezvoltarea Resurselor Umane, Str. Nicolae Titulescu, Nr 17, bl. I5ab, sc. b, ap. 5, Craiova, Dolj, mariana_petrescu@yahoo.com, 0724482330

Marketing analyze the condition that defines the mechanism and market evolution. Being in a permanent movement because of new models, permanent changes, development of technology and market penetration by Asian car manufacturers, the auto market can be characterized as one of the most dynamic markets.

Using of a proper strategy will let to survive and even to success in the hard competition from auto market.

An important place for success in automobile international market is represented by the product promotion, positioning it in the consumer mind.

Automobiles are products capable of a pronounced difference; the difference is made by shape, attributes, characteristics, durability, liability, style, qualitative performance.

Cuvinte cheie: marketing, market, automobile , sales

General economical theory defines the market by the selling-buying relations, establish between the contractual parts, the products and services providers on one part and the consumers on the other part; complex mechanism of confrontations between demand (solicitations, needs, desires of consumers) and supply (diversity of goods and supply services) under the form of selling-buying document.

Marketing analyze the condition that defines the mechanism and market evolution, explaining the consumer comportment, analyze the level and evolution of prices, competition behavior, real and potential supply, real and potential demand, ideally but also the macro environment (demographic, economical, technological, social, political, institutional, and cultural environment).

The market can be structured in: internal market, external market, organization market and products market. Between total market and products market and organization market are establish interdependent relations named market rapport's (indifferent rapport's, association rapport's and substitution rapport's). The market is defined in rapport with the ensemble of realized transactions, the location of realized transaction with a certain product, products gamma and necessary time for realize the transactions.

In its evolution in time the market goes four stages same as the product life cycle: beginning stage, growing stage, maturity stage and decline stage.

- beginning stage is close to the existence of a unsatisfied need, the appearance of a new product. In this moment it is identify with the product market;
- growing stage means the satisfy of the need by more producers, the similar products offered by those are suffering a difference process;
- the maturity stage is formed by the market of more products related with concurrence, the market is suffering an accentuate segmentation;
- decline stage is determined by the technology evolution and by following down the demand for existent products, the companies are abandoning the market of some products and create new products and implicit new markets.

The study of automobiles market resume the analyze of demand, analyze of automobiles supply for identify the structure and the dynamics of the supply but also to investigate the buying comportment of the automobiles buyers.

The automobiles production represents one of the most important economical activities, which is related with other economical sectors, we assist today at a global process, an expanding of automobiles market.

World production of automobiles was placed in 2006 at a level of 67 millions in according to a study realized by American organization WORLDWATCH INSTITUTE; SUA was the most important auto producer with 10.8 millions, followed by Japan. On the other hand China is in a rapid grow, and the Asian state will become an important provider in the following four years.

Being in a permanent movement because of new models, permanent changes, development of technology and market penetration by Asian car manufacturers, the auto market can be characterized as one of the most dynamic markets

Using of a proper strategy will let to surviving and even to success in the hard competition from auto market. At the beginning the change does not represent a problem, in the fifty's in United States purchasing of a car means the acquisition of a model from GM, Ford, Chrysler or American Motors. In our days the choice of a car is more complicated the automobile range is bigger GM, Ford, Daimler-Chrysler, Toyota, Honda, Volkswagen, Fiat, Nissan, Mitsubishi, Renault, Suzuki, Daihatsu, BMW, Hyundai, Daiwa, Mazda, Isuzu, Kia or Volvo.

At the same time the number of auto-models had grow, at the beginning of seventy's were 140 models, in the present are a little more then 260 car models.

Even on small market of deluxe sport cars which costs over 175000 dollars a piece, the competition is in growing, the models from this market are: Ferrari, Lamborghini, Aston Martin, a new sport-car Bentley and the new Mercedes Vision SLR.

Thirty years ago most car manufacturers offers a few automobiles styles, in our days are the following car types: SUV (sport utility vehicle), coupe, break, two places cars, trucks, and auto trucks; this fact is leading to force the companies to find new financial resources to produce the models.

In our days, the big difference is that the national markets with local companies that compete for business - are being transformed in a global market, because today the competition is at the global scale (Jack Trout – Trout Despre Strategie)

The automobile market has been diversified very match as the computers market, at the beginning the consumers could chose only from three brands Chevrolet, Ford and Plymouth.

The extension of chose possibilities in the auto market can be exemplified by extension of car models from 140 in the seventy's to 260 in the present; automobile styles from 654 in the seventy's to 1121 in the present, and as a different market share from 8 SUV models in the seventy's at 38 models in the present. An important place for success in automobile international market is represented by the product promotion. Chevrolet is one of the most promoted products in the world; General Motors spend in one of the latest year over 178 millions dollars for promoting the product in the United States. At the same time must be taken in consideration the problems which are being in a society which communicate in excess that's why it must realized the product positioning in the consumer mind.

Chevrolet has been the brand with the best car selling in United States, for example, in 1986 Chevrolet Division from General Motors had sold 1 718 839 units, but because they want to satisfy to every one and to grow the number of models had underestimated the branding force, today Chevrolet sales about one million cars and is in the second place after Ford. Conform to Al Ries, Chevrolet has 10 separate models and Ford has 8, that is one of the reasons Ford has raised above Chevrolet in United States – the force of branding is un proportioned with its extension. Chevrolet Company has on the market more automobiles because they want to sell more auto vehicle, in a short period of time they succeeded but in a long period of time they underestimated the brand name in the mind of consumer witch will go to affect the number on sold units.

In a recent classification in United States, made with 16 automobile brands, number one seen from quality point of view is on the 12th place in sales, number two is in the 9th selling place, and number three in quality perception is in on the last place of sales classification. In the case that quality will be translate in sales results, but it is not like this. Most buyers want to acquisition the car with the best quality they can afford. Quality or much more perception of quality is in the mind of consumers. For building a powerful brand must be built a powerful perception of quality in the customer mind. One factor for building the perception of quality is to establish of a higher price. Names as Mercedes-Benz, Rolls-Royce are brands witch have benefits after a high price.

In Romania the automobile was introduced at the end of XIX century at the beginning of production start in world scale. At the end of XIX century in Romania were 60 registered automobiles that ones gathered in the year 1904 in automobile society Romanian Automobile Club (ACR).

So, the automobile history in Romania concurs with the History of Romanian Automobile Club. In September 1904, A.C.R. has made the first automobile rally on the Bucuresti - Giurgiu road and back, and at the end of that year A.C.R. was numbering 29 members and 19 countries clubs. Romania was situated in the first ten countries in Europe where automobile circulated, and was in the first 6 worlds states witch organized automobile competitions (information's from www.acr.ro/Romanian/denumire.htm).

In 1895 three peoples from Craiova Romania had bought three Benz carriages with 10 HP motors, one year later were imported another 3 carriages, a Peugeot, a Rochet-Schnaider and a tricycle Bollee, in 1898 had been imported an Oldsmobile, by the year 1906 had been imported in Romania a number of 150 auto vehicles, in the year 1907 number was 233, and in 1912 the number reach at 850, the most numerous brands were Mercedes, Panhard and Dion-Bouton.

From year 1910 it beginning the fabrication of automobiles with four cylinders of 20, 30, 40 HP under the licenses of Westinghouse at Arad at Marta Company Marta (Magyar Automobil Reszveny Tarsasag Arad). The beginning year of the First World War catch Romania with 650 auto vehicles produced and at the same date ware circulate 1000 automobiles.

After the year 1918 the number of automobiles grow because the branch of Renault, Fiat, Ford, Chevrolet, and General Motors, in 1926 in Romania were more then 11 300 automobiles.

In 1935 Ford Romania Factory from Bucharest began the production of model Ford 193 equipped with the 60 HP; in the year 1945 the engineering Radu Manicatile produced a mini auto vehicle M.R. 1945 equipped with modified monocycle 11.5 HP engine, in the year 1946 had been produced a prototype auto vehicle in Malaxa Factories, followed by the building of an automobile in the factories from Brasov under supervising of engineering Radu Mardarescu.

The real production of automobiles in Romania starts with the factory Dacia from Colibas witch debuts with Dacia 1100, the auto market being comleted by production facilities from Campulung Muscel, Timisoara and Craiova.

Dacia Logan was the best-sold car from the Centre and Eastern Europe, in the third trimester, where it has 24 000 buyers on a market with a total of 350 000 auto vehicles; conform to a study of JATO Dynamics, taken by Newsin. Logan with 24 171 sold units is better then Skoda Fabia (witch sold 17 641 units) and Skoda Octavia (witch sold 16 015 units). Top five of the best-sold cars in Center and Estern Europe is closed by Opel Astra, with 8 492 units, and by Ford Focus with 8116 units. (www.tmcvt.ro)

Conform to a study made by Jato Dynamics; the number of new automobiles sold on Romanian Market in the first nine months of the year has put Romania on the first position of automobile market from Eastern and Central Europe. In the next positions are Poland with 217 412 sold cars in the nine month, in grow with 24% as the similar period of 2006, and Hungary with 128 958 sold units, in descending with 5.9%, conform to the dates of research company.

At the level of all region, the seals of new auto-vehicles grow in the period of January-September with 14% to 981 052 units. In the third trimester Romania is in the leading of the classification of Central and Eastern Europe with a lead of 20.5% of new auto-mobile sells, compared to the same period of 2006 at 82 585 units.

The most sold model in region was Dacia Logan, with 76 924 units sold in the first nine months, in regress with 5.1%for the same period of the last year. Logan was followed by Skoda Fabia with 58 920 sold units (-14%), Scoda Octavia, with 49.510 units (+5.9%), Opel Astra with 24797 units (22%) and Ford Focus, with 23 036 units (+20.1%) (www.informatiiauto.ro).

At the level of year 2007 the automobile sales on Romanian market has grow with 23% toward the level of 2006, reaching a level of 351 000 units according to the dates from APIA, the highest sells were made by Dacia with approximately 95 00 automobiles. The trade turn over of auto industry from Romania, in the year of 2007 (the two local manufacturers and components manufacturers) has reach a level of 7.2 billions euro, in grow with 28.5% (from 5.6 billions euro in 2006). The market leader was Dacia with 93.666 registered automobile, followed by Renault, with 28.824, and on the third place was Volkswagen plus Skoda, at almost equality, 23.824, respective 23.187 automobiles.

The second platoon is constituted by Opel, in a rapid grow, with 18.743 units, Ford with 163573 and Daewoo. From the total sold automobiles, 137.978 had diesel engines and 177.643 had petrol engines. Renault brand had a market share of 9.3%, Opel 6.1%, Ford 5.55%.

Peugeot Brand has a total of 13.682 registered automobiles in the year of 2007, being catch up from behind by Chevrolet and Hyundai, one of the 2007 year revelations, followed by two other brands Fiat and Toyota with approximately 10.0 registered automobiles.

Toyota Romania had reported sells of 10.458 units of Toyota and Lexus, in grow with almost 70 % faced the precedent year. From the total of sold cars in 2007 10.301 were Toyota (with a grow of 67% faced 2006), and 157 Lexus units, for the Lexus brand the grow was almost 200%. The best sold units were Yaris (2.341 units), Avensis (1.968 units) and Corolla (1.835 units). Toyota Auris had registered sales of 1.167 units.

Renault had commercialized in 2007 on Romanian market 32.200 units with 37% more then last year, more than 29.000 from that units were automobiles. Megane had known the most spectacular grow, reaching more than 11.800 units, with 73% more then 2006. Symbol remains the leader of import classification with more than 13.400 sold units, with a grow of 16.7% more than last year. A grow of 48.9% had registered Clio III with more than 2.700 units.

Nowadays, insurance products are seen in developed countries as products for basic needs. In order to successfully adjust to changes in the environment insurers need a thorough knowledge of the characteristics of the market achieved through a coherent marketing activity. The paper aims to present a methodology of how to analyze the consumer behavior in the Romanian insurance market, which are the proper ways of analyzing the influence of endogenous and exogenous factors on the insurance consumer behavior using desk research as well as direct market research so as to study the most important factors in the decision making process.

Multicultural Marketing, Global Marketing, Consumer Behavior, Endogenous Factors, Exogenous Factors, Documentary Study, Qualitative Direct Market Research, Quantitative Direct Market Research

1. Global marketing versus multicultural marketing in insurance

The marketing activity in insurance has been the concern of renowned specialists – they tried to find the answer to these questions: “What kind of marketing is the right one for the development of the insurance sector and for enhancing welfare?”, “Which are the main characteristics of the consumer behavior in insurance market and how we can adapt the marketing activity to these characteristics?” and “How to study the consumer behavior in the insurance market?”

The consumer behavior particularities influence the marketing orientation of the insurance company. Even in the services sector the globalization has made important changes in the way the consumer behave and in consequence in the way the firms manage their marketing activity. By this perspective we shall try to find the response to the question “What kind of marketing is the right one for the development of the insurance sector and for enhancing welfare?” by presenting the various theories concerning the most appropriate type of marketing in insurance: global marketing or multicultural marketing.

The globalization of the insurance market is a fact that cannot be contested. It is determined by a series of factors such as: the development of world trade, the entry on foreign markets of business clients of insurance companies, the need of a more effective activity of insurance companies, economic growth on emerging markets, a greater need of capital and know-how on these markets etc. (*Swiss Re, Sigma no. 4/2000*). The globalization of the insurance market has lead to the uniformity of tastes of consumers worldwide, making their attitudes and preferences similar (Harold Chee, Rod Harris, 1998).

However, starting with the '90s, multicultural marketing - which accounts for the differences in perception, attitudes and behavior of consumers in different cultural areas - has been viewed as an alternative to global insurance marketing. Ruy de Carvalho in “How does the future look?” went even further in predicting the appearance of the so called *emotions marketing* in insurance – a type of marketing necessary as a consequence of an increasingly sensitive consumer behavior. (Ruy de Carvalho, 1998).

Philip Kotler showed that companies tend to turn more and more to the marketing of images and emotional incentives to gain the best position in the clients' minds and hearts and try to sell an attitude or a way of life, promotional campaigns acting more on emotions than on the intellect. (Philip Kotler, 2003).

Michael Solomon, Gary Bamossy and Soren Askegaard maintain the theory that nowadays consumers are trying to build an identity through various consumption activities (Michael Solomon, Gary Bamossy, Soren Askegaard, Margaret Hogg, 2007) and consequently a consumer will choose the product / service / company brand that has an image in accordance with the ideas he holds about himself - the choice being indicative of the type of image the consumer desires. The same idea is sustained by a renowned specialist in international marketing, Charles Croue: he argued that the 21st century has a complex **cultural heritage** which is a decisive factor for the success or failure of the marketing activity on international markets (Charles Croue, 2003) and the insurance companies should adapt their activity to the specific consumer behavior. This situation implies that consumer should be treated as individuals and the insurance companies should try to comprehend the consumer behavior and the complex factors that influence that consumer behavior and the insurance companies should try to act as a one-to-one partner. Sergio Balbinot in *STRATEGIES FOR THE NEW WELFARE SOCIETY IN THE LARGER EUROPE* notices that the interest of insurance companies to make profits corresponds to the interest of customers, as making profits means establishing long-term relations with customers in order to have a stable portfolio. (Sergio Balbinot, 2005).

Theories regarding the importance of taking into account the features of different cultures in marketing are numerous in specialized literature in the field. Moreover, in the context of the new positions of power created by globalization, there are many supporters of the theory that global marketing is the best solution, as the globalization of markets has led to the uniformity of tastes of consumers worldwide, making their attitudes and preferences similar (Harold Chee, Rod Harris, 1998). In any case we should study

2. How to study the consumer behavior in the Romanian insurance market

The social development and quality of life in Romania depend to a large extent on the way in which Romanians view insurance services, as well as on their attitude towards risk and insurance. So it is very important to know and understand the consumer behavior in the Romanian insurance market.

There are three important aspects that should be studied in order to know the consumer behavior in the Romanian insurance market:

1. the main characteristics of insurance supply and demand and the trends on the Romanian insurance market,
2. the particularities of the Romanian consumer behavior and the particularities of the consumer decision making process in the Romanian insurance market and
3. the influence of exogenous and endogenous factors on the behavior of the Romanian consumer of insurance services.

For the study of the consumer behavior in the Romanian insurance market we consider that we should combine three research methods: the documentary study, the qualitative direct market research and the quantitative direct market research. Documentary researches, qualitative and quantitative researches are complementary – see Image no. 1. Both primary and secondary sources of information should be used in the study of the consumer behavior in the Romanian insurance market.

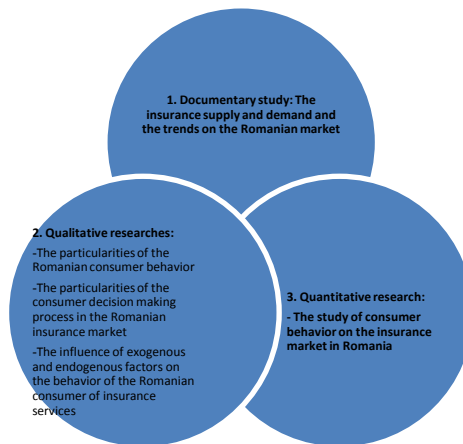

Image no. 1. The study of the consumer behavior in the Romanian insurance market using complementary marketing researches

We can use the documentary study for analyzing the insurance supply and demand and the market mechanisms, for studying the trends on the Romanian insurance market. This will lead to obtaining important information for the harmonious development of the sector in Romania. The study of market trends can help insurance companies in Romania become more competitive. An important source of information on the Romanian insurance market is represented by the reports of the CSA. This study can be used in order to establish some of the hypotheses for the quantitative direct market research.

The direct research is the most important modality of obtaining information for the study of the consumer behavior in the Romanian insurance market and both qualitative research and quantitative research should be used for identifying the particularities of the Romanian consumer behavior and the particularities of the consumer decision making process in the Romanian insurance market and for analyzing the influence of exogenous and endogenous factors on the behavior of the Romanian consumer of insurance services. The exogenous variables that should be studied are: family, belonging and reference groups, social class, culture and subculture. The study of the endogenous factors implies the study of perception of insurance services among Romanians, the study of the attitude of Romanians towards insurance services and the study of the motivation of the consumers of insurance services.

We propose to use two qualitative marketing research methods: the semi-guided interviews and the Delphi group method. The qualitative marketing research using semi-guided interviews is the best method for studying the particularities of the Romanian consumer behavior and the particularities of the consumer decision making process in the Romanian insurance market and the influence of exogenous and endogenous factors on the behavior of the Romanian consumer of insurance services. There are two qualitative marketing researches to organize: (1) a research for studying the particularities of the Romanian consumer behavior and the particularities of the consumer decision making process in the Romanian insurance market and (2) a research for studying the influence of exogenous and endogenous factors on the behavior of the Romanian consumer of insurance services. To find the influence of endogenous factors we have to study the role of family, belonging and reference groups, social class, culture and subculture in the decision making process in the Romanian insurance market. To find the influence of endogenous factors we have to study the attitude of Romanians towards insurance services on age, income, environment and socio-professional categories and to analyze the way in which specific features of perception, attitude and behavior of the consumers in different cultural areas influence the marketing in insurance activity. The organization and implementation of the qualitative marketing research using semi-guided interviews implies designing marketing research, implementing marketing research: selecting the participants based on the recruitment questionnaire, interviewing each subject by using the conversation guide and recording the interviews, the analysis and interpretation of information, drawing up conclusion and presenting the final report. The qualitative researches will be conducted among Romanians living in urban and rural environments, between 18 and 60 years, by using semi-guided interviews.

The Delphi group method can be used in order to establish the particularities of the marketing activity function of the particularities of the consumer behavior and of the influences of endogenous and exogenous

factors on the behavior of the consumer of insurance services. The qualitative market research using the Delphi group method involves questioning a group of experts composed of 8 -10 specialists in insurance and marketing. In the group of potential experts we should include persons that have an overall view of the problem and use multiple information sources – journalists and consultants included. The method of information gathering can be based on “on line systems”: questionnaires and their answers can be sent via Internet.

The quantitative research should be used for the study of consumer behavior on the insurance market in Romania. Quantitative research aims at quantifying data and generalizing results at the level of the entire population studied. The phases of research are: determining the objectives of research, determining the hypotheses of the research, defining the research variables, identifying the population studied, the unit of observation and the unit of survey, setting the sample, establishing modal, spatial and temporal coordinates, elaborating the questionnaire, the pilot survey, gathering information, processing information, analyzing results and drawing up the final rapport. The direct marketing research using the market survey should be made on a representative sample of 1083 insured persons (the error $\pm 3\%$). As to the risks we might face – we must take into account the fact that in direct market research problems might arise related to the elaboration and applying of research tools (for instance, questions might be insufficiently clear and precise, subjects might miss interpret them etc.), therefore the research tool: the questionnaire must be tested in advance.

In order to study the evolution of the Romanian consumer behavior of insurance services and the influence of endogenous and exogenous factors on the behavior of the Romanian consumer of insurance services we should realize a diachronic study: this suppose to repeat the qualitative and quantitative research that will use the same methodology as the study realized before and to compare the results obtained so as to emphasize the way in which the behavior of the Romanian consumer of insurance services evolved and in order to highlight the evolution of the influence of endogenous and exogenous factors on him.

SOME ASPECTS OF MARKETING IN KNOWLEDGE SOCIETY

Petrișor-Mateuț Oana

University of Agora, Oradea

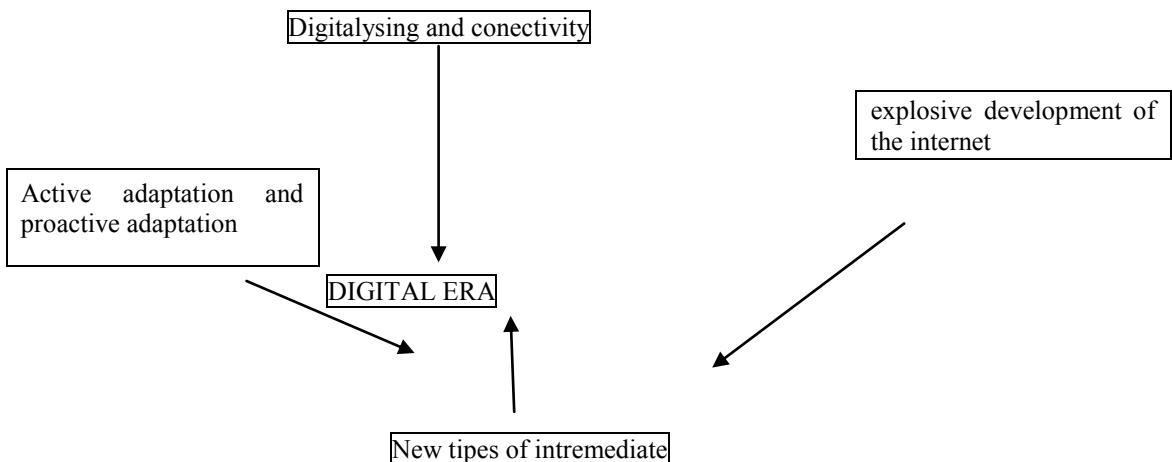

Oana_mateut@yahoo.com

Abstract: In the last decade, the strategy and marketing practice have passed through many spectaculars changement. The great technological progresses, inclusive the explosive development of the internet, exercited a strong impact on the buyers and marketerilor that serves them. To prosper and even to survive in this digital era, marketerii has to re-think their strategies and to adjust them to the new today's environment.

Key words: tehnological progresses, digital information, e-business", electronic business

The new technological progresses including the wide spread of the use of internet lead to appearance of what some name already the New Economy.

Although there has been many controversies in the last years about the nature – or existence itself – of this “new economy”, few will deny the fact that the internet, together with other new and efficient technologies of connecting, brings a spectacular influence on marketerilor the an buyers. Many strategies and marketing practice who in the past represented “usual norm” – the mass marketing, products standardize, publicity through mass-media, en detail selling in stores and others - where perfect matching in the context of the so-named "old economy". Although all these strategies continue to be important in the "new economy", the marketers will have to conceive new models, in more measure adequate to the different environment from these days. The forces that play a major role in the reshape of the world economy, among which is technology, globalization, ecologist and others. Digitalizing and connectivity, explosive development of the internet, the new types of intermediates and active adopting of the offer made to the client in tandem with the proactive adopt. Numerous equipments and systems available in the past – ranging from apparata and phone connections, watches and music records to measurement apparata for industrial parameters – all functioned based on analogical information. The analogical information is permanently variable due to the function of response to physical stimuli. Nowadays, an increasingly larger number of equipmnets and systems function based on *digital information* which occurs in the form of 0 / 1 sequences or bytes. Texts, data, sounds, images, they can all be read as byte sequences. A laptop operates precisely these bytes whitin the thousands of applications it runs. Computer soft programmes consisted of a digital content for operating systems, games, memorized information and also other applications.

Forces that modelate the internet era

In order to allow bytes to pass from one location to another, or from one application to another, connectivity is needed - a network of telecommunications. Worldwide, economic activities exist via these networks which connect **economic agents** and entrepreneurs. **Internets** are networks that connect people from a company, both one with the other and with company's network too. **Extranets** connect a company with its contractors and distributors, and also with other external partners. The Internet, a large organism of networks connects users of all kinds from all over the world both with each other and with an enormous "information store". The Internet represents a very large "information highway" which allows bytes to pass from one location to another at an incredibly high rate

Encouraged by the new technologies available, mainly the Internet, the economic agents is going through a process of transformation, similar to the industrial revolution. In order to survive and prosper in this century, managers must enter their brains a new set of regulations. The economic agent must adapt to the the new targets of Web management. The Internet revolutionizes our way of thinking, our relations with the contractors and distributors, our way of making money and liabilities/assets (pasive si active), in a nutshell it revolutionizes the Marketing.

Some marketing experts foresee the day when all transactions will be operated via electronic connections between the firms and their customers. The new activity pattern will change fundamentally the customers' conception regarding comfort, speed, prices and information availability on products and distribution. This new consumers' way of thinking shall have important effects on all firms/businesses, irrespective of the area of activity. Adopting the Internet as the main connection and other marketing technologies may be compared to the beginning of flights.

Using the electronic platforms, the internet - the extranets and intranets - to develop a business is coined "**e-business**", **electronic business or business activity in electronic system**.

Electronic commerce refers to all sales and purchases/buyings performed via electronic system, mainly the Internet. Electronic markets are virtual markets. Sales agents use the electronic markets to present their services and products in on-line system. Customers use them to find information and the location of whatever they need, to order by means of credit card payments or other electronic payments available.

The electronic commerce consist of *e-marketing* and *electronic supply/purchase*. Electronic marketing is the marketing area of electronic commerce and consists in the company's efforts to present, advertise and sell products and services via Internet, thus existing firm that have marketing in their own web sites (Dell company). The counterpart of electronic marketing is the electronic system supply, which stands for the purchasing part of the electronic commerce and consists of all firms which purchase goods, services or information from on-line suppliers.

Within the firm-to-firm sales, e-marketers and e-buyers are assemble in large networks of alectronic commerce.

Purchasing via the Internet brings upon some advantages to both kinds of buyers/customers - organisational and final ones. This method of purchasing is very comfortable. Customers are no longer obliged to stay in traffic, to find parking sites, and to walk along the shelves in order to find and prospect the product needed. Customers may compare all existing offers simply by skimming the catalogues in the postbox or surfing among web sites. Direct marketers are never closed. Purchase is easily done without unwanted intrusions: customers meet much less obstacle in their way, no efforts, no sale assistants to deal with. Organisational purchasers/buyers may also find out existing data and buy products and services without time-consummation and endless discussions with the shop personnel.

Moreover, the Internet allows customers/buyers larger acces and choice possibilities regarding all the products.

Electronic commerce is very conveninet for the sale firms. First of all, the Internet is an instrumnet of great impact for developing relations with one's customers, for marketing - firms can interact on-line with their customers and find out more about the clients' needs and desires, on-line clients can post commnets, questions and personal opinions regarding products. Based on this continuous interaction, firms/companies can increase their clients'/customers' satisfaction by improving and expanding the product offers.

The Internet and other electronic channels of comunication also have disadvantages, like low costs, speed and efficacy increase. Electronic marketers electronici avoid the costs of maintaining and adminnistering a supermarket, with all annexed costs: rent, insurance, utilities.

Using the Internet in order to connect to their suppliers/contractors, all production factories, distributors and customers/clients benefit from low cost production, thus transferring some saved money towards the clients.

Because clients are in direct contact with sellers, electronic marketing has often as a result lower costs and better efficiency for logistic functions and from the distribution channel, as would be the processing the orders, stock's administration, delivering and promoting among distributors. Communication through electronic means often consists less than communicating through mail. For example, a company may work with digital catalogues, whose production cost much less than the printed and whose online distribution also would cost less than the one made by mail.

Electronic marketing offers more flexibility, by allowing the marketer to adjust permanently the offers and programs. For example, once that a catalogue printed on paper was sent by post to the final consumer or organizational clients, the products, prices and other elements of the catalogue were fixed and remain the same till expedition of the next catalogue. But, one on line catalogue may be changed daily and even from one hour to another, in order to adopt the products assortments, prices and promotional actions to market's change of conditions.

Internet is an environment indeed global, that allow sellers and buyers to go from one country to another in only few seconds. Thus, even small electronic marketers found that they have easy access to global markets.

TENDENCIES OF INTERNATIONALIZATION IN RETAILING

Pop Nicolae Alexandru

Manufacturing companies took advantage of internationalization as early as in the seventies and eighties of the last century, whereas retail companies have used these chances not before the last few years in order to improve access to resources, to increase sales and to extend activities to external markets. Once a retail company has decided to penetrate a foreign market they must be aware of the unfamiliar working of external environment that they cannot control. Even the world's leading retailers make mistakes when approaching markets they do not understand properly.

Key words: retailing; internationalization; elements of external environment; behavioural polyvalence; consumers' orientation

1. Introduction – The Marketing Environment of Companies

Literature has defined the market environment of manufacturing and retailing companies in different ways. So, it represents “the assembly of elements and forces that come out under the instant control of the company (manufacturing or retailing) and influence the maintenance or the development of their relation with gainful clients” (1, p.76). Alternatively the market environment comprises all entities and “external forces of the company capable to influence the way in that it develops and maintains satisfying exchanges with the target market” (8, p.178). Companies need know their environment for two main reasons, first to fully use the chances the market offers, second to avoid uncertainty in an aleatory, undetermined or antagonistic universe. (17, p 73).

2. Economic Aspects

Nowadays retailers see themselves with a host of economic changes confronted both on a micro and a macro level as well concerning intra- and inter-organizational management. (16, p. 59).

Retailers are exposed to a continuous change all over the world with a steadily harder growing competition and an increasing saturation of their home markets since the nineties. (2, p 186). These circumstances contributed essentially to the movement outside the national borders. Most retailers think that internationalization is the best strategy to raise sales, and to conquer new markets. To solve the connected problems a different approach of retailer as well as wholesalers is required (29, p.226). The extent of such a process is illustrated by Fig. 1 for the case of the Metro Company.

In 1992 the first 30 retailers that have gone abroad were present in less than five countries. Today some of them realize even more than 50% of their total turnover on foreign markets. Some of the retailers penetrated up to 30 external markets (31, p.77). Usually, only powerful retailers manage to penetrate foreign markets. They can easier bear the consequences of a possible mistake when attacking a new market (see the case of Wal-Mart in Germany). Wholesale trade is only to a lower degree internationalized. It rather concentrates on local and regional expansion. There is, however, one important exception: Those wholesale traders that practice international trade by export and import.

Figure 1: Comparison: number of penetrated countries versus the total turnover on global scale (for 2006 in 1000 million Euro) (31, pp. 76-89)

The present movement of internationalization of retail trade started off in the nineties and follows a trail set by pioneer manufacturers during the seventies and eighties (12, p.233). A comparative view is illustrated in table one.

Years	Manufacturers		Traders
	70 – 80	90 – 00	90 – 00
International situation	Pioneers / “early starter”	Internationalized, but among many others	International situation
International competition	weak	strong	International competition
Importance of international strategies	reduced	high	Importance of international strategies
Spatial orientation	Neighbour countries	Worldwide	Spatial orientation
Entry form, respectively market approach way	Export; agencies	New foundation; cooperation	Entry form, respectively market approach way
Main lines of internationalization	Distribution activities	Creation of value; co-ordination of activities	Main lines of internationalization
Speed of internationalization	medium	high	Speed of internationalization

Table 1. Central features that determine manufacturers’ internationalization, European traders respectively (20, p.166)

Most of European retailers (19, pp.500-502) – Carrefour, Metro, Ahold, Tesco, Rewe, ITM Enterprizes, Edeka, Schwarz, Auchan, Spar International – derive their sales basically from the food sector. Some of them do understand the necessity for globalizing activities and the need of “reactive extension” to Central and Eastern Europe (28, p.244). Such an extension is a fundamental option of strategic diversification (5,

pp.196-212), a concept which is not properly understood by most retailers. This lack is aggravated by their inability of fast transfer of resources to new markets, and insufficient flexibility with respect to cultural, political, juridical aspects or simply to proper understanding of consumers.

The largest retailer of the world, Wal-Mart, with an estimated turnover of 350 billion USD in 2007, entered in the middle of the nineties the German market. After investing initially 1.6 billion USD and losing over 3 billion Euro during their activities, due to the strong competition of the discounters Aldi and Lidl / Schwarz (Kaufland), the company failed to develop a favourable image in both consumers' and employees' minds. At the same time, local competitors boomed considerably. Therefore, in July 2006 the management of Wal-Mart decided to sell the German branch with 85 stores to the Metro Group. The buyer announced that he will shut down 13 of them.

3. Political – Legal Factors

Liberalization of world commerce according to the rules established by the World Trade Organisation (Eastern Europe, Asia) and opening of new markets are among the most important factors of internationalization (12, p.343). Agreements like GATT, GATS, TRIPS (33) that create a favourable framework for free trade and lead to a global integration of world trade (28, pp.4-11) concerning manufacturing, agricultural, services and intellectual property rights. They aim at establishing rules that are reliable (32).

The role of behavioural rules for retailers on external markets is underlined by literature (23, pp.410-436):

- Foundation and development of subsidiaries on external markets – an approach designated as “subsidiary strategy” and considered as “the most successful way of internationalisation” in retailing (29, p.343).
- Acquisition of local retailers (“acquisition strategy”) or of local commerce networks. This is an easier way to penetrate foreign markets, due the fact that a local retailer has adapted himself to the local market. Much time can be saved, too, and possible juridical complications can be avoided (29, p.344). The acquisition of local or national retailers can also be regarded as an economic globalization phenomenon (27, pp.75-90).
- Cooperation with local retailers (“cooperation strategy”) on the base of “franchising” or “Joint Venture”: Such decisions may be the result of legal restrictions that do exclude foundations of subsidiaries or alternatively may bestow a better access through a local partner to resources. The shares can than later be sold to them or to third parties. Metro, the second European retailer (31, p.65) used this type of expansion in China, by establishing a Joint Venture in 1996 with the Chinese group Jinjiang. Nowadays Metro China has more than twenty locations (30, p.12).

Proper entrance means the decision of finding the right moment of entering a new market. It also means choosing the right number of locations and size of stores (regarding assortment variety and surface) (5, p.198), but also the two learning dimensions – the intra-organisational learning (given by the own experience of internationalisation) and the inter- organisational learning (seen from the point of view of the competition, which already exists on the market) (15, p.96).

4. Technological and Natural Factors

There is a large concentration of retailers on an international level, which means also an increase of financial, human and technical resources. Commerce and especially retail commerce is not considered any more as a simple distributor for producers, but it becomes a special dimension, a partner (24, pp.1-4). Such a professionalization of commerce was also possible by modern technical systems (14, p.83).

This makes it easier to access final consumers. There are even more new possibilities of obtaining relevant information from consumers and their behaviour, for e.g. by automatic cash registers with scanning devices. Such machines do not only contribute to increase the efficiency of paying processes but also of gathering the necessary information concerning a basket of consumers' commodities. Further examples are consumer cards (7, pp.104-107), which can provide necessary personalized data concerning buying behaviour. Through such loyalty programs, retailers have the possibility of observation consumers' buying behaviour. Furthermore he can observe everything what was bought. Retailers also can compare buying baskets and correlate these data with the socio-demographic characteristics of card owners (14, pp.83-84).

Retail succeeds to be perceived, due to information technology, more easily and faster by consumers, practically to “access” him and to induce him an affection that leads once more to accepting retailing firms. The non – stationary of e-commerce, but mainly the provided comfort (customers does not have to go anymore to retailers and to buy products, but the entire acquisition process is carried out from any computer) represents at least theoretically, a proper alternative for retail, if not even a future threat (26, pp.687-706).

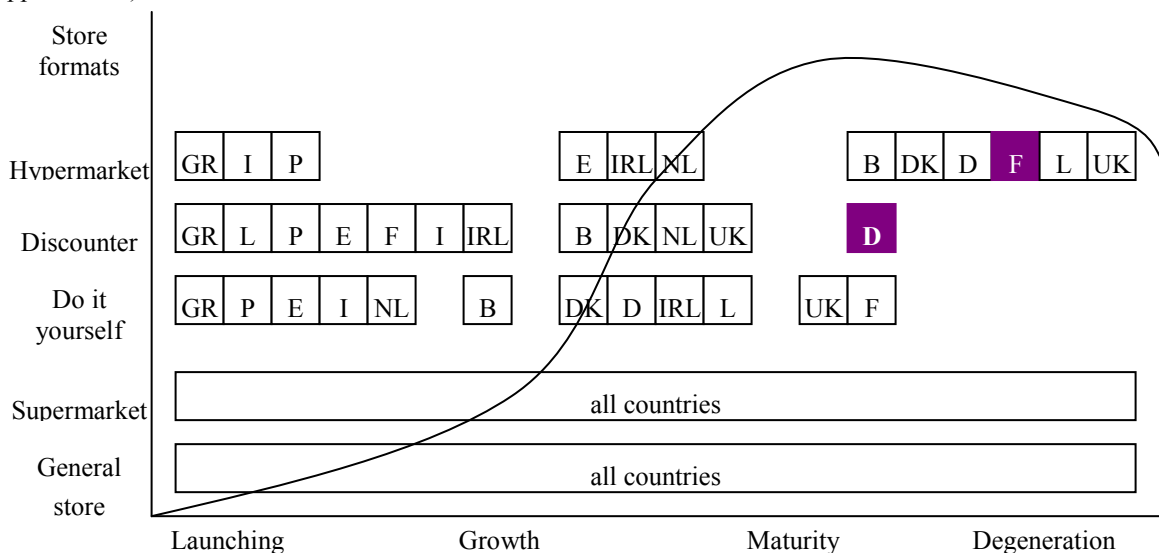

Figure 2. Phases of the life-cycle of some selected European retail stores (29, p.518)

Internet is used as a distribution channel which contributes to the growth of their awareness (25, pp.168-177). From some empirical studies (18, p.36) we see, that consumers rely on names when buying in internet. This means that such names are perceived as brands (14, pp.84-86). Just those retailers who succeed in positioning themselves in consumers’ minds as strong retail brands will have the chance of being recognized adequately by them (25, pp.168-177).

For different foreign markets there are also distinctive types of stores. For Germany the specific store are run under the designation of “discount”. In France we find the “hypermarkets” are the most specific format. Some studies (4, p.133) have “succeeded” in integrating retail stores in the life-cycle model, as shown in figure 2 (3, p.44).

Information overcharge must not be neglected by the media (22, pp.19-38). Literature also states that consumers are overfed by commercials. Other sources report that the total time spent on TV commercials is of at least 40 hours per day (6). As a consequence, consumers are not able to process that much information. This means that commercials must reach the attention of consumers in a very short. This becomes more and more difficult (6, p.13).

