Measurement of the association between the indicators expressing the performances of the travel and tourism industry and economy and the scores expressing the competitiveness of the natural resources in the CEE countries shows rather poor relationships between these variables in the cases of the gross domestic product and travel and tourism economy (r=0.27), and employment and travel and tourism economy (r=0.22), respectively very poor relationships in the case of the employment and travel and tourism industry (r=0.11) and gross domestic product and travel and tourism industry (r=0.07).

A more effective employment of the natural resources available in the CEE countries seems to not determine a significant improvement in terms of the macroeconomic performances generated by the travel and tourism industry and economy (gross domestic product growth and/or a higher number of newly created workplaces). Or, in other words, CEE countries should orientate their efforts, on a shorter-term perspective, toward the improvement of the business environment and infrastructure, respectively the regulatory framework as these appear to be the major determinants of their overall travel and tourism competitiveness.

Association between the number of the international tourist arrivals and the international tourism receipts and the scores expressing the competitiveness of the natural resources in the CEE countries shows also a very poor relationship between these variables (r=0.06, respectively r=0.11). These results may suggest the necessity for these countries to expand the specific efforts of preserving, promoting and taking advantage of their available natural resources. In spite of the less significant present, these resources should become one, considering a medium or a long-term horizon, one of the most important motivators of the international tourists in their selection of the CEE countries as destinations for the travel and holidays to be made.

Table 2. Major determinants of the natural resources pillar competitiveness

Country	TTC	13NR	1301	1302	1303	1304
Czech Republic	4.86	5.41	0	15.8	4.3	390
Estonia	4.83	2.26	0	31.1	5.5	327
Slovenia	4.53	2.68	1	6.5	5.3	396
Hungary	4.45	3.92	1	5.6	4.0	383
Slovakia	4.34	2.69	2	19.6	4.5	401
Latvia	4.31	2.11	0	14.1	5.3	346
Lithuania	4.30	2.39	0	6.1	4.9	319
Bulgaria	4.30	3.13	2	9.5	3.8	447
Poland	4.18	5.08	1	23.6	4.1	398
Romania	4.04	2.85	1	11.3	3.7	439

Notes: TTC – Travel and Tourism Competitiveness Index; 13NR – Natural Resources; 1301 – Number of World Heritage natural sites; 1302 – Protected areas; 1303 – Quality of the natural environment; 1304 – Total known species; countries ranked in the descending order of the TTC index.

According to the Travel and Tourism Competitiveness Report, variables describing the content of the natural resources pillar are the number of UNESCO natural World Heritage sites, the protected areas, the quality of the natural environment and the total known species. Measured correlations between each of these variables and the general competitiveness of the natural resources illustrate a moderate association in the cases of the quality of the natural environment (r=0.47), the number of the World Heritage sites (r= -0.45), and the total number of the known species (r= -0.40), respectively a rather moderate association in the case of the percentage of the protected areas in the total surface of the country (r=0.33). The inverse connection between the competitiveness of the natural resources competitiveness and the number of the World Heritage sites and the total number of the known species, although surprisingly to a certain extent, indicate that CEE countries could seize the opportunities created by the relative scarcity of these elements: international tourists could probably be more interested and to visit a destination where the natural environment has provided less places registered as World Heritage sites and/or hosts a lower number of animal species.

Assessment of the correlations between the factors used in the TTC Report 2009 to describe the content of the natural resources pillar and the overall competitiveness of the travel and tourism industry in the CEE countries had led to the following, and again surprising, results:

-there is a moderate and inverse correlation between the overall competitiveness of the travel and tourism industry and the number of the World Heritage natural sites in the investigated CEE countries (r=-0.45); apparently, a lower number of the natural sites registered by UNESCO (at least by comparison to other tourist destinations worldwide) should transform these countries in more attractive destinations for the international tourists, generate higher receipts (and revenues) and influencing in a favorable manner the overall competitiveness of the travel and tourism industry;

-the correlation between the protected areas and the overall competitiveness of the travel and tourism industry in the CEE countries can be characterized as a rather moderate one (r=0.33); it could be expected that an increase in the percentage covered by the protected areas in the total surface of the countries would determine a positive evolution but not in the same measure significant of the travel and tourism industry's competitiveness. Maintaining and expanding the areas of land and/or sea especially dedicated to protect and preserve the biological diversity and natural resources should determine a slightly reasonable increase of the CEE countries competitiveness as tourist destinations;

-the correlation between the quality of the natural environment and the overall competitiveness of the travel and tourism industry in the selected CEE countries can be characterized as a moderate one (r=0.47); an improvement of the natural environment quality will determine a moderate effect at the level of the overall competitiveness of the travel and tourism industry of these countries;

-finally, the correlation between the total known species of mammals, birds and amphibians and the overall competitiveness of the travel and tourism industry in the CEE countries can be characterized as a moderate but inverse one (r=-0.40); like in the case of the natural World Heritage sites. countries registering a lower number of known species, at least by comparison to other tourist destinations worldwide, should be more attractive as tourist destinations, generate higher receipts and revenues and being more competitive in terms of their travel and tourism industry.

Conclusions and Future Directions of Research

Although their overall scores vary around the determined average value, the investigated group of CEE countries form a relatively uniform assembly in terms of their travel and tourism competitiveness characterized through a higher attention given to the appropriateness of the business environment and infrastructure and the regulatory framework and a less concern for capitalize the existing natural heritage. The overall scores registered by these countries according to the TTC Report 2009, place them in the middle area of the hierarchy built in terms of the travel and tourism competitiveness.

Natural resources are related, surprisingly, very poorly to the overall competitiveness of the CEE countries seen as travel and tourism destinations although it would have been expected a more consistent contribution in this respect. Knowledge as well as the capacities for an effective employment of the natural resources become both essential for the CEE countries in their attempts to transform this category of resources in a critical driver of their travel and tourism competitiveness.

A lower number of the natural sites registered by UNESCO in the World Heritage, and a lower number of known species (at least by comparison to other tourist destinations worldwide), as well as an expanded surface of the protected areas and an overall better quality of the natural environment should transform these countries in more attractive destinations for the international tourists, generate consequently higher receipts and revenues, and exerting a favorable influence over the competitiveness of the travel and tourism industry.

Further directions of research to be followed refer to the:

-identification of a more adequate set of determinants of the natural resources competitiveness, including, on a hand, some of the elements considered by the TTC Report methodology (such as the enforcement of the environmental regulation or the number of the threatened species) and, on another hand, new elements besides the existing ones considered by the TTC Report methodology in order to allow a better measurement of the natural resources impact over the competitiveness of the travel and tourism industry;

-conducting of a benchmarking analysis of the travel and tourism industry's competitiveness in the selected CEE countries having as reference the most important world tourism destinations and taking into consideration the elements describing the natural resources and their contribution to the industry's competitiveness.

THE ANALYSYS OF THE EVOLUTION AND TENDENCIES OF RETAIL MARKETS, WORLD WIDE AND IN ROMANIA

Bălășescu Marius

Str. Ciucaş, 38, Mun. Săcele, județul Brașov Transilvania University of Brasov Economic Sciences Faculty sala AIII7 – Colina Universității , corpul A, etajul III, Brașov, f-economic@unitbv.ro 0268419304

The present work aims presenting and analyzing the evolution and tendencies of retail markets all around the world, but mainly in Europe and in Romania. Under these circumstances the major objectives of the work are: clarification of retail market concept; evolution and tendencies of retail markets world wide, in Europe and in Romania; effects of the economic crisis on retail markets in Romania.

Keywords: market, retail, evolution and tendencies, consumption, crisis.

JEL code: M

1. General consideration

Contemporary economy, by the means of the complex phenomena it generates, leads to a continuous evolution of the methods and forms of distribution. Therefore, permanently show up new forms of selling, as well as new distribution systems. Besides new forms of selling, new visions and perspectives appear in commerce. So, by this point, retail meant a form of small quantities selling. Nevertheless, retail market refers to consumption goods market (final consumption goods), goods that are sold either by en-gross distribution forms, or by retail distribution forms, or by any forms of distribution and selling that reach the final consumer.289

A brief analysis of the way the distribution systems evolved in different countries of the world emphasizes that in all areas of the world distribution has become progressively an extremely dynamic sector. We may state that the commercial apparatus suffered profound mutations, implying a continuous evolution of selling methods, distribution forms, geographic expansion, company administration, and so on.290

The appearance of modern ways of organization of the commercial activities is due to the continuous growth of competition and consumers' needs. Companies realized that without restructuring activities, remake strategies and thoroughly analyze commercial markets, cannot survive.

The modernization process of distribution circuits in Europe started in the northern countries in the 60's and gradually expanded towards Mediterranean countries. This evolution which allowed a well concentrated and organized method of distribution, determined the appearance of new operators with the following features:

- Large dimensions (supermarkets, hypermarkets, large specialized stores).
- Highly automated operations.
- Retail units covering a region or an entire national territory.
- Larger selling and service areas.
- Sophisticated methods of supplying, especially for well known branded goods.
- Internationalization of distribution, both conceptually and logistically.

2. Evolution and tendencies of retail markets around the world

Once with the expansion of distribution and commerce companies and with their systematic development increased the **concentration** of the companies in the domain. In Luxembourg, for example, 96.7% of the market is owned by top 5 companies in distribution. At the opposite pole are the countries in Central and Eastern Europe. (Figure 1)

²⁸⁹ Balasescu M,Balasescu S,.-Restructurarea activitatilor din domeniul distributiei bunurilor de consum final in conditiile integrarii Romaniei in Uniunea Europeana.Ed Tehnica a Moldovei,Chisinau,2005,pag 13

²⁹⁰ Patriche D. – Bazele comerțului, Ed. A.S.E. București, 2004 – cap.1 Distribuția mărfurilor, pg.15

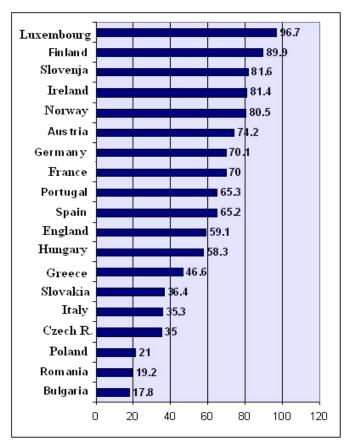

Figure 1. Concentration of the European retail markets in 2005 (share of top 5 retailers, %)²⁹¹

The statement according to which the concentration degree is directly connected to the level of economic development must be moderately accepted. The relatively small selling areas per individual in the U.K. are not a proof of underdevelopment, but one of a very specialized distribution system. Actually, this country registers the higher consumption rate outside households in Europe, and restaurants are the main competition of the superstore. Concentration's effects are also visible in the goods acquisition domain by the decrease of national groups and maximum focus, and on the other hand by creating international buying groups (euro-groups). More than this, buying groups join, aiming:

- Common exploration of the market.
- Identifying European producers.
- Increasing the power of buying and the presence on the market of the members.
- Sharing logistic resources, as well as administrative, financial, and marketing ones, in order to optimize the acquisition of goods.

Globally speaking, concentration is a bit different. There are markets on which concentration is very high, meaning top 5 retailers owning 85.31% of the sales in the country (e.g. South Africa), and important markets on which concentration is relatively low. For example, on an important market such as China, the top 5 retailers own 5.74% of the sales. (Table 1)

Table1. Sales volume on the 20 most important markets in 2006 (€ million)²⁹²

	Top 5	Others	Total		Top 5	Others	Total
USA	416,853	966,135	1,382,988	Russia	10,780	89,741	100,521
Japan	114,433	514,118	628,551	Spain	57,705	35,674	93,379
China	16,825	376,230	293,055	Mexico	27,471	63,794	91,265
UK	139,017	153,644	292,661	Canada	55,778	43,871	99,649
France	151,289	75,556	226,845	South Korea	26,610	76,361	102,972
Germany	146,022	72,673	218,695	Indonesia	3,105	20,325	23,430

Italy	38,249	68,431	106,680	Turkey	7,019	27,171	34,190
Brazil	18,427	51,943	70,370	Poland	10,547	36,000	46,547
Netherlands	20,976	15,492	36,468	South Africa	17,355	2,988	20,342

Concerning sales on regions world wide, we may state that the European, North American and Asian markets are equal in dimensions (Figure 2), but different when it comes to concentration. (Table 2). In North America, the top 10 retailers own 41.14% of the sales, while in Europe 32.49%, and Asia only 13.76%.

17	Walgreens	USA	39,751				

Globally speaking, we may state that almost 32% of the total retail sales volume is owned by the most important 30 retailers. There are some other preoccupations meant to differentiate the retailers' offer from the one of different players on the market. Therefore, private labels and their development and administration, is the latest preoccupation of retailers.

Introducing private labels on the global market is increasing without stop, as a study realized by Planet Retail shows, called: "Private Label Trends Worldwide". The phenomenon is positively influenced by globalization, concentration and consolidation. In other words, private labels spread more and more, as international retailers strengthen their position on the market and export their ranges of products on new geographical markets.296

The development level of private labels touches the highest values in Europe (especially in the Occident), followed by North America. In spite of this, South America and Asia-Oceania, are far behind.

A market study realized in Europe in 2006, called "European Retail and Foodservice Trends" shows that consumption in Europe had a value of 1015 c billion, being estimated for 2007 at 1088 € billion. The predictions for the following years show that there are small increases in consumption. According to the same source, modern trade will continue to dominate the retail market in 2010 and own approximately 70% of the total consumption goods sales.

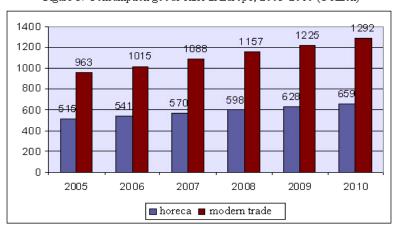

Figure 3. Consumption goods sales in Europe, 2005-2010 (€ billion)

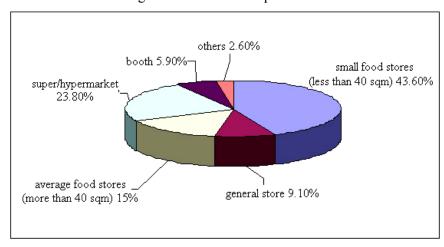

(Figure 3). 297

On the Romanian retail markets, modern forms of trade are small in comparison to other European countries (Figure 4), but they are fairly dynamic. Therefore, the percentage of hyper and supermarkets in the total sales volume of consumption goods reached the value of 23.8%. The attraction of Romanians towards modern forms of distribution and commerce is very high, representing a new form of relaxation and entertainment. Romanians caught the "shopping" fever, which has become for more and more people a new way of spending spare time.

^{296 &}quot;Piata" Magazine, no. 35, 2007.

^{297 &}quot;Piata" Magazine, no. 35, September, 2007.

Figure 4. Share of sales per distribution forms ²⁹⁸

Even though the growth of the Romanian retail market is high, specialists say that it is still immature and that only in 2010-2012 it will reach its maturity. This maturity implies, taken under consideration the experience of neighbor countries (Poland, Czech Republic, Hungary and Slovakia), that shop networks to stop investing in new locations and start transactions between themselves. Nowadays in Romania, big retailers head towards smaller provincial cities, where traditional commerce still rules.

3. The effects of the economic crisis on Romanian retail markets Romanian retail markets will grow up suddenly due to the economic crisis

Retailers' profits on local market will decrease consistently in the following 2-3 years, reaching a normal level of 1-3%, as a result of the consumption reduction with more than 20% in the context of the global economic crisis. Retail industry has normal profits of 1-3%, but Romania is a great exception, net profits reaching even 50%. Things will change in the following 2-3 years in which consumption demand reduction is clear in parallel with competition growth in the domain.

The reduction of the operational profit will attest the achievement of a mature stage in the retail market in Romania, which needs a few adjustments due to the new macroeconomic conditions. More than this, in the following years a reduction of the consumption is expected with 20-30%, as it happened on the foreign markets after the strike of the crisis.

Retailers will confront this year with financial problems and many of them will find impossible completing the announced and already started projects. Meanwhile, banking market is blocked and so are 90% of the retail credits. Retailers will be forced to change their development plans and reduce profits in order to survive and to adjust selling points to the new conditions on the market.

2009 will be characterized by a deceleration of the expansion process of commercial chains, most retailers stating that difficulties met by constructors and/or retailers in finding finances are the main issue. Nevertheless, expansion plans for 2009 announced by 25 big retailers show a decrease of 9% of the expansion rhythm, compared to 2008: 162 locations compared to 176 in 2008 (expansion by acquisition is included).

This year will be a rather difficult one especially for local networks, confronted with the alert expansion of the international chains on a market that is shaken by the global financial and economic crisis.

THE EVALUATION OF ATTITUDES AND OPINIONS OF RETAIL COMPANIES MANAGERS IN BRASOV REGARDING THE USE OF MARKETING INSTRUMENTS

Bălăsescu Simona

Str. Ciucaș, 38, Mun. Săcele, județul Brașov Universitatea Transilvania din Brașov Facultatea de Științe Economice sala AIII7 – Colina Universității , corpul A, etajul III, Brașov, f-economic@unitbv.ro 0268419304

As a consequence of the present economic crisis situation, identifying new means of improving the activity of retail companies is a must. Marketing is considered to be one of the most profitable investments, its results having a positive influence on long term, but in Romania, marketing in the true meaning of the concept is only used by companies which can afford it, which have sufficient funds. A small shop chain or a company with only one selling point consider marketing a luxury that is not worth the effort. The present work emphasizes companies with marketing activity, as well as the marketing instruments used by retailers and the marketing intermediaries, if they exist.

Keywords: economic crisis; retail; marketing instruments; information.

JEL code: M.

1. Introduction

In order to have a clearer opinion on the present situation of the Brasov retail market, a quantitative marketing research was done amongst retail companies. At the basis of this research stood the statement or hypothesis that retail companies' managers use, in most cases, adequate marketing instruments. Using these instruments, as well as using marketing, can lead to a diminution of the negative effects of the economic crisis that our country is going through. The quantitative research was done after a qualitative research, a focus-group amongst retail companies' managers. The results of the focus-group imposed a secondary research, the quantitative one, briefly presented in this work, in order to obtain a better observation and understanding of the phenomena on the retail market. A profile of the consumer was also drawn. When it comes to this profile, all subjects characterized the consumer by the means of one word. Therefore, the consumer's complete profile is: snob; pretentious; undecided; and susceptible to influence. In other words, the profile of today's client is as follows: clients want high quality, low prices and very short terms of delivery. This profile makes thing even harder for retailers, given the context they confront with. The focus-group lead to obtaining a set of hypotheses that set the basis for the quantitative research. One of the main hypotheses is that marketing is highly important for all companies. The usage of marketing leads to improving activity on the markets. The importance given to marketing instruments, strategies and plans emphasizes the fact that in our country marketing activity has become a primary condition for the success of any company.

From the aspects of the quantitative research, are underlined through the present work only the most important ones that allow drawing a clear opinion on the retail activity in Brasov.

2. Methodological considerations regarding sampling

The quantitative marketing research was done on a representative sample of 384 subjects, with an error of \pm 5%. The exactness of the sample was assured by giving equal chances to all individuals of taking part to the research. This leads to a minimization of the subjective elements in the selection process, by using the principle of random draw.

2.1. The population and its size

The analyzed population is formed by all active retail firms in Brasov. From the selected companies were interviewed only General Managers, Executive Managers or Marketing Managers, in the case of companies that have marketing departments. The structure of the population is as follows:

Table 1. Structure of active companies registered in Brasov²⁹⁹

Class	Lei	No.	Retail form	No.
Small	0 - 250.000 lei	2648	Food	1239 (46.7%)
		(75.77%)	Non-food	1409 (53.3%)
Average	250.001 – 800.000 lei	500	Food	248 (49.6%)
		(14.3%)	Non-food	252 (50.4%)
Large	More than 800.000 lei	347	Food	178 (51.3%)
		(9.93%)	Non-food	169 (48.7%)
Total		3495		3495

²⁹⁹ Camera de Comerț și Industrie Brașov, 2009.

2.2. Choosing the method of sampling

Proportionally random multistage sampling was used in order to create the sample, taking under consideration 2 aspects: the size of companies and the retail form.

Table2. Structure of the sample by turnover and retail form³⁰⁰

Class	Lei	No.	Retail form	No.
Small	0 – 250.000 lei	291	Food	133 (45.7%)
		(75.8%)	Non-food	158 (54.3%)
Average	250.001 – 800.000 lei	54	Food	27 (50%)
		(14.1%)	Non-food	27 (50%)
Large	More than 800.000 lei	39	Food	20 (51.3%)
		(10.2%)	Non-food	19 (48.7%)
Total		384		384

3. Presenting relevant questions in the research

The research had a questionnaire of 41 questions. Out of these, the most relevant ones are presented:

How much is your company interested in gathering marketing information in order to conceive marketing actions?

Table3. Frequency of preoccupation towards gathering marketing information

How much is your company interested in gathering marketing information in order to conceive marketing actions?

		Frequency	Percent
		Trequency	LOLOGIE
Valid	very little	19	4,9
ı	2	24	6,3
ı	3	40	10,4
l	4	63	16,4
l	5	97	25,3
1	very interested	141	38,7
	Total	384	100,0

From the results we may see that 4.9% of the subjects claim that their companies are very little interested in gathering marketing information in order to conceive marketing actions, while 36.7% are very interested in gathering information. So, we may state that retail companies in Brasov that have marketing departments collect marketing information from the market. The information is used in conceiving marketing actions and in developing activities per se.

Do you own a clients data base, at the moment?

Table4. Frequency of owning a clients data base

Do you own a clients data base, at the moment?

		Frequency	Percent
Valid	no	95	24,7
	yes	289	75,3
	Total	384	100,0

From all analyzed companies 24.7% do not own a clients data base, while the rest of 75.3% do. This means that retail companies in Brasov are interested in knowing information about their clients, most retailers owning data bases of their own clients. The preoccupation towards owning clients data bases emphasizes the importance given

to having devoted clients. Having under consideration the present situation of economic crisis, the development of the market is slow down, and having devoted clients is an essential condition for surviving on the market.

How often do you appeal to information in mass-media in order to know what happens on the market you act?

Table5. Frequency of informing from mass-media

How often do you appeal to information in mass-media in order to know what happens on the market you act?

		Frequency	Percent
Valid	daily	315	82,0
l	weekly	42	10,9
l	monthly	23	6,0
	do not use this kind of information	4	1,0
	Total	384	100,0

82% of the analyzed companies appeal daily to information in mass-media in order to know what happens on the market they act, 10.9% appeal weekly, 6% appeal monthly, while only 1% of the companies do not use that kind of information. From here results that companies are permanently interested in the events on the market they act, mass-media being an important resource of information. Retail companies in Brasov are preoccupied in staying informed because of the possible threats that need to be foreseen, as well as the opportunities that can show up. Any information connected to the domain of retail can lead to a development of companies' activity, despite the economic crisis. Knowing the market is vital, given the strong competition.

How much are your suppliers willing to give you useful marketing information?

Table6. Intensity of the information exchange between suppliers and retailers

How much are your suppliers willing to give you useful marketing information?

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	very little	121	31.5	31.5	31.5
	2	95	24.7	2 4.7	56.3
	3	37	9.6	9.6	65.9
	4	70	18.2	1 8.2	84.1
	very interested	61	15.9	1 5.9	100.0
	Total	384	1 00 .0	1 00.0	
Total		384	1 00 .0		

A lack of communication is noticeable between suppliers and retailers, as the retailers state. A very significant percentage of subjects, more precisely 31.5%, claim that their suppliers are not so interested in sharing useful marketing information, while only 15.95% of the subjects claim that their suppliers are very interested in this matter. The lack of efficient communication between business partners, in our case suppliers-retailers, is not a beneficial to neither of them when it comes to the activity on the market, but it only sets barriers in the way of developing and improving partnership relations.

Please evaluate the influence of the economic crisis on your market activity:

Table 7. The intensity of the crisis effects on the activity of retailers on Brasov market **Please evaluate the influence of the economic crisis on your market activity**:

		Frequency	Percent
Valid	very much	155	40,4
l	much	113	29,4
l	little	67	17,4
l	very little	35	9,1
	does not affect the activty of the company	14	3,6
	Total	384	100,0

40.4% of the subjects consider that the present financial-economic crisis can affect the activity of their companies very much; 29.4% of the subjects consider that the crisis will affect their activity significantly, while 17.4% of the subjects state that the crisis will have a little influence on their companies and 9.1% go for very little influence, and only 3.6% state that the crisis will not affect the activity of their companies.

How much does marketing can help getting through the present economic crisis?

Table8. The importance of marketing in getting through the economic crisis

How much does marketing can help getting through the present economic crisis?

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid very little	19	4.9	4.9	4.9
2	28	7.3	7.3	12.2
3	43	11.2	11.2	23.4
4	109	28.4	28.4	51.8
very much	185	48.2	48.2	100.0
Total Total	384 384	100.0 100.0	100.0	

4.9% of the subjects consider that marketing can help very little in getting through the present economic crisis, while 39.3% of the subjects claim that it can help very much. It is visible that most of the subjects consider marketing very useful in diminishing the negative effects of the economic crisis. This aspect will lead to a development of marketing activity at the level of retail companies in Brasov, in the nearby future.

4. Conclusions

The present situation on the retail market in Brasov is to become more and more difficult for most companies in the domain. Staying informed regarding the events on the market as well as the struggle to have devoted clients certify that retailers fight not for supremacy, but for survival. Marketing instruments, such as data basis, marketing strategies, and so on, used by retailers confirm the hypothesis referring to the importance given to marketing in developing the activity of any company. Most managers of retail companies in Brasov claim that by an efficient marketing activity the negative effects of the economic crisis can be diminished and even eliminated. The insufficient communication and cooperation regarding information exchange between business partners, such as suppliers and retailers, in a real threat to the development of the activity of retailers in Brasov.

The impossibility of an extensive expansion as a result of the financial blockage and the deceleration of the demand impose an intensive development of retailers. Therefore, the fight is not only for finding new clients, but also for having the devotion of the actual clients. In the context of economic crisis, retailers who know how to better use marketing instruments and limited resources that they posses will gain the confidence of clients as well as market share. Nowadays, the focus is on services that lead to winning clients' devotion.

The results of the present study can be used as a source of information for all retailers in Brasov and not only, regarding the phenomena on the local retail market. Educating retailers in the direction of using marketing instruments and marketing per se can lead to a diminution of the crisis' effects.

THE INFLUENCE IN ROMANIAN HOSPITALITY INDUSTRY OF SMALL MEDIUM-SIZED FIRMS AND THEIR SPECIFIC MEANS TO IMPROVE PERFORMANCE

Băltescu Codruța Adina

SMEs play an important role in fostering variety, self-fulfillment, and independence in society as well as essentially contributing to social and local integration. Because the tourism sector, especially the hospitality industry, in Europe is dominated by SMEs, inevitably each tourism destination represents an amalgam of the SMEs providing tourism products and services. SMEs are also claimed to be a key factor in the development of tourism destinations, but they also face a number of challenges. Implementing marketing strategies in real-life SMEs firms overcome the talking-doing gap and the problems created by a turbulent environment and by the weaknesses of the firms' structural and systemic mechanisms.

Keywords:small medium-sized enterprises, tourism, performance, Internet

JEL Classification: M

1. Introduction

According to an EU recommendation (European Commission 2003), SMEs are classified into three categories—micro enterprises, small enterprises, and medium-sized enterprises—based on four criteria. Applicable to all are the number of employees, annual turnover, and total balancesheet. The fourth criterion, independence, is applied only to small- and medium-sized enterprises categories³⁰¹. The details of the criteria are outlined in Table 1.

Table 1. Definition of Small and Medium-sized Enterprises (SMEs)

A small hotel is financed by one individual or small group [and is] directly managed by its owner[s] in a personalized manner and not through the medium of a formalized management structure. It may or may not be affiliated to an external agency on a continual basis for at least one management function. In comparison to the largest unit of operation within the hotel industry it is perceived as small, in terms of physical facilities, production and service capacity, and number of employees.³⁰²

2. Challenges and opportunities facing SMEs in the tourism sector

The SME sector is regarded as fundamental to the competitive development and as the backbone of the European economy. As stated by the European Commission, "SMEs make a significant contribution in terms of competitiveness, research, innovation, skills and employment" Furthermore, SMEs are claimed to contribute significantly to the productivity and growth of large enterprises as they increase competition, add to a diversity of enterprises, and adapt new technology and ideas developed in other enterprises³⁰⁴. Because the tourism sector in Europe is dominated by SMEs, inevitably each tourism destination represents an amalgam of the SMEs providing tourism products and services³⁰⁵. Romania is no exception in this.

SMEs are argued to be well suited to tourism, but they also face a number of challenges. As far as their suitability for tourism is concerned, small business owners have personal contacts with their customers, and they are therefore able to respond rapidly to customers' needs and demands. They provide an interface and a contact between local

culture and tourists and thereby contribute in communicating the particular characteristics of their destination. As SMEs are flexible because of their size, they are also able to provide customized products and services. In addition, through SMEs, tourism expenditure reaches the local economy rapidly ³⁰⁶.

Turning to the challenges, SMEs in tourism, including those in Romania, and like SMEs elsewhere, face a shortage of financial resources, a lack of management and marketing skills, and a lack of industry expertise and strategic vision.

3. The hospitality industry overview in Romania

According to the European Commission, the European tourism industry is dominated by small medium-sized enterprise (SME) organizations, with more than 99% of firms employing less than 250 employees and about 94% employing less than 10 persons. On average, tourism SMEs in Europe provide jobs for 6 employees (microenterprises). Of the total turnover generated by SMEs in Europe, 6.5% is sustained by tourism SMEs. As tourism is a labor-intensive industry, any improvement in performance will enhance employment levels, which, in turn, will enhance competitiveness at the national level³⁰⁷.

In our country the small and medium-sized firms account 99,8% of the total units acting on this market, out of which the micro and small enterprises represent the majority (Table 2).

Table 2. Active enterprises in the "Hotels and Restaurants" activity, by size class (number units)

Furthermore, the analysis of the units type suggests that the small establishments of tourist reception with functions of tourists accommodation, such as tourist villas, urban and rural tourist boarding houses, tourist chalets, bungalows, hostels and hotels for youth dominate the romanian lodging industry, by representing more than 70% of total active units in 2006 (Table 3).

4. Improving business performance in hospitality SMEs

The importance of SMEs for tourism in Europe is clear. At least in terms of numbers they dominate the tourism sector. They do, however, lack resources.

An analysis performed recently among the SMEs in the tourism industry outlined the following issues:³⁰⁸

- Enterprises are seldom, if ever, self-sufficient, and they need to exchange resources to survive.
- Start-up enterprises are particularly in need of adequate externally sourced resources.
- SMEs intending to internationalize are often held back because of a lack of appropriate resources.
- Resource dependence theory suggests that a possible way of managing dependencies is to *enact* its environment. Enacting means that by responding to environmental and resource factors organizations attempt to reduce uncertainty by minimizing their dependencies. Strategic planning is one possible way of "enacting" the environment. It was assumed that those SMEs that plan their operations would be more aware of the demands in their environment and would be able to respond to them better. Therefore, they would be less dependent on external resources than SMEs that did not make plans.
- Growing SMEs have a greater need for external resources than do enterprises that do not aim to grow. Use of external resources may increase an SME's dependence on resource providers. Therefore, enterprises' plans for the future were expected to explain differences in the extent of resource dependence between enterprises.
- Cooperation not only is considered to be an important factor in helping small enterprises achieve economies of scale and expand their business but also is believed to be important for their mere survival. SMEs might need to cooperate with other organizations to gain the resources they require. Cooperation is a means for an organization to decrease its dependency on external resources.

The following actions provide a way to overcome the number of challenges:³⁰⁹

- Collect the relevant information to support financial decision making. In essence, operators will be better equipped to formulate performance measurement strategies if they work with appropriate information.
- Build a customer profile. Operators are not able to set effective customer related indicators and targets unless they have a good understanding of their customer base. SMEs should be aware of who their customers are, where they come from, what they expect from a visit, and whether they will return.
- Investing in staff is essential. Operators should think more about their internal business processes and enable them to form more effective performance measurement strategies across the business as a whole—in terms of the guest/staff relationship, encouraging innovation, and facilitating learning, as well as refining internal operations.

A study carried out among 242 small firms in the tourism accommodation sector in Canada indicates that success requires an emphasis on both transaction marketing and interaction-based relationship marketing to acquire customers and achieve sales growth. More contemporary practices such as database marketing, e-marketing, and network marketing are in evidence, but they are not found to influence performance. Furthermore, it is success with customer acquisition rather than customer retention that leads to profitability for these firms. On one hand, these firms focus their efforts on establishing and developing relationships at an individual customer level based on face-to-face and interpersonal contact. On the other hand, they also focus on managing their offer to attract customers in a more arm's-length and impersonal manner, and invest in internal marketing assets to develop classic marketing mix capabilities. The findings for e-marketing and database marketing support reports that the tourism industry may not be using online or database technology to its full advantage, although some level of implementation is apparent across most firms. The lower level of network marketing (a practice requiring interfirm cooperation) is also consistent with the high proportion of independent operators in the study. Finally, when certain practices are implemented (e.g., database marketing and network marketing), this tends to be with somewhat larger firms; firms likely having a greater resource base for such activities.

 $³⁰⁸ Seppala-Esser,\,R.,\,Airey,\,D.,\,Szivas,\,E.,\,The\,dependence\,of\,Tourism\,SMEs\,\,on\,\,NTOs-The\,case\,\,of\,Finland,\,Journal\,\,of\,Travel\,Research,\,March\,\,2009,\,p.1-14.$

Turning to the marketing practice-performance relationship, the study shows four interesting results. First, customer retention is positively associated with interaction marketing, whereas customer acquisition is positively associated with both interaction marketing and transaction marketing. Consequently, the interaction form of relational marketing is effective as both an offensive and defensive strategy, whereas transaction marketing is an effective offensive strategy. Second, customer acquisition is positively associated with sales growth, whereas retention is not. Third, only sales growth (and not customer retention) is positively associated with profitability. Fourth, although the sample was dominated by smaller firms, the findings for the practice-performance relationship are independent of firm size. These results suggest that for tourism accommodation firms, (a) customer acquisition appears more important to financial success than customer retention, and (b) transaction marketing is still relevant to the customer acquisition process. Given the findings, the conclusion is that tourism accommodation firms profit from sales growth, generated by the use of interaction marketing and transaction marketing, to attract customers. Furthermore, investment to retain customers seems inconsequential for the firms in the study regardless of firm size or market served. Despite increased attention in the literature on newer forms of practice such as database marketing, e-marketing, and network marketing, and the fact that they are all implemented by the firms in the sample, these forms of marketing appear to have no impact in terms of either directly influencing performance or enhancing the effect of transaction marketing and interaction marketing³¹⁰.

From the early stages of the internet's commercial use several authors outlined the unprecedented opportunuties for small businesses. It was suggested that the internet would assist organizations in the areas of communications, personnel, sales, advertising and business intelligence. Those observers thought the internet would support innovative small businesses and even individual entrepreneurs in developing 'virtual size' so that they could compete with much larger corporations. The outcome would be that all businesses would effectively become worldwide enterprises regardless of whether they wished or planned for such globalization. ³¹¹

In comparison to other industries, the tourism and hospitality industries have traditionally been relatively slow on the uptake of new information technologies. This has especially been the case amongst small to medium-sized tourism enterprises (SMTEs). In many respects, the major impediments to SMTEs' uptake of the Internet appears to be the confusion caused by the masses of information concerning e-commerce, Internet marketing, online promotion and the plethora of solutions currently available, as well as issues related to the adoption of new technologies, the initial financial burden of uptake, the structural nature of the market and problems with content and design. If SMTEs are to remain competitive they need to overcome these impediments and they must decide on how to strategically use the Internet as an important marketing tool. Many of these businesses have few clients to manage at any one time and accounts are open for short periods of time compared to other credit dependent industries, therefore there has been little need for advanced software applications. There are many cost-effective promotional opportunities afforded by the Internet, and the demographic similarities between Internet users and consumers of tourism and hospitality goods and services is obvious. Some of the steps to follow include³¹²:

- Developing a site (defening the website's objectives, clearly identifying the target audience, establishing the buyer-readiness stage of the target audience, developing simple and persuasive messages, answering all of the most frequently asked questions, avoiding the use of gimmicky technology, promoting the website).
- Distribution. Searching and indexing of the Internet is now dominated by a handful of large players (Yahoo, Google). In addition to these mainstream search facilities, there are a growing number of specialist search engines and directories offering highly targeted distribution to particular businesses such as those within the tourism and hospitality sector. The only way to increase the distribution of the independent site is to list the URL in as many relevant places as possible.
- Joining a special-interest site/portal.

5. Conclusions

_

This paper outlines that managers within best practice SME tourism, hospitality, and leisure organizations who wish to develop effective performance measurement systems should incorporate digitization, holistic approaches, and well-trained and motivated staff into the process. Managers should aim for digitization to enable the swift and accurate retrieval of information from financial and management information systems, a system that would, in turn, allow for greater operational control. Financial, customer- related, internal business process and innovation and learning should not be measured in isolation but must be viewed as part of a whole. Staff should be acknowledged in the formation and performance measures. Well-trained and empowered staff enhance the guest experience, track and evaluate the effectiveness of internal business processes, and drive innovation and learning.

The article analyzes some key issues in advertising industry in times of crisis. Marketers are always in search for new and effective ways to reach the target market before the competitors. The general spirit is that by disturbing the markets, the deceleration of the economy, and especially of consumption, creates news, gives the opportunity to reconfigure the strategies marketing. One of the main consequences of the economic crisis is to reduce marketing budgets of major corporations for huge growth markets; after a long time, they will start to lower investment in advertising, at some time on an upward trend.

Keywords: advertising, recession, media markets

JEL Classification: M37, E37

1. Introduction

Financial uncertainty weighs on the cost and the accessibility to the financing, the rise of the raw materials seem to feed a share of inflation, the weak growth is and even more slowed down, the profits of purchasing power are extremely heterogeneous, the movement of globalisation continues and changes. In the short run, these factors weigh on investment, consumption continuing to increase even slightly. Such a climate can worry the advertisers, who, under the pressure of financial, are encouraged to reduce their expenditure in order to maintain the levels of margins.

Reasons to continue to spend in advertising during recession are as follows: to protect the value of the mark at a time when it can be mined by promotional actions of the market actors; in the short run, to facilitate the choice of the consumers who redefine theirs practices and change their behaviors; from the same point of view, to even maintain or increase the penetration of the mark and the sales, when this one does not reach its potential level (not all the consumers are reached) that economic environment redefines; in the medium term, to support the resumption of the sales at the time of change of cycle; to benefit from what the reduced advertising interference to launch an offensive in terms of market shares; to benefit from the effect of ousting (of the intermediate actors) to maintain and increase, all things being equal, a profitability stronger than the others; to send positive signals to the financial markets to maintain and increase the financial value of the mark and thus to reduce the volatility of the courses.

The three major functions of advertising are as follows: it is informative and gives to the consumer the means for a rational decision, while communicating him the existence of the mark and by informing him on its characteristics, including the price; it is persuasive insofar as it changes certain beliefs in connection with the mark and of the product.

2. Literature review

The variations of the advertising budgets seem to be the consequence of the variations of the economic activity, whether it is seized by consumption or the GDP. Ashley, Granger and Schmalensee (1980) which by a causal analysis return account the fact that the growth of consumption involves the growth of the advertising budgets, without one being able to accept the reciprocal one.

Rohme and Weisser (2007) find that advertising does not Granger-cause growth but Granger-causes consumption. They considered that advertising is good for consumption; consumption is good for output and output growth. Hence, advertising is good for economic growth.

In spite of often contradictory results as for the direction of causality, a point of agreement is established in the fact of a strong correlation of the advertising expenses and GDP and in the short-term impact of advertising when this impact is established. The cause of the correlation probably comes from budgetary determination of the type ratio (pub/sales), which confirms a study of Chakrabarti and Arora (1997) by stressing that this ratio depends mainly on the category and consequently of elasticity price, to a lesser extent by the frequency of launching of new produces and by the price One includes/understands too easily that to cross in the budgets is an immediate decision which makes it possible to preserve profitability when the sales stagnate or erode whereas the effect of the reduction of the budgets cannot be seen in the immediate future.

The recession does not affect the homogeneous consumption of manner

What is true on a macro-economic level is undoubtedly debatable on a microeconomic level. The recession does not have the same direction for all the actors, certain markets see their growth continuing and others crumble. One can with difficulty expect that the environment affects in a homogeneous way the behavior of the firms. The crucial point is sartorial specificity. The current context is that of a quasi stationary maintenance of the incomes, of a fear of devalorisation of the saving which acts in the direction of a feeling of reduction of the income intended for consumption (returned permanent); it is also characterized by one restarting of the all the more significant inflation as the discretionary share of budget is reduced, and which is occupied by food expenditure and fuels. One thus expects modifications of behaviors of the consumers, some occurring already.

If the restriction of consumption is very probable, another behavior can be observed: consumption turned towards quality. Economies are made on functional products while turning to white promotions, products and other marks of distributors, but for hedonic consumption by reducing volume or frequency, a preference for products of the first quality can appear - to drink less wine but of the middle-class vintages! Substitution effects can also occur between the categories: if the idea to leave on holiday is deferred, the budgetary economy can be affected with expenditure of decoration or gardening, to give only one example. One understands with this argument that the effect of a recession (or a deceleration of the economy) plays less quantitatively than qualitatively by moving the request, in redefining the segments, and naturally the nature of the offer. It would be thus an error to stick to an average effect, they are the effects differentiated by segments which must be retained. This change in the preferences is the occasion for certain actors to reinforce them by the adequate publicity, centered on the economy on the one hand, or the exceptionality on the other hand. These phenomena encourages less the budgets reduction than the reformulation of the messages. For the company it is thus necessary before acting to understand what the deceleration of the economy involves, individually, by examining the impact on the incomes and consumption.

Cycle business and effectiveness of advertising

A long time ago, one was interested in the relative effectiveness of the variables of the marketing mix in the various phases of the life cycle. The life cycle of offered product as a succession of different modes of growth, it is the old assumption of Mickwitz. Unfortunately, this work was little developed even if recently some researchers reconsidered the question. Naturally we are at the level of analysis of the markets and either of the economy as a whole. But this level has more relevance for the advertiser. The general environment is less important than that of the sales. The phases of growth correspond to an extension of the market; the role of advertising is informative, in particular on the new consumers of the category. One thus expects a strong response of the market to the requests, and definitely positive advertising elasticity. It is the result obtained by Abraham et al., or Parker and Gatignon (1996). On the other hand price elasticity is likely to be increased by advertising of the informative type (the case of I-pod is rather revealing from this point of view. In spite of its success, a notable fraction of the market resisted the purchase, speculating in falls to come). In the phase of maturity the advertising effect is supposed to be weaker. He plays volume with difficulty, but can have effects in terms of considerable market shares. With a more persuasive type of advertising, one expects little effect on the sales of the category, but a paramount effect on the market shares. If one cannot confuse recession and cycle of business, the recession can be considered as a disturbance which affects them, slowing down the phase of growth and accelerating the maturity of the markets. It is thus a question of considering the interaction of these two tendencies, and of carefully distinguishing the type of advertising and the types of effects.

Supporting the sales in economic period of deceleration

When the economy even slows down contracts, the main aim of the firm is to resist the erosion of the sales. This resistance can be passive, and results in a correlative reduction of the expenditure to the contraction of the sales aiming at maintaining the margin; it can be also active and pass by a reinforcement of the effort marketing. This objective of resistance privileges the short term insofar as the variation of the sales is recorded instantaneously. There will be thus preference for the immediate effects, mechanics, calculable. The hope of the support by the sales is however moderate insofar as the elasticity of advertising is low in period of maturity. A great part of the advertising effectiveness comes from its information effect; the effect of seduction is longer to settle. It thus seems to us not very reasonable to propose advertising a role of support of the sales in period of recession. However, this point of view deserves a thorough examination. The evolution of the sales is function of the penetration and of average sales by purchaser. Insofar as the deceleration of the economy affects consumption (and thus the purchasing power), one can understand that advertising does not strongly support the level of consumption per purchaser. On the other hand, the things are different in terms of penetration. The problem is thus not to reduce the advertising expenses, but to reorient them to the marks which can profit from a greater penetration.

One expects that the effect of advertising in period of deceleration exploits more the market share than the volume of the sales. This effect is more pronounced for the marks with strong Brand equity. Thus, the investments will be more effective as the interference advertising-executive decreases. In conclusion, independently of the growth targets or the maintenance of the sales, to make advertising in period of recession is the occasion to increase market shares.

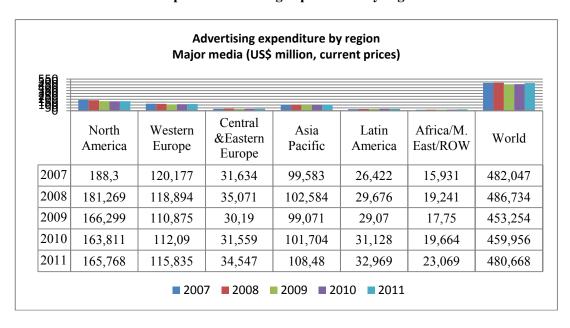

Creating mark value. One of the principal effects sought by advertising great media is the construction of the image; positioning consists in creating a value, that of the reputation, legitimacy, statute, reference and to support thus the prices. Persuasive advertising plays this part by decreasing the sensitivity to the prices. One imagines a famous brand not to be based on a strong legitimation and to shine without occupying in the space of the media a paramount place. We must underline that if the variations of sales relative to a price change are immediate and that the effects of remanence are moderated, the elasticity-price is constant.

Benefiting from opportunities. The recession leads to a redistribution of the market shares insofar as the marks do not have all an equal capacity to resist the contraction of the market. Those of which profitability is reached quickly are strongly encouraged to disinvest, offering opportunity for their competitors of taking market shares to them. There are serious arguments to think that this inequality is systematic. To reinforce the expenditure thus amounts exerting a pressure on the competitors more threatened in the incentive to maintain their investments, even if it means to reduce their profits. With this argument, from an extreme point of view, it is not necessary for the advertising effort to have important effects on the sales, the market shares or elasticity price. It is enough that it influences the level of relative profit, and consequently the competitive advantage of the firm (i.e. the difference between its level of profit and the mean level of profit of the market). In other words, if the recession by the weakening of the sales which it involves, led to a general reduction in the profit, the strategic use of advertising can allow the most profitable marks, to preserve or even to increase their "excessive profit".

3. Media markets

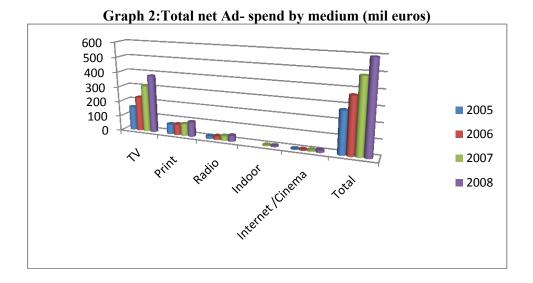

Forecasts from Zenith Optimedia predict that global ad spend will decline with 6.9% over the course of 2009. Ad spend in North America will shrink by 8.3% in 2009 in the absence of quadrennial events such as the Olympics and presidential elections. This includes an 8.7% decline for the US and stable 0.2% growth for Canada. All major markets in Western Europe currently are suffering substantial decline in ad expenditure and the overall market is expected to drop 6.7%. With regard to specific countries, a 7.3% decline is expected in France, a 5.5% drop in Germany, a 5.0% drop in Italy, 10.1% drop in Spain and an 8.7% plunge in the UK. Overall spend is expected to drop 6.7%.

In 2010, all major markets are expected to grow with the exception of Italy, which will shrink another 0.8%. Central and Eastern Europe will suffer the sharpest drop-off in 2009, at 13.9%. The Asia Pacific area is expected to drop by 3.4% in 2009, including 5.4% growth in ad spend in China (down from 18.8% last year), 6.4% growth in India (down from 18.9%) and 7.9% growth in Indonesia (again down from 18.9%). Though these and several smaller markets are also still growing, they are being counterbalanced by sharp falls in other markets (-11% in Taiwan, -16.5% in Singapore and -20.0% in South Korea) and a 5.0% fall in Japan, which contributes with 38% of the region's ad expenditure. Most markets in Latin America are still growing, but the region as a whole is being dragged down by two markets (Brazil and Colombia). Overall ad spend is expected to shrink 2.0% but will return to strong 7.1% growth in 2010 (See Graph 1).