5. Socio-Demographic and Socio-Cultural Factors

Worldwide acting retailers must take care about various socio-economical and socio-demographic characteristics of consumers. Some behavioural tendencies are present even in different regions. This is regarded as a behavioural polyvalence, also known as the dynamic of consumer’s behaviour (11, pp.133-136). On this base, we distinguish the following kinds of consumers in retailing:

- The “consistent” consumer: He behaves in a constant way, and is easy to include in a category. He always keeps his buying characteristics and causes no problems when being approached by retailers. His principle is: “I am what I own”;
- The “hybrid” consumer: He is known to have a bipolar behaviour because he is inclined to invest a lot of money in a shopping situation. In another one he will try to dramatically reduce the spent amount of money. He is actually the type of individual who buys both from exclusive stores and from discounters, his principle being “I am the way I live”;

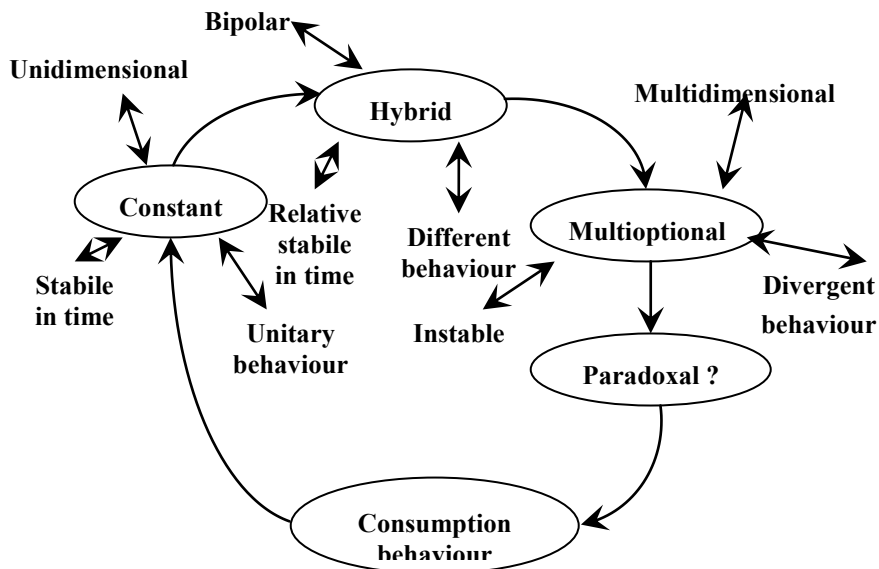

Figure 2. Evolution of consumers behaviour (10, pp.37-54)

- The “multi-optional” consumer: He starts off from hybrid stage and adopts different roles. He actually belongs to several types of consumer groups. The instability of consumption, the fact that he lives exactly how he is at a specific moment makes him always keep some options open. He represents a real challenge for both retailers and their assortment variety;
- The “paradox” consumer: He is the future transposition of a present consumer which flies between various traditional groups and swings between an “inside” and an “outside perspective”. Figure 3 shows the evolution of consumer’s behaviour in retail.

Among the “basic orientations” under that a retailer can be regarded as a “brand” the following approaches can be noted (26, pp.24-29):

- *Orientation towards “adventure / spare time / action / fun”*: This orientation does not only suggest a way of spending spare time by consumers, but also refers to the way in which a retailer succeeds to differentiate himself from competitors.
- *Convenience orientation*: Several factors contribute to this new orientation, such as the fast growing number of individual households, the fact that women try to successfully combine career and family, but also the tendency of optimizing time and space. For example, a convenience buyer is the one who shops and refuels at a gasoline station.
- *Attitude towards brands*: It contradicts price orientation; it is more likely a trend of the younger generation. This orientation is sometimes combined with the one for organic products. Here, the brand is regarded as a safety element and a warrant of quality and trust of the products origin (11, pg. 137).
- *Price orientation*: Is a new trend in retailing, which tends to offer products at lower price level that can supplement typical brands without any lack in quality.

Price orientation is typical for discounters (14, pg.88). A corresponding strategy does not mean buying low quality products. It stands for a professionalization of shopping. Although consumers are price sensitive they try to buy products above a minimum level of quality. Such consumers are regarded by literature as “Smart Shoppers” (11, pg.137). The main orientations of consumers are shown in figure 4.

- *Orientation towards organic products*: This orientation is also directed towards nourishment that is good for health (13, pg.189). This can be regarded as the newest challenge of retailing.

Abstract: Positioning is an already popular subject, mentioned in almost every marketing book throughout the world. Although there is consent on what positioning means, there is still some debate on how this concept could become more operational. This paper aims to help organizations introduce positioning as a part of their everyday marketing activities.

Key words: marketing, positioning, marketing research, framework.

Positioning, as we all know it

Any marketing strategy is built on “STP” – Segmentation, Targeting, Positioning. A company discovers different needs in the marketplace, targets those needs that it can satisfy in a superior way, and then positions its offering so that the target market recognizes the company’s distinctive offering and image. If a company does a poor job of positioning, the obvious result will be a generalized confusion. On the other hand, if a company does an excellent job of positioning, then the rest of its marketing planning comes along smoothly.

The word “positioning” was popularized by two advertising executives, Al Ries and Jack Trout. Positioning is the act of designing the company’s offering and image to occupy a distinctive place in the mind of the target market. A good brand positioning helps guide marketing strategy by clarifying the brand’s essence. The result of positioning is the successful creation of a “customer-focused value proposition”, a convincing reason why the target market should consider buying the product.

The first step in defining a competitive frame of reference for a brand positioning is to determine category membership. Determining the proper competitive frame of reference requires understanding the consideration sets consumer use in making brand choices. Once the competitive frame of reference for positioning has been fixed, marketers can define the following:

- **Points-of-difference.** Points-of-difference are attributes or benefits consumers strongly associate with a brand, positively evaluate, and believe that they could not find to the same extent with a competitive brand. Creating strong, favorable, and unique associations as points-of-difference is essential in terms of competitive brand positioning.
- **Points-of-parity.** Points-of-parity are associations that are not necessarily unique to the brand and may in fact be shared with other competitors.

Category points-of-parity are associations consumers view as essential to be a legitimate and credible offering within a certain product or service category. They represent necessary but not sufficient conditions for brand choice. Category points-of-parity may change over time due to technological advances, legal developments or consumer trends.

Competitive points-of-parity are associations designed to negate competitors’ points-of-difference. If a brand can achieve the same performance in those areas where the competitors are trying to find an advantage and obtain advantages in other areas, the brand should be in a strong competitive position.

In order to achieve points-of-parity on a particular attribute, a sufficient number of consumers must believe that the brand is good enough on that aspect. If consumers believe that, they may be willing to base their evaluations on other factors potentially more favorable to the brand. On the other hand, with points-of-

difference the brand must achieve clear superiority. Often, the key to positioning is achieving all the necessary points-of-parity. Otherwise, it would be impossible for the company to compete on equal terms. After acquiring the required minimum level in order to be recognized as a competitor on that market, the company can focus on achieving as many points-of-difference as possible.

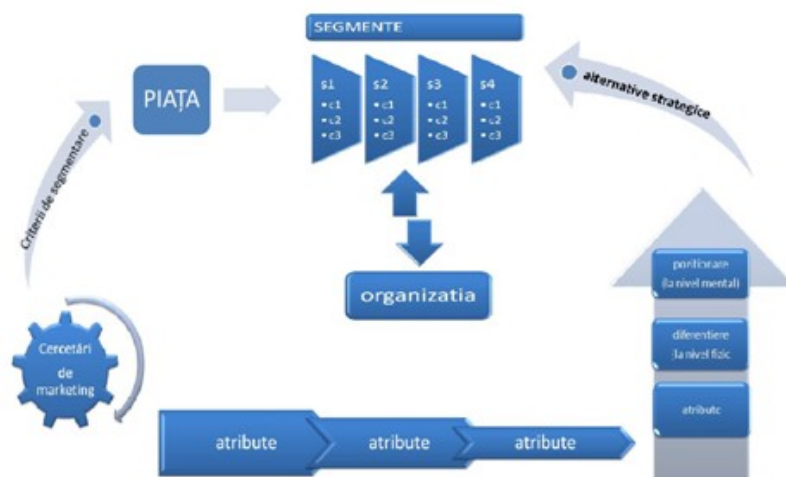

There are still many unclear aspects about the concept of positioning. The first problem is where to fit this concept in the marketing process as a whole. In my opinion, positioning should have its place between marketing research and marketing mix design. Nowadays, there are still many companies which go straight from identifying the need to marketing mix, without taking into account and choosing from the number of positioning alternatives. This situation of “no positioning” is the worst possible.

The second problem derives from the first: how can we motivate this concept’s place in the marketing process? In other words, what role does positioning fulfill in the marketing process? I believe that positioning has the role of coordinating the company’s marketing policy. After choosing the place it wants to occupy in the consumer’s mind, the company has to act upon the marketing mix components in order to put it into practice. All the marketing mix components have to support the same image, in accordance with the selected position. If there is no coordination between these elements, each marketing mix component will support a different image, and the result will be an “unclear positioning”.

Neither positioning nor marketing mix can be developed in the absence of accurate market information. This emphasizes the importance of marketing research as the starting point in the marketing process. We can break the marketing process into four stages:

- the research stage: the company gathers all the necessary information related to the general environment, the market and its competitors;
- the positioning stage: after analyzing the above data, the company must select a position that offers the best chance of success on the market, but also a position it can support with its strong points;
- the marketing mix stage: upon choosing the desired position, the company’s task is to communicate it through all the components of the marketing mix. The company’s brand cannot occupy the desired position unless the four components of the marketing mix converge to the same image;
- the implementation stage: this stage can determine the success or failure of the above program, because process management errors can result in seriously damaging marketing mistakes.

A picture of the first two stages of the marketing process is shown below:

Picture 1: The first two stages of the Marketing Process

The Marketing Process starts with marketing research. This stage lays the foundation for all the upcoming stages. A solid foundation would be to correctly identify the segmentation criteria and the consideration set consumers use in making brand choices. By applying the segmentation criteria, the market can be divided into a number of segments, each with different characteristics and different consideration sets.

When considering the strategic alternatives involved in segment selection and targeting, the company must adapt its offer to the consideration set each segment uses in making brand choices. This adaptation process is named “differentiation”, and its result is easily visible when testing the product. At this point it’s easy to conclude that the differentiation process has results on a physical level, effectively changing the product in order to make it more “likeable” in the consumer’s eyes.

After the differentiation stage, the new product characteristics, selected in accordance with the consumers’ consideration set, must be communicated in order to determine brand choice changes. A proper communication will lead to a clear and strong brand positioning. In other words, the product will obtain the desired position in the consumer’s mind, thus attracting those consumers who value its offer. We can now conclude that the positioning process has results on a mental level, giving the consumer a cogent reason for buying the product. On short term, a well communicated brand positioning can determine brand choice changes even without a preliminary differentiation process.

Once a company has selected its desired brand positioning, there is still a long way to go. There are still four marketing mix components to be harmonized, which is always a difficult task. Moreover, there is still the implementation stage, a never-ending battle for market supremacy. Yet all the upcoming battles are half-won if the obtained brand positioning provides a solid foundation.

THE ROLE OF THE CATEGORIES IN INTERESTS IN CONSOLIDATING THE IMAGE OLTCHIM SA RAMNICU VALCEA

Popescu Loredana

Universitatea Spiru Haret, Facultatea de Contabilitate și Finanțe, Rm. Vâlcea, str. G-ral Praporgescu, nr. 22., Email : popesculrdn@yahoo.com, Tel. 0745885587

Oltchim SA, as a modern organization is functioning in a real context very complex , the result of combination of the three categories of production factors getting in relation with Oltchim SA.

This scientific communication is a research of the role of three categories of production factors getting in relation with Oltchim SA as components of its environment: suppliers of material resources or services, suppliers of financial resources (banks) and personnel suppliers.

For realizing his objectives, Oltchim Rm Valcea, during the activity period, it was and it is obliged to face the date situations, to utilize at the maximum material capacities, technical - scientific and human for assure and keep the competition success by anticipating the evolutions in the area of research, developing technology and innovation.

Key words: financial environment, external environment, local environment, financial communication

Since 1966 Oltchim has provided chemical products that improve human life worldwide. Its products, either caustic soda, propene oxide, propylene glycol and polyethers, chlorsodic products or construction materials, are highly appreciated in all the 80 countries in which Oltchim is present. 300 partners, a family of over 5000 members, along with the quality and environmental protection certificates obtained up to present, make Oltchim one of the most important chemical products companies in Europe. Oltchim is the unique producer in Romania of a series of very important products, such as PVC or pearls of caustic soda.²¹⁵

The structural changes from Romanian economy, after 1990 has decreased the instruments of the state for intervene in the work market. The social insecurity, the financial situation and the absence of a culture of work market already make from personnel suppliers an agent of the company's environment.

Material resources or services suppliers are a special category with for Oltchim SA, and together they create a real partnership tacking in consideration the implications of the activities concerning the implications of their activities about development to an optimal level of the activity of the company.

Personnel suppliers are also an important component of the Oltchim SA environment.

For SC Oltchim, clients are the most important component of its microenvironment.

Financial environment is also important and icludes bancks, creditors, financial analits, share market agents, consultancy agents.

For Oltchim the main stockholder is Roumanian State by National Agency For Valorify The State Assets, and agency's decissions are significant for the company.

Sareholders are not so importants for Oltchim, but we analyse as a part of the company's environment.

The activity of SC Oltchim SA is very much influenced by the public authorities wich represent a part of external environment of the company.

Local environment is constituted from the hole public existing on local and regional area: Mayoralty, Prefectur, families of the co-workers and employees, education institutes, cultural and sportive asociations, local and regional press, others companies.

OLTCHIM is one of the biggest companies that produce chemical products in Romania, established in 1966 under the name Chemical Group of Enterprises Ramnicu Valcea.

²¹⁵ www.oltchim.ro

Starting with this short description we can conclude that the provider's raw materials and services are a special category which OLTCHIM has to make a real partnership with, taking into consideration the implications of their activities in the optimal development of the activity of the company. They had a major impact in the company activity, the reason for establishing this enterprise, become after 1990, company divided in shares, was the natural resources the area has (gas, water, coal, limestone).

The assurance of the company progress was up to the providers' capacity to adapt themselves to the new requests of the market. They contribute to the image promotion of the company through the fact that the contracts they have with OLTCHIM they realize an important part of their business. In this kind of relation, based on a cooperation climate between partners, the providers become the real collaborators of the company.

For the market relations to take place in a normal way, it is well to know aspects concerning the providing firm (strikes, exceptional happenings) and any other elements that could become at a time factors that could become perturbation factors, unforeseen for the company activity. A kind of these perturbation happenings was the moment when the Saline from Ocenele Mari from the Mining Exploitation could not provide the necessary salt solution for production at the contracted parameters; OLTCHIM could not honor the contracts in the estimated time, thing that had a negative impact on the company clients.

The efficient management of the OLTCHIM resources is the key of success. The increase of the efficiency of administrating the financial instruments represents one of the main goals for OLTCHIM.

OLTCHIM has elaborated since 1990 an ample program of investments for renewing the technology and to modernize the key-plants which aims to raise the productivity, the characteristics of quality of the products and, not at least, to decrease the impact on the environment. It has to be identified the new and alternative technologies and their introduction in the Program Of Renewing and Development is made depending on the OLTCHIM strategy, to face the requests concerning the protection of the environment.

A major objective of OLTCHIM is to evaluate and to select the providers. There is being kept a permanent communication with the providers so that these ones get the information concerning the category they are included in, and also the score they got as a result of the evaluation.

The company has a number of almost 400 providers of raw materials and different services that have an important contribution in a good image of the company. These relations have been consolidated in time and had an important contribution in raising the company profitableness.

The financial world represented an interest category for OLTCHIM from the moment it was quoted on the market. At that time it appeared the obligation for the company to publish the results, and it evolved in time, when it began to call for the public's savings in order to purchase the capital necessary for the development. It is imposed to make shareholders devoted in the conditions that there are many negative factors that threat the company capital.

It raises the necessity to initiate a coherent dialog between the society and its financial world. It appears the financial communication that shows the organization the means that can make it evident in front of the shareholders, the financial analysts and bankers.

Taking into account that the financial world of OLTCHIM is characterized by the wide diversity of the public, are two categories of public: the shareholders and the specialized financial worlds.

The shareholders form a heterogeneous world, and it is formed, in the case of OLTCHIM, from legal and natural persons. These ones have, not many times, divergent interests, because some of them just want to have a safe investment, other of them want to get important dividends, other of them want to use the power given by the shares to intervene in the company activity.

The little shareholders are a category that represents 4.26% from the registered capital of OLTCHIM, having 151.520.824 shares. These ones are natural and legal persons. The information about the company these people get are from the economical, financial and money market magazines of general information. Their actions are according to the safety that the investments give them, and also according to the advantages they hope to get in a short time. The company tries to give a bigger attention to this category of shareholders and to initiate an efficient dialog with them in order to make them devoted. The communication with these persons is made by letters, faxes, e-mails, through the phone or through the web-site where there are present, half-yearly, quarterly, annually reports all made according to the CNVM and BVB requests.

The big shareholders, in case of OLTCHIM, are the Ministry of Economics and Commerce that has 95.73% from the registered capital of the company, having 3.395.705.177 shares and which acts according to its own interest. The decisions of the Ministry of Economics and Commerce have significant importance society, the complete information being absolutely necessary.

The specialized financial worlds include the banks and the credit institutions, financial analysts, exchange agencies and consulting agencies in the field of investments which OLTCHIM has relations with. These ones have importance for the society through the role they play as image supporters.

The financial worlds are characterized by a high prudence, reason for which there is imposed to establish relations of quality, a trustable climate between these ones and OLTCHIM.

CNVM and BVB have an important place in OLTCHIM's life because they inform, contributing to the formation of the image for the public in general, and indirect influencing the exchange on the market.

With the help of the communicational actions directed to the financial worlds there can be realized the devotement of the shareholders and the realization of a powerful financial image that shows the global image of OLTCHIM.

Another category of interest is represented by the company employees. OLTCHIM needs proper people to fulfill the proposed goals. OLTCHIM employees represent an essential factor and that is the reason for why the continuous improvement of their performances quality at job has become a strategic goal of the management, supported by training and qualification programs.

All forms of training/ specialization adopted by OLTCHIM for the employed people support the management flexibility for: clients' requests satisfaction using the existent human resources, improving the people according to the level of the used technologies. In OLTCHIM the training and the improvement of the employed people constitute one of the main criteria for employees' promotion.

There is realized a functional communication on vertical and on horizontal, at all levels and promote a system of proposals for improvement, succeeding to have an active participation to the problems solving.
²¹⁶

There it is acted to find out what the employees believe and how do they act to get good results in business. All the employees are involved and liable to bring a positive contribution to the success of the OLTCHIM businesses.

Motivation, implication and a strong team spirit are important elements of the OLTCHIM successes.

The real results obtained every year offered the employees the trust in the policies and the programs adopted by OLTCHIM which followed the improving of the whole activity, not to punish the mistakes.

The feedbacks we get from our employees prove us the increased performance of OLTCHIM in many fields:

- the qualities of good managers are appreciated in a positive way by 90% from the employees
- the employees appreciate in a positive way that the executive managers involve themselves in the current production problems and this thing helps them to increase the quality of their work
- the employees understand and involve themselves to fulfill the goals of the policies concerning the quality and the environment and support the realization of these goals through their activities
- good collaboration in the work teams from the research, design, development and execution departments prove an opened communication and a good appreciation for the management style, this one being reflected in the positive results they obtain
- participation to congresses, expositions of the employees who had special results.

The OLTCHIM commitment for quality and its continuous improvement is supported by very day activity results, in this way the continuous improvement is part of their daily activities and responsibilities, the compartments they belong to must be better to fulfill the domestic and foreign clients' requests that are higher, must try to use the best things they can take.

²¹⁶ Popescu.I. Communication in Marketing , Uranus Publishing, Bucarest,2001

The public opinion represents a wider environment where OLTCHIM carries on its activity. Its influence on the enterprise activity doesn't have to be neglected, and with the help of marketing communications it can be created a good image for the public opinion.

OLTCHIM has a permanent preoccupation for the impact of its activities on the local environment and to the identification of those opportunities to evaluate and to improve them continuously.

In the center of the preoccupations of OLTCHIM there is the fact to have strong relations with the community where it lives and carries on its activity.

The public opinion is structured in two components: the local environment and the large public.

The local environment is made up of the ensemble of the public from the local and regional field: city hall, the families of the collaborators and of the employees, the institutions for learning, sportive and cultural association, local and regional media, and other enterprises.²¹⁷ This kind of environment is indispensable to every day life of OLTCHIM because the organization is integrated part of the environment where he plays an economic role. This kind of image is formed on the grounds of local public opinion regarding the policy of the organization and its results. From this point of view, the policy of OLTCHIM in the field of sponsoring takes into consideration the social field (High School Olthim, kindergarten Olthim), the sportive one (Sportive Club Olthim) and the cultural one. The local environment will amplify in a positive or negative direction, as it is the case, the image that it has formed regarding the company.

The large public has characteristics similar to the local environment; the difference is the fact that we don't talk at a local scale, but at national scale. In this way, at national level, it carry on activities of sponsoring the Bucharest University (Faculty of Chemistry), the Romanian Handball Federation (organizing The European Handball Championship).

In the relation between OLTCHIM and public opinion, the role that comes to the marketing communications is very important because it contributes to promoting the society policy in the field of environment protection, problem that had a negative impact on the company image.

The role of OLTCHIM in the area is not just to produce certain goods but also to assume some social responsibilities. OLTCHIM believes in making strong relations with the community where it carries on its activity. By participating to activities in the cultural field, and also in the social one, OLTCHIM integrates itself in the social life, having preoccupations about everything that is connected with the man, with his private and collective life, contributing to environment protection or to making cultural offers.

In this way there is attributed a social legitimacy to its activity.

As it has a major preoccupation the impact that the activities and the business of OLTCHIM have on the local and global environment, the company searches the most efficient means to communicate in a better way with the public.

As a result, we can see a considerable increase of the insiders' role (managers and employees). The dissipation of the shareholders represents an obstacle for strengthening the corporative governing. And if the property is not enough varied, the risk for the company activity raises excessively; the big investors are tented to model the company activity according to their own interests, in the prejudice of little shareholders, managers or even the employees. More than that, the permanent non-information of the administrators and the lack of transparency of the data presented to the little shareholders regarding the financial condition of the company could deteriorate the company activity.²¹⁸

The marketing contributes to the achievement of the goals of the global policy of OLTCHIM.

Maximizing the profit, raising the satisfaction degree of the consumers' requests and favoring the long term interests of OLTCHIM are taken into consideration by the marketing specialists in the process of elaborating the global strategy of marketing. The role that comes to marketing is detailed through establishing some specific marketing goals as raising the volume of selling, maintaining the market quota, attracting new kinds of consumers, entering on new markets.²¹⁹

²¹⁷ Idem

²¹⁸ Olteanu.V Financial-banking Marketing, Ecomar Publishing, Bucarest , 2003

²¹⁹ Olteanu.V Management-Marketing, Ecomar Publishing, Bucarest , 2002

Realizing the marketing goals of OLTCHIM is up to the way the four vectors of the marketing activity are directed: the product, the price, the distribution and the communication.²²⁰

The communication has a well determined place, its steps being very important for OLTCHIM.

In the conditions of joining the European Union, of increasing and diversifying the goods and services for satisfying the material and spiritual needs of the society, of increasing the international economic exchange and in the context of the globalization of the economy and the markets, the problem of communicating with domestic and foreign consumers become more and more difficult, and it takes more varied efforts for mutual familiarization and information.

In this context OLTCHIM has set the attention to the domestic consumer and also to the foreign one. In the absence of a modern and efficient system of communication and information, it is difficult enough to find by themselves what kind of products and services are being offered to them by OLTCHIM, where, how and in what conditions they can purchase them, how they correspond to their exigencies, preferences or to their different styles of life.

OLTCHIM has built a model which ensure a permanent communication between the company as producer of those goods, traders on the one hand and consumers on the other hand.

The messages the company transmit don't have to be isolated, they must constitute themselves in a coherent system which ensures a complex action with a precise target, the ensemble of the market agents (consumers, users and intermediaries).

It is a preoccupation of the company to find original and efficient means of communications which allow it to communicate in a better way with the public.

From this point of view, the work proposes to analyze the categories of interest in OLTCHIM.

OLTCHIM has as its permanent preoccupation the impact of its activities on local and global environment and to identify those opportunities for improving and their permanent evaluation.

There it is noticed that in the center of OLTCHIM preoccupations there is the realization of strong relations with the community where it is and it carries on its activity.

The priorities and the objectives of the General Strategy of Oltchim SA Ramnicu Valcea are for the period 2006-2013 taking in consideration the area of scientific research, technological development and innovation and the European Policy in the system of research- development in Chemistry.²²¹

Oltchim SA Rm Valcea proposed in the meantime, in the context of general strategy for the period 2006-2013 to allot funds for programs/ projects with major impact for the environment and life quality.

For promoting the results of research, the investments, OLTCHIM SA Rm Valcea will participate consequently to the market and exhibitions national and international, Workshops, conferences.

THE SMES COMPETITIVENESS AUGMENTING, IN THE CONTEXT OF SUSTAINABILITY POLICIES AT EUROPEAN LEVEL, THROUGH IDENTIFICATION OF INNOVATIVE SOLUTIONS FOR THE MARKETING COMMUNICATION DEMARCHES

Popescu Ioana Cecilia

The sustainability represents a direction which has to be followed by the Romanian enterprises, but unfortunately, it is adopted by a few of these companies. One of the causes of this situation is the lack of some rules and instruments meant to help this orientation implementing in the business, especially at SMEs level, which don't have the possibilities and capacities of big enterprises. Such a scientific demarche is very useful, especially when sixty percents of Romanian enterprises are small and medium, so that the identification of some innovative solutions regarding marketing communication, in order to augment the small and medium enterprises' competitiveness, in terms of sustainability, involve an important part of the Romanian business environment.

Key words: Competitiveness, SMEs, unconventional communication, marketing, sustainability

The sustainability must be a desideratum of many Romanian organizations, assuring this way, the correlation between their individual objectives and societal general objectives. Meanwhile, the value creation nowadays must be associated with the possibility of supporting sustainability of the business in the future. In the context of limited resources is necessary a long term management of productive processes, which is meant to assure a harmony between pecuniary interests of organizations, consumers' interests and society's global interests. The big companies can take into consideration these concerns, even more seriously, because of their real potential. For SMEs is more difficult to implement some classical policies sustaining the durable development, due to the fact that some instruments are not adapted to their resources and capacities. An economy with competitive SMEs brings long-term economic stability, which leads to the improvement of the majority population's lives, in terms of economic, social and environmental equilibrium. An economy, in which the SMEs involve in social activities, just in order to create an event that must be communicated lately with commercial purposes, leads to the improvement of the social climate. In Romania, the enterprises concerned of sustainability are the multinational ones, which have international experience in applying some policies in this field. At SMEs' level there is an insignificantly interest regarding redirecting their actions towards supporting the sustainability. As long as a direct connection between long-term social involvement and the profits' augmenting can't be identified, the SMEs will not involve in this type of actions. In European developed countries such concerns are much more spread abroad, being stimulated by legislation, organizational culture values and business principles adopted by enterprises, and oriented towards the fulfilling of organization needs by controlling the economic, social and ecological risks and sustaining the human, productive and financial potential, on long term.

The concerns regarding the SMEs' competitiveness augmenting by improving the promotional communication policy, aiming an economy which should develop durably, are much reduced in Romania. This situation is due to the fact that most of SMEs are interested in achieving some short term objectives,

within the context of an unstable environment and of a poor knowledge of marketing instruments, generally speaking and promotional techniques, particularly speaking, which might be used for obtaining and supporting some long term competitive advantages.

From this perspective, it is necessary to design some action directions and a set of instruments in the field of promotional communication, meant to support the SMEs' competitive advantage. These concerns have been very few until now, not only in the academic sphere, according to the published books, articles or scientific communications, but also in the business environment, where services suppliers from promotional sphere (advertising agencies, media suppliers, public relations agencies) mainly oriented towards big companies. So, there is missing a conceptual and operational set of rules and communication instruments adapted to SMEs' possibilities, which leads to a slow competitiveness augmenting in comparison with big enterprises or foreign SMEs, on national market, but also on international ones. The complexity of the proposed solutions for solving this problem is offered by the development of the communication techniques, some of them from the unconventional sphere, and the measurement of their efficiency, which should be adapted to SMEs' particularities and also the development of some consultancy offering interactive forms, in order to choose the best promotional action ways and to implement them.

So, we propose a complex project, that the main objective is to research the present-day marketing communication methods and to identify some innovative solutions, in order to augment the SMEs' competitiveness, in the terms of sustainability. The specific objectives of this approach are the following:

- Knowing the European sustainability policies and their particularities in the promotional communication sphere;
- Studying the national and European legislation regarding SMEs' activity and marketing communication;
- Evaluating the importance of marketing communication in generating a proper context for durable development;
- Analyzing the European SMEs' promotional communication demarches and how they contributed to the creation of some competitive advantages;
- Analyzing Romanian big companies' marketing communication;
- Researching the main promotional techniques used by the Romanian SMEs;
- Studying the type of collaboration between different communication services suppliers (advertising agencies, public relations agencies, media suppliers) and SMEs;
- Evaluating the connection between the fairs and exhibitions organizers and Romanian enterprises (not only the big ones, but also SMEs);
- Comparative analysis of SMEs' and big companies' communicational demarches and their efficiency's evaluation for each of these two categories;
- Testing and comparing the effects and the efficiency of some unconventional promotional techniques, according to the target market;
- Creating a soft which should guide SMEs towards the best promotional method, according to a set of proposed indicators (notoriousness, achievement rank, impact, influence on sales, time).

The project will be developed in four stages, each phase with same specific set of activities. In the first stage of the project it will be establish the research context at European and national levels. The studies will be based on secondary data sources and there are developed many activities:

- Studying the European sustainability policies;
- Studying the European legislation regarding SMEs, from the perspective of the sustainability policies (European law regarding SMEs' activities, European law for the marketing communication domain, the analysis of European legislative context regarding the advantages offered to SMEs);
- Evaluating European policies regarding marketing communication;

- Analyzing the implications of European sustainability policies over the marketing communications of enterprises;
- Establishing the importance of marketing communication in generating a proper frame for durable development;
- Studying the national legislation about SMEs' activities;
- Studying the national law in the field of marketing communication;
- Analyzing legislative context from the point of view of advantages offered to SMEs;
- Analyzing the importance offered to SMEs, in Romania, within the sustainability policies.

The second lap of the project, the research of European SMEs' and Romanian big companies' marketing communication demarches and the establishment of the research methodology for Romanian SMEs include the following activities:

- Studying the European SMEs' communicational demarches, by applying on-line research and investigating secondary sources (studying the adopted positioning policies, studying the used communication techniques, identifying the most used innovative communication methods, establishing the most efficient communication methods);
- Analyzing Romanian big companies' marketing communication, from the historical perspective (the analysis of main Romanian companies, which evolved from the level of SMEs to the level of big organizations) in comparison with multinational corporations, which operates on Romanian market (the secondary-data-based study of the communication techniques and means used by the big companies for the target market, qualitative research among the managers of these companies, to highlight the present-day communication methods, and their influence over the durable development of the company);
- Qualitative research between the managers of the large companies to distinguish the present means of communications and their influence among the durable development of the company;
- Designing and creating a web portal, which contains in the first phase the data gathered from the research;
- Designing the soft for analyzing the communication and guidance towards the most indicated promotional method;
- Exploratory research regarding SMEs' communication demarches, in order to elaborate the research methodology.

The next step is about the research of Romanian SMEs' marketing communication demarches and results dissemination through a web portal, and supposes the following activities:

- Qualitative research at SMEs level, using the in-depth interviews and focus-group methods, in order to identify the main communication techniques and means used by SMEs and the motivation of using them;
- On-line and off-line quantitative research among SMEs, in order to count the measure of using some communication techniques and means, to count the effects obtained from such a demarche and in order to generalize the results at the level of studied collectivity;
- Qualitative research among communication agencies, in order to study their collaboration with SMEs and the communication solutions in terms of a limited budget;
- Qualitative research among media suppliers, in order to find out if SMEs contact them directly, to buy advertising space or to establish partnerships within some event communication operations;
- Qualitative research among fairs and exhibitions organizers, in order to study the collaboration with SMEs, on one hand, and the collaboration with big companies, on the other hand;
- Clients research, in order to determine the most efficient method of communication with them;

- Experiments over SMEs, which use different communication means (direct marketing, on-line marketing, events marketing, sales-force marketing, outdoor advertising) in order to determinate the efficiency of these methods;
- Populating the web portal with the research results;
- Elaborating a first version for the analysis soft.

The main objective of the project is achieved in its last phase - Identifying some innovative solutions regarding marketing communication, in order to augment SMEs' competitiveness - which combine the information obtained along the other phases and proposes some directions according to the purpose of the project. This lap includes activities as:

- Studying the potential of unconventional communication from the perspective of SMEs' competitiveness augmenting;
- Elaborating some marketing communication regulatory guidelines, which can be adapted to SMEs' particularities;
- Creating the final software and incorporating it within the web portal, which can offer consultancy to SMEs in the domain of marketing communication;

After project achieving, the Romanian business environment will obtain valuable information about some innovative marketing communication techniques, which can be used by SMEs and the modalities of implementing them, it will be elaborated regulatory guidelines regarding marketing communication, which can be adapted to SMEs' particularities and it will be created an on-line instrument embodied within a web portal, which can offer consultancy to SMEs in the domain of marketing communication. Also, the innovative marketing communication solutions will be presented in some workshops with SMEs' representing people and with representing persons from advertising agencies.

The achievement of this project will generate effects at economic level, in order that the information resulted will lead to SMEs' competitiveness augmenting, compare to big companies, which will generate a broad concern of the investors for developing such organizations. Meanwhile, the communication services suppliers (e.g. advertising agencies, media suppliers, public relations agencies, fairs and exhibitions organizers) will be stimulated to offer their services also to SMEs, leading to developing and specialization of these organizations. At the same time, the resulted information will highlight the modalities and mechanisms which can help SMEs to direct their activity to sustainability, leading this way to a long-term orientation regarding resources management and also, to a broaden concern over the natural environment. We can visualize some activities related to environment protection, organized as events communicated with commercial purposes.

ETHICAL ASPECTS RELATED TO THE POLITICAL MARKETING

Potincu Cristian

Transilvania University of Brasov, Romania, Faculty of Economic Sciences (PhD candidate, Marketing), 5, Eroilor Blvd., cristipotincu@yahoo.com, 0729/140740

Abstract: The present work deals with the legal and ethical aspects related to the development of the electoral campaign. A correct electoral campaign induces the choice of capable political actors who will develop an effective administrative and legislative activity.

Key words: ethics in marketing, political marketing, election conduct.

1. The Legal Framework of Political Marketing

Choosing the Chamber of Deputies and Senate is currently regulated through **Law no. 15/2008**, which abrogated Law no. 373 of 24 September 2004 regarding the choice of the Chamber of Deputies and Senate. We can notice a wider legislative approach of this field through the new law. Besides the uninominal vote, Law no. 15/2008 also deals with a few aspects to be analyzed below, aspects included through this legislative regulation.

Thus, as compared to the old legislative regulation, Law no. 15/2008 regarding the choice of the Chamber of Deputies and Senate and for the completion and modification of Law no. 67/2004 for choosing the local public administration authorities, Law of local public administration no. 215/2001, and Law no. 393/2004 regarding the Statute of the local elected persons, **legally defines** the most important terms used in the electoral campaign:

1. **Elections** are considered, from a legal point of view, those actions intended to designate the members of the Chamber of Deputies and Senate; **the general elections** are those elections which take place on one single day, throughout the country; **the anticipated elections** are the elections organized when the chosen authority is dissolved before its deadline; **the partial elections** are the elections organized when the elections in a certain electoral district are cancelled, as well as when a deputy's or senator's mandate becomes vacant. More precisely, the **parliamentary election** concept strictly designates the elections for choosing the members of the Chamber of Deputies and Senate within the Romanian Parliament.
2. **The elector** is any Romanian citizen having the right to vote, who has turned 18 until the election day.
3. **The political alliance** is the association between political parties based on an association protocol filed at the Bucharest Court, according to the Law of political parties no. 14/2003, while the **electoral alliance** is the association between political parties and/or political alliances and/or citizens' organizations belonging to national minorities, with the purpose of participating in elections, filed at the competent electoral authority.
4. **The electoral poster** is considered to be an appeal, a statement, a photo or another printed material, used by the electoral competitors with the object of information and electoral propaganda.
5. **The electoral district** is that administrative and territorial unit – county or Bucharest municipality – or the electoral district for the Romanians residing outside the country, in which elections are organized, and at the level of which mandates are awarded, depending on the results of the elections.
6. **The uninominal college** is a subunit of an electoral district, in which a single mandate is awarded.
7. **The electoral campaign** is considered to be that period within which the electoral competitors are performing propaganda activities in order to determine the electors to express their votes in their favor.
8. **The candidate** is that that person who participates in elections further to the proposals forwarded by the electoral competitors or on their own behalf in order to obtain a deputy's or senator's

mandate, in the conditions in which his candidanship is declared definitive by the proper electoral authority. **The independent candidate** is that person who participates in elections in order to obtain a deputy's or senator's mandate, and who proposes himself for it, being supported by a certain number of electors, in the conditions in which his candidanship is declared to be definitive by the proper electoral authority.

9. **The electoral competitors** are: political parties, political alliances, electoral alliances and legally constituted organizations of the citizens belonging to a national minority represented in the National Minority Council, which is forwarding candidanship proposals, as well as independent candidates.
10. **The electoral list** is that list containing all the electors who are exercising their right to vote within a polling station, while the **supporters list** is the list containing certain personal data and the signatures of the electors supporting a certain candidanship proposal in order for it to be entered in the elections.
11. **The electoral period** is the time span between the day when the date of the elections is made public and the date when the final results are made public, i.e. published in the Romanian Official Gazette, Part I, after the expiry of all contestation deadlines and related answers.
12. **The candidanship proposal** is the act of entering in the electoral competition the person who wishes to compete in elections in order to obtain a mandate in the conditions in which the respective person is proposed and supported by an electoral competitor, or he/she proposes himself/herself, and is supported by a certain number of electors, according with the legal stipulations.
13. **The electoral threshold** is the minimum percentage of the validly expressed votes, separate for the Chamber of Deputies and Senate, or the minimum number of uninominal colleges where the candidate is on the first place in the order of the number of validly expressed votes, for a political party, political or electoral alliance, required in order for the candidate to enter the mandate distribution process;
14. **The electoral fraud** is any illegal action taking place before, during or after the voting is closed, or during counting the votes and concluding the minutes, which results in the distortion of the candidates' will, and in the creation of advantages materialized in votes and extra mandates for a political party, a political alliance, an electoral alliance or an independent candidate.

Regarding the **exercise of the vote by electors**, Law no. 15/2008 analyses more concretely (art. 4) what the old law only suggested:

1. each elector has the right to one single vote for choosing the Chamber of Deputies and one single vote for choosing the Senate,
2. each elector expresses his personal vote; the exercise of the vote on behalf of another elector is forbidden,
3. the vote exercised during elections is confidential, any control of the way an elector is voting is forbidden,
4. the participation of the citizens in elections is made based on their free will; nobody has the right to exercise pressures on the elector in order to determine him to participate or not in the elections.

2. Ethical Aspects in Political Marketing

The marketing ethics combines the problematic of the norms which must be fulfilled and values which must be achieved within the performance of all partners of market acts, in order for them to develop within a moral environment. It also considers the claims of the social groups affected by the consequences of the supply of goods, services and ideas, on short, medium and long term. The marketing ethics has crystallized during the post-war period, against the background of the debates regarding the social responsibility of the enterprise in its relations with the suppliers and clients. The development of the critical spirit of the demander and the social responsibility of the enterpriser regarding his acts represent the background of the challenges which marketing must face in the contemporary society. [1]

Political marketing implies the identification of a segment of the population to which one would address, implies the transmission of an adequate message, as well as an adequate means of transmitting this message.

Political marketing has two main approach directions: **studying the electors** and **political communications**. The political communication is part of the strategy elaborated for the proper development of any electoral campaign.

The implementation of the electoral campaign implies finding the proper place, in the structure of the political marketing program, of the following issues:

1. Organizing the major staff of the campaign implies selecting the specialists, led by the campaign manager, who would prepare and implement the best electoral strategy. Within the standard organization chart, five directions meant to coordinate the entire campaign can be distinguished:

1.1. The central staff is made up of the candidate (candidates), campaign manager and the counselors taking the main functions: establish the strategic orientation of the campaign, prepare or order studies or investigations, coordinate the actions of all the other directions, establish the general action plan, permanently control the development of the campaign plan (program), quantify and analyse the results of the investigations and evolution of the attitudes and voting intentions of the electors.

1.2. The “Creating the campaign material” direction is made up of experts in communication and promotion, and has the role to prepare and formulate the messages to be sent by means of several media vectors, to conceive and prepare posters, TV shows, electoral newspapers and letters, slogans, to prepare the electoral programs and mainly the candidate’s speeches. This direction divides the activities into two sub-directions:

1. - the first one deals with the preparation of the electoral offer,
2. - the second one deals with creating the electoral image of the candidate/party.

In the case of national elections, the direction issues a “manual” or “sheet” intended for the local candidates, in order for them to be able to use them during the campaign. It also provides the connection to the external service providers.

1.3. The “Mass-media relation” direction has the role to maintain a permanent contact with the representatives of the main media vectors, and to obtain maximum “editorial space”, which would project the candidate/party as the main subject. Within this direction, a special part is played by the “spokesperson”, who presents the official position of the central staff and candidate/party, given the main events which can occur during the electoral campaign.

1.4. The “Financial resources” direction has the role to collect the financial resources from different official and legal sources. The main character of this direction is represented by the official financial mandatory who is in fact an expert in the financial field, usually sympathizer (or even member) of the respective party/candidate.

1.5. The “Site Operation” direction takes upon itself all the main tasks resulting from the implementation, on site, of an electoral campaign. Its members are normally employees of the organizational department of the respective party; together with the required experts, they make a team which most of times bears the brunt of an electoral campaign. The direction establishes the detailed plan of all operations required on site (posting, mailing, canvassing, etc.). Moreover, the direction receives from the central staff tasks related to possible external service provisions (printing companies, posting companies, companies providing videos and promotional spots, etc.); participates in the local organization of electoral demonstrations (candidateship launching shows, electoral meetings, electoral visits); are used at the local level for several purposes by parties/candidates, volunteers; organizes the so-called “electoral caravan”, etc. Then, the direction provides the local organizations with technical assistance under several forms: canvassing methods, mailing, telephone contacts, other promotional materials (banners, posters, lighters, pens, electoral T-shirts), preparation of public reunions or great electoral shows.

2. The planning and control of the electoral campaign is one of the main tasks of the central staff of the campaign, a special sub-direction which would deal with the electoral analysis and strategy. The members of this sub-direction exclusively deal with establishing a calendar which would include all operations, as well as keep track of the changes which could occur further to unpredictable events. In order to establish this calendar, a special part is played by the modulation, period and intensity of the campaign.

3. The control of the efficiency of the campaign implies the use of techniques characteristic to marketing; the investigations are a precise instrument of controlling the course of an electoral campaign. Three main types of investigation are used: pre-testing the electoral messages, studying the impact, and investigations (surveys) made in order to highlight the evolution of the attitudes and voting intentions.

It is considered [2] that the specific marketing techniques, used in an electoral campaign, incite politicians to be demagogic, and the instruments used by them are considered to be electors manipulation instruments. The opinion surveys may be used by candidates for purposes which, most of the times, **transgress the ethics concept**. These candidates use the surveys in order to quantify the “market quota” and the “popularity index” which they have at a certain point among the electors. When the “market quota” or “popularity index” is decreasing, they express, in the form of an offensive strategy, their own programs and projects, discovering however that the subsequent investigations prove the reproaches existing at the level of the electors towards these conjectural attitudes. Political marketing can also be an electors manipulation instrument. This can be achieved in two forms: the first is specific to the opinion surveys which have a negative influence, i.e. they are published during the electoral campaign only to change the voting intentions of the electors; the second is more general and implies the excessive use of persuasive methods and techniques by the political marketing.

The pluralism of the political formations and the actual possibility of all parties and candidates to use the methods and techniques specific to political marketing are in fact the guarantee against dangers and abuses which could occur at a certain point in the political life of any country.

However, we wonder whether this diversity of political formations and candidates **is enough** to determine the insertion of ethics as normality in leading a political campaign.

We also wonder whether the use of methods and techniques specific to the political marketing are a **“brake”** in the way of the unethical expressions which can be adopted when leading a political campaign.

3. Ethical Codes Used in the Political Marketing

It is interesting to notice the fact that last year the **Parties in the Republic of Moldova** adopted a **conduct code** regarding the development and reflection of the electoral campaign at the local and general elections in **2007**.

This electoral conduct code regulates the conduct norms among parties, other social and political organizations, electoral blocks, independent candidates and mass-media representatives involved in the development and reflection of the electoral campaign. (Art. 1)

As **objectives** [3] of the conduct code regarding the development and reflection of the electoral campaigns in the Republic of Moldova, the following have been established (Art. 3):

1. developing a correct electoral campaign, under equal competition conditions;
2. objectively informing the electors on the electoral processes;
3. free political participation in the electoral campaign;
4. observing the dignity of the participants in the electoral campaign;
5. creating a mutual trustworthy and respectful environment among the participants in the electoral campaign.

The general principles established through this electoral conduct code are presented in Art. 4, i.e. each participant in the electoral campaign shall rely upon the following principles:

1. observing the norms related to the electoral legislation and stipulations of the present Code;
2. correctly and objectively informing the electors on the participants and their political platforms;
3. observing the right of the electors to vote based on their own convictions and information they received;
4. avoiding the intimidation and obstruction of the free expression of the vote;
5. avoiding the corruption of the electors through any methods and forms.

Regarding the **implementation of the Code**, it has been established that each participant shall take action for:

1. informing and convincing the members, trustworthy persons and supporters not to allow for the present Code to be breached;
2. not accepting possible abuses related to the unfounded or false invocation of the violation of the present Code by opponents;
3. providing the complete observance of the present Code and legislation in force.

During the **development of the electoral campaign**, each participant shall observe:

1. the rights, liberties and dignity of the other participants in the electoral campaign and of the electors;
2. the freedom of the press, including the right to monitor the elections;
3. the rights and liberties of the accredited observers.

The obligations of the participants in the local and general elections in 2007 are the following:

1. not to create obstacles in the way of the journalists on duty;
2. not to obstruct the electoral campaigns developed by other participants;
3. not to publish false defamatory materials about other participants;
4. not to prevent other participants from spreading or posting electoral materials in the allowed places;
5. not to deteriorate or destroy the electoral materials of other participants;
6. not to prevent other participants from organizing electoral meetings or demonstrations;
7. not to prevent the citizens to participate in the meetings or demonstrations of other participants;
8. not to cause electoral agitation in the holy places and educational institutions during classes;
9. not to offer money, goods or other patrimonial advantages to the citizens during the electoral campaign in order to determine them to vote or not to vote for a certain electoral competitor, or to refrain from voting, to forward or withdraw their candidanship;
10. not to mislead the electors, insufflating them that the secret of the vote shall not be kept, or that the elections shall be falsified;
11. not to accept the direct or indirect involvement into the electoral agitation of the religious cults;
12. not to allow the involvement of the authorities and administrative resources of the organizations and public or private institutions in order to influence the options of the electors and their intentions to participate against their will;
13. not to cause electoral agitation on the day of the elections and on the day previous to the elections;
14. not to accept any immixture actions into the activity of the electoral authorities.

4. Conclusions:

The conduct code regarding the development and reflection of the electoral campaign at the local and general elections in 2007 in the Republic of Moldova, previously analysed, reflect the need of ethics in the electoral campaign.

Even though the Romanian law regulates the electoral campaign in detail, an ethical code similar to the one used in the Republic of Moldova would be an extra guarantee in observing the ethical principles during the electoral campaign.

The purpose of an electoral campaign organized while observing the ethical principles overlaps over priority 4 of the National Development Plan of Romania 2007-2013, a priority regarding the improvement of the administrative capacity, because a correct electoral campaign determines the choice of capable political actors, who will perform an effective administrative and legislative activity.

This priority concerns the development and effectiveness of the public services. The institutional transparency, credibility of the regulation and decrease of the regulation and administration costs are a fundamental determinant of the competitiveness of an economy.

Abstract.

Lots of people are living their entrepreneurial dreams by running a business from home. Many entrepreneurs start with an idea to sell a product or service, working part-time out of a home office, kitchen or garage. Some leave the corporate world to become independent consultants, offering their skills to companies on a per-project basis. Still others turn their hobbies or sidelines as eBay sellers into successful home based operations.

The paper presents an alternative way of running a business – from home. That's where e-mail marketing can do the difference. Here are some tips of how one should run a home based business, starting with describing the ideal marketing tool to be used in such a case, some ways to grow the business, tips to get started and tips for getting the emails opened.

Key Words: home based business, e-mail marketing, e-newsletter, promotional e-mails

1.Introduction

Whatever your skills or passions, the rewards to owning a home based business are undeniable. Be your own boss, make your own hours, enjoy more time with family, earn income doing something you've always wanted to do; you're free from the constraints of a traditional work environment. The flip side is that there's no marketing or sales department to bring in business and keep it coming.

2. The advantages and disadvantages of email marketing

Advantages:

- The advantage of a mailing list is clearly the ability to distribute information to a wide range of specific, potential customers at a relatively low cost.
- Compared to other media investments such as direct mail or printed newsletters, it is less expensive.
- An exact Return on investment can be tracked ("track to basket") and has proven to be high when done properly. Email marketing is often reported as second only to search marketing as the most effective online marketing tactic.
- It is instant, as opposed to a mailed advertisement, an email arrives in a few seconds or minutes.
- It lets the advertiser "push" the message to its audience, as opposed to a website that waits for customers to come in.
- It is easy to track. An advertiser can track users via web bugs, bounce messages, un-subscribes, read-receipts, click-throughs, etc. These can be used to measure open rates, positive or negative responses, correlate sales with marketing.
- Advertisers generate repeat business affordably and automatically
- Advertisers can reach substantial numbers of email subscribers who have opted in (consented) to receive email communications on subjects of interest to them

- Over half of Internet users check or send email on a typical day.
- Specific types of interaction with messages can trigger other messages to be automatically delivered.
- Specific types of interaction with messages can trigger other events such as updating the profile of the recipient to indicate a specific interest category.
- Green - email marketing is paper-free

Disadvantages

- Many companies use email marketing to communicate with existing customers, but many other companies send unsolicited bulk email, also known as spam.
- Illicit email marketing antedates legitimate email marketing, since on the early Internet it was not permitted to use the medium for commercial purposes. As a result, marketers attempting to establish themselves as legitimate businesses in email marketing have had an uphill battle, hampered also by criminal spam operations billing themselves as legitimate.
- It is frequently difficult for observers to distinguish between legitimate and spam email marketing. First off, spammers attempt to represent themselves as legitimate operators, obfuscating the issue. Second, direct-marketing political groups have pressured legislatures to legalize activities which many Internet operators consider to be spamming, such as the sending of "opt-out" unsolicited commercial email. Third, the sheer volume of spam email has led some users to mistake legitimate commercial email (for instance, a mailing list to which the user subscribed) for spam - especially when the two have a similar appearance, as when messages include HTML and flashy graphics.
- Due to the volume of spam email on the Internet, spam filters are essential to most users. Some marketers report that legitimate commercial emails frequently get caught by filters, and hidden; however, it is somewhat less common for email users to complain that spam filters block legitimate mail.

3. The Ideal Marketing Tool

If running a home based business, one should take into consideration that the resources are limited. The challenge is to get business and keep it coming. That's where e-mail marketing can help without breaking the bank. E-mail marketing is a fast and easy way to do the following:

- Reach out to your contacts directly and let them know you are open for business
- Encourage repeat and referral sales by reminding customers you're there
- Share your expertise so customers turn to you as a trusted resource
- Create promotions that boost business and keep your brand alive

E-mail marketing works for any kind of home based business, whether you're a jewelry maker or a dog groomer, a freelance accountant or an online seller of collectibles. There are two types of e-mail marketing that can build your home business:

- **Create a newsletter**--A simple e-mail newsletter will share free advice, insights, and success stories with current (and potential) customers. This sets up you as a trusted expert in the eyes of the people on your list. When they need what you offer, your e-newsletter will help make sure that you come to mind. Come up with a few content ideas for your newsletter -design tips, recipes or financial insights - and ask people in your network what they would like to read about. Customers, associates, friends and family are a great source of topic ideas. Newsletters should be short with just a few paragraphs of useful information.

Email newsletters are a great way to build trust and customer relationships over time. If they include promotional content, they will also grow revenues. Either way, the key is to make sure your subscribers actually read them.

When designing your newsletter always keep in mind the amount of time you can expect your reader to spend viewing your newsletter. Everyone today is information hungry, but always in a hurry. How you display your content within your newsletter can capitalize on this assumption.

The information included in the newsletter will depend on your business and the audience in which you are marketing, but here are three recommendations:

- **Announcements:** Include recent information about your company and/or products that impacts your readers. For instance, you can include a link to an upcoming tradeshow where your company will be exhibiting or perhaps a seminar that your company will be sponsoring.
- **Article:** Include an article that relates to your products or services and helps your readers. It is also a great idea to develop a resource library that contains additional articles and provide a link for your readers so they can find more information on similar topics.
- **Case Study:** Provide an example of a client who has achieved great results while using your products or services. This will help build credibility with your readers. Again, provide a link where your readers can view additional case studies.

Those are three key items to include in your newsletter. If you include these you are keeping your readers up to date on recent information about your products or services, including an article providing value on topics affecting them and by providing a case study you are proving to your readers that others are achieving success by using your products or services.

- **Send promotional e-mails** - Combine the newsletter's informational content with promotions that stimulate demand for your products or services. If you are in a gift-oriented or other retail business, the holidays create natural opportunities for promotions. If you are a consultant offering services, your business may be more cyclical or seasonal depending on clients' needs. You can also plan an event or a sale to create a business booster during otherwise slow times. A 10 percent off coupon, open house, or a free sample or consultation are examples of popular e-mail promotions.

When most people see the term "email marketing", they think of opt-in email promotions. You know, where you buy a product and click on the "send me periodic mailings with news of related products and services from ...(company name)".

Then once a month you get a short email extolling the virtues of the new ...(product name), and inviting you to "sign-up for a free trial".

This kind of email marketing has established itself as an effective direct marketing technique. The problem is when you apply this perception of email marketing to the other ways in which you might communicate with customers via email.

This is often the case with *email newsletters*. Many websites and businesses don't understand that email promotions focus on acquisition, while email newsletters focus on retention.

Email promotions seek to get the recipient to take an immediate action. The design and writing funnels the reader through a persuasive process which ends with a sale. And by sale, I don't just mean purchases, but also sign-ups, downloads, registrations, and other kinds of actions.

The keyword here is immediate. Promotional emails are generally short-term in nature (unless part of a sequenced campaign). If the recipient doesn't respond more or less immediately to the offer, then chances are that the value of the email is lost. It has little long-term impact or influence on the recipient.

Newsletters on the other hand are about building long-term relationships. They may, of course, include calls-to-action, but their prime goal is to strengthen the relationship between the customer or prospect and the publishing entity.

The objective is usually to induce actions in and over the long-term. Newsletters aim to make the recipient of a newsletter much more likely **at some time in the future** to take the kind of actions ultimately desired by the publisher, and take them again and again if possible. Newsletters build long-term impact and influence.

Promotions focus on persuasion, newsletters on trust and loyalty. Promotions look for immediate returns, newsletters for long-term benefits. Promotions make an offer, newsletters offer value.

Confusing the two leads to all sorts of problems. Subscribers expecting a newsletter often find themselves receiving one-off promotions. Since their expectations aren't met, the response is low and unsubscribes high. The publisher then rejects the idea of a newsletter because "it doesn't work".

When you see companies bad-mouthing the email newsletter concept, it's nearly always because what they've actually been doing is selling customers on the idea of a newsletter, and delivering a promotion instead. Instead of giving subscribers valuable, trust-building content, free of **overt** sales pressure, they've been delivering advertisements.

It's expectations that are key here. It's not the idea of sending commercial messages that's wrong, just the failure to meet the readership's expectations. Sending promotional emails to newsletter subscribers is much less effective than sending newsletters to newsletter subscribers or sending promotional mails to those who opted in specifically for such promotions.

4. Tips to Get Started

1. Choose a reputable e-mail marketing service provider.

Features to look for include affordable plans, a variety of easy-to-use templates for different kinds of e-mails, e-mail list management, a commitment to e-mail marketing standards and best practices, and access to support and helpful resources.

2. Collect e-mail addresses.

Even if your mailing **list** is just a few friends and family members, that's enough to get started. Grow your list by collecting names during your regular course of business, whether it's at a home product party or a chamber of commerce event.

3. Get permission.

Before you send anyone a commercial e-mail marketing communication, remember to get permission. Permission is perishable, so don't wait months to e-mail someone after you get their contact info. And you must offer a way for recipients to unsubscribe or opt out of your mailings.

4. Make your first mailing count.

This could be a simple announcement that you're open for business or an e-mail that welcomes people who recently joined your list. Thank recipients for joining and tell them who you are, what you offer and why you're e-mailing them. Your first e-mail is your opportunity to make a good impression and show the benefits of being on your e-mail list. Include a "forward to a friend" link so people can easily share your correspondence with others who might be interested in what you offer.

5. Create a schedule.

Plan to communicate with customers via e-mail at least six times a year. Once a month is even better. If you plan to e-mail more often--and you may if you run events or weekly specials--make sure you are providing information your contacts value.

Customers and prospects might not need your products or services at the moment they receive your e-mail, but the key is to *keep your business on their minds*. That way, when they're ready to buy -or when they hear of someone who needs your products or services - they'll think of you.

Even if e-mail marketing is the only marketing activity you do, it can help you connect with customers and encourage referrals and repeat business. You don't even need to have a website to get started. As long as you have a computer in your home office, e-mail marketing is a great way to grow your home based business.

One of the most important elements of your e-mail communications is the subject line. Next to the "from" address - which should be a recognizable company name - the subject line will determine whether your e-mail gets opened.

Writing a great subject line is a great challenge. You only have a few words to make it compelling, urgent and specific - without sounding too sales-like or misleading your readers. Here are some [ideas for writing subject lines](#) that will get great results.

1. Keep it short and sweet.

Do the best to keep your subject lines under 50 characters, including spaces, as most e-mail clients display 50 characters or less. A recent study done by an e-mail monitoring company showed that subject lines with 49 or fewer characters had open rates 12.5 percent higher than those with 50 or more characters. The study also found that click-through rates for subject lines with 49 or fewer characters were 75 percent higher than for those with 50 or more characters. Keep the subject line short and sweet.

2. Be specific.

A vague subject line is a waste of prime real estate. A great example of this are monthly newsletters with subject lines like "The Green Thumb Newsletter: June 2008." This tells the receiver nothing about what they will find when they open the e-mail and gives them very little reason to do so. A better approach for a newsletter is this: "The Green Thumb: 3 Tips for Summer Gardening."

3. Write it last.

Many e-mail marketing services prompt you to write your subject line first as you are building your e-mail. It is important to determine all the elements of your e-mail first, then look for the most compelling topic to highlight in the subject line. When you are done with the body of your e-mail, read it over and pick the nugget that will entice your readers to learn more by opening your message.

4. Take some time.

Don't just dash off your subject lines. Considering how important they are, take some time to think about them and write several - at least three or four - before choosing which one to use. Once you have a few subject lines you like, run them by a friend or colleague and see which one they think is most compelling.

5. Test it.

When you have two strong yet different subject lines, test them. Split your list in half and use a different subject line for each group. After a number of tests like this, you will have a very good idea of what works for the people on your list. And the better you know your audience, the more effectively you can communicate with them. When you are tempted to rush through the process of writing a subject line, think about the number of e-mails you get every day. After the effort of composing the e-mail, it is ideal to ensure that people open and read it.

5. Tips for getting your e-mails opened

In the beginning, e-mail marketing was seen as the perfect marketing tool: cheap, fast and measurable. Click-through rates were the only numbers that mattered, and people were still excited to receive - and open - just about every e-mail in their inbox. Meanwhile, things have changed. The explosion of spam and the sheer volume of e-mail people receive has ruined the effectiveness of e-mail as a marketing tool. Even perfectly legitimate e-mails are being trapped by spam filters or deleted - unopened - by wary recipients.

E-mail marketing can still deliver a higher return on investment (ROI) than methods such as direct mail and newspaper and radio advertising. The truth is, spam and volume didn't kill e-mail marketing, but they did manage to create a few hoops you now have to jump through to get your e-mails delivered and opened.

Here are some techniques for getting today's e-mails delivered, opened and acted on.

1. Manage Your "Subscribe" and "Unsubscribe" Requests

One of the most important things you can do to minimize your problems - and maximize your profits - is to stay on top of your "subscribe" and "unsubscribe" requests. This is especially important if you don't have an automated system for managing subscriptions to your opt-in list.

Always treat requests to unsubscribe from your list seriously. People who aren't promptly removed from your list after making an unsubscribe request can accuse you of spamming them, and you can quickly find yourself in trouble.

Of course, it's just as important that people who ask to be added to your list are subscribed right away, since you never know which one of those subscription requests is going to end up being your best customer.

If your subscribe and unsubscribe requests aren't handled automatically, you should take care of them right before you send out a mailing. This ensures that your list is as current as possible, and it also means that you don't have to deal with this chore on a daily basis.

2. Remove Duplicate Addresses

Before you send any mailings, you will want to make sure that you don't have any duplicate e-mail addresses in your list. There will always be some people who will opt in to your list and come back later and sign up again, forgetting that they have already joined.

Now, people are happy to get one copy of your e-mail, but start sending them multiple copies and just watch how fast they unsubscribe from your list - or worse, report you as a spammer.

This kind of spam complaint is relatively easy to clear up, but it's still a hassle, and instead of having a potential customer who was so excited about what you had to offer that they signed up twice, you now have nothing.

3. Clean Your List

Cleaning your list also means sifting through the messages that "bounce back" to you after a mailing, and deciding which ones should be removed from your list completely, and which ones you might want to try mailing again.

"Bounced" messages, for whatever reason, weren't successfully delivered to the intended recipient. Most can be categorized as either "soft" bounces or "hard" bounces.

- *Soft bounces.* These are messages that couldn't be delivered at the time they were sent, but may be deliverable at some time in the future. These types of bounces are usually caused by the recipients' ISPs being busy or their inboxes being full.
- *Hard bounces.* These are messages that can never be delivered. Hard bounces are usually caused by the user typing in an incorrect e-mail address when opting in to your list, or the subscriber no longer using the e-mail address they originally opted in with.

Delete hard bounces immediately. If you leave these addresses in your list, you will just have to wade through unnecessary bounce messages every time you send a mailing, and that's a waste of your valuable time.

More, if you continue to send e-mail to an address that's invalid, you can get into real trouble. Dead addresses are used as spam traps, and if you are found to be repeatedly sending messages to one of these addresses, you could have a problem with the ISP receiving them.

E-mails that are returned as soft bounces, on the other hand, are the result of a temporary problem, so you would re-send your promotions to all the soft bounce addresses a couple of days later. You will be surprised how many messages get delivered on the second try. And since you have already written the e-mail, there's almost no extra work on your part.

4. Divide Your List to Conquer More Subscribers

Given the mountains of e-mail people receive these days, most only want to see what's relevant. And, unfair as it may seem, anything irrelevant could be considered spam, and reported as such.

If the people on your list know the message you are sending is something they want, they will open it. Using e-mail to target different segments of your audience is one of the single most effective ways to market products or services on the internet. A 2006 report found out that e-mail marketers using segmentation saw click-through rates that are 72% higher than e-mail marketers who aren't segmenting their opt-in lists.

You can segment them by whether or not they have bought from you, where they live, the brands they have bought, their age group, etc. There is no end of ways to segment your audience depending on the information you have collected - and e-mail automation makes it not only possible, but simple.

5. Snag Your Recipients' Attention by Using Their Names

If there's a "secret" to getting e-mail recipients' attention, it's this: Personalize the subject line. No other single technique will boost the response rate of your e-mails as much as personalization.

Have you ever noticed that a great salesperson will find out your name and then use it every so often while they talk to you? It's a way of establishing trust and building rapport. And the truth of the matter is that nothing gets a person's attention faster than hearing or seeing their own name!

By personalizing your subject lines, you also make your e-mail appear more authentic and safer to open, because recipients will be more likely to view your e-mail as coming from a trusted source. Unfortunately, typing each individual recipient's name into the subject line of every e-mail you send is just not practical! Once you grow your list to more than 50 or 100 people, it becomes unmanageable. It's way too time consuming.

The good news is that there's great e-mail marketing software available these days that'll help you completely personalize your campaigns automatically, and save you tons of time and effort.

6. Conclusions

E-mail marketing remains a highly effective tool for any business, and the success of your campaigns rests largely on the percentage of your messages that get delivered and opened. It's a little more of a challenge to make sure your e-mails get delivered and opened these days, but by keeping your list squeaky clean and sending highly relevant and personalized messages, you'll not only improve the likelihood of people opening your e-mails, you'll avoid being labeled a spammer.

LEGAL FRAMEWORK SETTING UP ADVERTISING ON THE AUDIOVISUAL MARKET IN ROMANIA AND THE EUROPEAN UNION

Prihoanca Diana Magdalena

University of Bacau, Faculty of Economic Sciences, Spiru Haret str., no. 8, dianaprihoanca@yahoo.com

Abstract: In most of the Member States of the European Union, the audiovisual market is regulated by: laws, administrative practice, individual regulation – in many countries the main actors on the audiovisual market, either as they represent an initiative or the reaction to the regulations introduced by the country.

Key terms: audiovisual media service, television advertising, audiovisual transmission, sponsorship, teleshopping, product placement.

Audiovisual industry blends economic, social and cultural features both uniquely and in a unitary way. Consequently, the starting point of any analysis of the general policy applicable to the audiovisual industry is the acknowledgement of the role this industry has in society and the need to ensure the balance between the free market and protecting the general interest.

The European Union's audiovisual policy has two basic objectives:

- To create a genuine European audiovisual area and make it work
- To implement a strategy for strengthening European audiovisual production industries.

These two objectives are pursued taking full account of the cultural aspects of the audiovisual industry.

The legal framework related to the audiovisual market is issued by the European Parliament and the European Council. In most of the Member States of the European Union, the audiovisual market is regulated by: laws, administrative practice, individual regulation – in many countries the main actors on the audiovisual market, either as they represent an initiative or the reaction to the regulations introduced by the country. These regulations do not represent the unique solution to the protection problem on this market. That is why, on the one hand, the recourse to supervision and control focuses on protecting consumers against deceptive advertising or against the achievement of the individual rights by pressure exercised/produced by means of communication. On the other hand, these regulations focus on protecting admen against the competitors that use unfair procedure.

Part of the regulations that settle the procedure in the audiovisual area and that are issued by the European Council and valid for the Member States are the following:

- **Directive 84 / 450 / EEC** relating to misleading advertising. The purpose of this Directive is to protect consumers, persons carrying on a trade or business or practicing a craft or profession in order to promote the supply of goods or services including immovable property, rights and obligations. This Directive was amended resulting **Directive 97 / 55 / EEC** relating to comparative advertising. The Directive focuses on the harmony of regulations in the comparative advertising which is banned in some Member States as possible differences may prevent the free circulation of trade communication.
- **Directive 97 / 7 / EC** on the protection of consumers in respect of distance contracts. The Directive is applicable to any distance communication and focuses on the harmony of laws, regulations and administrative provisions in the Member States. The object of this Directive is to approximate the laws, regulations and administrative provisions of the Member States concerning distance contracts between consumers and suppliers. It stipulates that before drawing conclusions on a distance contact, consumer needs a minimum number of information (the identity of the supplier, price, delivery costs, payment means,
- **Directive 98 / 43 / EC** on the approximation of the laws, regulations and administrative provisions of the Member States relating to the advertising and sponsorship of tobacco products.

- **Directive 92 / 28 / EC** on advertising for medicines aims to eliminate differences in the Member States' laws concerning advertising for medicines as they are likely to give rise to barriers to the establishment and the functioning of the internal market since advertising distributed in one Member State can have an impact on the other States. Also it was considered necessary to generalize the prohibition on advertising for the medicines on prescription as already prohibited for TV by the Directive "TVWF".

Advertising distributed on TV shall comply with the **Directive 89 / 552 / EEC**, also known as **Directive Television Without Frontiers**. The Directive was adopted in order to ensure the free circulation of transmission of audiovisual works in the European Union. Laws in Member States included differences that were likely to prevent the free circulation of transmission of audiovisual works and reduce competence. The objective of this Directive is to eliminate these restrictions and coordinate the national laws applicable by ensuring minimal rules necessary to guarantee the freedom of transmission of audiovisual works.

This Directive was amended by the **Directive 2007 / 65 / CE** of the European Parliament and the Council of 11 December 2007 known as the Audiovisual Services Without Frontiers Directive (ASWF). The objective of the Audiovisual Services Without Frontiers Directive (ASWF) is to bring up – to –date the laws in connection to television advertising in terms of the revolution produced by the Internet, cellular phones and digital television. New technologies in the transmission of audiovisual media service call for adaptation of the regulatory framework in order to take account of the impact of structural change, the spread of information and communication technologies (ICT) and technological developments on business models, especially financing of commercial broadcasting, as well as in order to both ensure the optimal conditions of competitiveness and legal certainty for Europe's information technologies and its media industries and services and to respect the cultural and linguistic diversity.

The following concepts are defined in the Directive: audiovisual media service, programme, editorial responsibility, supplier of mass – media services, television transmission, on – demand audiovisual media services, audiovisual commercial communication, television advertising, audiovisual transmission, sponsorship, teleshopping, product placement.

This Directive also introduces a new audiovisual media service. Besides the traditional audiovisual media services, such as television, there are also on – demand audiovisual media services. They are "television – like" – they compete for the same audience as television broadcasts, and the nature and the means of access to the service would lead the user reasonably to expect regulatory protection within the scope of this Directive.

Television broadcasting currently includes analogue or digital television, live streaming, webcasting, near – video – on – demand whereas video – on –demand, for example, is an on – demand audiovisual media service. On – demand audiovisual media service is provided by a media service provider for the viewing of programmes at the moment chosen by the user and at his individual request on the basis of a catalogue of programmes selected by the media service provider.

Chapter 4 of the Directive of Audiovisual Services Without Frontiers called **Television Advertising and Teleshopping** includes rules in connection with television advertising. The changes in this Chapter are defined in Chart 1.

This new Directive took into account some basic aspects that refer to:

- Duration between advertising intervals shall be of 30 minutes, against 20 minutes.
- Proportion of advertising spots and teleshopping is settled for one hour transmission.
- Placement advertising is possible if it is allowed by the legislative framework in each Member State for cinematographic works, films, series and serials and light entertainment.

Member States shall apply the laws and administrative measures necessary to comply with the present Directive until 19 December 2009.

Chart 1 Differences in the Articles of Chapter 4 of the two Directives

Directive Television Without Frontiers	Directive of Audiovisual Services Without Frontiers
Chapter IV Television Advertising, Sponsorship and Teleshopping	Chapter IV Television Advertising and Teleshopping
<p>Article 10</p> <p>1. Television Advertising and teleshopping shall be readily recognizable as such and kept quite separate from other parts of the programme service by optical and / or acoustic means.</p> <p>2. Isolated advertising spots shall remain the exception.</p> <p>3. Advertising and teleshopping shall not use subliminal techniques.</p> <p>4. Surreptitious advertising and teleshopping shall be prohibited.</p>	<p>Article 10</p> <p>1. Television advertising and teleshopping shall be readily recognizable and distinguishable from editorial content. Without prejudice to the use of new advertising techniques, television advertising and teleshopping shall be kept quite distinct from other parts of the programme by optical and / or acoustic and / or special means.</p> <p>2. Isolated advertising and teleshopping spots, other than in transmissions of sports events, shall remain the exception.</p>
<p>Article 11</p> <p>1. Advertising and teleshopping spots shall be inserted between spots. Provided the conditions contained in paragraphs 2 to 5, advertising and teleshopping spots may also be inserted during programmes in such a way that the integrity and value of the programme, taking into account natural breaks in programme, duration and the nature of the programme and the rights of the right holders are not prejudiced.</p> <p>2. In programmes consisting in autonomous parts or in sports programmes and similarly structured events and performances comprising intervals, advertising and teleshopping spots shall only be inserted between the parts or in the intervals.</p> <p>3. The transmission of audiovisual works such as feature films and films made for television (excluding series, serials, light entertainment and documentaries), provided their programmed duration is more than 45 minutes, may be interrupted once for each complete period of 45 minutes. A further interruption is allowed if the programmed duration of is at least 20 minutes longer than two or more complete periods of 45 minutes.</p> <p>4. Where programmes, other than those covered in paragraph 2, are interrupted by advertising or teleshopping, a period of at least 20 minutes should elapse between each successive advertising break within the programme.</p> <p>5. Advertising and teleshopping shall not be</p>	<p>Article 11</p> <p>1. Member States shall ensure where television advertising or teleshopping is inserted during programmes, that the integrity of the programmes, taking into account natural breaks in and the duration and the nature of the programme and the rights of the right holders are not prejudiced.</p> <p>2. The transmission of films made for television (excluding series, serials and documentaries), cinematographic works and news programmes may be interrupted by advertising television and / or teleshopping once for each scheduled period of at least 30 minutes. The transmission for children's programmes may be interrupted by television advertising and / or teleshopping once for each scheduled period of at least 30 minutes, provided that the scheduled duration of the programme is greater than 30 minutes. No television advertising and / or teleshopping shall be inserted during religious services.</p>

<p>inserted in any broadcast of a religious service. News and current affairs programmes, documentaries, religious programmes and children's programmes, when their programmed duration is less than 30 minutes, shall not be interrupted by advertising and teleshopping. If their programmed duration is of 30 minutes or longer, the provisions of the previous paragraph shall apply.</p>	
<p>Article 18</p> <p>1. The amount of advertising shall not exceed 15 % of the daily transmission time.</p> <p>2. The amount of spot advertising and teleshopping spots within a given one – hour period shall not exceed 20 %.</p> <p>3. Without prejudice to the provisions of the present article, advertising does not include the following:</p> <ul style="list-style-type: none"> - announcements made by broadcasters in connection to its own programmes and ancillary products directly derived from those programmes; - announcements made by public services and 	<p>Article 18</p> <p>1. The proportion of advertising television spots and teleshopping spots within a given clock hour shall not exceed 20 %.</p> <p>2. Paragraph 1 shall not apply to announcements made by the broadcaster in connection to its own programmes and ancillary programmes directly derived from those programmes, sponsorship announcements and product placements.</p>
<p>Article 18 a</p> <p>1. Teleshopping window present on a channel that is not entirely devoted to teleshopping shall be of a minimum uninterrupted duration of 15 minutes.</p> <p>2. The maximum number of teleshopping windows is of 8 hours per day. Their total duration shall not exceed 3 hours per day. Teleshopping window shall be clearly identified by optical and acoustic means.</p>	<p>Article 18 a</p> <p>Teleshopping windows shall be clearly identified as such by optical or acoustic means and shall be of a minimum uninterrupted duration of 15 minutes.</p>
<p>Article 19</p> <p>Chapters I, II, IV, V, VI, VI a, and VII shall apply <i>mutadis mutandis</i> to television channels exclusively devoted to teleshopping. Advertising on these channels is allowed provided that the daily limits are respected according to article 18, paragraph 1. The provisions of the article 18, paragraph 2 are not applicable.</p>	<p>Article 19</p> <p>The provisions of this Directive shall apply <i>mutadis mutandis</i> to television channels exclusively devoted to advertising and teleshopping as well as to television channels exclusively devoted to self – promotion. Chapter III as well as Article 11 and Article 18 shall not apply to these channels.</p>
<p>Article 20</p> <p>Without prejudice to Article 3, Member States may, with due regard for Community law, lay down condition other than those laid down in Article 11 (2) to (5) and in Article 18 in respect of broadcasts intended solely on the national territory which may not be received, directly or indirectly, in one or more Member States.</p>	<p>Article 20</p> <p>Without prejudice to Article 3, Member States may, with due regard for Community law, lay down conditions other than those laid down in Article 11 (2) and Article 18 in respect of television broadcast intended solely for the national territory which cannot be received directly or indirectly by the public in one or more other Member States.</p>

Harmonization of the Romanian legislation and the European legislative framework is made by the National Audiovisual Council. It is an autonomous public authority under parliamentary control that ensures a climate based on the free expression and the responsibility for the consumers in the audiovisual area.

Most of the decisions taken by the National Audiovisual Council are based on the two pillars that ensure the legislative framework governing in Romania in the audiovisual area:

- Audiovisual law no. 504 / 2002 that provides the general framework in connection to radio and television broadcasting and to the National Audiovisual Council of Romania.
- Regulatory Code regarding audiovisual content adopted in 2006 that defines the obligations of radio and television channels licensed in Romania related to editorial content, such as correct information, protection of human dignity, minors' protection and respect the advertising system.

Also there are other laws that influence the audiovisual area, such as Laws regarding elections, Advertising Law or Regulation on controlling the incorrect practice of providers towards consumers.

Taking account of the permanent process of evolution in the audiovisual area, the National Audiovisual Council set up new regulations, including provisions of the European Directive and the transition to digital television. Romania has to comply with the European law concerning digital television until 2012. According to Digital Terrestrial TV Action Group from Geneva, there is the following situation: the transition from terrestrial analogue television to terrestrial digital television finished in 2007 in Finland and Holland and Germany, Switzerland and Sweede foresaw it for the year 2008.

In 2007 the activity of European integration of the National Audiovisual Council was insured by the Service of European Integration and consisted in identifying the short – and medium - term priorities in order to comply with the Community law pursuant to the evolution of the European policy in this field. The sources of relevant information to comply with the European legislation were identified; the documentation, analyses, syntheses and translation of the laws concerning European integration were also insured.

In 2007 the Directive Television Without Frontiers was reviewed and the implementation of the harmonized national legislation was took into consideration so that, starting from 4 January 2008, the amended text of Decision no. 187 of 3 April 2006 entered into force. The Decision was amended on the basis of the following:

- Decision no. 194 / 2007 of the National Audiovisual Council (with the subsequent changes)
- Decision no. 516 / 2007 of the National Audiovisual Council
- Decision no. 762 / 2007 of the National Audiovisual Council
- Decision no. 1105 / 2007 of the National Audiovisual Council

CONSIDERATIONS ABOUT GROUP INFLUENCES ON CONSUMER BEHAVIOR

Puiu Carmen

University of Craiova, Faculty of Economy and Business Administration, Dr.Tr.Severin, str.Oituz nr.35, bl.2, sc.2, ap.3, cvpuiu@yahoo.com, tel.0745087609

Each consumer is a member of a culture, various subcultures, and a social class; most of us belong to a number of different groups and almost would like to belong to several others. A group is defined as two or more individuals who share a set of norms, values, or beliefs and interact to accomplish individual or mutual goals. A group becomes a reference group when an individual identifies with it so much that he or she takes on many of the value, attitudes or personal standards of group members. The degree of reference group influence varies across product and brands with factors such as (1) the visibility to the group, (2) the necessity/nonnecessity nature of the product, (3) the level of commitment the individual feels to a group, (4) the relevance of the behavior to the group, and (5) degree of individual's confidence in his own judgement in the purchase situation.

Key words: reference group, norms, social power, consumption subculture

The majority of people belong to more different groups at the same time and frequently they want to be included in other groups as well, but in a specific situation they report themselves to a single group. When a new situation appears or the conditions change, the individuals may report themselves to the rules of another group which becomes the reference group for the given situation. Most people prefer to adapt, more or less, to the group's rules, from politeness or the desire to not be left aside. The *norms* are the general, common expectations of behavior that are considered appropriate for everybody in a social context, indifferent of their position. A group's norms cover usually all the important behavioral aspects for the functioning of that group and breaking those rules can bring up penalties.