Graph 1: Advertising expenditure by region

- The publishing industry has been building an online presence to balance falling print revenues. But only a few online newspaper and magazine sites have managed to generate sufficient profit to offset declining margins from print versions.
- The Romanian media market has grown in size and diversity in recent years. The media market is characterized by: media fragmentation, media pricing inflation; decreasing inventory on main TV channels. In 2008, the Romania media market grew in net value by 22 %% (See Graph 2).

As for advertisers, P&G maintains the leading positions from 1999 through 2007, with the biggest TV budget. L'Oreal climbs on second place and Unilever maintains its 3rd positions in top (Table 1)

Table 1: The biggest advertisers expenditures

Advertisers	Exp (000'euro)
P&G	526,909
L'Oreal	345,859
Unilever	315,663
European Drinks & Food	188,160
Danone	177,601
Coca-Cola Co.	163,681
Colgate Palmolive	143,341
Kraft Foods Romania	134,301
Henkel	128,939
Nestle Romania	120,204

Source: TV-TNS AGB International, Press and Radio: AlfaCont

The publishing industry has been building an online presence to balance falling print revenues. But only a few online newspaper and magazine sites have managed to generate sufficient profit to offset declining margins from print versions.

The online advertising continue to grow by 50-60% annually. Even if currently the Romanian media market is geared toward traditional media, we can notice a fast grow of new media.

4. Conclusions

Through this survey a certain number of key ideas appear.

First of all, the recession or the economic deceleration disturbs doubly the market equilibrium and consequently opens a window of opportunity. It redefines the market segmentation and modifies the capacities of action of the advertisers, creating for some an effect of ousting, but for others the occasion offers to redefine their policy in an offensive way.

Secondly there is not obviously less effectiveness of advertising on the sales. This one is related to the life cycle of the market, than with the business cycle. The informative role of advertising can then play full. It is then the occasion to launch out to the conquest of the market shares.

A third idea also sticks to the capital of mark, and obviously of the increase in the sensitivity to the price in difficult period. Not to spend in advertising, it is to be likely to lend the side to the marks of distributors and the whole of the low cost and thus to resort excessively with the price weapon. Advertising would immunize against degradation too much strong of profitability.

Fourth is that on the medium-term, an important issue is given by the exit of the cycle. Those who would have given up the effort are likely not to benefit from the recovery, because they will have let degrade the capital of mark.

BUILDING A RELATIONSHIP WITH THE CUSTOMER: A CRM VERSUS A QM PERSPECTIVE

Customer relationship management (CRM) and quality management (QM) both define the customer as being the focus of all business activities. The question arises on how these two concepts work together. In the change defined environment, where getting ahead of the competition means survival, how should one juggle the two concepts? This paper defines the terms, compares them and gives a clue for managers on how they might dose their effort on customer focus.

Keywords: relationship marketing, customer relationship management, quality management, customer centric approach

The article's JEL code: M

1. The evolution of the CRM concept

From the first suggestion Levitt made in the late 1960s of the importance of creating relationships with the customers (Mendoza, et al., 2007, p. 914), the evolution of relationship marketing (RM) is directly linked with the evolution of the business environment. Sheth (Sheth, 2002, p. 290-291) presents the main factors that contributed to the development of RM as follows:

- -the energy crisis of the 1970s and the consequent economic stagflation which confronted companies with excess capacities and high material costs;
 - -the emergence and development of services marketing;
- -the collaborative as opposed to combative attitude towards suppliers stimulated by the quality drive in the 1990s;
- -the rapid evolution of the information and communication technology which created the support for addressing customer needs directly and more specific.

In addition, the issue of profitability resulting from the customer-company relationship led scientific research to focus on identifying the most profitable segment and designing models for customer valuation. Sheth concludes that the focus in marketing shifted from customer acquisition to customer retention and thus RM "emerged as a popular new paradigm".

The 1990s are marked by the popularity of the new RM concept. The rise of RM and the emerging research interest have been regarded by Webster (1992) and Nevin (1995) (as quoted by Greenberg and Li, 1998, p. 208) as "a fundamental reshaping of the field", respectively as "one of the most revolutionary changes" within the marketing area. Loyd (Loyd, 2000, p. 12) even gives the number of articles publishes on the concept between 1995 and 2000 – in this five year period 500 scientific articles were published.

Loyd (Loyd, 2000, p. 15) selected a set of definitions for RM to show the evolution of the concept: Copulsky and Wolf (1990), Gronsroos (1990), Shani and Chalasani (1992). Copulsky and Wolf regarded RM in 1990 as a combining "elements of general advertising, sales promotion, public relations, and direct marketing to create more effective and more efficient ways of reaching consumers. It centers on developing a continuous relationship with consumers across a family of related products." Although stressing the focus on a long term relationship with customers this definition doesn't recognize RM as a new paradigm. It is rather a combination of various instruments of the promotion policy within the marketing mix. Gronroos' definition from the same year offers a different perspective: "To establish, to maintain, enhance, and commercialize customer relationships (often, but not necessarily always long-term relationships) so that the objectives of the parties involved are met. This is done by a mutual exchange and fulfillment of promises." This time RM appears as an activity with the scope of creating and sustaining relationships with the customers. In addition, the definition includes the implication of the customers with their objectives and promises. Interesting for this definition is the time perspective – Gronroos doesn't regard the long term perspective as a must. Shani and Chalasani offer in 1992 a more comprising definition, corresponding with the version accepted also in the recent years: "An integrated effort to identify, maintain, and build a network with individual consumers to continuously strengthen the network for the mutual benefit of both sides, through interactive, individualized, and value-added contacts over a long time period." RM is referred to as an *integrated* effort, reaching all company levels and departments. The relationship acts out through interaction and individualization; in an effort to offer value to the customer.

As Sheth predicted (Sheth, 2002, p. 291), RM shifted and evolved into *Customer relationship management* (CRM). It emerged as a concept defining the implementation effort at the overall company level of RM. Teo et al (Teo et al, 2006, p. 1614-1616) categorized the definitions CRM into three complementary perspectives: technology, business

and customer. The technology perspective regards CRM "as the underlying infrastructure and sophisticated applications to understand customers and analyze customer information." The second, business perspective considers CRM as "the strategy of identifying, understanding and predicting consumer behavior to foster long-term profitable relationships". From the third perspective, the one of the customer, CRM is viewed as focusing "on all interaction points of the customer with the organization". All three perspectives rely on the use of IT and change management. While the technology perspective uses IT infrastructure on a high level, for the other two perspectives change in the mindset of employees is needed.

Another way to classify CRM definitions is presented in a recent article by Richard and Jones (Richard and Jones, 2008, p.121). They make the distinction between the strategic and operational definitions different other authors give. "A comprehensive strategy and process of acquiring, retaining, and partnering with selective customers to create superior value for the company and the customer" is one strategic definition offered by Parvatiyar and Sheth (2001). On the other side, operational definitions are more closely related to the processes and technologies associated with enabling better customer relationships. Such a definition is offered by Rigby et al (2002): "CRM allows companies to gather customer data swiftly, identify the most valuable customers over time, and increase customer loyalty by providing customized products and services".

2. CRM implementation and its problems

In spite of the positive definitions, stating that CRM enables the creation of superior value to both company and customers or that CRM allows the increase of loyalty, the reality companies face seems to be rather different. Studies analyzing the results of companies undertaking CRM projects show alarming figures. A Forrester Research report of 2006 indicates that "only 10% of the business and information technology executives surveyed strongly agreed that expected business results were achieved from implementing CRM" (Richard and Jones, 2008, p.120). A Gartner Group study from 2001 reveals that only 3% of the companies are developing successful CRM projects (Mendoza, et al., 2007, p. 914). In fact 55% of all CRM projects don't produce results. According survey of 451 senior executives from 2001, 20% of the users reported that their CRM initiatives not only had failed to deliver profitable growth but also had damaged longstanding customer relationships. According to Bain's 2001 survey of management tools CRM ranked in the bottom three for satisfaction out of 25 popular tools (Rigby, et al., 2002, p. 101).

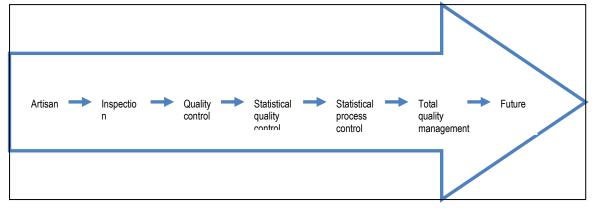

These reported bad numbers apparently don't reduce the popularity of CRM among practitioners. During eight years of analysis CRM reveals itself as the fastest-growing technique. And, "according to the research and consulting firm META Group, the CRM software market is expected to more than double from \$20 billion in 2001 to \$46 billion by 2003" (Rigby, et al., 2002, p. 102).

The importance of *correct CRM implementation* is obvious. In order for companies to be successful, Mendoza et al underline that CRM projects need to be viewed as more than the implementation of IT. Companies need adequate planning, coordination and controlling – 35% of the companies have started projects without any type of coordination and 45% have not evaluated CRM. Another study, performed by Forsyth on a sample of about 700 companies, names the main causes of failure as being:

- -Organizational change (29%).
- -Company policies/inertia (22%).
- -Little understanding of CRM (20%).
- -Poor CRM skills (6%) (Mendoza, et al., 2007, p. 914).

3. Quality dimensions

Quality has evolved during time and turned into a multifaceted concept (see fig. 1), becoming part of the steps necessary to deliver products that comply with customers' needs. Thus, the latest developed form of the quality notion is total quality management, "a management approach that places emphasis on continuous process and system improvement as a means of achieving customer satisfaction to ensure long-term company success" (Summers, 1997, p. 12).

Source: Summers, D. C. (1997), Quality, Prentice Hall, Upper Saddle River 1997, p. 8.

From artisan to inspection, from quality control to statistical process control and total quality management, quality is a complex notion. So, how would one define quality? On a primary level it indicates the "characteristic, property or attribute" of things, "character or nature, as belonging to or distinguishing a thing" (Webster's Encyclopedic Unabridged Dictionary of the English Language, 1996, p. 1175). On more elaborated levels its meanings become, as well, more sophisticated:

- -"character with respect to excellence, fineness" (Idem, p. 1175),
- -"fitness for use" (Juran, 1974 in Wonigeit, 1994, p. 17),
- -"conformance to requirements" (Crosby, 1979, p. 15), "zero defects" (which is step 7 of Crosby's 14 Step Quality Improvement Process³¹⁴)
- -"the total composite product and service characteristics of marketing, engineering, manufacture, and maintenance through which the product and service in use will meet the expectations of the consumer" (Feigenbaum, 1983, p. 7),
- -"Quality in a product or service is not what the supplier puts in. It is what the customer gets out and is willing to pay for." (Drucker, 1993, p. 228).

As one can observe, the definition of quality, though pointing towards a customer related perspective, begins to be more and more directly, explicitly related to satisfying clients' needs. Thus, customers become the binding element of both quality and customer relationship management.

Building a relationship with the customer, and thus, building customer loyalty is the premise of successfully adopting relationship marketing (Morris et al., 1999, p. 660).

4. QM – what lies behind the customer perspective?

According to Garvin (in Oess, 1993 p. 31-34; in Wonigeit, 1994, p. 15-20), apart from its user related definition which places the customer as the decisive factor in judging the usefulness of the product/ service in satisfying needs and expectations, quality bears more meanings that will be further on briefly presented (see fig. 2).

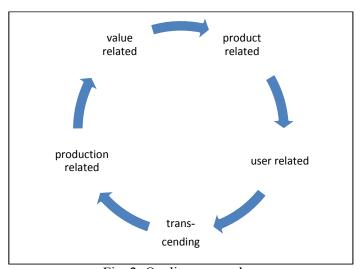

Fig. 2: Quality approaches

Source: cf. Wonigeit, J. (1994), *Total Quality management: Grundzüge und Effizienzanalyse*, Deustcher Universitätsverlag, Wiesbaden, p. 15-20 and Oess, A. (1993), *Total Quality Management: die ganzheitliche Qualitätsstrategie*, Gabler, Wiesbaden, p. 31-34.

If the client holds the central role in the QM-CRM equation, should quality be restricted only to this dimension, should, under these circumstances, all the other quality approaches be banned?

From a transcending perspective, quality is to be understood as something exceptional, absolute, whose high standards leave no room for compromises in their aim to reach them. It is extremely difficult to find measures and benchmarks for such a perception, experience being seen as a possible way to reach such a state. Within this approach could lie the germ of a possible intrinsic need which requires further exploration.

³¹³ The concept "zero defects" does not mean that everything must be done perfect and no error must occur; it refers to communicating employees a performance standard (Crosby, 1982), namely if someone does things right the first time, then a certain number of errors is not allowed to occur within a product/ service.

³¹⁴ See Winter Park Public Library (Ed.), links to Philip Crosby's Essays and Writings, retrieved on 8 May 2009 from: http://www.wppl.org/wphistory/PhilipCrosby/grant.htm

A product related approach brings within quality differences as identified in different and divergent product characteristics. Within this approach, quality becomes an objective attribute of products/ services which provides a basis of comparison between *similar* outputs, while a product/ service classification becomes possible. Though within this approach quality is associated with the sum of comparable higher (better) product characteristic, one can conclude, as well that customers' needs are different and that their fulfillment corresponds to different levels of quality.

Production related quality highlights the idea that along the supply chain levels, product/ service related norms, standards, specifications have to be met. *Conformance with requirements and doing things right the first time are not so much related with fulfilling customers' demands, but with meeting given specifications*. A much expected consequence of keeping standards is the delivery of *reliable* products/ services for clients. This approach brings within the idea that despite keeping similar specifications, two products/ services may differ and have a different impact on consumers. Though highly reliable products/ services are being marketed, it often happens that by not fulfilling customers' needs, these are being rejected.

Last, but not least, quality is perceived by customers as a price-benefit relation, approach which is beginning to gain supporters on the market. In this respect, quality is that particular benefit that a customer enjoys by paying a certain price, by blending a user related and production related approach.

The meaning of quality should, thus, not be limited only to a customer-focused approach. It needs the whole range of meanings because of all them generate a more or less significant impact on customers.

3. QM versus CRM and the customer approach

So what do QM and CRM have in common except for a customer focus?

- -A quality centered offer (see fig. 3),
- -which refers not only to a *quality based output*, but also to *quality based processes*,
- -and a customer centered interaction,
- -which sets the ground for receptiveness towards customers' needs and requirements,
- -and involvement of the entire personnel,
- -by not limiting contributions only to the marketing and sales *departments*, are the main binding elements.

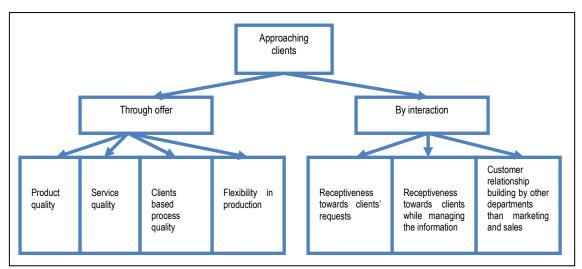

Fig. 3: The concept of "customer approach"

Source: Cf. Bruhn, M. (2001), Orientarea spre clienți. Temelia afacerii de succes, Ed. Economică, București, p. 20.

From a more technical perspective, the integrative character the two concepts together build, resides in their capacity to employ tools and techniques and serve joint goals. If we take, for example, the notion of "customer satisfaction", then, reaching this CRM goal implies implementing total quality management (TQM) tools, such as scatter diagram, as well as TQM techniques, such as gap analysis customer needs mapping (Morris, 1997, in Morris et al., 1999, p. 663). CRM and QM, respectively TQM have to team up in order to fulfill clients' intrinsic needs and expectations. Often, it is CRM "intrinsic promise" (Morris et al., 1999, p. 663) that needs to be made explicit by using TQM related tools and techniques.

In *conclusion*, to meet customer expectations and motivate customer retention, high levels of customer awareness and service need to be present throughout the product service delivery process. TQM offers a solution to operationalize such a system and insure the success of CRM implementation.

The marketer must remain an active agent in the pursuit of quality throughout the organization (Morris et al., 1999, p. 663) in order to successfully fulfill its goals. This means that the marketer does not necessarily need to personally employ the tools and techniques of TQM but an understanding of them would prove beneficial.

GUIDELINES REGARDING EFFICIENT COMMUNICATION WITHIN MODERN ORGANIZATIONS

Bente Florina Maria

University of Oradea The Faculty of Economics Postal Address str. Carpaţi nr. 1B, Bl. PB 36, Ap. 9, Oradea, România E-mail: florinaalb@yahoo.com Phone: 0745-087.095

Abstract: Efficient communication is one modern organization's key to success, strengthening from within the employees' confidence in the vision and mission of the organization, pinning them down to the reality of their workplace, feeding the development process of that entity, facilitating the necessary amends towards progress and contributing to the change of employees' way of being. On the outside, the image of the organization, the discovery of new opportunities and the relation with the society depend a great deal on how well this continuous process of communication is being conceived and managed.

Keywords: organization, feed-back, memo

Cod JEL lucrare: M3

Under the influence of the changes in the economic, political and social activities, as well in the infocommunicational revolution, today more than ever, managers must undergo a multilateral performance training in order to face the situations related to the overall success of an organization. Experience, outlook, conduct, efficient communication skills in general and persuasion of the entourage in particular, prove to be of essence in spotting out and avoiding the difficulties and inherent risks of a restructuring process, substantiating adequate solutions to the complex issues of Romanian organizations. Or, the economic, functional and structural evolution of the organizations pertaining to the national economy sector mostly depend on the communication methods of managers and on the persuasive strategies enforced in their activity. Holding onto multiple advantages communication is an important strategic resource of maintaining and/or increasing performance.

Communication is that continuous process through which data, information, instructions, ideas and feelings are conveyed from individual to individual and from one group to another. Thus, communication presumes the transfer of the sense and meaning of a certain message sent to the interlocutor, depending on the way the conveyed message is being percepted.

Communication is essential for the efficient coordination of the activities implying such connections; it is a process for the materialization of which it is necessary to build communication channels that may transmit ideas, knowledge and exigencies. The qualitative dimension focuses on the maintenance of a mutual understanding attitude, on creating and developing a motivational climate as well as on assuring the solving of demands and claims in an amicable manner.³¹⁵

In order to achieve its goal communication must be good and efficient. One method of communication is considered good if the message sent to the receiver is understood. The efficient communication is the one that manages to send a relatively short and clear message understandable by the receiver and at the same time prone to assimilation in order to forward it. As a comparison between good and efficient communication, the latter implies motivational related elements meant to positively influence the receiver, to trigger acceptance of the message and its enforcement in life.³¹⁶

Realization of such an efficient communication supposes optimal dosage of data and information conveyed. One too vast, or, on the contrary, too small amount of information influences in a negative way the efficiency of the activity within the organizations. Likewise, forwarding a substantial volume of information in a short period of time has bad consequences on the established target.

Employees of certain organizations with a good communication feel connected to the normal evolution of facts and understand the way in which their actions may support that activity. New comers link themselves more quickly to the culture of the respective organization and face much better the changes that may be demanded of them by the management in certain situations.

In other words, organizations communicate more and more but – considering the technological progress – they prefer the more modern and faster ways to send and receive messages. Measuring up the communication process becomes compulsory to design, apply and modify – where necessary – the communication strategy of a company or of an organization, in order to enhance its profit.

Of course, some may wonder how the separation of the communication process from the organization's development related factors was achieved. And the answer is simple: communication is the foundation for the other company related factors, like investments (shareholders invest more confidently in a transparent organization with a predictable future), a performing management (the true managers are in fact leaders who bring their team to success especially through a motivational internal communication development), human resources and their clever

³¹⁵ Luminița Gabriela Popescu, Comunicarea în administrația publică, Economic Publisher, Bucharest, 2007, p.11.

³¹⁶ Stancu Şerb, Relații publice și Comunicare, Teora Publisher, Bucharest, 2006, p. 36.

use (people give the greatness of success), brilliant ideas (without communication and team effort they cannot be put to practice), tenacity-endurance (communication is the only catalyst for building and maintaining a constantly performing team throughout the years).

In situations when the other factors are approximately equal, efficient communication is the only one to make a difference, being the most important vector influencing radically all the others.

Efficient communication begins with listening to the other. Listening is not a behavior. Listening is a status of availability to the others and to what they have to say. It means to give the others all the importance and to unconditionally recognize them in the moment of communication. To really listen doesn't mean to nod, to utter sounds like "aha", "hmm" while staring in their eyes. Listening means to do one's best to understand the point of view of one's discussion partner. It is indicated, especially for business men, to listen at least as much as they talk. Many don't realize that an efficient communication is a double process: we send information and receive information. Thus, while their interlocutor speaks they often think about other things that distract them. It is commonly known that during a conversation, besides listening to the other, thinking is also functioning. Meaning that we get distracted by a thought that has nothing to do with the subject of conversation or we think about how to respond to the other and what advice to give our partner in conversation. In both cases, attention is diminished. We can reach the highest point of attention (thus of real listening) if we are able to stop the flux of thoughts and try to just listen. Studies show that employees who are not listened to by their managers would loose motivation, would feel unappreciated, missing more hours from work, facts that would lead to a great fluctuation within the organization

Communication is one of the most difficult tasks of a manager. The source of most communication problems is the difference between the content of the message or its intended impact and the way the other organization members receive it.

One of the most appropriate methods for the manager to be more efficient is for him to check the impact of his words and actions on those around him. So the key is to trigger their reaction, the feed-back, which is risky. In intimate relationships, the more trust they gain in one another the more open they get. But in an organized context things change, on one hand because the manager has the power and, on the other hand, because information is distorted as it passes through informal communication channels. There are methods to develop an efficient communication strategy which gives managers the certainty of a correct reception of the conveyed message as method to obtain the needed feed back.

In order to increase the performances linked to the organizational communication, the majority of managers develop their ability to process the information obtained from their subordinated employees and to transmit a quick and concrete feed-back. Such feed-back assures a good reception and understanding of the message, adjusting the information to the receptors' characteristics, social balancing by flexibility of roles and functions held by the receptors as well as increasing the work satisfaction. Organizations are more and more interested in implementing such instruments, because the productivity rate of every employee depends greatly on them.

Beside a good salary package, bonuses and benefits, for a worker will always count the working environment, the way his access to information and development is or not facilitated; he needs to understand his own role in applying a strategy and the impact he will have at a certain point on him and the others, the way he relates to his colleagues and other teams, the managerial practices, or, in other words, the culture of the organization. All of these are key factors for keeping a good employee and, through informal communication, to attract new ones. The bases of an efficient communication always start with establishing the targeted audience.

Developing a community the employee feels he is part of, is crucial for preserving the talents. Communication inside the organization becomes an essential weapon for any entity that wants to exist on an ever competitive labor market.

Based on the organization developing such practices, the way of communication differs from one entity to another. Some of them developed own tactics, specific to their field of activity, other chose to implement some Western "rules" that worked on other markets. Internal communication started to find its way up on the Romanian company managers' agenda, especially on the multinational ones.

One organization having internal marketing is more interested in the faith of the employee beyond the professional stiffness. Internal communication channels are as important as they may become at any time the conversation subject between friends, increasing its notoriety.

While the Romanian organizations use mainly vertical formal communication, the Western ones and the multinationals passed on to more complex techniques, meant to keep the employee closer as an individual.

Maintaining a steady control over the conveyed information but also assuring the understanding, receiving and fulfillment of obligations, objectives and tasks is much better controlled by using the vertical formal way of communication. Such an organizational communication proved to be efficient especially with the organizations having multiple employees as long as it is backed up by other types of inter/intra departments communication.

In order to have an efficient communication one must firstly know one's audience. That's why an important phase is audience segmentation in order to set up the tactics. Dialogue openness is the first change in attitude; employees are more available to presenting their opinions about what works and what needs amending, about their

expectations and problems, these having a major impact on the results, many times helping the simplification/improvement of some processes, technologies and services destined to clients/citizens.

At present, internal communication lies in constructing the correct relations types, with no regard to status, hierarchy, politics, personalities and technologies meant to contribute to the consolidation of the image of one's organization because image is a way of communicating. Practically, it is the way the internal communication may add to its value.

In order to be sure that in the entities they work in, communication goes on in good conditions and the feed back is at its optimal range, many managers rely on certain ways and procedures through which they find out if what they conveyed is properly received by employees. Also, by these methods they may find out about opinions, problems and other suggestions the employees may have about their tasks. According to the study results performed by HR in Romania³¹⁷, among the most popular ways to improve organizational communication are the following:

- Open meetings;
- Inter-departments meetings;
- A more correct adaptation of the organization chart to an efficient communication, both horizontally and vertically;
- Realization of an internal newsletter;
- Mail messages to the entire organization;
- INTRANET;
- Preservation of contact with the employees. Maintaining permanent communication channels.

Those organizations which manage to effectively communicate with their employees have a four time bigger probability to report an increased level of employees' commitment as opposed to less efficient communicative companies.

Also, there is the feed back not only between manager and subordinates but also between managers themselves. When talking with their superiors from a hierarchy point of view, managers face many of their subordinates' problems when they are given the possibility of feed back. When they speak with their underlings they must know about the standards the underlings must reach, the degree to which an employee must improve its performances and the consequences of an alleged failure. Having as main subject the manager's expectations of performances, communication should begin before the actual hiring of the underling.

There are within organizations types of communication in a horizontal plan or on a diagonal/oblique one, as methods to improve coordination between different departments. It also may be the case that people from technical departments coordinate their activities and exchange information with the engineers, creating the need to communicate horizontally (communication between equal titles holders within the hierarchy of the organization). Oblique communication is the least used modality because it crosses the traditional authority hierarchy lines. Employees situated on uneven hierarchy positions from different departments may still feel the need to directly communicate among themselves especially when that means avoiding time loss.

Due to the fact that it links directly the emitting party to the receiver, oblique communication may prove to be more efficient and precise in certain situations than the traditional ways of communication.

Communication may follow several directions: from top to bottom, from bottom to top, and sideways. The updownwards communication is used to convey messages to superiors and may take up different shapes like *memos*, organization politics manuals, bulletins, direct orders and statements regarding the mission. This type of communication is essential to the proper functioning of an organization, but harms its survival if it becomes the only acceptable way to transmit information. This type of unilateral communication may halt innovation causing increasing dissatisfaction among the organization's employees.

There must be a balance established between the up-downwards communication and the down-upwards one because messages conveyed from up downwards loose their true meaning and their motivational power due to the distortions introduced while crossing the hierarchy levels.

The down-upwards communication permits a free informational flux in the organization. Free circulation of information may be improved by putting to practice by managers of certain communication policies (the policy of "open doors", free discussion sessions between managers and employees, and so on)³¹⁸.

The employees are being eased into the different aspects of the organization environment and need a communicational channel through which to share their knowledge with their superiors. Recent practice showed that managers who receive feed back from their underlings are more efficient in fulfilling their tasks as the others. There are certain aspects that may cause failure of the communication process. Usually managers communicate personally by direct impersonal contact, but also formally by memos, orders, speeches and other.

"At the core of most managerial communication problems are the issues of perception or credibility. None of us sees the world as it is but as we or our reference systems or "maps" describe the territory. And our experience owed perceptions influence to a large extent our feelings, convictions and behavior." 319

³¹⁸ Luminița Gabriela Popescu, Comunicarea în administrația publică, Economic Publisher, Bucharest, 2007, p. 210.

We find in communication the explanations of misunderstandings, disapprovals and even conflicts; in the barriers people – managers and executants - put up more or less intentionally in the way of communication.

Thus, every organization, public or private, must develop a communication strategy built on the organization's objectives and attributions as an essential part of the overall strategy.

Communication means teamwork and the department of communication cannot function efficiently without the support of all colleagues and without their expertise in different fields.

THE CLINICAL MANAGEMENT - THE SANITARY MARKETING CONVERGENCE AND COMPLEMENTARITY

Bitca Tiberiu Alexandru

National School of Politic and Administrative Science, Strada Uranus nr 5-7, Bl. A7, Ap.7, sector 5, Bucuresti, tiberiubatca@gmail.com, 021.410.72.74.

Ioanăs Corina

Initially appeared in the context of increased preoccupations for leading the organization as best as possible, the Marketing-management has later imposed itself as a management of the request, concretized in the formulation of marketing objectives and strategies for all the problems concerning performance achievement. In what these objectives are concerned, the sanitary organization differs from the other domains, since it doesn't enjoy the freedom of establishing the prices and choosing the consumers according to their payment capacity, this difference leading to conflicts, because, while doctors make decisions in the best interest of the patient, the management is mainly concerned with the cost and efficiency of the performed activities. Having as a starting point a literature review, the present paper sets to highlight the main difficulties encountered in the implementation of this frontier discipline in the medical field.

Key words: health management, sanitary management, business marketing, social marketing, sanitary marketing, marketingmanagement.

JEL classification: I18, M31, P36

1. Management versus sanitary management

At its origin, the word **management** comes from the Latin "manus", which means "to hold a horse or a carriage with the help of the reins", and throughout the time, several other definitions have been given to management³²⁰:

- Henry Fayol: to foresee and plan, to organize, to lead, to coordinate and control;
- Hersey and Blanchard: working with individuals or groups in order to accomplish some organizational objectives;
- H Brech: assuming the responsibility for deciding, planning and regulating the activities of some individuals working for a common purpose, in order for the correct result to be efficient and economic. Synthesizing the above mentioned assessments, we can state that, in a broader sense, the word **management** represents an ensemble of activities coordinated in view of directing and controlling an organization.

The play upon words management – health has been conceptually delimited by A. V. Ciurea, V. Gh. Ciubotaru and E. Avram in the paper *The development of Management in Health Organizations*, University Publishing House, Bucharest, 2006, making a clear difference between:

The management of health systems, which is concerned with planning and accomplishing, in good conditions, the division of responsibilities, of the coordination and regulation mechanisms, the distribution of decisional power, of resource management, in the regulating and deciding institutions of the health system.

The management of health structures comprises all the management activities and operations of the medico-sanitary practice and of the personnel management of each health unit.

The health management refers to all the management activities that are accomplished and which can be achieved in the system and subsystems of the health department; it includes the economic management, the organizational management and the human resources management, being applied within and between the organizations from the social sector of health-care.

Sanitary management deals, mostly, with those managerial operations that strictly regard the activities, actions, the medico-sanitary tasks, operating with that knowledge and practice related to the norms and specific actions of the health-care units.

If concepts such as economic management, organizational or human resources management are considered to be somehow obsolete, being treated for several decades in the specialty literature, the greatest challenge of our times seems to be **the quality management.**

Even though the dictionaries provide a plentitude of definitions for the term of **quality**, neither of them has been universally accepted. Strictly related to the concept of **product**, the term quality can be approached in two ways³²¹: "the quality is rendered by those characteristics of the products that meet the needs of the customers; the better these characteristics, the higher the quality, and quality implies lack of deficiencies; the lesser the deficiencies, the better the quality".

³²⁰ Petru Armean, Management sanitar noțiuni fundamentale de sănătate publică, Editura CNI Coresi S.A., București, 2004.

³²¹ Petru Armean, Managementul calității serviciilor de sănătate, CNI Coresi S.A. Publishing House, Bucharest, 2004.

Some authors³²² offer a more pragmatic definition of **quality, adapted to the medical activity**: "The achievement of the client's durable satisfaction, primarily of the patient's, at the best cost. Quality is nothing else but the satisfaction of the client, the consistency between what they expect and what they get. On the one hand, we have the patient, with a certain number of needs, of expectations and demands, and on the other hand we have the care, with a certain number of characteristics and attributes. So: quality means how to satisfy your patient? How to proceed so as the attributes of the health-care should correspond to the expectations of the patient?".

2. Marketing versus sanitary marketing

There are more definitions given to the notion of "marketing", the most complete being this one³²³: Marketing represent the process of planning and executing the concept of establishing the price, of promoting and distributing idea, goods and services, in order to create fluxes that should satisfy the individual and corporate objectives.

The American professor **Philip Kotler**, also known as "the father of modern marketing" proposed, in 1992 the following definition³²⁴: Marketing represents the economic and social mechanism by the means of which individuals and groups obtain what they need and desire through producing and exchanging goods and services.

Therefore, the dynamic force that stands at the base of the marketing activity is the human need. To meet this need, we must come prepared, equipped with the knowledge that should help us know what, when, how and to whom we must offer in the exchange process.

The marketing vision combines the adoption at the level of the entire organization of the marketing philosophy with the functional aptitudes of satisfying the consumers' needs, in such a way that the *previously known market is* the one that determines the characteristics of the product and service and the manner of commercialization, and the producer creates only the products and services the customer desires.

This way, the **objective of the marketing activity** is achieved, objective about which the great American specialist **Peter Druker** says that "it is not the one of making the sale redundant. The purpose is getting to know and understand the client so well that the product or service should match its needs... to sell itself" This vision has gradually gained ground, along with the transition from the concept of marketing, which represented only the sale activities, the physical distribution and advertising, to the **marketing managerial orientation**, **expressed through the marketing mix.**

The key elements of the marketing activity are: the consumers, who must be the focus of attention for the activity of the enterprise, with their needs and desires; the profit, which is the final purpose accomplished through the satisfaction of consumers' needs; the marketing organizing that enables the making of decisions according to the demand.

Therefore, accepting **the marketing vision** can be transposed in the following imperatives: to discover the needs of the consumer and to fulfill them; to produce only what can be consumed, instead of trying to sell what is produces; to love the consumer, and not the product; to profitably satisfy the needs of the consumer.

The universality of marketing – a feature of modern marketing theory and practice – has asserted itself over the last few decades, when the fundamental structural changes taking place in the configuration of the economic, social and political environment created new opportunities that confer new dimensions to the content and functions of marketing, new perspectives and orientations. A retrospective of marketing evolution reveals, over the last few decades, a permanent tendency of diversification and specialization, in various rhythms and proportions, determined by the particular conditions of each domain, which has led to the outline of a marketing typology.

The delineation of marketing types can be made on according to certain criteria, which abound in the specialty literature, such as: *the objective of the activity, the level of organization, the territorial area, etc.*

The objective of the activity enables the classification in:

- **1.** The marketing in social or non-lucrative domain, in which there are no products or services produced or performed for commercial use, but in which we deal with ideas meant to trigger social behaviors pointing towards a social legitimate cause.
- **2.** The marketing in the economic domain, which refers to the lucrative department, in which goods and services are produced in order to satisfy the demands of the consumer, but at the same time in order to bring profit to the producer. Due to the profit or to the nature of the economic activity, the economic marketing has split into:
- **a. Consumer goods marketing** the consumer goods is the field where marketing has originated from, now having the widest applicability.
- **b.** Productive use goods marketing (of the means of production or investments goods), mainly destined for industrial consumption, meaning industrial marketing, employed on a broader scale.

³²⁵ Kotler Ph., Armstrong G, Principles of Marketing 5th, Prentice Hall Englewod Cliffs, New Jersey 1991 pag. 497.

3. Services marketing – has as a domain the tertiary sector, characterized by heterogeneity, intangibility and inseparability of the provider, fact which has imposed some specific methods and techniques, and, along with the development of both tertiary sector and marketing, led to the delineation of separate areas, that are now at their peak; medical services marketing, financial marketing, transport marketing.

Bearing in mind the previous classification, we further present the main differences between the business marketing, the social marketing and the medical marketing.

Table 1: Differences between the business marketing and the social marketing ³²⁶:

Business marketing	Social marketing
It is applied to goods and services, and less	It is applied to persons, places, ideas, goods and services
to ideas.	
The changes are of a financial nature	The changes are not of a financial nature.

	which there are antagonistic liaisons.

Table 2: Differences between the business marketing and the medical services marketing:

Business marketing	Medical marketing	
The purpose is profit increase, either through the improvement of the product's features, or through cost reduction, in order to maintain the supremacy on the market.	The purpose is the increase of the quality of the provided services, in order to better serve the patients and in the end, the improvement of the population's state of health.	
The main objective is having a price policy that should maximize the profit (the rapport between incomes and costs)	0	
The purpose is of bringing the product in contact with potential consumers.	The purpose is making the medical service accessible to all patients.	
The purpose is that, through the means of advertising, to modify the demand of the consumer, in the benefit of the promoted products.	The purpose is to adapt the medical service to the patients' expectancies and to familiarize them with it, taking into account the asymmetric information of the patients, due to the different social environments they emerge from.	

3. Sanitary management-marketing. Difficulties and controversies

Henri Guitton, to whom we owe the development of **health economy** in France, considered that that was a new discipline, ascertaining that "the principles that gave birth to the economic science are not perfectly applicable to the health related issues." Indeed, the concepts and paradigms employed for the description, explanation and organization of all the activities of a human collectivity, related with the production and exchange of material goods, seem not to be adapted to the goods and services that regard life itself.

The first difficulty the economists specialized in health-care problems are confronted with, concerns the definition and measurement of the quality of the product resulted from the activities of the professionals in this field (producers). Undeniably, even though, in theory, the means used by these professionals are relatively easy to determine, the definition of the obtained result is of an unquestionable difficulty. What the consumers that resort to the services of one of these producers desire to obtain is: to recover the lost health, to maintain their health or to improve their health.

The second difficulty encountered by the health economists is the one of the information the agents have about themselves and about the results they hope to attain by addressing themselves to a professional in the health department. The patient doesn't generally have more than minimum information regarding the state of his or her health and its evolution; therefore, the patients resort to the professional in order to obtain first of all a piece of information about this state: a diagnosis. Irrespective of the qualities of this expert, the answer cannot be

596

,

³²⁶ After Violeta Rădulescu, Marketingul serviciilor de sănătate, Uranus Publishing House, Bucharest, 2008.

formulated in anything more than probability terms. The patient will then want to obtain information about the various means and technical processes that could allow him or her to either maintain this state or improve it. Again, the results of these means and processes can be described only in probability terms. The context in which the patient must exercise his preferences over certain distributions of probability determines him to generally give the producer the freedom to choose the treatment strategy. The client assigns the producer to decide for him. We are, thus, very far from the common hypotheses of neoclassic economy, because the independence of the demand and of the offer is no longer ensured.

A third problem emerges from the specific character of the "health" good and of its social representations. In our modern societies, "the right to health for all" is a undeniable value, resulting from a continuous process of social negotiation concerning the definition of the health needs that must be satisfied. The concept of need is imprecise, and since every need brings about another need, they risk becoming infinite. Consequently, the society engages to establish social justice and equity principles and then implement devices that should allow it to define the objectives of health, compatible with these principles.

A forth problem is represented by the evaluation, which is generally defined as a "demarche that consists in a judgment of value over a technique, a practice, program or policy, enacted in view of making a decision". The apparition of medico-sanitary evaluation and analysis as a new discipline that adds the economic criteria to the medical ones, is regarded with a certain withholding, even reticently we might say, by the world of health care. Therefore, questions such as: "How should financial criteria be introduced in such an essential area as the health-care domain? Wouldn't it be appalling to refuse certain medical care due to economic considerations? Is it in the doctor's power who has the liberty to prescribe treatment, to take into consideration only the well being of the patient, providing him the best medical treatment?" determine the medical institution not to take into consideration the economic consequences of their decisions.

The health-care economist, however, will fill in this simple instrument with: a theoretical efficacy evaluation of the health programs that quantify the therapeutic benefits for the patient in a situation defines as ideal; a practical evaluation of the health programs, which has as a goal the integration of the patients' adhesion to therapeutic benefice; and an evaluation of the health programs availability that concerns the selection of the studies population.

Controversies related to the economic evaluation – medical evaluation rapport take into account:

I. The perspectives of evaluation. The evaluations can be performed from the point of view of several actors. So, we can concentrate *only on the patient and his or her family* (for instance: for the cost of *dialysis we can analyze the expected repercussions over the patient's entourage*); further on, we can extend the perspective over the *health institution* (example: what operations in the ambulatory can be performed in view of improving the budget of certain structures); or over the collectivity taken as a whole – the state.

In either of these hypotheses we might place ourselves, the adopted angle must be indicated, since it influences the nature of the elements taken into account and the calculation of costs. Therefore, the cost of a health program depending on the chosen perspective can be defined as it follows:

- **a.** From the point of view of the **social security system, the cost of the health program** equals the sum of the reimbursements of the expenses it triggers, its evaluation having as a starting point the nomenclature of the documents published by the health insurances.
- **b.** The patient perceives the same cost through the prism of the honoraries and possible expenses related to the disease and treatments not reimbursed by the social insurances.
- **c.** The medical institution evaluates the cost of a certain health program from the perspective of financial, material and human resource, necessary for its implementation.
- **d.** From the viewpoint of the **employment institution**, the cost of a health program consists in the production losses related to the patient's work interruption.
- **e.** Regarded from the **global perspective of the society,** this cost corresponds to the amount it accepts to pay for health, in the detriment of other budgetary domains, being evaluated through adding together the costs engendered by the previously enumerated programs.
- **II. Cost determination.** From the standpoint of the sanitary institution, there are **three possible types of classifications of the hospital expenses: accounting classification,** which corresponds to the distinction between *direct-indirect expenses*; **medical classification,** which distinguish between *medical expenses, logistics expense and structure expenses*; **economic classification** sets in contradiction *variable costs fixed costs.* As such, the regrouping of the expenses will have to be operated depending on the purpose of the study: *the perspective of the made decision, the perspective of the management through budgetary abatements or the perspective of the hospital structures financing*.
- **III. Evaluation instruments.** The experts in the health department are more and more preoccupied by issues such as: *Is it necessary to launch a breast-cancer detection program? Should laparoscopic surgical interventions be preferred over classical interventions? What type of anti-asthmatic treatment must be planned and for what type of disease? For what kind of surgical intervention should be established a smaller number of hospitalization days?. The answer to all these questions can be given once we have the evaluations of the rapports cost-results of various*

health programs that presuppose, in fact, three types of interventions: cost measurement, result measurement and the combination of the two elements. The proposed endeavor is rather heavy because in the health-care field, the lack of market price raises serious problems in cost evaluation. At the same time, in the absence of economical aspects, it is difficult to express measure and regroup the patient's preferences.

IV. The temporal horizon. The medico – economic studies generally analyze the health programs whose costs or consequences extend over a longer period of time. Time intervenes both on the *level of accomplishments (for instanced the long term treatments that require long life equipments)* and at the *level of the consequences (avoiding a disease for a long time)*. Due to this fact, if we wish to compare the different periods of time, it is important to account them in the same measuring unit, technique called *actualization, which takes into consideration the population's preference who benefits from the health-care programs in the present, which will be paid for later on, in the future*. Health, regarded as a non-transferable good in time that doesn't belong to the market, raises the following issues, in the actualization domain: *What actualization rate should be employed? Are we actualizing only the costs or the results, as well? In case of a positive answer, is the actualization rate the same?*

CONSUMER BEHAVIOR AND ENTERPRISE AGILITY – A MODEL OF THE SURVEYED INDICATORS

Boier Rodica

Tehnical University "Gh. Asachi" of Iaşi Economics and Marketing Chair 53 D. Mangeron Blvd., 700050 Iaşi Inovare Marketing@tex.tuiasi.ro Tel/Fax: 0232.239.154 Mobile: 0744.514.441; 0728.332.996

Enhancing the agility of the response to market demands is one of the most desirable qualities for the management of today's enterprise, which is facing an unstable environment, with abrupt, frequent and unpredictable changes. The paper proposes a model of the consumer behavior factors involved in market monitoring, in order to secure rapid responses: brand image, buyer risk, the customers' attitude toward the product, the buying intentions and the post-purchase satisfaction. The correlation type is described and the measurement method is proposed for each of these factors.

Key words: agile enterprise, customer value, marketing research, brand image, customer preferences, buyer risk, customer attitude, buying intentions, post-purchase satisfaction

The article's JEL code: M

1. Conceptual framework

1.1. The agile enterprise

During the times of rapid technological changes, extensive globalization and intensive competition, but especially during the current financial and economic crisis, perhaps the most critical concern is finding solutions for the quick, flexible and consistent adaptation of the enterprise to a business environment marked by frequent, abrupt, extensive and unexpected opportunities, events, and challenges, leading into unpredictable directions. Enhancing the *enterprise agility*³²⁷ – as sum of flexibility, visibility and consumer responsiveness –, is pursued constantly and in all its components. The enterprise's marketing agility is particularly important as it highlights its ability to manage and even generate change, which is viewed as an opportunity. Thus, the agile enterprise basically relay on marketing and innovation, an iterative and incremental development, which means to continually explore new opportunities and exploiting the marketplace with new solutions.

The agile enterprise relies on its ability to rapidly evaluate feedback, and also new information, followed by taking decisions almost in real time. The agile organization of the enterprise effectively means that it operates according to the "just-in-time" principle. For this purpose, the enterprise constantly builds and upgrades its IT architecture so that it is able at any moment to handle the complex data flows that must be retrieved, processed, analyzed and interpreted to ensure rapid, effective and efficient decision-making.

There is a further point to note here: agility must not be understood as navigation without a compass, as just a series of responses to the opportunities and/or threats in the environment, but rather as the complex process of assessment, planning and monitoring the enterprise's resources and capabilities³²⁸ that deliver *customer value*, to a higher level than the competition, and therefore guarantee sustainable competitive advantage and stability on the market.

1.2. Customer value – a benchmark guiding the agile enterprise's market responses

The concept of "customer value" assesses the benefits obtained through the consumption of the product (utility of the offering for the customer), on the one hand, with the costs incurred in order to acquire and consume/use it (customer costs), on the other hand. The cornerstone in understanding the chances of the enterprise to generate the success of its offer on the market is the value that it is able to propose to the client. Value is created by meeting a customer need, solving a problem, helping him to achieve a goal, in a word, by delivering a certain benefit to the customer.

Customer value = Customer utility - Customer costs

The product's utility for the customer derives from the benefits of the proposed products in relation to the intensity of the customer's needs. This will result into what the customer estimates to be the fair price for the functional and emotional benefits provided by consuming / using the product. For example, the utility of a textile clothing product may derive from the possibility to modulate its components in order to extend the occasions of use or to match it with necessary accessories to keep up to date with fashion trends. Utility may also stem from the feelings of pride, satisfaction and self-confidence that the product generates in the owner.

The product's cost for the customer consists in the total expenses involved, which the customer expects to incur in order to enjoy the stated benefits. They include, in addition to the actual purchasing price for the product, a whole

³²⁷ Nirmal Pal, Daniel Pantaleo (Eds.) (2005), The Agile Enterprise: Reinventing your Organization for Success in an On-Demand World, Springer, Berlin; Ori Brafman, Rod A. Beckstrom (2006), The Starfish And The Spider: The Unstoppable Power of Leaderless Organizations, Penguin Books, London.

³²⁸ Cohn, Micheal (2005), Agile Estimating and Planning, Prentice Hall PTR, New York; Krebs, Jochen (2008), Agile Portfolio Management, Microsoft Press.

series of other potential expenses related to transport, installation, operation, insurance, storage, maintenance, servicing, dismantling, disposal, etc., in addition to possible waste of time, frustration, anxiety, and others. For example, to the perceived cost of purchasing a textile clothing product, the customer will add expenses for potential waist adjustments or for purchasing matching accessories, etc. Some costs may be anticipated by the buyer/user, yet others are not generally expected or desired (wasted time, stress, etc).

It emerges therefore that the agile enterprise will seek to respond rapidly and gain competitive market advantage either by delivering superior benefits to those proposed by competitive products or by providing comparable benefits at a lower cost for the customer. In either of the two types of response, the enterprise's effort will focus on delivering on the market the type of product that will provide target consumers with a level of value that they will perceive as being *superior to the competition's* offe³²⁹r.

The agile enterprise creates value when it rapidly transforms the various inputs into commercially viable products. All along this complex course, marketing is involved in:

- 1. designing value identifying the market opportunities and configuring the product in such a way as it is as compatible with the needs, desires, and preferences of target customers and provides sustainable competitive advantages, in brief, being attractive for the market;
- 2. communicating value the science and art of informing the market about all the aspects of the proposed offering, so as to aid the customers in making the most favorable buying decision;
- 3. delivering value that is the whole system of distribution activities, through which the consumer accesses the product/service in the most convenient way.