A *group* is defined by two or more persons that share the same norms, values and beliefs and have certain relationships with each other so their behavior becomes interdependent. A *reference group* is a group whose rules, *norms* and values are used by an individual as the base of his daily behavior.

Types of reference groups

Groups can be classified depending on many criteria, like the affiliation, the type of contact (frequent/occasional) or the attraction (positive/negative).

primary groups/secondary groups

The primary groups are formed by the persons that we meet most often: friends, close colleagues, family(it is usually the most powerful primary group). A primary group has a sufficiently low number to allow face to face contact, and the subjects' participation is characterized by cohesion and reciprocity which determines similar behaviors and beliefs within the group. The primary group is usually coherent and lasting being made of persons that think in a similar manner and have the same interests.

The secondary groups are formed by persons that meet occasionally and have certain common interests. These groups have lower influence on the attitudes' formation and the behavior's control., but can have influence within the common activity, usually special groups of persons whose common interests are above the ones of the rest of the secondary group.

affiliation group/dissociative groups

The affiliation groups are the ones to which the subject wants to belong. These groups can be very powerful in influencing the behavior, since the subject will adopt the group's behavior in the hope of his affiliation as member. The marketing frequently uses images of the affiliation groups suggesting in this way that usage of a certain product will determine the subject's advance to the quality of group member.

The dissociative groups are the ones to which the person does not want to belong. This tendency can have a negative effect on the behavior – the individual avoids certain products or behavioral aspects in order to not be assimilated by the dissociative group. Like in the case of the affiliation groups, the defining of the dissociative groups is purely subjective, varying from a group to another.

official groups/informal groups

The official groups are materialized in a known list of members, often recorded in a way or other (ex. associations, clubs). The structure and rules of the group are written under the form of a statute, the quality of member implies to respect certain rules, and the members' behavior is regulated during his affiliation to the group. The quality of member can bring special privileges, or can imply only responsibilities in order to satisfy the group's aspirations.

The informal groups are less structured and are generally based on friendship. These groups do not have written statutes even if in this case the pressure to be in conformity with the group is higher than in the official groups. They need to adopt a more rigorous behavioral standard and larger reference domains than in the official groups.

Though the marketers seem at first view to have more success in developing strategies and tactics to influence of formal groups (easier to identify and more accessible), experience proves that the informal groups are the one having higher power of influence because they are part of our daily routine (an example of the normative influence exercised by the reference group).

implicit groups

The implicit groups are the ones to which the affiliation is implicit, because of the age, gender, culture or education. They are sometimes named category groups. Though, at first sight, they seem to have no significant influence on the members behavior, because they are not constituted based on voluntariness, the subjects are however influenced by the conformity pressure of the group (for example, the manner in which teenagers and older people dress).

virtual groups (communities)

A virtual group is a community of persons that interact on-line on various themes of common interest or specific activities. These groups on anonymous are passing through an explosive development in the last years and share their opinions on the most diverse subjects – from movies, Barbie dolls, wines or medicines. The majority of the companies recognize the Internet's power and also know that the opinion of a real person has more power of influence than a promotional clip so they support the post in of the opinions related to their products on th own sites.

Reference group influences on the consumption process

The nature of reference group influence can take three forms:

- *informational influence* – the reference group is used as an informational source in the different stages of the decisional process. This type of influence appears when an individual uses the behaviors and opinions of the reference group members as reliable informational sources. This influence is based either on the similarity of buyer's desires and preferences with the ones of the group members or on the recognition of the group recommendations' quality.
- *normative influence (utilitarian influence)* – the reference group establishes the level of norms, values and aspirations of an individual in the process of consuming products and services. It is obvious when a person respect the rules and expectations of a group in order to gain a reward or to avoid a sanction. The normative influence is used in the ads that promise the social acceptance or popularity in consequence to using a certain product or suggests disapproval or rejection from the group if a certain product is not used (usually hygiene products);
- *identification influence (value-expressive influence)* - the reference group is used to validate, by comparison, the consumer's opinions, attitudes, norms and actual behavior. The individual

behaves in a manner consistent with the group's values because the individual's values and the group's values are the same.

The group's power of influence depends on a number of factors with predefined role:

1. the product/trademark's degree of visibility by the group members - the group's power of influence is higher for the products used visibly (sport shoes, cars, holidays etc.) and lower for the products used in a particular way (vitamins),
 - the product's degree of necessity - the group's power of influence is higher for the products that do not belong to the category of strict necessity, and enter the category of luxury products (jewels, holidays, hobbies etc).
 - the person's degree of involvement – if a person is dependent to a certain group, he/she will conform even more to the rules and expectations of that group;
 - the relevance of a person's behavior for the good functioning of the group;
 - the certainty of the buyer during the buying process – the group's influence is manifested especially in the case of specialty products (TV sets, furniture, cars and assurance policies), products for which the buyer relies on the specialized information of the reference group.[Hawkins, D., Best, R., Kenneth, C., *Consumer Behavior. Building Marketing Strategy*, Irwin McGraw Hill, 1998, pp.219-220]

The influence of the reference groups is not as powerful for all types of products or consume activities. For example, the low complexity products, for which the identified risk is low and can be tested before buying them are unlikely to be influenced by the reference groups. The impact of the reference groups can vary: reference group might determine the choosing of a certain category of products instead of other (healthy food instead of fast-food) and can further influence the option for the trademark (Peugeot car or Toyota car).

Some reference groups include persons that the consumers know and have contact with, while others are made of persons with whom he might identify or admire. Because people have the tendency to compare themselves with others they consider similar, many marketing activities include ordinary persons sustaining positive opinions about a certain products. The probability such a person to be included in a consumer's reference group depends on many factors, among which:

- *propinquity* – studies show that people interact most frequently with the persons in their immediate vicinity;
- *mere exposure* – the persons met on regular bases (daily or by media exposure) are appreciated or the goods promoted constantly(for example, a candidate has greater chances to win elections if he is more present in the media environment);
- *cohesiveness* – means the degree of intimacy and dependence of the group's members to one another, as well as the importance they give to the group's declared values. When the individuals respect strictly the group rules, it is more probable that the group has a more powerful influence on the consume habits. [Solomon, M., *Consumer Behavior*, Prentice Hall, 2002, pp.321-322]

Persons want to belong to a group because of the status and the promised benefits they obtain. They want to be associated with groups that have an attractive social status, considering they can promote socially or professionally. The groups have power due to their ability to influence persons that one to become members. Certain groups, because of their unique characteristics, are perceived as having a superior social status and more power of influence than other groups; these groups are usually selective with the individuals that aspire to membership, the degree of attraction being amplified in many situations by the difficulty of affiliation. The group's capacity to influence the actions of various persons (members or non-members of the group) is called *social power* and can have a number of forms:

- reward or coercive power - an individual's perception that a group has the ability to mediate rewards or punishment for him/her;
- legitimate power – an individual's perception that a group has a legitimate right to prescribe behavior for him/her;

- expertise power - an individual's perception that a group has some special knowledge or expertness;
- referent power – an individual's identification with group. *Referent power* is described as the perceived status, standards, position, value or prestige of groups which influence individuals to seek membership into its ranks. [Dawson, M., Chatman E., *Reference group theory with implications for information studies: a theoretical essay*, Information Research, Vol.6, Nr.3, aprilie 2001]

The profound investigation of the consume particularities determined by the affiliation to a certain group lead to the defining of the term of consumption subculture. The consumption subculture is represented by distinctive subgroup of the society, whose members are selecting themselves on the base of the particular interest for a category of products (e.g. motorcycles), a trademark (e.g. Harley-Davidson) or a certain activity (sport fishermen). Such subcultures need a certain social structure, a common set of interests and values and a jargon or special expression rituals. Most consume subcultures are beneficiary of specialized media, especially reviews by which they can be influenced through precisely targeted marketing programs. The marketers are interested in comprehending these subcultures because they represent some consume rituals that can be exploited commercially.

The conclusion is that reference groups present the following characteristics:

1. the individuals are influenced by the groups they considered important from the social point of view;
2. individuals use certain groups to define their own behavior and attitudes in different situations (normative reference groups);
3. individuals report themselves to other groups or persons (comparative reference groups);
 - individuals can use more types of reference groups to define their own behavior and attitudes (multiple reference groups);
 - certain groups that the individuals use for model have power of influence on them even if they belong or not to the respective groups.

MARKETING APPLICATIONS OF THE LEARNING PROCESS

Puiu Carmen

University of Craiova, Faculty of Economy and Business Administration, Dr.Tr.Severin, str.Oituz nr.35, bl.2, sc.2, ap.3, email: cvpiuiu@yahoo.com, tel.0745087609

Abstract: Understanding consumer behaviour is an important task for marketers in their attempt to offer consumers greater satisfaction. Each individual consumer is influenced by his or her perceptions, motivations, learning, attitudes and personality. Learning refers to changes in a person's behaviour caused by information and experience. Learning can occur through simple associations between a stimulus and a response, or as a result to a complex series of cognitive activities. There are two basic types of learning – conditioning (classical conditioning and instrumental conditioning) and cognitive learning

Key words: classical conditioning, operant conditioning, cognitive learning, incidental learning, marketing wareout

The learning process

For an even more complete understanding of the mechanism behind the consumer's behaviour, the variable known as the learning is of great importance. It is considered that learning is the base of the perception mechanism and of the consumer's motivation to buy or not buy a certain product or service. The learning is essential for the process of consuming if we take into account the fact that the buying behaviour is a learnt behaviour. Learning may occur in situation of high involvement (when the consumer has reason to learn) or of low involvement (when the consumer is very poorly or not at all motivated to learn).

Learning can represent a noticeable or unnoticeable change in a consumer's behaviour due to the consequences of experience and it leads to the increase of the probability that a behavioural act to be repeated. Learning is a constant life time process for the consumer by the mean of many categories of activities: responding the communications received from the environment, following the example of another consumer, making repeated attempts or using logical reasoning. A person's knowledge is improving and changing permanently as the individual is influenced by new environmental stimuli, as he learns from past experiences so, in time, the consumer might change his behaviour related to a product or a situation of buying or consumption.

The process of learning sometimes happens without any intention of the individuals; we can recognize many trademarks, we can reproduce slogans or even hum jingles learnt unconsciously for products we do not use and have no interest in. This process of casual, unintentional learning is called *incidental learning*.

Summary of learning theories

The learning theories explain the manners by which the consumers learn confronted with a large variety of situations. The following learning theories are studied in this paper: *the classic learning theory, the instrumental learning theory and the cognitive learning theory*.

The classical learning theory (classical conditioning) is based on the Pavlov repeating principle according to which the automatic responses can be learnt. This principle is used especially in the promotional activities based on the idea that learning is achieved not only by the repeating of the behavioural act (buying and using a product) but also by the repeating of the promotional messages about it.

In order to make this procedure efficient it is necessary to repeat the stimulus for a certain number of times so the response to it to stabilize. The number is determined by the stimulus capacity and the subject's receptiveness and motivation. H. Krugman sustains, for example, that "*more than three exposures to a marketing communication are wasted. The first exposure creates the awareness of the product, the second demonstrates its relevance to the consumer, and the third serves as a reminder of the product's benefits*". [H.Krugman, Journal of Advertising Research, 1986] Research proved that, even if there is only one conditioned event, at least 30 exposures to the stimulus are necessary in order to maximize the effect.[Blythe, J., Comportamentul consumatorului, Editura Teora, București, 1999] On the other hand, an over exposure to the same message can be harmful for the marketing efforts, meaning that consumers complain

quite often about the annoying frequency of an advertising that becomes disturbing and even determines aversion against a certain trademark or ceases to be perceived by the consumer. This situation, also known as *marketing wearout* can be avoided by presenting the basic message in a variety of forms. [Solomon, M., Consumer Behavior, Prentice Hall, 2002, p.75]

Another efficacy factor of the classic conditioning is the order in which the conditioned(the product) and the unconditioned(the sonorous background of the message) stimuli are presented:

- In the *anticipated conditioning*, the conditioned stimulus is presented before the unconditioned one;
- In the *delayed conditioning*, the unconditioned stimulus is presented before the conditioned one;
- In the *simultaneous conditioning*, the two stimuli are presented at the same time.

The method of anticipated and simultaneous conditioning give the best results in the case of promotional activities, especially when the used media is represented by radio and television, since the sponsor can not control the order in which the subject reads the information in the case of written messages. Even if the two stimuli, conditioned and unconditioned, are presented simultaneously in the same promotional message and on the same page, there is a possibility of perceiving them in the wrong order, for a newspaper page is not read necessarily in the normal layout, from front to bottom of the page.

Generalization appears when two related stimuli determines a similar response. The marketers rely on generalization in the management of the mix of products; strategies based on stimulus generalization include family branding, product line extensions, and licensing. Another frequently used tactic by the small enterprises is to capitalize the advantage offered by the generalization phenomenon by packing the product in similar shapes and packages with the ones of the better positioned competitor (*look-alike packaging*).

Discrimination is the process with the help of which the consumers learn to differentiate stimuli and response only to the right stimulus. The marketers provoke discrimination between products by making the opinion on a product more positive by the mean of an unconditioned stimulus and ignoring at the same time the competing product.

Annulment happens when a conditioned stimulus do not determine anymore the conditioned response due to some causes, such as:

- The conditioned stimulus is manifesting in the absence of the unconditioned stimulus (e.g. the product is presented without the sound background);
- The unconditioned stimulus is manifesting unexpectedly in the absence of the conditioned stimulus (e.g. the sound background is presented in the absence of the product).

The instrumental learning theory. According to this theory, if a product/service offers a high degree of satisfaction while consuming it, the consumer will have the tendency afterwards to choose again, when the same type of needs will emerge. This reaction is known as operant conditioning and means that the product had a positive sustain and the consumer has become conditioned to buy the product again. If he is satisfied by the result once, the consumer will desire to make his feeling permanent. This phenomenon can have for consequence the excessive consume of aliments and, generally, of any products that induce the affective reaction of pleasure. Even if his needs are not completely satisfied, the consumer will still be tempted by that product, for the mere pleasure it offers. An example of affective conditioning is the assuring of the clients' fidelity through the sales, special offers, coupons etc. as well as the extension of fidelity cards given by some stores.

The instrumental learning (the operant conditioning) can be the result of one of the following situations:

- *Positive reinforcement* – is the pleased or desired result of a situation (a woman receiving compliments after using a certain perfume trademark, learns that its use has a positive effect and it will still use it);
- *Negative reinforcement* – means the avoidance or elimination of a unpleasant consequence (a mother misses her daughter performance on a show due to a migraine; solving this problem with a help of a certain medicine will determine the subject to learn how to avoid unpleasant consequences);

- *Punishment* – when the active behaviour determines a negative result, the subject learns not to use that product again (the use of a certain product is unpleasant for a person or determines a negative reaction from relatives and friends).

The operant conditioning does not necessary means the acquisition of the product. The marketers often offer free samples or the possibility to try it, to test some products in the hope that the positive experience lived will determine the ulterior buying of that products. The active conditioning is useful in explaining the way in which consumers can be preconditioned and of the manner in which buying habits emerge; however it does not explain how the learning process evolves when the subject searches the information. For understanding this aspect, the comprehension of the cognitive learning process is necessary.

The cognitive learning theory. This theory is inspired by the idea that learning process can not always be reduced to the automatic response to a stimulus action. The people analyze the situations that happen during the buying process taking into account the previous experiences and make evaluations. The conclusion is that, even if the theories of classic conditioning and active conditioning are based on the fact that the leaning process is automatic, the cognitive theory considers it is based on a conscious process.

The process of cognitive learning needs the following elements:

1. cognitive effort – represents the degree of effort the consumer is prepared to invest in the analysis of the products. This will depend on the complexity of the product, on the level of involvement and the subject's motivation;
2. cognitive structure – is the device with which the subject acknowledges the information received and integrates it in the already existent knowledge;
3. information's analysis – means selecting first the correct and relevant information from all the information received from the environment and, secondly, their correct interpretation so to develop a plan of action;
4. elaboration – refers to the structuring of the information by mental processes and the integration of those data in the memory;
5. memorization – is the mechanism by the mean of which the learnt information is stocked.

The cognitive learning may have the following variants:

- *Iconic rote learning* – means the learning by association of two or more concepts, in the absence of conditioning. A significant quantity of information is assimilated mechanically, unintentionally, and at the moment when a certain needs manifests itself these information gathered in time are used to select product or a trademark.
- *Vicarious learning (modelling)* – consumers learn not only from self experiences but also by deliberate observation of other consumers behaviour which they adapt depending on their own needs.
- *Reasoning* – is the most complex learning method, through which a person involves in creative thinking and reasoning processes of the information memorized and of the new ones received by the environment for creating new associations and concepts.

In conclusion, marketers are very interested to help consumers learn about their products and stimulate the consumption process. Knowledge of learning theories can be used to structure communications that will assist consumers in learning relevant facts, behaviors, and feelings about products or brands.

Abstract: The main purpose of this paper is the today's interactive information (data) exchange between producers, retailers and consumers that takes place on the market. It focuses on the creative process of investigating and making connections between different ways of thinking about marketing future. We also try to develop some thoughts in understanding this "marketing world" by analyzing the significance of distribution channels knowledge to consumers' benefit.

Key words: marketplace challenges; trade marketing; consumer experience; efficient consumer response, consumer insight; critical marketing; participation marketing; revolution in marketing; new distribution channels; selling solutions; enhance communication; strategic logistic; Romanian retail market.

An interactive information exchange takes place on the market in our days. Marketing must help confused consumers to be more successful in facing the offerings' proliferation and to make the right choice. Consumer marketing targets the consumer. But who knows the consumer better? The retailers, of course, who know what is happening at the level of the store and want to improve the category management, while the manufacturers need their point of view: a feedback which represents the synergy of the partnership's knowledge in which are involved the producer, the distributor and the consumer.

As consumers, we all require information about this marketing knowledge and we all need to be able to think of it having a deep understanding of the main marketing explanations that give us a framework for making sense of the "marketing world" around us. Therefore, the need to create and deliver information about goods/services - to the consumer - is more than obvious, and it is challenging to take part to the creative process of investigating and making connections between different ways of thinking about marketing future. And also to try to express some thoughts about marketing world by analyzing the dynamic distribution channels' to the consumers' benefit (the increase of the use of marketing techniques; the increase in the use of the Web by those responsible with marketing, etc.).

Trends in consumer behavior research

According to Geac there are major implications for existing distribution channels: logistic has become an indispensable competitive weapon within most distribution environments; both customers and suppliers are demanding more and more access to the company's data and at any time of day or night; sales people and managers often spend a disproportionately large amount of time on sales forecasts, reporting, tracking and performance reviews.

Efficient distribution with adequate pre and post sale support is a part of the competitive process which brings significant benefits to the consumer. Consumers' feelings about the product depends on product distribution and consumer experience during the purchasing process. Consumers' perception about the product affects how they mentally position the product in relation to competitive products. As distributor's actions can affect how consumers view the marketed products and as the marketer's distribution system must deliver these products to the right place, in the right amount, in the right condition (efficacious), at the right time and for the right cost (efficiency), marketers must look for distribution assistance for their channel arrangements.

Successful distribution (retailing) involves making sure that stores are stocked with the right products at the right prices at the time the consumer wants them. Efficient Consumer Response is a performing strategy

based on today's technology tools - that causes fundamental changes in the business process – which provides more added value to consumer. The three pillars of ECR are: providing consumer value, removing costs that do not add value, maximizing value and minimizing inefficiency throughout the distribution chain.

Focusing on products and brands choice rather than on channel choice is a current trend in consumer behavior research, but nobody can now deny the obvious impact of the proliferation of channels on the consumer behavior. Nina Michaelidou, David C. Arnott and Sally Dibb argued that channel characteristics are determined - in comparison with multiple choice of products and by taking into account the elements used by Hoyer and Ridgway, 1984 - by channel involvement, channel perceived risks, channel loyalty, channel similarity and channel hedonism. It can also be included other aspects like self confidence, information seeking, channel commitment, enduring channel involvement. They state that the increased choice and the decision complexity is likely to impact on behavioral aspects such as brand switching.

In the case of FMCG consumers obtain the marketed products by requiring them while visiting retail outlets, retailers selling in many different formats (physical location or virtual space) and using multiple distribution methods. Distribution fulfils a variety of economic and social functions and has a regulatory role to play in the confrontation with the permanent upstream and downstream diversification.

The business environment is complex and requires a high flexibility from the companies (entrepreneurs). It is considered that flexibility is the condition to success in the complex global environment; temporal dimension is indispensable to any approach of complexity. So, this dynamic business environment has to be managed in such a way to produce a competitive advantage immediately.

In a world of continuous change, where the boundary between the organizations becomes even more complex, reacting to the marketplace's challenges means to build architecture that will flexibly integrate corporate information. Today we are speaking about "knowledge-based strategies", "knowledge-based operations", and an integrated model of battle is at the same time cerebral and cyber, takes place on land, air, sea, and space; and it is producing predictive analysis, and creating anticipatory decision models.

As this "marketing world" is governed more by perceptions, marketers need an adequate marketing roadmap to arrive at the best positioning on the targeted market. They have to know how customers perceive them, having the ability of being perceived as they really are, trying to offer their customers expertise and insights because they really need to have someone buy, so they must help their customers to decide how to buy. To understand what customers expect marketers must be value driven, implementing the knowledge obtained, overcoming the barriers to communications, translating each value proposition into the customer's language, thinking of expertise as an abundant resource and time to respond as a scarce one, enabling the future.

The knowledge process makes up this construction in the complex business environment whose components can be easily understood by well trained marketers; this understanding is essential and influences the result of the knowledge process. Without knowledge through education, innovation suffers in the context of stiff competition. Education is the most important instrument of the company for adaptation to economic change, as an opportunity.

As the business is becoming more focused on processes, the marketing process should provide the foundation for the organizational structure in such a way as to deliver the very basic of what customer expects, improving customer retention, looking after what the ultimate customer wants to buy and achieving increased profitability.

It is important to renew organizational knowledge continuously - developing a knowledge culture - and within this framework to improve communication between internal suppliers and customers, by supporting a cross-functional process and adopting an interactive value perspective, according to a relationship value management, working in a way that enables the relationship marketing process to deliver on key-stakeholder expectation.

We have to mention that the twenty-first century is characterized by the emphasis of business marketing on developing relationships – and not on generating transactions – within a new focus on customer, requiring increased levels of information about its needs. During "the Year of Differentiation", 2007 a greater emphasis on adding new services can be remarked.

Focusing on what is important to customers

In the “next-generation marketing”, customer experience is going behind the lines, "audience is king" so, let's “learn more about the customer and how they think”. First of all a company has to see if it is possible to integrate this customer orientation and how can be this possible. According to Don E. Shultz – as Professor Emeritus-in-Service of Integrated Marketing Communications at the Medill School at Northwestern University, President of the consulting firm Agora, Inc. and founding editor of the Journal of Direct Marketing - the first thing is to stop thinking about products (ensuring the transition from product to service) and start thinking about customers as income flows, then think about all of the ways customers touch you, or you touch them.

When a firm is oriented towards customers it is able to see how customers respond to its efforts to meet their needs and expectations. This customer alignment and integration presumes having good customer data and using it efficiently. Customers always appreciate the manner in which the company and its partners deal with dissatisfaction, inefficiency and opportunity. The “machinery” made up of the employees' engagement and the clients' engagement can significantly influence the company's performance.

Why is this phenomenon possible? Because in reality people feel more than they think, while “models” require and expected too much thinking from customers. Today's marketing people - brand managers - are more preoccupied about customer engagement rather than finding new customers, the difficulty consisting in the fact that the recognition of the customer engagement's need and the actual measurement of the real engagement are two different things. And real engagement is the consequence of the marketing/communication programme which produces and increased level of brand perception as meeting and overwhelming customer expectations (“brand equity”), while customer expectations are generally based on emotions.

Shultz considers that marketers' training must be focused on what is important to customers, not to the company because there is an increasing retailers' focus on trying to build their own brands, their own private labels. On the other side, the manufacturer has to start thinking about how to become a better partner for the retailers in terms of capturing, sharing and using information and data.

Successful retailing involves making sure that stores are stocked with the right products at the right prices at the time the consumer wants them and this aim can be achieved by implementing ECR strategy. Implementing ECR means dramatic change in current business practices. ECR is about redesigning the processes, altering paradigms and changing attitudes. Proper management of the ECR process is effective in mitigating resistance and increasing co-operation. A clear communication by top management of the benefits and rewards of ECR will make the process more effective. To implement ECR, distributors and suppliers are making fundamental changes in the business process using today's technology tools. Their goals are clear: provide consumers with the products and services they want; reduce inventory; eliminate paper transactions; streamline product flow.

At the same time, from a retailer point of view, the real challenge is how to deal with Wal-Mart – that is the 21st Economy of the World - which pioneered in replacing inventory with information and has the very best distribution system in the world. Nobody can ignore the “**Wal-Mart Symphony**”...played on a global scale “over and over 24/7/365: delivery, sorting, packing, distribution, buying, manufacturing, reordering, delivery, sorting, packing...coordinating disruptionprone supply with hard-to-predict demand...the world's most efficient supply chain...constantly looking for new ways to cooperate with its customers”.

Trading partners are asked to work together in order to increase value to the consumer. The intensifying competition among trading partners often presents an apparent barrier to achieving this. However, just the opposite is true – ECR allows companies to seek a competitive advantage by demonstrating their superior ability in working with trading partners to add value for the consumer.

The consumer experience and consumer-created media

It's very important to understand the consumer behavior, how customers buy products, what products are purchased together and what is the meaning of a satisfied *consumer experience* – which can be defined as the cognitions and feelings the consumer experiences during the use of a product or service; managers' goal must be the converting of merely satisfied customers into completely satisfied customers: only the completely satisfied customers should be considered loyal.

That is why we need to see what kind of customer data there are inside the company and bring all of the various types of captured and stored information together - by conducting an audit of all customer information that is available within the organization. But as we face some practical obstacles in making the needed changes we have to assign a budget and it ideally should be coming from the top of the organization (the cost really has to be an organizational expense, not a departmental or group expense). The first business command should be this kind of a holistic overview of all of the customer data and customer information and customer institutional knowledge.

Vincent Grimaldi argues that resistance to change – which is ingrained in human nature - makes good marketing difficult in practice. He adds that in order to maintain competitive company's marketing must be given a role that is both strategic and systemic, managing to live in a symbiosis with the increasingly demanding customers and the changing environment, going beyond marketing's support role and penetrating most aspects of the organization. What is marketing in fact? It is worth to consider the opinions expressed by Grimaldi that marketing is the corporate equivalent of a central nervous system; it is an art and also a management science calling for the implementation of rigorous processes and metrics; it should be both creative and accountable.

Grimaldi insists further that: the Baldrige criteria for performance excellence puts marketing in a leading role, together with leadership and strategic planning; because the customer is at the very heart (the core) of the problem, great strategies are developed around him; the corporate strategy ends up being totally customer-driven ensuring that every step of the process is developed with a market quick feedback and... obtaining the customers' "Wow".

"Marketing is what the organization does", says Shultz. The marketing department ought to be the one that is aligning the organization, taking into account that there are lots of tools, tactics, techniques that can be outsourced - including strategy - rather than having those done by employees.

Within this framework Shultz's company has proposed a "media consumption model", because every developed approach is based on distributing messages through the media and what is measured is distribution: every consumer today is creating his or her own internal information network, having an internal model for how he evaluates information sources and how he solves his problems (internal networks created for themselves). Consumers have created the ability to not only give advice, but also to get advice from multiple sources and, that is why marketers need to look at how customers and consumers and users communicate with each other, by going back to the consumer-created media. In the same time, Jonah Bloom shows that "we now live in a culture of instantly disseminated opinion", everything in the public domain being instantly spread and dissected and in such a world marketers have to accept that they won't please all the people all the time: **consumers are in control** and messages are reinterpreted and criticized.

Achieving a broader perspective on marketing

There is a continuous debate within the academic marketing community about the so-called "critical marketing" and providing critical understanding: of the organization and impact of marketing operations; of the factors that are shaping marketing activities; of marketing professions and morality on the marketplace; of the mechanisms used by marketers for creating and supporting customer values; of consumer culture and the impact of brands; of the development and implementation of marketing strategies and programs; of the impacts of the marketing concepts' and techniques' application in a competitive environment; of marketing's interpretation within the framework of the relationship marketing; of redefining markets and marketing.

Marketers or not, we are all consumers and cannot escape the market, but we are not passive recipients of what marketers do, that is why – sustains Michael Saren, Professor of Marketing at Leicester University School of Management, UK – marketers must look at the marketing phenomenon as consumers experience it, as active participants in it, by achieving a broader perspective on marketing. And, the key to achieving such a new perspective is building of customer relationships, by understanding that customer relationships are the most important company's asset needing to be managed.

This “interaction approach” (Industrial Marketing and Purchasing-IMP), whose essential aim is to create value for both parties, is based on the idea that this process of interactivity takes place between active buyers and sellers that are individually significant to each other.

According to Saren, the “critical marketing” extends its domain and gives a specific example to demonstrate the necessity that the academic discipline of marketing must encompass the wide range of activities and effects that it manifests in practice today. The recent stream of research asserting that the human body itself is the site of all consumption, people’s identities and self-esteem are closely associated with their bodies. He also adds the problematic issue of relevance in marketing, considering the fact that in management and marketing relevance itself has often been defined in a restricted manner to imply usefulness as measured by a sub-group of either practitioners or self-selected intermediaries.

The future marketing department: more customer insight

Three years ago, being in Bucharest, Philip Kotler attracted our attention to the imperative of “the development of better abilities in innovation, differentiation, branding and service, in a word marketing”, recommending the development of a stronger marketing: holistic, strategic, technological, financially oriented. The “father of marketing” emphasizes, among other things, the need to resort to a lateral marketing, conceiving new product and service ideas. In Kotler’s opinion marketing is the art of brand building.

He also showed that one of the shortest definitions of marketing is the profitable fulfillment of needs. The commercial space is no longer what it was, more and more marketing people acknowledge the need to have a more complete, cohesive approach which goes beyond traditional applications of the marketing concept. An approach that attempts to acknowledge and reconcile the sphere and complexity of marketing activities is represented by holistic marketing (development, design and implementation of programs, processes and marketing activities which acknowledge content and interdependencies) whose components are: relational marketing, integrated marketing, internal marketing and marketing of social responsibilities.

Marketing management is - according to the same authorized opinion - the art and science of choosing target markets and winning, preserving and increasing the client base by creating, delivering and communicating a superior value to the client. This - the client - has, in many cases, undefined preferences, which are ambiguous or even conflicting.

The famous Al Ries wrote - in the spring of 2006 – that marketing study starts with psychology study: if psychology is the systematic study of human behaviour, than marketing is the systematic study of human behaviour on the market. In order to discover how the company can better satisfy customers’ needs, marketing people have to work together with the company’s clients, offering assistance and trying to understand their preferences. That is why Kotler considers “participation marketing” as a more appropriate concept, compared to “permission marketing”.

On the other hand, Kotler’s mentor - Peter Drucker - says that the purpose of marketing is to know and understand the customer so well that the product or service is perfectly suited to him and sells itself. But customers respond differently to the company’s image and the company’s brand; the identity - the way in which a company identifies itself, self-positions itself or positions its products - and the image - the way in which the public perceives the company or its products/services – require a distinction.

The key to branding - emphasized Kotler and Keller - is the customers’ perception of the differences between the brands belonging to a category of products. A branding strategy identifies which elements of a brand (name, term, sign, symbol, design, a combination of the previous) the company chooses to apply to the different products it sells. In order to serve multiple market segments often multiple brands are required (the basic principle in designing a brand portfolio is the maximization of market coverage, so that no potential customer is ignored).

But how do we get customer insight? The **future’s marketing organization is going to have employees who can deal with both push and pull forms of marketing**, by recognizing that today’s real challenge is to be very responsive, and to give feedback (the responses generated by the marketing come back to customer service, sales, technical support), so that the marketing people have relevance and view of what the responses are. Brand experiences today - according to the same Don E. Shultz - are the responsibility of part-time marketers - employees, retailers, customer service people who are not trained as marketing people but they are doing most of the marketing for the organization being on the ground responding to

people – and not of marketers. That is why one of the challenges is to get budget starting by thinking about customers as flows of income, aggregating those customers up and, building a financial calculation so that it is an investment and a return (beyond the actual marketing department as a cost center that can't measure, financially, the returns the marketing organization is generating).

The main distribution chains in Romania

It is well known that marketing's study object is a result of the economists' research (from the end of the XIXth century) referring to the nature of distribution process. An article published in Fortune magazine (April, 1962), where Peter Druker considered that distribution represents "the African continent of economy", led to a significant development of marketing theory referring to the conceptualization of physical distribution (marketing logistic).

Eleven years ago, in a study about goods distribution, there were identified two main factors which create the motivation which is necessary to the distribution progress: technological innovation and stiff competition.

Philip Kotler mentioned - in a book published three years ago - that marketing people use three types of marketing channels: communication channels, distribution channels and service channels. Distribution channels - that are used for displaying, selling or delivery of product or service to the consumer or user - include distributors, engross sellers, retailers, agents. In a market approach, competitors are represented by those companies which satisfy the same requirement to the consumer. The competitive advantage is referring to a company's ability to perform better than its competitors in one way or another. Long term competitive advantage is a profitable target for companies. Distribution efficiency requires finding out inventory, location and transportation savings.

Kotler and Keller underline the need to build a creative marketing organization, the capacity for strategic innovation and imagination coming from the assembly of instruments, processes, abilities and measures which will allow the company to generate more and better ideas than their competition. And this requires also assuming social responsibility because the business success and the client's continuous satisfaction are closely related to the implementation of high leadership standards of a business and marketing.

But according to Nirmalya Kumar, "management has forgotten, or never realized, the ability of the marketing function to help drive organizational change". CEOs have lost faith in marketing primarily for two reasons: shareholders and analysts are pressuring corporations and their CEOs to deliver against short-term profit and revenue objectives; marketers are too often seen as specialists and tacticians talking about the marketing-mix rather than strategists who help CEOs lead organization-wide initiatives that have strategic, cross-functional, and bottom-line impact. To improve value the company's value, marketers must engage CEOs and the top leadership in meeting the two marketplace challenges that all companies face: enhancing customer loyalty and reducing downward pressure on prices. To meet this, companies are looking for growth-related initiatives like expanding to new and growing channels of distribution, selling solutions instead of products, and pursuing radical rather than incremental innovation. The challenge consists in finding which aspects of marketing are really scale-sensitive versus those elements where local adaptation truly increases value for customers. The methods used - to reduce the tension between designing programs and products that are global versus local - are: increasing understanding through market research that allows the examination of this issue in a more "objective" manner; moving managers across countries to enhance communication.

This preoccupation towards distribution efficientization is also demonstrated by the role played by the unique European market that is referring to: the creation of new market opportunities in Europe; costs savings and increase of productivity as a result of distribution methods' efficientization – required by the sustaining of business strategies. Efficient distribution facilitates innovation in the distribution process, new technology implementation, and also low price products' at high quality and high service for the client.

Romania is an important market for the large international distribution networks, a fact proven by the investments that continue to increase constantly, due to the following factors:

- Romania is a continually developing (increasing) market, with a significant economic growth rate, both effective and forecasted, above other European economies, the consumption market being far from saturated;

- the size of the Romanian market is significant (second place in terms of size in Central and Eastern Europe, after Poland);
- the average income per capita registers growth;
- on the first of January 2007 Romania has become member of the European Union.

In the past years Romania has recovered some of the gap registered from the point of view of the development of the retail market - even if there was another significant intermediary network of small shops and kiosks. Important structural changes have taken place through the development of national logistic distribution structures. The new formats – cash & carry (replacing wholesalers), supermarket (still representing one of the main types of modern retail outlet), hypermarket (offering maximum product range and good discounting performance) and discount have remodeled the image of domestic trade. A substantial change in the population’s consumption attitude can be mentioned, behaviour which in fact is the promoter of the development of retail networks.

At present numerous international distribution networks are active on the Romanian market: Metro, Carrefour, Intermarc (Interex), Rewe Zentral AG (Selgros, Billa, XXL Mega Discount), Louis Delhaize (Cora, Mega Image, Profi), BricoStore (each having a network of stores developed according to the target market and the specifics of the group), Auchan, Ikea, ...waiting for and Tesco. Their entry on the Romanian market was determined by the development potential and opportunities offered. The entry of new players on the Romanian retail market and the development intentions of those already existing cause the growth of competition at a market level and consumer is the one who gains important advantages.

No	Name	Group	Store Type	No. of stores		Entry onto the Romanian Market
				Total	Bucharest	
1	Carrefour	Hyparlor Group	Hypermarket	10	5	2001
2	Cora	Louis Delhaize	Hypermarket	3	2	2003
3	Real	Metro Group	Hypermarket	13	1	2006
4	Auchan	Auchan Group	Hypermarket	3	1	2006
5	Pic	Grupul Pic	Hypermarket	4	0	2004
6	Metro Cash&Carry	Metro Group	Cash&Carry	23	4	1996
7	Selgros Cash&Carry	Rewe Zentral AG	Cash&Carry	17	3	2000
8	BricoStore	BricoStore	Do It Yourself	9	4	2002
9	Praktiker	Metro Group	Do It Yourself	14	2	2002
10	Spar Hypermarket	Spar	Hypermarket	1	0	2006
11	Spar Supermarket	Spar	Supermarket	13	0	2006
12	Billa	Rewe Zentral AG	Supermarket	25	3	1999
13	Mega Image	Louis Delhaize	Supermarket	18	15	1994
14	Gima (G'Market)	Gima	Supermarket	5	3	1999

The Main distribution chains in Romania

(Source: Romanian-American University, TOEMM, February 2008)

The first international retail company that entered Romania was Metro, in 1996. Subsequently stores such as Billa, Gima, Profi, Mega Image, XXL Mega Discount, Selgros, Carrefour, Bricostore, Praktiker, Intermarche, Cora, Univers'All (this last mentioned case should become an „interdisciplinary” case study; we also remark the „birth” of Carrefour in the previous central location of Univers'All Bucuresti) opened. Alongside these mall-type commercial centers were opened, local specialized stores networks were also opened.

We can consider the evolution of the retail market in Romania to be significant, in tune with the evolution of consumption behaviour which is referring to:

- target clients, buyers with medium and high income, targeting time and energy savings and the satisfaction of various needs;
- the increase of the number of products sold (FMCG);
- the increase of the presence of private brands (products marketed under their own private label);
- the increase of promotional efforts.

The big companies on the retail market are continuing their aggressive expansion nationally. The supermarket chains are looking to cover well defined areas from a client potential point of view. The strategy of these companies that invest in Romania takes into consideration the trends of the Romanian market. An important element is therefore represented by the changes in consumer behaviour, which is modeled by outside stimuli and which, in the conditions of an ever stiffer competition, will become more and more demanding regarding services, price and placement.

The competition on the retail market is stiffer and stiffer. The following period will impose major changes on the retail market. Traditional trade will reduce its share with the development of modern forms of trade. The importance of the niches left open on the market will increase, one of these being represented by neighbourhood trade and specialized small stores. It is surely that in the near future significant changes will take place on the retail market. Time will demonstrate if the traditional commerce will keep the tempo with modern commerce development, generated by: the increase of marketing competition for gaining free

market niches and new ones' identification; more frequently usage of participation marketing; authorities' attempts to achieve indispensable commercial balance between city centre and periferical areas (by net evaluation of commercial implants' contribution to the social-economic development).

Distributors have a multidimensional vocation and duty in the field of information. The value of information is universally acknowledged and the importance of certain issues such as information management and IT resources management has increased accordingly. Information technology is what today connects the business strategy and quick organizational reaction time. Strategic management and the demands of artificial intelligence, information systems management, integrated electronic businesses and marketing in the IT sector, all of these require a careful evaluation of the technology trends in technology, economy and abilities, as well as the periodic auditing of information systems.