Highlighting the indicator "customer value" involves market measurements related to the *customers' perception of* the level of value – data generated through marketing research – and comparisons with the equivalent values of competitive offers (benchmarking).

2. Indicators of consumer behavior surveyed

The indicators proposed to be tracked in order to identify the solutions to enhance the organization's agility will be (Table 1):

- brand image (I1),
- the customers' perceived risk (I2),
- the customer's attitude towards the proposed product (I3),
- the buying intentions (I4), and
- the level of post-purchase satisfaction (I5).

Marketing research will provide such information.

Tab. 1. Consumer behavior indicators monitored to enhance the organization's agility

Indicator	Explanation	Type of influence	Measuring method
[I1] Brand image	The enterprise gains agility when it is able to rapidly create a strong favorable perception of its brand/brands among customers.	Direct correlation: enhanced agility due to better product/brand image.	quantitative researchnumerical evaluation scales
[I2] Buyer perceived risk	The enterprise acquires agility when it is able to rapidly create a strong favorable perception of the limited buyer risk involved by the proposed product/brand.	Indirect correlation: enhanced agility due to the more favorable perception of a lower risk involved in buying the company's products/brands (consumer protection against the purchasing risk).	 quantitative research verbal evaluation scales
[I3] Attitudes towards the product/brand	The enterprise gains agility when it is able to rapidly create a favorable attitude towards its offering and its approach to the market, etc. among its customers.	Direct correlation: higher agility due to a more positive attitude towards the company's product/service.	quantitative researchattitude scales
[I4] Buying intentions	The enterprise gains agility when it is able to create a more defined buying intention among its customers.	Direct correlation: enhanced agility due to a more favorable rating of the intention to buy the enterprise's products/brands.	quantitative researchnumerical evaluation scales
[15]	The enterprise gains agility when	Direct correlation: enhanced	- quantitative

Post-purchase	it is able to rapidly create a higher	agility due to a higher post-	research
satisfaction	level of customer satisfaction.	purchase satisfaction.	 numerical
			evaluation scales

2.1. The customers' perception toward the brand (brand image) – Indicator [I1]

The overall vision or position of brand in the mind of the consumer defines the *brand image*³³⁰. The enterprise gains agility when it manages to rapidely create a strong and favorable perception towards its brand/brands among customers. In order to link the brand image more expressively to the company's agility, the "consumer brand preference" will be suggested for monitoring. The indicator will be tracked both in relation to the enterprise's own brand and to those of its competitors.

Fig. 1. Measuring customer preferences toward product category / brand

In terms of influence, there is a direct relation, i.e. enhanced agility due to a more positive image for both product category and brand. Measuring method: in general, quantitative research – market survey based on a sample of consumers and a questionnaire with a numerical scale for preference evaluation; the method of administering the questionnaire will be selected on a case-by-case basis. Figure 1 presents the potential configuration of the survey sequence.

2.2. The customers' perception of purchasing risk – Indicator [12]

Perceived risk means the uncertainty that consumers face when they cannot foresee the consequences of their purchase decisions³³¹. The enterprise gains agility when it is able to rapidly create a strong and favorable perception of the limited buyer risk carried by the proposed product/brand.

```
Please mark on the scale below the corresponding level of your view of the risk involved in using the brand ......

I believe that the risk is
the highest
-5...-4...-3...-2...-1...0...+1...+2...+3...+4...+5 is the lowest
```

Fig. 2. Measuring customers' perceived risk

The type of influence is an indirect correlation, i.e. enhanced agility due to a more favorable perception of a lower buyer risk in purchasing the enterprise's products/brands (consumer safeguard against the purchasing risk). The measuring method will be, in general, a quantitative research – market survey using a sample of consumers and a questionnaire with a numerical scale of evaluation; method of administering the questionnaire – it is selected on a case-by-case basis. Figure 2 presents the potential configuration of the survey sequence.

2.3. The customers' attitude towards the enterprise's offering – Indicator [13]

Attitudes are learned predispositions to respond to an object or class of objects in a consistently favorable or unfavorable way, which can be used to predict consumer behavior³³². The enterprise gains agility when it is able to rapidely create a favorable attitude towards its overall offering or just a specific product/brand.

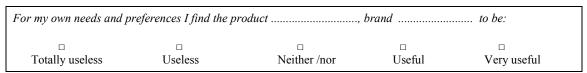

Fig. 3. Measuring customers' attitude towards the utility of product ... / brand

The type of influence is a direct correlation, i.e. increased agility owing to a more positive attitude towards the enterprise's offering. The measuring method will be, most likely, a quantitative research – market survey using a sample and a scale questionnaire to evaluate attitudes; the method of administering the questionnaire is to be selected on a case-by-case basis. Figure 3 presents a potential formulation of the corresponding survey sequence.

2.4. Buying intentions – Indicator [14]

Intention is the behavioral component of attitude, and it describes attitudes not toward a brand, but toward brand purchase³³³. This way, it is a far better predictor of behavior than either beliefs or affective responses. The enterprise gains agility when it is able to rapidely generate more definite buying intentions among its customers.

³³² Banwari Mittal (2008), Consumer Behavior: How Humans Think, Feel and Act in the Marketplace, Open Mentis, Cincinnati, OH.

If product were available on the market, for the price:				
I will definitely not buy it	I will probably not buy it	Neither/nor	I will probably buy it	I will definitely buy it

Fig. 4. Measuring buying intention for product brand

The type of influence is a direct correlation, i.e. enhanced agility due to a better rating of the intention to buy the enterprise's products/brands. The measuring method will be, in general, a quantitative research – market survey using a sample of consumers and a questionnaire with a evaluation sacle for buying intentions; the method of administering the questionnaire is to be selected on a case-by-case basis. Figure 4 suggests a potential design of the corresponding survey sequence.

2.5. Post-purchase satisfaction – Indicator [15]

Positive evaluation after purchase leads to *satisfaction*, while negative evaluation after purchase leads to *dissatisfaction*³³⁴. The enterprise gains agility when it is able to rapidely deliver higher customer satisfaction.

The type of influence is a direct correlation, i.e. enhanced agility due to the increased level of post-purchase satisfaction. The measuring method will be a quantitative research – market survey using a sample of consumers and a Likert-scale question; the method of administering the questionnaire is to be selected on a case-by-case basis. Figure 5 suggests the potential questionnaire sequence.

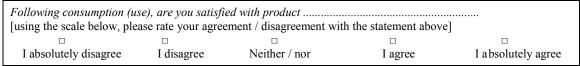

Fig. 5. Measuring customer satisfaction for product brand

The proposed model of consumer behavior indicators involved in managing the enterprise agility will be validate by further investigations.

EVALUATING ENTERPRISE AGILITY – AN EXPLORATORY RESEARCH ON CONSUMER BEHAVIOR INDICATORS

Boier Rodica

Tehnical University "Gh. Asachi" of Iaşi Economics and Marketing Chair 53 D. Mangeron Blvd., 700050 Iaşi Inovare Marketing@tex.tuiasi.ro Tel/Fax: 0232.239.154 Mobile: 0744.514.441; 0728.332.996

Starting from a model of the factors which are directly involved in the consumer's buying behavior – brand image, the perception of purchase risk, the attitude towards the product category and, in this context, the attitude towards the brand, the buying intention, and post-purchase satisfaction – the paper describes the exploratory research carried out through a set of focus group sessions and multiple case studies. The objective of the research was to validate the proposed indicators and design – on these basis – a self-evaluation system expressing the level of enterprise agility.

Key words: agile enterprise, exploratory research, focus group, brand image, customer preferences, buyer risk, customer attitude, buying intentions, post-purchase satisfaction.

The article's JEL code: M

1. Enhancing enterprise agility

The current study is the continuation of a first part, which described a possible model of consumer behavior factors that the enterprise must consider to gather feedback and wholly new data in its efforts to enhance market agility ³³⁵. The agile enterprise relies on its rapid decision-making capability. The agile organization of the enterprise effectively means that it operates according to the "just-in-time" principle³³⁶. For this purpose, it constantly builds and upgrades its IT architecture³³⁷ so that it is able at any moment to handle the complex data flows, which the company must retrieve, process, analyze and interpret to ensure rapid decision-making³³⁸. It is therefore relevant to identify those indicators, which the marketing of the agile enterprise will require for a sound decision-making.

Enhancing the agility of the response to market demands is one of the most desirable qualities for the management of today's enterprise, which is facing an unstable environment, with abrupt, frequent and unpredictable changes. The present paper develops researches around a prior proposed model of the consumer behavior factors involved in market monitoring, in order to secure rapid responses. The objective is to validate the described correlation type and the proposed measurement method for each of these factors of the model.

A set of indicators were proposed to be monitored in order to identify solutions for enhancing the enterprise's agility, information about them will be ascertained by means of marketing research:

- [I1]. "Brand image" reflected in the customers' preference for the brand.
- [I2]. "Customers' perception of purchase risk".
- [I3]. ",Customers' attitudes towards the firm's offering".
- [I4]. "The buying intentions of prospective customers".
- [I5]. "Post-purchase satisfaction of consumers (users)".

2. The focus group exploratory research

To validate the indicators, a preliminary exploratory investigation, conducted by a transversal qualitative research, was designed and executed, using the group interview (focus group) method, to facilitate the design of the further more specific, descriptive/causal research.

The surveyed group consisted of 11 Romanian companies from various industries (software, construction, textiles, chemical products, pharmaceutical products, wine, and wood exploitation and processing) based in the North East Region, considered as representative in terms of their distribution of the industry profile in that area, their expertise in marketing, openness in detecting opportunities, determining and implementing new solutions, their consistent market share and strong brand equity.

Five specialised sequential interviewing sesions were conducted, each of them sustaining the validation of the five proposed indicators.

The moderator of the focus group session was a project team member, specializing in such method of marketing research, with the rest of team playing an observer role. The moderation guide was designed in cooperation by the project research team and tested in advance with three leading (key) customers as test-agile enterprises. The basic sequence of the moderation guide was organized as shown in figure 1.

- 1. To what extend do you estimate that customers' perceptions of your offering impact the agility of the firm's response to the rapid (sometimes abrupt) and pronounced market changes?
- 2. Do you regularly measure, analyze and diagnose the perceptions of customers (current, potential, prospective) have of your company's offering?
- 3. Does this process help you to make rapid and accurate strategic and/or tactical marketing decisions? In what manner? To what extent?
- 4. Do you regularly measure, analyze and interpret the image that have of your company's brand?
- 5. Does this process help you to take rapid and accurate strategic and/or tactical marketing decisions? In what manner? To what extent?
- 6. Do you regularly measure, analyze and interpret the consumers' perceived risk toward your company's brand?
- 7. Does this process help you to make rapid and accurate strategic and/or tactical marketing decisions? In what manner? To what extent?
- 8. Do you regularly measure the cognitive component of your (current, potential, prospective) customers' attitude?
- 9. Does this process help you to take rapid and accurate strategic and/or tactical marketing decisions? In what manner? To what extent?
- 10.Do you regularly measure the emotional component of your (current, potential, prospective) customers' attitude?
- 11. Does this process help you to take rapid and accurate strategic and/or tactical marketing decisions? In what manner? To what extent?
- 12. Do you regularly measure the conative component of your (current, potential, prospective) customers' attitude?
- 13. Does this process help you to take rapid and accurate strategic and/or tactical marketing decisions? In what manner? To what extent?
- 14. Do you regularly measure the buying intention of your (current, potential, prospective) customers?
- 15. Does this process help you to take rapid and accurate strategic and/or tactical marketing decisions? In what manner? To what extent?
- 16. Do you regularly measure the level of satisfaction of your (current, potential, prospective) customers?
- 17. Does this process help you to take rapid and accurate strategic and/or tactical marketing decisions? In what manner? To what extent?

Fig. 1. Moderating guide in focus group session

To verify the proposed agility factors multiple case studies were also conducted which, based on the activity on the Romanian market, aimed to highlight both positive and negative experience. The longitudinal qualitative research was carried out using method of in-depth, face-to-face individual interviews with top managers of the surveyed companies, most often the executives, general or marketing managers.

Finally, a descriptive/causal (transversal) quantitative research was carried out, in order to validate the proposed set of indicators; the type of influence specific to each individual indicator of agility on the organization's actions; the measuring method for each indicator in the proposed set; the mutual conditions established between the factors and the impact of their joint action on the market performance of the agile enterprise.

The information gathering during this stage of the research was the questionnaire-based survey. The method of administering the questionnaire – mail survey. To increase the answer rate and limit error sources in the research, the interviewing method was accompanied by phone support provided to respondents by the research team.

3. The findings

The processing of the data collected following the research has produced a number of conclusions, which are able to validate the indicators proposed earlier, as outlined below.

- 1. The surveyed companies monitor the proposed indicators [II]. Customers' perception of the offering. The brand image reflected in the customer preference for the brand; [I2]. Customers' perception of purchase risk; [I3]. Customers' attitudes towards the company's offering; [I4]. The buying intentions of potential (prospective) buyers; [I5]. The consumers' (users') post-purchase satisfaction which is dependent on the consumers' actual statements and reliability, as these are assessed in a largely empirical manner, quite different from the methodology exposed above.
 - 2. With respect to **Indicator [I1]. Customers' perceptions of the company's brand**, the surveyed firms estimate that:
- the indicator impacts on the company's agility in responding to rapid (sometimes abrupt) and pronounced market changes;
- the enterprise gains agility when it is able to create a strong and favorable perception of its brand/brands;
 - one direct correlation is confirmed enhanced agility due to more positive product/brand image.
- 3. With respect to Indicator [12]. Customers' perceptions of purchase risk, the surveyed firms estimate that:

- the indicator impacts on the company's agility in responding to rapid (sometimes abrupt) and pronounced market changes;
- the enterprise gains agility when it is able to create a favorable perception of limited buyer risk; one indirect correlation is confirmed enhanced agility due to a more favorable perception of lower buyer risk involved in purchasing the company's products/brands (consumer safeguard against purchasing risk).
- 4. With respect to **Indicator [I3]. Customers' attitude towards the company's offering**, the surveyed firms estimate that:
- the indicator impacts on the company's agility in responding to rapid (sometimes abrupt) and pronounced market changes;
- the enterprise gains agility when it is able to create a favorable attitude towards its overall offering; one direct correlation is confirmed enhanced agility due to more positive attitude towards the company's offering.
- 4. With respect to **Indicator [I4]. Customers' buying intentions towards the company's offering,** the surveyed firms estimate that:
- -the indicator impacts on the company's agility in responding to rapid (sometimes abrupt) and pronounced market changes;
- -the enterprise gains agility when it is able to create a more definite buying intention among customers;
- -one direct correlation is confirmed enhanced agility due to a higher rating of the intention to buy the enterprise's products/brands.
- 5. With respect to Indicator [I5]. Customers' post-purchase satisfaction, the surveyed firms estimate that:
- the indicator impacts on the company's agility in responding to rapid (sometimes abrupt) and pronounced market changes;
- the enterprise gains agility when it is able to create a higher level of customer satisfaction;
- one direct correlation is confirmed enhanced agility due to a higher level of post-purchase satisfaction.

4. Assessement form proposed for further research

As a result, an assessement form for the enterprise agility, based only on consumer behavior indicators, was proposed (Table 1).

Tab. 1.	Assessing the lev	el of the enterprise	's agility based on	consumer behavior indicators
I WO. I.	TIBBOODS TITE TO			

Indicator	Perceived risk	Brand preference	Attitude towards the brand	Buying intention	Post-purchase satisfaction
Level of agility					
Very good	[+4.0 -+5.0]	[+4.0 - +5,0]	The rating ,, Very useful" is prevalent	The rating "I will definitely buy it" is prevalent.	The rating "I absolutely agree" is prevalent.
Good	[+3.0 - +3.99]	[+3.0 - +3.99]	The rating ,, Useful" is prevalent	The rating " <i>I will probably buy it</i> " is prevalent.	The rating "I agree" is prevalent."
Poor	[+1.0 - +2.99]	[+1.0 - +2.99]	The rating "Neither useful nor useless" is prevalent	The rating "Neither/nor" is prevalent.	The rating "Neither / nor" is prevalent."
Very poor	[-5.0 - +0.99]	[-5.0 - +0,99]	The ratings "Totally useless" and "useless" are prevalent	The ratings "I will probably not buy it" and "I will definitely not buy it" are prevalent	The ratings "I do not agree" and "I absolutely do not agree" are prevalent

The exploratory research presented here will be extended through a quantitative research, based on questionnaires, conducted on a relevant sample of enterprises that operate with agility or/and aim to gain improved market agility. The objective of the research will be build a multi-criteria decision-making model for the evaluation of the whole enterprise's agility level at a particular moment and also to provide information that will underpin decisions for agile market actions.

CHOOSING THE MEDIA CHANNELS ACCORDING TO THE IDENTIFIED MARKET SEGMENT

Botezat Elena

University of Oradea, Faculty of Economic Sciences, Pţa Independenţei nr. 53,bl. A10, ap. 12 ebotezat@uoradea.ro, 0722/260.308

Sav Teodora

The present paperwork presents the importance of the linking of the media channels chosen in the framework of an advertising campaign with the identified target for the product/service that will be promoted.

Starting from the identification of the need to promote a product / range of products, from the identification of the target (target market) of the respective product, the most creative and innovative promoting methods can be chosen; but, quite often, these can prove to be useless or irrational if the chosen promoting support does not aim directly the people interested in this product. The final monitoring of the advertising campaign helps us analyze and detail the results obtained as a consequence of the promoting process.

Keywords: media channels, target, rating, CPP vs. RC

Jel Code: M31

We can notice that a lot of marketing people do not understand the concept of "integrated campaign" and consider that an advertising campaign limits to the realization of booklets, a week/month of broadcasting a radio or a TV spot or the display of their brand on street billboard, without thinking wheter through these variants they reach the aimed public or not.

For exemple, let's talk about sponge cake products, a range of half made alimentary products.

1. Identifyig the products

The range of half made products aims at the active housewives who like to cook at home but who do not have enough time to spend hours in the kitchen.

Even if they are top quality, many people are afraid of using them, because usually they contain lots of preservatives. But, let's consider there are some products made following traditional recipes, with natural ingredients, with a low content of additives and preservatives, in the best hygienic and food safety conditions. There are few big companies producing this range of products in our national alimentary industry and many small enterprises - bakeries - that commercialise them. So, for a big company should be vey easy to become a leader on this market, taking in consideration the fact that it does have no important competitor. Still, imposing a range of this kind of products on the national market can be unfeasible unless it takes measures to promote it. For that, the best decision is to turn to a specialized advertising agency to promote these products, in order to increase the notoriety and the sales of the company.

2. The identification of the target market

In order to elaborate an advertising message, the marketing specialists need **preliminary essential information** about the target group:

- to know the benefits that the consumers expect;
- which benefit is more important, relevant and different in report with other offers;
- information about: social, demographic, psychological characteristics;
- consumption behaviour;
- the attitude towards the brand and the attitude towards the products.

Which is the target aimed by the Sponge-Cake advertisement campaign?

In order to identify the target market of the sponge-cake products, **the virtual communities** that had as interest and discussion topic – gastronomy. Except for this research method, other **qualitative research instruments** were used: groups, shelf research, direct interaction with potential clients, observation. Of all these methods, the most **efficient in the determination of the target market was, in this case, the focus-groups and the discussion forums on-line.** After the research developed for the identification of the target of the sponge-cake products, the partial results were the following:

- Sex: female
- Age: between 25-55 years
- **Social status:** married, with at least one child (usually younger than 7 years)
- **Profession**: housewife, baby-sitter, on maternity leave; confectioner, pastry chefs, chefs, apprentices, students of specialized schools; assistants; journalists, educational system.
- Environments: mostly urban
- Income: average and slightly above

Features of the aimed woman:

- very sociable, opened to new, active, dynamic, joyful and ready to experiment new recipes in the kitchen;
- likes to tell stories and to share recipies with friends;
- they are proud of a "well done cake" that looks very good;
- the joy of a surprise made to the child / husband / friends;
- devoted to the family, she is willing to dedicate a big part of her free time to cooking;
- willing to accept innovations in the culinary field, without giving up "traditional recipes";
- the habit of the weekend dessert to please the family / the neighbours;
- considers cooking is a method of relaxing and bringing the family close to one another around the table;

The purchase decision:

- the purchase decision belongs to her both in what regards the impulsive shopping and in most of the analytic shopping.

The sponge cake layers represent an **impulsive shopping.** In the decision of buying this product, housewives can be **influenced** mostly by the recognition and acknowledgement of the product / brand, but also by the opinion of friends, neighbours, family, the environment of the virtual community where she is a member. Therefore, here we can observe the increasing importance of the promotion method known as "word of mouth".

Interest topics: cuisine / international cuisine, children / topics about children, health and food / diets, flowers and / or pets, sports, romantic movies; they get their information from magazines.

The identification of the behaviour of the target towards the use of the product

Even if the aimed target has been very well identified by the campaign that will be launched the marketing specialist needs another important information before moving to the action itself: **finding out the opinion of the target public about this type / range of products**. How does the potential buyer perceive the use of the ready-made sponge cake layers? Would they buy it? What would determine him to buy them, use them and stay faithful to the product?

Therefore, after several variants elaborated, debated upon and analyzed, according to the benefits identified as important for the consumers of the "sponge cake" product, the message suggested to communicate the Sponge Cake can be:

"Sponge cake layers – For the cake that is always a success!

3. Choosing the communication channels

After the identification of the product target, the message and the creative concept that will address to the target market were established, we need to identify the channels through which we reach it. Therefore, where do we promote our message? Obviously, were we find the target! This is where the research work of the media department comes up.

For the beginning, let's make the distinction between two notions: the declination of the *campaign concept* and the *declination of the campaign*.

We call "declination of an advertising concept" the way it will vary according to the media supports. The objectives stay the same, but the concept varies. What changes is the way the advertising specialist will adapt its concept according to the concept in the case of various media channels. It is the same as in the case of the grammar specialist that declines a noun, the marketer keeps the same radical, the same structure, the same concept. In the case of the declination of the message, the media channel and the support stay the same, but there are a series of variants 339

The communication channels have two types: personal channels and the non-personal channels.

Personal channels- involve the existence of two or more persons that communicate directly with one another, through discussions, discourses, through telephone, post or internet. The efficiency of these channels derives from the possibility to individualize the presentation and to perceive directly the reaction of the auditorium.

Non-personal channels – spread messages that do not imply the contact or the interaction at personal level. These can be: information means: press, newspapers, magazines, radio, billboards and manifestations organized in various occasions (press conferences, sponsorships).340

According to the marketing mix and the creation strategy, the decision of the media plan follows the following process:341

1. Choosing the media channel;

_

³³⁹ Luc Marcenac, Alain Milon, Serge- Henri Saint- Michel- "Advertising strategies: from the marketing study to the choise of the various media" (ro. orig. "Strategii publicitare: de la studiul de marketing la alegerea diferitelor media"), Polirom Publishing House, Collegium Collection, 2006

³⁴⁰ Lazăr, D.D.- "Strategic marketing" (ro. orig. "Marketing strategic"), Printing House of the Oradea University, Oradea, 2003;

³⁴¹ Luc Marcenac, Alain Milon, Serge- Henri Saint- Michel- "Advertising strategies: from the marketing study to the choise of the various media" (ro. orig. "Strategii publicitare: de la studiul de marketing la alegerea diferitelor media"), Polirom Publishing House, Collegium Collection, 2006

- 2. Choosing the supports;
- 3. The sharing of the budget;
- 4. The campaign plan.

For the sponge cake products campaign, the general promotion media chosen can be:

Television,

Street display (OOH billboards)

Written press – magazines aimed at women,

On-line media.

A.Television

TV Advertising is the most efficient promoting mean. The results of a TV campaign are measurable; when we contract publicity space on the TV, we actually buy viewers who find out about our message. The results of a campaign are measured in thousands of viewers who have seen the spot. The measurement of the audience is realized in Romania by TNS / GfK Romania. GfK is the new company who takes over the measurements supplied by TNS, realised electronically (through the people meter). The results are unanimously accepted because GfK was designated through bid, starting with the summer of 2007, to perform this service by ARMA (The Romanian Association of Measuring the Audiences) – formed of the representatives of the TV stations, advertising agencies and advertising clients.342

ADVANTAGES AND DISADVANTAGES

The television, even if it has the biggest weight in the total of media means, is overloaded. This fact leads to an advertising suffocation (number of broadcasts, rapid rhythm of broadcasting the insertions). In what regards the target, we can observe the tendency to become faithful to a TV show or channel, according to it's type.

Strong points:	Weak points:
- Strong media channel	 Very suffocating
- Wide national covering;	- Low selectivity;
 It has a strong effect of notoriety; 	- Considerable technical
- Fast impact in the households;	expenses.
- Strong demonstrative effect.	

RATING (audience) - It shows how many TV owners watch a certain TV program / TV channel at a given moment (it is measured in thousands of people or percentage from the universe).

MARKET SHARE - It shows how many of the TV owners, who have their TV sets on watch a certain TV program / channel at a given moment (percentage).

- GRP (Gros Rating Point): represents the total of the rating points (rtg%) accumulated by a spot campaign, in a certain period of time.
- TRP (Target Rating Point): represents the total of the rating points (rtg%) accumulated by a spots campaign, in a certain period of time, on the client's target, that is TRP = GRP in the client's target.

AFFINITY: represents the report between the audience on the studied target and the audience on the reference target, that is: **Affinity** = **TRP**/**GRP**; **A good affinity has to be higher than 100%.** Affinity, **from the point of view of the campaign**, shows how efficient some TV channels or TV programs are for this.

COST PER POINT vs. RATE CARD

Cost Per Point (CPP) or the net cost of a rating point. The guaranteed audience sale is the most correct method. At its basis, there are accurate scientific researches, for establishing the compatibility between the profile of the target public of the promoted product and the profile of the target public of each program of the TV channel that makes the promotion. The method allows a complete post-campaign analysis and even the modification of the promotion strategy during the development of the campaign.

Rate Card (RC) or the classic method; list price – discount = net cost – nr. of broadcasts. Through this method we buy broadcasts, not audience. The tariffs are established statistically through: demographic & economic reports, the performance of the sales of that channel.

According to the results of these indicators, the following are suggested: the TV channels, the hour intervals, the shows during which the commercial will be broadcast considered adequate to the target.

The proposal of the agency for the Sponge Cake Campaign should be the following: **acasa**. These Tv channels were chosen because the target of the sponge cake products fits perfectly in the typology of their target:

Main Target Acasa (MT Acasa): Urban women between 15 and 49 years, average and high incomes, medium and higher education.

³⁴² http://www.arma.org.ro

Main Target ProTV (MT ProTV): Urban between 18 and 49 years, average and high incomes, medium and higher education.

"Acasă" has the higher audience on the target of the half made cakes campaign. Additionally, ProTV contains men too.

The hour intervals, respectively the shows proposed were the ones that after the TNS Agb analysis turned out to be audience leaders on the aimed target:

- 1. "acasa" channel: At home in the kitchen, The recipe at home, the soap opera "Inimă de Țigan" (Gypsy Heart);
- 2. "Pro Tv" channel: Happy Hour, ProTv News, the 7 pm edition, Pro Movie, at 9 pm.
- 3. "prima tv" channel- Teo Live! The sponge cakes products presented by Teo! Teo is very popular and she has become an opinion leader who is able to promote topics.

B. Display

The display represents one of the oldest promotion means in the world. From graffiti to 3D, the will of every man to leave something behind is a logical one. Together with television and written press, the display remains one of the most important media channels.

Its big disadvantage is represented by the incapacity to select the target audience, followed closely by the difficulty to assess the number of targeted people, reached through the billboards. But, in what regards the covering offered by the posted, it is total, the percentage of the Gross Rating Point (GRP) reaching a maximum level. 343

Strong points:	Weak points:
 Incisive media channel Violent, impact character Strong media channel, capable to create rapid notoriety Good geographic frequency and selectivity Direct connection with the distribution Colour visualization and good reproduction. 	 Ephemeral media channel Weak demographic selectivity Weak adaptability of use Important technical expenses.

The display proposal for sponge cake:

For the sponge cake campaign, the OOH display is not one of the recommended variants in this situation. However, in order to make a certain selectivity – at least geographical – panels were chosen in the cities where are sales points for this products. The number of billboards suggested for each city took into consideration the number of inhabitants of that city. Other selection criteria can be: - The number of Key Accounts of the producer of this products in that city;

The sales percentage of the sponge cakes range in that city.

C. Press

The press represents an exceptional tool to create the files or the request of the documentation, but also a good direct sale support. It occupies the second rank, after television. The press offers the marketing professionals a high number of segmenting possibilities, analysing the ranking of the periodicals that dedicate most pages to the announcements. 344

Regional daily press is a strong media channel, even if it varies from one region to another.

Strong points:	Weak points
National covering;Faithful target;Strongly argumentative.	 Ephemeral message; Suffocating media channel Low degree of adaptability and
	availability

The magazines suggested for the target of the sponge cake campaign

In order to reach the target public of the Sponge cake products, a series of fashionable magazines were suggested, aiming at the public with average and above average incomes. The readers of these magazines are between 25-54 years old and they are interested on topics such as family, health, kitchen, carrier, children, medicine, beauty.

³⁴³ Luc Marcenac, Alain Milon, Serge-Henri Saint-Michel- "Advertising strategies: from the marketing study to the choise of the various media" (ro. orig. "Strategii publicitare: de la studiul de marketing la alegerea diferitelor media"), Polirom Publishing House, Collegium Collection, 2006

³⁴⁴ Sasu, D. V.- Strategic marketing" (ro. orig. "Marketing strategic"), Printing House of the Oradea University, Oradea, 2008

Briefly, the proposal for this range of products, can be divided in three categories: fashionable magazines, culinary magazines and magazines aim at fresh moms.

- **1.** *Lumea Femeilor* ½ page in the "Culinary" section starting with the second half of the month of February until the first half of the month of April. In total: 5 apparitions.
- 3. *Ioana* ½ page in the section "Kitchen secrets" starting with the second half of the month of February until the first half of the month of April. In total: 5 apparitions.
- **4.** Practic în bucătărie- magazine with an impressive number of readers per edition: 160.000 people. Proposal: one page in the months of February, March and April (presentation of recipe) in the section: "Recipes for the Sunday in my family".
- **5.** Cărticica Practică- special Easter supplement of the magazine "Practic în bucătărie";
- 6. Baby- Cover 3 in the months February, March, April.
- 7. mami- ½ page in the months of February, March and April in the section "Mommy recipes".

D. On-line promotion

Considering the exponential growth of the on-line promotion, it could not miss from an advertising agency's proposal. All the more that, as we have already seen, a big part of the campaign's target was identified with the help of the on-line forums and magazines. Therefore, the most read on-line magazine of our target proved to be: www.reteteculinare.ro - Leaderboard: at least 3000 displays/day + Advertorial

Obviously, for this presentation, it is also important to realise a site of products presentation that offers a direct link on the banners on the site.

4.CONCLUSIONS

The Campaign "Sponge Cake, for the cake that is always a success!" led to the increase in popularity of this brand and especially the "sponge cake products", as well as to the increase of sales of the products during the campaign. These favourable results obtained after the implementation of the campaign at national level for two months were due to the declination of a well-conceived advertising concept on the target aimed by the product.

According to a popular saying" "One flower doesn't bring the spring", in the same way we can say that in marketing "one campaign doesn't make brand awareness!". After the end of the campaign, a drop in the sales could be observed and also a decrease of the traffic on the site.

Therefore, from a promotion campaign of a brand or range of products there is a long way until its transformation in a brand or even in a "love mark" for the client!

Half of Romanian small and medium-sized firms are seriously and severely affected by the economic and financial crisis. In Romania small businesses do represent a high percentage of the total number of enterprises. Three young professionals (a sociologist, a mathematician and an economist) invests without reckoning, in studies, market surveys or even project studies necessary to identify opportunities of creating enterprises and/or new and more-paying jobs for the population – create Daisy Sara a services company designed to produce and manage private events. Now, like thousand others small companies Daisy Sara should acquire marketing knowledge and use marketing techniques in order to survive the crisis.

cod JELlucrare: M3

Keywords: SME, marketing strategy, case study

1.General economic context:

Small Business Enterprises (SBE's) do play a major role in the world economy, and they are recognized as one of the main contributors to economic, development and employment growth. That is also true in Less Developing Countries like Romania since small businesses do represent a high percentage of the total number of enterprises.

During the early stage of the transition, small and medium enterprises (SMEs) began to grow dramatically, primarily because of the privatization of enterprises in trade and services. The majority of SMEs at that time specialized in trade. While the state did not take appropriate measures to promote SME development, the number of SMEs still more than quadrupled and their total employment doubled during this period.

Romania registers over 600,000 small and medium-sized businesses345 any many operate in the shadow economy. It is primarily greater state support to micro, small and medium enterprises that could attract many of the enterprises operating in the shadow economy back into the formal sector. Current taxes policy put a higher pressure an SMEs in order to back into the formal sector. But the answer to reducing the informal sector is not higher taxes on micro, small and medium enterprises or more regulation of their activities. Such policies would only drive more entrepreneurs and workers into the informal sector. This would shrink the tax base even more and produce added pressure to raise taxes on formal-sector enterprises—intensifying a vicious circle of increasing tax evasion and spiraling taxes.

Like many of its East European neighbors, Romania is experiencing a sudden reversal of fortune. After years of record economic growth fueled by easy credit and heavy foreign investment, people here are bracing for a sharp slowdown that they hope does not turn into an outright crash

Romania's biggest problem is its current-account deficit: Far more money has been pouring into the country than going out. Much of the money comes from the estimated 2.5 million Romanians -- more than 10 percent of the population - who work in countries such as Italy and Spain and send earnings back. But with those economies now suffering as well, many emigrants are expected to return home empty-handed. The deficit has tripled in the past five years, making the Romanian economy vulnerable if foreign investors suddenly pull out.346

However, a big economic slowdown is inevitable in 2009 as a result of slowing exports, harder access to finance for business and slowing consumption. The first signs of the slowing economy are increased unemployment and lower consumption. Initially layoffs were announcing by private companies, but recently also state-owned firms have started to cut jobs.

Half of Romanian small and medium-sized firms are seriously and severely affected by the economic and financial crisis, according to a poll conducted in April 2009 by the National Council of Private SMEs in Romania.

The poll conducted in Romania's Sights development regions indicated that 23.53% of firms polled were "catastrophically" affected by the financial crisis and 25.49% experienced large negative effects of the crisis. 36.27% of SMEs said the impact of the crisis on their business was medium and 11.76% said the impact was mild. Only 2% of Romanian SMEs are unaffected by the crisis.

On the other hand, most respondents (80%) said measures taken by authorities to reduce the effects of the crisis on SMEs are unsatisfactory and 13% said the measures are satisfactory. Only 1% of respondents said the respective measures are good347.

2. The Daisy Sara company

In 2004, 3 young professionals (a sociologist, a mathematician and an economist) invests without reckoning, in studies, market surveys or even project studies necessary to identify opportunities of creating enterprises and/or new and more-paying jobs for the population - create Daisy Sara a services company designed to produce and manage private events. This small businesses that require minimal capital or a level of kick-off investment lower than 5000 Euro is today one in its closed region well-known. As a small sized enterprise planted in the society, they are established in the centre of a city and form an integral part of Bacau local community. As a result both the small enterprise and the three entrepreneurs are very visible and they form a recognisable unity. This makes it possible to have meticulous and involved contacts 348

None of the owners has previous experience, training or even idea about business. They practiced an adapted training that qualifies each one of them directly operational for the job market (not academic or diploma). Two more persons are added to the team as full time employee and more than 20 persons like collaborators. For new personals training is adapted according to the tool (equipment in the environment), to the mentality of the environment, according to the needs of the enterprises and the society.

It has also with poor marketing activity enough customers. Every kind of improvement and innovation depends on phantasm, capital and enterprising temper.

However, like other small-scale entrepreneurs, especially at the early stages, often lack the necessary information and tools needed for running their businesses. They were also lack of updated data about the market and about the threats and opportunities around them.

Daisy Sara creates some of the most spectacular and memorable events in Bacau area Daisy sara are a full service event planning and production company with over 5 years of experience, into a young market (around 10 years), producing events for private individuals and corporations, ranging from 20 to several thousand people. Company plan and produce imaginative special events, worry-free corporate events, meetings, trainings, road shows, incentive trips and product launches as well as parties (Weddings, Birthdays, Anniversaries, etc...). Detailed some other services Daisy Sara can provide include venue site inspections, securing quality vendors for catering, decor, floral, entertainment, transportation, audiovisual / production and rentals, to name a few.

The market they act – Bacau area349, is covered by almost 25 competitors and is dominated by 3 local competitors (around 70%). One of them is Daisy Sara. Almost none of the companies in this sector are dealing with full service of an event like Daisy Sara. The large majority of them are small companies which are active only in the cities where they have been established. Big, powerful player, with national coverage are less important (few than 10%) from local market.

With little help and almost five years of experience, now they are able to design a SWOT analyses. Key strengths and weaknesses, opportunities and threats of the enterprise analyzed in terms of its operating capabilities and the external environment are:

Strengths: dynamism; creativity; flexible enough to the changes of market; simply structure; supply is according to demand; full services offer for any event; well skilled personal; low cost for a large range of used materials due to own production; influent local clients who are bringing value to the company portfolio

Weaknesses: poor cost control; poor/incipient use of marketing –management techniques like most SMEs; poor environment information; none customer profile/segmentation; sales based only trough word of mouth and wedding fairies

Opportunities: today, they are perceived as the best local wedding organizer; the market is fix enough, if the prices remain competitive, the market is given for new products, according to the experiences; to improve the technical background; extending market in other geographical areas; strong word of mouth importance; new markets – raw material for other companies who provides events; create alliances with other suppliers for events (tourism operators, public alimentations, music/artistic bands, camera/film operators)

Threats: increase competition from old players; entrance of new competitors; copy of their products and services; decreasing economy; perceived more like wedding organizer than any event organizer, loss of corporate events market and others private events

3. Marketing proposals for Daisy Sara into socio-economic crisis context

The main purpose of this initiative is that of promoting a new entrepreneurial culture, helpful for companies to consolidate their position on the market supported by innovative processes. First of all Daisy Sara must prepare a realist and adequate business plan for a small size enterprise. Indeed, small enterprises have specific characteristics which distinguish them from big businesses.

Elements of a marketing plan should be outlined in accordance with the enterprise vision, mission, objectives, and the external operating environment estimation of market size, identification of key competitors. When the

³⁴⁸ UEAPME Position Paper on the Green Paper, Promoting a European Framework for Corporate Social Responsibility, COM(2001)366 349 Daisy Sara estimations

marketing discipline is well practiced and combined with a notion known as the marketing concept most small businesses will enjoy significant success. Main proposals for Daisy Sara in terms of marketing are:

- setting marketing objectives: increasing customer satisfaction and though this increasing notoriety, increasing market share,
- target market profile(s): several years of experience on the Bacau market are enough in order to be able to create and use an accurate segmentation for private and corporate events. We recommend development of actual position segment private clients. Daisy Sara can create customer loyalty and enduring success by offering human, personal, and specific knowledge in it's transactions with its customers.
- **positioning strategy**: in order to surpass the individualism which normally distinguishes them one from another, allowing them to appear on the market to *offer services that are unique through high degree of personalization*
- range of products/services offered: special products *standardized offer for dedicated segment*, extend the product line in amount *producing materials for similar companies*;
- **pricing strategy:** double oriented *price structure* cost and competition; *seasonal prices; forfeiter prices* for ready made package
- **promotional strategy**: improve the presence into local media *especially trough PR techniques, barter promotion* with all other event involved suppliers By collaborating with complementary partners, small business can expand its footprint quickly and at lower cost. Advertising is an effective tool to create awareness and sales but is less affordable for this moment.
- **distribution strategy**: *extending his position in the Internet*. Implementing E-marketing by small business enterprise can change the shape and nature of SBE's business all over the world350

Other said, Daisy Sara should escape to the vicious cycle of the most often ignored marketing area in the small business setting. She must exploit that SMEs are more flexible and adaptable to rapid changes than bigger companies. Marketing can be learned or outsourced and it is the foundation for small business success.

Marketing research is the activity through which, by using methods and techniques of investigation, specification measurement, data collection are made, as well as analysis and interpretation of information marketing units required for the knowledge management environment in which it operates, opportunities are identified, alternatives, marketing actions and effects are evaluated. Marketing research has a sphere of extremely wide coverage. We could say that there is no area of business marketing which is not subject to investigation and research.

Keywords: qualitative research, National Public Television, audiovisual and cultural field, television broadcasting market, the nature of the TV audience

JEL codes: M10, M31

Of the many variants of marketing research, television in particular uses quantitative research - via the people meter. We however, proposed to have a qualitative approach to investigating the phenomenon, the purpose being able to develop a series of proposals to improve the performance of public television's audience. Through qualitative research one records opinions, attitudes, feelings, leading to certain behaviors. Our basic idea was to surprise the phenomenon from the perspective of professionals from the audiovisual and cultural field. For this purpose, we considered research through semi-structured interviews among specialists to be extremely useful, having the intention to turn the results to a better positioning of the channel in the public broadcasting landscape of Romania, but especially for the better fulfillment of their role and functions. Specialists consider that the role of marketing research in decision making is very important, because it allows: identification of favorable opportunities and potential dangers of the environment in which the business operates, enabling the choice of alternative decision-making within the field, assessing the effectiveness of marketing decisions. Fulfilling this role, research marketing practice creates the conditions necessary for a proactive management, adapting continuously to changes in the economic, social and competitive environments.

The issue is addressed is one of special and national interest, because broadcasting in general and television in particular, determine passionate contradictory views; in this context it is useful to remember that public television more specifically the role and importance in the local broadcasting landscape - raise special interest. The main issues that determine the controversies are: the audience, the quality of broadcasts, assuming a cultural – educational role, the TV fee, etc., which we address through this research.

Research performed fits into the qualitative research category as exploratory research, conducted in order to allow a deeper understanding of the problems addressed in this paper. The results are of qualitative nature and cannot be extrapolated to the entire population studied. Research through the semi-structured interview seeks specialists in the field of broadcasting. The steps followed in carrying out research are the classic ones, recognized by professionals - setting objectives and hypotheses, designing the research, including determining the sample survey, the place and time of data collection, methodological issues on the actual interview, developing an interview guide, presenting research results.

As far as objectives are concerned, we mention that given the research purpose stated above, we proposed a series of objectives for it, of which we consider of particular importance the following:

- identifying the main issues in the television market in Romania;
- knowledge of opinions on current trends specific to the television market in Romania, regarding the number of broadcasters, their typology, the promotion of certain values / non values and personalities / characters through the TV channels as well as other points of view;
- shaping the role and importance of public television in today's Romanian society and the broadcasting market;
- identify the strengths and weaknesses of public versus commercial television;
- identify views on the typology of broadcasts and assuming the specific role of public television;
- values promoted by public television versus values which should be promoted;
- establish the extent to which target audiences are indicated in public television broadcasts;
- the nature of the audience which public television should focus on: quantitative, qualitative, mixed;

- advice on identifying sources of income of public television: the TV tax, budget allocations and revenue from advertising;
- opportunities to improve public television's audience performances.

Regarding the test study, we must point out that our intention was to investigate a number that varies between 30 and 50 people involved in broadcasting and in particular the television, and finally managed to talk to 36 subjects, all involved in activities undertaken in specific broadcasting institutions such as public television, certain commercial television, the National Broadcasting Council, the Ministry of Culture and Religious Affairs. The choice of subjects interviewed was done through personal relations.

Regarding **the place and time** of data collection, we note that the interviews were conducted during 15 April-13 June 2008 in Bucharest, particularly at the workplace of the people interviewed.

Regarding specific activities, the respondents engaged in particular activities in the area of marketing, marketing research, promotion, is also important to specify that some people held lower level positions, while others were in management. As regards the timeframe when people were involved in the institution as staff, they all had an experience of at least two years by the time that the study was performed.

Regarding the television broadcasting market in Romania opinions were targeted in two main directions, namely: the main problems in the television market in Romania and on issues of current trends in the television market in Romania

Regarding the overall **television broadcasting** market in Romania, the specialists have underlined a number of distinct aspects of the phenomenon examined, the most common being the congestion of the Romanian media landscape, the lack of clear strategy and effective marketing, excessive politicization messages, lack of content, concentration of capital in real media trusts.

In relation to matters concerning the running staff (TV stars) and messages being broadcast, the opinions of specialists are very similar and particularly focused on the absence of genuinely cultural and educational programs, and the rush for the sensational and macabre, doubled by the appetite of part of the public for such information, promotion of false stars and values, promoting the plain and derisory to exceptional levels.

Regarding the **position and role of public television in today's broadcasting market**, we have outlined several aspects focused mainly on: the importance of public television in the market and use of public sources of income to support this institution, relevance to audience the nature and objectives aimed by an ideal public broadcasting service.

The **role and importance** of public television services are recognized by most of the specialists interviewed, especially on what should the institution be and less on what it is. To take in more of the aspects investigated, we divided them into two categories: the importance of public television broadcasting in the current landscape and the values that public television services should promote in today's society development context and the demands of the knowledge society.

Regarding the **importance** of public television broadcasting in the current landscape we outlined a number of issues arising in particular from the fact that it is an institution of national interest, which has assumed the role to inform all citizens fairly, as per its legal status under which public television promotes the values of domestic and European culture. The general opinion is that public television holds an important role and place in the contemporary media landscape.

The values that public television services should promote arising from its status and as defined by their legal organization and functioning, but also European regulations on public television services. The most representative ideas were outlined as issues around culture and cultural diversity, human rights, public education, promotion of national minorities, the family values and Christianity, a healthy business environment and proper reporting of problems with social aspects etc.

Regarding the **importance and relevance** for public television audience, specialists have varied and contradictory views, therefore they were divided - for ease of analysis - into three categories: utility of audience for public television stations, the target audience that should be related to in public television services and means by which to increase ratings.

The usefulness of audience to public television stations is a subject whom has led to different opinions, leading us to appreciate that it is extremely useful to measure the activity and orientation of the institution in terms of these indicators up to the part where it is considered unnecessary. Arguments for the first possibility are the need for public television and to periodically assess the activity compared to commercial stations in determining objectives and targeting the supply, and for the second alternative is the premise that public television still has the largest audience at national level.

Regarding the **nature of the audience** that public television services should cover, the importance of both quantitative and qualitative indicators was highlighted. In fact, the need to assess the audience both in the qualitative and quantitative aspects is important because both the quality of the public and its impact on supply are key in the idea of future development. Considering especially the quantitative audience is appreciated by specialists as halfway work and sabotage of targets set for public television, because it also has the function of public education. From a quantitative point of view, it is interesting to know first that almost all the population has access

to public programs, and on the other hand is actually the number of those who view them. From a qualitative point of view, there is the effect that a TV program has on people who watched it, how well it has informed; to what extent has it enriched the knowledge and learning of new things, useful and interesting. Specialists consider that performance through public television audience is important for orientation in terms of the offer according to public preferences, and also for the presenters and directors, for the purpose of directing the budget and formulating the messages.

In relation to options to improve public television audience, the answers are simple and straightforward: no bad taste - which involves removal of some grid shows of emotional entertainment, but also the soap item on TVR2, even if some of the public demands it, - addressing the issue of quality - good series and movies, cultural shows, sports, music, debates, well prepared presenters - and respecting the principles of journalism, especially impartiality and equidistance.

Public Television has three sources of income: TV tax, budgetary allocations and advertising revenue. We entered this issue into debate, because the survival of the institution and particularly important the role they assume in the Romanian society, cannot be achieved without financial resources, and how it's thus worthy to mention the large disputes they determine. We focused the discussion on TV tax revenues and advertising revenues, as these two are of particular interest; budgetary allocations in itself led vehement reactions, rather as an addition to the fact that public television charges the fee but also features advertising spots (it's true, with some restrictions in duration for the one hour program and without the opportunity to discontinue the program). In connection with the broadcast of advertising, opinions are divided on the one hand those who argue that only by revenue from advertising can the public television broadcasting service achieve all objectives, on the other hand, the introduction of the fee along with the advertising distorts competition in the industry. As for TV tax, there are a series of very interesting issues, primarily in the communication strategy of television to determine payment of the public is ineffective because, although the fee is very low, evasion is considerably high, and the number of subscriptions is declining.

On the ideal public television, experts consider that although it is impossible to satisfy all of the audiences' tastes, a number of features that focus public television the ideal can be identified: reliability, dynamics, attractiveness, editorial independence or exclusion of political interference, sanity in terms of spending money mainly for the purchase of TV formats from abroad and accountability.

In the end of the interview, we scored certain aspects on items discussed earlier with respondents, and asked them to add some elements that they consider relevant, but unaddressed previously. Thus specific aspects were outlined, such as the management, programs broadcasted, image and communication, social involvement.

Issues on management and overall organization, outlined the following ideas:

- "the organizational structure of the institution is frequently changing, and often for subjective reasons";
- "as long as management of the institution is appointed by political forces, it is practically impossible to be fully impartial and apolitical";
- "competitions to fill vacancies raise some suspicions, some managers being appointed on political criteria";
- "although there is an organizational structure that takes care of retrieving messages from the public (via e-mail, forum, phone, letters), feed-back is not always compatible";
- "some presenters and directors migrate to private stations, attracted by wages and consistent public television frequently face the problem of lack of professionals (although it is the largest supplier of professionals)";
- "although some of the activities have been outsourced, the cost cut is not very visible, sometimes it looks as though the opposite has taken place";

Issues on the programs broadcasted:

- "there is a paradox: some shows which have a large budget recorded small audience, and others have much smaller budgets but higher numbers";
- "the main broadcast, the 7pm news, although it is superior in terms of broadcast news, has a lower audience than news channels from competing stations";
- "TVR movie broadcasts are better than those of Pro TV and Antena 1, but not well promoted";
- -"to be more daring in promoting its quality shows";
- "organize regular and qualitative research to guide its activities according to the results";

The debate generated by **communication and image**, was outlined by ideas regarding:

- "TVR brand valuation";
- "the need for a corporate communication strategy";
- "the need for campaigns where the public is informed on its importance on the one hand, and the level very small level of this tax compared to the needs and market realities of the television services industry on the other";

In the field of **social involvement**, the main issues are:

- -"it would be useful to engage in social responsibility projects";
- "to promote projects that are conceived on the universal values of humanity".

In analyzing the problems identified in the television market in Romania, following the discussions, two main aspects became obvious: the overall problems in the market and problems regarding the programs, personnel (TV stars), and work placements.

Average consensus is that at this time, the television is overwhelming the public because of the large number of networks, but even so, when there are many investors, the major TV channels are concentrated around some "moguls" of the media.

Most often, the issues regarding the quality of broadcasts was identified, which is obviously directly linked in with the personnel policy of the television networks and their availability and ability to invest in serious projects.

Trends in the television market in Romania are rather bleak, at least in terms of quality broadcasts, and unfavorable effects on the public will occur, as long as TV is regarded as the most important means of entertainment. Specialists consider that the thirst for information and entertainment of the public on the one hand, and intentions to invest or to expand the "mogul" in the press on the other hand, will lead to the emergence of new TV channels.

Recently, on the Romanian market, big trusts in the general press and television in particular, the tendency is to reach different niches outlined, of which in particular we note the niche of information and debate politics, sports and music

The reality is that the market has expanded enormously in recent years and will probably be extended, but this trend will lead to:

- reduction of ratings in each channel;
- control over the market by the CNA, will decrease;
- danger for television, called zapping, will increase;
- some form of cannibalization between presenters and directors will extend;
- competition, although generally beneficial, it is possible that this field would lose a quality in the race for ratings;
- emergence of pay-per-view TV channels;
- as ratings decrease against the backdrop of dilution and sharing between multiple TV channels, the financial resources obtained from advertising will also decrease;
- positions of bankruptcy or takeovers by the more powerful networks;

Nowadays, we are witnessing an interest in this market, so young, i.e. all TV stations are successful in Romania, or at least manage to survive on the market.

The role and importance of public television itself derive from its status as an institution of national interest, which should choose as first objective the interests of the citizens and meeting their needs for information, education, culture and entertainment, though not because we always like it, television is the cheapest means of entertainment for people of poor and average income. In this context, it is public television's role to contribute to the reconstruction of the Romanian society, to promote the genuine and to find ways to reach the public. Although experts consider that the efforts directed television programs to provide quality are considerably higher, compared to the commercial channels, has no ability to communicate clearly and effectively, it seems somehow in expectation, waiting for the public, but doing nothing to bring the audience to it. On the other hand, public television broadcasts feature some programs of a quality at least questionable, according to the specialists.

TV station audience is an important issue which instigates heated discussions among experts and among ordinary people. The idea of usefulness of the audience in particular when establishing editorial policy was clearly outlined, even if public television relates to these indicators, especially in order to sell more advertising space. It's also worth mentioning that television has the obligation to determine which has been the impact of its messages, and how they have enriched the capital of information and knowledge of the persons concerned. Most facts were determined as follows: the audience relevance when assessing position on the market, that in some cases it is more or less useful (e.g. for national minority issues, where the audience can be very limited), the idea of addressing issues of both quantitative and qualitative aspects of the audience. Regarding the possibilities to improve the public television audience, the views of respondents were focused on improving schedules, eliminating the bad taste of fake stars and non - values and respecting the principles of journalism concerning equidistance, editorial independence, the elimination of political interference, etc.

Also the fact that an ideal public television is impossible to achieve has come to attention, especially in the context of diversity of opinion, there are some elements that could guide public television toward this goal, of which the key ones are: reliability, professionalism, editorial, financial and managerial responsibility, authentic European and world (especially the BBC) models, etc.

Regarding the sources of income of this institution, there are contradictory opinions and concerns both regarding the TV tax and earnings from advertising. The margins were views ranged from assessing the tax as being useful for the TV institution to fulfill its mission, to remove tax as long as public broadcast stations are advertising, or surrender the option to run advertising altogether. The latter seems more plausible, even more so now that at European level this issue is being debated on the principle of unfair competition against commercial stations. In respect of the tax, a number of issues surfaced, such as the fact that there are many are evasionists, the control system is ineffective, the problem was not covered for those individual customers who have multiple TVs in the household, the institution does not communicate with the public enough on this topic.

At the end of the meetings, some elements were outlined, which although they were not part of the research, specialists have determined to be useful in this context. Of these the most significant are: the management and organization, communication and image, as well as social involvement.

The competitive environment in Bucharest is, probably, the strongest in Romania, and it is featured, in general, by a large number of companies, free competition, respect of fair-play rules, and use of competitive policies. The competitive environment in Bucharest is a normal one; it demands adaptation efforts from all companies witch wish to gain an important status on this market. This research proposal aims to determine the level of competitive rivality on the Bucharest' market and it uses a quantitative research among the marketing managers of companies acting in Bucharest.

Mots-clé: rivalité compétitive, recherche de marketing, marché, Bucarest

Classification JEL: M31

Introduction

L'environnent concurrentiel du marché de Bucarest est caractérisé par une forte concurrence, déterminé par le grand nombre des entreprises, qui offrent une gamme diversifiée, qui s'adresse aux segments des consommateurs identifies par l'intermédiaire des moyens et des techniques spécifiques de marketing. Pour les organisations qui désirent à activer sur un tel marché, il est obligatoire de très bien connaître l'environnent concurrentiel et d'essayer de s'adapter pour conquérir une position compétitive avantageuse.

La compétition sur ce marché offre des opportunités réelles, qui peuvent être valorisiez par les entreprises, mais un enivrement d'une forte compétitivité donne naissance, aussi, a des menaces importantes. Par la suite, il est nécessaire une bonne connaissance et une analyse correcte de l'environnement compétitif, surtout des concurrents directs et indirects, l'adoptassions d'un comportement concurrentiel fonde sur fair-play et le respect de la loi, le ciblage des segments de marché les plus profitables.

La complexité de l'environnement et la compétition de plus en plus dure, l'augmentation des exigences des consommateurs, ainsi que l'existence d'autres facteurs, obligent les entreprises à développer et à implémenter des stratégies compétitives capables à accomplir les objectives établîtes. Les entreprises comprennent de plus en plus la nécessité du déroulement des recherches de marketing pour obtenir une image réelle de l'environnement concurrentiel.

Méthodologie

Cet article présente quelques aspects concernant les problèmes mentionnés, qui sont le résultat d'une recherche quantitative de marketing réalisé sur un échantillon de 75 entreprises activant sur le marché de la ville de Bucarest. Les résultats de la recherche peuvent être considéré comme représentatifs pour le marché de la Capitale, mais, si on parte de la prémisse que les entreprises de Bucarest se situent dans l'avant-garde des entreprises roumaines en ce qui concerne le niveau de l'implémentation du marketing, les résultats peuvent être analyses du point de vue qualitatif en relation avec la situation au niveau national.

La collecte, l'analyse et l'interprétation des données ont été effectuées pendant la période janvier-avril 2009, en utilisant un questionnaire avec 23 questions préétablies. L'unité d'observation a été l'entreprise de Bucarest, et l'unité de sondage le responsable du compartiment de marketing, ou, dans le cas que le compartiment de marketing n'existait pas, le manager général ou la personne qui est responsable de l'activité de marketing dans l'entreprise.

Dans l'échantillon ont été inclues des entreprises qu'activent dans les domaines d'activité suivants : services (c'est a dire télécommunications, assurances, tourisme, le secteur immobilier et la publicité) avec le pourcentage le plus élevé (54,7%), commerce (25,3%), production (17,3%), constructions et aménagements intérieurs (2,7%).

Résultats

Le premier objectif de cette recherche a été l'identification du niveau de la rivalité compétitive dans le domaine d'activité des répondants.

Les réponses concernant la capacité des agents économiques d'identifier correctement leurs concurrents directs et indirects de leur domaine d'activité sont présentés dans le tableau suivant. Dans la colonne des fréquences sont présentées les fréquences cumulées des réponses concernant tant les concurrents directs que les concurrents indirects.

Tableau nr. 1. Opinions concernant le niveau de connaissance des activités des concurrents directs et indirects

Réponses	Fréquences	Pourcentage
Pas du tout	9	6,0
Un peu	14	9,3
Satisfaisant	31	20,6
Bien	47	31,4
Très bien	47	31,4
Non-réponse	2	1,3
Total	150	100,0

62,8% des entreprises ont apprécié qu'elles connaissent bien et très bien leurs concurrents directs et indirects, ce qui dénote une préoccupation de leur parte vis-à-vis du phénomène concurrentiel, au moins en ce qui concerne l'identification des concurrents. Quand même, 15,3% des entreprises ne connaissent pas suffisamment leurs concurrents, ce qui représente une très grave erreur de marketing. De plus, le plus grande nombre des répondants sont enregistrés dans la catégorie des entreprises qui apprécient leur niveau de connaissance des concurrents avec le qualificatif « satisfaisant ». Il s'agit soit d'un manque d'interes, soit d'un manque de possibilité. Peu importe la cause. Les effets sont extrêmement défavorables, la méconnaissance de l'environnement concurrentiel empêchant le management des entreprises de prendre les décisions de marketing correctes.

Une autre question concerne l'opinion des entreprises sur la rivalité compétitive dans leur domaine d'activité. Les résultats sont présents dans le tableau suivant.

Tableau nr. 2. Opinions concernant la rivalité compétitive sur le marché du Bucarest

Réponses	Fréquences	Pourcentage
Très faible	1	1,3
Faible	0	0
Moyenne	6	8,0
Forte	40	53,3
Très forte	26	34,7
Non-réponse	2	2,7
Total	75	100,0

On observe que 88% des répondants considèrent que la rivalité est forte (53,3%) ou même très forte (34,7%).

En corrélant ce pourcentage de 88% avec le pourcentage de 62,8% qui affirment qu'ils connaissent bien ou très bien leurs concurrents, on peut constater que un quart des entreprises de Bucarest, tandis qu'elles sont convainques que le marché est un marché a une concurrence très forte, ne sont pas capables d'obtenir des informations importantes concernant leurs concurrents.

Des informations intéressantes on peut obtenir en étudiant les réponses provenant des différents domaines d'activité. Dans le tableau suivant on présente le niveau perçu de la concurrence dans les domaines d'activité.

Tableau nr. 3. Corrélation entre le niveau de la rivalité compétitive et le domaine d'activité

Niveau de la	Domaine d'activité				
concurrence	Services	Commerce	Production	Constructions	Total
Très faible	1				1
Faible					0
Moyenne	3	3			6
Forte	20	13	7		40
Très forte	16	2	6	2	26
Non-réponse	1	1			2
Total	41	19	13	2	75

La lutte de concurrence est perçue comme très dure dans toutes les domaines d'activité, avec un plus dans les domaines industrielles, par rapport aux domaines du secteur des services. Il est surprenant, mais il semble que dans le domaine du commerce, malgré le grand nombre des magasins ouvertes a Bucarest, la concurrence n'a pas aboutit a son sommet et les possibilités de développement du secteur ne sont pas fermées.

Pour meilleur s'adapter aux conditions de la concurrence, il est nécessaire de prévoir une bonne stratégie de marché. Comment répondent les entreprises de Bucarest a ce desiderata? Les résultats sont présentés dans le tableau nr. 4.

Tableau nr. 4. Existence d'une stratégie de marché

Existence d'une	Domaine d'activité					
stratégie de marché	Services	Services Commerce Production Constructions Total				
Oui	31	16	11	0	58	
Non	10	3	2	2	17	
Total	41	19	13	2	75	

A peu prés un quart des entreprises de Bucarest (22,6%) n'ont aucune stratégie de marché. On peut apprécier qu'il s'agisse d'un pourcentage très élevé, par rapport aux critères d'un management modern. L'existence d'une stratégie de marché est une condition minimale pour un bon rapport avec le marché. Les entreprises qu'ignore cette nécessité auront des difficultés majeures pour survivre sur le marché, surtout dans les conditions d'une crise économique.

Une dernière question concerne le type de stratégie de marché utilisé par les entreprises de Bucarest. Les réponses sont présentées dans le tableau nr. 5.

Tableau nr. 5. Types de stratégie de marché utilisées par les entreprises de Bucarest

TD 1 + +/ 1 1					
Types de stratégie de		Domaine d'activité			
marché	Services	Commerce	Production	Constructions	Total
Non-différenciée	4		1		5
Différenciée	19	12	9		40
Concentrée	5	4			9
Critère non-applicable	3		1		4
Total	31	16	11	0	58

La plupart des entreprise (69%) déclarent qu'elles utilisent une stratégie différenciée, ce qui est surprenant, en connaissant que cette stratégie est recommandée aux entreprises de grande taille, capable a couvrir les expectations des clients appartenant aux segments différents. Les explications possible sont : les répondants ne connaissent pas le contenu de cette stratégie, les marchés ne sont pas très segmentes, ou les stratégies adoptées par les entreprises sont inadéquates.

Conclusions

La concurrence sur le marché de la ville de Bucarest est apprécié comme une concurrence importante par la plupart des répondants (presque 9 sur 10 ont une telle opinion). Malgré ca, seulement 63% connaissent leurs concurrents directs et indirects, et seulement 77% ont établit une stratégie de marché. De plus, le contenu de cette stratégie est du moins ambigu. Les entreprises de Bucarest ne semblent pas être très bien préparées pour les enjeux d'une forte lutte de concurrence.

THE USE OF THE MULTI-FACTORIAL GRID IN THE SELECTION OF THE ENTRY STRATEGIES OF OMV AG IN THE ROMANIAN MARKET

Danciu Victor

Bucharest Academy of Economics Business and Economics Faculty Str. Aviator Stefan Protopopescu nr. 3et.6 ap26, sector 1, Bucuresti dvictorsambotin@yahoo.com 021230 95 14/0723 178547

The foreign market entry is a strategic choice of any company. The firms use a practical approach in order to select and utilize the most appropriate market entry strategies and modes. This paper aims at showing how the multi-factorial grid can check up the assessments OMV AG has made at the entry in the Romanian oil market. This supplementary analysis has brought a research tool in a particular case of foreign market entry practices. The assessment the multi-factorial grid allows and its results in the case of OMV confirm the practical approach of the Austrian company.

Key Words: target-market, entry strategies and modes, multi-factorial grid, competition capability of the company, market attractiveness.

JEL code: F23

Introduction

The foreign market entry is part of the external expansion strategy of a company. In a broad interpretation of the Ansoff Matrix, this strategy could be considered as a geographical expansion strategy with a regional character, which provides for the new market access [V. Danciu, 2009, p.181]. As many authors think, there is no ideal entry strategy and many companies often combine strategies to enter particular foreign markets [V. Danciu, 2009; Gillespie, Jeannet, Hennessey, 2007; Muhlbacher, Leihs, Dahringer, 2006; Hollensen, 2004].

There are many points of view on entry strategies classification in the international literature [V. Danciu, 2004, p.220], but they could be found within a three broad grouping based on different degrees of control, risk and flexibility associated with each of the different market entry strategies:

- Export strategies: low control, low risk, high flexibility;
- Intermediate strategies (associated or contractual modes): shared control and risk, split ownership;
- Hierarchical strategies (investment strategies): high control, high risk, low flexibility.

There are many internal and external factors which impact on the choice of the most appropriate entry strategy or mode and the company may use more than one of the strategies and modes at the same time.

OMV Company has used such "a many strategies approach" when entering the Romanian oil market. The initial entry strategy was a green field investment mode. This strategy has been followed by successive acquisitions of stock packages in Rompetrol and Petrom. In the year 2004, OMV has purchased the majority stock package of Petrom SA which was the local market leader at that time.

By purchasing a firm in a market to enter, the buyer eliminates the need to build manufacturing and distribution capabilities from scratch. Buying an established brand gives the entering firm immediate market presence, existing customer base and market share. Along with the firm itself, the buyer also acquires its experience and its network of relationship with customers, intermediaries and other important stakeholders.

One of the most important and frequent used motivation of favoring acquisition to other market strategies and modes is the help it provides for establishing a strong position in a new country or regional market. This strong reason has influenced the entry strategy of OMV in the Romanian oil market, along with the attractiveness of the local market.

The Experience and Strategic Goals of OMV

Osterreichische Mineralverwartung Aktiengeselschaft (OMV AG) has been since 2004 one of the most important companies activating in the oil industry of the Central and Eastern Europe and the biggest company listed in the Austrian Stock Exchange. OMV was established in 1956 and has been involved in exploration, processing and marketing activities in seventeen countries from Europe, Middle East, Asia and South America. Osterreichische Industrieholding AG (with 34% of the shares) and International Petroleum Investment Company - IPIC (19.6%) are the main shareholders of OMV. The Group has about 1.4 billion barrels oil equivalent of natural gas and some oil reserves, an yearly production of 45.9 billion oil barrels and about 2400 distribution stations in thirteen countries.

OMV has an important stock package in companies such as Boreals A/S (35%), AMI Agrolinz International Gmbh, Hungarian MOL (10%), Bayernoil Raffineriegesellschaft Gmbh (45%) and Ecdias Gmbh (50%).

Prior entering Romania, OMV's strategy envisaged the extension of the exploitation areas, the diversification of the crude oil resource, the extension of the compressed gas network and the active participation in the Nabucco project.

Romania as an OMV Target-Market

Even since 1990 OMV paid attention to the Romanian market, but various events, mostly political ones, delayed the investment decision of the company until 1999.

In 2003, Romania delivered about 63% of Eastern and Central European oil production and 35% of the natural gas production. S.N.P. Petrom S.A. was the strongest company in Romania, having a turnover of USD 1.85 billion in 2001 and USD 1.5 billion in 2002. At the same time, the company has been restructured and needed investments. Hungary was the other country in the ECE region with a significant oil production. The national MOL Company was a competitor of OMV, the last one constantly trying to take MOL over.

Romania has large processing capacities with a yearly volume of 34 million tones, much more than the necessities of the country. The capacity distribution of the oil products was significant too. The distribution sector has over 170 storehouses and more than 1600 petrol stations, out of which the majority, that is 695, were owned by Petrom. Distribution was supported by transportation by means of oil pipelines, rail and auto tanks, by organizational structures like Romcontrol, by oil terminals in Constanta, Galati, Giurgiu and by custom-houses officers.

Another motivation was the potential of the market development. This potential has been estimated in accordance with the car park and implied an increase from 130 liters per capita to 300 liters per capita of fuel consumption; the average consumption in Central and Eastern Europe.

Romania became a target due to the fact that OMV had no other development opportunities but Eastern Europe. Because in Western Europe competition was intense, costs were high and profit margins were low, Romania became an interesting market. Romania's imminent EU joining also stimulated the Austrian companies entering Romania, especially after the year 2000.

The efforts of OMV were materialized in investments in industries like oil processing, bier, sugar, furniture and services like banking, insurance, trade and real estate.

OMV's Entry Strategy and Position Consolidation on the Romanian Market

OMV has entered in Romania in 1999. During 1999-2004 period of time, the Austrian company has had some strategies for the Romanian market and position consolidation.

- The direct investment in the form of Greenfield investment was the first entry strategy. OMV has begun the construction of fuel stations in 1999. During the following five years, the Austrian company has begun to explore and analyze the Romanian market, aiming to get a 10% market share of the sold fuel. The fuel stations were placed at the proximity of big cities, like Bucharest and in the North-West and South-East counties, having a higher population density, a more intense traffic and higher revenues at the national level.
- The prices at the fuel stations of OMV were just over the list prices of SNP Petrom. The stations have been supplied by Petrobrazi, Arpechim (Petrom) and Petromidia (Rompetrol) oil distilleries and the Austrian gas OMV 100 which has a high, ecological octane number. Fuel stations have constantly increased from 4 in 1999 to 17 in 2000, 34 in 2001, 46 in 2002 and to 60 in 2003.

In 2002, OMV owned 25.1% of stock of Rompetrol and this move has allowed its access to the oil distilleries of the Romanian company and to Oil Terminal Constanta.

On the 23rd of July 2004, OMV has purchased 51% of the social capital of SNP Petrom for Euro 1.5 billion, which represent the majority stock package. At that time, SNP Petrom was the local market leader, having a 6 million tons of oil production and about 6 million m³ of natural gas per year. All these activities performed by OMV in Romania were multiple reasons for acquiring Petrom.

- The first motivation was the consolidation of the position of OMV in the Romanian market as a result of obtaining the dominant position in Europe. Romania has a particular geo-strategic position which allows it to play as an interface between the European Union, the Balkans and the Black Sea region.
- The exploitation of the competitive advantages is another important reason. The Romanian company has numerous integrated activities in the field of exploration, production and distribution, a national commercial network and a pronounced volume of investment.
- The strong position OMV has in Romania is a strategic support for the present expansion to the international market. This expansion could be accomplished as OMV has taken over the branches and offices of Petrom had in Kazakhstan, India, Hungary, Serbia, Iran and Moldova. By acting this way the Austrian company will consolidate the corridor Vienna via Balkans Dardanele Strait East Asia.
- The OMV association with Petrom S.A. has evident and multiple advantages. The most important are the access to Petrom assets, risk division and investment cost sharing and diminishing of management and cultural risk. To all these advantages one can add the expansion on the international market as a result of foreign organizational structures of Petrom.

The Mc Kinsey Multi-factorial Grid as a Tool for the Most Appropriate Entry Strategy Selection

The multi-factorial grid is a portfolio method which operates with two vactors or criteria, the market attractiveness and the capacity of the company [Danciu V., 2009, pp. 373-376). In the present case, the vectors are the

attractiveness of Romania as an oil and natural gas producer and consumer, and the capability OMV AG has for entering and resisting on the Romanian market.

The Romanian oil market attractiveness. The "Oil Market Attractiveness" vector is an aggregate one obtained as a result of the assessment of Romania's strategic position, Romania's oil reserves, favorable legislation for foreign investment, convenient economic environment, favorable political climate, good technological standard for oil extraction and processing, relatively low competition and ecological requirements.

Romania's geo strategic position was the main attraction point, since the country is placed on the course of Nabucco gas pipeline and Constanta – Trieste pipeline. Both pipelines have to convey in transit the Romania's territory.

The proved oil reserves were an important attraction factor. Romania has over 200 million tons with a production of 6 million tons a year for about the next 33 years.

These reserves could increase if new oil and gas fields are detected. Romania is the only country in Eastern and Central Europe region which is an oil producer and dominates the area, due to its ten out of the eleven oil distilleries of the region.

The favorable legislation for foreign investment was another reason for Romania's attractiveness. The no 322/2001 Government Ordinance, as modified, stipulates that the Romanian state guarantees the freedom of legal status and investors, equal treatment for Romanian and foreign investors, protection against nationalization, expropriation or other measures having equivalent consequences [Monitorul Oficial nr. 356, 7.07.2001].

The convenient economic environment was a major motivation for OMV. In the year 2004, Romania had a 8.3% growth, a decrease in the inflation rate to 11.9% and in the unemployment rate (6.2%).

The favorable political climate had a strong impact on the choice of Romania. The Romanian business environment became relatively stable. Romania has entered NATO and the negotiations for joining EU began.

The good technological standard for oil extraction and processing had a significant contribution to OMV's choice. Romania has a rich history in the oil industry. The country is the first one having a record industrial oil production. Romania occupied the second place in the world as an exporter for oil drilling and extraction equipment. The Romanian specialists have designed and built many of the world's distilleries. Today, Romania has a totally integrated oil industry. This means that the extracted oil is processed in the local oil distilleries and the resulted products are distributed through the existing infrastructure.

The relatively low competition was a stimulus for OMV entering the Romanian market too. Already present in the market were Petrom, Rompetrol, MOL, Lukoil, Agip. Only MOL and Lukoil were important rivals having a regional vocation but no one had an important or regional amplitude [www.rompetrol.ro , www.lukkoil.ro , www.molromania.ro].

Romania's ecological requirements were low by the time OMV has decided to enter the Romanian market. The no. 1570//2002 Government Ordinance concerning the approval of the mechanism for financial aid from the state budget allowance through the program for industrial products competitiveness increase was a modest beginning for the environmental standards adoption. OMV had to take into account that Romania should take over the EU standards, but the company was ready in 2007 [OMV in Dialogue – Corporate Social Responsibility Performance Report, 2007].

OMV's competition capability in the Romanian oil market. In the year 2004, OMV AG had the following strengths in the competition battle in the Romanian market:

The size of the company was the result of the financial strength, the number of the international subsidiaries, the position in the regional market with an 18% of the Danube market segment and the access to resources and the processing capacity.

The significant experience OMV had gained following many years of activity in the oil industry, supported by a big capacity for the integration of the complex extraction, processing and distribution operations in various countries. The strength of the experience was the result of the good performance in project developing in difficult political environments.

The important negotiation power of OMV was gained by the capitalization of its capacity to get the support of the Austrian and local authorities, the position OMV had in the Eastern and Central Europe, the accumulated experience and expertise in the capitalization of the competitive advantages.

The good international brand image has been gained by OMV as a result of its high quality products. This image has facilitated a favorable association of the company with its products.

The strategic distribution in Eastern and Central Europe and the ability for the quick creation of its own distribution capacity in the market OMV has entered has also been a support for entering the Romanian market. The Austrian company received one third of the gas exports of Gazprom (Russia) to Western Europe and a 200 km pipeline network.

The performing management of OMV has solved many projects and difficult situations and has had a complete expertise, also including the management of the complex integrated operations.

OMV has a high technological standard, since the company has used last generation technologies and has been aware of the latest production and distribution technologies.

The ecological solutions represent a constant objective for OMV. The European Directives have forced the companies to have and use systems for environmental risk monitoring and find green technical solutions for product processing. OMV has anticipated Romania's EU entry and has taken early ecological actions.

The Drawing up of the Multi-factorial Grid

The Quantitative Attractiveness of the Romanian Market. The eight factors of the Romanian market attractiveness analyzed before are now being used for elaborating the aggregate vector. Each factor has received a weight for its importance and a mark on a 1 to 5 scale showing its contribution to the market attractiveness. The synthesis of the Romanian oil market attractiveness is shown in Table 1.

Table 1: The Romanian market attractiveness

Factor	Weight	Mark	Score
Natural resources	0.20	5	1.00
Strategic opportunities of the market	0.20	4	0.80
Political climate	0.15	3	0.45
Competition	0.10	4	0.40
Legislation	0.10	4	0.40
Technological standard	0,10	3	0.30
Economic environment	0.10	4	0.40
Ecological requirements	0.05	3	0.15
Total score	1.00	-	3.90

The total score, 3.90 points out of 5, has indicated that Romania's market attractiveness is over the average, especially due to its natural resources, strategic opportunities and low competition.

OMV's Capability in the Romanian market. The factors describing OMV's competition capability analyzed before have been used for elaborating the quantitative aggregate vector. The outcome is presented in Table 2.

OMV's competition capability has a very good total score, 4.10 out of 5, showing a big competition capability in the Romanian market. The experience, the negotiation power and management performances have had the most important contributions to OMV's capability of entering the Romanian Market.

Table 2: OMV's competition capability

Factor	Weight	Mark	Score
Experience	0.25	4	1.00
Negotiation power	0.15	4	0.60
Brand	0.10	4	0.44
Size	0.05	3	0.15
Distribution	0.10	4	0.40
Management	0,15	5	0.75
Technological standards	0.10	4	0.40
Ecological solutions	0.10	4	0.40
Total score	1.00	-	4.10

OMV's negotiation power has been improved as a result of the strong support of the Austrian authorities, by means of the diplomatic channels in the process of the privatization of Petrom. OMV's important experience of more than 40 years in the international market, the high technological standards and the strong support from the Austrian authorities have had a major contribution to OMV's competitive capability in the Eastern and Central European region, Romania included. This strong support has given OMV a competitive advantage over the other rivals.

The Multi-factorial grid for Entering Romania by OMV

The total score for the market attractiveness (3.90) and the competition capability (4.10) have been used for elaborating the multi-factorial matrix which has indicated the proper entry strategy OMV could use, as shown in Fig. 1:

OMV's Competition Capability

		5 4.10	3.66	2.33 1
		Direct	Direct	Partnership and
	3.90	Invest OMV	Investment	Association
	3.66	ment ROM		
Romanian		Direct	Partnership and	Export
Market		Investment	Association	Strategies
Attractiveness	2.33			
		Partnership	Export	Export
		and	Strategies	Strategies
	1	Association		

Figure 1: The Multi-factorial grid for OMV's entry in the Romanian market

OMV's positioning in the S₁ matrix field at the intersection of the competitive capability of the company with the market attractiveness score where direct investment is recommended as entry strategy confirms that buying the majority stock package was the right strategy approach for OMV. The subsequent excellent financial and market results show once again that the decision has been right. The assessment made after four years has indicated a three time increase market value of Petrom, up to Euro 3 Billion. At the end of the year 2007, the Romanian oil market was dominated by OMV/Petrom which had 750 gas stations and two brands, with a 30-35% market share, ahead of Rompetrol (18-20%), Lukoil, MOL and Agip.

Conclusions

OMV has paid attention to the Romanian oil market even since 1990, but has entered it later on when the conditions have allowed this to happen. The company has had different alternatives of direct investment as entry strategy. At the beginning, OMV has built gas stations then it has bought about a quarter of the stock package of Rompetrol and in July 2004 it has acquired 51% of the social capital of Petrom SA.

In order to assess if OMV has been right about the entry and position consolidation strategy, an analysis based on the multi-factorial grid utilization has been carried on.

The oil market attractiveness assessment has showed that Romania has many advantageous factors such as natural resources, strategic position, strategic opportunities and low competition. These factors have given the "market attractiveness" vector a value (3.90 points out of 5) which has explained the reasons why OMV has preferred Romania as a new market expansion.

OMV's competitive capability has been based mainly on the experience, negotiation power and management performances. The whole synergetic effect of all OMV's factors has placed the Austrian company close to the maximum capability in the Romanian market (4.10 points out of 5).

Both the good result of the assessment of the Romanian oil market and OMV's competitive capability have shown that the direct investment entry strategy used by OMV has been appropriate. Subsequently, favorable results registered by OMV/Petrom have also supported the idea that the chosen entry strategy has been adequate.

STRATEGIES FOR HIGHER SATISFACTION OF THE ROMANIAN BANKING CUSTOMERS

Danciu Victor

Bucharest Academy of Economics Business and Economics Faculty Str. Aviator Stefan Protopopescu nr. 3et.6 ap26, sector 1, Bucuresti dvictorsambotin@yahoo.com 021230 95 14/0723 178547

A bank must identify, assesses and clearly and fully understands customers' values and expectations if it's target is their higher satisfaction. The banking customers are expecting to receive individual attention and support and good quality banking products. The Romanian banks haven't yet succeeded to provide all services the customers expect, even they are progressively focusing on the banking services segment of their offer. This state of facts must be the starting point for the elaboration and performing coordinated strategies aiming to a better customer care, transforming the banking product into a complete offer and finding solutions for the customers education with a view to enlarging the customer base and enhancing the customer satisfaction.

Key words: customer values and expectations, customer satisfaction, customer care, banking product model, banking service. JEL code: D12

1.Introduction

The focus on the customers should be a priority for every banking institution. This prerequisite requires a central place for the banking customer in the bank activity. The banking institutions should have relationship marketing with the main objective the customer satisfaction by added value delivering. In order to achieve this objective, the banks should identify and understand the customer's values and expectations.

The Romanian banking market has still a growing potential and the banks aren't at the highest level of their relation with customers. For this reason, a better transparence and more efforts aiming to enhance customer's loyalty is needed. The turbulence of financial international market, the concurrence and the higher expectations of Romanian banking customers are strong reasons for the banks to seek the higher satisfaction of the customers as main way for customers loyalty.

2. Customer satisfaction: from expectations to value delivering

The first mission of any company is to attract customers, since without customers a company couldn't survive. Attracting and maintaining customers are not easy as it could appear. Customers choose the best offer of many available alternatives. They wish to receive values as big as they could, therefore customers prefers the best offer in terms of delivered value.

How customers choose the most valuable products is a question the marketing professionals should find the best answer at. The customers have expectations about value and they act on the basis of these expectations. A value is an enduring belief that a specific mode of conduct or end of state of existence is personally or socially preferable to alternative mode of conduct or end of state of existence [Mühlbacher, Leihs, Dahringer, 2006, p. 199]. The values are influencing the customer's perceptions. Values having an important impact on customer behavior are based on religious beliefs, concern work, achievement and wealth, are related to risk taking and changes, related to consumption in general. The firms create and deliver products they hope to exactly represent the expected customer values. The customers buy an established value which is comparing with the expected value. In this way, the customers could assess and establish if the expected value is different or not from the perceived value. The expected value depends on cost, experience, information, income and customer mobility. The perceived value is the customer's overall evaluation of the product or service offered. [Hollensen, 2004, p. 95]. It is the result of checking up the value they buy. The customer perceives the obtained value depending on the value of product. In its turn, this last value depends on the product features, quality and brand, social status it provides, company's reputation and provided services. The delivered value is the difference between the perceived value, which provides profit to the customer and the total cost for the customer in terms of money, time and energy. The customer satisfaction depends on his expectations' fulfillment. The expectations fulfillment depends on the delivered and perceived value. The fully satisfied customer only could be content and used as vector for new customers attraction.

The extreme diversification of customers is present in the expectations too, but common values for regional and global customers could be identified. The most often and fully shared are the following values [Hollensen, 2004, pp. 200-208; Danciu, 2005, p. 132]. Health is a very high common value to all countries. In the Anglo-Saxon countries, the material welfare is a priority, and image and social status are important values. Independence is a highly shared value in U.S. and Eastern Europe, while group membership is preferred in Japan and Latin America. The Germanic countries have the comfort and security as priorities.

The level of customer satisfaction depends on the ratio between the perceived value and the customer expectations. When this ratio is equal to one or more, the customer enjoys the complete satisfaction; otherwise the customer gets a partial satisfaction. Some claim a total customer satisfaction when there is equality between customer satisfaction and the delivered value. In other words, the delivered value should be as big as the expected value. Such on equality could be obtained only if companies identify, assess and understands customer's values and expectations

in various markets and, most of all, if it succeeds to create and delivers the expected value under the form of goods and services.

3. The expectations and the satisfaction level of banking customers in Romania

The dominant relationship characteristic of banking marketing requires big permanent efforts of the banks for better customers understanding. On the basis of variable combinations the customers use, the banks should identify the most valuable proposition under the form of banking suppliers using five variables in the following order: the convenience provided by the distribution; the cost in terms of price of banking service; the product satisfying the customer expectations, services which are including an effective communication and customer's experience.

The banking institutions should permanently find the successful alternative. In the last decade of 20th century, banks were focused on their internal issues. This pervasive internal focus was the most limiting factor in the development of the banking industry, in J. Driscoll opinion [J. Driscoll, 1999, p. 23]. The recipe for success in the 1990's was to standardize, centralize and automate. This approach often improved several of the organization's key attributes – convenience, product selection and price – but had little focus on customers and it often adversely affected service levels and ambiance. This approach showed that many banks failed to make the value they add visible to the customer. At the same time, a new banking approach toward creating and maintaining close customers relationship becomes obvious. First of all, banks require a clear and complete understanding that they are in the services business. The banking customers are expecting personalized care, appropriate attention and high quality services. In an article published as early as the end of 20th century in the magazine Bank Marketing [1996, p. 50], H. Finch and M. Helms highlighted four major longstanding trends in customers' service expectations:

- Greater expectations of customized service dealing;
- A stronger need for one stop service
- A growing desires for high/tech to be balanced with high touch
- Increased demand for add-on value.

These expectations were confirmed by further evolutions and they are present in fierce rivalry circumstances. Similar trends are perceptible in the Romanian banking market, too. A study performed by Mercury Research to which refers Romanian economic magazine Capital [13 December, 2007, p.45] suggests that high growth rate of banking market couldn't longtime sustainable.

The Romanian banking markets is not a saturated one, so a question is arising: so long as banks are hoping for low costs and customers for maximal benefices how banks will succeed to increase future sales? As the conclusions of the above mentioned study suggest, the answer seems to be an increased direction's change toward services activities. The findings of Mercury Research study mentioned above confirmer the already existing trends in the banking customers expectations. Until when some banking indicators and sometime the market's positions begun to erodate, the banks have ignored such trends.

Prior to 2006, the population has not been ask if she is interested in alternative solutions to the existing services. These services were relatively poor in terms of number and diversity, as data from Table 1 show. Moreover, the numbers suggest that most customers are expecting numerous, prompt, high quality services.

Table 1. Banking services expectations of Romanian customers (percentage)

8 1	J u	8 /
	Y	'ear
	2006	2007
Expected service		
Polite banking staff	73	73
Fast solved requests/complaints	91	92
Consultations	87	88
Alternative solutions	*	86
Contact with the manager	*	80
Help in complaint solving	*	67
Help at the filling in the blanks	*	66

^{*} Researches have not been performed

Source: Capital, 13 December 2007, p. 45 (According to Mercury Research)

Since 88 % of customers should like benefits by available services suggest that banks should increase the quality of it. If 65 % of banking customers want new services such as help by filling in the blanks and complaints solving, easier contact with the manager shows that the available services are not enough and they have not allaways the best quality.

4. The increased influence of the customer care on the delivered value and banking customers satisfaction

First of all, the suppliers of services should take their customers care in order to become loyal. The customer care is a concept meaning "the fundamental approach of the service quality covering every aspect of the supplier's operations, such as a bank, from the service's design to its performance" [D. Carson, A. Gilmore, 1989/1990, p.51]. Kotler et al. [1999] Consider that in fact the service quality depends on the relationship between the buyer and the seller. The quality of the banking service shouldn't be the only concern for the customer satisfaction. The banking institutions should prepare a package of the customer care, which is a mix of several banking services and is aiming to adopt an attitude carefully defined by the readiness of the banking institutions for help, being friendly, concerned in the relationships with their customers [D. Carson, A. Gilmore, 1989/1990, p. 51].

The complete model of the customer care could be conceived and performed as a package including the parts of the banking customers expectations. The banking customers expectations have a quantitative, tangible of instrumental dimension and a qualitative, intangible or psychological dimension. Both dimensions are related to the expected performance of every banking service.

The banks activating in the Romanian market should work both components, especially the intangible one, which is the customer care dimension. The physical facilities, the banking product, the appearance of the staff for example, which is tangible components of the customer care generally, are at the level of customers expectations.

Other quantitative parts, such as the speed of service delivery, are sometimes under customer's expectations. The easy success to the services, of the banks, good communication, the readiness for help of the staff and sometimes his competence, specialized consulting, courtesy, politeness and even confidentiality are most frequently accused by the customers of numerous banks being under their expectations.

As the study performed by Mercury Research all ready mentioned shows, the Romanian customers of the banks want more intangible services, having a better quality and being as customized as possible, such as specialized consulting and help for various activities and operations. All these findings suggests that the banks should improve not only the environment of banking transactions but even perform an effective internal marketing aiming to a particularly attention to the personnel.

5. The consolidation of customer's relationship by transforming the banking product into a complete offer

The banks aiming to develop closer relationship with their customers could take into account the fact that the majority of customers are not rewarding. Only 10 % of most rewarding customers generate on an average 86 % of profit while the first twenty per cent provide some 114 %, according to a research performed by Retail Economic Revisited. The other eighty per cent are consuming profit [Understanding the Customer: The Issues Strategies and Solutions/Activity Servlet? Ks Action]. Under these circumstances, the identification of the rewarding customers and the modification of the present customer behavior to the advantage of the banks offers become top priorities. The banking institutions should very well know what and when customers demand and perform profitability

analysis [Identify and Increase Consumer, Channel and Product Profitability/Vnncrn/Activity Servlet? /Ks Action]. In their turn, the banking customers have their reasons when decide to abandon buying one-bank services. Around the world, over two third of all customers are not buying because of insufficient services. In order to understand what customers in the present and in the future want, this phenomenon suggests that the banks should place the customer in a key posture. The banks should prepare and perform complete services offers, within a relationship system, the contribution of customers included.

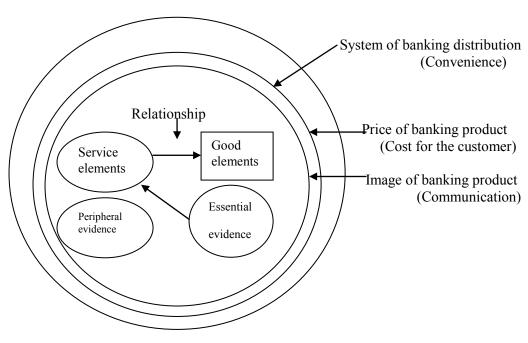

The banks approach aiming to persuade by their care for customers could be successful if they are using the complete model of the banking product. The molecular model proposed by Shostack [1985, p. 224] and illustrated in Figure 1 suggests that any banking product like every service / have complex character due to the mix of tangible elements, having a physical existence, and intangible elements. Both categories of elements are evidences of the banking service. This approach makes different the banking product from a good. A good never requires evidence, it is own evidence.

The essential evidence is related to the basic product and can't be possessed by the customer of banking product. This type of evidence could have a dominant and crucial impact on purchase and the use of banking product. The deposits, credit and card are essential elements of the banking product.

Peripheral evidence is related to the secondary elements of the banking product. Typically, while peripheral evidence is actually as part of purchase, it has little value or no independent value and is possessed by the customer. As peripheral evidence, the banking card has no importance and is useless without an account and no possibility to withdraw or transfer the money.

In order to design a complete banking product, the remaining elements of the marketing mix should be take into account. First, the bank must consider the distribution channels and the needed logistic. Second, the bank must evaluate the cost and set a proper price for banking product, such as a card, credit, deposit and so on. Finally, the communication of the banking product must be considered. In this respect, a strategy based on the product evidence is needed. The promotion of a card must consider not only the card advantages but where it may be used, the ATM network etc.

The banks need a competitive advantage, preferably qualitative in nature, if they want to maintain present customers and to persuade new customers. The quantitative side of a banking product performance is fully found in the complete molecular model of the banking product. Every physical evidence must be supported by specialized and diversified services. Superior service has been a significant differentiator for a long time. As H. Finch and M. Helms highlighted in the last decade if twenty century [1996, p. 49], two points of view are proving they are true. One is the observation made by L. Berry [1986] that is futile to invest heavily in advertising and promotion to attract new customers of those customers subsequently leave because of poor service. The other is a observation made by F. Reichfeld and W. Strasser [1990, p. 106] who showed that the longer a customer stays with a firm, the more profitable that customer becomes.

Source: Adaptation according to Donnelly and Williams (1985)

Figure 1. The complete molecular model of the banking product

Obtaining a better satisfaction of the customer is an increasingly difficult objective to achieve, since customers expectations are permanently growing and diversifying. The longstanding customers expectations seems to follow the main trends of consumers' service expectations, which are the perception that service quality is deteriorating, increased demand for add-on value, a growing desire for high-tech to be balanced with high-touch, greater expectations of customized service dealing and a stronger need for one-stop service [Helms and Finch, 1996, p. 50].

The banks of Romania are in a consolidation process, but the Romanian banking system seems still to "industrialized" and standardized. They should be very carefully about how validate the customers demands and reformulate the banking product approach. Many Romanian banks declare customer loyalty, more market share and profit or consolidation of customer relationship as main objective [Business Standard.ro/article 24142/article 26492]. Such objectives show that banks are aware they need more stress on the customer orientation. This type of objectives validates the results of the researches performed in Romania, shown in Table 1, about the banking customers expectations. The results show that the overwhelming majority of the banking customers want improvement in the customer care segment. Such services as access to the manager, consulting, immediate support and so on are placed in the essential evidence category of the point of view of the banking customers.

The banking institutions may change the situation if they are able to integrate all the evidence customer expects, support services in particular, into the banking product and propose it as an unique and having a superior quality offer. Banks could fulfill such a strategic objective if they find adequate solutions to threats could appear getting fidelity of present customers and attracting new ones. The main way to seize the opportunities, improving the profit rate and attracting new customers could be superior ability for the estimation and quick performance of the proposed offers. A closer knowledge of the banking products by the seller could be added. The staff of the distribution network have first to promote and sell those banking products which better meet the customer expectations and are more profitable for the bank. In order to get a complete offer, a quick updated information about prices and banking products is needed. Updated and detailed information is a condition for the promotion and selling of most profitable products to the most profitable customers. The larger and easier the access of the customers to web auto service has a growing importance.

The customers like most channel mixes in negotiations with the bank. The on-line access to the information allows a quicker relationship with the bank and could reduce the customer's cost and time. Most of Romanian banks are still in the phase of the development of on-line service. A research performed by Romanian economic magazine Capital in 2007 found out that from 13 studied banks meaning 34,5 % of the whole number of existing banks in Romania, all of them offered internet services, most had home banking and only 3 offered access to the mobile banking.

6. The enlargement of customer base and superior satisfaction through education

The success of the relationship with banks customers depends heavily on the level of customer education. The informed and educated customers are an important source for the enlargement of present and potential customer base. The banks operating in the Romanian market are too little able to use this strategic component of the customer care. Even top banks ignore many of the methods for customer education and still have not coherent plans aiming different retail customer groups such as children, students and women. Individual education plans with themes such as financial planning, family and individual budgets, educational event in schools and universities are not yet parts of bank strategies aiming to attract and maintain customers and enlarge of customer base.

The banks mostly have promotion and information campaigns targeting the offer and news, but they have not meeting with customers or plans where customers work. The banks must considerate the customer education as the pressures on terms and offers of the banks and on customers become progressively greater as the numbers of players in the Romanian financial market multiply, available incomes are bigger and the threats due to international financial markets turbulences become a permanent variable.

The educational and informative plans seem not only justified but highly necessary, since little over 50 % of Romanians are in relationships with the banks and the majority of them still pay cash the invoices. Such plans could target groups such as employees, pensioners and students, Romanians who work abroad. The banking institutions could involve themselves in educational plans meeting the needs of local communities where they operate. In order to serve for local communities, banks could deliver information the customer needs. They have to organize seminars, educational plans including courses, letters and other educational materials.

7. Conclusions

As the present paper shows, the Romanian banks haven't yet succeeded to meet all the expectations, both quantitative and psychological, of their customers. Since the banking customers want more intangible services, having a better quality and being as customized as possible, the Romanian banks should work both components, especially the intangible one.

In order to consolidate the relation with customers and to have more loyal customers, the banks should take vigorous actions. They should transform the banking product into a complete offer and enhance the other components of the marketing mix: distribution channels, the proper price and communication of banking services. Some Romanian banks recognize the importance of the higher satisfaction of the customer by declaring customer loyalty or consolidation of customer relationship as main future objective.