The globalization process accelerates the distributors' will to rationalize and improve administration. The priorities in terms of investment will be: client performance; running activities from an operational point of view and an economic point of view. A generalization of technology is noted and the realization of the strategic importance of a better knowledge of the client base. We see today a multiplication of the methods of consumption, a modernization of logistic structures, an evolution of conceptions and store formats. Consumers want more and more choices, more and better services, more information, increasingly better price/quality rations, less and less expanded time and energy, higher and higher trust in the distributors and the products offered.

Conclusions

We are all consumers and we require to be informed about the marketing knowledge and eager to participate in this debate about knowledge to the consumers' benefit by creating internal information networks about distribution channels that are constantly changing. Consumer's feelings about the product depends on product distribution and consumer experience with the purchasing process.

FMCG distribution on the Romanian market has proven to be the field with the most rapidly impact on our EU integration. There is an obvious result of marketing activities which substantially increase the power of the brand in the eyes of the Romanian consumer (not being passive recipients of what marketers do within this symbiosis).

The existence of a clients' identity alternation between two extremes – traditional client and cyber client – that impose a more proactive marketing style, is becoming visible. More creative market conducted approaches are necessary, taking into consideration the advantages of traditional marketing, combined with new techniques and proposals of superior value in relation with the evolution of market structure, channels and clients' expectations.

As a final conclusion, we must take into consideration Ph. Kotler's recommendations. In hypercompetitive economies marketing should constantly create new ideas and build brands more through performance and less through promotion; also, the clients have to be served differently, but appropriately, building performing information and communication systems and analyzing profitability by segment, by client and by distribution channel. This evolution and confrontation with the new opportunities and challenges require new abilities and competences.

Abstract: The objective action of the socio-economical conditions of the contemporary society represents the basic argument of the extreme mobility of the touristical consumption demands. Given the fact that these contemporary conditions in themselves are permanently changing, at the present time, more than in the past, the necessity of permanently analyzing and getting to know the touristical consumption's demands and the factors that determine them is imposed

Key words: touristical consumption, the touristical demand's, touristical products, equilibrated touristical balance, the measurement of the touristical consumption

Introduction

The touristical products, like any other, have a life cycle, that is, they appear, they develop, they grow old and then they disappear from the market. Experience shows that the life cycle becomes shorter and shorter, that they become more and more perishable and that they go out of use faster. Historically speaking, the touristical products and the services offered at the beginning of the century are by far outdated, and along the years, more types of touristical products, more and more advanced from all points of view, as a consequence of some new and newer demands of the market, were alternated.

This rapid change of the touristical consumption's demands is not just a fashion thing, they are not only provoked by the consumers' caprices, even though no one can deny that nowadays, fashion and taste play a more and more important role in the change of the demands in general and of the ones of touristical consumption in particular.

1. The ups of the touristical consumption

The touristical demand's concrete mode of manifestation is the touristical consumption. This represents the touristical products, effectively purchased and consumed by the tourists. Taking into consideration this concrete aspect, as well as the fact that it represents a high importance factor for the economical study of the market, the touristical consumption is the element Statistics most frequently looks for.

In the intent of defining the place the touristical consumption occupies within the total consumption, the specialists start from the repartition of the national income and of the individual income that comes to the individuals after the subtraction of the imposts and local taxes. These individual incomes are supposed to cover, first and foremost, the expenses related to the satisfaction of the vital needs that can be arbitrarily reduced. The rest of the incomes constitute *free disposable* incomes from which a series of consumptions, related to the satisfaction of some demands of the life standard, to the constitution of reserves and to the free consumption, are subsidized. The free consumption includes the touristical consumption and other free consumptions (fig. .1).

K. Kraft, as a consequence of the increase rate analysis of the touristical consumption of a household with incomes that only come from salaries, concluded that the level of this rate depends on the expenses made for the compulsory consumption that attracts a relatively constant part of the income. If the part from the income allocated to the compulsory consumption is in decrease, then the free-disposable income will be bigger, and, therefore, the family's expenses and disposability for holidays and spending the leisure will be higher.

Given the fact that under the conditions of the increase of the global individual income, the part of this one affected to vital necessities will be in decrease and, therefore, the part allocated to the touristical consumption will increase, having an elasticity superior to the unity.

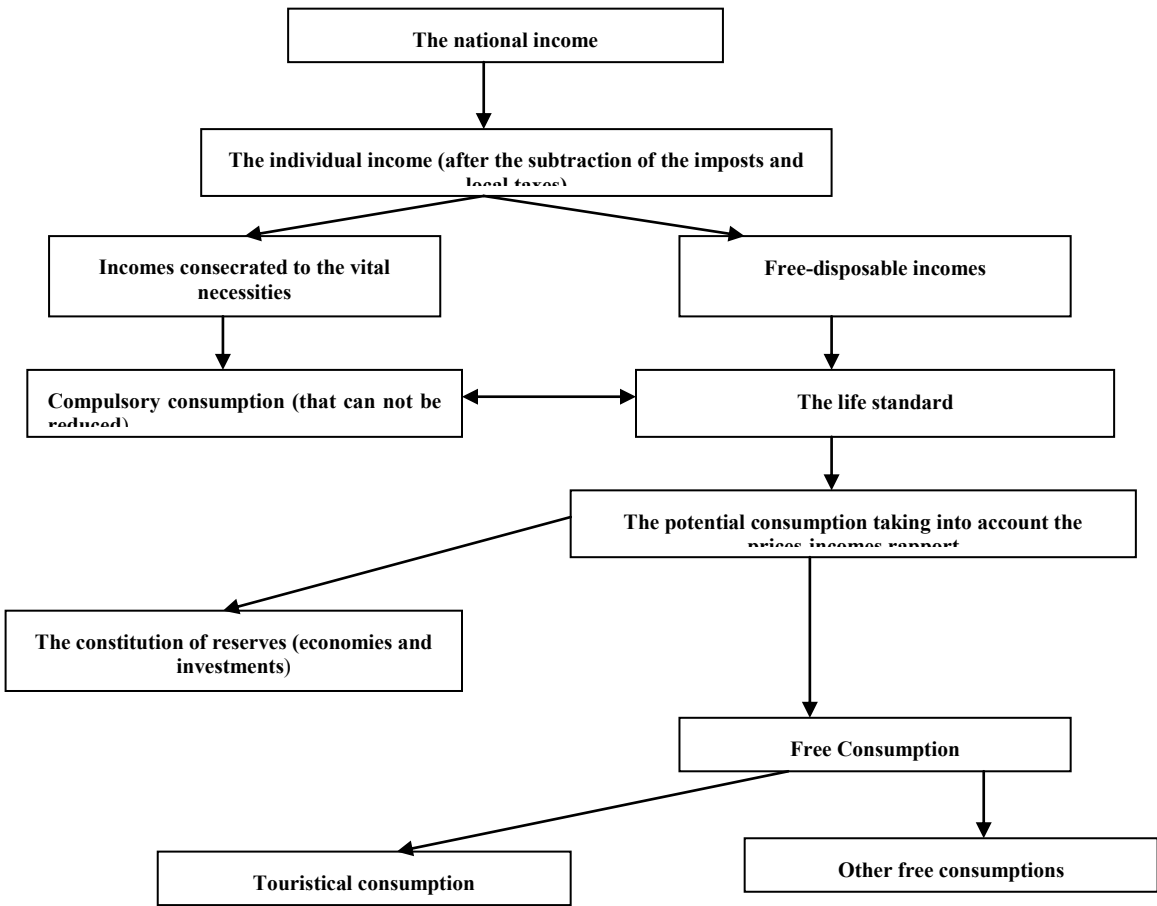

Fig.1. The sources of the touristical consumption

The economist Engel, after he made an inquiry on the family budgets in 1875, concluded that between the level of the income and the level of the consumption there are some correlations determined by the size of the income. Thus, the following rapports can appear between the incomes and the consumption:

- a sub-unitary rapport when the increase of the income doesn't carry on an increase of the consumption;
- an equal rapport with the unity when the increase of the income doesn't carry on the same increase of the consumption;
- a supra-unitary rapport when a slight increase of the income determines an important increase of the consumption.

In the intent of substituting Engel's laws, in our present day tourism, we can observe the following:

- for the prime necessity and alimentation consumption goods, the heft in the total income can decrease in general, but as these products cover a big volume of services and as the population's tastes are more and more sophisticated, the choice's elasticity for some products can be supra-unitary;
- touristical services don't register an a lot bigger increase then the one of the incomes, but it is a very temperate one.

The factors that have direct and immediate consequences upon consumption refer to the economical recession phenomenon that regularly influences the consumption, and, first and foremost, the touristical one as well as the element called *political atmosphere* that plays an important role, especially for the evolution of the international tourism.

The touristical consumption doesn't depend, nowadays, only on the family's incomes and on the structure of its expenses, but a fairly important influence is represented by the factors with social, economical and political character, and sometimes the very irrational factors that appear as a result of the individual's personal experience. We can include here the social affirmation desire, his tastes and conceptions, his state of disposition, the propaganda, the reputations which the diverse touristical destinations have, etc.

2. The measurement of the touristical consumption

The analysis of the touristical consumption, on a global basis, encounters big difficulties caused by the lack of some corresponding statistical data. Sometimes they are totally missing, other times they cannot be compared with each other. The respective situation appears because of the fact that not all the countries unitarily accept and apply the definitions regarding the notion of tourist, as well as the fact that the statistical techniques differ from one country to another. We can add here the fact that, nowadays, the national touristical consumption's value is not calculated at the level of one country's economy.

In order to measure the touristical consumption, the clarifications of the basic statistical notions from this domain are necessary.

At the present time, there is no unanimously accepted definition of the internal tourist, but only of the international tourist even though no country contests the existence of both categories of touristical activities (internal and international).

At the International Conference of the United Nations for Tourism and International Travels that took place in Rome in 1963, the notions of tourist, visitor, excursionist, that only refer to the international tourism, were defined as follows:

- *The visitor* designates any person that visits a country, other than the one where he has his usual residence, for any purpose except the one of obtaining a remunerated occupation in the visited country.
- *The tourist* is the visitor that has at least a one night stay or over 24 hours in the visited country and whose visit has as a purpose either spending the vacation or the affairs, familial purposes, work etc.
- *The excursionist* is that temporary visitor that doesn't spend the night in the visited country (or spends less than 24 hours there).

A major lack is observed in what concerns the definition of the internal tourist, even though in our country, as in many others, the internal tourist represents a determinant touristical consumer.

In general, the statistics are interested in highlighting only the number of the tourists, without even proposing to give a little bit of importance to the valuable determination of the touristical consumption level.

Nowadays, the international touristical circulation became very intense, and its analysis constitutes a basic preoccupation for all the countries.

The registration of the international touristical traffic is made by registering the tourists, either at the frontier points or at the housing points. The frontier registration can be permanent (by registering all the tourists that enter the country) or temporary (through inquiries). The data that can be gathered through the frontier registering method are limited, fact determined either by the reduced time the frontier authorities have at their disposition, either by the difficulty with which they are gathered, taking into consideration the fact that the visitor's ids don't always permit the determination of the data referring to the tourist.

The registration at the unity of housing implies the existence of an unique organizational system at the level of the whole country, that should include absolutely all the unities and should be uniformly effectuated.

In practice, the registering is realized through a form that the tourist fills in at his arrival. In order to calculate the touristical consumption, there is no computational technique at the present time. In most of

the countries indirect indicators, as for example the amount of money cashed in from tourism or the expenses for tourism, are used, for this purpose.

On an international basis, the amount of money cashed in from tourism represents the amounts of money cashed in from the payment of goods or services purchased by the foreign visitors in the visited country in foreign devises.

Nowadays, we use two methods for the calculation of the touristical incomes and expenses:

- *The central bank's method*, having the character of a total statistical registration of the type of the measurement, consists in the registration made by the banks or by their branch offices of all the exchange operations made by the foreign tourists. Based on these ones, they periodically report to the central bank all the exchanges realized. This method is the most prevalent one at the present time, even though in some countries certain impediments, given by the great number of banks and particular branch offices whose centralized references is hard to control, appear.
- *The survey method*, from a methodological point of view, presents a series of deficiencies, and that is why the central bank's method is recommended to be used with priority. It consists in the appreciation of the incomes realized from the international touristical activities based on some inquiry-survey, especially effectuated.

If we refer to the touristical expenses, we can affirm that the two methods, antecedently presented, can be used when it comes to calculating them. The central bank's method is applicable in the cases in which the allocations of devises for the foreign travels are made in a centralized manner.

The data presented above only permit the formation of some global images of the touristical circulation and of the touristical encashment, but they don't permit a more detailed analysis of the foreign touristical consumption's structure. The use of the statistical indicators of touristical consumption structure is thus imposed.

The nomenclature of the touristical expenses that characterizes the touristical consumption is extremely complex and includes four important groups of expenses:

- Transport expenses;
- Housing expenses;
- Alimentation expenses;
- Diverse expenses.

Inside those four categories there are though a multitude of posts with an extremely differentiated structure. The most diffused system of evaluation of the touristical consumption is represented by the medium touristical consumption using the indicators of the medium touristical expenses or encashment on visitor of day-tourist.

The medium touristical expenses on visitor represent the total expenses effectuated on an average by a foreign visitor or inhabitant in order to purchase touristical goods and services. They can be calculated in two ways:

- Through the division of the total touristical expenses to the total number of foreign visitors, this being only applicable in the case of the international tourism;
- Based on some specially organized investigations, this being applicable for both the foreign tourists and the inhabitants.

Taking into account the fact that the currency exchanges don't always reflect the effective volume of the touristical expenses and that the indicator calculated on this basis can only give a global image of the consumption, for a more precise calculation of the touristical consumption's structure it is preferable to appeal to the investigation method.

For the appreciation of the real touristical consumption, the medium touristical encashment's indicator during a day or the medium expenses' indicator during a day are frequently calculated.

As *the indicator of the encashment a day-tourist* are calculated based on the currency exchanges reported to the global number of days tourist, *the indicator of the expenses a day-tourist* are calculated based on the inquiry-survey method, through the direct investigation of the tourist.

Making reference to the touristical consumption in general, we can state that their volume in valuable expression is given by the touristical expenses (C) that, from an economical and mathematical point of view, represent a function of an entire series of factors, namely:

- of the total number of visitors in a calendar period given by (T): $C = f(T)$;

- of the total number of those tourists' registrations (N):

$$C = f(N);$$

- of the effective duration of the touristical sojourning, that is of the number of tourists and of the medium number of nights spent there (D=N/T):

$$C = f(TxD);$$

- of the general level of the touristical prices practiced in a certain period in the visited country (P_t):

$$C = f(TxDxP_t).$$

A devaluation or a revaluation of the currency in which the prices are expressed determines an artificial increase or decrease of "C's" value, this indicator not even expressing an effective increase or decrease of the touristical consumption.

The re-emergence course of the international tourism is an indicator that not only represents a mean of appreciation of the touristical activity's efficiency, but also a familiarity instrument of the touristical consumption orientation of the foreign visitors. It is calculated by reporting the prices of the goods and services purchased by the foreign tourist in the national currency (C_{VN}) to the sum cashed in for those goods and services in currency (I_{VS}):

$$R = \frac{C_{VN}}{I_{VS}}.$$

Thus calculated, the re-emergence course proves a great flexibility and power of adaptation, being able to be applied both when it comes to individual touristical operations and when it comes to the level of the touristical enterprise's activity or of the touristical branch.

The comparison of the re-emergence courses inside the touristical branch can reveal the profitableness of the different goods and services between the diverse touristical products, between the diverse markets where they are sold, between the different touristical seasons or between the different touristical resorts.

In order to keep the expressivity of the re-emergence course intact, we have to have in view other elements that can influence it too. For example, the devaluation or revaluation of the foreign currencies, a so frequently encountered phenomenon in the last few years, comes in the way of a correct analysis of the evolution of the re-emergence course on a larger period of time.

On the other hand, it is necessary to also take into account the politic of the prices practiced in the country visited. There are some countries where the prices politics expresses the state's politics towards the incomes of some categories of citizens. This fact presupposes that the level of the internal prices, respectively the one of the effective expenses for the purchase of some touristical goods and services, doesn't always express the real price of those products.

The application of the calculation formula of the re-emergence course can only be done in the cases of the organized tourism, respectively when the tourists directly pay in the currency the value of the services and goods they will benefit of.

Situations can come upon when part of the touristical goods and services are entirely paid in currency, and in other part they are purchased with national currency coming from the currency exchange.

For some countries, tourism got to represent an important chapter of their encashment and external payments balance.

The idea that obtaining an equilibrated touristical balance raises serious problems must be underlined. The touristical incomes and expenses represent two completely different elements, being related not only

through pure economical aspects, but also through a series of natural climatic factors that don't permit an immediate increase of the arrivals or the departures depending on the situation of the payments' balance.

In practice, the balance of external encashment and payments consists in the comparison of the encashment and of the payments. Another problem that needs to be explained is the one referring to the inclusion of the international touristical transports in the active or passive of the touristical payments balance.

Even though, in conformity with the international practice, the international touristical transports are often considered distinct activities and, as a consequence, their inclusion in the touristical encashment is not recommended, there are sufficient and solid reasons that plead for the contrary.

First and foremost, we must signal the fact that the tourism necessarily implies the transport. A confirmation of this truth is constituted by the very process of integration that is observed today in the world, when the touristical enterprises fuse with transport enterprises in order to offer a complete touristical service and in order to banish the inherent dependency of a sector to another one.

Secondly, we must emphasize the fact that the special aeronautic transports for tourists (charter), tend to exceed the regular aeronautic transports.

Abstract: Strategies of quality assurance in health services mean a new approach of primary medical assistance, focusing on the consumer. This can be achieved by the development of the integrated services of primary assistance within a group of medical practice that gathers more doctors with the sanitary and auxiliary medical staff.

Sometimes in hospitals quality is difficult to be measured, especially when it is about the carrying out of an individual or a team, at certain departments or therapeutic interventions as operations or complex treatments. The quality of the services offered by the hospital can be appreciated from the consumer's point of view, by means of the following elements: staff, physical support of carrying out, hospital environment, and process of creation and delivery of service, the result of the treatment.

Keywords: marketing in the field of health care services, health care service, the market of health care services, marketing strategies, product strategies, improving quality strategies

The foundation of the product policy grounds on the content of the process and it is materialized through the formulation of some objectives and strategies which concern the product on the whole and within its components. As an element of the marketing mix, the product refers to the finality of the organization's activity.

In the health services, in the projection of the offered product are involved several factors from the macro and microeconomic level, namely: the Ministry of Health, the organizations, the physicians and the consumers (figure 1)²²². The insurance of equity and equality with respect to the access to the health treatments for all the members of a community imposes that the Ministry of Health to play the major role in the projection and dimensioning of the health service, the strategies aiming at the projected product as a component of the external marketing. Consequently, the access to the services of primary, secondary and tertiary assistance, as well as the series of activities through which the service is performed are strongly regulated. The health product is above all a global product formed of a series of interdependent services, most of it being included in the object of activity of any organization. Its components, theoretically, may enter separately as well in the offer of a single organization. Therefore, there may be consulting rooms of primary assistance, specialized consulting rooms, hospitals, ambulatory centres, etc.

In order to reach the objectives of the health organizations, they must establish directions of action with respect to the services range, in order words to formulate **product strategies**. In a first approach, the product strategies concern the quality, the differentiation and the productivity²²³.

➤ **The quality** is at the basis of the product policy within the health services, being impossible to separate it of the utility, a defining element of them.

²²² Laing, A. (coordinator) – Managing and Marketing Health Services, Thomson Publication, London 2002,

²²³ Kotler, Ph. – Quoted work, pp 592

The totality of actions of the organization through which it is determined the attitude towards quality is included within the quality policy in the services field. The objectives of this policy are defined by the differences which occur between the promised quality and the one effectively delivered, between the perceived quality and the one received, as well as between the promised quality and the effectively delivered one, on the one hand, and the perceived and received one on the other hand. These differences are determined by the ignorance of the consumers' expectations, the use of some inadequate standards of these expectations, the non-delivery of the services according to the prescriptions and the incompatibility of the performances with the promises.

During the last years, it is noticed within some organizations from the health field as well a preoccupation for the reduction of this gap through a series of measures such as: the representation of the consumers in the board of directors, the performance of some marketing researches concerning the satisfaction of the consumers, the development of some mechanisms of settlement of the claims, etc.

The basic principle on which rely the strategies concerning the quality of the medical services from the primary medical assistance is represented by the "strategies dictated by clients"²²⁴. The system of creation and delivery of the health services involves an assembly of interconnected elements which operate in terms of some pre-established regulations. The relations between different groups of partners, between the components of the system, as well as the relation with the consumers are reflected directly on the quality of the services. Therefore, from the government point of view or of the third parties payers, the quality is closely associated with the efficiency and the adequate use of the resources, whereas the health staff focuses on the professional competence, on the existence of some adequate means and the consequence of these processes over the patients' health. For the consumers, the quality has first of all a dimension granted by the interpersonal relations and then by the professional competence, the sanitary units determining certain characteristics of quality through the competence of the staff, an individualized conduit of care deliveries, the technical-material base²²⁵.

The insurance of the health services at different levels (primary assistance, specialists' services, ambulatories) imposes a clarification of the concept of quality for each level.

1. The approach of the services **delivered by the family physician** in the light of quality focuses on the following elements²²⁶.

- **accessibility** considered from an organizational, geographical, financial and psychological point of view.

From an organizational point of view, the family physician should organize his activity so as to be permanently at the disposal of the clients. Since this fact is not possible, are necessary actions of cooperation with other physicians in order to ensure an availability of the products.

With respect to the geographical aspect, it is important that the location of the building where the consulting room is situated is not too far; this aspect is often met in the rural environment, fact which determines the opening of some working points.

Concerning the financial aspect, the introduction of the health insurances system allows the access of some important part of the population to these services. There is also a series of services and categories of persons for which the access is restricted by the financial availabilities, the payment being made through individual contribution.

The psychological aspect is considered to be equally important as the professional competence. For many consumers, the family physician must display availability for the problems of the patient, others than the medical ones.

- **continuity**, through the insurance of the services both within the consulting room and the home visits, the optional organization of the hours of consulting and of the non-scheduled patients, the existence of a medical file and of a medical archive;

- **satisfaction of the patients** given by the measure in which the physician corresponds with the consumers' expectations. They are interested both of the professional competence and of the interhuman

²²⁴ Armeanu, P. – Management of the health services quality, Coresi Publishing House, Bucharest, 2002, pp 57

²²⁵ Palmer, R.H. – Consideration in defining Quality of Care, Health Administration Press, 1991, pp 23

²²⁶ Armean, P. - Quoted work, pp 43

relations. The evaluation of the consumers' satisfaction allows to the family physician or to the generalist physician to determine the level on which his services meet the expectations of the client.

The strategies of insuring the quality of the health services mean a new manner of approach of the primary medical assistance, placing in the centre of attention the consumer. This may be performed by developing some integrated services of primary assistance within a group of medical practice which gathers several physicians along with the sanitary and auxiliary medical staff. The organization of an integrated system of services of primary medical assistance leads to the improvement of the service quality by reducing the waiting time of the patients, ensures a fast and easy access, ensures the continuity of the cares, allows planned investigations, imposes the training and improvement of the staff, increases the satisfaction of the patients.

2. **In the hospitals**, the measurement of quality may be sometimes determined with difficulty, especially when it refers to the performance of an individual or of a team, at certain sections or therapeutic interventions of the type of complex surgeries and treatments. The quality of the services granted by the hospital may be appreciated from the consumer's perspective, through the following elements: staff, the physical support of the performance, the hospital environment, the process of creation and delivery of the service, the result of the treatment.

- **the staff** includes one of the most important factors in the insurance of quality, this being defined in quantitative (the number of the staff) and qualitative (qualification and competences of the staff) terms. In addition to these, is added, as in the case of the family physician, the availability for the problems of the patient (kindness, personal interest, to be accessible and trustful etc.);

- **the physical support of the performance** - the performance of the services involves equipments and specific endowments, from the most simple to the most complex. Their safety and functioning is essential for the insurance of a high qualitative level of the services;

- **the hospital environment** must offer comfort, safety and a pleasant environment. The safety refers to an environment lacked of risks which may cause infections, complications, traumatisms. The comfort and the environment involve both cleaning and a soothing image offered by the décor and furniture. In the private hospitals and sections where the accommodation service is offered on cost, the comfort includes as well a series of additional facilities (television, fridge, room-service);

- **the process of creation and delivery of the service** includes on the one hand the activities performed by the physicians for the obtainance of the diagnostic and the recommendation or imposing of the treatment and, on the other hand, the activities of the consumers for the search and obtainance of the cares.

- **the result** refers to the impact of the services offered on the health condition of the consumer. The evaluation of the result must not be made only in the light of the services offered, it must consider as well a series of factors such as: environment, genetic and conduit factors.

- **The increase of the productivity** represents another direction of action and relies on the perishable services, on the impossibility of stocking and delivering them on the moment of the request. For this reason, the demand and the consume are performed during a waiting moment which affect the quality and the quantity of the services delivered. The inclusion of the productivity within the objectives of product is justified by the effects that it generates with respect to the quality of the service, as against the waiting time of the consumer for the delivery of the service.

Although the health productivity may seem improper and opposite to quality, it may be considered a method of improvement of the quality if it is compared the release program of two similar sections or the number of programs of education placed at the disposal of the consumers²²⁷.

➤ **The differentiation of the services** represents a means of positioning the product on the market. This appears as an effect of the services intangibility and it is imposed by the necessity of ensuring a distinct representation of these in relation with similar products. Its enrollment as direction of action relies on the fact that the innovations, as elements of differentiation, not being protected, are easy to be copied, loosing without difficulty the competing advantage obtained.

In the health services, the strategies of differentiation considered by organizations aim at:

- **the operational advantage** – the consumers are offered services of confidence, easy to obtain;

²²⁷ Armean, P. - Quoted work, pp 77

- **the closeness to the consumer** – the thorough knowledge of the consumers and their capacity to answer fast to all their specific needs;
- **the advantage through product** – the offer of some new services, with a superior utility in comparison with those of the competition.

The application of these strategies is realized with the help of some specific instruments, namely the standardization and personalization, the dimensioning of the offer and the ordering of the demand and the use of the brands.

1. The standardization of the services represents a technical regulation of the process of creation and delivery, realized through specification, typifying and unification and follows the reduction of the gap between the promised service and the effectively delivered, on the one hand, and the perceived and expected one, on the other hand. Although considered inadaptable for services due to their intangibility, the health services' nature makes necessary the use of the standardization (the stages covered for the performance of the service is every time the same – programming, consulting, fill up the personal medical sheet, the prescription etc.).

The activity in the health field relies on five types of standards: (1) fundamental standards which refer to terminology, conventions, signs and symbols; (2) organizational standards which describe the functions of the organizations, their connections and the modeling of the activities; (3) the standards of specifications which set forth the characteristics of a product, service, proceeding, or of a system and the levels of performance; (4) the standards of method of attempt and of analysis through which are measured the characteristics of the products, services, proceedings; (5) the standards of recommendations which contain a series of instructions, directive lines, etc.

2. The personalization of the services represents their performance in accordance with the individual requirements of the consumers, the adjustment of a “standard” service to their individual services. Although the performance of a health service, as we have mentioned, involves a high degree of standardization, its specificity imposes as well a high degree of personalization. The personal manifestation of the consumer's conduit involves a great variety and therefore a necessity of personalization given by the tendency of individualization of the one who requires the respective service.

Besides the aspects related to the individual characteristics of the consumer – genetic and of conduit – to which are added the environmental factors, the consumer brings with him as well a series of norms, values and knowledge which impose a high degree of personalization.

The great diversity of the demand and the variety of the services determine that not all the health services to be carried out at the same degree of personalization. Considering the model of Richar Larson and David Bowen²²⁸, it may be obtained a typology of the health services according to the diversity of demand and the degree of participation of the consumer at the realization of the performance:

3. The dimensioning of the offer and the ordering of the demand represents another tool used for the application of the product strategies, imposed by the rigidity and perishable offer on the one hand, and the variety of the demand on the other hand.

The performance of the services is closely related to the capacity of the offer, namely the capacity of the resources intended for the attraction and maintenance of the consumers, of the equipments and of the staff, as well as to the sometimes limited capacity of participation of the consumer. The capacity of the hospitals, consulting rooms, surgery rooms, recovery rooms, wards, is limited by the number of places stipulated by the regulations imposed by the Ministry of Health and from the level of the organization. The offer is conditioned as well by the number of equipments and their degree of physical and moral use. The labour force represents maybe the most important element of the production capacity and it is expressed by the number of physicians, nurses, auxiliary staff and by the professional preparation. The ordering of the demand follows the reduction of the effects generated by the limited capacity of the offer and by the impossibility of serving the demand according to its manifestation. Due to the specificity of the health services, their performance brings modifications to the physical and psychical condition of the patient and although the offer is dimensioned correspondingly, there are situations when the service cannot be carried out and therefore, it cannot realize a balance of the demand with the offer.

²²⁸ Larson, R., Bowen, D. – Organization and Customer – Managing Design and Coordination of Service, *Academz of Management Review* 14, no. 2, pag 213 – 233, in Bateson, E.G., Hoffman, D. – *Managing Services Marketing*, fourth edition, The Dryden Press, 1999, pag. 123

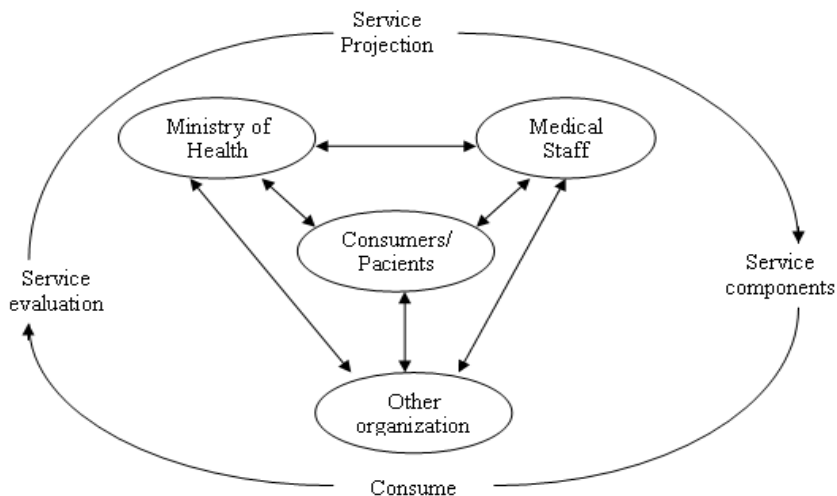

4. Renewal of the services. As an instrument of the marketing policy, the renewal of the services ensures the increase of quality and the differentiation of services and appears under the form of major innovations, new services on the current market, the extension of the services line, the perfection of the services.

The major innovations represent new services unknown at the moment of their occurrence. In the health services, the major innovations are related to a strong activity of research, being represented by the occurrence of new equipments, new monitoring procedures, treatment and recovery, as well as new medicines. *The new services on the current market* represent the inclusion in the offer of an organization of some types of services existent in the portfolio of the competition (taking over the laser surgeries, 4D echography etc.). *The extension of the services lines* involves the addition of services in terms of some supplementary or potential services (for instance the public-private partnerships within the hospitals in Romania led to the modification of the degree of comfort at the level of the wards, by the introduction of side-rooms of 1 or 2 beds, with all the medical and comfort facilities). *The perfection of the services* brings modification in the manner of process performance, without modifying the basic service (more performant equipments, extension of the physician's or consulting room's program, informatization of the patients' evidence etc.).

5. The use of the brands represent, in the conditions of some similitudes related to the power of services, the main tool of differentiation and positioning on the market. Considered a technique of promotion, the use of the brands is at the same time an instrument of quality certification, symbol of the basic characteristics and of the organization's culture²²⁹.

If in the selection of the family or stomatological consulting rooms the role of the brand name has a relatively reduced role for the consumer, this cannot be stated in the case of the hospitals. The consumers are tempted to select those hospitals about which they have heard, associating to the name a certain quality of the carried out services.

Figure 1 Factors involved in the projection of the health service

Abstract. *Customer satisfaction depends on the accuracy of specific information on destinations' accessibility, accommodations, facilities, attractions and activities. The Internet satisfies the needs of consumers for convenient access to transparent information. It allows them to compare information. They are able to cover the entire variety of choices of travel, accommodation, transportation and leisure services, holiday packages, prices and availability. This type of information will naturally help tourists to plan complex tourist activities, such as long trips. Today, the Internet is assumed to be an important channel for services marketing and is leading to profound changes in the way firms interact with consumers. Consumers now have increased access to informational electronic marketplaces and use this information in a sophisticated way to select their services. The Internet provides accurate and specific information that can reach the target audience with the accuracy of more personalized information sources.*

Key words: *marketing, destination, internet, site, market, consumer*

From a theoretical perspective, understanding consumer behavior is essential in decoding all the activities used to develop, communicate and sell services. Similarly, from a practitioner's perspective, it is necessary to understand the motives regarding why some services are preferred or rejected by consumers. With this understanding, it will be possible to influence consumers' decisions by developing appropriate strategies.

Consumer behavior study is much more complex for services than for goods, due to their intrinsic characteristics: intangibility, inseparability of production and consumption, heterogeneity, and perishability. Tourist consumer behavior is particularly complex because the final decision of buying tourist services presents distinctive aspects. First, the acquisition process has a strong emotional component for consumers (Leong, Huang, & Stanners, 1998).

Second, purchasing is often the culmination of a long process of planning, choice, evaluation and assessment of alternatives by a large number of people. More importantly, this intangibility of tourist services creates uncertainty and perceived risk in the consumer's mind. So, before buying a tourist service, consumers acquire a large quantity of information and anticipate the consumption, creating images and expectations.

Mass media information sources are a key communication channel for service firms because they present immediate benefits to consumers (Zeithaml et al., 1985). Although this search provides a greater variety of information to solve a specific information problem, it does not provide customized information. Consumers spend more time and effort than when collecting information from customized sources, as mass media information sources act independently of the consumers' active process of information search. Researchers consider it as a formal and impersonal information source. Mass media information sources have a volunteer character, and include reports and advertising on broadcast media.

Global exposure is of prime importance for tourism destinations. Till the mid-1990s destination promotions were entirely reliant on travel agencies to market its products. The web has enabled tourism destinations to market themselves through well designed and well promoted websites. Doing business on the web has helped avoid regulations and restrictions that companies must follow when physically doing business in other countries. For example in some countries, foreign travel companies are forbidden to operate. Finally, compared with the traditional media, the web allows unlimited access for hundreds of millions users to an unlimited amount of information.

Information search is a dynamic area of services research, with a relatively large conceptual and empirical basis. However, selection of information sources mostly explains “who, when, where, how and why” consumers search for information in the pre-purchase phase. Rare research indicates that the use of information sources influences future search behaviors.

To our knowledge, no research exists regarding the impact of information search patterns on future information search behaviors. Moreover, although a wide range of empirical studies have been developed concerning the impact of information sources on expectations, no empirical study has analyzed the impact of expectations fulfillment on the future use of information sources (Parasuraman & Zinkhan, 2002). Previous research indicates that expectations fulfillment is shaped through information sources that consumers obtain in the pre-purchase stage. Since future consumer choices are based on expectations, a better understanding of this relationship is vital to marketing managers. By understanding how consumers will search for information, we have a basis to influence consumers’ expectations. Information search in the pre-purchase stage strongly influences overall consumer decision, mainly because it influences consumers’ images and expectations .

Similarly, the process of expectations formation in the tourism industry is particularly relevant given that tourists make their purchase decisions while building on expectations. Tourists typically travel to a place different from their residence, and in several cases to a place where they have never been before. To explore or reduce the risk of unfamiliar product experimentation, tourists seek information and create destination expectations. Hence, since consumers perceive tourism products taking into consideration their service expectations, these expectations become a major influence on consumer choices.

Common sources of customized information are travel agents, institutional and commercial brochures, and the Internet (Murray, 1991). Marketers use these sources to build tourists’ specific expectations with the goal of influencing future purchase decisions. Non-customized information might also affect tourists’ product image. This information is typically not requested by consumers, but comes instead in the form of reports and advertising in mass media. It is our aim to develop a model that assesses the importance of non-media information sources, and their impact on expectations fulfillment and on the use of mass media information sources in future trip planning. In addition to mass media information sources, we include four non-media information sources: travel agents, institutional brochures, commercial brochures and the Internet. Tourists use these non-media information sources in information search to select the route to the destination, accommodation, and activities at the chosen destination.

Though the internet has been in existence for a while now, its popularity has sky rocketed in the recent years. There are two broad categories of internet services i.e. communication and information services. Of the two, communication services allow direct exchange of information between internet users. E-mail, e-mail-based discussion lists and net news are also included in the communication services. Information services, Telnet, Gopher and anonymous FTP (File Transfer Protocol), allow users to access data made available by other users.

This new interactive medium can be considered as a rational medium of difficult classification. The Internet is not easily classified as either impersonal or a mass media channel.

The World Wide Web (WWW) has completely overhauled the internet since 1993. WWW allow the user to access hosts through Telnet, read newsgroups and use e-mail. Internet browsers have now become a source of unlimited information for both leisure and commercial purposes. The web’s ability to blend text, pictures, sounds and video clips into multimedia documents, transformed the internet into an effective means of communication. The WWW has changed the appearance of the internet so much so, that for many it is now the same as the internet.

The vigorous growth of the internet has drawn a lot of attention from both academic researchers and business operators. People in the fields of Information Technology (IT) and marketing have swarmed the internet. Internet publications on tourism marketing have grown significantly in the last few years.

Some have provided a necessary background to some in-depth discussions of the various issues of marketing tourism on the internet. Some of these articles have highlighted the internet's impact on tourism distribution. However, this field of research is still in its infancy. Efforts must be made to understanding the internet's role in tourism marketing and as to how tourism organizations and destinations can exploit its full potential.

The Internet has transformed the well-known marketing communication model from one-to-many to one-on-one or from broadcasting to narrowcasting. The traditional print, radio and television, follow the passive one-to-many communication model. This way a company reaches many current and potential customers through repeated broadcasts of the same message.

This approach has three problems:

1. Generic message to every consumer,
2. Wasted exposures to uninterested audiences,
3. Competing and conflicting messages being sent to consumers.

The Internet gives the ability *to address each consumer* personally. Each time a user visits a web site its server has a record of the user's electronic address. This information will help, to send a personalised message to a smaller target audience or an individual consumer.

Though mail, telephone and personal selling have been in existence for many years, the internet however offers high-speed information transmission and retrieval at a low cost. The addressability of the web provides the ability to customize and tailor the product and/or the marketing effort to one consumer at a time.

The internet makes it possible to squeeze one-on-one marketing's well-known four Ps into one element - the relationship. It represents the ultimate expression of target marketing. Well-designed web sites, emails and news-groups, can be as effective as personal selling. Internet marketers can do the job of a sales-force with more flexibility, better memory and at a fraction of the cost. Another element of the net that makes it different from traditional communication media is its *ability to interact*. The internet enables feedback. Dialog forms an important element of relationship marketing, and is a vital factor in building customer loyalty. Customers are empowered to communicate with companies, research information and conduct transactions at the press of a few buttons. Companies too can easily contact customers to clarify their needs or inform them of new products.

Unlike in the conventional communication channels like newspapers or television, the customer is in greater control of choosing and processing information about the firm. The internet makes the exchange of information between consumers as well as between companies possible. Information exchanges between companies will provide competitive intelligence and will enhance alliances and co-operation. Information exchanges between the consumers establish virtual communities. Such virtual communities will have significant implications for market segmentation, customer service and understanding consumer behavior.

The web offers more *flexibility* than the conventional mass media. A website is like an electronic brochure where visitors can read information on products or services. A webpage is more flexible than a physical advertisement or catalogue. It can be updated with fresh and current information gathered through feedback from consumers. A virtual catalogue can be kept in sync with the requirements of the consumers and inform them about new products and price changes.

As an industry heavily reliant on brochures the web's flexibility and immediacy in information transmission is invaluable. The preparation and distribution of holiday brochures is a costly and lengthy process during which the demand conditions and competition situation could change greatly. In print media, any price and availability changes can only be notified through supplementary brochures. With the web this can be done instantly at little cost. A webpage can be linked to inventory data to show the availability of any holiday tours. A website can be indexed in many ways and be equipped with search facilities to locate items quickly.