A better education of customer may support the effort of the banks. In this area, the Romanian banking system has little initiative. Thus, educational and informative plans for customers are higher necessary. Such plans could target groups such as pensioners, students, and local communities.

All these areas of customer care and higher satisfaction of the banking customer could be a reason for further research.

The Bucharest Academy of Economic Studies, Faculty of Management, Piaţa Romană, no. 6, m dimian@yahoo.co.uk, 021 319 19 00

PETROM SA represents an oil company which acts on a tough competitive market, characterised by international risk factors. Thus, its results and performances are influenced by the quotations of the oil prices, technological development from the alternative energy area, the financial crises, the evolution of the main foreign currencies related to the national one. Into this area of activity, the central and east European market is characterised by the consolidation of five major groups: OMV Austria, PKN Orlen Poland, MOL Hungary, LUKOIL Russian Federation and ROMPETROL SA.

The strategies of some of them, conceived in order to dominate the indigenous oil market, can succeed only if they manage, in the same time with the market development, to attract PETROM SA customers. Thus, the main threat for the Romanian company is represented by the competition, which succeeded to consolidate its presence and position in the field while the national company has been massively restructured after it has been taken over by the OMV.

Key words: strategy, market share, oil, refinery, competition

JEL: F01; L10; M31

I. Introduction

PETROM SA represents the main oil company with Romanian capital. Thus, on the second position after the major stakeholder, OMV Aktiengesellshaft which holds 51,01% of the shares, the Romanian state owns by the Authority of State Assets Recovery 20,64% of them, 20,11% belong to the Property Fund, 2,03% to European Bank for Reconstruction and Development, and 6,21% are traded on the Stock Exchange Market351.

Taking account of the fact that these factors also influence the competitors, and PETROM SA is advantaged by its significant domestic production, being not so exposed to such kind of risks, it can be appreciated that, in the most significant measure, the company is influenced by the competition and the actions undertaken by the companies from this area in order to dominate or survive on the oil market, this factor representing the main external threat.

II. The regional market

Into this area of activity, the central and east European market is characterised by the consolidation of five major groups: OMV Austria, PKN Orlen Poland, MOL Hungary, LUKOIL Russian Federation and ROMPETROL SA, company registered in Holland, controlled by the KAZMUNAYGAZ Kazakhstan and which main operational base is in Romania.

OMV Aktiengesellshaft (OMV), the main company from the south Eastern Europe, is located in Viena and, starting with 2005 year, has conceived an offensive strategy of development on the external markets having as a priority to consolidate its oil products operations in the east of the continent. The company has an integrated character, besides the oil business it develops operations with natural gases, being the coordinator of the NABUCCO project, focused on the construction of

a gas pipeline designed to bring gases from Iran and Caspian Sea area, going around the Russian Federation, in Europe.

From the oil business point of view, into the medium and long term strategy of the OMV company352, it is emphasised the fact that the Austrian company wants to develop onto the "growth belt" of the European Union, aiming to grow onto the emerging markets from this area and the neighbouring countries possible to be included in the European Union, previously consolidating itself onto an mature market.

Thus, the target market for the Austrian company is formed by the Baltic States, Poland, Czech Republic, Slovakia, Hungary, Romania, Bulgaria, Serbia and Montenegro, Croatia, Slovenia, Macedonia, Bosnia and Herzegovina, Albania, and they are completed with Greece and Turkey.

³⁵¹ PETROM SA, Raportul anual pe 2007, p. 75, www.petrom.com.

³⁵² Wolfgang Ruttenstorfer, director general executiv al OMV, OMV Strategy 2010, Conferința Capital Markets Day, București, 12-13 octombrie 2005.

An axis of the consolidation and development of the Austrian company, both from refining and distribution point of view, is known as Danube 13, showing very clear the area in which OMV wants to be the leader, more precisely in the countries placed on the middle and downstream Danube. This one represents a first step in order to expand the Austrian concern's operations with oil products, tightly linked with the general frame of European Union development.

Figure 1. Oil refining into the Danube basin

Source: Data processed in accordance with Gerhard Roiss, deputy executive on Refining&Marketing in OMV, Refining and Marketing Strategy 2010, p. 10, Capital Markets Day Conference, Bucharest, 12-13 October 2005 and the Annual Reports of MOL and PKN Orlen, released on the sites: www.mol.hu and www.orlen.pl.

Observations:

- data for MOL also includes the refining capacity of INA Croatia and IES Mantova Italy;
- data for PKN Orlen also includes the refining capacity of UNIPETROL Czech Republic and Mazeikiu Lithuania;
 - data for OMV also includes the refining capacity of PETROM SA Romania.

PKN Orlen, set up in 1999 by the merger between Petrochemia Plock and Centrala Productow Naftowych (the largest refining unit has been merged with the most important distributor), represents the main oil refiner from Central Europe, with an annual processing capacity of 31,7353 million tones. Oil refining is done in 7 units: Plock, Trzebinia and Jedlicze placed in Poland, other three: Litvinov, Kralupy and Pardubice in Czech Republic, and another one,

Mazeikiu in Lithuania.

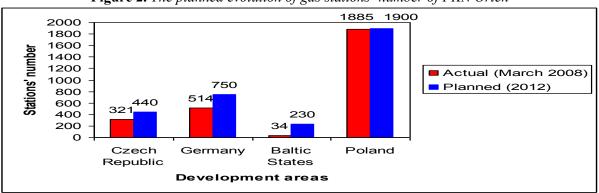

Figure 2. The planned evolution of gas stations' number of PKN Orlen

Source: Data processed in accordance with reports, press releases and official analyses posted on www.orlen.pl

Practically, the Polish company has planed to have the most developed gas stations network in the central and east European area (from 2.754 it wants to reach, over four years, at 3.320), reason for which PKN is going to consolidate its position into this area, to finalise the brand strategy in Germany and the Baltic States, to implement the biofuels sales and analyse the development on the Ukrainian market.

MOL Group includes the Hungarian firm TVK, the Slovakian company SLOVNAFT, ROTH distribution network, IES (Italia Energia e Servizi) Italy and holds a significant participation

353 www.orlen.pl.

(25%) from INA Croatia, together with this company also controlling 67% from ENERGOPETROL Bosnia and Herzegovina.

Both the partnerships and the acquisitions of MOL are focused on consolidating a business that follows the direction Adriatic Sea – Baltic Sea, sustained by a powerful refining segment, this one being supposed to enter into competition with the interests of the others regional competitors: PKN Orlen, OMV and LUKOIL.

9 8 7 The refining capacity 6.1 Slovnaft 6 Mantova 4.5 5 Duna 4 ■ Sisak 2.6 3 2.2 Rijeka 2 o Mantova Slovnaft Duna Sisak Rijeka **MOL Group refineries**

Figure 3. The total refining capacity of MOL Group

Source: Data processed in accordance with MOL Strategy 2006-2008, "Setting the pace from "New Europe"" and the company's Annual Report 2007.

The main oil company from the Russian Federation that undertakes commercial operations into the central and east European area is LUKOIL, one of the largest companies vertically integrated into the oil&gas field from the entire world. The LUKOIL shareholders are mainly (96,90%) Russian economic entities, that are owned by different multinationals (for example ING Bank Eurasia ZAO holds 71,76% from the capital). To the private shareholders are allocated only 3,09% from the shares, while to the foreign ones, 0,01%354.

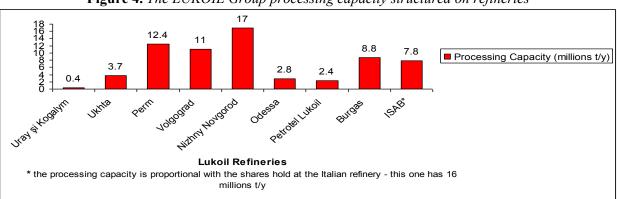

Figure 4. The LUKOIL Group processing capacity structured on refineries

Source: Data processed in accordance with Vagit Alekpeov, Lukoil president, Lukoil – Global Energy Company: Focused on Value Growth, April 2008 and Lukoil and ERG form ISAB Refinery Joint Venture, June 2008, www.lukoil.com.

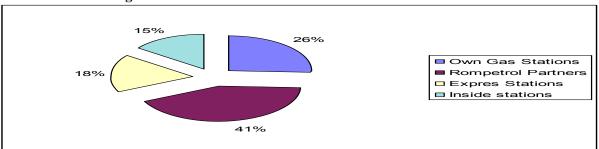

Represents a multinational company established in Holland, but with the main assets and activities undertaken in Romania (country where it actually came from), south-east Europe, France and Spain.

The areas of business development and consolidation in the ROMPETROL vision are the countries placed close to the Black Sea shore and the Mediterranean Sea basin.

ROMPETROL energie vie

³⁵⁴ www.lukoil.com.

Figure 5. ROMPETROL DOWNSTREAM distribution structure

Source: Data processed in accordance with the ROMPETROL Group Annual Report 2007, pp. 9, 16.

III. The place and the role of PETROM SA on the regional oil market

PETROM SA, part of the OMV Group, is adapting to its regional and international interests, and on the domestic market it implements the strategy conceived in order to compete with ROMPETROL SA, LUKOIL Romania and MOL Romania, the other key players on the domestic oil market. Concrete, on the foreign market PETROM SA is primarily involved into activities of obtaining raw materials while at the regional and local level it is focused on the production, processing and the distribution of oil products.

OMV, the main shareholder, wants to maintain its position of the most important company from the Danube basin. On the downstream of this river the Austrian company owns PETROM SA, company that is regionally competed by:

LUKOIL, Russian concern of international level, that benefits of the advantage of raw material resources, refining capacities and superior financial potential;

MOL, which consolidation and radial development also includes this geographical area. The partnerships with SLOVNAFT, INA Croatia, the penetration of the markets of Bosnia Herzegovina and Serbia doubled by the stabilisation at a market share of 10-12% in Romania, threats the OMV interests and its member PETROM SA;

ROMPETROL SA, after the moment when it has been taken over by the Kazakh oil group KAZMUNAYGAZ, has succeeded to eliminate its main weak point: supplying with raw materials. Also, it holds an advantageous position on the PETROM - OMV target market: Ukraine.

As it can be observed from the below figure, PETROM SA occupies the third position from the refining point of view into the neighbourhood of Romania, after LUKOIL and MOL.

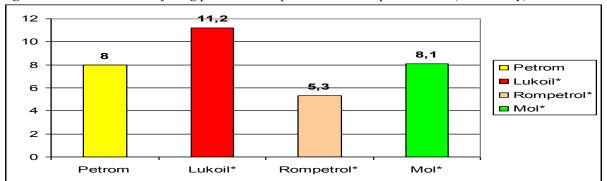

Figure 6. PETROM SA's refining potential compared to the competitors one (millions t/y)

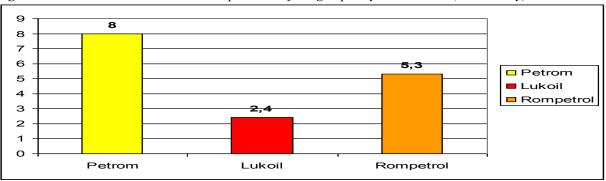

Source: Data processed in accordance with the information from the companies Annual Reports 2007 (supervised) *for LUKOIL it has been taken into consideration the Petrotel (România) and Burgas (Bulgaria) refineries; ROMPETROL is represented by the capacity from Petromidia and Vega (both from Romania);

MOL has been taken into account only with Duna (Hungary), refinery that supplies the company's gas stations from Romania.

Such an approach is justified by the fact that all the countries where these processing capacities are placed (Romania, Bulgaria and Hungary) are members of the European Union, the common market tending to the complete liberalisation of merchandise, fact that economically redesigns the area of activity of the mentioned companies, that in order to commercialise their products in the neighbouring countries will not have to fight against protectionist barriers.

Thus, PETROM positioning on the oil products market according with the mentioned criteria, presents a superior relevance than if we had been treated it strictly into the Romanian borders. In this case, PETROM SA would have held the dominant position, as it can be observed from the Figure no. 7:

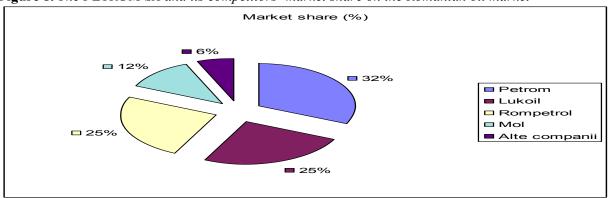

Figure 7. The PETROM SA and its competitors refining capacity in Romania (millions t/y)

Source: Data processed in accordance with the information from the companies Annual Reports 2007 (supervised)

Into this case, we could consider that PETROM SA has a weak competition on the refining segment and we would over evaluate the competitors' performances regarding the market share that they own. (See the figure no. 8).

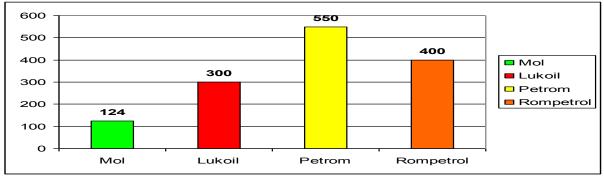

Figure 8. The PETROM SA and its competitors' market share on the Romanian oil market

Source: Data processed in accordance with the information from the companies Annual Reports 2007 (supervised)

Even in these conditions, for the Romanian company the market share remains a low one, because even it owns the largest retail network (550 gas stations, with 11% more than ROMPETROL SA (400 stations) and 18% more than LUKOIL (300 stations)) it doesn't goes over 32%, while each of its main competitors controls 25% from the oil market.

Figure 9. The number of gas stations owned by the main oil companies from Romania

Source: Data processed in accordance with the information from the companies Annual Reports 2007 (supervised)

IV. Conclusions

Taking account of the aspects presented we can consider that, from the competition point of view on the internal market, PETROM SA is still on the first position, but its market share is progressively decreased by its significant competitors (ROMPETROL, LUKOIL and MOL).

Their strategies, conceived in order to dominate the oil market, can succeed only if they manage, in the same time with the market development, to attract PETROM SA customers, because both ROMPETROL SA and LUKOIL plan to increase their market shares by 5% while the competitors represented by the others companies, except MOL, hold only 6% from the entire national market.

Thus, the main threat for the Romanian company is represented by the competition, which succeeded to consolidate its presence and position in the field while the national company has been massively restructured after it has been taken over by the OMV.

ROMPETROL SA has designed an innovative strategy, with a distribution dominated by partner stations, express stations and inside stations. Thus, the précised company attracts the small distributors, occupies the rural market and establish tight commercial relations with its most important customers. In the same time, by the oil terminal planed to be built at Midia (14 millions t/y) it assures the supply with raw material, also guaranteed by its major shareholder: KAZMUNAYGAZ.

LUKOIL Romania intends to buy already built gasoline stations, and its results (the Headquarter recognised the fact that it is its most competitive foreign subsidiary in 2007) will allow to access significant funds in order to achieve this objective. Also the Russian company benefits of a privileged position from the oil supplying point of view because it is owned by one of most important oil exporter from this region.

Research and practice indicate that the main features of high tech markets are dynamism and complexity. These features result in a changing target market over the life cycle. The complexity of the high – tech product influences the market acceptance in different ways. As high tech products are more complicated, they require greater customer education and more product information. This necessity results in greater effort on the part of marketing to adequately convey the necessary information as well as greater effort on the part of the consumer to digest the information.

The concept of "speed" defines the high tech markets and is explained by increasing competition and the continuous evolving expectations of customers. To all of this, we remind the higher levels of risk for both the customer and the producer on the high-tech markets. Consumption of high-tech products will continue to grow in the near future and it is very necessary for the producers and retailers to study and understand the high-tech consumers' behavior.

Keywords: high-tech, consumer behavior, decision process, adoption process

Cod JEL lucrare: M31

1. Factors shaping consumer purchase behavior

One "official" definition of consumer behavior is "The study of individuals, groups, or organizations and the processes they use to select, secure, use, and dispose of products, services, experiences, or ideas to satisfy needs and the impacts that these processes have on the consumer and society."355

People buy different products from different brands to satisfy their needs. Consumer purchases are influenced strongly by cultural, social, personal and psychological characteristic.

The technology keeps growing and it affects every aspect of human life. In electronics and computers innovations have become a necessity rather than a luxury. Modern consumers are always aware of the changes in the marketplace. They have access to a variety of sources that provide information about the changes that happens in the marketplace.

Consumer purchases are influenced strongly by cultural, social, personal and psychological characteristic. Although marketers cannot control such factors, they must give attention to them.

a. Culture

Culture is the set of basic value, perception, wants and behaviors learned by a member of society from family and other institution. Culture is the most basic cause of a person's wants and behavior. Every group or society has a cultural influence on buying behavior may vary greatly from country to country, or even neighborhood to neighborhood.

Example³⁵⁶: when business representative of a US community trying to market itself to Taiwan learned a hard cultural lesson. Seeking more foreign trade, they arrived in Taiwan bearing gifts of green baseball caps. It turned out that the trip was scheduled a month before Taiwan elections, and that green was the color of the political opposition party. Worse yet, that according to Taiwan culture, a man wears green to signify that his wife has been unfaithful.

Subculture

Each culture contains smaller subcultures. Subculture is a group of people with shared value system based on common life experiences and situations. Subcultures include nationalities, religions, racial groups, and geographic regions.

Example: In US, the important subcultures include Hispanic, African American, Asian and Mature consumers.

Social Class

Almost every society has some form of social class structure. Social classes are society's relatively permanent and ordered divisions whose members share similar values, interest, and behaviors. Social class is not determined by single factor, but is measure as combination of occupation, income, education, wealth, and other variables.

³⁵⁵ Lars Perner - Consumer behavior: The Psychology of Marketing, http://www.consumerpsychologist.com/

³⁵⁶ Characteristic affecting consumer purchase behavior – published in Marketing and Advertising, on July 17, 2007; http://bizcovering.com/marketing-and-advertising/characteristic-affecting-consumer-purchase-behavior/

b. Social Factor

A consumer's behavior also is influenced by social factors, such as the consumer's groups, family, and social roles and status.

Groups: A consumer's behavior is influenced by many small groups. A group can be defined as two or more people who interact to accomplish individual or mutual goals.

Family: Family member can strongly influence consumer's behavior. Husband- wife involvement varies widely by product category and by stage in the buying process. Children may also have strong influence on family buying decision. For example children as young as age six may influence on the family car purchase decision.

Roles and status: The consumer's position in each group can be defined in terms of both role and status. A role consists of the activities people expected to perform according to persons around them. Each role carries a status reflecting the general esteem given to it by society.

c. Personal Factor

A consumer's decision also are influenced by personal characteristics such as the consumer's age and life cycle stage, occupation, economic situation, lifestyle, personality and self concept.

Age and life cycle stage: People change the goods and services they buy over their lifetimes. Clothes, furniture, and recreation are often age related. Buying is also shaped by the stage of family life cycle. Traditional family life cycle stages include young singles and married couples with children.

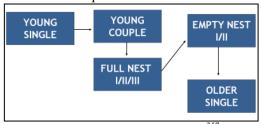

Figure 1: The simple life cycle³⁵⁷

Occupation: A consumer's occupation affects the goods and services bought.

Economic situation: A consumer's economic situation will affect product choice. If economic indicator point to recession, marketers can take steps to redesign, reposition, and reprise their products closely.

Lifestyle: People coming from the same subculture, social class, and occupation may have quite different lifestyles. Lifestyle is a consumer's pattern of living as expressed in his or her psychographics. It involves consumer's activities, interest and opinions.

Personality and self concept: Each consumer's distinct personality influences his or her buying behavior. Personality refers to the unique psychological characteristics that lead to relatively consistent and lasting response to one's own environment. For example, coffee marketer have discovered that heavy coffee drinker tend to be high on sociability.

d. Psychological Factor

Motivation: A need becomes a motive when it is aroused to a sufficient level of intensity. A motive is a need that is sufficiently pressing to direct the person to seek satisfaction.

Perception: Perception is the process by which people select, organize, and interpret information to form meaningful picture of the world.

Learning: When people act, they learn. Learning describes change in individual's behavior arising from experience.

Beliefs and Attitudes: Through doing and learning, people acquire beliefs and attitudes. A belief is a descriptive thought that a person has about something. Attitude describes a person's relatively consistent evaluations, feelings and tendencies toward an object or idea. Attitudes put people into a frame of mind liking or disliking things, or moving toward or away from them.

2. The profile of the high-tech consumer

The high-tech consumer is that person who purchases and consumes innovative products and services. Usually, the person who decides to buy presents the following characteristics:

³⁵⁷ Lars Perner - Consumer behavior: The Psychology of Marketing, http://www.consumerpsychologist.com/

Table 1. The profile of high-tech buyer

1 40 10 11	The premie of mgn teen eager

Reddy

2.1. The profile of the high-tech consumer in the digital era

Understanding the consumer's social ecosystem - a person's extended household and larger social network - is essential. Based on a more sophisticated segmentation strategy and an ecosystem approach, companies can tailor offerings, sales, marketing and service experiences, which can, in turn, keep them on pace for market leadership and high performance.

The Accenture Digital Household Segmentation Study³⁵⁸identified eight distinct consumer segments in the digital era:

Early Adopters: High-value users who are consistently interested in the latest devices and services.

Technocentrics: Sophisticated users of technology and heavy consumers of entertainment; such households often contain teenagers.

Convenience Consumers: Also called "simplifiers," this group makes purchases based primarily on whether products and services will make their lives easier.

No Frills: These customers want just the basics; technology developments do not dominate their lives.

Family-Centrics: This group is more interested in Internet-based communications than in creating content.

Socialites: These consumers are more personally involved in the creation and sharing of media content, and may use that activity to form social networks.

Entertainment-Focused: A group more interested in entertainment for the family.

Content Creators: A heavy user of personal computers, this group has embraced the latest technologies to create and share content.

2.2. How the high-tech consumers buy?

High-tech products need a high level of involvement from the consumer. This need appears because of the characteristics of high-tech products.

- Complex features
- Significant differences between alternatives
- High price
- High perceived risk
- Reflect self concept of buyer

Features of high-tech buyers' lifestyle³⁵⁹

Survivors: Price conscious, not very knowledgeable, depressed.

Sustainers: Strugglers, swayed by brand guarantee, impulse buyers.

Belongers: Conventional conservative, nostalgic, unexperimental.

Emulators: Ambitious, upwardly mobile, status conscious, buy to impress others.

Achievers: Leaders, work in hi tech top line products.

I-am-me: Young, Self engrossed, impulsive.

Experimental: Pursue a rich inner life, High sense of social responsibility.

Integrate: Fully matured psychologically, combination of best elements

A. If we talk about an innovation in the high-tech sector, **the process of adoption** take into account the following factors 360:

Relative advantage: The benefits of adopting the new technology compared to the costs

Compatibility: The extent to which adopting and using the innovation is based on existing ways of doing things and standard cultural norms

 $³⁵⁸http://www.accenture.com/Global/Research_and_Insights/Outlook/By_Industry/Communications/CommunicationsMarketing.htm\\ 359\ profsamkulka.files.wordpress.com/2007/12/sakscb.ppt$

³⁶⁰ Mohr, J.J., Sengupta, S., Slater, S.F. – Marketing of high-technology products and innovation, second edition, published by Person – Prentice Hall, 2004

Complexity: How difficult the new product is to use

Trialability: The extent to which a new product can be tried on a limited basis

Ability to communicate: The ease and clarity with which the benefits of owning and using the new product can be communicated to the prospective customers

Observability: How easily other customers can observe the benefits received by a customer who has already adopted the product.

B. 5 steps in the decision process of buying high-tech products

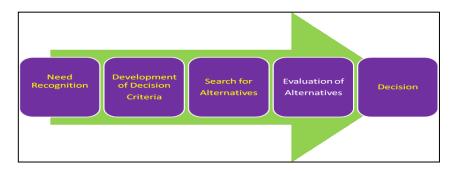

Figure 2: Purchase decision in high involvement products³⁶¹

We chosen an example based on the model shown up, illustrating the purchasing of a car. As you can see, in the first square, there are all the brands on the market (hypothetically speaking), in the second square there are the brands the consumer is aware of, in the third square there are the brands that the consumer take into account, in the fourth square we have the evaluation of the two brands that were chosen. In the last square, we have the purchase brand.

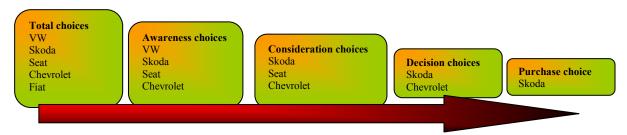

Figure 3: The decision process in car purchasing

C. Post-Purchase evaluation

At this stage, the buyer assesses how well the product has lived up to its potential. Some questions arise for the customer:

- Was I able to successfully learn how to use the new technology?
- Did the technology deliver the promised benefits?
- Were there hidden costs to using the new product?

3. The consumers' segmentation

Purchasing habits fluctuate over time with every generation, but because of increased access to new technology and uncertainty due to world events and insecure futures, the consumer trends of generations have changed. In order for businesses to appeal to these consumers, it is important to understand what these buying habits are, how they have changed, and what techniques can be utilized to expand sales among five consumer segments.

A recent article from American Demographics Advertising Age³⁶² highlights these changing behaviors.

Birth -12 years old

Because of the changing tastes of these "sub-teens" towards consumer electronics and fashion goodies, marketing for this age group has now been split into four distinct under-13 segments: newborns -to-3-year-olds, 3-to-5-year olds, 5- to-8-year-olds, and 8-to-12-year-olds.

³⁶¹ Sameer Kulkarni – Consumer behavior, profsamkulka.files.wordpress.com/2007/12/sakscb.ppt

³⁶² What drives consumer behavior, Article Summary by Erika Rence, April 2006 -

http://www.uwex.edu/ces/cced/downtowns/ltb/lets/LTB0406.pdf

Today, children within this market segment also differ from their predecessors in that they are technically empowered. They grow up in a world with ready access to multifunctional gaming consoles and Internet connections.

13-17 years old

The image of the typical teenager looks like this: an optimistic, ambitious, self-assured person with a more confident and positive outlook on life.

Because teenagers are accustomed to multi-tasking, products need to be presented in a way that will catch the attention of the consumer. As self-expression is important to many teenagers, this can be encouraged by allowing them to customize products.

18-34 years old

Technology and luxury are two things this generation clearly desires. Social responsibility plays an important role in selling products to this age group. They are not only concerned with the value of a product but also the extent to which it is environmentally safe, connected to a cause, and gives back to the community. By buying these types of products, they can feel socially responsible without having to commit any significant amount of time to these causes.

Appealing to this generation requires offering a product with good design; good value, preferably luxury; at least the appearance of some social responsibility; and an advertising campaign that sells with the consumer not at them.

35-54 years old

This generation, called the trailing boomers, is characterized by spending a lot but spending carefully. This segment has three primary characteristics. They are quite sophisticated in the use of technology to get information, they have the money to buy things, and they are still in the householder life stage, many raising teens. Another aspect of concern for this age group is fitness and well-being.

This market segment wants to get a deal but not sacrifice quality. A good marketing strategy for these demanding and technologically adept consumers is through product segmentation.

55+ years old

They define themselves based on their values and attitudes giving marketers opportunities in the areas of financial, hospitality, and wellness products and services.

Two key trends describe a change in consumption patterns and priorities of adults in this market segment: "Aging Process" and "Transition to Empty Nest" (20). Products that will "keep them going" are in high demand.

Therefore, the transition to an "empty nest" may not be achieved. Due to this uncertainty, many in this generation are simply concerned with catching the happiness while they can. They are focused on making purchases that will make them happy on a daily basis.

Conclusions

The purchasing behavior of a person is the result of an interaction between many factors (cultural, social, psychological and personal ones). Speaking of purchasing high-tech products, this behavior become different because of the high involvement of consumer. The decision process is longer and it needs much information from different sources.

A big influence in choosing products it has their usage by persons that the consumer considers truthfully. This happens because of the high risk presented by purchasing high-tech products. Not everyone can afford to buy and use high-tech products: those who can, have a special lifestyle and a special education level. Buying these products, they achieve a new status in their community.

Taking into account the social and psychological implications, the high-tech producers must analyze very carefully the behavior of this type of consumer. Not every new product will be accepted and will be bought by consumers because there are products that they can't understand.

So, it must be a permanent relationship between the producers and consumers of high-tech products, and the must collaborate for both side interests: for the producer to create and to sell the product, and for the consumer to buy and to use the product which brings him satisfaction.

THE SIGNIFICANCE BY PUBLIC RELATIONS ACTIVITY TO THE LEVEL OF ORGANIZATIONS

Duhalm Simona

University of Bacau Faculty of Economic Sciences Str. Spiru Haret, nr.8, Bacau simonaduhalm@yahoo.com 0742.42.44.79

This paper focuses on the importance and role of public relations activities at the level of an organization, viewed in connection with marketing. Besides advertising and sales promotion, public relations is another important marketing tool used to promote mass. The activity of public relations gained in scale last time, one of its advantages are much lower cost compared to advertising.

Keywords: public relations, lobbying, public

Cod JEL: M0

1. Introduction

New approaches to modern marketing require more specific activities combining advertising, sales, promotion, direct marketing and public relations.

Public relations activity has grown and increased in importance during the economic and social development, is gradually being in a distinct and important activity to contemporary society.

In the current period, in terms of increasing competition, which requires thorough knowledge of market ,potential customers and gain their trust, the vast majority of organizations believe that advertising is not the only answer to the increasingly complex issues of marketing.

According to the definition given by the Foundation for Public Relations Research in 1975, the concept of public relations can be interpreted as follows:

- represents a distinct function of management, which help to establish and maintain a psychological climate of communication, understanding, acceptance and cooperation between an organization and the public;
- help management to inform and be informed about public opinion;
- defines and coordinates the management responsibility to serve the public interest;
- help management to use effectively any change;
- uses research and ethical communication techniques as its main instruments.

Public relations pursue building good relationships with their public by obtaining a favorable publicity, by a good company image, as well as management and elimination of rumors, news, and adverse events.

Lower cost communication strategies that can easily adapt the client profile, and market requirements, thus providing a greater impact and increased efficiency of communication - here are the strengths of public relations services that will have more weight in the balance of companies.

In terms of services required by clients, most will be those required by that reinforces the image of the product, but also the relationship between the company and them public. The most likely strategy will guide the promotion of product and customer satisfaction campaigns, but also to investors relations or B2B communication - for maintaining a constant connection and trust with business partners and investors.

Another service that will register a growth surprises is the online PR, because low cost, and migration of print publications in the online sphere.

2. Functions of public relations compartments

Public relations departments can fulfill any of the following *functions*:

- relations with the press or media agents: relationships with the press aim is to put in the means of communication, information novelty value to draw attention to a person, product, or service organizations;
- promoting a product or service: consists of various efforts to publicize specific products or services; press releases or events that increase knowledge of media company shares may be exacerbated by PR. Large firms issued press releases or new products many times are salable.
- corporate communications: this activity includes all internal and external communications of the company and promote its knowledge to the public; in terms of internal communication, Spreading information and correct/referral actions disinformation in a firm can reduce the impact of rumors and can grow support employeds. If reducing the number of employees or the merger of companies, internal communication can do much to dismiss rumors that circulate among company employees or local community.
- lobbying activity: involves building and maintaining relationships with those who adopt laws and the rulers to influence legislation and regulation;
- consultancy: include providing support for company management on matters of public policy, the positions adopted by the company and the image.

3. Factors influencing the development of public relations activities

The development of the public relations is favored by the following factors:

- diversification of markets for consumer goods with increasing public demands;
- explosion of technology and information system through the development of computer, a telephone, cable television, video equipment;
- increased the pace and level of competition with direct impact on the ways of making progress;
- decline in classic television advertising and increasing the role of TV commercial;
- increasing costs of television advertising, with the immediate need to increase advertising budgets;
- growth and diversification of the facilities offered by commercial television stations, radio and newspapers;
- development actions and increase the sponsorship role of the sponsoring;
- emergence and development of powerful Internet networks worldwide.

Public relations are used to promote products, people, places, activities, ideas, organizations and even nations. Through public relations activities of a brand can be well promoted compared with advertising costs as required much less.

Public relations may play a role less than or greater to play in the development and introduction of new products and services, but this depends on the context in which these products are new. With a product as less innovative, with both must be more creative work of public relations or other marketing strategies.

Currently, public relations are present in all activities and when social and political importance, in almost all institutions, in preparing and carrying out major sporting events and cultural, crisis situations and in the normality. The practice of modern public relations is based on research methods which aim at both a public organization (to

The practice of modern public relations is based on research methods which aim at both a public organization (to be determined the public objectives), and the staff of organizations (to be set their own objectives). Following analysis of the two types of objectives are developed public relations programs that transmit messages to the public to promote the image of the organization, winning the trust and change public attitudes and behavior.

4. The main instruments of public relations

In the public relations domain may be used many methods and techniques, their number being limited only by imagination and ability of those who apply.

One of the main instruments is represented by the news. Public relations specialists must find or create favorable news about the organization, about its products and services or its employees. Articles should be topical and attention of the reader.

Discourse is a tool for achieving product and advertising firm. They follow the presentation of a proper view of the firm, as well as its positive experiences. Company representatives must answer questions from the media, and these events may be to build or to affect the company's image.

Another tool of public relations is represented by special events. Among them include: press conferences, seminars, exhibitions, contests and competitions, anniversaries, sponsorships of sporting events.

Publications. To establish contacts with the target audience and influence of firms is based on communication materials. These materials include annual reports, brochures, articles, newsletters and magazines of the firm.

Means of creating identity. To create and strengthen the identity, companies should also create a visual identity for the public to easily recognize. Logos, printed materials, brochures, logos, company documents, buildings, uniforms and vehicles, these are marketing tools when they are attractive, distinctive and worthy of note. Activitatile in folosul public. Firmele pot atrage bunavointa publicului contribuind cu bani si timp la activitatile legate de cauze nobile.

5. Conclusions:

Public relations is an important tool for promotion and communication at the level of an organization.

A public relations campaign well planned and wide is the most effective to create in the minds of the public a favorable impression about the organization or to implement the desire to buy a certain product or service organization.

New types of approaches to public relations can sometimes help to keep alive a product that is in real decline in the market - or to help find new opportunities to assert themselves.

Planning activities of public relations involves setting targets for public relations, choice of appropriate messages and vehicles designed to transmit, and evaluate results.

The main instruments of public relations publications, events, news, speeches, public service activities, the means of achieving corporate identity.

Regardless of the means and techniques used, the public relations should be correlated with other variables promotional placed in a unit program with a global vision. Efficiency public relations work depends on the quality of activities performed by the entire organization.

SIDE BANKING MARKET OF ROMANIA IN THE PERIOD OF ECONOMIC CRISIS

Duhalm Simona

University of Bacau Faculty of Economic Sciences Str. Spiru Haret, nr.8, Bacau simonaduhalm@yahoo.com 0742.42.44.79

In this article I will present how react the banking market of Romania in terms of economic and financial crisis. Given the fairly strong competition on the banking market will call to offer differentiation, creating and promoting the image and positioning in the mind of the consumer. Across our country is observed that banks, besides the aggressive campaigns to promote credit cards focus on promotional offers for deposits.

Keywords: banking market, offer differentiation, credit, competition

Cod JEL: G21, M31

Romania integration in the European Union took place in early 2007 and establishes a realistic integration. At the same time is conditioned by several factors such as: strengthening financial and administrative discipline, growth to the national economic productivity and achieve an appropriate level of purchasing power of the individual.

Following the monitoring of economic indicators on the domestic market such as: economic growth, foreign exchange variations, financial intermediation, real rates of interest bank, Romania is among Eastern European markets falling under the category of "dangerous financial market" along with Bulgaria, Latvia and Estonia. This is due to low performance of some of the indicators monitored.

In Romania, Competition continues to grow,new banks is foundet and, therefore, the customers have the opportunity to choose of the banks that they will meet their specific needs in terms of financial-banking services. In the financial-banking sector, services and products are all similar in their effect, therefore a bank must maintain competitive advantage. Quality of services is an area in which an organization is able to act and is key to future developments. One of the secrets to insure a good service to the customer is understanding the needs and desires wishes it.

The main objective of the banking market is to offer additional benefits to the banks customer, advantages will result from two important considerations:

- customer will benefit from increasing freedom of choice by targeting the institutions that offer lower prices or by obtaining the services that were not previously available;
- prices (tariffs, fees) in most financial services should fall as a result of higher domestic market. Competition will be the main factor of a sale, although can be envisaged reducing profit margin of the bank.

Banks will inevitably focus to customer retention and to win customers in the system, not outside it, as before. This approach is necessary to maintain profitability and can not be done only by specialized investment solutions – CRM banking, modern and innovative ebanking solutions. Development of informatic banking system allows automating the process of electronic transmission a credit files of branches to the processing center, automating the flow of credit approval, and achievement a central data warehouse from which reports can be obtained by monitoring the activity.

To maintain existing customer loyalty and to attract new clients it is important to know their behavior of purchasing products or services banking. In the financial-banking market the customer chooses not only the product or service but the bank will respond to the needs of existing.

Factors that influence customer behavior (as purchaser) in relations with the bank are the following:

- confidence in the banking system;
- Accessibility purchasing services;
- bank's reputation;
- range of products and services;
- service quality;
- perceived value of services;
- ability to meet needs in terms of financial and banking services;
- existing staff courteous and capable.

During the current economic and financial crisis the banking market reacts as follows:

- is appealing to differentiation and positioning of supply:
 - image differentiation;
 - offer differentiation:
 - personnel differentiation.
- improving communication and promotion

1. Differentiation and positioning of supply

Image differentiation

In the banking creating and promoting the image, positioning in the mind of the consumer is done in a first phase by the formation of brand using slogans. It has the ability to position a product on the market to create a segment, a target, a point of departure, a image in relation which will be judged by its customers all services launched under the brand question. Because the banks are out to a targeted one segment and launch services in various sectors and the slogan is often vague, Overall, abstract, times referred at a human ethics, a principle of life or a general need to customers. Slogans are positive, induce a state of prosperity, seriously, or even power. However, many banks are on the market that do not identify with a particular brand because that promotes their products rather and too little focus on one image campaign or a product campaign of successive spots. For example, I will list the top 3 banks in Romania ranked according to total value of assets and their slogans, to highlight their impact on clients:

- Romanian Commercial Bank: "Think of the way";
- BRD-Groupe Société Générale: "More and simple";
- Raiffeisen Bank Romania "Succeed together."

Offer differentiation

Borrowing market in Romania is in a moment of stagnation both because of the international financial context, as well as changes in internal credit policy. Regarding offer banks compete through various promotional offers savings and credit even if they are similar in terms of interest, penalties or facilities.

Because consumer credit have decreased considerably in the last period, banks that offer alternative credit cards. These are advantageous for those who want to finance short-term but also for customers who are able to return the money quickly. If the end of 2008 banks promote credit cards with grace periods of very high (three months) now, most have grace periods of much lower: 55-56 days. Each bank offers to physical persons various programs and benefits of using the credit card.

Romanian Commercial Bank adapted the offer with discounts and bonuses in partner stores. The bank's website shows that if you pay by credit card at merchants like, you get bonus value of 0.6% for each payment.

Raiffeisen Bank which has the highest number of credit cards to national level (310,000) care are cel mai mare număr de carduri de credit la nivel național (310.000), optimal combination between overdraft (discovery credit card) and credit cards. Thus, the client have the possibility to draw money from the card and using the overdraft to repay them in the grace period and avoid paying interest on credit cards.

BRD-Groupe Société Générale launched a loyalty program to customers who have used credit cards by offering loyalty points. Bank offers loyalty points proportional to the amount spent by the payment card to merchants. Each lion spent with the card represent a loyalty point and these can be converted into money for shopping to partners BRD. Also,BRD guarantee to credit card users the long grace period on the market for 60 days.

The same system with the benefits by points has been implemented and the Romanian Commercial Bank, through Powercard BCR and Raiffeisen Bank, through Multishop program.

Regarding commissions amounts that holders of credit cards out of the pocket differs little from one bank to another. Commission apply have the role to loyalty and to ensure the smooth running of the transaction.

As in recent months demand from customers has been reduced based on the uncertainties regarding the evolution of the economy, Raiffeisen Bank resume the crediting with a promotional offer for sale of auto loans. This promotion consists of providing loans for the purchase of vehicles for which no interest is charged in the first year. This movement is the reaction of bank to the competitors, which reduced the interest on loans.

If offers savings, banks have entered a real battle on interest on deposits.

BRD-Groupe Société Générale diversifying their business offer, launching a new savings instrument - Deposit Advance. It customizes the payment of interest in the current account, available to the client, since the formation time. Thus, the customer will benefit from the safety of a win and maximum flexibility in the use of interest earned on money deposited. This amount can be reinvested in conditions or withdrawn from the current account, for any other purposes. Advance deposit is available in lei or euro, term of 90, 180 or 365 days. The minimum amount required for the formation is 1,000 lei, or 1,000 euros.

Personnel differentiation

Banks can obtain a competitive advantage by hiring and training staff with qualities superior to those of competitors personnel.

A well-trained personnel must meet six conditions:

- competence: employees must possess the knowledge and skills;
- courtesy: employees must be friendly, respectful and attentive;
- credibility: employees must be trustworthy;
- safety: employees need to meet expeditiously and consistent with the obligations;
- spirit of responsibility: employers must respond promptly to customer requests and problems;
- communication: employees need to understand his client and to express their understandable.

2. Improving communication and promotion

Banks continued to allocate budgets for advertising, just changed the message: banks will not provide money, but will receive. In the last year, has already felt that banks are starting to store money, not only to provide loans. More and more banks have invented special deposits and savings accounts with interest that exceeded the standard. The apogee was reached but now, when banks began to carry out various campaigns aimed at attracting funds to ensure Cash assets.

Since the beginning of 2009 the advertising from banks were reduced in all environments. During January-February gross volume of advertising on TV decreasing by 52% compared to the same period of 2008. Regarding other channels of communication, advertising in newspapers has declined by 54%, and the radio 65%.

Regarding the approach of the **Raiffeisen Bank** this remark by ensuring a top 3 interest in the market. The bank appealed to advertising cognitive triggering in the minds of customers the processes of rational thinking on the advantages it could obtain.

BRD-Groupe Société Générale through campaign by "Great men" appeals by emotional advertising. The spots aired by television channels transmitted emotions and associated the bank experience through the combination of someone important in the world of sport: Nadia Comaneci, Ilie Nastase and Gheorghe Hagi.

Romanian Commercial Bank calling all emotional advertising in the last TV spot to the new credit card Powercard BCR. BCR had the most advertising inserts (2100), on TV, radio and written press.

Leader in the standings TV station that attracted most publicity are the banks, according Alfacont Mediawatch, Antena 1, which run 638 advertising spots. Television Intact trust is followed by Kanal D (549 inserts), Prima TV (346) and ProTV (273). As regards radio, Kiss Fm broadcast the first two months of this year most advertising spots (215).

3. Conclusions:

Once triggered the crisis, local banking system has gone through unprecedented transformations that can not only benefit the customer. Especially depositors.

Financial crisis had a strong effect on credit institutions, which in addition have less money invested in advertising, have changed and the strategy for the products promoted.

Thus, banking institutions are also invited consumers to make savings with beneficial interest, or have proposed loans with smaller amounts, instead of borrowing consistent long-term.

In modern thinking, the concept of "manager in charge with understanding the client" is the person who leads a brand new department, which combines the marketing research and the clients' database. Some organizations consider "the understanding of the clients" just a new name for the marketing research, probably sustained by the data obtained from databases. Understanding the clients can take two form, on one hand in can be a moments inspiration or a revelation which can lead to certain opportunities and on the other hand it represents the ability of clearly perceiving a hidden truth about the consumer and the market and which helps the decision making process. Basically in the client orientated organization, understanding the client is a determining element.

Keywords: Client experience, managing the client's experience, key-moments of the truth,

Cod JEL lucrare: M30, M31, M39

Introduction

The accurate understanding of the client, forces the organizations to rethink the way the clients perceive the organization and interact with it. Starting from these premises, we have to explain two important concepts: the client's experience and the client's evolution. In the context of permanent changes, the client changes his needs and desires and of course he changes his consumer behavior. The appearance and the development of the new communication technologies has raised a series of challenges for the organization and for the way he deals with present and potential clients. In order to better sell the organization's goods or services, we have to have a proper understanding of these concepts.

The development of these new communication technologies and the marketing development towards these new ways of reaching the clients will have a strong influence on the strategies developed by the organizations for their clients.

Managing the client's experience

The clients' experience can be defined as the combination between the actual performances of the organization and the feelings generated by it. The organizations efforts are compared and evaluated by the client intuitively, with regard to his expectations for all the contact point that exists between the two parts. The contact point can be defined as the clients' evolution. They represent a series of cumulated experiences, by which the client has contacted or interacts with the organization, which moves constantly in accordance with the expectations of obtaining loyalty, sustaining and promotion. An organization's reputation, its brand, is not formed only with the help of mass-media. The reputation or image is build by interacting with the clients at the contact point, with the help of the new communication technologies, like the Internet, the e-mail, instant messaging or short text messages by phone.

Every time the client enters in contact with an organization, the clients feel how it is to interact with that entity and they immediately form an opinion about it. The experience is the main valued factor for the client. This element has a major influence on his future behavior and consequently it has an important potential value for the organization. The way the client "feels" the bard at every interaction and every channel will become a new and durable source for a competitive advantage. The capacity of offering to the client's rich and qualitative experiences has become a differentiating factor in a world in which the products or services are more and more similar to one and the other. In this time when the competition is stronger by the minute, the organizations must offer an unforgettable experience, and its planning and managing is of great importance for the marketing. A bad experience is a first step in loosing a client or even more clients if the experience is presented to others by "word-to-mouth" process. On the other hand a good experience can encourage repeated acquisitions and will finally lead to the transformation of the client into a loyal costumer.

A stranger focus on the clients experiences are an opportunity of profitable development, of an increase of clients' loyalty and of the shareholders capital. All this will become possible if the organization better integrates: the concept of *client understanding*, the distribution channels, the employees, the means of communication, the new

information technology systems in her activity and will focus with the same measure on the emotional experience and the functional dimension. In order to be able to manage the experience, the organization must collect and monitor the subjective information. The subjective information is often considered irrelevant for the client – organization relationship or to difficult to collect with the help of existing systems (figure 1).

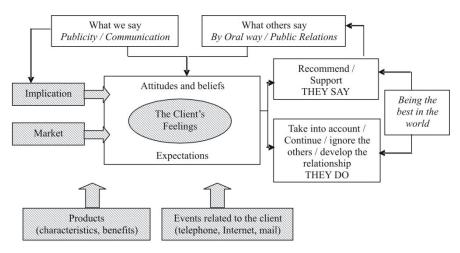

Figure 1. The Clients' experience
Source: Paul R. Gamble, Alan Tapp, Anthony Marsella, Merlin Stone, Revolutia in Marketing, Editura
Polirom, Bucuresti, 2008.

From the client's point of view, every experience is offered by every manifestation of the brand values, the organization's, the product's and services personality and by providing the services and with the interaction with the community. The unique combination of these elements creates a unique experience for the client; unique because every client will have his own perceptions. As it can be seen in figure 1, the client's experience is a combination between the products or the services and the "good feeling" generated by a series of stimuli resulted from the contact points with the clients.

The main objective in planning and managing of the client's experience is the limits overtake of the expectations in the field or area that matters for the client, and barely fulfillment of the other expectations. In figure 2 is presented the activity of positioning the client's experience planning system.

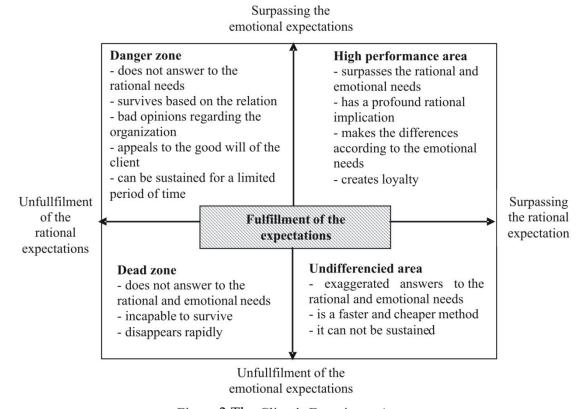

Figure 2 The Client's Experience Areas

As it results from the above figure, the main objective is maintaining a balance between the rational expectations and the emotional ones, where the rational expectations are fulfilled and the emotional experience is positive.

The main stages in planning the client's experience are:

- Demonstrating with the help of researches that the brand values of the organizations and its image are appreciated by the clients and are considered different from the ones of the competition. What are the employees and the managers of the organizations thinking?
- Developing the means of understanding the client for a better identification of the way the consumer seas the experiences right now, what are his expectations and what is his most important interest when the interactions work:
- *Identifying the key moments of the truth* from the interactions with the client by using a combination between the analysis of the contact points, the consumer's life cycle interaction processes and the diagram of the known factors that determine the relations;
- *Identifying the moments* when the experience has the most positive and the most negative impact on the consumers;
- Analyzing the difference between the wanted experience and the perceived experience of the client at the key moments of the truth;
- *Analyzing the employees experience* at every key moment of the truth;
- *Planning and testing the experience* for the consumer and the employees;
- Recruiting, training, guiding and stimulating the personnel in order to sustain and support the clients' experience;
- The *creation of a measuring tool* which will allow a sufficient evaluation of the client's experience;

The client's route is pointed out in the above context in the *Client's Experience Model* – figure 3.

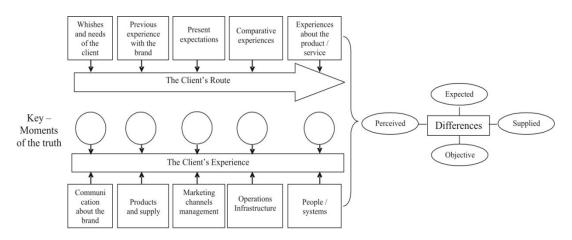

Figure 3 The Client's Experience Model
Source: Paul R. Gamble, Alan Tapp, Anthony Marsella, Merlin Stone, Revolutia in Marketing, Editura Polirom,
Bucuresti, 2008.

In practice, the management of the client's experience has two important parts: the *strategic planning and the continuous improvement*. *The continuous* improvement is possible with the help of the clients' feedback or by the presentation of his experience. The feedback allows the organization to solve the complaints and to improve the daily experience of the client. It can have an immediate effect on the business by the reduction of the discarding degree of the organization's services and its risks, and in the same time it can lead to the increasing of the possibility of expressing some favorable opinions.

The feedback can reduce the number of the ones who give up the organization's services with approximately 2-3% per year. There are a grater number of possibilities of collecting the feedback like: surveys, research projective techniques, customer relationship management (CRM), free phone lines (green phone lines), the analysis of the phone interactions, the Internet and the discussions that take place within the groups of service users.

The client's experience is important for continuing the development of an emotional loyalty for a long term or the attachment of the client for an organization. The client's experience is the main valued factor for the client and has a major influence on his next behavior. A bad experience represents a step towards loosing a client and for

expressing of negative opinions. A good experience will lead most likely to repeated transactions, to the promotion of the organization and to a greater loyalty from the part of the client.

The clients are prepared to recommend an organization immediately after an important interaction. The more loyal the client is, the easier it is, in such moments, to encourage him to talk about his experience and organization to others. Consequently the organizations that create emotional loyalty have an important advantage from the other organizations interested only in the rational satisfaction of the client.

Managing the client's experience can offer four important benefits:

- 1. better references made by opinion leader or other important persons;
- 2. improving the client's loyalty;
- 3. increasing the differences with regard to the competition;
- 4. improving the retention percentage.

Conclusions

Right now the management of the client's experience is the check point of many projects that are part of the top organizations of the world, and it is considered as the "peak of the client's satisfaction". The total client's experience management is based on how the organizations manage all the factors that contribute to the client's experience with regard to the: organization's products, the associated services, the promoting campaigns and with regard to the brand name under which they all sold. This is an integrative perspective that crosses the boundaries between marketing, sales, services and the different distribution and communication channels. Focusing on the clients experience implies a strong attention to be given to the client itself.

In light of the new and rapid developments of the Internet and of the Internet based strategies, the organizations have to act quickly, and with the help of the new communication technologies and the integrated systems that are at their disposal, in order to reach a bigger number of clients from all over the worlds and fulfill their needs and desires and in the same time enrich and improve their experiences.

It is estimated that the internet today has over 5 billion online pages. In this sea of internet, users search for products or services they require, compare them, then they choose. Worldwide, online advertising expenditure will increase, according to specialized studies, particularly with the attraction on the web of key traditional advertisers. They come mostly from the car industry, IT&C, tourism, financial services industry and healthcare. Experts estimate that the value of Internet advertising expenditure will grow in Romania from 15.06 million USD (2008), to 21.2 million USD (2009).

Worldwide, the online advertising market has exceeded the value of 65.2 billion USD and it's predicted that by 2011 the annual increase of investments made in online advertising will be of 15-20%. In the same year, the amount spent on promotion, will be somewhere around 106.6 billion USD.

Keywords: online advertising, website strategy, broadband services, internet campaign

1. Online advertising – developments

Online or interactive advertising is a method that uses online media, respectively Web pages, newsletters, e-mails, in order to send a message to the targeted audience, in the form of banners, contextual advertising, ads in search engines etc.

The following are among the most commonly used forms of advertising online:

- Advertising in search engines 50% of last year's expenses with online advertising. Here we talk about Search Engine Optimization (SEO) and pay per click ads (PPC). The biggest players in this field are: Google, Yahoo and MSN. There are other smaller engines, but usually, for best results, use the big companies.
- Advertising on websites 21% out of the total cost of online advertising. Advertising through banners or contextual ads is still quite widespread. One can rent some space on a website, the payment being usually negotiated for a certain amount for click per M(thousand) (CPM). Taking into account the success of search engine optimization and pay per click publicity, CPM is considered a bit risky, although in the case of the websites with quality visitors (possible clients) you can obtain good results.
- Online ads 17% out of the cost of online advertising last year, summing up 4 billion USD; the online ads are very efficient, especially considering that they represent one third of the search engines' budget.
- Client generating/initiatives over 1.4billion USD, this section has 6% of online advertising. For the advertiser this model is the perfect representation of client targeting on the internet: the advertiser pays only when a client that buys is sent to his website
- Media ads with a number of one billion, it covers 4% of the online advertising market. Media ads refer to the integration of the ads in videos, this aspect helping to increase the conversions. It's no surprise Google bought YouTube for 1.5billion USD.
- Email although it covers only 2% of the online advertising, should be noted that 500 million USD is still a large number.

Although online advertising offers a series of advantages (better targeting, large volume of information, the possibility of interacting with the potential client etc), the online environment still remains one of the advertising segments that doesn't attract major investments, due to the fact that the investors aren't completely certain of it. Even so, there is an increase in the investments made in this extremely dynamic environment

In 2008, net investments in online advertising were 2.6% out of the total of the investments, which is about 16 million euro.³⁶³

The biggest percentage increase of advertising in 2008 was the Internet, with an increase of over 50%, followed by television, with only 24%. The total amount is also confirmed by the official study conducted by The Interactive Advertising Bureau Romania (IAB), that shows that in 2007 the investments in online advertising were of 42.6 million lei, and in the first semester of 2008 33.9 million lei.

363 Ardelean A., Double click on online advertising, Biz Magazine, No. 177, 18 - 31 March 2009, pg 27

This evolution is also determined by an escalating degree of internet use in all the world. The conclusions of the Eurostat Report say that 50% of the inhabitants and 9 out of 10 companies used the Internet in the first semester of last year in The EU (including Romania and Bulgaria). So, 47% of the Europeans with the age between 16 and 74 used the Internet in the first semester last year, out of which there were more men than women and more young people than older ones, the record being registered in the category of youngsters with the age from 16 to 24 - 75%. And for companies: in the beginning of 2008, 89% of the European companies were using the Internet, more than half of them having broadband connection.

Together with the usage percentage, the Eurostat report also watched the frequency of the broadband connections and e-commerce and e-government solutions. In the first semester of 2008, the highest degree of usage in The EU was registered in Sweden (82%), Denmark (76%) and Finland (70%), while the lowest percentage was registered in Greece (20%), Hungary (28%), Lithuania, Poland and Portugal (29%, each).

On average, in the 27 countries members of The EU, men used the internet more often (51%), women (43%), but in some countries, like Estonia, Letonia, Lithuania or Finland, the percentage was almost the same.

At the beginning of 2008, most of the active companies on the Internet were registered in Denmark and Finland (both with 97%), in Belgium and Sweden (with 96%), and the least attracted to Internet's utility were Portugal (77%), Hungary (78%), Lithuania (81%) or Cyprus (82%).

Ensuring a much faster connection, and possibilities to use the Internet definitely superior to other Internet solutions, broadband services have won numerous supporters in the EU. Out of all the EU members, a larger number of households with broadband connection were registered Denmark (36%), Finland (21%) and Estonia (20%). The same type of connection used 53% of the companies in The EU, most of which are in Denmark (80%), Sweden (75%) and Spain (72%).

The most recent IAB study concerning the optimization of the mix media has proven how a higher percentage allocation from the marketing budget for online advertising determines an increased efficiency of the campaign. Among the companies that participated in the previous campaigns were Unilever, McDonalds and Colgate-Palmolive. Ford announced that it will take part in one of the next stages.

The main conclusion of the studies conducted so far was that, ideally, every advertiser should allocate 10% of the company's budget to the Internet.

Referring to Romania, the information quality of the information and services has convinced the Romanians that the Internet deserves attention: the number of users has grown and the advertisers turn their attention more and more to the online media.

Romania has one of the highest increasing rates of internet usage in the Central and Eastern Europe comparative to the Western market, a study of the Romanian internet market, conducted by Roland Berger Strategy Consultants shows.

The Internet is mainly used by the Romanians for the email (49%), chat (46%) and information finding (37%). Most users access the internet from public spaces (50%), from the office (25%) or/and from their home (20%). The study, based on a survey conducted among internet users, also shows that the users are mostly young people between 18 and 29 and adults between 30 and 39.

The internet sector is characterized, according to the analysis completed by Roland Berger, through the increase in the number of users and the number of registered domains, the improvement of the quality of the contents, of the information and services offered by the Romanian websites, the increase of the volume and the sophistication of the online advertising, together with a growing interest of the advertisers for the Internet medium

The development of the access to the internet through cable and mobile internet, the appearance of additional services with added value at the main ISP's (online protection of emails, Customer Centers, VoIP), the definition of a group of important players with business activities online, that develop website networks in order to attract publicity or to offer online applications and services, like recruitment, e-markets, etc., elaboration and adoption of the legislation in ITC domain have also contributed to the increase of users.

The number of users is in continuous growth and the quality of the content is enriched, so that the online advertising is also going to expand, the study shows. The advertisers opt for the online advertising due to the advantages that it presents:

- the targeted audience has attractive attributes: it's young, dynamic, modern.
- an online advertising campaign can reach the audience in the working hours, when it's not targeted by any other media channel, has relatively low costs compared to other media channels, can be monitored shortly after its launch, implies a direct and personalized communication with the consumer;
- the advertisers can access precise segments of consumers, due to the existence of specialized websites.

364 Eurostat - Report concerning the use of the Internet in the EU, www.adspace.ro / inside - news & articles

2. Online advertising – trends

The spectacular growth each year of online advertising in European countries, including Romania, had, as an effect, a dynamic of the advertisers that invested in this media channel.

This phenomenon is a sign of the beginning of market maturing and, at the same time, it's a sign of recognition of internet value and the modern mix media in Romania, possible effects that will be induced in short and medium terms as a result of this phenomenon, are as follows:

- increase in prices in the news/business segment. This effect is immediate and natural, over the internet manifesting itself pretty strikingly as an expression of a balance between demand and offer, and shouldn't be regarded as a speculative game, but as a market evolution and a value recognition and reach of audiences by the Romanian websites.
- orientation of the advertisers towards other website categories. The appearance of quality specialized websites will make the advertisers concentrate a part of the online budgets towards less crowded websites where their brands would be more visible and where the affinity for their products can overcome the affinity registered on general websites
- orientation of the advertisers towards "beyond the banner" solutions. They bring in more feedback than banner advertising, creating an association with certain brands and online communities, avoiding the competition on that website and having a cost per person lower than the banners, where the transmission is harder to control
- the appearance of new business and news websites. This phenomenon will be doubled by the growth and development of already existing websites.

Concerning the biggest investors in online advertising, today they come from the telecommunications field, banking and the auto industry.

But an online advertising campaign can have very specific objectives. With its help, one can obtain notoriety (for a brand, product, offer, service, etc.), customer relationship (for example, an online free service develops a long term relationship with the targeted audience), sales leads (the user can be brought to the point of offline or even online sale if we speak of an online shop), direct data about users can be collected and generated content about the consumer can be obtained.

Concerning the efficiency of the website strategy to which the user has been sent by clicking on the banner, one can make several conversions, depending on the objectives. This way, one can see how many users continue browsing the site after clicking on the banner versus how many close it immediately, how many of those who got on the website by clicking on the banner use the interaction options on the website (detail information, send to a friend, print information, show online content, sign up for an online service), how many decide to buy (contact online a seller/dealer or buy online). And, in fact, these are the details that matter. ³⁶⁵

Even if the internet doesn't have as many measurement instruments as television, radio or written press, there are measurement instruments of efficiency for the campaigns conducted on the internet. In many cases, the measurement of the results stops only on counting the clicks on banners. Very few look at what happens to the users after they click the banner. If they did, they could know if the banner was placed in a good spot, if they sent a good message, if the site sustains or not their campaign.

Advantages of online advertising:

For those who know how to use the internet, this communication presents unthinkable advantages:

- Of them, the interactivity is the most evident, the internet being the only channel that permits this way of communicating.
- The cost of an internet campaign is much lower than in the case of other means of advertising. The internet is, mainly, a complementary media vector, that adds value to the classically conducted media campaigns. But we shouldn't forget that in order to have a single full-page insertion in three or four women's magazines in a media plan (Unica, Avantaje, Tabu, etc), one has to pay at least 10-15,000 euro, but in order to target the same number of women, the same targeted audience on a website visited mainly by women, the cost is about 50% lower for an online monthly campaign.
- Also, these communication ways offer extensive creative possibilities, measurement of exposure, control of targeting, high affinity for young and modern targets, extremely low production and media costs, compared to classic media, possibility to test the reaction of visitors to different messages or executions, in different hours of the day, in different contact points.
- On the other hand, the companies that advertise have the possibility to get instant feedback, and based on that, the marketing people can build interesting projects. Plus the way of targeting is fast and an online advertising campaign can reach its audience during work hours, an option that other media channels don't have. Prime time on the internet is between 9am and 6pm, in this period, online represents the best way of reaching a few millions of

_

educated users, with above average income, that know how to use a PC, that have a mobile phone, etc. Also, from our studies we see that online users consume less and less the traditional media.

- But maybe the most important is that when in front of the computer and browsing the Internet, the consumer has a different behavior. His attention level is high, is distributed differently, because he is there with a certain well-defined purpose.

For 2009, specialists are more reserved in estimations concerning the value of online advertising, due to the financial crisis, estimating an increase of only 10-15%.

ART COLLECTIONS - BETWEEN PASSION AND INVESTMENT

Dutu Mihaela

Constantin Brâncoveanu University of Pitești Faculty of Management Marketing in Economic Affairs of Rm. Vâlcea Calea lui Traian Street, no. 171, bl. 7, sc. F, ap. 11, Rm. Valcea, Jud. Valcea elamica67@yahoo.com 0250/741153

This paper reveals us a few aspects about the role of art objects in our society. They are having a distinct world of creation, appreciation and valorization, constituted by artists, art traders and collectors.

So, the art collections are constituted by art lovers driven by several motivations: the need of ownership, of finding an identity, or of categorization. All of these motivations are integrated also by economic reasons of investments. Art investments are proved to be profitable for a long time because their value was always increasing. On the other hand, we may add also that art investments are not requiring maintenance costs and neither the necessity of tax payments.

Keywords: art objects, art collectors, investments, artistic and commercial value.

JEL Classification: Z1 – Cultural Economics; Economic Sociology; Economic Anthropology

In nowadays the people must fight an unique provocation, consisting in their capacity of distinguishing between the common goods, evaluated by their utility and practical character, and the art objects which cannot be reproduced, known the fact that the repeatability is not the actual future of beauty. So, it is more and more evident that any object wins or loses its own "beauty" 66 not by the criteria of what it is, and by the social coordinates which determine the way of being and, obviously by its perception.

Analyzing the immaterial production of the cultural field, in which there are being created the art objects, the ration of its existence becomes more and more complex derived from it attributed roles³⁶⁷: stimulate and nourish the sensibility, suggesting a certain vision of the human being in the universe; the value, the using value and the price of art objects are specific particularities given by the specific nature of the satisfied needs; they are having only one utilitarian finality, by stimulating the human sensibility, they are creating an artistically educated public, capable to enjoy all that is beautiful. So, it results that the attraction face art objects proves to be more lasting that any other human feeling by its supreme quality of not disappointing. Only that, it must be cultivated, conserved because as the exponent of French romanticism Delacroix says: "[...] the eyes of the most are either insensible or false, they are seeing the things in a bilateral way and, from all the miracles, they are not surprising anything." ³⁶⁸. In the meantime, no art objects are indifferent to each other; they may have their own sympathies and antipathies, they may be cheerful or sad, they are talking or keeping silent according to the place and the light where they are situated. So, our relationship with the art objects is by an intense intimacy, like anything, they are exactly knowing what we are thinking; they are our life, they are heaving heart, personality and their own destiny.

On the other hand, the art objects are created, contemplated and bought in a special world – artists, collectors, evaluators and art traders. It comes from the fact that the authentic art lover re-lives the artist's emotions, the last sending to the first genuis of his creation, like an unfinished source of esthetical enjoining. The art lover is his own artist, connected to the art opera creator by his receptivity, the intensity of artistic emotion, spontaneity and the full liberty of contemplation, by the pasiion for all what is beautiful which subordonate all the other sentiments. Relevant remains Victor Eftimiu's confession to one of his guests: "I can't accept having coffe from a Sevres cup, without impressing you, offering you the jam on an English tray from the XVIIth century, in a Delft cup and the brandy in a glass, a rarity - of Boemia. Your admiring face of their beauty is my reword and, while you are impressed by their charm, I'm re-living myself the estetichal extasis". 369

So, it is more and more evident that the beauty lovers who have converted into art collectors are representing a specific chategory of consummers, like those fine tasters of the world's miracles. They are having their own instinct which permits them to see over the image because, the art objects, to some of us are showing more, and to others less. So, it becomes evident a feeling of artistical value present at some persons, like the feeling of the taste for a wine taster or that of smelling for a parfum's lover, so that, the authenticity of art objects is not evaluated only by the agreable criterium. We must also discover the distinction between the emotion lived in an exhibition and the enjoyment offered by the permanent owning of it where, it is in our house, and it can be admired daily. So, Al. Vlahuta's opinion about the influence exercited by his own collections is relevant ,,[...] What, do you think that I

am the master in my house? No, they are the masters [...]. I am neglected." ³⁷⁰ By concluding, the reasons which determine the beauty lovers to be transformed into art collectors are the following ³⁷¹

- a. needing of owning, natural for every human being, by which, over the centuries, the art was confirmed as a sure investment, that derives from the dominating passion, driven to supreme sacrifice, for the art of beauty, being seen like a step which, at the most collectors, lasts a few years; than, the need of having unicate or exception operas appears;
- b. the personal need of a spontaneous activity, derived from the definition of our own identity or from the urge of evasion into another period and space; after some psychologists, the collector seems to be an isolated human being separated in his passion from the others who, in his relationship with the family and friends, the first thing transmitted, is that he's owner of big wealth. In these situations only, the descendents in a few cases have reached or perpetuated the collections, from the simple reason that the passion can't be inherited;
- c. the enthusiasm and the necessity of having an order in a chaos of objects after some criteria which, after many years, are becoming valuable criteria; here from comes a sensibility which cannot be expressed by the people because, the artistical sense is borned. This situation is described by Serban Cioculescu as follow: "[...] you may be born receptive or dry, as you are born with brown or blue eyes".

From what has been presented, we may conclude that art may notably be assumed like a passion but also like an investment, by distinguishing between the authentic collectors and those who are seeing art as a profitable business. Relevant is also the opinion of our artist Nicolae Grigorescu whi was an eye witness when Millet³⁷² tried to offer to a butcher eleven paintings for paying a debt and was refused, saying that he can't by cattles with paintings; the same person was in Barbizon after a few years when, after Millet died, his paintings were sold. In the same time, the butcher was seen crying because he didn't know to evaluate the pieces of painted canvas, paid under his eyes by many thousand more expensively. It is known, the authentic art has always been traded, being one of the most profitable investments because it's a luxury product and we must know how to invest in it. There are a lot of collectors who are talking about paintings like about cars or horses: for example, "I have one "Petrascu" like they'd tell I have a Mercedes or a Toyota" for the simple reason that, in their conception, wealth is something which must be stored.

The art investor, like any other investor, looks to find the alternative by which the excessive and borrowed resources to be introduced in the economic flux for creating a new excess. The modern market economies are exploring the opportunities of satisfying the needs in an investment style: we are buying the house in an area which may multiply the value, we are having productive hobbies (art collections), we are educating so that our work may be evaluated. The investments are the main premises of economical growth so that, by creating an "Investment culture", people are learning to distinguish between an investment profitable for one person but unprofitable for another.

So, in every society, the savings and the investments are having a very important role at all the levels (macroeconomic, economical agents and individuals). If we are considering the savings, these are offering the best assurance of money, but also the possibility of their multiplication in time. This may be transformed into an investment. Promoting the savings and the investments strategies means creating an optimum report between the capitalization and the risk, report adapted at everyone's expectations. By comparing with treasure receipts or with the banking accounts, from which the money may be quickly recovered, the situation is not the same with the art objects; the art placements don't have an increased liquidity, so that, these investments are made either for a long time, or for a few years, at least. There are many situations in which the paintings of some artists multiplied their value ten times in a few years, but those of the others only covered the rate of inflation, resulting so the unequal distribution of risks. On the other hand, the advantages of art investments are determined by the fact that they may be placed on a not very well institutionalized market, that they are not generating costs of keeping in form and don't require tax payments, like the situation of other investments. In this way, the economical analysis of the art investments put the problem of the proportionality relationship between the artistic value of an art work ant it's price. For a correct understanding, we must establish the distinction between value and price because, on the art market there are not acting exclusively the economic laws by which there are measured the material costs, the quantity of labor, the report between supply and demand.

In our country, the prices of art workings are still small enough and, presently, only 4% from Romanians are ready for art investments³⁷⁴. In 2008, the prices had an ascendant trend till July, and beginning with August – September, the art market begun to go down for the first time after 1990³⁷⁵.

³⁷⁴ www.tudor-art.com.

³⁷⁵ Economical Journal.ro, December 3rd 2008

The middle selling quotations for art workings and for antique objects at the auctions from all over the world decreased with around 14,5%, as compared to January 2008. Similar tendencies were registered at the province auctions, but also at the Christie's and Sotheby's. 2009 is estimated to be a year of decreasing on all the art markets. With all the tides, the art market has still big opportunities, and who has the intuition and the courage to invest nowadays in contemporary art, despite of the fact that they will have a spiritual wine, but in a few years they will have bigger efficiency than that from stock exchange.

We may appreciate that the art objects and their market are constituted like a gravitation point which attracts the consumers categories with another perception about the environment. They are knowing to establish the real interdependencies between the esthetical and the utilitarian categories. It becomes more and more evident the trend of linking the economical world and the cultural one. So, while in the last century, the culture exercised its role only at the outskirts part of society, presently, in became an essential premise of development, being situated in the middle of events. I think the modern society should measure its progress not only in the material goods, but also by its capacity of growing the access choices to the spiritual goods, like genuine spots of culture and civilization. This situation is commented by Mihail Manoilescu³⁷⁶: "If the technical perfections will make the material comfort life easier, the art gives to this world a spiritual connotation. The progress of material, its humanization, are only the result of a certain serenity, which can be obtained only by contemplation and artistic environment".

CONTRADICTORY EVOLUTIONS OF MARKET ART IN NOWADAYS

Duțu Mihaela

Constantin Brâncoveanu University of Pitești Faculty of Management Marketing in Economic Affairs of Rm. Vâlcea Calea lui Traian Street, no. 171, bl. 7, sc. F, ap. 11, Rm. Valcea, Jud. Valcea elamica67@yahoo.com 0250/741153

Gangone Andreea-Daniela

Constantin Brâncoveanu University of Pitești Faculty of Management Marketing in Economic Affairs of Pitești Dorobanților Street, no. 14, bl. 51, sc. A, et. 3, ap. 15, Pitești, Argeș andreeagangone@yahoo.com 0741/778317

On this paper, we interred to present a few aspects about the main characteristics of art market from our country.

So, first of all, we are showing the infrastructure of this market, consisted in: elements of supply (consignations, galleries, traders, artists) and that of demand (collector of art objects). We are also insisting above the aspects of legislation and of

In nowadays, in the context of joining the European Union, the globalization and the financial crisis also, this market is suffering from structural contradictions, which culminates with notable differences in evaluation and in finding the real rapport between the artistic and the economic value.

Keywords: art market, art objects, consignations, galleries, traders of art, collectors, artists, quotations, artistic and commercial value.

JEL Classification: Z1 – Cultural Economics; Economic Sociology; Economic Anthropology

By its long history, the institution of market has proved to be the essential mechanism of regulation and intermediation of transactions between the economical actors, like sellers (the suppliers) and the buvers (the exponents of demand). Using like a criteria of classifying the objects of transactions, the market is presented in a large variety of forms, and the interest field of this paper is constituted by the objects of art market.

But, the objects traded on this market are different from the other goods which, by their unique character, are subjected to particular transactions. Being created, admired and valorized in our consumption society, they are depending on social coordinates, which determine their perception. Despite this fact, thanks to their specific characteristics, they can't be considered consumption goods, their existence being justified by the fact that they are considered the best synthesis between spirit and matter and, as is already known, a market economy, by its competitive mechanism, harmonizes all the created and the distributed values. In this context, it's relevant and welcome the affirmation which says that: "[...] In a society without luxury and missing by the economic activities which generate it, the poor people will be even poorer."³⁷

Despite its spiritual connotation, studied from an economical point of view, the art market is constituted like an institution which is functioning by its own rules, being equipped with an infrastructure managed by the interdependence and partnership of its principal actors.

Analyzing our country's situation in the field, we may say that the legislation of art market suffered from multiple changes along the times. For example, by adoption the no. 63 Law/1974 about the art goods, the collectors were put under the state protection, being in a continuous menace of the confiscation hazard. After 1985, the art passion become bigger and bigger among the intellectuals, especially among the doctors, the transaction intermediaries being the descendents whose families from the ancient times had acceded at this ostracized cast.

The political regime changes created the premises adopting the no. 90/February 5'th 1990 Draft by C.F.S.W. by which the no. 63/1974 law about the protection of national cultural patrimony was annulated. This created the conditions for the liberalization of the art trade, for creating its specialized institutions, so that, the period between 1990 – 1993 can be characterized by the appearance of lots of private stores which, first of all, functioned as consignations.

The consignations are having a long tradition in our country. The well known collector Krikor H. Zambaccian³⁷⁸ is the man who opened the first store of the kind after the second world war on Calea Victoriei (Romarta), called "The Romanian Art". In a consignation, the owner of a painting comes and demands a level of price, for which it is perceived with an errand between 10-33%.

After 1990, there were also specialized firms exclusively on art objects auctions, the best known being the auctions houses ALIS and MONAVISA. The most reliable clients of those are art traders, but also the big companies interested in their offices' decoration. Abroad, there are practiced also the "dumb" auctions, where every written supply is put in the ballot and the owner of the biggest price is becoming the owner of the art object. There are also less ostentatious ways they used to be practiced in our country too. In conformity with the legislation, the auctions are registering only the sellers, but the buyers are anonymous.

³⁷⁷ Bernier Georges: "Art and trade", Meridian's Publishing House, Bucharest, 1979, page 80.

^{378 &}quot;The evasion increases the consumption and investments", The Capital, April 7'th 2005.

The art galleries are often institutions with the role of intermediating the transactions between the collectors and the artists, their owners are buying art objects for reselling them at higher prices. These are promoting their own strategies in discovering the new talents or they are competing for attiring consecrated artists. The gallery owners, but also the art traders, gave the possibility to many artists to be known by the art amateurs and collectors. But talking about the workings of the dead artists, the gallery owners are responsible by promoting the invitations.

We must not neglect the social partnership either, to much present on the art market, which is generated by the fact that the multinationals understood to assume the values from the countries where they are functioning. So, the dialogue between the private investors and the state institutions seems to be more and more profitable. In this way, the partnership between B.R.D. and The National Art Museum is relevant. It is also important to mention the activity of the Romania's National Bank, as the most important institution which collected art objects before 1920 and the period between the two world wars. But, in 1917, all its valuables were sent away, with the national treasure, to Moscow.

So, it is necessary to build an initiative which means to wise, to create, to have an intelligent strategy for passing the opposition between the capital, money, utility, meritocracy, on one hand, and aristocracy, culture, art and gratuity, on the other hand.

The consumers of cultural goods, like exponents of the demand on the art market, are forming a larger circle, being represented by the readers of the books, by the theaters spectators, the art exhibitions visitors. So, they are those who need the cultural values, having the capacity of assimilation and perception, so that, without them there is no culture. After all, without economical goods consumers, there is no economical life. They are not just considered specialists as most of them are practicing other jobs but, after as Mihail Manoilescu told: "In profession, the dilettantism may be catastrophic, but out of it, it may be one of the few good things of the society" These passive "dilettantes" are having the role of filling the spectacles, concerts, conferences, exhibition rooms and of creating the opportune medium for the promotion of art workings.

The art collectors are having a definite role among the cultural goods consumers, they are really wanting to own and to admire the art objects in their private medium. In terms of preferences, it's obvious that the most wanted art objects are the canvas oil paintings, followed by the cardboard oil paintings. The sculptures are situated at the end of the preferences of art collectors from Romania, but also from abroad. Among the authentic art lovers, they are consisting in a restricted category, because, a lot of them are having low and middle incomes, and the art objects they can afford are at their power of buying. On the other hand, the genuine collectors are very restrictive, they must cultivate an artistic taste, they must have important wealth and they must benefit by substantial sources of acquisition. In many times, the disappearance of an important collector is always an event with important consequences for a very restrictive market. But there are a lot of survivors and o lot of rich people ready to invest on this market. We must not neglect the notable collectors either, but with middle income, who prefer to by relevant operas from middle artists, despite the minor operas of the consecrated artists. We must also add the buyers who are not interested in the artistic value of the opera, but they are buying them at high prices (thousand of E) liking investing at the stock exchange for coffee, oil etc. We may conclude that the big handicap of the actual collectors is consisting in their incertitude in finding the values of the actual art, determined by the absence of veritable references. This phenomenon is generated by the fact that the economical value of an art working is not influenced by precise criteria, not even in situations where references points assumed by everybody are evident. In spite of this situation, there are some evaluation criteria, but those are not put in practice with equal choices in all

the times and in all the situations. So, the most significant ones are consisting in: the authenticity criteria, accounted in the situation of a dead artist; the period when the opera was created (in "salad" days or at maturity); the preferences, the trends; the notoriety of the artist. The relativity of these situations is given by the paradoxical circumstances which may be seen everywhere. For example, it's possible that paintings of the same artist or the operas of the same sculptor to present big fluctuations of prices. In the meantime, there were a lot of situations in which the workings of some less notable artists than those recognized by all the art critics and historians are more representative and have bigger market prices. So, we must eliminate the prejudice that a painting of a notable artist (for example, Nicolae Grigorescu or Ion Andreescu) must get the highest prices, simply because they are the classics of Romanian paintings from the same period (G. D. Mirea, Sava Henţia) to reach prices situated above the prices of the artists named before. Analyzing the evolution of this situation, we cam appreciate as relevant the next examples: a Tonitza's paper which, in 2004 was sold at 5.000 E, in 2007 it was evaluated between 15.000-30.000 E³⁸⁰; the Schweitzer Cumpăna's paintings which, between 1995-1998 were evaluated between 300-1700 \$, in 2005 that were situated between 3000-7000 E³⁸¹.

But, the Romanian art market is still growing, though it is slightly undervalued (hasn't been sold yet the object evaluated at 1 million E). The situation is still the same for the contemporary art, obviously, from the province

^{381 &}quot;The Capital", November 1st 2005

artists, and not only because they are less promoted than those from Bucharest, but also for the reason that a little number of businessmen are likely to invest their money into the operas of some unknown artists.

By reporting it to the international situation, it's difficult to accept and to understand why an opera of an irrelevant post-impressionist artist is evaluated, at an occidental auction, with a price which cannot be touched by a masterpiece of Andreescu. Andreescu's paintings, sold in our country with ten thousand Euros, in any case won't reach the same values of Parisian, Italian and German markets. The reason is that the operas of our classics and moderns could travel abroad only on the occasion of officious cultural parties and, in this situation, the Romanian creations are generally ignored. We must accept the idea that, everywhere the artist is living, he belongs to the whole world, and the tops of an international confirmation may be reached only by promoting the national specific values. The artist helps nation to upon the map of the world. This is his big mission because, when he raises the public interest, that is not only the interest for art, but also for his nation.

Now, after joining the European Union, the globalization also, means the access to the cultural values, their free circulation and participation to the stock exchange of art operas. We must also accept that nobody can be forced to accept the Romanian artists hierarchies; from abroad and with value scales practiced for a long time on the market, situation seems quite different. And this may be proven by the fact that some national collectors are buying from obscure stores from France Pallady's paintings with only 1000-2000 E, while in Bucharest, Pallady has a big notoriety among the big investors (for example, at the transaction from auction ALIS from March 18th 2007, a painting of that artist was evaluated at 75.758 E). The example of Dimitrie Stirbei (1901-1985)³⁸², also relevant, his paintings were bought, in 2003, with 100-200 E, while in Germany these are having fixed and attractive prices situated at the levels of a few thousand E, the artist also has his place in all the art dictionaries.

A big art trader from New York claimed that, at a moment, veritable paintings are everywhere, but the market makes them to be "big". But, on the art market, many people assimilate value like the opportunity of buying cheap and then, of collecting and reselling more expensively.

Which is the meaning of "quotation"? In our country, we may talk about it later, when in art will be realized an index with the references of the sales from Romania and abroad. In this moment, only the selling-buying prices are being known, and not the real ones. This is because, for eluding the big taxes, the gallery owners are looking for finding the possibility of not paying for all the sales. But, we may have information about what a "good price" or a "under evaluation" means. By joining the international art evaluation system, the art operas will be realized by creating of a national market, and a national network of galleries, of houses of auctions, periodicals about the sales, with all the afferent effects.

In any country from Europe is not possible to buy from galleries or auctions, operas created by artists with notoriety on international markets of notoriety, but well educated and with a rich biography, in epoch frames and at prices situated only at 100-300 E. Talking about this aspect, an art trader accounted that an 1\$/year "the rent location" for the paintings deposited for a century, generate the situation that, when we are buying the opera, we are paying the location and we are buying the opera free, By distinguishing the European art markets, where there are also evaluated the isolated realizations of middle class artists, the Romanian society seems to penalize the big realizations of some marginal artists. It is known, in literature, a writer remains as notoriety and s cultural point of reference with one book. We can suppose that a nation like ours, with only a century and a half easel painting won't be so exigent with the "mid-class" exponents of its culture.

Analyzing our present and future, one thing is sure: in the last 16 years of auctions houses activity from Romania, the quotations of Romanian artists have had an ascendant trend. A painting is penetrating into the auction houses after 10-12 years. But, in 2008, on the background of financial crisis, the ascendant estimations from 2007 couldn't be confirmed. The same trend was registered on international markets. The decreasing power of buying of wealthy people form Russia, Eastern Europe, Middle Orient has stopped the economic period of boom from the art objects market. So, the art objects from auctions houses Christie and Sotheby's were sold only 1/3 from the predicted prices, and the most of them couldn't be sold. As a conclusion, 2008 may be considered year of reflections on the art market.

Accelerated adoption in the consumer and business markets of Internet, of wireless network, and other new technologies specific to "new economy", is a trend that can not be ignored at the organizational level. Taking into account the fluctuations in the financial markets, the difficulties reported by companies on the business and consumer markets, trying to develop new business models, and the "digital divide", through which significant differences in access new technologies appear among different segments of the population may be noted as long-term prospects of the new type of economy.

Keywords: new economy, new technologies, marketing strategies, metamarket.

JEL M31

1. Introduction

Technological development characteristic of the XXI century has had an overwhelming impact on lifestyle, consumption patterns and economic well-being of individuals worldwide. The effects of these unprecedented technological developments come to expand human horizons to the new century, through opportunities in all areas of activity.

The impact of these new technologies on global markets, European and national can be quantified in at least three aspects, namely:

- the emergence of new industries and new outlets;
- the disappearance or restructuring existing industries and related markets, the emergence of cable television, which led to a rapid fall of radio and cinema, which required considerable efforts to return, and the emergence of computers, which replaced typewriters quickly, causing bankruptcy of the profile producers;
- the emerging and development of markets and industries not related to new technology. New electronics and appliances generate an increase in leisure time, encouraging and developing those sectors that do not benefit from the innovation processes.

Internet - a network of computers, which was created to facilitate communication between scientists worldwide - has important ramifications for marketing. A study realized over 10 years ago by IBIS Business Information in U.S., done at a sample of 500 private companies, revealed that 75% of them have a website to promote their products on the Internet. With Internet, this company can offer its target consumers, benefiting from a combination of advertising, information and entertainment. Currently, although the majority of organizations have integrated the Internet into the palette of tools for marketing, however, there is some debate around some critical aspects of Internet as marketing media.

2. "New economy" and marketing

Last decades have brought in business literature a series of new concepts, among them being the "new economy". The concept refers to those areas of activity that fuels the development or significant participating in e-commerce and the Internet, in the development of hardware and software and also in the development of matrix structures specific to telecommunications services. High-caliber players and creators of this "new economy" are so-called dot.com companies: Amazon.com, Web portals such as Yahoo and Google, companies such as Cisco and 3COM, producers of Mozzila and Microsoft software, telecommunications companies, communications networks that allow transmission of data on different types of media (on the wire, wireless, satellite).

Accelerated adoption in the consumer and business markets of Internet, of wireless network, and other new technologies specific to "new economy", is a trend that can not be ignored at the organizational level. Taking into account the fluctuations in the financial markets, the difficulties reported by companies on the business and consumer markets, trying to develop new business models, and the "digital divide", through which significant differences in access new technologies appear among different segments of the population may be noted that long-term prospects of the new type of economy are real.

Examination results of such new realities should be materialized, at least for the specialists in marketing, in a high degree of awareness of the need to develop new strategies able to optimize organizational performance in this new context. Moreover, marketers must identify those environment mutations and identify to what extent they constitute threats or opportunities for them and for their own customers.

So-called "new economy" makes its presence felt through a series of phenomena, which may include: information syndication, increased ability to customize and adapt the supply, distribution, restructuring, global access, uninterrupted access, the possibility of instant delivery.

Information syndication involves the sale of goods, usually in the same category, in digital format to many clients, which then combines that with information from other sources and distribute it further. Although in Internet marketing is rarely used the concept of syndication, this phenomenon is the basis of many e-commerce business models. Operation principle of such a mechanism is relatively simple. Companies collect articles in electronic format, enrich them, adding the new information content, and then distribute them further. The information syndication is important from the perspective of at least two reasons. On the one hand, it concentrates on information goods, and less on the tangible goods, these goods being likely to be distributed with very low costs. Secondly, the process of syndication involves digitization and automation, which allow further development of digital networks business, much easier to implement compared with those traditional.

Syndication via the Internet, mobile phones or other devices, creates opportunities for marketing. The deficit is replaced with an abundance of data information, information that can be infinitely replicated and combined and recombined so that it can be distributed anywhere, at the same time and with a permanent availability. In this context, companies should identify and handle the most important niche in such syndicated networks, because these give the ability to maximize the number of contacts and relationships with other companies, and to conduct relations with existing and potential customers. Thus, implementation of web technology is the greatest advantage in dealing with the firm's clients.

The possibility for customization and adaptation of the offer is based also on technologies related to Internet use. "Collaborative filtering" is such a process, based on the comparisons made between different purchases from customers and using these to anticipate future behavior. This process has a great impact on how can be identified and targeted different market segments. The most effective sites for e-business, both through the traffic generated, and through the sales volume reached build relations based on a coherent process of customization as integrated concept of sale. Customers who access, several times, the site become the target of these personalized offers. Amazon.com and Dell are two of the companies that apply this technique, obtaining exceptional results. Much of the success of Amazon is due to the recommendations, which, depending on the customer profile and his previous acquisitions, involve proposing new products in the same range or complementary products. Another key element of Amazon success lies in submitting to buyer the items purchased by people with similar interests, thus prompting the addition of new products in the shopping cart and increase the average value of the transaction.

The Internet offers companies the opportunity to market products directly to consumers, bypassing classics distribution channels. This bears the name of restructuring of the distribution. Such a decision must be correlated to identifying the structures that carry out the functions which normally would be carried out by members of the traditional distribution channel. Assessing the efficiency and effectiveness of these activities constitute the criteria of choice for use or non-use of intermediaries in efforts to cover demand.

Internet and other modern communication technologies have not been associated, usually, with additional costs incurred in obtaining information, the sale of digital goods or services, or in creating a global availability and in assuring a instant delivery. Moreover, mobile telephony and GPS technologies generate similar benefits in the case of the products adapted to the reality of the existence of mobile media.

Taking account of those specified in previous lines, it can be said that many companies can benefit from one or more of the new technology. In this respect, the availability of these technologies may be the marketing opportunity for those who employ them. At the same time, however, such technologies may raise some ethical issues and even of an operational nature. Failure to protect the content of the product or even the product itself, barriers, almost nonexistent, in accessing the technology and lack of privacy are just some of the problems arising from the use of new technologies.

Marketing can protect, however, its interests through two actions. One relates to the patent and copyright, and the second bears the name of "versioning". This last possibility to protect the interests of marketers is based on the assumption that the value of a product varies from one consumer to another and the products can be adapted to be relevant to some consumers and irrelevant for others. The process of "versioning" can be developed on several dimensions: time, comfort, complexity, use, community and support. This process may lead, ultimately, to improved skills of market segmentation, targeting, differentiation and positioning, extremely necessary for a marketer to take advantage of the specific context of the new economy.

Most companies must develop new strategies to exploit the realities created by new technologies. The main aspects of remodeling marketing approach to be adapted to new conditions relate to: how the consumer display and analyze information obtained through new technologies, developing and promoting brands, the completion of transactions, the development of post-sales support, post-acquisition relationship between seller and buyer.

Marketing is based on a flow of information from current customers or potential customers about their needs, used to generate consistent judgments and sustainable approach to development of new products. Using the Internet in order to carry out marketing studies, it is no longer a novelty, but this process has attracted a number of controversies in practice and criticism in the scientific community. In traditional market, operators develop

marketing research addressing issues of substance regarding the following components: representation, selection, error, random sample. Thus, if in the case of a qualitative research, the problems faced by researchers can not be considered to be extremely difficult, in the case of quantitative research, the problems may be more complex, generally caused by the aspect of sampling. If the research does not face such problems, as is the case of organizing focus groups, the Internet can be very attractive as a research tool.

In the literature are mentioned three approaches in the use of the Internet: as the promotion tool for specific products and/or services, as a tool for providing information to the target market, on a product and / or service, as a tool used in the actions of building brand equity.

Using the Internet and mobile telephony, as vectors of communication, be considered a proactive strategy, but subject to a number of issues. A simplistic way to advertise on the Internet consists of fructification of power held by consumers, encouraged by easy access to information, especially to compared information

Practice and literature provides multiple tools for quantifying the effects of using different forms of advertising on the Internet. One way relates to the possibility of using opt-in e-mail, possible action if the consumers allow companies to send e-mail with new promotions. This provides companies land suitable for development and generate trust in the customer and building long term relationships with them, increasing the chances of anchorages, fidelity and even loyalty. Another way of quantifying the Web advertising lies in the development of partnerships with advertising agencies, depending on the performance achieved.

While Internet advertising has already a relatively "consistent" history, mobile technology appears again as an important catalyst for promotion. Technologies such as WAP, GPRS, HSDPA, 3G penetrate in an accelerated manner different markets. Aspects of the use and effectiveness of this environment will reflect to some extent the evolution of Internet, but time is now the key term for this marketing tool.

The Internet can be considered now the place where consumers and producers participate in the co-production activity that involves the delegation of a series of tasks the customers, who, using new technologies, assess, compare and propose the idea of producing further benefits for both parties. In doing so, companies can identify and implement new ways to serve customers.

3. The concept of metamarket

Another consequence of the phenomenon of globalization has been spreading on a large scale of a new concept, namely the metamarket. In literature, the metamarket is defined as, "a market based on the new form of World Wide Web communication, centered on an event or an industry and not on a single product". These markets are those specific to complementary products, closely interrelated in the minds of consumers, but belonging to different sectors.

The overall metamarket is the result of the convergence of three industries that were created at an interval of 50 years: the telephony industry (1890), the television industry (1930) and industrial computers (1980). The process of convergence describes a process of change in industrial structures, which combines economic and technological dimensions of markets with the need to meet consumer needs.

The concept of metamarket comes from a simple idea, but profound insight: customers think about products and markets in a very different manner from the way in which products and markets are physically combined and placed on the market. In other words, consumers think in terms of activities, while firms thinking through the products and/or services. Activities that are logically linked in the cognitive space can be extremely widespread, as belonging to the various suppliers in the market. Metamarkets are thus cognitive clusters of related activities, found at customers who are committed to meet a set of distinct needs.

Among the essential conditions for the construction of metamarkets are:

- a whole range of related activities in the cognitive space. These activities should be important in terms of customer, in terms of time and economic impact;
- to perform these tasks, customers must be "confronted" with a diverse set of products and service providers, including a number of industries;
- an openness of the consumer, in terms of time and financial resources.

The concept of metamarket led logically to a new concept, that of metamediars. It appears that this concept is in fact a variant of the original concept, more conventional, the infomediars.

Metamediars are neutral third-parties, which operates in the market in order to realignment it with cognitive space. Thus, metamediars make possible the existence of metamarket, integrating products and services into a coherent whole. They serve as a single point of contact between buyers and sellers, improving effectiveness and efficiency of trade. Metamediars are trusted advisors of the clients who need support to make better decisions for a heterogeneous group of activities. Unlike intermediaries metamediars represent suppliers of products and services, facilitates trade, but not participating in the actual transactions rates.

Metamediars allow distribution flows to be disaggregated, distributed through a number of specialist suppliers to the market, and then reassembled perfectly, taking the form of an integrated offer. These measures involve issues such as processes disintermediation and re-intermediation. Metamediars create and capture value by facilitating exchanges between customers and suppliers.

Fertile ground for the emergence of metamediars is linked to the existence of products with the following characteristics:

- complexity in the decision making process;
- have a high informational content;
- requires a degree of effort for the customers as a result of the need to collect information from a variety of sources, usually fragmented;
- a combined form;
- characterized by inefficiency of the classical distribution channels and require a disappointing experience in the retail purchase.

In the new digital era, market-oriented companies define their goal as creating a partnership with their clients to become "solutions providers", which involves the building of combinations of products and services. Internet technology makes this solution to become feasible.

Among the important benefits to the concept of meta-market are included:

- -the concept is perfectly aligned to customer vision and thus can facilitate communication;
- -income that is generated by a meta-market, is always higher than that generated by a discrete product-market.
- -allows the company to provide a total solution for customers, building thus exclusive, loyalty and trust.
- -helps to identify opportunities for growth in activities directly or indirectly related to basic services.
- -helps identify indirect or potential competitors.

4. Conclusions

Sixty years ago, current technological miracle was called television. Currently we are witnessing a growing range of digital products and services that can be delivered to customers through any digital medium, including the Internet, satellite and mobile phones. This delivery is closely correlated with that of providing different types of customer service, which replaced much costly and sometimes more inconsistent human support services. In almost every sector of activity sustained efforts are being made to identify new ways to exploit the potential of the Internet in order to create value for customers. In the absence of a real capacity to retain these customers, even the best business models on the new technologies will fail. Benefits offered by these technologies are clear and there are available for companies operating in the markets for business and for those working in the markets for consumption.