The internet has an edge over any other media in its ability to *permanently expose information* to a global audience. The net vastly improves the information availability and user interaction. An effective web site keeps a company in business 24 hours a day, 365 days a year in a global market place. Anybody in any part of the world can access its marketing information at any time they desire. This ability will greatly reduce place and time utility woes. Accessibility is vital in international trade where business spans across different time zones.

The Web makes it possible for companies to *improve the service quality* at all levels of customer interaction i.e. pre-sale, during and post sale. The web provides four tangible improvements in customer service.

1. A wider choice for the consumers: A website can display an array of products and services
2. Quick processing of payments: Automatic processing of cyber-cash or credit card charges.
3. Faster delivery: Especially for products like online software and music distribution
4. Making available a wealth of information that can be quickly and easily accessed.

In tourism the web-based distribution systems can help satisfy the consumer needs of easy access to a wide choice of information and hassle free reservations. Increasingly tourist satisfaction depends on the timely availability of accurate and relevant information. Improved access to information on all aspects of tourist activities has made it possible for marketers to offer personalized services at the same prices as standard packages.

There are mainly five areas where *costs can be minimized* on the internet

1. Automation of the reservation processing and the payment system cuts down sales costs.
2. Implementing a menu-driven web-based travel reservation system as opposed to a command driven system where a sales clerk has to remember commands and airport codes.
3. Implementing direct links between the producer and the consumer, saving on huge distribution costs.
4. Saving on promotional costs due to the net's ability to send customized messages through electronic communication.
5. Reduced rental costs on office and sales space, and on administrative overheads.

Setting up a promotional web site without booking facilities, costs relatively less. An averagely skilled person with the use of a proper software package, such as Microsoft FrontPage can build a basic company web site in days (Fodness & Murray, 1999).

However a more comprehensive and powerful web-site offering in depth information such as virtual multimedia brochure including cataloguing products offerings and reservation and transaction facilities, will cost more and take longer to develop. Even though such a site will cost more to build, the cost is considerably less than tens of millions of dollars spent by airlines, tour operators and hotel chains on TV and magazine ads. By providing information on a website, customers feel empowered to find answers to their inquiries themselves, cutting costs on telephone charges on toll-free numbers.

Using the internet can help save on distribution costs. Promotion and distribution of tickets, is a big cost factor in the airline industry. Selling tickets on the internet can eliminate travel agent commission and GDS fees paid by the airlines. An internet based supply channel management can also save procurement costs for businesses.

Indeed, analysts have identified the Internet as the cause of a revolution in the services sector. Its potential allows service firms to enlarge their market worldwide, providing firms with an unprecedented ability to communicate directly and effectively with potential customers. This is due to, among other things, the cost-effectiveness of the Internet and the convenience for customers. Increasing digitalization will make it progressively easier to alter particular aspects of a service and quickly observe how customers respond.

In the tourism sector, the internet has become an important source of information to consumers who are more and more demanding, and who become each day more familiarized with this emerging world of information.

With the relatively widespread adoption of the Internet, tourism businesses of all sizes might expand and acquire new customers and create more sophisticated products to reach new customer segments. Tourists have become more independent and sophisticated in using a range of tools to arrange their travel. The key to the tourist's decision is the existence of relevant information. With the Internet such information might be available and more accessible.

Tourism search typically makes use of a variety of external information sources (Moutinho, 2000). These information sources form the basis for trip planning. When searching for tourist information, one must consider the variety of sources used. From both theoretical and practitioner perspectives, it is particularly useful to study the importance of specific information sources that tourists use for selecting services.

Customer satisfaction depends on the accuracy of specific information on destinations' accessibility, accommodations, facilities, attractions and activities. The Internet satisfies the needs of consumers for convenient access to transparent information. It allows them to compare information. They are able to cover the entire variety of choices of travel, accommodation, transportation and leisure services, holiday packages, prices and availability. This type of information will naturally help tourists to plan complex tourist activities, such as long trips.

Abstract: For the customer driven companies, clients' satisfaction represents a marketing objective and instrument, at the same time. Companies that wish to be successful – but also those which want to survive – need a new way of thinking: final success belongs to those which will put the customer in the centre of their activity, and will offer him a superior value.

Our paper is focusing on Customer Experience Management as a coordinated effort to accomplish specific goals by improving the quality and consistency of customer interactions – or touchpoints. Using this strategy, a service company can gain important advantages like: constantly positive customer experiences, achieving differentiation, increasing sales, customer retention and referrals.

Key words: customer experience, customer interactions, Customer Experience Management, customer centricity

In the service industries it's crucial to be better than your competitors – knowing what might lie ahead is the key to continuing success. It is obvious that a major goal of the service companies' management must refer to the continuous improvement of services quality according to the dynamic consumers' expectations and requirements. The service industry presents a particular challenge in regards to aligning service with the experience.

The modern customer is highly educated, and has greater and greater expectations, a product or service which today is considered having an acceptable quality, tomorrow it could be considered in a different manner. Nowadays markets contain a great variety of goods and services and therefore, the sellers must offer quality products and services, otherwise they risk to throw their customers into the competition's arms.

At the same time with the raise of customers' exigency and selectivity regarding their choice about products and services, companies become more and more concerned about keeping their clients, based on their long term loyalty. In this respect, companies are focusing their efforts to completely satisfy customers' expectations and exigencies, by permanent analysis and identification of customers' wishes and demands, by transforming these into products and services with a view to develop and perpetuate lasting and economically advantageous relationships with the customers.

Companies that wish to be successful – but also those which want to survive – need a new way of thinking: final success belongs to those which will *put the customer in the centre of their activity, and will offer him a superior value*. These companies will focus on *creating their own customer* – not only on creating products and services – and will prove their capacity of demand creators, not only of products and services creators.

Attracting customers does not represent the exclusive task of the marketing activity – the marketing department, respectively – which must co-operate with other departments to attract and keep the customers. Even the most performing marketing department in the whole world can not sell low quality products or services, or which do not correspond to customers needs. Marketing could be efficient only in those conditions where different departments and their employees make up an unite team, who's goal is to elaborate and implement a competitive system in order to satisfy the customer through the created value. It is becoming obvious that „coming nearer to the customer” represent a necessity not only for companies that follow the success, but also for those which do not want to be eliminated from the market.

Customer satisfaction and memorable customer experience

For the customer driven companies, clients' satisfaction represents a marketing objective and instrument, at the same time. As Peter Drucker remarked, three decades ago, the first objective for a company is to „create its own customer”. Customers will choose from the multitude of offers present on the market, the one that maximize the value in relation with the costs involved in searching the products, and with the limited mobility, knowledge and income they possess. As a consequence, customers will appreciate if the offer will reach the expected value level, which will influence the satisfaction and the probability to buy in the future.

Even if a customer driven company intends to offer a high value of satisfaction, it should not be forgotten that the first objective is not to maximize the consumers' satisfaction. Therefore, the company should focus, in the first place, on increasing customers' satisfaction by improving the offer's and supplementary services' quality, by decreasing the prices, by investments in research and development, by increasing the production capacity, and so on, but, at the same time, it should protect the interests of different categories of persons – employees, suppliers, distributors, shareholders. As a consequence, it is recommended that the company should focus on offering a high level of satisfaction to the consumers, and at the same time, it has to ensure an acceptable level of satisfaction to the other persons involved in the company's activity.

The companies have to understand that the customer should be placed in the centre of all specific marketing operations. The brand message should reflect the focus on the customer. The products' and services' quality should be placed in the core of the organizations' commercial strategy. The offered products and services must represent exactly the solutions that customers expect. The touchpoints (or contact points) with the customers must be well mastered in order to convince them to accept the proposed solutions. Companies must be capable to look beyond customer's behaviour or product and service acquisition.

Profit and growth come only after deeply understanding the customers, by listening to their needs and by offering what they are asking for. This is something that can be easily lost or even impossible to gain, if this is the single method used by the marketing team. For the marketing people in all the domains, it represents an important responsibility to share this desire to listen, to develop and to deliver at every level inside the organization.

It is well known that the strategies built on consumers' feedback have more chances of success than the ones based on managerial intuition. It's a real challenge to any marketer to find out why the customer chooses a service or another. Because there is always a certain dynamic of the selection, depending on the analyzed market structure, on company's positioning on the market (image, marketing communications) and on product and service development. Taking into consideration a series of factors (such as: needs, brand image, price, and product or service availability, experiences) in a comprehensive evaluation process, consumer will decide to request a specific product or service.

Although modern marketing focuses on strategies (mixes) that give impulse to sales and to attracting new customers, the company's most effective defence weapon is represented by customer retention. And the most effective approach to achieve this objective consists in offering high satisfaction to the customer, and this will lead to an improved customer loyalty.

Today, many companies acknowledge the importance of customers retention. According to a recent study, by decreasing the loss of customers with only 5%, companies can improve their profit with 25 – 85%. Unfortunately, many companies do not appreciate the real value of customer loyalty.

In this context, it is worth to mention the opinion with two prestigious authors who consider that customer relationship management represents the most important dimension of the company's strategy. In this respect, *Robert S. Kaplan and David P. Norton have analyzed the four essential processes in customer management: client selection, acquisition, retention and growth.* This is because the relation has to maintain on the long term the contact with the customers, due to a proactive approach which strategically integrates the four processes – considering every process individually – maximizing in this way the client's value, and the value creation, in general. Many companies make the mistake of considering sale as just a transaction and this is causing lose of contact with customers, without knowing exactly if these still are firm's clients.

If the consumer is satisfied with the provided service in relation with his expectations, he will become loyal to the service provider, who applied, in this case, adequate marketing strategies (improving service quality;

improving service differentiation confronted to competition services/offer, distribution, and image differentiation; increase service productivity; motivate the personnel to better serve the clients etc).

Customer satisfaction is the key to customer retention. Fully satisfied customers are more likely to become loyal customers, even advocates for the firm and its products and services. Although firms put enormous amounts of money and effort into loyalty initiatives, they often are not successful in building true customer loyalty. The main ways in which firms can manage customer satisfaction and reach customer loyalty refer to: understand what can go wrong; focus on controllable issues; manage customer's expectations; offer satisfaction guarantees; make it easy for the customers to complain; create relationship programs; make customer satisfaction measurement an ongoing priority.

We consider that the two most important things for delivering the best customer experience are: a great product, that emotionally connects with the customers and fulfils a basic need or desire; and a deep understanding of the customer, an understanding that allows the firm to anticipate what they need better and sooner than they know themselves.

Customer relationships management

Customer relationship management can be defined as a business philosophy aimed at creating and increasing customer value in ways that motivate customers to remain loyal to the firm. It is about retaining the right customers.

Considering CRM as the ability to build and maintain relationships with customers, suppliers, and partners based on trust, commitment, cooperation and interdependence, it involves the creation of relationship capital. This effort refers to finding ways to integrate all these relationships toward the ultimate scope of customer satisfaction. Customer relationship management is a customer-centric business strategy with the goal of maximizing profitability, revenue, and customer satisfaction.

CRM requires that firm looks beyond current transactions to examine the long-term potential of a customer, being based on creating mutually beneficial relationships where each party provides value to the other party.

CRM is an information industry term for methodologies, software, and usually Internet capabilities that help an enterprise manage customer relationships in an organized way. For example, an enterprise might build a database about its customers that described relationships in sufficient detail so that management, salespeople, people providing service, and perhaps the customer directly could access information, match customer needs with product plans and offerings, remind customers of service requirements, know what other products a customer had purchased, and so forth.

Improving customer-centricity through understanding customer interactions

Companies are now talking about customer centricity rather than CRM and are receptive to the idea of creating alignment across the business to ensure consistency in the customer experience, which means developing all the non-IT capabilities as well as the obvious CRM ones.

What customer-centricity means is how the whole organization behaves towards customers, not just the touch points, the decision points, but how the whole business is organized and optimized around the needs of the customer.

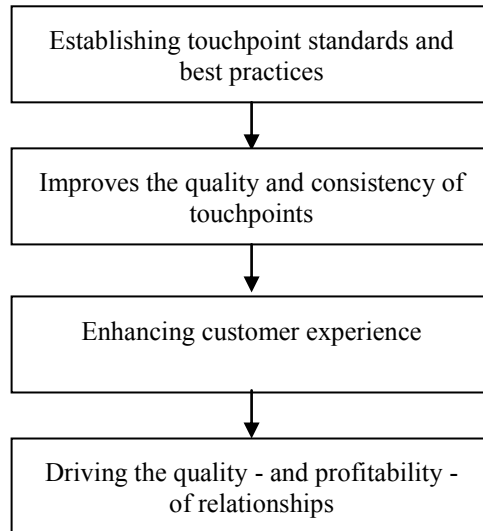

A customer centric approach should be incorporated into the overall CRM plan and vision that a company has. Customer-centricity should go hand-in-hand with a product focus by promoting the product by all means but be show genuine care for the customer's sensibilities and feelings.

What could be more important than improving sales and customer relationships? Today, there is a fast-growing movement among organizations interested in improving their customer-centricity through a better understanding of customer interactions, or touchpoints. Called "Customer Touchpoint Management" (CTM), the goal of this new movement is to improve customer experiences, and as a result, improve customer relationships. By improving customer relationships, service organizations improve market share, sales, and both customer and employee loyalty and advocacy.

A touchpoint is all of the communication, human and physical interactions that customers experience during their relationship lifecycle with the service organization. Touchpoints are important because customers form perceptions of the organization and brand based on their cumulative experiences. CTM-

oriented organizations know that they can best enhance relationships with customers by improving touchpoints across the entire enterprise

The key to delivering outstanding customer experiences is improving the quality and consistency of touchpoints: quality in terms of meeting needs, and consistency in delivery and image. And the key to improving the quality and consistency of touchpoints is establishing touchpoint standards and best practices.

Customer Experience Management Process

Setting standards establishes performance expectations. Employees need to understand what the standards are in order to perform consistently. Without standards, the quality of touchpoints is left to the individual employee. In other words, without established standards, the quality of a customer experience can be in the hands of the worst firm's employee.

Taking into consideration these ideas, we can define Customer Experience Management as a coordinated effort to accomplish specific goals by improving the quality and consistency of customer interactions – or touchpoints. Using this strategy, a service company can gain important advantages like: constantly positive customer experiences, achieving differentiation, increasing sales, customer retention and referrals.

A customer experience is not just one piece of theatre or a momentary delight. While those are great, and a step in the right direction, real positive customer experience comes from companies who show they care about the customer. Companies that have a memory (so customers don't have to tell their story repeatedly) and really provide ongoing value to a customer understand that customers are truly the most valuable entity of any business. Those companies treat their customers as not only their only source of revenue, but as a scarce, valuable resource. When companies work this way we are much more likely to see really terrific customer experiences.

Abstract: Cooling drinks are an important piece of our everyday life. The most important segment of the cooling drinks market is that of the aerated products as cola. These non-alcoholic drinks are frequently associated to free spirit and rebellious lifestyle of our days young. The fight for the young Romanian market is hard, even though the main actors-Coca Cola, HBC Romania and Pepsi Co and their followers promote some products alike.

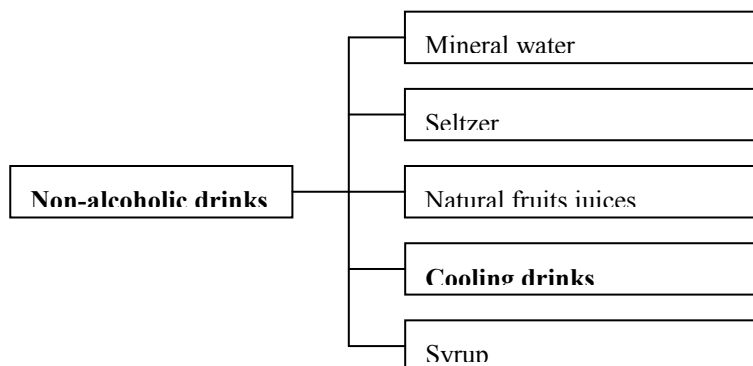

Naturally, on this market segment appeared and developed specific promoting techniques. This work proposes to analyze these penetration strategies and the consolidation of the cooling drinks producers presence on local market of Suceava, trying partially to quantize the efficiency of the promoting activities. The correct appreciation of the efficiency of those techniques, as well as general ones is very important, because only by a well association the wanted impact might be achieved.

Keywords: cooling drink, promoting strategies, promotings, young consumers.

Romanian Cooling Drinks Market

Cooling drinks market has known a major development during last years, with an intensification starting 2006, when the unprecedented explosion of retail on the Romanian market was seen. The visit frequency of the consumption stores was intensified on the base of some smaller market baskets on each visit, as an effect of a light power of buying growth along the population. This way, reported to the total expense of Romanians starting 2006, constantly, the alcoholic and non-alcoholic drinks weight, has outrun the food products. The drinks expenses represented in 2007, almost half of the daily Romanian's market basket.

Conceptual delimits of big prospective firms, underline the fact that cooling drinks have an important part of non-alcoholic drinks market. From the sums assigned to drinks, 60% go to non-alcoholic and 40% to alcoholic ones, the first places in top being taken by beer and acidulated juices.

Non-alcoholic drinks classification

According to the dates given by the market researching company, ACNielsen, the sales trend of cooling drinks is ascending. If during 2005, 94462.2 thousands litres (349209.9 thousand lei), in 2006, the volumes have ascended up to 98527.9 thousands litres (399909.2 thousand lei), for 2007 it is estimated that about 100000 thousands litres of over 460000 thousand lei have been commercialized.

Carbonated cooling drinks represent the most developed segment of soft drinks market, with 45% in all volume, being followed by mineral water, with approximately 42% of the market and not carbonated cooling drinks. Coca Cola HBS Romania, Pepsi Co and European Drinks accumulate on this segment a value rate of 95.7%, in growth comparing it to 2005 with 9.5%. The other competitors, Romaqua, Parmalat – Santal or the bottling firm Tuborg – Orangina and Granini have an insignificant rate of market for now, but in slow growth.

<i>Top 5 brands 2006 (vol)</i>	<i>Top 5 brands 2006 (val)</i>
Coca Cola	Coca Cola
Pepsi Cola	Pepsi Cola
Fanta	Fanta
Frutti Fresh	Sprite
Adria	Kinley
<i>69.80% of the market</i>	<i>79.90% of the market</i>
Tabel 1: Carbonated Cooling Drinks	

The most powerful brands of profile on Romanian market are Coca Cola and Pepsi Cola both from volume point of view as well as of the quantity which was sold (*table 1*), a situation that can be compared to the one on the international plan.

Analyzing the numbers of consumers of the cooling market it was seen that in 2004 level there were 17 millions potential consumers from which only 15 millions have actually bought the products. About the cooling drinks consume per head of the population, the carbonated occupy the first place, with 49.6 litres non carbonated registered 11.6 litres. The cooling drinks producing and importing companies are constantly attentive to the market tendencies and to the evolution of the consumer’s preferences.

Coca Cola Versus Pepsi Cola on Suceava Market

Acidulated cooling drinks as cola represent an important segment of the market, because of the fact that the sums that were allocated for the products promotion are consistent and the popularity of them, especially on the young lines attract an important attention given to the promoting companies and supervising the competition. The cooling market is marked by the impetuous offensive of the multinational Coca Cola and Pepsi, Fanta Mirinda or Sprite – 7Up.

The emerging Romanian market and the activation of the oligopoly effect have determined an extreme aggressive strategy approach, but in the same time orientated to innovation. On this market segment, some

promoting techniques have been perfected, meticulously elaborated, focalized on the youth segment. We refer here to populist actions meant to increase the sales volume and to fidelity the clients, techniques like promotions: “2.5 litres at a price of 2 litres”, “3 caps = 1 promoting glass”, “three or more caps with different inscriptions you get a plush toy” etc.

For testing the efficiency of this three particular techniques of cooling drinks, but also the relevance of the classic forms of promoting: that is, publicity through mass – media (TV and radio) or the wrapping up, we have made a statistic study on a sample made up of 100 young from Suceava, a research that had as a purpose the emphasize of visual and sound impact of the aggressive promotions and of the advertisements along pupils and students. This segment was preferred because the youth are the most interested ones in the image that they made themselves though consume, but the most important, are very easy to influence by the promoting strategies of the important firms.

Over 70% of the questioned persons said that, in general, prefer to serve refreshing cooling drinks like Cola, while 29.55% have declared against such drinks.

The overwhelming majority of the ones that refuse to drink acidulated drinks like Cola, consider them not healthy (92.3%) and only 7.7% have ascribe this to the fact that they are potentially novice. Also, feminine persons seem to be more preoccupied with their own health, and implicit more attentive to the products that they consume, that the masculine ones, more receptive to what it is consumed inside their circle. As an alternative, the auxiliary products of the most famous brands (Coca Cola and Pepsi), mineral water or soda and Parmalat products (Santal) are preferred.

The Acidulated Refreshing Drinks Like Cola Non Consumers Preferences

Along the ones that consume acidulated drinks like Cola, 63% prefer Coca Cola and 37% prefer Pepsi Cola. It is interesting that none of respondents is attracted by the European Drinks products, Adria Cola and American Cola respectively. The motivation of the restriction manifested toward these two drinks is not enough radically founded. Affirmations like: “they are cheap and that could ruin my image”, “they are for the rural environment”, “at such a low price the quality must be doubtful”, explain partially the detachment from the native products European Drinks and the orientation towards an international very well known brand. Even though it manifests a particular preference, Coca Cola or Pepsi Cola, the majority of the ones questioned consume both products, for example, only 9% of the Coca Cola fans are faithful.

The demand for acidulated cooling drinks like Cola is seasonal, 48.38% of the subjects consuming small quantities that rarely pass over two litres/ week. But, 45.16% of the respondents consume such acidulated drinks with a higher frequency, precisely because they are stimulating and revitalizing, and, as a social effect, it influences their image and personal status.

The main reason that determines the acidulated cooling drinks amateurs to choose one of the two drinks is the taste. This way, it is also full accepted that Pepsi Cola has a sweeter taste than Coca Cola. About 13.04% of the subjects choose for Pepsi Cola when counting the price, comparatively to 2.56% the ones that choose Coca Cola under the same pretext. One can conclude that the price strategy of the ones at Pepsi Cola offer a better quantity – quality relation.

The wrapping out of Coca Cola brand attracts in a bigger way the cooling drinks consume, but, even the shape of the rivals from Pepsi, does not enchant the view, still, in youth's memory, the blue wrap out drink, is associated to footballs players or big international music stars printed on the bottle's paper. Most of the times the manoeuvrability and the shape, are considered to be distinct characteristics for the red wrapping out of Cola products.

The "2.5 litres at 2 litres price" promotions gain more and more appreciation, this being one of the defining criteria when the buying decision is taken. Over 64% of the Coca Cola consumers choose for a big contain of the bottle, in this case the special design displays have a really important role. The Pepsi offer, "buy two litres and get 2.5 litres", is considered to be more attractive and tempting for 73.91% of the consumers of this product.

Attractive are also the promotions like "3 caps=one promoting glass" initiated by the ones at Coca Cola, but the action is not equally appreciated as the offer that supposes 0.5 litres for free. Even though at least for now, Coca Cola does not implicate in such faithful actions of the clients, 56.52% of the ones questioned do not know about this thing, declaring them satisfied by the Pepsi offer.

Advertising actions in which the producers offer to faithful customers some promoting products (plush bears, T-shirts, bags, balls, etc), have as purpose the devotement of the clients, but also try to attract new clients. Such actions aim especially to young ladies much more receptive to this kind of offers. Also to this chapter, Coca Cola is better positioned in its "fight" with its rival Pepsi. But it must be said that, often, the quality of the offered products as a prize, is not that good and the main effect is not the one wanted.

This study also suggests that the promoting strategies need to be re-thought because some of the companies of this type are out-of-date and risk having a boomerang effect.

About classic advertising, realized through TV, the opinions are quite divergent. Coca Cola is promoted in a more inspired way on TV for 81.04% of this cooling drink supporters, while 65.21% of the Pepsi Cola supporters consider the advertisements dominated by the blue colour, attractive and very attractive. The slight deformation of reality, dues to the multiple brand Coca Cola (Cola, Sprite and Fanta), being more powerful reported to Pepsi (Pepsi, Pepsi Twist 7Up). Particularly, very appreciated are the advertisements "Football Planet" – Pepsi or the Cola Zer0 afferent advertising. Even though some advertisements are controversial they have a special effect on young generation. The most eloquent example is the "Big Bang Song", advertisement. Such advertisements captivate many young, influencing and manipulating them towards the promoted products.

The study underlines a surprising situation. Even though the great majority of cooling drinks consumers like Cola considers these drinks harmful, they still continue to consume them. Parents are the first ones that should take action about limiting the Cola consumption, the fact that it creates dependence and favorsises the diabetes apparition at children, being known.

Realizing a very short portrait of the cooling drinks consumer, it is represented equally by women (51.61%) and men (48.39%) with ages between 15 and 35, adept of a sedentary life with a diet filled with carbohydrates (like fries from McDonald's), living in the urban area and possible a smoker.

Comparison Between the Promoting Methods

To compare the effects of the four methods of promotion we have given the points for each type of answer starting from the questionnaire's items as follows:

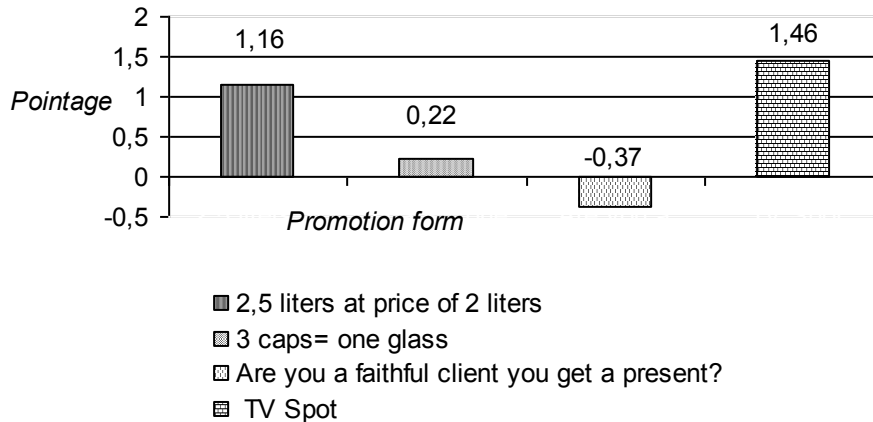

Very attractive	Attractive	Acceptable	With no importance	I don't know/I don't answer
+2	+1	-1	-2	0

The questionnaire's items responses

In the second phase we multiplied the percent obtained by the two actors: Coca Cola and respectively Pepsi Cola, after the centralization of the questionnaires with the points from the table (+2; +1; -1; -2 and 0). The third phase consists in applying the formula in all the four cases:

$$C = \frac{\text{Coefficient Coca - Cola}}{100} + \frac{\text{Coefficient Pepsi - Cola}}{100}$$

After making the calculations needed, the following results were obtained:

The attractivity coefficients

One can observe that the methods 1 and 4 are the most efficient ones in attracting and devotement of the clients. The visual impact that the advertisement has (1.46), is fructified at maximum by the two companies that produce cooling drinks, but this promoting ways need to be doubled with most diversified promotions among which, according to our diagram, offers like “buy 2.5 litres and pay only 2 litres” (1.16) needs to be found again. The young from Suceava are more and more not interested by the prizes offered by Coca Cola and Pepsi Cola, probably because these are most of the times symbolic.

Conclusions

Aside the economical rivalry, the two big companies have decided, in the last 30 years, two new fronts – the aggressive marketing and the one of exclusivity distribution. About the exclusivity areas, extremely well known, including the last Romanian decade, these left their place, step-by-step, to a new kind of delimitation, based on the marketing orientation of the two companies. Promotions are now the main factors of attracting and devoting the clients.

Even though some studies associate the acidulated cooling drinks consumption with the growth of some different forms of cancer, obesity and diabetes, big acidulated cooling drinks producers minimize the long term effects of their own products, but what is worst, do not care much about the consumer’s health. Only commercial and supremacy interests count on this small emerging market.

SUMMARY OF DOCTORAL PAPER “THE IMPACT OF ECOLOGICAL MARKETING ON THE ROMANIAN ENTERPRISES”

Rosca Mihai Ioan

Bucharest University of Economics, Marketing Faculty, str. Mihai Eminescu, no. 13-15, sect 1, Bucharest, miroasca@ase.ro, 021.319.19.00

Cătoiu Iacob

Bucharest University of Economics, Marketing Faculty, str. Mihai Eminescu, no. 13-15, sect 1, Bucharest, facultatea.marketing@ase.ro, 021.319.19.00

Resume: This article is a summary of doctoral paper “The impact of ecological marketing on the Romanian Enterprises” sustains in November 2006 by Mihai Rosca and coordinated by prof. Iacob Catoiu at the Bucharest University of Economics.

Key words: green marketing, eco-marketing, environmental marketing, ecological behavior.,

The work is structured in 3 well defined parts. While the first part analyses the knowledge state in the field, the second part tries to be an analysis of the marketing medium and the third is dedicated to a series of research studies unique to date in Romania.

The part dedicated to the knowledge state in the field opens with a review of the scientific ideas about ecologic marketing. First chapter starts from the appearance of the concept of ecologic marketing, passing by its various definitions and senses used by various authors and ends with the role and place of ecologic marketing in science.

The second chapter is dedicated to the ecologic marketing peculiarities; a chapter talks about the ecological products market and another one about consumers. On this market there is a paradox: people with big revenues try to become ecologists, while the ones with small revenues, due to the lack of money, use cleaner, environment-friendlier methods to satisfy their needs, being in this way better ecologists than the ones who want to be ecologists.

It is serious, however, that everyone wants an improvement in their life level, following the example of the most developed state, USA. The problem is that we would need a few more planets if every Earth inhabitant would adopt the American life model. From this perspective I tried to analyze what is an ecologic consumer and I offered a set of market segmentations based on this criterion from the international scientific literature. This subchapter supported an absolute novelty in Romania, the author's segmentation of ecologist clients presented in chapter eight of this work.

As we cannot talk about ecologic marketing without an ecologic policy of marketing/marketing mix, I had studied and developed ecological policies inside each element of the traditional marketing mix from the third chapter. The products which are more ecologic from a customer point of view are not necessarily more ecologic. The concept of ecologic product starts from the idea of a total product, followed during its whole life, from the project phase to the phase of its reintegration in environment at the end of the life cycle. The price of ecologic products hides many aspects developed in this chapter, from ecologic costs to strategies of ecologic price. In the subchapter about promotion I followed the influence of communication of ecologic character messages, a whole section being dedicated to the correct communication. In the subchapter about distribution, I proposed a new logistic chain, in which to be also covered the gestion of goods after use. I gave a strong importance to the inverse distribution as an anti-pollutant activity, while a different section is dedicated to the strategies of ecologic distribution, with an accent on the strategies of prevention of pollutants and on the strategies of recourse recovery.

The second part of the doctoral paper is dedicated to the marketing medium. I wanted this part to be a helping instrument for the ones interested in introducing an ecologic marketing policy in their company. As the implementation of ecologic marketing in a company cannot be realized without the implication of its leading factors, in the first chapter of this part I analyzed aspects connected with the internal company aspects, such as management problems. I analyzed the management of ecologic marketing, with all that its

implementation in a company means. Here we pointed to the means of economic management, as well as to numerous strategies of ecologic marketing, that can be used in a company. The chapter tries to unify theory and practice, mentioning on one hand theoretical aspects and on the other hand numerous examples of companies that used various ecologic principles.

The fifth chapter is dedicated to the macro-environment factors. The elements of macro-environment have a large influence in the implementation of ecologic marketing: the continuous degradation of the environment is the main reason inspiring the writing of this dissertation. The impact of people on the environment is provoking maybe one of the the largest unbalances in nature. If for each natural substance there is some living factor that can transform it, people are the only ones who managed to introduce in nature materials that cannot be decomposed and keep accumulating.

Another problem treated by me was the political implication of various nations in treaties to limit the pollution, as well as a presentation of the most important treaties in which Romania participates.

The last subchapter was not planned when I had started to work on this dissertation. It was not planned for two reasons: first, because the year of intergration of Romania in European Union was not a certitude in that moment. The second reason was discovered during my research in Romanian companies. The starting hypothesis of my research was that, due to economic development, the Romanian companies will be more and more responsible for their hosting society and they will integrate environmental protection policies in their activities. I was sincerely surprised by the unmodified lack of interest and I realized that most changes regarding environment are made not due to an internal pressure from the company, not even due to civil society or consumer pressure, but due to external pressures, especially the ones coming from the European Union as conditions of integration of Romania. This is why I consider that the mimum ecologic direction appeared in the Romanian economic medium is not started by companies or clients (as the theory of ecologic marketing says) but it is due to european integration.

In the sixth chapter I analyzed the elements of micro-environment and their role in ecologic marketing implementation. The role of civil society, so important in other countries for a „green” transformation, is in Romania quite unimportant. But a surprising case appeared; while I was ready to jump to somber conclusions on the lack of citizen impication in social problems: the Roşia Montana case, the first battle between the ecologist organizations and a large company. The restart of economic growth in Romania brought with it new investitions. The new mining investition, with plans to exploit whole mountains using cyanides flamed the unrest of some ecologist organizations. The fight between the non-governmental organizations and the mining company was an extremely new thing for Romania, and I am very happy to have had the opportunity to analyze it. Truly interesting is the fact that both camps used a full arsenal of communication tehniques to touch their objectives. This fight is presented in the last subchapter of chapter six.

The third part of the dissertation is completely dedicated to direct research. I consider this research to be an absolute novelty for Romania because in my search for secondary data I found no published study on a similar subject. The two chapters of the last part are divided after two big studies of the dissertation. In the first is the longitudinal research in the Romanian companies from years 2002, 2004 and 2006, while the second comprises the 2006 study on the Romanian consumers.

The study regarding the impact of ecologic marketing on Romanian companies was interested in obtaining general information on the way in which companies had integrated ecologic marketing concepts at the level of upper management of the organization. This study, designed as a longitudinal search, is not a complete study but rather a research interested in the general traits. In fact, started as a longitudinal research, it was transformed based on the better understanding of Romanian business environment and of the way this problem is perceived. Thought in 2001, this research wanted to see the transormations in Romanian companies during my Ph.D. studies. To this end, data collection were organized in the years 2002, 2004 and 2006. Of course, in the 3 data collection campains, the research morphed under the light on previously collected information, some research areas being stressed, while other areas had been abandoned. Because the studies were thought as omnibus-type studies, the quantity of data being somehow limited, in 2006 I realized two personal studies inside the business environment. Moreover, due to the data collected at the level of years 2002 and 2004 and of the conclusions based on those, presented also in the oral exam phase of my Ph.D., I decided to start a study of the consumers.

This last research, initially unplanned, appeared due to the surprising conclusions from the first research. Although my hypothesis was that the companies will be more and more ecologist, this did not proved true

during the three studied year. Trying to find answers to the initial question of this dissertation, I studied consumers' interest in ecologic ideas. The primary reason for the start of ecologic marketing in companies is the appearance of consumer needs that have to be satisfied in ecologic ways. As long as the market will not require ecologic behavior and products, the business environment will not offer them. A list of my studies related to this dissertation, together with their year of data collection, follows:

1. Organizational behaviour regarding ecologic products and activities (2002)
2. Organizational behaviour regarding ecologic products and activities (2004)
3. Organizational behaviour regarding ecologic products and activities (2006)
4. Social responsibility of businesses (2006)
5. Ecologic behavior of consumers (2006)

The aim of this paper is to present the specific of the decision process in choosing tourism destination and the role of the loyalty programs existence as a factor that influence the choosing tourism destination. It also includes a case study based on an internet research that refers to the existence of the loyalty programs offered by some chain hotels in Romania.

Keywords: decisions process, tourism destination, loyalty programs, hotels

Decision of choosing tourism destination

The process of choosing a tourism destination is a very complex one, not at all easy and it suppose the following main general steps in taking the buying decision, as represented in the Figure 1.

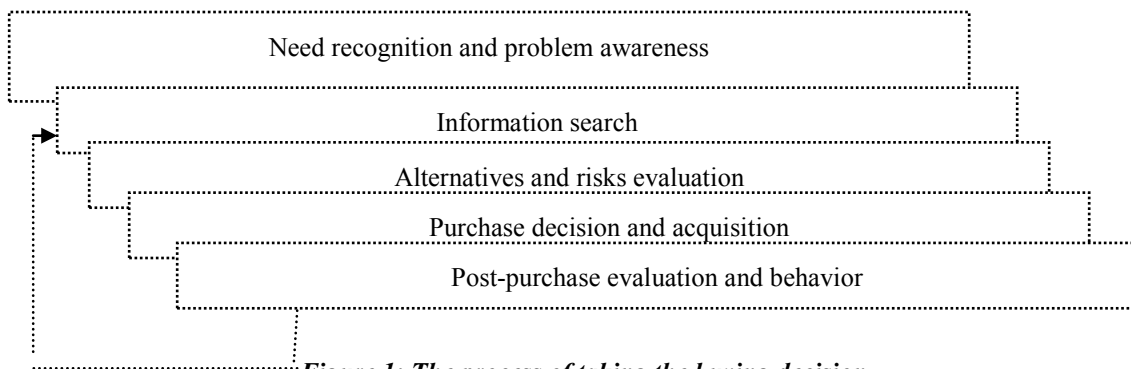

Figure 1: The process of taking the buying decision

Mostly, choosing the tourist destination includes a certain degree of risk from the customer. The choosing of the tourism destination is the kind of decision that implies a medium to big risk because the potential tourist can not try the services before buying it. The previous experience can help the customer in taking the decision and choosing the destination, but there is not guarantee because even if it was satisfied in the past, this does not guarantee that things will be the same in the present time. Because of the risks involved, the decision process of choosing destination suppose a long time. In most Western European countries, tourists start the process of planning the summer holiday most of the times from the beginning of the year or even from the previous year.

The analysis of the buying decision is based on the existence of a need determined by the difference made according to the Maslow's hierarchy of needs. From this point of view, the tourism need may be included in the category of basic needs, more exactly it is integrated in the category of bio-physiological needs of rest and health improvement. For any person, the first point in the process of taking the decision to have a

holiday, is represented by the recognition of the own needs and wants, which both generate the individual motivation. While needs have mostly an intrinsic character, reflecting a lack, a physical or psychological discomfort (the need to rest for instance), the wants have an extrinsic character, being finally the real, concrete and external way to show the needs. The wants depend on the cultural values of the person (the group and the society it belongs to) and on the concrete circumstances in which they manifest. The motivation is the reason behind a specific behavior. The motivation to behave in a certain way may have reasons such as basic needs, an object, goal, state of being or ideal, or it could be based on morality. According to Geen (1995), motivation refers to the initiation, direction, intensity and persistence of human behavior.

Another point of view in approaching the tourism destination choosing is another much known motivational theory, Herzberg's Two Factor Theory. Like Maslow's Hierarchy of Needs, Herzberg's Two Factor Theory is a need-based motivation theory. Two Factor Theory (also known as Herzberg's Motivation-Hygiene Theory) was developed by Frederick Herzberg who separated the motivational factors in two categories: factors that lead to satisfaction and others factors that do not affect satisfaction or the level of it, but if not present, could lead to dissatisfaction.

Regarding tourism, if in a hotel, a category of services is missing (for instance the quality of room cleaning), this could be a dissatisfaction factor for many clients, but on the other hand, if that services category exists in the hotel, its simple existence is not enough to guarantee clients' satisfaction. According to this theory, to assure tourists' satisfaction, a tourism operator must do two things:

- Firstly to be sure that all possible dissatisfaction factors were eliminated, and
- Secondly, to create the satisfaction factors because these satisfaction factors represent the main reason for which the customers choose one or another product or service in tourism.

Influence factors in choosing tourism destination

Next to the general factors that influence the behavior of the customers in tourism services, and which can be delimited in 4 categories: personal factors, social factors, situational factors, economical and marketing factors (see table 1), in choosing the tourist destination a big influence belongs to the previous destination choice.