MARKET SEGMENTATION – FUNDAMENTAL STEP IN MARKETING STRATEGY DEVELOPMENT

Market segmentation is essential in the strategic planning of marketing activities. Due to their limited or insufficient resources, many companies have realised the difficulty of effectively serving all the prospects from the market and begin to develop marketing strategies oriented toward customer segments, with specific needs and long term profitability potential. The marketing strategy development has to be based on a well planned market segmentation activity which is a process of dividing a market into homogeneous groups of consumers with similar characteristics. This is possible by using different segmentation criteria that are best classified in four categories: geographic, demographic, psychographic and behavioural.

Key words: market structure, methods of segmentation, segmentation criteria, customer profile.

JEL classification: M31

In order to understand the market structure in which they operate, businesses must find answer to a series of strategic questions: What criteria should be used to segment the market? What are the segments that provide more opportunities for the organization? What is the best combination of benefits and costs that has to be delivered to a targeted segment so that customers will perceive a superior value comparative with other competitive offers? What is the specific marketing-mix that can be used?

Market segmentation is essential in the strategic planning of marketing activities. The concept of segmentation recognizes the existence of significant differences between the customers and the prospects from the market, showing that not any segment may be the target of the marketing efforts made by a company.

The market segmentation may be described as a process of dividing a market into homogeneous groups of buyers with similar features (called market segments) according to certain criteria or variable of segmentation (geographic, demographic, psychographic and behavioural). For each segment which has resulted, the company designs a specific profile that summarizes the values obtained according to the criteria used for segmentation. The next step undertaken by the organization consist in the selection of the target market, which is a process of evaluating the profitability of each segment separately and the extent to which the points of attractiveness identified are in accordance with the strengths of the company.

The strategic decision of market segmentation cannot be based only on the possibility of partitioning the market in homogeneous groups of consumers. Market segmentation will be useful only to the extent that the efficiency and the effectiveness of the marketing activities are significantly influenced by the differences between the segments identified. From this perspective, in marketing theory and practice there is an agreement regarding a series of necessary prerequisites that have to be met in order to develop viable segmentation strategies. Thus, to be useful, market segments must be:³⁸³

- *Measurable*: The size, the purchasing power and the features of the segments can be measured.
- Substantial: Segments are large enough and profitable to deserve to be served.
- *Accessible*: Marketing activities targeted to specific market segments meet the company's objectives regarding the efficiency and effectiveness of the business. Segments may be served through the distribution and communication channels used by the firm.
- Segments have distinct characteristics: Segments are conceptually differentiated and respond in a different manner to different marketing programs.
- Segments will have a specific value for the firm: Companies can develop effective programs for attracting and serving the segments.

According to the results of the studies made by the British researcher Green, the principal **methods of market segmentation** can be classified in two major categories:³⁸⁴ a priori segmentation and post-hoc segmentation.

The a priori segmentation assumes the existence of a significant correlation between the observable customer demographic features and their specific needs. In this case, consumers are assigned to segments based on a number of variables selected by the researcher, such as: age, gender, income, socio-professional status or the stage in the consumer life cycle. For example, the research of the financial needs of individuals aged between 25 and 40 years,

³⁸³ Kotler, Ph., Managementul marketingului, Ediția a IV-a, Editura Teora, București, 2005, p. 367.

³⁸⁴ Cited in Machauer, A., Morgner, S., Segmentation of bank customers by expected benefits and attitudes, International Journal of Bank Marketing, 2001, Vol. 19, p. 6-8.

for women compared to men. The use of a priori segmentation is mainly based on theoretical principles. Therefore, there is a high probability that the standardized package of services offered to different types of customers do not meet their specific expectation. This risk is caused by the fact that customers with a similar sociodemographic profile may present differences regarding their attitudes, expected benefits and life styles.

The post-hoc segmentation implies the analysis of a heterogeneous population, which is then broken into segments of consumers, structured on the basis of similar responses in relation to the objectives pursued in the study. For example, the study of all persons with higher education, which will be divided into segments according to the expected benefits in dealing with financial and banking institutions. The allocation of cases into different segments is then possible by the use of cluster analysis or factorial analysis.

Companies use different variables in the segmentation of their current and potential customers, according to their affiliation to the consumer market (individual clients) or business to business market (firms).

Segmentation criteria used in consumer market

The segmentation based on *geographic criteria* consists of dividing the market into different geographic units: regions, countries, cities, districts (buyers' provenance can be determined, for example, by zip code) and then applying a differentiated approach according to the particularities of local consumption. When serving clients in different areas of the world, the organization often faces with cultural differences, fact that requires additional efforts to adapt the content and the forms of communication used in the domestic market.

Demographic and socio-economic segmentation consist of grouping the buyers in homogeneous segments on the basis of sex, age, size and life-cycle of the family, income, occupation, level of education, religion and ethnic origin. Segmentation based on demographic variables presents advantages regarding the facility for the collection of information, indicating the profile of individuals who purchase goods and services from a certain company. At the same time, companies must take account of the limits of these criteria. For example, according to demographic premises, the differences in consumers' buying motivations may result from differences of individuals relative to aspects such as age, gender, income, etc. In reality, the demographic variables are weak predictors of purchasing behaviour for a wide category of products and services, since they are descriptive rather than causal. Consequently, customers and prospects who have similar or identical demographic characteristics can record significant differences on their lifestyles, preferences, motivations, expected benefits, etc.

The psychographic segmentation, contrary to the segmentation based on demographic variables, assumes that the differences noticed in individuals' buying behaviour are due to some internal factors or personal features which include: personality, values, attitudes, opinions, beliefs and lifestyle characteristics.

The segmentation based on *behavioural criteria* often uses the specific needs and expected benefits of different buyers in the consumption or the use of certain products and services. For example, buyers of cars differ significantly regarding the benefits or attributes they want; from fuel economy to performance, reliability or prestige. Behavioural criteria are considered to be among the most relevant in the process of consumer markets segmentation, providing important clues on the ways in which consumers take buying decisions, their preferences in the use of a particular channel of distribution, and also their apparent sensitivity to marketing stimulus (the extent that the purchase decision is influenced by price discounts, advertising, etc). Among the most commonly used behavioural variables are included:

- The *frequency of use* relative to certain products or services is a criterion which divides the buyers in categories such as: heavy users, moderate users, occasional users and non-users of the product or service in question. From the perspective of the organization, the most attractive segment belongs to the heavy users, due to their high buying potential and the significant contribution to company revenues.
- The user status is a variable that segments individuals in the following categories: potential users, first-time users, repeat users, ordinary users, occasional users or non-users. Knowing the status of users for the products or the brands of a company, offers important clues on the measures that have to be taken in order to stimulate, enhance or maintain consumption.
- The loyalty of the buyers/customers (from a behavioural perspective consisting of the repurchase actions oriented toward specific brands or products) makes the differences between: very loyal customers who buy the same brand every time (they buy exclusively the products of one company), customers who shows a medium level of loyalty or a moderate loyalty (they buy two or three competing brands) and disloyal customers (they are not loyal to any brand).
- The consumption occasion/situation. According to this criterion, the buyer' decision to consume or use a particular product is influenced by the specific situation in which consumption occurs. For example, depending on the time of day or the location where consumption takes place, an individual can consume a beer without alcohol during the day, a beer of high quality in a luxury restaurant or a popular brand at home.

A relatively new term introduced in the marketing literature is the "technographic criteria". These variables are used to describe the extent to which the existing customers and the prospects of a company are willing and able to use the latest technologies.³⁸⁵

Segmentation criteria used in business to business market

Business to business market is significantly different comparative with consumer market, both in terms of structure and features. Its distinct nature translates into specific needs and a more complex organizational buying behaviour. Market structured is characterized by a small number of customers, but more important from a value perspective. Also, organizational requirements are different in terms of size and quality standards and they are negotiated with a high level of professionalism.

Market specificity has a significant influence on the segmentation process, implying the use of distinct segmentation criteria. Therefore, organizational buyers can be classified into segments by applying the variables presented in table no. 1.

Table no. 1. Variables used in the segmentation of organizational customers

Variables	Segments
1. Geographic	
Region	Bucharest, North-west, etc.
County	Arad, Bihor, Cluj, Giurgiu, Harghita etc.
Environment	Urban, rural.
2. Demographic	
Industry	Quarrying, construction machinery, retail, telecommunications, etc.
Size of enterprise	Micro enterprises, small and medium enterprises and large corporations.
Number of employees	1-9 employees, 10-25 employees, 26-50 employees, 51-100 employees, 100-150 employees, 151-250 employees, 251-500 employees, 501-1000 employees, over 1000 employees.
Turnover	Less than 2 million Euro, 2 million-10 million Euro etc.
Structure of capital	Romanian capital, foreign capital, joint capital.
3. Operational	
Customer' technology	New, old.
User status	Non-user, first-time user, majority user, etc.
Customer' possibilities	Customers who requires services of a particular type and a specific value, customers who require a wide range of services, etc.
4. Purchasing methods	
Supply function of the organization	Centralized or decentralized supply.
Buyer-seller relationship	Occasional relationship, close relationship, relationships based on mutual trust, etc.
Purchasing criteria	Quality, price, technology, service, etc.
5. Situational factors	
Size of order	Less than 100.000 pieces, etc.
Emergency of order	The supplier can or cannot fulfil the emergency orders which occur.
6. Personal characteristics	Age, social class, personality, loyalty to the organization, the
of the buyer	inclination to risk, etc.

The level of investment and specific instruments established in relation with large customers, such as corporations will be different compared with those allocated toward small or medium-sized customers. Large enterprises are faced with complex organizational needs, requiring detailed knowledge and then developing specific solutions or products with a high degree of personalization.

³⁸⁵ Concept introduced by Forrester Research and cited in Lovelock, Ch., Wirtz, J., Services Marketing. People, Technology, Strategy, 5th Edition, Prentice Hall, New Jersey, 2004, p. 360.

Regardless of the market to which they relate (consumer market or business to business market), companies should base their segmentation strategy on a set of relevant criteria, which provides a complex and unique profile of the overall preference and value expected by each segment of buyers. Information obtained is used by the company in evaluating the opportunities offered by different groups of buyers. In the next step, the strategic process continues with the selection of the segment or segments which are compatible with the strategic objectives and the specific capabilities of the company. After that, the management of the company will decide on the appropriate strategies for attracting and retention of the selected segments and will develop the right marketing mix consisting of adequate products and services, price levels, distribution channels, messages and methods of communication, in accordance with the specific requirements of each target segment and their long term profitability.

As a conclusion, information resulted from the activity of market segmentation is absolutely necessary to the organization in the process of designing customers' geographical, demographic psychographic and behavioural profile. However, customers' needs change over time due to the action of many factors, which are also difficult to quantify. Revenue growth, changes of the life cycle stage, changes in residence or workplace, are factors that often cause an evolution in customers' preferences and requirements, which translates into changes in their buying behaviour.

ANALYSIS OF MARKETING DATA - EVOLUTIONS OF TOPIC APPROACH

Gabor Manuela Rozalia

"Petru Maior" University – Tg. Mureș Faculty of Economic, Low and Administrative Science Livezeni no.69, Tg. Mureș, Mureș rozalia gabor@yahoo.com 0742 760 430

Because data analysis as a free-standing field has experienced a much broader theoretical development than that of using the methods in practice, and in Romania, it is a field less approached in the literature, a short review (cronological) will be done in this paper – Romanians and foreigners – who apprached the field of data analysis, specifying for each of them the novelty character of approaching data analysis and focusing on the application of the data analysis methods in the field of marketing.

Keywords: data analysis, marketing data, evolution

JEL:M31, M39, C10, C40, C81

Introduction

We should mention that, almost all statistic papers in Romania contain at least a chapter dedicated to data analysis and issues related to it, the authors who detail this field being C. Mitrut, V. Voineagu, Al. Isaic- Maniu, T. Andrei, Elisabeta Jaba, G. Ciucu, V. Craiu, D. Porojan etc., and in the Romanian literature there are also papers totally dedicated to data analysis, among the authors being: Maria V. Ştefănescu, Gh. Ruxanda, Carmen Pintilescu, Liliana Spircu, T. Spircu, M. Calciu etc.

Also, as data analysis is a field with a wide applicability concerning marketing issues and implicitly, the analysis of characteristics related to marketing data, there are authors and specialists in this field who provide – theoretical or practical references - in their papers to data analysis methods used in marketing, of these, the papers of the following authors are used: I. Cătoiu, T. Dănețiu (whose doctoral dissertation is in the field of marketing data analysis with various software), V. Balaure, J. C. Drăgan, M. C. Demetrescu etc..

In the *foreign literature*, **data analysis** is a widely approached field, both theoretically, statistico- mathematically, and practically with concrete examples of data and fields where it has been used successfully, some of the surveyed foreign authors even mentioning the software used in data processing by means of data analysis methods. Foreign authors contain both names recognized as "parents" of data analysis methods, for instance, **G. Saporta**, **J.P. Benzécri**, **F. Benzécri**, **H. Fenneteau**, **C. Bialès**, **Bernard Grais**, **M. Vollé** or **N. Malhotra** for the marketing data analysis methods. Alongside these authors, the most quoted foreign authors in the surveyed papers are the following:

- for marketing data analysis methods: D.A. Aaker, V. Kumar, G.S. Day, J.M. Bouroche, T.C. Campbell, C.H. Davis, K. Dewar, Wen Mei Li, C.H. Davies, J. Delnero, D. Montgomery, M. Gauthy Sinéchal, M. Vandercammen, J.L. Giannelloni, E. Vernette, A. Smajda, J.P. Vendrine, N. Malhotra etc;
- for data analysis methods in general: H. Elhoweris, N. Alsheikh, M. Volle, R.G. Waters, L.J. Haskell, W. Wolfe, Gilbert Saporta, J.P. Benzécri, F. Benzécri, H. Fenneteau, C. Bialès, Bernard Grais etc.

Evolutions of topic approach

The data analysis methods were elaborated long time ago, in 1930, H. Hotteling laid the basis of the *analysis of the main components* and *canonical analysis*, thus developing the works of C. Spearman and K. Pearson that were dating early the century, from the same period theories were retained (1935, W. Stephenson – Spearman's last assistant, the inventor of factor analysis) that afterwards were the basis of new data analysis methods. Also, the main principles of *factor analysis* belong to Spearman (1904), the word as such being introduced much later, in 1931, by Thurstone in the field of psychology and the origin of *typological analysis* are considered to be two articles published in 1938, by Tyron and entitled "A technique to measure the similarities of spiritual structures" and "The general dimensions of individual differencies: typological analysis or multiple factor analysis".

If we order chronologically the surveyed literature we notice that, in 1960 - 1970, the approaches related to the field of data analysis are purely theoretical, being mathematical descriptions of the principle of the methods with very few practical applications.

Thus, in **1961**, in his paper, *The Q-Sort Method in Personality Assessment and Psychiatric Research*, **J. Block** makes the first references to this method and its applications in the field of psychiatric research.

In 1974, P.E. Green (University of Pensylvania) and D. S. Tull (University of Oregon) within chapters 10- 13 of the paper – translated into French - *Recherche et decisions en marketing*, approach data analysis methods as: related data analysis – regression, the χ^2 test- discriminatory analysis, canonical analysis, factor analysis of related data, typological analysis, multidimensional analysis of perceptions and preferences presenting various aspects of a data matrix.

In 1977, in the paper entitled *Analyse des données en marketing* J. M. Bouroche – in cooperation with other authors, members of the French Association of the Economic and Technical Cybernetics – approaches for the first time the marketing data analysis methods in market studies respectively for grouped proximity data, the metric

analysis on table of distances measured on the range scale and non-metric analysis, emphasizing the Kruskal algorithm and the Young and Torgerson algorithm. They also approached, for individual proximity data, the IDIOSCAL and INDSCAL algorithms used for data metric analysis and the NINDSCAL algorithm for the non—metric analysis. In the same paper, issues related to positioning in marketing are approached by using classification as a data analysis method, the preference analysis suggesting new methods such as: PREFMAP 1, PREFMAP 2, LINMAP, MDPREF, ANAPREF. The authors of this paper have also approached the field of marketing decisions as regards data analysis, proposing the combined application of two methods namely, proximity analysis and preference analysis. The paper also contains chapters related approaching the qualitative data both by means of descriptive and methods and explanatory methods related to data analysis being supplemented—in plenty—with examples of the conjoint analysis applied to marketing data.

In 1980, J. P. Benzécri and F. Benzécri in the paper entitled *Pratique de l'analyse des données* approaches in detail (with the full presentation of mathematical and geometrical aspects) correspondence analysis, presenting in stages the use of this method for various examples processed by means of the FORTRAN programming language: socio-professional origin of the students in universities in Greece, development of Brazil's imports of industrial equipment in 1970 – 1975, family budgets, analysis of the table of marks achieved by the candidates to the Polytechnical School – analysis by column duality, school census in Lebanon, the discriminatory method applied to medical data in order to make a therapeutic decision, etc. J. P. Benzécri also has the merit of suggesting a new method (in another paper), the correspondence analysis respectively, in order to study not only to test the independence between variables as well as for the description of association (also called correspondence) between two qualitative variables. The proposed version facilitates the highlighting of connections existing among the ways, and on the other hand it provides the possibility of a graphic that is relatively easy to explain.

In 1988, in the paper entitled Segmenter ses marches – applications pratique de technique de segmentation dans le marketing A. Smajda makes his contribution to the development of segmentation as a method of data analysis developing aspects related to the concept of market segmentation, segmentation technique, similarity measurement, classification method applied in segmentation, description and validation of groups and completion with an application of the segmentation method for the study of a product perception.

Beginning with **1990**, both abroad and in **Romania**, papers that relate to the field of data anlysis – and especially its specific for marketing data – experience a strong development first of all thanks to the development of the special programming languages and software dedicated to this field.

In 1991, in the paper entitled *Le traitement des données en marketing – en 10 questions, 13 applications, 27 exemples et exercices commentés et corigés* J.P. Vendrine (University of Clermont) approaches the univariate analysis of quantitative, qualitative and ordinary data, the bivariate analysis for quantitative, nominal, and ordinary data, multivariate explanatory analysis for example the linear regression analysis - specifying by examples for nominal data in the field of marketing – and variance analysis with a factor and with multiple factors – approaching the issue of factor interaction and extension to several factors. It also approaches other explanatory methods such as: segmentation, discriminant analysis, applications of conjoint analysis, canonical analysis and some of the descriptive methods, mainly focusing on applications for the marketing data of analysis in main components, detailing this method for additional information and approached by additional analyses and also providing examples concerning the typological analysis for marketing data, completing the paper with the factor analysis of correspondence and the ordinal descriptive analysis in case of preference analysis and similitude analysis.

In 1993, H. Fenneteau (professor at the University of Montpellier) and C. Bialès, in the paper entitled *Analyse statistique des données – applications et cas pour le marketing* approach the statistic analysis of univariate data and the bivariate data on each type of data – ordinary quantitative and metric quantitative, nominal qualitative and ordinary qualitative, as well as the statistic analysis of multivariate data, every analysis being sustained by practical examples for marketing data.

In **1994**, the first paper is published in Romania. This paper approaches the marketing data analysis as a distinctive field, in the approach of authors **Liliana Spircu**, **Mihai Calciu** and **Tiberiu Spircu** in the paper entitled *Marketing Data Analysis*, that apart many practical examples of data analysis methods and commands of using the SPSS software for marketing data processing with data analysis methods, of the MINITAB software, and functions of the EXCEL – WINDOWS package for data processing.

In 1996, Maria Viorica Ştefănescu in cooperation with one of the most important foreign authors in the field of data analysis, Gilbert Saporta approaches the data analysis as regards data processing in the paper entitled *Data analysis and data processing – with applications at market surveys and opinion surveys*, work that shows many examples of applying the methods of data analysis (univariate analysis, bivariate analysis, multivariate analysis, canonical analysis, correspondence analysis, classification methods) taken over from the French literature and accompanied by the related data processing algorithms with SPAD.N, SPAD.T. This paper is developed and elaborated afterwards, in 2000, by the author, by means of her lecture entitled *Data Analysis– case studies-* held within the Academy of Economics in Bucharest.

One of the most important papers in the field of market survey after 1990 was published in 1996, too. The paper was carried out by professors **J.C. Drăgan, J. C.** and **M.C. Demetrescu**, being entitled the *Practice of Market Survey – research techniques in marketing* and shows, as advanced methods for data analysis and given as examples for marketing data, group aggregation, factor analysis, discriminatory analysis, metric and non-metric multivaried scaling and analysis of compensations between consumer's preferences.

In 1997, the fourth edition of the paper entitled *Analyse de données* of M. Vollé is published in France. It presents as factor analysis methods: the method of factor analysis, analysis in main components, correspondence factor analysis, multiple correspondence analysis, discriminatory analysis, canonical analysis, generalized canonical analysis. The paper also contains methods of automatic data classification, of which the following is approached: formal aspects of classification, classification starting from qualitative comments, classification in a metric space, the downward classification method, methods of data partitioning.

In 1998, the sixth edition of the paper entitled *Marketing research* having as authors **D.A.** Aaker, **V. Kumar** and **G.S. Day**, paper that, as the authors mention right from the beginning, the chapter related to marketing data analysis is more rigorous compared to the previous ones and contains real applications of the data analysis methods for marketing data. The paper approaches the methods of data analysis compared and grouped thus: analysis of regression and correlation, discriminatory analysis and canonical analysis, factor analysis and cluster analysis, multivariate scaling and conjoint analysis. The paper chiefly distinguishes for the fact that, apart the examples of the methods for marketing data (examples come from well-known companies such as, Ajax, Pepsi – Cola), makes comparisons between different methods, mentioning the features of their application for the specific of marketing data, for instance comparison of regression analysis with discriminatory analysis or between factor analysis and discriminatory analysis etc. Another major contribution of the paper is that, for approximately all quantitative and qualitative methods used for marketing data, authors also make connection with the opportunity of using internet either for collection or processing of collected data.

Beginning with the year 2000, the literature in Romania enriches with new valuable papers, doctoral dissertations promoting either new data analysis software, or new data analysis methods, and it should be noticed that, in the papers related to the field of market research and marketing in general are either mentioned or detailed with examples of their application in Romania. Internationally this phenomenon is much more intense, the data analysis methods being applied for various types of data.

In **2001, Gheorghe Ruxanda** published the paper entitled *Data Analysis* that distinguishes in the literature in **Romania** by means of a careful and rigorous approach, with mathematical rigour and detailed presentation of statistical support that data analysis methods are based on, for the time being this paper makes reference to the analysis method in main components.

Internationally, in 2001 the paper of authors **J.L. Giannelloni**, and **E. Vernette** was published. Its title was $\dot{E}tudes$ de marche – 2e edition, that approaches the analysis of association and causality, chapter where they refer to adjustment by means of the regression method and testing of adjustment quality for marketing data, associations between non-metric variables, and between the nominal and ordinal variables respectively, multivariate analysis, where in the presentation of data tables used for these analyses, the Burt's table or disjunctive in full is shown. The types of questionnaries are also presented being customized for various types of data in case of similarity analysis, for similarity data respectively, for data expressing preferences, and the presentation of main issues inevitable to questioning similarities is carried out.

In **2003**, **Tudorel Andrei** made his major contribution to the specialty literature by means of the paper entitled *Statistics and econometrics*, due to the profound approach of aspects related to the statistic inference in case of the method of simple and multiple regression, the presentation of some new statistic tests that can be applied to the simple regression analysis (the Jarque – Bera test) presentation of new non-linear regression methods (the CES function), of statistic tests used in case of conventional regression (the CUSUM and CUSUMSQ tests) as well as the detailed approach of self-regressive linear processes.

Also in **2003**, the paper entitled *Data Analysis*, author **Carmen Pintilescu**, was published apart data analysis methods, this paper (analysis in main components, factor analysis of correspondents, hierarhical classification) this paper also presents applications of these methods.

In **2004, N. Malhotra** republished the fourth edition of the paper entitled *Études marketing avec SPSS*, paper that distinguishes itself by the fact that, all quantitative methods applied in the field of market research, the author mentions the commands related to the SPSS software for marketing data processing, and also by the manner of structuring, phasing and specificity of each method (descriptive or explanatory) and implicitly of each statistic notion in data analysis. Apart the conventional regression methods and regression with "mute" variables, aspects concerning the relative importance of explanatory variables for marketing data, applications of factor analysis for common factors in case of marketing data multivariate analysis of similarities and preferences and conjoint analysis are also presented.

Among Romanian authors, there are papers that I used for documentation and an author with a paper that presents a novelty in the field of data analysis – the *Q methodology (Q factor analysis)*, is **D. Iliescu** respectively. Aspects presented in the paper published in 2005 relate to: *introduction in Q methodology -Q sort as a data collection*

technique, Q factor analysis as data analysis technique, interpretation of significance of factors, examples and its usefulness. Apart his merit to detail aspects related to this method, D. Iliescu comprises in his paper, examples concerning the application of this method both for marketing research and advertising (he used this method to divide the attitudes and readers concerning advertising) as well as for data from political research and political marketing, using the Q methodology to divide political expectations.

Also in **2005** the doctoral dissertation entitled *Multivariate methods used in the analysis of computer aided analysis of marketing data*, presented by **T. Dănețiu** whose major contribution was that he provided examples on various software that can be used for data analysis methods, their limits and advantages being singularized on different methods of data analysis.

Conclusions

Until the 60s these methods have developed and improved to versions that however remained unapproachable in practice as they were requiring a very high volume of calculations. Appearance of software and PCs have opened the access of practitioners to the data analysis techniques.

Especially the methods of factor analysis were the basis for the development of other methods, for instance factor analysis on distance tables and disimilarities (that have the same purpose as the main component analysis but the difference is that initial data is different, knowing only distances or disimilarities between individuals and not the variables describing them), analysis of Euclidean distance tables, to this effect developing the MDSCAL algorithm of J.B. Kruskal that uses ordinal information and the INDSCAL model (INDividual Differences SCAling) developed by J. D. Carroll enabling the analysis of several distance tables (the second model developed by the same author is IDIOSCAL). Other developed factor methods are:

- ACP of instrumental variables (ACPVI),
- ACP with orthogonality restriction,
- ACP with partial covariances.

Among other authors that contributed significantly to the development of the descriptive methods of data analysis (especially the non-metric analysis) we can quote the following: F.W: Young, W. S. Torgerson - the latter is related to one of the first software used for data analysis, then TORSCA - , J.C. Lingoes, L. Guttman and V.E. McGee respectively.

ASSESING THE EFFICIENCY OF THE SOCIAL POLICY IMPLEMENTATION IN THE CONTEMPORARY ORGANIZATIONS

Gangone Andreea-Daniela

Constantin Brâncoveanu University of Pitesti Faculty of Management Marketing in Economic Affairs of Pitesti Dorobanților Street, no. 14, bl. 51, sc. A, ap. 15, Pitesti, Arges andreeagangone@yahoo.com 0741/778317

Ioneci Mihaela

Constantin Brâncoveanu University of Pitesti Faculty of Management Marketing in Economic Affairs of Pitesti Petrochimiștilor Street, bl. B2, sc E, ap. 18, Pitesti, Arges IONECI MIHAELA@yahoo.com 0727/844821

Making the contemporary world become aware, under the impact of the current economic crisis effects, resulted in increasing the pressure exerted by the society on the field for economic affairs in order to review its fundamental mission in terms of a larger responsibility.

Thus, the contemporary organizations must contribute, in developing their activities, to the protection of the natural environment integrity, to the creation of a business environment that works with the observance of the ethical principles and to the improvement of the social conditions, in the communities where they operate. To achieve this desideratum, the contemporary organizations must develop social policies integrated in their business strategy, on long term.

Keywords: corporate social responsibility, company's social policy, business ethics, marketing research

JEL Classification: M14 – Corporate culture; Social Responsibility.

The social policy of the organization represents a variety of motivations, resources and objectives that set up the company's vision and strategy in what regards providing services to enhance the social welfare of the communities upon which it acts and also of the entire society in order to acquire good economic and social results.

Any organization that wants to elaborate or improve its social policy must begin with an objective and integral evaluation of the level of present moral, ecological and social consciousness. The development of a study at the employees' level represents a simple and accessible method for the companies that start such a process.

We developed such a study at S.C. Cord Romania S.R.L. Slatina, considering that it is the oldest Romanian component of Pirelli Group. The study was developed only at managerial level within the organization, at all hierarchical levels, and it regarded 39 employees. Thus, we made up a survey to collect the relevant information for the study, which was applied between 18 February – 03 March 2008.

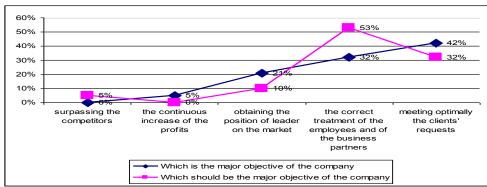

About the surveyed persons holding managerial positions we may say that 10% attended higher education, 58% attended technical universities, 16% attended economic universities and 16% attended high school. Also, about the persons surveyed for the study we may say that 79% are masculine and 21% feminine.

The first important aspect that we considered in analyzing and interpreting the information was the employees' length of service within the organization, because there is a direct link between the period of time spent within the company and the acceptance degree, understanding and organizational value assimilation by the employees. According to the survey's results, 47,5% of the managerial staff have a length of service higher than 2 years, while 52,5% have less than 1 year.

Regarding this aspect, it is very interesting to compare the organizational objective, considered to be the most important by the employees, and the objective considered to be the most important by the organization.

Thus, the employees appreciate that the organization tries, first of all, to meet the clients' demands (42%), then to fairly treat employees and business partners (25%), and, finally, to obtain a leader position on the market (21%). In spite of all these they did not entirely accept these organizational objectives and consider that the organization should try, first of all, to fairly treat employees and business partners (53%), then to meet the clients' demands (32%), and to obtain a leader position on the market (5%), as presented in the following figure:

Fig. 1 Correlation between the organization's view and the employees' view regarding the most important activity objective

These results demonstrate that the managerial staff did not accept and assimilate entirely the fundamental values of the company, which may generate misunderstanding of organizational objectives. So, it would be useful to organize some discussions with the employee groups and popularize and support the role of values and organizational principles on a long term.

A support factor is the manner in which communication is made within the organization, considering that the majority of the managerial staff (79%) appreciated that the information fluctuation is double-sensed, respectively from the superior hierarchical levels to the inferior ones and vice versa.

This demonstrates that managers take into consideration the subordinates' proposals and observations in their process of decision-acceptance. Still, 21% of the surveyed persons considered that within the organization communication is made only from the superior hierarchical levels to the inferior ones. This aspect may indicate that there is a series of autocrat managers within the organization, or can be determined by the short length of service within the organization;

It is important to underline that the managerial staff's opinion regarding the factors that provide company's success and the company's opinion, presented within their code of ethics, are divergent meaning that, while the innovation and adaptation capacity at the clients' requests get the first positions of organizational objectives on a long term, according to the managerial staff's opinion they occupy the 8th position, respectively the 5th.

Factors that provide the company's success, according to the managerial staff's opinion

Table no. 1

Conferred importance	Considered element
1.	Respect to the employees
2.	Quality of products
3.	Fairness to partners
4.	Respect for the environment
5.	Adaptation to the clients' requirements
6.	Transparency of operations
7.	Open communication with partners
8.	Innovation capacity
9.	Supporting various social causes
10.	Initiative capacity

On the other hand, the respondents considered, in a large majority (95%), that it is important for the organization to pay the same attention and offer fairness to all clients, since all clients are important for the business success, attitude that must really support the organizational success on a long term .Also, 5% of the respondents considered that since the clients' needs are different, they should be treated differently and no respondent considered that the value of contracts should not influence the company's behavior to the clients.

Another element of large importance in the moral, ecological and social conscience process regards the factors generating employee satisfaction at the work place in correlation with the factors that generate dissatisfaction. Thus, within the studied organization, employee satisfaction is mostly generated by the possibility of continuous professional training (72%), but also the fair manner of treatment (11%) or the pride to work in an internationally known company (11%). The organization should take into consideration the employees' desire for continuous professional training, especially as 79% they consider that both they and the organization must deal with this aspect.

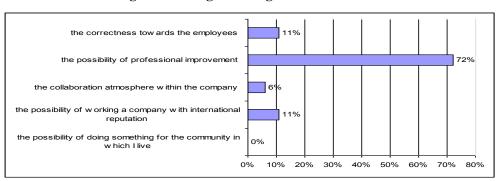

Fig. 2 Factors generating work satisfaction

The aspects generating the highest work dissatisfaction are: the preferential treatment of various employees, the superiors' pressure to meet deadlines, too much volume of work and the unfair/inflexible salary system or bonuses.

The organization must identify the causes of the factors that generate work dissatisfaction, and if these causes prove to be pertinent they must be alleviated

It is interesting to see that the organizational involvement or non-involvement in supporting the community does not represent a source of work satisfaction or dissatisfaction within this organization.

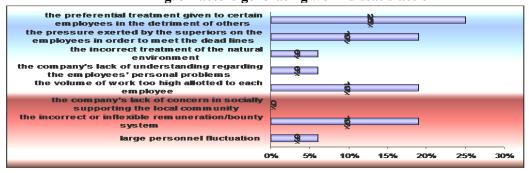

Fig. 3 Factors generating work dissatisfaction

The opinion expressed by the managerial staff at S.C. Cord România S.R.L. Slatina regarding work behavior is determined by their perception of appreciation at work place. Thus, 55% of the respondents consider that, to be appreciated at their work place, they must achieve their duties, 30% consider that they must be creative and have initiative in solving problems, while 15% think that they must obey organizational rules, which means getting professional training or strictly respecting superiors' orders.

More than that, none of the subjects considered that meeting deadlines represents a factor that could bring them an increased work appreciation, although it is considered an extremely important source of dissatisfaction.

Within S.C. Cord Romania S.R.L. Slatina the managerial staff does not entirely know the existing stipulations of any codes, even though 79% of the respondents stated that work regulations are very important and useful, and they respect them in any situation and, more importantly, they do not use them. As a result, these regulations are considered to have more a declarative character than a practical one and consulting them does not represent the final solution in solving a problem.

On the other hand, when they face a problem that they cannot solve, the existing rules within the company represent the final solution to solve the problem after they debate upon it with their colleagues or superiors.

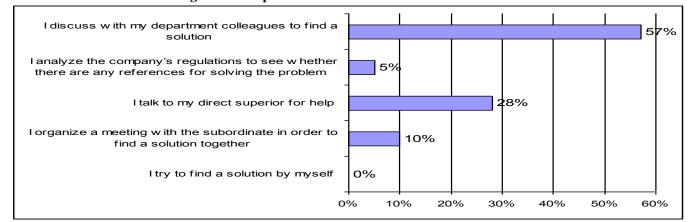

Fig. 4 The respondents' behavior to an inedited matter

Further on, the study was concentrated on identifying the perception of the managerial staff at S.C. Cord România S.R.L. Slatina regarding the role of social policy that provides the organization's future success.

Thus, the company has a code of ethics that was distributed to the employees as a presentation brochure and is, also, available on the web page of the Group.

More than that, 62% of the respondents said that they participated at various actions that were intended to facilitate the understanding and the daily usage of the organizational code of ethics. Still, a percentage of 11% respondents said that they are not aware of the existence of such a document.

At the same time, the respondents' opinion regarding the utility of the code of ethics in the organization's activity is not unitary; about 55% of them consider that the code of ethics does not provide solutions that could solve the problems with an ethical character, while 45% appreciate that the role of the code of ethics is to give orientating advice on the significance of a fair behavior at work.

It is even more relevant that, although 48% of the respondents said that they know exactly what the code of ethics contains, and 48% said that they know some things about the code of ethics, and when they were asked to identify

some of its rules on a list with more variants, around 30% of the indicated variants cannot be found among the stipulations listed in the code of ethics of Pirelli Group.

All these aspects demonstrate that, within the analyzed organization, the code of ethics is not considered as a standard to be followed in he activity development but as a simple declarative document, without too much practical value. Thus, the company must popularize its stipulations at the level of the managerial staff and evidence its role in providing the ethical character of the organizational activity;

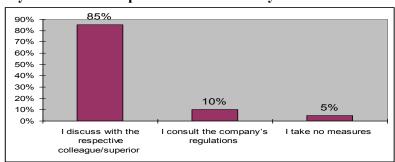

Fig. 5 The way in which the respondents act when they face unethical work behaviors

It is a known fact that when an employee faces unethical behavior from his superior or colleagues, 85% prefer to discuss about it with the respective person, 5% they take no measures, and only 10% consult the organizational regulations. Further more, although 37% of the surveyed persons said that in their organization there is a person that deals with ethical issues, 21%, said that there is a department specialized in ethical issues, when they are in doubt about the lack of fairness regarding any decision or behavior, none of the respondents go to this person or department when facing such practices.

The managerial staff at S.C. Cord Romania S.R.L. Slating also consider (63%) that the implementation of anew system of rewards/punishments for unethical work-related attitudes would stimulate the employees to adopt an ethical behavior.

A source of competitive advantage for S.C. Cord Romania S.R.L. Slatina, both at national and mostly at international level is the active and pro-active preoccupation to maintain the integrity of the natural environment. This preoccupation is proved by the organization's activities and appreciated by the employees (95% of them said that, in their opinion, their organization is actively preoccupied with protecting the environment integrity).

Another important aspect in the study was identifying the managerial staff's opinion about the connection between the community and the organization in developing its activity. Thus, 84% of the respondents considered that companies, in general, can and must do more than impose rules for sustaining the communities where they are located.

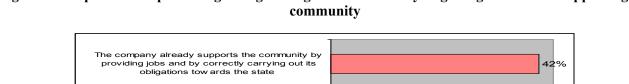

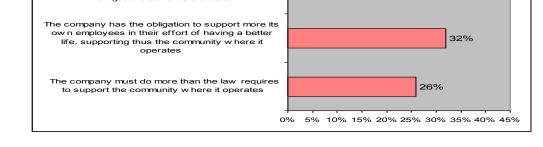

Fig. 6 The respondents' opinion regarding the organization's utility in getting involved in supporting the

Also, the managerial of the company considers that the organization where they work supports the community and the society for mutual benefit. In spite of all this, the way in which they understood the principles of social responsibility is a pretty narrow one, as 74% appreciate that an organization's responsibility to the society means safe jobs, supporting the employees, being always updated with all taxes owed to the state.

This opinion is expressed by the fact that S.C. Cord Romania S.R.L. Slatina was mainly preoccupied, by the social programs it developed, to increase its own employees' welfare and less to solve any social problems manifested within its community.

As a result, it would be useful if the organization could diversify its portfolio of social causes in which it takes involvement, without neglecting the ones that were already mentioned.

Another interesting aspect emphasized by the survey was that 50% of the managerial staff of S.C. Cord Romania S.R.L. Slatina donated, in 2007, 2% of the global income to a social cause, but only 40% of them knew that they could have this opportunity within the organization. We consider that the organization could popularize more this governmental initiative which, though it does get direct implication to it, does not require too much effort;

The initiatives at S.C. Cord Romania S.R.L. Slatina in the field of social responsibility demonstrated that 53% of the managerial staff is aware that there is a person responsible for its involvement in the community's social support. Also, 42% of the respondents participated at individual or group debates on social responsibility, within their organization, while 53% said that they never participated at such manifestations.

More important, 37% of the respondents participated at a series of events that demonstrate the organization's involvement in the society's amelioration process of social involvement, events represented by offering various scholarships for the employees' family members (32%), offering financial support to the employees with health problems (32%), making various humanitarian donations (26%), and offering presents to disfavored categories, with the employees' involvement (10%).

According the opinion of the managerial staff of S.C. Cord Romania S.R.L. Slatina, the main social fields that the organization must support should be protecting the environment (64%) and making donations to various humanitarian foundations (24%), and they mentioned SMURD, CNRG and Casa Speranței.

Regarding this aspect, the modalities of social involvement at S.C. Cord Romania S.R.L. Slatina preferred and mentioned by the respondents within the study were mainly represented by various donations, occasional or systematic, for various social causes (55%), creating a foundation that will be in charge of the company's social activity (15%), sponsoring some cultural, sports events (15%) and the employees' willingness to volunteer (15%).

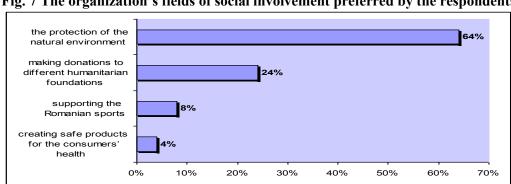

Fig. 7 The organization's fields of social involvement preferred by the respondents

It is interesting to remark that the respondents consider responsibility assuming to society, by the organization in which they work as an attribute of it, proving to be reticent about the volunteer work or making donations from their salaries, even if they are minimal, to support some social causes.

We consider that a very useful method of social involvement is the employees' volunteer work which, though it does not get too much appreciation among them (15%), has positive results regarding the team spirit and increase of their loyalty towards the organization.

In conclusion, in the organization under study, the international social policy of Pirelli Group has not been fully implemented, but by observing the proposals and recommendations made on the basis of the study results, we believe that the organization can successfully finalize this process.

STRATEGIES FOR INCREASING MARKETING FLEXIBILITY: AN APPLICATION OF THE SERVICE DOMINANT LOGIC

Gurău Călin

GCSM –Montpellier Business School 2300 Avenue des Moulins 34185 Montpellier, France Email: c.gurau@supco-montpellier.fr

The paper outlines the necessity of marketing flexibility in the context of new theoretical and practical conditions, and proposes a synthetic model of flexible marketing systems capable to enhance the value co-creation process.

Keywords: marketing flexibility, the service-dominant logic

JEL code: M

Introduction

Flexibility is a controversial concept that covers multiple aspects (Sushil, 2001). In the last 30 years, both theoretical and technological advancements have increased the importance of flexibility for customer satisfaction and marketing performance. In business studies, flexibility was often associated with manufacturing processes (McTavish, 1984; Prabhaker, 2001), human resource management (Dyer, 1998), and strategy. Despite the fact that flexibility is implicit in the application of the marketing concept (Combe and Greenley, 2004), very few studied have directly addressed marketing flexibility.

The main role of marketing is to develop and deliver better value propositions for customers (Keefe, 2004; Payne and Holt, 2001; Woodruff, 1997). However, the meaning of this purpose has significantly changed in the last century. The 21st Century markets are characterised by dynamism, unpredictability, intense competition and increased consumer power, evolving towards and increased fragmentation of targeted segments. In this context, creating and delivering customer value is increasingly considered as the next source of competitive advantage. Many leading scholars argued that this process can be enhanced by emphasizing marketing relationships as opposed to transaction-based exchanges (Kotler, 2000; Parvatiyar and Sheth, 1997; Webster, 1992).

In their book 'The Future of Competition', Prahalad and Ramaswamy (2004) suggest that nowadays the value is co-created by companies together with their customers, and therefore, marketing should adopt a relational approach. From this perspective, value is embedded directly in the co-creation experience, and does not stem from products, services, or from the expertise of marketers and service providers. This orientation leads to a service-dominant logic in marketing, in which the firm should concentrate on operant rather than operand resources, in order to develop valuable experiences for its customers (Vargo and Lusch, 2004).

The service-dominant logic in marketing

A clear shift was made in marketing logic, with the statement that consumers do not buy products and services, but rather life-enhancing experiences (Vargo and Lusch, 2004). This new approach has eliminated most of the differences between product and service marketing, and extended value delivering process from transactions to relationships – both ante- and post-purchase.

For centuries, the excessive focalisation of theorist and practitioners on exchange-value has introduced an important conceptual bias in the firms' marketing orientation (Vargo and Lusch, 2004). In the context of the service dominant logic, it is rather the value-in-use that determines the level of consumer satisfaction (Gummesson, 2002; Jüttner and Wehrli, 1994; Normann, 2001; Normann and Ramirez, 1993; Stobarcka and Lehtinen, 2001; Vandermerwe, 1996; Woodruff and Gardial, 1996). In comparison with the exchange value, which was standardised and rigid, the value-in-use is relative, depending on the specific needs, wants, perceptions, attitudes and circumstances of every customer. Satisfaction can therefore be defined as the affective response of the customer to the consumption experience of a product or a service, being always personal and subjective (Giese and Cote, 2000; Westbrook, 1987).

In comparison with previous marketing paradigms, the service-dominant logic modifies the source of competitive advantage from operand to operant resources. Constantin and Lusch (1994) define operant resources as physical, tangible assets on which operand resources, such as skills, knowledge and know-how, are applied in order to produce specific effects. If consumer satisfaction is personal and subjective, determined by a dynamic relationship rather than an impersonal transaction, the creative use of operant resources is the key to develop and deliver personalised experiences to customers.

This conclusion supports the service-dominant paradigm in marketing, showing that the role of the firm is not confined to manufacturing and commercialisation, but extends also to facilitating consumption during the entire period of customer-object or consumer-service interaction. On the other hand, this new paradigm drastically redefines the role of the customer and his/her responsibilities. Customers cannot be considered anymore as a passive element of the transaction process; the new orientation implying the active customers' participation in the

design, development, and choice of elements that permit the fulfilment of their existing needs and wants. The customers become partners in the value-creation process (Deighton and Narayandas, 2004)

The modern shift in consumer's role

The increased competition in all markets coupled with the recent advances in communication and information technologies have empowered the customer. The traditional passive role of customer in market transactions has shifted towards a more active stance because of information availability, globalization, ability to network, and the desire to experiment (Prahalad and Ramaswamy, 2004). Using the Internet, the customers can easily access, select, and compare information regarding the available offers of goods and services, at a global level. More than that, they can express their own views and opinions regarding about personal consumption experiences, creating lasting online knowledge that can benefit other consumers.

As a result of enhanced communication and interactive access to information, consumers have become more knowledgeable and more active in their relation with the market environment.

Lawer (2004) identifies the rise of the 'One Minute Customer' which has an increased technological versatility in finding the necessary market information, and who initiates a new type of contact with companies. This new customer is characterized by four main requirements during market interactions:

- a. Value for time: the recent technological advances in communication and information technology compress and enrich time, and as a consequence, accelerate and fragment human activity. In these conditions time rapidly becomes a valuable currency for customer and organizations alike. The new customers perceive time-saving and efficiency as important quality dimensions of their interaction with firms (Stalk, 1988).
- b. Value for attention: the high level of interactivity of the new media channels offer the customer an increased control over the information s/he consumes. On the other hand, multiple marketing messages with different contents are competing for consumers' attention. Godin (1999) estimates that US consumers are roughly exposed to five thousand advertising messages every day. To protect themselves, modern customers learn how to use communication and information technology in order to select and control the number and the content of the received messages, and are increasingly capable to identify the marketing methods used by companies to step up commercial pressure and to manipulate emotions. As a result, the marketing media overload leads to lower levels consumer attention, since people are willing to access only personally meaningful messages.
- c. Control of personal data: the implementation of information intensive data- mining techniques and aggressive customer relationship campaigns has increased the awareness of modern customers about the value of their personal data. In an increasingly competitive environment, the consumers learn quickly how to valorize the information about their private buying and consumption behavior that has become a strategic resource for companies.
- d. Life-enhancing services: customers are focusing more and more on services rather than products, looking for life-enhancing experiences (Vargo and Lusch, 2004).

Marketing flexibility

The theoretical and practical applications of the service-dominant marketing paradigm directly imply an increase in the flexibility of marketing structures and processes. The opportunity to receive real-time information from consumers who expect immediate value benefits can be used only if the organisational value-chain allows flexible participation, interaction and implementation.

Flexibility of participation

The customers should be capable to decide and if, and in what measure, they want to participate to the value co-creation process. When the consumer needs are simple and the value of the purchase is reduced, the consumer might prefer to purchase a highly standardised product that has a reasonable level of quality. Other possible elements that can determine the customer involvement in the co-creation process are the degree of technical competence, the subjective satisfaction derived from the co-creation process, and the sacrifices/costs required for a meaningful participation.