Tourist personal factors	Socio-cultural factors	Situational factors	Economical and marketing factors
Needs	Family	Age	Income
Motivations	Referential groups	Health	Interest rates
Sensations	Social status	Mood	Inflation
Perception	Social Role	Time allowances	Prices
Attitudes	Culture	Family cycle	Products
Personality	Education		Commercial communication
Self image	Religion		
Life values	Leaders		

Table 1: General factors that influence the tourism destination choosing

According to a study made by Charlotte M. Echtner and J. R. Brent Ritchie, titled „The Meaning and Measurement of Destination Image” and published in The Journal of Tourism Studies Vol. 14, No. 1, May '03, the main attributes used by consumers in choosing specific touristy destination are:

Mostly FUNCTIONAL (physical, measurable)	Mostly PSYCHOLOGICAL (abstract)
Scenery/Natural Attractions Costs/Price Levels Climate Tourist Sites/Activities Nightlife and Entertainment Sports Facilities/Activities National Parks/Wilderness Activities Local Infrastructure/Transportation Architecture/Buildings Historic Sites/Museums Beaches Shopping Facilities Accommodation Facilities Cities Fairs, Exhibits, Festivals Facilities for Information and Tours Crowdedness Cleanliness Personal Safety Economic Development/Affluence Accessibility Degree of Urbanization Extent of Commercialization Political Stability	Hospitality/Friendliness/Receptiveness Different Customs/Culture Different Cuisine/Food and Drink Restful/Relaxing Atmosphere (Familiar versus Exotic) Opportunity for Adventure Opportunity to Increase Knowledge Family or Adult Oriented Quality of Service Fame/Reputation

Table 2: Attributes used by consumers in choosing specific touristy destination

Aspects related to loyalty in tourism – Case study on loyalty programs in hotels chains in Romania

Customer loyalty refers to that specific behavior of repeat customers, and also those that offer good opinions, reviews or testimonials. Loyal customers are also those who do a great service to a company by offering favorable word of mouth publicity regarding products by telling friends and family or other members in the group they belong. Customer loyalty includes more than this; it is a process, a program, or a group of programs in order to keep a client happy so he or she will provide more business.

Customer loyalty can be reached in some cases by providing a quality product with a firm guarantee, also through free offers, coupons, low interest rates on financing, high value trade-ins, extended warranties, discounts, rewards, incentive programs, and other specific promotion tools. The final main goal of customer loyalty programs is to create happy customers who will return to purchase again and persuade other people to use that company's products or services.

Customer loyalty may be a one-time program or repetitive, or an ongoing group of programs to tempt consumers to buy more. Programs like “buy one – get one free” or purchases that come with discounts or free gifts are very popular, but they are not very often used in tourism. Another good method for reaching customer loyalty is offering a risk free trial period for a product or service. Also known as *brand name loyalty*, these types of methods are meant to ensure that customers will return not only to buy the same product again and again, but also to try other products or services offered by the same company.

In the tourism field, providing excellent customer service is one of the most important elements in gaining customer loyalty. If a client has a problem, the tourism operator should do all is necessary to assure that the customer will be finally satisfied. If a touristy product is improperly, the customer's money should be refunded. This should be standard procedure for any reputable business.

Customer fidelity is treated distinctly in the case of goods-products where there is customer loyalty toward company, brand and product and on the other hand in the case of tourism services where there is customer loyalty toward country, hotels chain and destination.

The most used customer loyalty programs include the following types:

1. Rewards - award points for purchases. Points can be exchanged for rewards, unrelated to the brand. This kind of program can be useful for instance in restaurants and services companies that have a limited product line and don't have unlimited options of products and services.
2. Rebate - When you have a wide selection of products, this reward program can be used to motivate new incremental purchases. Clubs and casinos use this method where members and cardholders have a swipe card, and can accumulate points from their gambling expenditure and apply them to food and beverage purchases.
3. Appreciation - The goal is to increase guest lifetime value, not to acquire new customers. It can also be used as a device to get good customer to sample more of company's other products and services. Airlines companies, hotels, phone companies use this to accumulate points for additional services within their own brand.
4. Partnership - Rewards a customer's accumulated purchases with a partner's products or services. For instance, airlines companies use this frequently when they give points for renting cars and sleeping in hotels.
5. Affinity - An affinity program offers special communications, value added benefits and bonuses and recognition as a valued guest. In tourism, this program offer access opportunity to special rooms for members who have reached a special level of spending or are regarded as VIP customers

The next table presents a study referring the existence of loyalty programs as they presented on Romanian websites of the specific hotel.

Hotel Chains in Romania	Types of Loyalty Programs				
	Rewards	Rebate	Appreciation	Partnership	Affinity
Continental Hotels **** www.continentalhotels.ro		yes	yes	Yes	yes
Best Western **** www.bestwesternhotels.ro	yes	yes	yes	yes	yes
Golden Tulip **** www.goldentulipbucharest.com				yes	
Ana Hotels ***/**** www.anahotels.ro	Not found on the website				
Hilton *****	Specific website not found				
Marriott ***** www.jwmarriottromania.com	Not specific on Romanian website				

Table 3: Types of loyalty programs used by hotel chains in Romania

Even if the study was based only on Internet research, we may conclude that the hotels chains do not give a big importance to develop loyalty programs offered for their hotels in Romania.

Abstract: Creating a brand and protecting it are two key functions of a marketing programme. Public relations create the brand, using a series of on-line communication, elaboration and transmission tools. Through these tools, public relations must be creative, permanently original, new and different, with a creativity value at the highest level. It is necessary that public relations lead and show the way to a marketing programme through which the company's ascent will establish the brand's strategic guidelines. According to the specialists' estimates, marketing has entered the public relations age, and the large brands are built with the help of public relations.

Key words: public relation, marketing, management, efficiency.

1. Introduction

Public relations are, according to Prof. Rex. F. Harlow, a distinctive managerial function that helps in establishing and maintaining certain mutual limits of communication, on the mutual acceptance and cooperation between an organization and its public; they involve the problem management, helping the managers to be informed on public opinion and meet the demands of public opinion; they define and enhance the managers' liabilities to anticipate the tendencies of the environment; they use as main work instruments research and communication based on ethical principles²³⁰.

The model of communication is no longer reduced to the source, channel and receiver, but it becomes a complex tree. Since the advent of public relations to this day we have witnessed a constant repositioning of the field in relation to the other components of communication. In the 19th century, public relations used to represent an instrument of influencing the public, guided only to propaganda purposes. With the development of the modern means of communication, we witnessed in the 20th century a transformation of public relations in a unidirectional process of communication and without rules, in a bidirectional, well-balanced process, guided by an ethical and deontological code.

The internal dynamics and diversity of action represents the most important elements where PR may take the form of any human activity.

According to a study presented in the book 'The Fall of Advertising and the Rise of PR'²³¹, the executive managers rank the PR department the third in point of its contribution to the success of the company they run, before the R&D department or of financial strategies. It highlights the unique role of PR in the context of overabundant information.

2. Instruments of communication in PR

These last two decades PR has constantly developed as a result of the need for communication on the background of globalization and the main support for all these transformations is technology modernization. We may say that at present it is only those who have nothing to say that do not need PR.

²³⁰ Coman C, Public Relations and Media, Polirom Publishing House, Bucharest, 2000, p. 25

²³¹ Al Ries, Laura Ries, The Fall of Advertising and the Rise of PR, Brandbuilders Grup, Bucharest, 2005

The modern PR use a variety of techniques which include opinion poles and focus-groups combines with a wide range of high tech techniques for the distribution of information in the name of their customers, including the Internet, sending faxes etc.

The expanding state-of-the-art technique caused impressive mutations in the instruments used in public relations, contributing to the increase of power and of the potential in the efficiency of organization, following and access to information. The effects caused by press, radio, TV and computer development are a proof to this respect.

The efficient management of events from the point of view of the PR specialist refers to the organization of an event for the company as one of the means of communication integrated to a context, not as a punctual event. The efficient management of this PR instrument is a combination of three essential components: detailed planning, unleashed creativity and perfect delivery in the day of the event.

The organization of a seminar, cocktail party, lunch or any other event may be an efficient mode of communication with the consumers, to build relations with media and to improve the profit of the organization. Yet, it may cause extremely stressing moments determined by several aspects such as: which is the most important meeting place?; the chosen moment; list of guests. The preparation of the event implies first providing enough time for the PR team to set the strategy from minimum three months for an average event to six months or more for major, complex events. The development of the strategy starts with determining the purpose of the objectives, the target public, the main message and planning the actions. Then editing a 'step-by-step' list of the activities to supply a route sheet of every member of the team. All in all, the agenda of the PR team of the event includes:

- detailing the focus and plan
- editing the invitations
- inviting the attendants
- identifying the list with potential speakers
- preparing the materials for the events and the press.

The coordinator draws up for a clear record of responsibilities a checklist with all the elements to be done, the deadline, who does them. The first step in assembling the puzzle is choosing the venue then the following details: suppliers, equipment etc. The equipment of presentation must be carefully inspected to work perfectly in the day of the event, and the suppliers and the press must be reconfirmed.

The organization of an event is a personal business, an 'ego'.

3. Instruments of online communication in PR

The online instrument of communication is a new medium which refers to the result of the convergence between the traditional media system (TV, radio, written press), telecommunications, digital technology and information systems. This convergence imposed the substantial rethinking of the mode of organization and development of the campaigns of communication.

The Internet provides with valuable opportunities for PR which are equal or even exceed in point of efficiency the standard PR instruments. The online environment may help the business to attain its target or global audience by increasing the market and media exposure.

The brand and message must be in accordance with all the other materials of marketing and public relations of the company.

The main online instruments of communication are: Corporate Website, Media Room, Blog, Corporate Intranet and Client Extranet.

The website is an essential part of the connection with the public in PR. The professional communicators cannot ignore the Internet, and the consumers, investors and clients may find information without waiting to be told by the PR specialist. At present, the small business may administer the site contents using a variety of software instruments. In the 21st century, the Internet is the most important PR instrument and the most efficient from the point of view of cost for the small and medium-sized enterprises.

The Media Room includes all the information that anyone would want anytime on the company and must be constantly updated. The following elements are included in Media Room: name, e-mail, phone and fax number, photos of products etc.

The blog may in many cases replace the website for a small company. Most of the cases, a blog must be used to add or enhance the website. The blog is an instrument by which the public relations man turns into an impersonal and more and more inefficient business practice, in an efficient and ethical means of promotion, exposure and involvement of the company.

Corporate Intranet is a vital instrument for internal communication, both in times of normality, and in times of crisis. The employees must share the outlook, the brand and the message of the company and be able to constantly communicate them to the world. On the other hand, Corporate Intranet allows learning trading and dynamic presentations.

Client Extranet – by this instrument the company provides access to the customers to a safe zone. Client Extranet is separated from Corporate Website and the password is protected. It may be used for cooperation between the members of the team which takes care of a customer, to manage customers' payments and for trade, when circumstances require it.

4. Instruments of information editing and transmission – use in public relations

Besides the online instruments of communication, public relations also use instruments of information editing and transmission. The instruments of information editing and transmission are based on a well-defined nucleus of objectives, notions and theoretical representations which are applied through a complex range of practical procedures and working techniques. They differ depending on the channel or the means chosen for the transmission of the messages required by the target public chosen.

In the case of written communication, the advantages and facilities offered by the non-verbal language must be replaced by the clarity, concision and logic of the message and for the use of proper illustration (photos, graphics, schemes, drawings, caricatures etc.). Moreover, he who spreads a piece of written information may not have the opportunity of answering the questions that the public may ask, so that he should use empathy, asking such questions for himself ever since the beginning and finding appropriate answers.

The main instruments of written communication are the following: the press news, the press release, the press photo, biography, interviews with the media.

The press news is the most available for spreading the topical information (events that have just occurred, that are in progress or that will take place in the near future). It is meant to publication exclusively and usually it is taken over and spread as such by the concerned media. The structure of press news usually follows the model of the 'upside-down pyramid'. This means that the information composing the news are in decreasing order of importance, the most important information are in the first paragraph.

The press release is a form of spreading in writing the information that unlike the press news is not meant first for publication but mostly for media briefing. Just like the news, the press release is an active form of spreading the information where the initiative belongs to the holder, unlike the interview, for example, where the holder of the information has a reactive attitude, of answering someone else's initiative.

When editing and spreading a press release, the PR expert should consider the fact that for the media, the releases are official sources of information. There are a lot of reasons why the press releases are still viable parts of the PR strategy. First, the press release forces the PR specialist to have a consistent message in the communication of the strategy, which is vital for the success of any company.

This instrument allows the firm to be a part of the universe of searching on the Internet, placing the news in the searching engines, news portals. Now, due to the boom of the Internet, the news are distributed immediately, and are handed over to the proactive consumer.

The press photo must cause for the onlooker an emotional reaction, an easily decoding image, so that its significance might be received without any difficulty.

In the process of selection of the press photos, the PR specialist must take into account three factors: the impact of photography, the quality and the possibility of page layout. The impact of photography must present the strong visual elements, which shall attract and interest the viewer.

The quality of the photography must provide for the qualities required for the exposure, the contrast, the colors, the shades etc.

The page payout must represent the possibilities of page layout so that its vertical or horizontal format should simplify the choice of the position by the journalists.

The biography reiterates facts and events in the life of an important person in the organization. Most of the organizations prepare in due time biographies of the main personalities, to use them in the elaboration of the breaking news, such as decisions of dismissal or appointment in important offices, resignations, unexpected death etc.

The media interviews are a passive form where the interviewer answers the questions of the journalist. The PR specialist is responsible both for the interviews he himself gives and for the training of the persons in his/her organization requested by the media representatives. The success of an interview depends directly on the quality of the training and on the level of self-control exercised during its progress.

In the media training two simple techniques are mentioned which allow the PR specialist to make an efficient transition from delicate questions of the reporter to key messages of the company:

- crossing the 'bridge'
- 'wave the flag'

'Crossing the bridge' is a metaphor suggesting that you are walking on a bridge far away from the dangerous subjects and to its purposes, the key messages that you want to convey. Although instead of answering a question with a message and to stop, the PR specialist lays a bridge to the other messages that he wants to transmit.

'Wave the flag' is a mechanism by means of which the PR specialist uses the flag to signal to the audience that a certain point is critical. Metaphorically speaking, the flag is waved to draw attention.

5. Conclusions

The PR work keeps developing as an imperative for the increase of the efficiency where the business must develop on new markets and find new places for the marketing of products and services.

The efficiency of the PR management is subject to government or local regulations and shall continue to meet the need for information of the consumers observing the provisions imposed by the authorities. The PR in business shall be subject to issues whose settlement must be based on a firm attitude and good communication, to be well-equipped to provide for a unite communication by enabling the meetings and by communicating the newest and most efficient methods of developing a business.

By assuring the performance, the companies assign a complex role to the PR department, from that of 'catalyser' of the business to creator of notoriety and change of public perception. As a result, more and more companies in Romania understand the importance of efficient communication by using more and more instruments of communication in the PR field.

Abstract: Even if there is a general consensus among the theoreticians and practitioners involved in international development on the importance of the role that different financial services (especially credits) play in strengthening the rural economy to foster growth and to fight poverty, there is a disagreement on how these services can be provided in rural areas. Today, the majority of the financial sector is still reluctant to extend business to rural areas due to higher risks and higher costs in comparison to doing business in urban areas. In consequence, ways have to be found to supply financial products in rural areas on a profitable basis. This paper was written based on the author's experience and empirical field research in Romanian microfinance sector and presents some recommendations that can be used by financial institutions in building up the delivery strategy of credit products for rural area.

Key words: credit, financial institutions, delivery chanel, rural market, milk value chain

The Value Chain Approach

Until an agricultural product reaches the final market it passes through a series of actors and activities with value addition at each stage. Actors typically involved in a chain are Input Suppliers, Producers, Processors, Wholesaler and Exporters (fig.1).

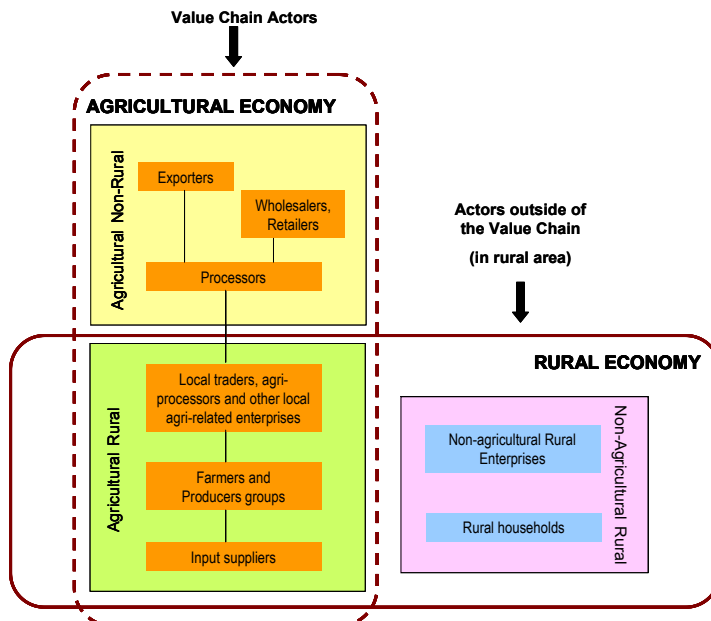

Fig 1. Demanders of Rural & Agricultural Financial Services

The value chain (or supply chain) approach analyzes the flow of commodities and the relationship between the actors of a specific sub-sector and helps to identify opportunities and constraints for growth. By eliminating bottlenecks within the chain this approach can help to enhance the competitiveness of a whole industry.

Financial services to value chain actors can generally be provided in two ways. On the one hand vertical linkages between actors can include financial services, for example an input supplier selling products on

credit. On the other hand, banks or microfinance institution can provide financial services. However, especially access to credit is vital to guarantee a smooth product flow through the chain. Lack of credit at any stage of the value chain has impact on all other actors. For example, if input suppliers can only offer a limited number of input materials due to lack of credit, all actors on a higher level will also suffer from this shortage. The value chain approach helps to identify these shortcomings and assists in finding appropriate interventions.

Overview of the Romanian Financial Sector Involvement in Rural Market

About 47% of the population in Romania live in rural areas. The majority of rural populations are poor and most do not have access to an appropriate range of financial services. Accumulating savings, taking out a loan and insuring against risks are important instruments for every economic activity and can help to overcome poverty. Until now, strategies to provide financial services (especially credit) to the rural population and to strengthen the rural economy have shown disappointing results.

Since the sector's liberalization, private Romanian lending institutions, especially banks, started by entering the corporate market, and then, when competition became stiffer on this market, turned to retail banking. At the present moment, most of the lending institutions (exception some microfinance institutions or credit cooperatives) are not considering to become particularly active in rural areas, and especially in agricultural sector. Agricultural is distinct from other sectors because of the seasonality, geographic limitations, price volatility and dependence on natural conditions. Moreover, some other aspects may affect the characteristics necessary for the success of the financial institutions operating on rural and agricultural markets:

- rural populations are often poor and have greater difficulties in managing risk, coping with shocks and accessing consistent cash-flows;
- lack of collateral can inhibit a borrower from receiving financing. However, a borrower may have collateral, but in the absence of infrastructure that defines property rights, such as a land registry, collateral cannot be used;
- geographic dispersion and poor physical infrastructure: because clients live far from urban centers where financial institutions are often located, it increases the transaction cost both for the lender and for the borrower. These transaction costs include transportation costs and the opportunity cost of lost labor days.
- lack of registered credit history: many rural clients, even if they have credit experience this is often more informal. Lack of historical information on the credit risk of a client hampers the process of determining who is a good borrower;
- attitude of rural people against the financial system in general: poor people are not used to work with formal institutions and perceive the bank atmosphere and attitude of a bank loan officer as being quite rigid.

Even with all these constraints, commercial lending in rural areas will soon become the next frontier within the general goals of increasing financial intermediation in Romania and contributing to growth and employment. Bringing formal credit institutions to rural and agricultural credit market requires commercial viability. The main challenge is thus to maintain the risks and intermediation costs at an acceptable level, i.e. the costs of contacting potential clients, credit monitoring, payment collection. This requires the specific credit delivery mechanisms, products and procedures.

The Romanian Milk Channel Analysis: Milking-Cows Producers and Milk Processing Units

Milking-Cows Producers

According to the figures published by the Ministry of Agriculture, the number of cows used for milk production remains fairly stable, just over 1.81 million in 2006, held in about 1.1 million households. 98 % from the Romanian milking cows' farms can be divided into three types:

1. Non-commercial small-holders ($\approx 92\%$) are people who have a small plot of land (less than 3 ha) and a few animals (1 or 2 milking cows, 1 sow and a few piglets). They usually cultivate their land, produce only

for self-consumption and spend very little for agricultural inputs (fertilizers, chemicals). They also keep most of their milk, making cheese for themselves, and most of their pigs. Their main source of income is not agriculture (they are either employees or retired) and they do not plan to invest in farming. The “non-commercial small-holders” do not need much cash for their farming activities whose sole destination is self-consumption to reduce the household’s food expenses.

2. Commercial small farmers ($\approx 5\%$) are persons who have a small plot of land (less than 10 ha) and a few animals (2 to 5 milking cows, 1 to 5 sows, and sometimes 5-6 ewes). They sell part of their production but the income they get from agriculture is not sufficient and they work elsewhere, either as service providers in agriculture, when they have managed to buy equipment or/and as employees in a different sector. They are usually young; they consider themselves as farmers and would invest in agriculture if they had the necessary financial resources.

They have two types of financial needs: a) in most cases, they do not have access to supplier credit and would thus need loans to buy inputs.; ideally, the duration of such campaign loans should be longer than the crop cycle, so as to be paid back from the proceeds of the products when they have been sold at a better price, some time after the harvest; b) all farmers need investment loans, either to buy equipment or to buy animals; the terms and the repayment of these loans would need to be adapted to the household’s individual activities and income.

3. Commercial medium farmers ($\approx 1\%$) usually earn a living from agriculture and plan to invest in their farms. Most of the time, they are family associations who have cattle, either milking cows (more than 5) or/and ewes (more than 7-10) and less than 50 ha of land. The land is usually owned but sometimes, additional surfaces from other landowners are rented. These farmers cultivate the land usually only to feed their animals. The milk is sold to dairies. These farmers are aware that they will need to increase both output and quality if they intend to stay in business. They need to increase the quality of the fodder in the first place, using adequate harvesting and storage equipment. Then they will need to purchase better breeding cows and, finally, modernize their shed. The “commercial medium farmers” present very diverse situations, with different organizational modalities depending on their juridical status, their localization and their main productions. However, in most cases, these farmers need credit to finance investments, either in animals or equipment; their cash flow normally allows them to purchase inputs for which they may also get credit from suppliers.

Milk Processing Units

Annual milk production per cow is very low, barely exceeding 3.500 liters; only 30% of the quantity of milk delivered to the processing units is according to the EU standards. The main constraints are quality of nutrition and improper, obsolete facilities. Romanian milk has four major destinations: processing units (25%), direct sales of raw milk (23%), feed consumption (12%) and household self-consumption (40%). Milk quality is a serious limiting factor to processors (not enough fat and high bacteria content).

Development of the dairy production sector requires investment in the number of good milk producing cows as well as improvements to increase the milk’s quality. The processing capacities in place are superior to production and milk processors compete both for quantities of milk and for obtaining the best quality produced. Despite the large number of milk processing companies in some counties, the cattle breeders, who are not well organized and who do not have cooling equipment on their own to store the milk, cannot really negotiate prices.

The villages are shared out among the dairy companies, which provide them with storage equipment in order to collect the milk more easily. The dairy companies have employees in the field, who are responsible for one area and know the producers very well. In some counties, all the milk processing companies, the small Romanian ones as well as the bigger foreign ones, maintain the same relations with the milk producers: they very rarely sign a contract with them except with very big producers; they usually employ one person in each village who will be responsible for the milk collection tank that the company sets up for free. This agent collects the milk from the producers in the village twice a day and records the quantity and the quality (density and fat content) brought by each of them. Once a month, some of the companies pay each producer individually, on bank account, by postal order or via the milk collecting agent in cash. In addition, the producers can receive a state subsidy (starting with July 2008, the state subsidy will be provided only for the milk that has a high quality, according to the EU standards). The subsidy is directly given to each farmer through an account or a postal order or given to the dairy

companies who then distribute it. In other counties, the milk production is lower and usually only one company collects the milk in the villages. Because the milk production is too small, it has not set up milk collecting tanks in the villages and is collecting the milk twice a day from each farmer or from agents. Most of the producers in these counties have only one cow, with a low production and a low fat content; these farmers thus very rarely receive the state subsidies.

In order to secure and improve their procurement, most of the big dairy companies grant advances to a number of their producers, in cash or in kind, with or without interests, to buy heifers, feed and equipment. The milk processors do it like this because nobody else supplies such credit facilities.

The dairy companies face two main problems:

- attracting sufficient milk production to feed their processing plants
- improving milk quality, especially to prepare to comply with EU norms

They are therefore actively looking for ways to keep their milk suppliers and to attract new ones, and to foster quality improvement. In answer to these concerns, most foreign companies have set aside a specific budget to grant advances to the milk producers: For example, one large foreign company provides cash advances representing 30% of the milk production to farmers who own at least 5 cows and who are willing to enter into 3 years contracts. These advances are disbursed each year in Spring and in Autumn and are used to buy heifers but also fodder and technical equipment in the case of big breeders; repayment is done in milk, with 50% of the production, without interest being charged (the company had thought of billing interests but abandoned the idea because of the fiscal and technical difficulties); the company never faced serious repayment problems; no material collateral securities are required.

All the dairy companies had difficulties with these financing schemes (insufficient resources, cost due to non billing of interests to the producers or difficulties in taking all elements into account to set the interest rate to the producers, too short term resources...). Many of them contacted banks to ask them to finance their producers but with no success as to now since no bank accepted to take the risk to finance agricultural producers.

Recommandations for Setting-up a Delivery Strategy for Credit Products in Rural Area

Based on the above results of the field research, an efficient way to deliver credit products for farmers involved in milking cow production is through an agreement between financial institutions, milk processors and milking-cows producers.

The basic principles of this partnership are:

- to make use of the agro-processors' intimate knowledge of their suppliers in order to select reliable borrowers, based on one of their major concerns: securing their procurement;
- to facilitate repayment through an assignment of receivables.

Accordingly, the intervention of the agro-processors might be:

- in the selection process: their field agents know the producers and can make a pre-selection based on their personal knowledge of the producers' morality and ability; this would contribute to greatly reducing the intermediation expenses for the bank;
- in the recovery process, by deducting installments directly from the processors' payments to the producers that would be assigned to the bank; this arrangement would require signing a three party agreement.

In order to ensure that the pre-selection process done by the agro-processors is done seriously, it is preferable that they carry a portion of the risk. The agro-processors and the banks have converging interests in distributing loans to rural producers: the banks are looking for eligible clients and the agro-processors want to deal with producers that are able to supply adequate quantities and qualities. But their preoccupations and priorities are not exactly identical: whereas the agro-processors are interested in seeing the producers undertaking investments that will allow them to supply larger quantities and better qualities, the banks are more interested in the producers' willingness and ability to service their loans. This will require the financial institution to always make its own risk assessment. Nevertheless, if the agro-processors are involved in the selection process, the most efficient way to make sure they pre-select

suppliers that appear to them as morally and financially sound is that they accept a share of the credit risk (for example 20%).

This type of arrangement between agro-processors and lending institutions requires a close relationship between producer and processor as well as limited alternative marketing possibilities for producers. Both of these conditions are fulfilled in the milk chain. The fact that milk is a very perishable product, i.e. that the producers absolutely cannot store to delay sales or look for another buyer, makes the relationship between producer and buyer very tight. Moreover, in Romania, the chain is organized in such a way that milk producers cannot easily sell their milk to anyone else than their regular buyer. On the other side, buyers are looking for milk on a market where it is scarcer than processing capacities, and therefore have an incentive to maintain good relationships with milk producers and to help them improve the quality of their production.

The dairy chain needs an improvement in milk quality through investments and increase in the producers' know-how. Whenever possible, cooperation arrangements with providers of technical assistance services will be a positive element for strengthening the producers' profitability. Dairies would like to face suppliers having high quality cows and knowing how to take care of them. This requires investments at the level of the cow breeders. However, it also requires technical assistance to sensitize them and transfer know-how to them. Therefore, a cooperation arrangement with providers of technical assistance services would contribute to securing the profitability of the borrowers' activities. These technical assistance providers need to be identified and then tested on the field (technical services public institution or other Romanian consulting companies)

The purpose of this paper is to identify the main opportunities and limitations of corporate social responsibility (CSR). The survey was defined with the aim to involve the highest possible number of relevant CSR topics and give the issue a more wholesome perspective. It provides a basis for further comprehension and deeper analyses of specific CSR areas. The conditions determining the success of CSR in Romania have been defined in the paper on the basis of the previously cumulative knowledge as well as the results of various researches. This paper provides knowledge which may be useful in the programs promoting CSR.

Keywords: Corporate social responsibility, Supportive policies, Romania

1. Defining CSR

CSR is a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis. In this context, an increasing number of firms have embraced a culture of CSR. Despite the wide spectrum of approaches to CSR, there is large consensus on its main features:

- CSR is behaviour by businesses over and above legal requirements, voluntarily adopted because businesses deem it to be in their long-term interest;
- CSR is intrinsically linked to the concept of sustainable development: businesses need to integrate the economic, social and environmental impact in their operations;
- CSR is not an optional "add-on" to business core activities - but about the way in which businesses are managed.

The concept of CSR was formulated in the countries of stable market economy, and consequently focuses on these countries. The promotion of the idea in Romania and other CEE countries has to be thoroughly researched in terms of a specific strategy of implementation, because a simple transfer of standards from the developed countries may prove to be a serious problem, defined as asymmetry of rationality.

2. The growing recognition of CSR

Responses to the Green Paper demonstrated the global nature of CSR issues and concerns, reflecting the fact that a growing number of enterprises, including SMEs, are developing their business world-wide, as they take advantage of market liberalisation and trade integration and are sourcing from subsidiaries and suppliers in developing countries.

Corporate Social Responsibility (CSR) is relatively new in Central and Eastern Europe. Since the mid-1990s, corporations slowly began to pay more attention to their social responsibility thanks to a clearer and more solid legal framework for employment and labour, and to the stabilisation of the economy. Despite growing knowledge and practice of CSR in Eastern Europe, there is still, in this region, a low level of awareness, limited understanding of it or its purely communication oriented use. More generally speaking, economic and social rights are not yet fully recognized as major concerns and globalization is not yet perceived as a challenge in these newly independent and economically liberal countries.

The concept of corporate social responsibility (CSR) is becoming increasingly popular in Romania, both in academic circles through researching its theoretical foundations, and among managers and businessmen who want to put these theories to use in everyday business practice.

CSR has found recognition among enterprises, policy-makers and other stakeholders, as an important element of new and emerging forms of governance, which can help them to respond to the following fundamental changes:

- Globalisation has created new opportunities for enterprises, but it also has increased their organisational complexity and the increasing extension of business activities abroad has led to new responsibilities on a global scale, particularly in developing countries.
- Considerations of image and reputation play an increasingly important role in the business competitive environment, as consumers and NGO's ask for more information about the conditions in which products and services are generated and the sustainability impact thereof, and tend to reward, with their behaviour, socially and environmentally responsible firms.
- Partly as a consequence of this, financial stakeholders ask for the disclosure of information going beyond traditional financial reporting so as to allow them to better identify the success and risk factors inherent in a company and its responsiveness to public opinion.
- As knowledge and innovation become increasingly important for competitiveness, enterprises have a higher interest in retaining highly skilled and competent personnel.

3. Promoting CSR in Romania

CSR is a concept more and more present in Romanian business society. Obviously, the main drivers in this process are multinational companies that have transferred their corporate culture to a local level. As with almost any imported concept, submitted to the need of accelerated assimilation, CSR has been imposed basically more as a fashion, than a result of awareness of the need for it. As might be expected in a social and economic framework that is still under development, social responsibility has been valued in Romania more for commercial reasons than ethical ones.

The market is more and more competitive, and players are rapidly discovered the potential of this dimension in helping to build their image and consolidate their reputation, as well as the promise for the commercial success in the medium and short term. In Romania, the challenge is to move beyond this assumption, and encourage people to realise that social responsibility is not only an image-building instrument, but an essential element of success in the long term, which is directly related to the social and environment performance of the community.

Over the last two years a series of conferences has been initiated in Romania on the theme of sustainable development, but this concept still requires supplementary information and elucidation. The companies in Romania that give a high importance to sustainable development tend, at least for the moment, to be multinational companies implementing demands and policies established at their head offices. In addition, the programmes frequently encountered are programmes for social assistance, programmes for support of humanitarian foundations, and donations and assistance to educational and research programmes.

Involvement in community projects is beginning to take place in Romania. It is coming to be seen not as a simple image-building tactic, a bid for publicity or an act of charity, but as an essential element in developing business activity, leading to success in the long term, which is directly connected to the economic and social performance of the community that hosts the enterprise.

Romania hosted the first international CSR conference in Eastern Europe (CSR06 – Investing in the future), which dealt with all the issues related to CSR: business conduct, relations with employees, occupational health and safety, systems of monitoring and community involvement. The participants encouraged the setting-up of a specific law regarding CSR, and especially the setting-up of an European Alliance for CSR. CSR is not a grounded area in Romania, so CSR06 had an educative role for the stakeholders in the Romanian market, including the public and private sectors, civil society and the mass media.

The project Social Responsibility in the Carpathian Region: 'The way it works', aims at enhancing CSR activities in the Carpathian region by exchanging best practices at the international level and with the involvement of all the relevant stakeholders. This project is co-financed by D-G Employment and includes

regions from Slovakia, Hungary, Poland and Romania. It is managed by the Carpathian Foundation. The main target groups of the project will be social partner organisations, SMEs, multinational companies, regional, national and local governments, universities, NGOs and civil society organisations, business and professional associations from the districts within Slovakia, Hungary, Poland and Romania that make up the Carpathian region. The direct goals of the project are:

- raising awareness and improving knowledge about CSR and its impact on society among businesses, governments, education institutions, civil society organisations and other stakeholders in the Carpathian region
- developing expertise and exchange of information on CSR and its existing instruments and practices
- constructing transferable models of CSR practice for new Member States of the European Union and the candidate countries, involving active partners from Member States of the European Union as well as from candidate countries.

4. Ensuring transparency of CSR in Romania

The European Union, the United Nations and the OECD are three of the most important institutions involved in the drawing-up of a framework defining CSR and establishing the indicators by which it may be assessed transparently. This framework has been accompanied by recommendations and principles that guide states and local authorities in formulating public policies that promote CSR, ensure transparency and support CSR initiatives. Moreover, taking into account the local need, it is necessary for Romania to ensure a better and permanent contact with the European experience and good practices that are promoting and regulating CSR activities. It will be useful to bring Romanian market norms into line with the experience of countries with a longer tradition regarding CSR. On the other hand, a weak point could be the fact that the social responsibility programmers are not yet well covered in the specialty press, because the level of public awareness is still low. Also, there are few major programmers and only a few companies are involved in social responsibility projects in Romania. Maybe when it becomes mandatory for companies to publish social responsibility reports, which will encourage local companies to be involved in such projects.

5. Supportive policies of CSR in Romania

Under the aegis of the Ministry of Labour, a Directorate for Corporate Social Responsibility has recently been set up. This will deal with CSR issues in the field of the ministry.

The Romanian Donors' Forum (RDF) was initiated in November 1999 when a group of foreign and indigenous donors active in Romania, came together with the understanding that they needed to improve their cooperation. The initial group of donors comprised of AIDRom (the Ecumenical Association of Churches in Romania), Carpathian Foundation, Charles Stewart Mott Foundation, the Romanian Environmental Partnership Foundation, Open Society Foundation, Princess Margarita of Romania Foundation and USAID decided to set up a structure through which donors could share information about their own activities, take joint initiatives to solve pressing issues and communicate more effectively. Later on, the group was joined by the Delegation of the European Commission in Romania, Allavida - Alliances for Voluntary Initiatives and Development, Co-operating Netherlands Foundations for Central and Eastern Europe (CNFCEE), the Royal Netherlands Embassy in Bucharest, the Resource Center for Roma Communities, the Ethno-cultural Diversity Resource Center, the Regional Environmental Center for Central and Eastern Europe (REC), Marshall German Fund of the United States (GMF), Romanian Fund for Social Development, King Baudouin Foundation. In 2005, Allavida and Trust for Civil Society in Central and Eastern Europe became members of the RDF. In 2006, the first corporate foundation, Fundatia Sensiblu, joined the Federation. The Romanian Donors' Forum has been actively engaged in promoting philanthropy and corporate social responsibility (CSR) by initiating dialogue with the banking sector and some large companies in Romania. Efforts have been made also individually by organizations members in RDF (such as the Princess Margarita of Romania Foundation, the Environmental Partnership Foundation, Open Society Foundation) to link and partner with the corporate sector on various projects.

6. The main conclusions:

The concept of CSR is still new and not well-known in Romania. Nonetheless, CSR-promotion initiatives launched by the government and business players seem to attempt to improve awareness of the concept and the importance of such policies for business players. The influence of multinational corporations and of foreign investors is clearly perceptible.

The corporations that adopt CSR policies are mainly concerned by their reputation and image. They wish to uphold a socially responsible image for their customers, consumers and investors. This also explains why most CSR departments or representatives are part of the communication department of the corporation. However, this should not undermine the interest of some notable good practices in some corporations.

CSR policies are defined under the concept of sustainable development and cover economic, social and environmental aspects. Corporations may include in their CSR policies a specific Human Rights commitment, respect of legal obligations, as well as charity. Although the information published on CSR policies of multinationals is clearly abundant, lack of a clear definition and misuse of the concept make it difficult to get a clear picture of the efficiency of such policies. Moreover, serious work has to be done to adapt CSR policies to specifically Romanian CSR concerns.

CSR is defined by business players on a voluntary basis, and implemented and monitored by business. This self-regulation process is hardly offset by governmental action aiming to promote the concept.

Cooperation of non-profit and commercial sector is a desirable indicator of a functioning civic society. It can be successful and beneficial for both only when based on equal relations, work and mission recognition of both partners, and when both of them pay enough attention to it. Non-profit sector must understand the needs of their commercial partner and the environment in which it functions while businesses must rid themselves of the tendency to turn charity programs solely into marketing tools.

7. The future of CSR in Romania

Based on the survey findings and our present experience with CSR here and abroad, we state some steps below that we consider necessary or proper in order for CSR to become a discussed and alive topic in our country. We are presenting these steps not as imperatives rather as points to think about. Their order is of no importance.

- explain the term Corporate Social Responsibility, give it a concrete content, and introduce a clear Romanian terminology
- bring the Corporate Social Responsibility concept from an intuitive level to a real one so as to make clear what exactly Corporate Social Responsibility means, what we are discussing and looking for
- point both at the international but mainly at the local context of the CSR topic
- show concrete examples of socially responsible company activities (show how CSR actually works)
- communicate the benefit of socially responsible behaviour to companies as well as the strategic character of CSR
- clarify to the public, media, as well as to the companies the difference between PR, marketing and CSR and interpret CSR in a broader context
- enhance the external involvement of companies in the future, this could also help reinforce their transparency, in which companies showed interest in the survey
- enhance the prestige of non-profit sector as a partner for realization of Corporate Social Responsibility, disseminate information about the possibilities of cooperation and create a motivating tax setting for it
- communicate more the topic of cross-sector partnership and work on building a transparent setting for these initiatives
- promote the CSR topic in media, turn attention to it

- point at irresponsible as well as responsible companies (show good examples, inspire, create "chain effect")
- find clear and understandable ways and tools for customer orientation, that will be considered trustworthy by the customer
- enhance communication and prestige of present and future tools and awards of CSR activities
- use CSR topics for gradual improvements of the business and social environment in Romania

The trend in understanding Corporate Social Responsibility is positive without doubts. Comprehension of this concept is improving, although slowly - depending on the cultivation of the whole society. One problem remains though, namely that so far these principles pass by the new Romanian businessmen without making much impact on them, and the criteria of management evaluation in big firms, foreign or partly state owned, are set up so that although their profit increases, budgets designated for philanthropic activities are rather cut down.

Abstract

The purpose of this paper is to present the challenges and opportunities faced by the Romanian hotel industry in regards with the recruitment and selection of the employees and to present some suggestions conducive to making more efficient the hiring process. The ideas and specific recommendations can be applied in other industries confronting with similar challenges related to the attraction of talent and work force shortage.

Key Words

Human Resources Management, attracting talent, employment, hotel industry

Challenges in attracting talented candidates for the hotel industry

The number one priority for 75% of the Romanian companies is the shortage of the work force. The specialists estimate that more than 40% of the companies are already facing shortage of qualified employees. Besides, the predictions are far from being pleasing: within the next 10 years the shortage of talent will increase by 15%. All the industries will face challenging times from the human resources point of view and will be every day more difficult to attract and retain the employees.

The hotel industry makes no exception to this trend. The deficit refers mainly to specialized positions such as chambermaids, receptionist, waiters, barmen, cooks, pastry cooks. The number of vacancies in tourism is increasing continuously: some 11,000 new jobs per year, according to the data forecasted by World Travel and Tourism Council.

The causes of the labour shortage in the hotel industry are multiple. It starts with the shrinking of population due to emigration, but also due to a diminishing fertility rate, which is actually under the level of replacement rate. The emigration of the labour force has deepened after the integration of Romania in the European Union which has allowed an easier transfer of the human capital. Moreover, the diversified offer, the higher wages and benefits have determined Romanians to apply for jobs abroad. The attractiveness of other sectors (tourism sector is often viewed as the "last resort" when choosing a job) and the low level of compensation have determined many employees to avoid applying for a career in the hotel industry. The lack of a national integrated strategy and action plan to support the development of the human capital in this industry explains also, partially, the deficit of the employees in this sector.

There are various solutions that can be implemented and actions that can be taken in order to overcome the challenges facing the hotel industry. Some of them have to be taken at national level, others at industry level and some at the employers' level. The latest will be the one analyzed further on, highlighting best practices from the industry.

2. Recommendations and suggestions for attracting talent for the hotel industry

The attraction and retention of the employees are two of the main priorities and challenges of the companies. This paper will focus on the attraction process of talent in the hotel industry. There are presented recommendations and ideas that can contribute to the improvement of the recruitment and selection process not only in this sector, but also in other industries.

New approach for the Human Resources Management

The management of human resources has experienced a period of abundant changes, searches, re-defining, re-positioning, and “cutting with the past”. It is a lot of talk about the management of human capital, but even this concept will soon become “obsolete”. The traditional strategies and policies in the field of human resources are not any more efficient. The executive managers and the specialists in human resources have to get out of the old paradigm and to project a new one, in which the human resources have to be a strategic business partner contributing in an effective way to the fulfilment of the objectives and financial results of the company.

Nowadays, the employers have to be more creative, more original, and more unconventional in order to find the most efficient methods to attract, to develop and to retain the talent. One has to create new strategies to recruit, retain and motivate. On the labour market we will soon witness a “guerrilla war”, more and more intensified in order to attract and to keep the talent. The strategies and the policies of human resources will “borrow” a lot from the unconventionality, creativity, originality, but also from the aggressiveness of the marketing, communications and branding strategies.

A new strategic partnership: Marketing, PR and Human Resources

We are witnessing the flourishing of a powerful, strategic relationship between Marketing, PR and Human Resources specialists. Their main aim is to create and develop a brand of a strong employer, using specific tools and methods. The teams have to cooperate in order to set specific strategies and action plans: to identify the features of the target people, to choose different channels for promotion and to create attractive ads, which distinguishes from the many others.

The correct identification of adequate and efficient communication channels to promote the recruiting ads represents the key factors for the success of the recruitment process: internet on-line recruitment sites, company website, outdoor banners placed in strategic areas, radio and TV announcements, participation to job fairs, university announcement boards, “open doors” day, etc. The secret of an unbeaten recruiting ad lays both in the content and the presentation features. The recruiting ad content has to be striking, different, and unconventional, to raise the attention of the potential candidates, which are already “assaulted” with a lot of recruitment ads. A new idea, a word, a picture, a colour, a punctuation sign can sometimes makes the difference.

The recruitment specialists have to be persuasive, able to “sell” the company and the vacant position when talking to the candidates. When inviting the candidates for an interview, the words and phrases used have to be carefully chosen. For example, the word “interview” should be replaced by the word “discussion” to project a more relaxed encounter in the mind of the candidate.

Internal transfers and promotions

The most used recruitment method is to transfer and promote internal candidates from within the company. It is more rapid and motivates the employees who are valued and appreciated for their contribution. In the hotel industry this is one of the most popular methods to fill a vacancy. Many managers and top managers in hotel industry have started as waiters, stewards or bellboys and have worked out their way to the top through hard work, dedication and commitment.

“One Day Hiring” Process

More than 60% of the employees are actively looking for another job. The labour market is very dynamic and rotates at an astronomic speed. The employees are not willing to wait long if a good job offer is been made to them. No wonder that the average time that a candidate is “available” to be hired or willing to wait for a job offer is less than 2 weeks. The recruitment specialists have to move very fast and try to complete the recruitment and selection process, including making the employment offer in maximum 2-3 days. If the

candidates find another attractive job offer, they will accept it immediately. If they are good professionals everybody will fight for them. It is recommended that the selection process (interviews, practical and other evaluation tests, reference checks, etc) should take no more than one day. An initial pre-screening is suggested to be done by telephone to identify the key requirements for each position. This will save time both for the interviewer and candidate. Ideally, the candidate should finalize the recruitment steps within few hours and if accepted for the job, to leave with the job offer in the pocket. There are some companies that have changed their long traditional recruitment and selection process and adopted “One Day Hiring” approach. Due to the rapid changes in the labour market this method will become a common standard for most of the companies, especially for entry and middle management positions.

By moving fast and efficient, without neglecting the quality of the applicants, the good candidates are not left to “escape” to the competition. This implies a higher planning of the recruitment steps, time management and coordination between the human resources department and the managers involved in the hiring process.

Keep in contact with the future candidate

Nowadays is not enough to shake somebody’s hand, say “welcome to our team” and hand in the employment offer. While the future employee is still in the notice period he or she should be contacted by the future manager or by a Human Resources team member to keep in contact with the candidate. The future employee will feel somebody cares about him/her, that he/she is important and valued by the company, that he/she is already welcomed and already part of the team. A simple phone call can make the difference. And it costs nothing!

Networking

Networking is a relatively new word but it was quickly adopted and used by most of the Romanian specialist to define the informal relationships and communication between employees working in the same professional community. Networking is used mainly to find candidates for middle and top management, but also operational, entry-level positions are taken into consideration lately. These candidates undergo the same selection process as any other candidate, but sometimes they have the advantage of having previous experience on similar positions in related field of activities and good reference.

Internships

The internship is a classic method to identify the future employees with high potential that might be consider for hiring after finishing their studies. The hotel industry offers a variety of internship programmes for entry–level positions in partnership with vocational high schools and universities. There are various types of organizing the internship, but the purpose remains the same: to discover and train talented candidates. The process runs both ways because the employer has the opportunity to evaluate the internees and also the internees learns more about the organization, the colleagues, and the job requirements and finally decides wheatear to start working within the company or not.

Attracting Romanian employees working abroad

Attracting Romanian workers working abroad is another option that deserves to be taken into consideration both by the authorities and employers. It is estimated that more than 4 million Romanian are working abroad, not all of them being officially registered. The Ministry of Labour has recently organized two Job Fairs in Italy and Spain, with more than 10.000 jobs available, in order to present the employment opportunities in Romania. The salaries are not that attractive yet, but they have increased considerably lately. The Romanians from Spain are taking into consideration coming back, especially because of the recession of the Spanish economy which is estimated that will free more than 300.000 employees, especially from the construction sector where Romanians workers are the majority. Also, employees working abroad in tourism sector are considering returning. A part of them want to start their own business; others will continue to work in the same industry. For the 5 star hotel industry it is estimated that the costs related to the employees (mainly salary related costs) have increased between 20 and 40% compared to last year and this is encouraging for this category of employees.

Identify potential new candidates

Seasonality is one of the main characteristics of the hotel industry and this implies different levels of employability during a year, according to the high and low seasons. The students are the number one preferred category of candidates for the seasonal jobs. In order to attract the young candidates looking for opportunities to work and study in the same time, more jobs will be part time and/or with fixed term contract during high seasons. Other targeted candidates are the housewives, mothers with children looking for flexible working schedules that will allow them to spend quality time with their family and raise the children.

Employment of mature candidates

A solution that has been started to gain ground is to recruit employees which are at their maturity professional stage. The general trend in Europe is one of ageing of the labour force and that is one of the reasons employers began to look into this category of employees, mainly for management and specialists position, but not only. These employees can bring to the companies valuable advantages: they bring in a considerable professional experience and know-how in their field of specialty. They are used to work in different working environments and organizational cultures. Also, their networking and business relationships are countless added-value to a company. They are more stable and loyal to the company and it is less probably that they would change their job frequently. Most of them are part of the “baby boomer” generation and have a different approach to work, they value hard work and steady professional growth, noting is obtained without effort and personal sacrifice.

Outsourcing

Outsourcing is mainly used in western countries hotels to insure work force for positions that imply repetitive or labour-intensive tasks such as: housekeeping, laundry, stewarding, food and beverage service, accounting, payroll, maintenance, etc. In Romania, the outsourcing industry is at the beginning of its career, but has great potential. Most of the hotels will go for this option which in time will be more cost efficient for them. This will give the employer the time and energy to concentrate on the development of the core employees. However, the outsourced workers should be treated applying the same rules and principles as for the company employees, in order to maintain the motivation and job involvement.

In conclusion, these recommendations are not exhaustive, they represent just a starting point for further ideas and solutions designated to improve the efficiency of the recruitment and selection processes.

On a global level, the current development stage of diverse societies is characterized through strong product-service interference in the satisfaction system of numerous needs, the services and, especially, the innovations within them, tending to determine the report, respectively to win new domains. The phenomenon is favoured, on one hand, by the strong development of new technologies, on the other hand, by the continuous growth of the consumers' expectations. This leads to the fact that the distribution's domain appeals, increasingly, to the use of commercial services, for succeeding to dynamically adapt to the new consumer's requirements. This adaptation is conceived in a complex frame, regarding, mainly: the merchandise; commercial network; commercial technologies; the services offered to the consumer in the purpose of individualizing the products or personalizing the commercial units.

Cuvinte cheie: complex sales, product increase, market, distribution/sale strategies, services.

Introduction

After the 90s, few firms which act in a competitive environment can hope for success in the absence of a strategic plan. As the markets' expectations and the consumers' increasingly sophisticated requirements, the future's enterprises must approach the market in a more intelligent manner than in the past. The running off this principle can have as a result inadequate decisions, which can transform themselves in long term losses.

In business, one of the most important success ingredients is creating for the consumer a clear image of the respective firm. The realization of this desiderate becomes very difficult in the absence of a good strategy and of some actions in concordance with these strategies.

The enterprise must be considered an open system, connected to the outside environment through the purchase and sale markets. The task of an enterprise's logistics system is projecting, organizing, leading and controlling the material and information flux and, likewise, taking into consideration the purchase and sale markets, the insuring of a stable service level within the enterprise.

The purpose of the enterprise's logistics corresponds to the principles:

- In conformity with the market, production and other specific requirements;
- The right merchandise at the right time, in the right quantity, regarding the quality and respectively, corresponding costs.

All of these aspects must be considered, because the performances of the logistic systems are tightly linked with the providement of the corresponding services. In the purchase and sale logistics, the characteristic elements of the logistics services are: delivery promptitude, flexibility, quality and services' guaranteeing.

Firm development strategies

Any company which follows to reach a certain market quota looks that through its objectives' expressing to establish specific performance standards, necessary for the mission's attracting. These objectives,

elaborated in conformity with the company's philosophy, can be echeloned long or short term. In the case of the larger commercial organizations, **the corporative objectives** are linked to the different levels and divisions; usually, the large companies split the actions in distinct business units or profit centres (can be considered as strategic business companies), with the purpose of establishing the objectives and implement the corresponding strategies, in order to harmonize them with the company's mission.

Moreover, the corporative objectives establish not only the action direction, but also, serve as a basis for the organizational efficiency's evaluation. For the objectives to be useful to such an evaluation, they must be specific and quantifiable (in the establishment of the objectives there are frequently used elements as: financial performance, market position, productivity); the vague or interpretable objectives (ex. "profit maximizing", "excellence reaching") are too large for an effective evaluation.

Another element of the strategy approached in the detail commerce is the **situation analysis**, which presumes the examination of two aspects, as followed:

- As the organization's current position is understood, there must be established an accord regarding the firm's future position, in the terms of some objectives. This component of the situation analysis can be determined through the collecting of information and analyzing the organization's current situation;
- The second aspect of the analysis involves the clear understanding of the restraints which could stop the proposed objectives' attracting. These restraints refer, often, to the incontrollable environment factors, such as: competition, current legislation, consumers' demand.

The elaboration of a product strategy is based on several fundamental elements, such as: potential market, prices, buying power, existent reglementations etc.

For an adequate strategy it is recommended to adopt a philosophy sensitive to the consumers' demand.

The typical product strategies are considered as being:

- **The product's penetration on an existing market** – suitable especially for the products in the "growth" phase and which needs efforts in the distribution and promoting activities;
- **The product's sale on new markets** – targets new consumer contingents;
- **The extension of the sales on the existing market** – strategy which, without modifying the products' destination, brings modifications or improvements of their characteristics and using manner.
- **Diversification** – through the launching of new products destined for new consumer categories;
- **Product's differentiation** – when products are adapted to the specific needs of some different consumer categories.

On the merchandises' technical-economic circuit, the strategic decision in the distribution marketing targets the opening network (distribution channels and physical distribution). In this sense, the typical distribution strategies are considered as being:

- **The direct distribution through the own network** – is corresponding to the launching of new products or in the case of the relations within the inter-industrial commerce; this formula knows the alternative of extending of the own network regarding the opening's growth;
- **The distribution through the intermediaries** – is recommended when there is no own network/when it is not sufficient or when it follows the launching of new products on new markets; it can be made through short channels (in the case of large consumption products) or long, using independent opening bases or en-gross commerce units, in the case of the industrial consumption or high value merchandises, having as result the lowering of opening spending.

Other types of distribution strategies are represented by the:

- **Extensive distribution** – realized through an increasing number of opening units and channels;
- **Selective distribution** – through a reduced number of specialized intermediaries;
- **Exclusive distribution** – one intermediary, small area, single market segment.

In this stage of the merchandises' circulation, a special importance must be given to the commercial services due to their complex character.

The role and importance of services in the firm strategy

The services provided by suppliers represent an extremely important element in the sale extension of certain product. Thus, the sales of products purchased together with specific services are considered complex. In this context, even the services range is diverse (production, consumption, productive, unproductive, industrial, and social or personnel services), at the substantiation of an extension strategy are to be considered:

- **Processes support services** – concerning the conception and proper make, as: consulting; licenses cession; technologies and proceedings; the know-how transfer; engineering; informatics services etc.
- **Services to facilitate commercialisation** – met also in the merchandise distribution phase, for example: leasing; marketing logistics; insurance services; franchising; factoring.
- **Support services in product utilisation** – ensured in the utilisation phase all over the life cycle and refers to: technical and economical assistance in distribution, transport, using; optional parameters functioning; currently and major overhauls; guarantee; spare parts assurance. That kind of services could be supplied both by producers or commerciants and specialized entities and could be differentiated in production and consumption services.
- **Assistance services** – in the field of organization and management of the production; distribution processes and employees recruitment, training and coaching.

Complex sales (totals) – represent a specific type of product sales coordinated and/or done by a single supplier in the benefit of a single user, consisting in a package of products delivered together with the afferent services. This type of services presumes a unique responsibility in the components achievement, the beneficiary being the same for all the action categories.

The functions of services provided to support complex sales are numerous and can be classified as follows:

- Stimulation functions;
- Sales increasement functions;
- Sales efficiency functions;
- Supply quality functions;
- Report functions;
- Promotion and relationship stabilisation functions;
- Stimulation function presumes the following aspects:
 - Production services stimulation – essential in the case of complex sales, having a directly impact on the activities linked to the effective products achievement and on the performer labour forces. The stimulation effect exerts also on the other services categories; but in the meantime, production services are receiver of the stimulation effect produced by other products or labour forces training services.
 - Often, in practice, are met situations when buyers purchase projects, technologies, maintenance etc., resort to equipment and installations with the same origin, registering in the same time an integration effect between the sales object and the services associated. Thus, we could assert that the production services accomplish also the role of the stimulation effect receiver.
 - Stimulation of the physical product versus the commercial and management assistance services, the recruitment and human resources training ones, and like consequence, receiver of those services.
- The services function of volume and efficiency of sales increase and modernisation of its structure – differs from product to product, depending on the complexity especially in what concerns the engine construction industry, products whose sale generates the increase of the spare parts and maintenance and repair services request.

- The report function (feed-back type) exerted intermediated by the networks of services provided on markets or market area already gained. Information become available intermediated by the service employees; it could refer to proper activities or could be suggestions or assessments and constitute a data base very useful for further modernization, reprojected or diversification actions with effect on the real or potential consumer satisfaction increase.
- Promotion function – exerted intermediated by services; is supported by the products complexity increase and means the entrance on new markets, extension of public relations, lancing and cultivation of certain brands etc.
- The relationship stabilisation and perpetuation function – exerted by the activities stability assurance, and the possibility to plan and program production and distribution in the situation of eliminating fluctuations and adapting products to the beneficiaries request. In this respect an important role play the employees training and competence level, substantially contributing to the beneficiaries trust increase.

We could appreciate that services are taken into account like a new manner to produce, consume and live in the society. Services generate various providing terms each with distinguished traces and special implications to underline specific sizes of this activity. The success in business could be assured by a good promotion technique of new technologies concerning the different products realization and by their conception and integration in a services assembly linked to product all over the technical circuit and in the consumption or utilization period.

During the distribution, actions and efforts done to achieve different services represent the proof of respect of customer and their exigencies, vision who must to transform the commercial employee activity in a success weapon.

From the economic point of view, commercial services became an opportunity both for firms acting in commerce and for production ones, because in their majority, services supporting the goods sale process prove to be means directly contributing to revenues and profitability of organizations increase.

The services quality image act directly on the purchase behaviour of products potential clients, the sales level being dependent in great measure on the supporting services quality.

A commercial services range application represents in the meantime a modality to create a relationship system and a communication channel between the commerciant and the customers.

All these lead in the last years at a significant increase of the commercial services role in the trade activity, prefiguring in the extension of the supply, concomitantly with an efficient management.

The success in business of an enterprising in commerce or production area will depend on his capacity to offer to clients a range of complementary services the most suitable and useful to contribute to the satisfaction degree and the firms competitiveness increase. This perspective is favourable to consumers, beneficiary of an assembly of utilities offered both by the products and the services associated.

Commercial services could be viewed both like an activity area integrated in the commercial and like element of the traders commercial policy.

Services could be seen like area integrated in the commercial activity, grouping the entire assembly of activities involved in the merchandise sale process (banking, assurance activities etc.) and some commercial activities other than the classical ones (example: the commercial agents displacement to residents to take orders, night sales etc.).

The nature and proportion of different operations give in general the complex content of services and the variation from a product to another (or from a distribution system to another) means that in reality doesn't exist a standard service. Thus it doesn't exist services that by their nature could respond in general to all the clients of a firm but services adapted to specific exigencies of each client. That's why organization and in particular, the content of services configuration must take into account the flexibility depending on the request moment, the place, environment and behaviour of each consumer.

Consequently, a good commerciant must take into account the frailty of the client's fidelity regarding a product, brand or producer and using a suitable policy to build purchasing behaviours based on a good knowledge of the effective and potential client's necessities.

The measurement and integration of commercial services in the complex of utilities offered to consumers involve a series of aspects concerning the manner to locate and support the costs by the partners.

Thus, the great variety of commercial services, the continuous multiplication of possibilities to their providement and also the mutations in the buyer's exigencies and request generate an increase of the integration systems complexity of the respective services in the supply of each type of commercial entity and some difficulties in what concerns the costs delimitation and the support of expenditures.

The solvement of all these problems depends on the consideration of factors as: the place of each partner in the products flux between producer and consumer; possibilities to pursue the respective expenditure; the commercial service type; trends in the product services utilities system.

Conclusions

The trials of continuous adaption to requests and new exigencies of the consumers become real in a complex management system, concerning the merchandise, commercial network, technologies and the commercial services. The respective trends of multiplication and diversification have in view a functional combination of these and not only the multiplication of some services and utilities from each group separately delivered.

Among the main trends outlined in this area, are to be underlined: the extension of the informatical systems in the achievement of production and commercial services; the guarantee and maintenance for long life goods placement inside the big commercial surfaces; the transfer of some commercial services (transport, repairs, consulting etc.) towards specialized forms in base of cooperation contracts; perfection of the services management and supply system.

CITY IMAGE – AS TOURISM DESTINATION

Stanciulescu Gabriela Cecilia

Academy of Economic Studies, Faculty of Commerce, Department of Tourism-Services, gabriela_stanciulescu@yahoo.com, gabriela.stanciulescu@com.ase.ro, Tel: +40 21 319 1996

ABSTRACT

Tourism is a competitive industry, even on a global scale. If access to a destination or attraction is too complicated, time consuming, expensive or not providing adequate capacity, even the most spectacular attraction will remain a secret to most tourists, as they will prefer competitive alternatives” (Smiths, 2003). And to continue this, it is considered that „that cultural differences and uniqueness are important if one wants cultural products to become a commercial success” (Lindenberg, 2004). When cultural tourists are looking to experiment or to improve their knowledge, the question is: “Which are the best strategies and practices to market that experience and knowledge for the cultural tourists” (Kantanen, 2005).

This paper will be dedicated to presenting city tourist destinations, their marketing and market positioning, also to analyze the way in which potential customers’ perception is built and how the process can be influenced, and to analyze the way the tourist product is assembled.

Key words: City, Tourism destination, Competitive advantage

THEORETICAL BACKGROUND ON MARKETING A CITY AS TOURISM DESTINATION

Destination advertising campaigns are typically evaluated by conversion studies or by advertising tracking studies. The conversion study model follows a sequential flow over time that leads from the production of advertisements to visitor awareness, positive image development, inquiry/fulfilment, motivation and conversion” (Siegel and Ziff- Levine, 1990; McWilliams and Crompton, 1997: 127 in Kantanen, 2005). The advertising tracking model describes changes in the levels of awareness of the destination and its image in the target markets, before and after those markets have been exposed to an advertising campaign” (McWilliams and Crompton, 1997: 129 in Kantanen, 2005).

City,s cultural attractions cover a wide range of cultural events, art exhibitions, museums, and buildings with cultural heritage” (Kantanen, 2005). Marketing in tourism can be described as both science and art, or a complex interplay of the two. Developing the right marketing channels; the right contacts; understanding how the tourism distribution and promotion systems work in the regional and national context; taking a unique approach; and persistence. Attaining the mix right in the context of a regional destination and maintaining flexibility in the approach will most certainly drive performance” (Smiths, 2003).

Marketing and advertising a certain geographical area (in our case a city) are essential for informing and convincing potential tourists to visit that area. A complet tourist plan must contain both a marketing component (Stanciulescu, 2004). As target group orientation is considered a prerequisite for good market communication, it is essential for tourism destinations to be aware of the frame of reference within which their promotional efforts are interpreted. A central part of this are cultural images – that is images which exist in the target group in relation to a given culture outside and a priori to tourism promotion – and to consider how the promotional effort goes down with the a priori understanding seems a necessary exercise for any marketer” (Therkelsen, 2003).

Tourism basically entails a search for that which is extraordinary (Urry, 1990) compared to one’s everyday life and environment. Hence contrasts would seem to materialize between the orientations of the supply side and the demand side in a tourism context. This line of reasoning is sustained by Viken & Jacobsen (1997), who hold that culture specific experiences are a necessary contrast to our standardized everyday life” (Therkelsen, 2003).The political, economic and cultural existence of places outside the tourism context means that tourism destinations have a more comprehensive meaning potential than most other consumer products, and meanings which are closely tied up with the present and historical relations between the country of origin of the tourist and that of the destination” (Therkelsen, 2003). Faced with

growing global competition where destinations are becoming highly substitutable, destination marketing organisations (DMOs) are in a constant battle to attract travelers” (Pike and Ryan, 2004 in Ekinici, 2006). As places seek to become distinctive, destination personality is viewed as a viable metaphor for understanding tourists’ perceptions of places and for crafting a unique destination identity” (Caprara in Ekinici, 2006). A tourist destination may be viewed as an amalgam of individual products and experiences that combine to form the total experience of the area visited (Murphy in Ekinici, 2006). Past research has demonstrated that destination image has both cognitive and affective components (Kotler in Ekinici, 2006). Although destination image has been acknowledged to consist of both affective and cognitive components. Past research has also shown a direct connection between a destination’s image and the trend of tourists recommending it through word of mouth” (Ekinici, 2006), and also a direct connection between the destination’s image and tourists expectations (Middleton, 2001). A study by Ekinici (2006) demonstrated it’s vital to create and observe a destination’s personality in order to position and differentiate it on the tourist market. This can be done through a whole set of marketing techniques including publicity and imagining (Ekinici, 2006). Very often, mature destinations rest on past laurels, forgetting that the reexamination of their marketing and communication strategies and the willingness to implement change are their last hope in an increasing global market, where world-wide competition brings challenges everyday” (Minghetti, 2001). In the same way, emerging destinations need to identify target markets and create a unique brand platform to enter competition. In addition to that, the gain of a global competitive advantage also requires the development of local partnerships...which allow destinations and SMEs to gain greater market power on intermediaries and other external actors” (Minghetti, 2001). To ensure competitive advantage, every destination has to offer its potential tourists a certain degree of attraction and a tourist experience superior to other alternative destinations (Dwyer, 2003). Perspectives from various disciplines reveal that competitiveness is a multi-faceted concept. We can regard the notion of competitiveness as associated with three major groups of thought. These are:

1. Comparative advantage and/or price competitiveness perspective (Bellak, 1993; Cartwright, 1993; Durand & Giorno, 1987; Fagerberg, 1988; Fakiolas, 1985; Hilke & Nelson, 1988; Hodgetts, 1993; Porter, 1990; Rugman, 1991; Rugman & D’Cruz, 1993).
2. A strategy and management perspective (Day & Wensley, 1988; D’Cruz & Rugman, 1993; Ghoshal & Kim, 1986; Grant, 1991; Kogut, 1985; Mahmoud et al., 1992; Mahoney & Pandian, 1992; Mathur, 1992; Parsons, 1983; Peters, 1988; Porter, 1985, 1990, 1999; Porter & Millar, 1985; Powell, 1992a, 1992b; Yip, 1989).
3. A historical and socio-cultural perspective (Aaker, 1989; Franke et al., 1991; Hofstede, 1980, 1983; Hofstede & Bond, 1988; Kennedy, 1987; Porter et al., 2001)” (Dwyer, 2003)

From a macro perspective, competitiveness is a national concern and the ultimate goal is to improve the real income of the community. On this perspective, competitiveness is a very broad construct encompassing all social, cultural, and economic variables affecting the performance of a nation in international markets” (Dwyer, 2003). The discussion of competitiveness in the general literature has tended to stress competitive advantage (resulting from value-added activities by firms and organisations), while de-emphasising comparative advantage as a source of international competitiveness. For a tourism destination, comparative advantage would relate to inherited or endowed resources such as climate, scenery, flora, fauna, etc., while competitive advantage would relate to such created items as the tourism infrastructure (hotels, attractions, transport network), festivals and events, the quality of management, skills of workers, government policy and so on” (Dwyer, 2003)

CITY DESTINATION’S IMAGE AND BRAND IMAGE

“In terms of tourism destination branding, provenance is even more critical because countries pre-exist any identities crafted for them by marketers and neither their advertisers nor consumers can have objective views of them” (Morgan & Pritchard, 2001, p. 281 in Therkselsen, 2001). Informing tourists before and after they reach a destination is considered a marketing component. In a new tourist destination, its important to create and transmit an adequate image of that area, based on the primary attractions, the facilities and the available services. The image has to be as close to reality as possible, so that tourists won’t be disappointed but carefully so that they don’t get a wrong idea either (Stanciulescu, 2004). All products which are decoded and taken into the consumer’s world gain a cultural existence and identity” (Kragh, 1996, p. 6, own translation in Therkselsen, 2001), and sometimes components can be common to

more than one culture. Beerli and Marti'n (2003) introduced nine dimensions with attributes determining the perceived tourist destination image, such as natural resources, general infrastructure, tourist infrastructure, tourist leisure and recreation, culture, history and art, political and economic factors, natural environment, social environment and the atmosphere of the place. All dimensions are also included in the cultural attraction" (Kantanen, 2005). The organic image of the attraction is based on non-commercial sources of information, such as news of the destination in the media, information received, and opinions of friends and relatives. The induced image is based on commercial sources of information, like different forms of advertising and information from travel agents and tour operators" (Kantanen, 2005).

City branding used to be associated with the flight from an industrial past (Holcomb, 1993; Bramwell and Rawding, 1996), but is now linked to enhancing the urban landscape with globally branded arts and entertainment destinations, encapsulated in the 'fantasy city' (Hannigan, 1998). As Hannigan (2003) suggests, a successful brand should be instantly recognisable, play on the desire for comfort and certainty and provide a point of identification for consumers in a crowded market-place" (Richards, 2004). Major events have become a particular valuable form of cultural currency, particularly in terms of their image effects. As Hall (1992, p. 14) notes: "it is apparent that major events can have the effect of a shaping an image of the host community or country, leading to its favourable perception as a potential travel destination". This potential has been a reason for events being used as an image-enhancement tool, particularly for large cities" (Law, 1993; Holcomb, 1993; 1999; Sassen and Roost, 1999; Judd and Fainstein, 1999; Selby, 2003 in Richards, 2004). A major problem with such strategies is that their impacts are very hard to measure. This is particularly true in the case of the relatively nebulous area of city image. One of the major problems is the complexity of images; multifaceted, highly subjective and often aimed at different publics (Paddison, 1993 in Richards, 2004). Adopting Aaker's terminology of brand personality, destination personality is defined as "the set of human characteristics associated with a destination".

In the tourism literature, there has been a proliferation of destination image studies over the last three decades, but destination personality has been largely unexplored. Aaker realising this limitation and drawing on the Big Five Model of human personality, developed the brand personality scale (BPS) that consists of five generic dimensions: excitement, sincerity, competence, sophistication and ruggedness. Since then the brand personality dimensions have been applied to various settings across different cultures to gauge consumers' symbolic consumption and their effects on behaviour (Aaker, Benet Martinez and Garolera, 2001 in Ekinci, 2006). Sincerity is represented by attributes such as down to earth, real, sincere and honest. Excitement is illustrated by traits such as daring, exciting, imaginative and contemporary. Competence is characterized by attributes such as intelligent, reliable, secure and confident. Sophistication is personified by attributes such as glamorous, upper class, good looking and charming. Finally, ruggedness is typified by traits such as tough, outdoorsy, masculine and western! (Ekinci, 2006). Faced with growing global competition where destinations are becoming highly substitutable, destinations are increasingly embracing branding initiatives such as the use of taglines and logos in order to attract visitors and expenditures to their respective destination (Blain, Levy and Ritchie, 2005 in Ekinci, 2006). As places seek to become distinctive, destination personality is viewed as a viable metaphor for understanding tourists' perceptions of places and for crafting a unique identity (Caprara in Ekinci, 2006).

Brand personality influences consumer preferences, and although it's considered a metaphor used for understanding customers' perceptions about brands, there is selection of literature concerning destination personality and their image. For some authors brand image is a wider term which also includes its personality. Others consider them similar and reflecting the customers' perception about brands (Ekinci, 2006). On the conceptual side, many theorised notions of place imagery (most notably from behavioural geography, for example, Pocock and Hudson, 1978; Golledge and Stimson, 1997; Nasar, 1998), have distinguished between 'designative' and 'appraisive' components of the image. The 'designative' or informational aspect is related to the categorisation of cognitive elements of the environment. The 'appraisive' aspect is concerned with feelings, values and meanings, or what is 'felt' about a place. The appraisive component can itself be demarcated into two different components (Pocock and Hudson, 1978; Wilson, 2002)

- The evaluative (concerned with the expression of an opinion) (see Nasar, 1998; Walmsley and Young, 1998).
- The affective (concerned with the specification of a preference) (Gartner, 1993; Dann, 1996). (Richards, 2004)" (Richards, 2004).

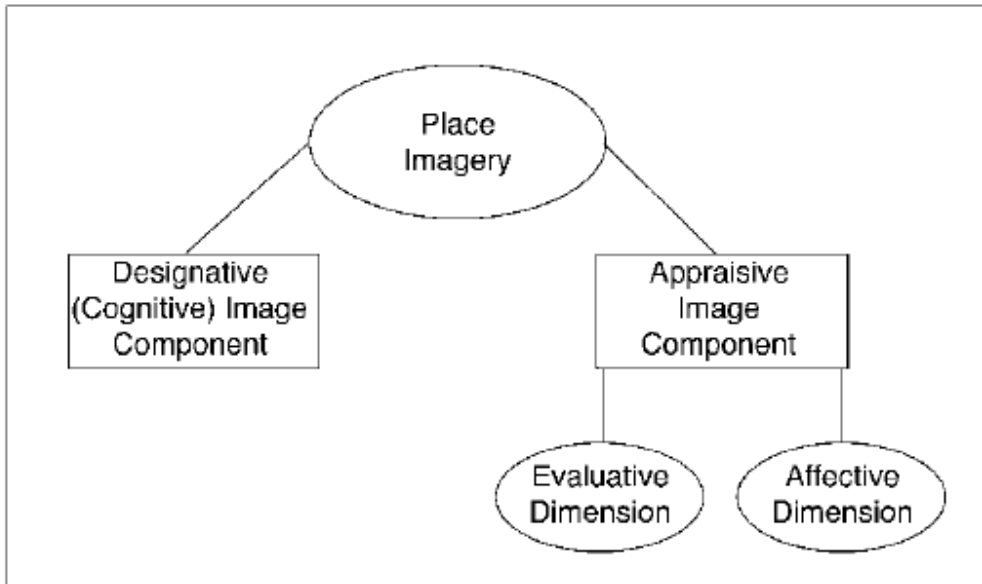

Figure 1. Components of place image.

(Richards, 2004)

In order to be successful, the message has to play a significant part in advertising. It needs to communicate what has to be known in order to make a decision regarding a trip (Stanciulescu, 2004).

CITY AS TOURIST PRODUCT – PACKAGE CONTENT

The way in which managers respond to customer's requests and needs and put together tourist products, are considered crucial decisions. These decisions influence not only profit and operations but also the firm's long term strategy, including its investment policy and human resource management (Middleton, 2001). For the tourist, the product covers the whole set of the experiences "from the moment he leaves home until he returns" (Middleton, 2001:122). So the product isn't represented by the plain seat or the hotel bed, but a whole amalgam of elements, or by a package composed by tangible and intangible elements. The package is perceived as an experienced available for a certain price. And it's five main categories are:

1. the environment and the attractions available at the destination
2. services and facilities available at the destination
3. ease of access
4. destination image
5. the price to pay.

The first category mainly motivates the tourist option influences the potential customers' motivation. It consists of natural attractions, built attractions, cultural attractions and the social attractions (e.g. way of life and locals habits, language and social interactions) (Middleton, 2001). The second category, represented by the services and facilities available at the destination allow tourists to check-in and enjoy the attractions. In this category we can include: accommodation, restaurants, local transport (taxis, busses, bike rentals and other facilities), services and infrastructure for practicing certain sports (skiing schools, navigation, golf clubs, stadiums), shops, tourist agencies, beauty saloons and spa's (Middleton, 2001). Ease of access determines in most cases the cost and speed for a tourist to reach a certain destination. In this third category

we include: general infrastructure (roads, parking places, airports, train stations, ports and aqueducts), transport equipment (size, speed and offer), operational factors (operated routes, service frequency, tariffs), government regulation for transport (Middleton, 2001). The fourth category refers to the image and attitude tourists have concerning a tourist destination. Such factors are not necessarily connected with the previous tourist experience or any other objective arguments, but these factors are considered very powerful motivators in the tourism industry. Each destination has an image, but most times this is based on passed events, and it doesn't regard the present. This is why, it is considered a very important destination marketing objective to sustain, demolish, or build images which influence potential customers' perception and expectations (Middleton, 2001). The last category is the price a client has to pay. This determines which products and services will be chosen, but it is also influenced by other factors including: season, wanted services, and from an international products' perspective, influencing factors are also exchange rates and transport method (Middleton, 2001).

Research and development activities are considered to generate and improve new technologies. This paper presents the relationship between academic and business environment in the field of research using the triple helix model and focuses on a comparison between economic and medicine researchers. Two focus groups were conducted in order to identify which are the most important aspects that determine the cooperation between academic environment and business environment regarding research activities. Despite the differences between these two universities, the conclusions reveal common characteristics of the cooperation between academic and business environment and the fact that is still room for improving this relationship.

An important issue of sustainable development of a country is the research that generates new and improved technologies. One of the most important promoters of research is the European Union, which included in its strategy to invest 3% from GDP in research. This paper focuses on the relationship between academic and business environment in the field of research. This paper presents the results of two focus groups conducted with economic and medicine researchers. The article begins by pointing out the strategy of EU regarding research, and then we present the Romanian national strategy, a short literature review is explaining the triple helix model.

Key words: academic research, focus group, triple helix,

Introduction

In the last decade, the research and development activities became a priority for the countries all over the world. The most developed countries from the world invests an important part of their GDP into research: for instance USA invests 2,5% in research, and Japan more then 3%. In order to maintain its position on the international market, its competitiveness the EU must increase its investment in research. The “Lisbon strategy” adopted by the EU is an important element settled to develop the R&D activities in all member states. In this strategy wants to transform Europe “in a vibrant knowledge economy, in order to boost economic growth, create more and better jobs and ensure lasting prosperity” (http://ec.europa.eu/invest-in-research/index_en.htm#). By this strategy, the EU wants to invest 3% of GDP in research. The 7th Research Framework Programme 2007-2013 developed by the EU has the biggest budget compared with the last FP's, having an amount of 67,8 billion EUR and 4 specific programme: Cooperation, Ideas, People and Capacities. Another source of funding for R&D comes from philanthropic sources (foundations, trusts, charities, non-profit organizations, corporate and individual donors, alumni). Countries like UK and Sweden covers more then 16% of R&D expenditures from such funds, but the average amount in the EU is only 4,2% (http://ec.europa.eu/invest-in-research/policy/expert_en.htm). Moreover, European Union published in 2008 a report on the best practice in financing academic research from philanthropic sources called “Engaging Philanthropy for university research”.

After Revolution, Romania's R&D system faced a continuous transition. According to the Ministry of Education and Research statistics in Romania there are 590 research units (including here national institutes for R&D, public institutions, institutes for R&D, and companies). In 2002 the Government issues the 57 ordinance regarding scientific research and technological development, in which it is presented the National Strategy for R&D. In this strategy, the R&D constitutes a national priority and has a determinant role in the sustainable development of the economy. The source of financing the research activities comes from government funds, private funds (from the private companies), and international funds. Also, the government seeks cooperation between academia, universities, research and industry in order to integrate the research results by:

- stimulating the realization of the research themes by common teams from R&D units, universities and academia
- stimulating to finance with priority the themes that have an immediate applicability, demanded by the industry,
- designing programmes for students and pupils in order to participate at training stages and practical activity in the R&D units
- developing of technical assistance services between R&D units and companies that uses the results of R&D
- participation of the researchers and specialists from R&D units to the postgraduate training,

The triple helix model