The flexibility of participation requires from companies to maintain a combination of classical and modern marketing systems, and to use them according to the specific situation of costumer involvement:

- a. when the consumer decides not to participate, a standardised product version should be available on demand, in this situation all marketing system acts by default, using the data collected from market and consumer research to produce a standardised consumer offer standardised marketing;
- b. when the consumer decides not to participate, but s/he is willing to explore alternative offers, the marketing system should use the input provided by other customers a with similar demographic profile to make new value propositions tribal marketing;

c. when a consumer is an active participant in one or more phases of the co-creation process its contribution should be integrated in the final value proposition, resulting in customisation – personalised marketing.

Flexibility of interaction

When a customer decides to get involved in the value co-creation process, s/he must have the possibility to interact with the organisation at different levels and through various systems. The main challenges of interaction flexibility are:

- (a) to adapt interaction to the specific level of consumer's competence consumers involved in the value cocreation process will present individual variations in terms of communication skills, level of technical competence, and cooperation patterns. The interactive systems must incorporate a sufficient level of flexibility to make them adaptable to specific consumer profiles and approaches. Usually, the interactive systems will be structured through a combination of operand (technical elements) and operant (human elements) resources, the human factors allowing a higher level of adaptability.
- (b) to the efficiently centralise the information provided by the customer; and
- (c) to make it readily available to any department that can customise the marketing offer. Considering all the communication formats and channels that can be used today by consumers, this problem can be solved mainly through the use of an integrated marketing communication/information system.

Flexibility of implementation

If the contribution of the customer is received but not implemented, it is not possible to speak about a real value cocreation system. The organisational value chain should be capable to absorb and implement customer requirements, creating the basis for a personalised marketing offer. However, a personalised marketing approach might not be profitable or desirable for every organisation. Because of this, in reality, any organisation will define the level of marketing flexibility that can be profitable sustained, and on this basis, define a series of implementation points, in which consumer contribution can be absorbed and used to customise the value offer. The sooner the consumer contribution will be implemented in the value-added chain, the more customised will be the marketing approach.

- a. Flexibility of the product design will determine a made-to-order marketing approach. The project will be expensive both for the firm and for the customer, and the internal resources of the firm will often limit the production output to a specific number of projects/year. This is a common example for public construction projects, that are developed through a close collaboration between architects, construction firms and beneficiaries.
- b. Flexibility of production will determine a modular marketing approach. In this situation, the consumer is capable to select and combine a number of pre-existent modular components of the final product. This is the case of online car configurators, that are now available on the web site of most car manufacturers, or of Dell, who allows customers to configure online the computers they order.
- c. Flexibility of supporting service will determine a customised service approach. The level and the specificity of supporting services will be specifically adapted to each customer's requirements. On the other hand, since in the service marketing model the consumer is actively participating to the creation and consumption of services, not only the type of service, but also the service scenario has to be flexible and customisable. This case is exemplified by the post-purchase assistance provided to firms by suppliers of electronic equipment such as computers or telecommunication systems.

The level of marketing flexibility in the value co-creation process will be influenced significantly by the predominance of operand and operant resources in the value-added chain. Since the operant resources are, by their nature more flexible and adaptable, they will allow a higher level of marketing flexibility. On the other hand, the consumer's contribution often represents an operant resource, that has to be flexibly absorbed and integrated in the process of value creation.

The new theories of value advocate an extension of marketing analysis and scope from a purely customer-centric model, to a multi-centred approach, which takes into account the interests of company's employees and stakeholders (Payne and Holt, 2001). From this perspective, the flexibility of the marketing structure and processes during the participation, interaction and implementation stages should be considered within an extended model of value co-creation, which addresses the creation and management of dynamic value constellations comprising employees, customers and other categories of stakeholders.

Concluding remarks

This article has a theoretical focus. Starting from an analysis of the modern marketing, both from a theoretical and practical point of view, the concept of flexibility is brought at the forefront of new marketing systems, which are built around procedures that favour customer participation. Flexibility, within specific limits determined by company's skills, resources and profitability objectives, represents the main feature of participative marketing systems, that allow interactions with, and among employees, customers, and other stakeholders.

The flexibility of marketing systems has to be applied to all the processes of participation, interaction and implementation, in order to develop complex value-constellation systems that are capable to maximise the satisfaction and the benefits of all parties involved.

The theoretical approach of this study has a number of limitations. First of all, the model developed and discussed is only a preliminary tentative to identify the main areas of the marketing system that need flexibility in order to enhance the value co-creation process. Secondly, the analysis of flexibility in the context of participative marketing systems has mainly focused on the advantages of this approach. Thirdly, the model presented is only a theoretical construct, that needs to be tested and improved through empirical research.

Despite the importance of the value co-creation approach for the marketing theory and practice, there is a lack of studies and models concerning the practical organisation and management of such systems. The existing research framework is mainly composed from a series of anecdotic examples that emphasise the opportunities provided by value co-creation system for modern organisations. This study can provide a starting point for developing a stream of research into the necessary features of a participative marketing system, organised and managed in order to enhance the value co-creation process among customers, organisations and stakeholders.

ETHIK IM INTERNET-MARKETING

Humelnicu-Severin Anamaria

Transilvania Universität aus Braşov, Fakultät für Wirtschaftswissenschaften Colina Universității nr. 1, Corp A, Etaj III, Brașov anamaria.humelnicu@unitbv.ro, Tel.: 0722582597

With the development of Internet-Marketing, a number of ethical issues have arisen. Issues of unsolicited e-mails, hacking, fraud, privacy phishing or cloaking bother the online medium. Unethical behaviour may distrust customer loyalty and the business itself. If a company wants to succeed, the company must develop its own code of ethics and its own standards. Ethics should be high on the list of priorities.

Einleitung

Internet ist eine wichtige Informationsresource, aber gleichzeitig hat es sich mit der Zeit stark zur Geschäftsplatform vieler Unternehmen entwickelt. Ein Internetauftritt ist heutzutage sehr wichtig für die Unternehmen. Zudem bietet das Internet starke, klare Vorteile gegenüber klassischen Medien. Die grosse Reichweite, die geringen Kosten, die einzigartige Interaktivität, attraktives Werbemedium sind als Vorteile wertvoll zu erwähnen.

Das Internet hat Einfluss auf die Entwicklung der Unternehmen, auf die Geschäftsmodelle, die Gesellschaft, auf das Verhalten der Konsumenten geübt. Das Internet hat die Geschäftspraktiken und die Wirtschaft revolutioniert. Wir sind der Bedeutung des Internets jederzeit bewusst. Trotz aller ethischen Probleme, erfreut sich das Internet wachsender Beliebtheit.

Egal, ob ein Unternehmen seine Produkte oder Dienstleistungen online verkauft oder nicht, ist die Online-Präsenz äußerst wichtig und nicht mehr wegzudenken.

Eine Frage die ein Ausgangspunkt für Kontroverse darstellt ist ob alles erlaubt ist, was Umsatz bringt. Ein ethischmoralisches Handeln wird sich nie der Ausrede orientieren "der Zweck heiligt die Mittel". Ein Unternehmen muss ethische Grundsatze definieren und verfolgen, sei es im online-Medium oder nicht.

Etisches und unethisches Handeln im Internet-Marketing

Bevor man entscheidet ob im Internet Platz für Ethik ist, sollte erst definiert werden was unter "Ethik" zu verstehen ist. Ethik kann als eine Sammlung von Richtlinien für das richtige Verhalten der Personen oder der Unternehmungen angesehen werden. Es gibt Unternehmen die für sich ethische Ansprüche erheben, praktizieren diese allerdings nicht. Untersuchungen in der letzten Zeit ergaben dass Konsumenten immer weniger dem ethischen Verhalten der Unternehmen vertrauen. Differenzierung eines Unternehmens gegenüber seinen Mitbewerbern kann durch solide Einhaltung der Ethikgrundsätze geleistet werden.

American Marketing Association - die wissenschaftliche Vereinigung im Marketingbereich - hat als Ziel auch die Förderung der gerechten und sauberen Praktiken unter den Marketingakteuren. In diesem Sinne wurde einen Ethik-Kodex erlassen. Die von der American Marketing Association entwickelten Ethik-Kodex, ist auf der eigenen Webseite einsehbar.

Vom Marketer wird erwartet, dass sie sich nach den höchsten Ethiknormen und ethischen Werte richten, in der Beziehung gegenüber allen Beteiligten (Geschäftspartnern, Vertragspartnern), wie Kunden , Mitarbeitern, Investoren usw.

Laut dem Ethik-Kodex sollen die Marketers folgendes in Betracht nehmen:

- a. Keinen Schaden verursachen
- b. Das Vertrauen in das Marketing-System fördern
- c. Ethische Werte annehmen

Keinen Schaden verursachen heisst schädigende Handlungen bewusst zu vermeiden indem man hohe ethische Standards setzt und alle geltende Gesetze und Vorschriften einhällt.

Das Vertrauen in das Marketing-System fördern bedeutet nach Treue und Gerechtigkeit zu streben, sowie auch den Betrug in der Produkt- und Preisgestaltung, in der Kommunikation, im Vertrieb und Lieferung vermeiden.

Ethische Werte annehmen bedeutet starke Beziehungen mit den Konsumenten aufzubauen und das Konsumentenvertrauen gewinnen indem alle Handlungen auf folgende Werte beruhen: Ehrlichkeit, Verantwortung, Gerechtigkeit, Respekt, Transparenz und Bürgerschaft.

Ethik sollte nicht dem Zufall überlassen werden und sollte ernst genommen werden in den Kampf um die Sicherung der langfristigen Kundenziehung und Kundenbindung. Es ist besonders wichtig die Zufriedenheit der Kundschaft zu erlangen und es immer wieder verbessern.

Wenn ein Unternehmen sich ethisch verhält und moralisch handelt, sind die Kunden eher positiv gegenüber der Firma, ihre Produkte und ihre Dienstleistungen eingestellt.

Im Marketing kann man über die Ethik der Marktforschung, über die Ethik der strategischen Marketingaktionen und über die Ethik beim Einsetzen der Marketinginstrumente sprechen. In der Marktforschung soll eine ethischmoralisch einwandfreie Datensammlung und -auswertung gewährleistet sein. Unmoralische Aspeckte können auch in der Produktpolitik, Preispolitik, Distributionspolitik vorkommen, wie zum Beispiel falsche Werbung oder ungerechtes Verhältnis zwischen Preis und Qualität . Das gilt auch im Internet-Marketing.

Sowie im traditionellen Einkauf, ist auch im online-Verkauf die Preisstrategie der Firmen wichtig. Es ist zu berücksichtigen, wie die Kunden die Gerechtigkeit der Preise wahrnehmen. Online-Shopping hat das Vorteil dass man Zeit sparen kann, dass es bequemlich und praktisch ist. Was der Preis angeht, gehört zu den Vorteilen die Möglichkeit Warenpreisvergleiche bevor dem Einkauf anzustellen. In diesem Sinne ist es noch mehr wichtiger eine gutgeplante Preisstrategie zu haben und gerechte Preise sicherstellen.

Andere Aspekte der Ethik im Internet Marketing weisen auf folgendes: keinen verfälschten Inhalt der Webseite, dieselbe Version von Internetseite allen Internetnutzern zeigen, keine täuschende oder unechte Informationen, keine irrende Informationen von Produkten, Geheimhaltung der Kundendaten, Schutz der Privatsphäre, glaubwürdige und vertrauenswürdige Webseiten, ein vorliegendes Etik-Kodex, Einhaltung der geltenden Gesetze usw.

Ethik im Suchmaschinenmarketing

Der Traum jedes Unternehmen ist in den Suchmschinen erstplaziert zu sein. Eine gute Website-Positionierung in Suchmaschinen kann sich nur über einen längeren Zeitraum entwickeln. Manchmal ist es aber gar nicht möglich wegen unethisches Tricksen im Bereich der Suchmaschinenoptimierung.

Suchmaschinenoptimierer können unethische Tricks verwenden , wobei man die Suchergebnisse einer Anfrage verfälscht und man eine Webseite "künstlich" höher plaziert.

Die wichtigsten Regeln für ein sauberes Suchmaschinenmarketing sind folgende:

- 1. Relevanz der Suchbegriffe sicherstellen
- 2. Spamming bzw. Spamdexing vermeiden
- 3. Gegen geltendes Recht verstoßende Webseiten ausschliessen

Unter Suchmaschinen-Spamming sind zum Beispiel Doorway-Pages, Einsatz von unsichtbaren Seiten oder Cloaking gemeint. Doorway-Pages werden gelegentlich auch als "Pointer Pages" oder "Brückenseiten" "Jump-Pages" "Spiegelseiten" bezeichnet.

Doorway Pages sind hoch-optimierte Seiten, deren Zweck es ist, für ein spezifisches Schlüsselwort oder für eine bestimmte Phrase in den Trefferlisten von Suchmaschinen angemeldet zu sein und gut platziert zu werden. Die Besucher werden durch diese Verfahren auf eine bestimmte Seite gelockt.

Wie der Name "Doorway" schon besagt, sollen solche Seiten einen Eingang in die zu werbende Website darstellen, über den der Nutzer von der Suchmaschine auf die eigene Site kommt.

Cloaking ist also die Technik die zur Verbesserung der Rangordnung in Suchmaschinen dient. Diese Technick, Doorway-Pages zu erzeugen wird als Cloaking bezeichnet.

Weisser Text auf weißem Grund ist ein anderer unethischer Trick. Dabei bleiben vom Anwender viele Stichworte ungesehen. Manchmal genügt es alles zu selektieren um den unsichtbaren Text sichtbar zu machen. Leider funktioniert das nicht immer so einfach und all diese Techniken können schwer aufgedeckt werden.

Webseiten mit irrenführendem, rassistischem, anti-religiösem Inhalt usw. oder die die gegen geltende Rechtsnormen verstoßen, sollten ausgeschlossen werden.

Unter dem Begriff "ethische Suchmaschinen-Optimierung"sind die Optimierungserfahren gemeint, die nicht gegen Regeln der Suchmaschinen verstoßen.

Ethisch einwandfreie Suchmaschinenoptimierung ist zu erwünschen.

Mehrere Untersuchungen haben hervorgehoben dass sich viele Internetnutzer um Datensicherheit, Phishing und betrügerische Nachrichten, um Spam und Malware-Attacken sorgen.

"Phishing" ist ein Kunstwort das sich aus den zwei Begriffen "Password" und "Fishing" zusammensetzt. Wie es schon vom Namen erkennbar ist, beschreibt "Phishing" die Situation des Abfangen von Passwörtern, das "Angeln nach Passwörtern". Phishing ist diejenige Handlung, die sich auf den Versand von E-Mails oder Nachrichten auf beliebten Websites bezieht. Der Nutzer sollte sich einloggen oder sein Konto aktualisieren, wobei am wichtigsten zu erwähnen ist, dass die "Phisher" über die angegebene Links die zur gefälschten World Wide Web-Adressen führen, an die Daten der Internetbenutzer gelangen.

Es steht außer Zweifel, dass man mit Geschäften im Internet schnell reich werden kann. Es ist aber besonders wichtig nicht zu vergessen dass das Vertrauen der Kunden gepflegt werden muss. Obwohl immer mehr Internetnutzer online kaufen, bleibt immernoch ein erhebliches Misstrauen gegenüber dem elektronischen Handel bestehen. Kunden brauchen ein vertrauenwürdiges Unternehmen, auch in dem Falle der Online-Unternehmen.

Um nicht angeforderte kommerzielle Kommunikationen (spam) zu senden gibt es mehrere Möglichkeiten an die Email Adressen zu gelangen und diese zu sammeln. E-mail Adressen können aus Websiten, Blogs, Diskussionsforen usw. gesammelt werden.

E-Mail Adressen werden aus Nachrichten geangelt, die der Benutzer versendet hat um bestimmte Informationen zu kriegen oder kostenlose Broschüren zu erhalten

Einsetzen bestimmter Roboter für Web-Seiten - web-bots, crawlers, spiders, zum Sammeln von E-Mail-Adressen für Spamzwecke. Die eMail-Bots, die autonom und ständig Internetseiten auf vorhandene eMail-Adressen absuchen und diese abspeichern

Dabei werden verschiedene Symbole erkannt (zum Beispiel "@", oder ".com". Falls jemand seine Adresse schreibt indem er das Symbol "@" mit "at" ersetzt, kann es der Fall sein dass der Roboter diese Adresse nicht anerkennt. Es ist selbstverständlich dass eine Person nicht so viele Adressen sammeln kann, wie viele es ein Roboter schafft, aber sie können Adressen erkennen, welche die Roboter zu erkennen scheitern.

Einsetzen von Viren die Mailprogramme entdecken und somit Adressen einsammeln.

Ein weiteres ethisches Problem ist das Absenden von Spam-Mails von gefälschten Email-Adressen. Es werden Webenachrichten geschickt mit einer falschen Absender-Adresse.

Durch die steigende Anzahl von Spam-bots wird die e-mail Sicherheit gefährdet.

Zum Datenschutz kommt in Frage auch das Problem von cookies, diese kleine Textdateien die Informationen über besuchte Seiten, Besuchsdauer und Benutzereinstellungen beinhalten. Wenn auf einer Internetseite cookies verwendet werden, sollten diese nie auf unethischer Weise verwendet werden.

Probleme wie "spam" (nicht angeforderte kommerzielle Kommunikationen), Datenschutz oder Transaktionensicherheit stören die Entwicklung des online Marketings. Es wird immer schwieriger sein, sich Rechenschaft zu geben wem man online vertrauen kann. Dies zufolge gewinnt moralisches Handeln immer mehr an Bedeutung für den Erfolg der Unternehmen in der Internetära.

E-MARKETING IN DER "E-EVERYTHING" WELT

Humelnicu-Severin Anamaria

Transilvania Universität aus Braşov, Fakultät für Wirtschaftswissenschaften Colina Universității nr. 1, Corp A, Etaj III, Brașov anamaria.humelnicu@unitbv.ro, Tel.: 0722582597

We are living the digital world now. We are speaking about e-commerce, e-mail, e-meeting, e-payment, e-security and others. It is the world of e-everything. In this world e-marketing has gained a special place. The marketing of the future is related to the Internet.

Schlüsselwörter: e-Marketing, Digitalisierung, Internet-Ökonomie

Cod JEL lucrare: M31, L81, L86

Die digitalisierte Welt

Heutzutage sprechen wir immer mehr über E-Auction, E-Banking, E-Books, E-Business, E-Cash, E-Commerce, E-Education, E-Entertainment, E-engineering, E-Government, E-Learning, E-Mail, E-Marketing, E-Market, E-Meeting, E-Procurement, E-Payment, E-Security, E-Service, E-Shop oder E-Strategy. Und die Liste könnte noch erweitert werden. Und das heisst e-everything.

Ein gewöhnlicher Tag kann so aussehen: E-Business betreiben, indem man im e-Mall ein e-Produkt kauft und das e-Payment System benutzt und mit E-cash bezahlt. Danach an einer E-Auction teilnehmen. E-vote im Internet durchführen. Nachher e-mails an Kollegen und Bekannte schicken und Preisvergleiche im E-shop anstellen , wobei man Bewusst der Regeln des e-Marketing ist. Unterrichtsmaterialien über eine e-learning platform zugreifen. Ein eBook lesen.

Internet zählt zu den grössten Erfindungen der Welt. Es hat unser tägliches Leben stark verändert, so dass für viele Menschen das Leben ohne Internet unerträglich und undenkbar ist. Das haben auch viele durchgeführten Studien hervorgehoben. Das Leben ohne "googlen", ohne chaten, ohne e-mails, ohne online-Einkäufe und ohne Ticketreservierungen ist kaum noch vorstellbar für immer mehr Menschen. Das gehört zum Alltagsleben.

Das Internet hat sich als das wichtigste Kommunikationsmedium entwickelt. Menschen und Unternehmen profitieren von vielen Vorteilen die dieses Medium anzubieten hat: Internet bricht zeitliche und räumliche Grenzen, gute Informationsquelle, schnelle Datenübertragung und effizienter Informationsaustausch. Internetpräsenz ist zudem äußerst wichtig für Kundengewinnung und Kundenbindung, erlaubt günstige Werbung und wichtig um ein gutes Unternehmensimage zu gewinnen. Unternehmen entdecken, dass sie keine andere Wahl haben, als im ebusiness mittendrin zu sein.

In der Mitteilung der Kommission im September 2008 über künftige Netze und das Internet wird angegeben dass insgesamt der Übergang zum Internet der Zukunft nur dann stattfinden kann, wenn ein schneller Internetzugang für alle zur Verfügung steht. Demzufolge "stellt die Kommission derzeit eine vorausschauende Strategie für Datenschutz und Vertrauen in einer allgegenwärtigen Informationsgesellschaft auf." Das Internet der Zukunft soll schneller werden durch die Einführung leistungsfähigerer Hochgeschwindigkeits-Breitbandnetze, soll dynamisch und offen bleiben und gleichzeitig auch sicherer werden. Die Mitteilung der Kommission soll den ersten Schritt darstellen auf dem Weg zum Internet der Zukunft.

Marketing im Zeitalter der Digitalisierung

Dadurch das alles digital wird, wird auch das Marketing beeinflusst. Das heisst aber lange nicht, dass das klassische Marketing ersetzt wird, sondern nur ergänzt.

Die kommende Internetgeneration bedeutet schnelle Internetverbindung und steigende Anzahl von Computer. Das drahtlose Internet wird immer beliebter - Internetzugang per handy, oder via PDAs (ein kompakter, tragbarer Computer, genannt "persönlicher digitaler Assistent").

Laut einer Statistik der comScore, am Ende des Jahres 2008 erreichte die Anzahl der Internetbenutzer weltweit 1.007,7 Millionen. comScore ist zu diesem Ergebnis gelangt, ohne den Zugang von Internet-Cafés, via Handys oder PDAs zu berücksichtigen. Die Anzahl ist wie folgt verteilt: Asien- Pazifik (41,3%), Europa (28%), Lateinamerika (7,9%), Mittlerer Osten und Afrika (4,8%).

"Eine Milliarde Nutzern weltweit zu überschreiten ist ein wichtiger Meilenstein in der Geschichte des Internet" sagte Magid Abraham, comScore CEO in einer Erklärung. "Es ist ein Denkmal für die zunehmend einheitlichen, globalen Gemeinschaft, in der wir leben, und erinnert uns daran, dass die Welt wirklich flacher wird."

Nielsen Mobile beobachtet derzeit die mobile Internet-Verbreitung in 16 Ländern. Die Vereinigte Staaten weisen den grössten Anteil mobiler Internetnutzer unter den Handy-Besitzern mit 15,6%. Grossbritanien (12,9%), Italien (11,9%), Russland (11,2%), Spanien (10,8%) kommen demnächst im Top. Diese Nutzer greifen auf das Internet zu via Handy, überprüfen das e-mail, erforschen soziale Netzwerke und führen Banktransaktionen durch. Das mobile Internet wird zu einem attraktiven Medium für Marketer.

Da die Gerätfähigkeiten sich erweitern und die Netzwerk-Geschwindigkeit sich verbessert, erhöht sich die Anzahl der Internetnutzer über Handy, was die Interessen der Marketer weckt, sich an das mobile Internet zu wenden und es als ein wichtiges Medium anzusehen, um bestimmte Zielgruppen zu erreichen.

Die neue Ökonomie bedeutet nicht unbedingt Entstehung einer neuen Wirtschaft, sondern eine "old economy", mit Zugang zu neuen Technologien. Laut Rohner K., haben die Basisinnovationen in der Informationsära bereits stattgefunden. Die Technologie basiert sich auf die digitale Technik. Sicherlich wird der nachfolgende Verlauf der Technologie weiterhin eine Entwicklung kennen, aber in der Richtung der digitalen und elektronischen Entwicklung. Es wird keine andere Kommunikation geben mittels alte Techologien, sondern nur digitale. Die Folge ist: digital denken, sehen, sprechen und fühlen und die Regeln der Digital-Ära anwenden. Die Industrie-Ära stützt sich auf das Massen-Marketing auf, während in der Informations-Ära, das Marketing den Akzent auf die einzelnen Kunden setzt.

Regis McKenna veröffentlichte im Jahre 1991 in Harvard Business Review seine Arbeit mit dem Titel "Marketing ist alles" ("Marketing is everything"). Der Autor sprach über das neue Marketingparadigma, in Anerkennung des Beitrags der Technologie zur Transformation des Marketings. Dies Transformation des Marketings ist durch die Macht der vorhandenen neuen Technologien vorangetrieben worden. McKenna meint dass die Technologie heutzutage so allgegenwärtig geworden ist, dass es nur Technologie-Unternehmen gibt. Technologie wurde mit erstaunlicher Geschwindigkeit in Produkte und auf dem Markt eigeführt.

Deinlein (2003) klärt was unter der viel erwähnten New Economy zu verstehen ist. Die New Economy charakterisiert sich im Wesentlichen durch den Übergang von der Industrie- zur Informationsgesellschaft. Viele Autoren definieren den Begriff nahezu gleich mit der Internet Economy, weil Sie das Medium Internet als der eigentliche Auslöser der New Economy betrachten.

Andere Autoren unterscheiden zwischen der Neuen Ökonomie und der Internet Ökonomie, welches auch mit der Net-Economy gleichzusetzen ist. Das Marketing der Zukunft muss im Zusammenhang mit dem Internet gesehen werden, weil dieses Medium die Märkte und die Kundenwünsche geändert hat.

Es ist Wert zu erwähnen, dass das E-Marketing erheblich an Bedeutung gewonnen hat im Vergleich zu den klassischen Werbeformen. Man kann behaupten dass die Zukunft der Werbung überwiegend digital ist.

Unternehmen fangen an die klassische Werbung zu reduzieren und investieren mehr in Online-Werbung. Untersuchungen ergaben dass die stärksten Instrumente im Internet-Marketing, e-mail und die Suchmaschinen sind. Dadurch dass das e-mail immernoch die beliebteste Anwendung der Nutzer ist, gehört die Kundenansprache durch E-Mail-Marketing zu den effizientesten Maßnahmen im Marketing-Mix. E-mail wurde als ein Marketinginstrument erfolgreich eingesetzt. Die Vorteile die das E-mail anbietet - geringe Kosten für versandte E-mails und auch die Messbarkeit geöffneten bzw. Gelesenen Mails - sind gar nicht zu vernachlässigen.Immer mehr Unternehmen erzielen einen erheblichen Anteil Ihres Umsatzes über das Internet.

Internet ist aber der am häufigsten gewählte Informationskanal wenn es um bestimmte Produktsuche geht. Wenn jemand Produkte wie elektronische Geräte, Autos oder Motorräder kaufen will und sich um dessen Charakteristika und Preis interessiert, wird er im Internet nach der gewünschten Information suchen. Informieren aus Zeitungen, Zeitschriften sind weniger beliebt. Das Potential des Internets ist auf jeden Fall gross, sogar grenzenlos.

Internet bietet über gezieltes Internet Marketing, Kunden auf das Unternehmen aufmerksam zu machen, also Kunden anzuziehen, Kunden binden und deren Loyalität zu gewinnen, aber zugleich ist Internet auch ein wichtiges Instrument zur Umsatzgewinnung. Nicht jedes Unternehmen nutzt heutzutage dieses Potential aus.

Mit der Entwicklung des Internets haben sich auch die Gründe für die Internetnutzung vervielfacht. Während früher der Hauptgrund zur Internetnutzung das Versenden und lesen von emails war, entwickelten sich heutzutage auch andere Aktivitäten im Internet. Online-Banking, online shopping, online Auktionen und Durchführung geschäftlicher Transaktionen wachsen ständig.

Um einen offenen und wettbewerbsfähigen Binnenmarkt für die Informationsgesellschaft und die Medien gewährleisten zu können, verfolgt die Kommision vier Ziele innerhalb der Initiative i2010 ("i2010- Eine europäische Informationsgesellschaft für Wachstum und Beschäftigung): die Steigerung der Geschwindigkeit der Breitbanddienste in Europa, die Förderung neuer digitaler Dienstleistungen und Inhalte, den Ausbau der Geräte und Plattformen, die "einander verstehen", Erhöhung der Sicherheit im Internet durch besseren Schutz vor Betrügern, schädlichen Inhalten und technischen Mängeln.

THE SATISFACTION OF THE PATIENTS – PANACEA OF THE MANAGEMENT ORIENTED TOWARDS THE MARKET OF THE SURGERY MEDICAL SERVICES

Ioanăș Corina

The Academy of Economic Studies Bucharest, The Faculty of Accounting, Informatics and Management Control Bucharest, Strada Piata Romana nr 6, Sector 1, corina ioanas@yahoo.com, 0723.425.592

Bitca Tiberiu Alexandru

National School of Politic and Administrative Science, Strada Uranus, Nr 5-7, Bl. A7, Ap.7, Sector 5, Bucuresti, tiberiubatca@gmail.com, 021.410.72.74

Nowadays, the new approach of the relations with the beneficiary of the surgery services promotes a new optical, the one in which the applicant of the health services is no longer considered "ill" or "patient" but "client" or "beneficiary". Therefore, the satisfaction of the patient, viewed as client, becomes generally a fundamental aspect of the strategy of marketing and especially of the medical marketing, which is viewed as an economic and social mechanism through which the beneficiaries of the sanitary services obtain what they need and what they want by the appearance of the service exchange. Therewith, this satisfaction of the client is transposed in a real management of demand reified in the formulation of the strategy of marketing for the problems that aim at obtaining new approaches for the excellence of the relationships with the beneficiaries of the surgery services

Key words: the marketing of services, sanitary marketing, the patient's satisfaction, perception, expectations, empathy

Cod JEL: 118, M31, P36

1. Literature review: sanitary marketing – as component of the service marketing

The constitution of the marketing in the health domain, as a distinct domain of the service marketing, is based on certain specificities determined by ³⁸⁶:

- 1. **The services characteristics**, formulated by *Ph Kotler* and adopted by all the specialists:
- a) **Intangibility** it aims at the immaterial aspect of the services, meaning that these ones cannot be seen, tasted, felt or smelt before they are bought.
- b) **Inseparability** it refers to the characteristic of the medical services which cannot be separated from the provider, being realized only by direct connection doctor-patient.
- c) **Variability** it refers to the fact that a medical service can never be repeated identically, being determined by the patient's pathology, by the medical personnel who administrates the treatment and by the material and medical support which represented the basis of the treatment.
- d) **Perishableness** it refers to the fact that the medical services cannot be stocked in order to be ulterior reused.
- 2. Another aspect of the health marketing is given by the three components of the services **marketing object**, meaning:
- a) The extern marketing of the organization contains an ensemble of strategies and tactics of marketing through which the consumer becomes aware of the organization offer. Thus, the basis characteristics of marketing meaning the concept "4P" Product, Price, Promotion, and Placement are transformed in the medical marketing in the concept STAP- Service, Tariff, Access, and Promotion.
- b) The interactive marketing is interested in all the services created and delivered and the interaction provider-consumer. Within this relation, applied to medical services, the patient will appreciate the quality of a service not only technically (the success of a surgical intervention for example), but also functionally (amiability, availability, trust, confidence, the understanding of the patient's expectations etc.);
- c) Internal marketing it refers to the approach in an optic of marketing of the personnel in order to realize the correspondence between the promised services and those effectively provided. (For example a surgical intervention imposes a tight communication between the surgeon, anesthetist, medical assistants, and nurses).
- **3.**Considering the sanitary marketing a component of the services marketing depends on a series of components being in interaction and which form the **creation and delivery system** respectively:
- a)The elements subject of the procession the patient being the element of the health services;
- **b)The processual components** afferent to services are: the client, the physical support of the supply, the contact personnel, and the service created and delivered. Adapted to the medical services, these components become: the patient, the medical instruments used and the medication, the doctor mainly as a contact person having a tight relation with the non-medical personnel; the service offered by the prevention, treatment or recuperation.

In principle, the sanitary marketing as a component of the services marketing presents the following features:
a) It applies to people (patients), ideas and medical services;

³⁸⁶ By Violeta Radulescu, Marketingul serviciilor de sanatate, Uranus Publishing House, Bucharest, 2008.

- **b)** The changes are not financial;
- c) The finality of the activity is more complex, and it cannot be strictly measured in financial terms;
- d) The benefits are not correlated with the payments effectuated by the consumer;
- e) The hospitals usually address to some groups having a low financial power;
- f) The hospitals market has 2 components: the relation with the patient and with the system of financing which are in antagonistic relations;
- g) The purpose is the increase of the services' quality in order to serve better the patients, and finally the improvement of the population health estate;
- **h)** The main objective is the offering of qualitative health services, insuring progresses, especially concerning the treatments offered, of the medical equipments used and of the medical personnel trained and oriented towards the patient;
- i) The purpose is to make the medical service more accessible to all patients;
- j) The purpose is to make the medical service adapted to the patients' expectations and known to these ones taking into account the asymmetric information of the patients due to the social environments they come from.

2. The patients' satisfaction: the key point of the marketing strategy

The patient's satisfaction represents the reflection of the health services' quality. Nowadays, a special importance is given in the sanitary system to the reaction idea of response of the client/user of medical services and to the idea of offering him what he wants.

In principle, for the patient's satisfaction, the relationship doctor-patient presuposes concomitantly:

- a) A medical dimension it refers strictly to the medical act itself; the satisfaction of the clients means cognitive evaluation and emotional reaction to the structure elements (human, material and financial resources and the hospital environment), to the process elements (technical aspects) as well as to the results of the supplied medical services. Further on, the researches in the domain demonstrate that the satisfaction is in relation with the perception of the technical aptitudes, the intelligence and the qualification of the medical personnel.
- **b)** A communication dimension This has to aim at the information of the patient both in what concerns the diagnosis, the treatment, the recuperation and the consequences upon the quality of its life which most of the times can be shocking. The patients must be asked what their expectations from the doctor are. An aspect of the medical care frequently studied is the extension and the accuracy of the communication doctor-patient. The satisfaction of the patient is strongly dependent on the clarity of the information offered and this could be an important sign of the quality of the communication doctor patient.
- c) An affective dimension which must exist during the entire hospitalization and must aim at the care of the medical personnel not only for the medical actions, but also for the recognition of the new function of the person, that of "patient", which suddenly passes from the estate of healthy man to that of ill man. Taking into consideration the fact that in general a surgical intervention is conceived as being complicated, it is necessary the presence of this affective dimension so that it maintains the equilibrium of the patient (for example interdisciplinary teams surgeon psychiatrist psychologist).

First of all, we must identify the patients' needs so that the medical personnel have the opportunity to prevent them, using properly the medical techniques and procedures.

One of the most important directions and actual moments concerning the medical assistance is putting the patient in the centre of attention and care. This is why the opinions of the patients can be considered keys for the evaluation of good or insufficient activities in the context of the marketing strategy. The quality of the sanitary services equally refers to the increase of the clients/users' satisfaction, to the professional audit and to the improvement of efficiency or the reduction of the costs, being approached differently by each category of actors implied in the sanitary services: the government, the patients, the professionals, and the management of the sanitary organization. Because nowadays in the sanitary system a special importance is given to the idea of response reaction coming from the client/user of medical services and the idea of offering this one what he wants, the methods and the techniques of studying the patient's satisfaction are used more and more in the sanitary organizations.

3. The patients satisfaction through the general evaluation of the service

This model is based upon the fact that the patients, in their quality as clients, can evaluate the quality of services comparing their perception with the expectations they are waiting for

The proposed scale includes five dimensions: **Tangibles, Trust, The medical staff's attitude, and the Insurance, the Empathy**, measured on a **scale Likart with seven steps**, starting with total agreement and ending with total disagreement:

1. TANGIBLE ELEMENTS:

- a) The surgery section has a modern and last generation equipment;
- b) The facilitations of the physical space (surgery room, dressing rooms, dinner salons) are enjoyed by the patients;
- c) The medical stuff has a professional and a neat aspect.

2. TRUST:

- a) When the medical stuff promises something, then he keeps his words;
- b) If the patients have a problem, the medical stuff will show an honest interest in solving it;
- c) The medical stuff will perform the services excellently from the beginning:
- d) The medical stuff will perform the services in due time;
- e) The medical stuff will follow the inexistence of errors.

3. THE ATTITUDE OF THE MEDICAL STUFF:

- a) The medical stuff will explain the patients where the medical services will be performed;
- **b)** The medical stuff will give prompt attention to all the patients;
- c) The medical stuff is always ready to help the patients;
- **d)** The medical stuff is never too busy to answer the patient's questions.

4. INSURANCE:

- a) The behaviour of the medical stuff will give confidence and trust to the patient;
- b) The patients feel safe and having no risks regarding the performance of the medical act;
- c) The medical stuff is always polite;
- d) The medical stuff has the necessary conditions in order to answer to all the patients' questions.

5. EMPATHY:

- a) The medical stuff assures the patients individual attention;
- **b)** The medical stuff has a program which is convenient to all the patients;
- c) The medical stuff understands the specific needs of the patients.

The proposed instrument operated as it follows:

1. The intensity of the patients' expectative regarding certain components of the surgery sections' services is **determined.** This way, the 5 criteria mentioned above serve as reference.

In table 1, there are shown 5 declarations extracted from SERVQUAL, each of them referring to a different criterion.

Table 1. The intensity of the expectative
Show to which point a surgery section should have the characteristics described in each declaration
Does the surgery section have modern and of late generation equipments? (TANGIBLE ELEMENTS'
DIMENSION)
1 2 3 4 5 6 7
When a medical stuff promises something does he keeps his word?
(TRUST DIMENSION)
1 2 3 4 5 6 7
Is the medical stuff always ready to help the patients?
(THE MEDICAL STUFF'S ATTITUDE DIMENSION)
1 2 3 4 5 6 7
Does the medical stuff comportment give confidence and trust to the patient?
(INSURANCE DIMENSION)
1 2 3 4 5 6 7
Does the medical stuff understand the specific needs of the patients?
(EMPATHY DIMENSION)
1 2 3 4 5 6 7

2. There are questions concerning the perception of different elements of the surgery section's elements which want to be evaluated by means of declarations parallel to that anterior, table 2.

Table 2. The percention of the elements of the surgery section's elements

Table 2. The perception of the elements of the surgery section's elements
Show in what manner the surgery section has the characteristics described in every declaration
Do the equipments of the surgery section have a modern aspect?
(TANGIBLE ELEMENTS' DIMENSION)
1 2 3 4 5 6 7
When a medical stuff promised something did he kept his word?
(TRUST DIMENSION)
1 2 3 4 5 6 7
Was the medical stuff always ready to help the patients?
(THE MEDICAL STUFF'S ATTITUDE DIMENSION)
1 2 3 4 5 6 7
Did the medical stuff comportment give you confidence and trust?

(INSURANCE DIMENSION) 1 2 3 4 5 6 7

Did the medical stuff understand your specific needs? (EMPATHY DIMENSION) 1 2 3 4 5 6 7

3. The quality of services in the surgery section is evaluated. For this, the "difference existent between the scores which are calculated by the patients to the different pairs of declarations" are calculated. Quality is defined as a difference between perceptions and expectative. This evaluation of the quality will allow the definition of the improvements points of the service. Also, the method allows the reaching of a score for each criterion.

QUALITY=PERCEPTION=EXPECTATIVES

For example, for one questioned patient, the calculation situation of the quality is presented as it follows:

Table 3. The calculation of the quality

DIMENSION	PERCEPTION	EXPECTATIVES	QUALITY
TANGIBLE ELEMENTS' DIMENSION	7	5	2
TRUST DIMENSION	6	3	3

Interpretation: the improvement of the service will be realised mainly in what concerns the Insurance Dimension At the same time in which an estimation of the satisfaction is effectuated, relying on the service factors, it is necessary to demand a global evaluation of the service. This can be made in the same questionnaire used for the evaluation of the service factors, using a similar number scale. Also, it can be effectuated an immediate evaluation of the service performance through a short and attractive form of investigation. Such a model adapted to the surgery section is presented in what follows.

In order to improve the services we are offering you, we need to know your opinion. In order to express it, please circle the number which indicates better the satisfaction upon each of the following aspects.

Keywords: Romanian insurance market, insurance supply, insurance demand, global crisis

Cod JEL: M31, G22

Nowadays, the insurance market in Romania can be characterized thus: a developing market both from a quantitative and a qualitative point of view, with demand concentrated in areas of above-average economic activity, having a varied supply and increasing competition. On the Romanian market there is a discrepancy between potential and effective demand. Potential demand is high, due to the large number of persons, the large number of properties, due to unsatisfied needs of both natural persons and legal entities. However, effective demand is quite low. The impact of the global financial crisis on the insurance industry in Romania was so far 'relatively limited' and has mainly affected consumer trust.

1. Insurance supply

Services supply is represented by the production of services on the market. Similarly, we can define insurance supply as being the production of insurance/reinsurance meant to be traded on the market. The insurance supply is presented by a number of insurers and reinsurers, specialized societies authorized to function in this domain. Insurers are financial intermediaries that use private capital to finance consumer and business risks of financial loss, for a profit to the providers of that capital.

Insurers and reinsurers must have the ability to meet payment obligations towards their customers. This ability is evaluated with the help of a series of financial – economic indicators. There are agencies specialized in evaluating insurance companies – the rating agencies. The largest and best known rating agencies are Standard and Poor's, Moody's, AM Best.

In Romania, the only parties which can be engaged in the insurance activity are public companies, mutual societies, branches of foreign insurers, constituted as Romanian legal entities, authorized by the Insurance Supervision Committee and branches and subsidiaries of insurers, foreign legal entities, authorized by the Insurance Supervision Committee. Insurance companies must observe a series of legal requirements regarding the size of the minimum share capital, the size of the obligations they can assume, the premium reserves, the reserves for indemnities they must hold, the modality of recording their activity etc. In 2008, there were 43 insurance companies authorized to function on the Romanian market by the Insurance Supervision Committee.

From the point of view of existing products, the supply on the insurance market is extremely diversified. Insurance services are in a continuous and complex process of diversification, emphasized by the permanent multiplication of insurance products.

A defining feature of insurance supply derives from the fact that insurance can be considered part of the category of services based on personnel. Consequently, the quality of the supply depends on the training and skills of the personnel (both the staff coming in direct contact with the clients and the staff in charge of the management of funds), on the managerial capacity of the managers of insurance companies.

The link between the insurers and the insured on the insurance market is either direct or through intermediaries. Insurers can distribute their products directly by opening branches in various regions or cities. The intermediaries can be insurance agents or insurance brokers.

On the insurance market, there are also specialized societies which offer services associated with the insurance / reinsurance activity, risk inspectors, risk managers, insurance experts etc.

The supply on the Romanian market - from the point of view of existing products - is varied, and there are numerous types of insurance which can be divided function of several criteria, such as: function of the nature and

387 The paper was elaborated based on a CNCSIS research grant (Program IDEI cod 1773)

type of risk insured, there are: non – life insurance (general) and life insurance; function of the domain they refer to, insurance can be divided into: property insurance, insurance for individuals and third party liability insurance; function of the legal form of taking out insurance, there are: optional insurance and mandatory insurance. In Romania, there is nowadays only one type of mandatory insurance, namely third party motor liability insurance.

The various types of insurance destined for natural persons offer protection against a large number of risks. For instance, through life insurance, financial protection is offered for the family and the persons in the care of the insured, in the case of the death of the insured; other forms of insurance include investments, retirement funds, savings funds (for example for the future of the children: studies, dowry etc.). Through health insurance, care is provided for the period of the illness, through travel insurance, accidents or illnesses that can occur during travel are insured, through property insurance, the protection of the house and goods is provided, through third party liability insurance, the insurer undertakes the obligation to pay indemnities for the damage caused by the insured to a third party, through financial insurance, the insured is protected against financial risks etc. The insurance supply for legal entities is mainly formed of the following types of insurance: group life insurance, health insurance, loss and injury insurance for the employees, retirement insurance for the employees, third party liability insurance, property insurance, freight insurance, financial insurance, insurance against lost of profit etc.).

The supply on this market continues to diversify, as an important number of new products adapted to the specific needs of the Romanian market have appeared. The societies bringing most novelties on the market are those with foreign capital.

2. Insurance demand

Demand is the result of the needs existent on the market manifested both by natural persons and legal entities, which are willing and able to take out insurance, when confronted with various (insurable) risks.

Potential demand on the Romanian insurance market is high, due to the large number of persons and properties and due to the existence of unsatisfied needs of both natural personals and legal entities. However, the real demand is quite low. This discrepancy can be explained, on the one hand, by a series of economic reasons: the low level of income of the population, the lack of financial support and, on the other hand, an important role is played by the lack of education in the field on the part of potential clients. The relatively low interest in taking out insurance is due to a large extent to misunderstanding the role and necessity of insurance. This lack of information is the result of a long period in which the population was used to free coverage of damages by the state. Therefore, the role of insurance companies is extremely important, as they have to create a new mentality. The insurance companies must not only supply a series of products, but they must also have an informative and educational role.

The insurance demand on the Romanian market does not have a uniform character, neither regarding the types of insurance in demand, nor concerning geographical distribution; it is focused on geographical areas with a high economic potential and on the above-average income population. Thus, most gross premiums were underwritten in 2007 in the Bucharest – Ilfov area, 46.26% respectively, followed, at a considerable distance by the North – Western region (which includes Bihor, Bistriţa Năsăud, Cluj, Maramureş, Sălaj, Satu Mare counties) with a share of 9.2% of the total. In the first semester of 2008, the distribution of gross written premiums by development regions has not recorded significant changes, being, according to the Insurance Supervision Committee data, the following: Bucharest – Ilfov area: 46.51%, North – Western region: 9.6%, Central region: 8.83%, Southern region 8.57%, South - Eastern region 8.04%,. North – Eastern region 6.89%, Western region 6.37%, South - Western region 5.2%.

The size and structure of demand on the insurance market depends to a large extent on the level of economic development of the country, as well as on the order of priority given by each person to insurance protection, compared to the need for food, housing, clothing, health care, culture, entertainment etc.

The evolution of demand recorded an ascending trend, as between 2002 and 2007 the volume of gross written premiums in the insurance contracts has increased from 548 million Euros to approximately 2 billion Euros. Even if the interest in taking out insurance is still quite low, we can notice from the evolution of the volume of gross written premiums that the insurance market in Romania is expanding – see Table 1.

Table 1. Development of the volume of gross written premiums in insurance contracts (both from direct insurance and from reinsurance incomes) in the 2002-2007 period

Years	Volume of gross written premiums (RON)	Volume of gross written premiums (mil. Euro)	Nominal growth compared to the previous year	Real growth	Inflation rate
2002	1,914,534,300	548.00	-	-	17.8%
2003	2,673,816,291	650.29	39.60%	22.40%	14.1%
2004	3,476,543,926	876.52	30.02%	18.96%	9.3%
2005	4,417,165,819	1,201.26	27.07%	17.01%	8.6%
2006	5,729,284,541	1,694.20	29.70%	23.68%	4.8%
2007	7,175,789,699	2,033.83*	25.25%	17.53%	6.57%

Source: CSA (Insurance Supervisory Commission) – Reports 2002, 2003, 2004, 2005, 2006, 2007 *Computed function of the leu/Euro exchange rate from the 31st December 2007: 3,582

Nowadays, the demand on the insurance market is affected by the crisis in Romania, but the effects are not so damaging, as it is based to an overwhelming degree on the mandatory motor third party liability insurance – RCA, professional liabilities, CASCO insurance for cars taken under leasing agreements, etc. (which are compulsory). In 2008, the demand for general insurance represented 80% of the insurance market, and auto insurance represented 75% of general insurance. Even if the automobile market has recorded a significant decrease, the effects on the insurance market are not immediate, as automobiles already existent are insured. On a medium and long term the effects can though appear on the insurance market as well, if the situation does not improve. These types of insurance are 20 to 30% more expensive in 2009 compared to 2008, on average, and specialists forecast a decrease in the number of optional policies issued.

The general insurance sector is much more developed in Romania than the life insurance sector, as mandatory insurance has a large share in the total volume of premiums collected. The most wanted type of insurance policy is and will continue to be the mandatory motor third party liability insurance – RCA. In the general insurance sector, the rate of growth of demand was lower than in the life insurance domain because after the 90s, the rate of growth of the demand in the life insurance sector was extremely significant due to the fact that the starting point was very

The global financial crisis has affected most the demand for the unit-linked and life insurance.

3. Statistical forecasts on the evolution of the Romanian insurance market

The fact that the Romanian insurance market is an expanding one is proved by the favorable evolution of some indicators, such as: the degree of insurance penetration in the economy and the insurance density. The insurance penetration in the economy has recorded a slow growth. If in 1996, the degree of insurance penetration in the economy was of 0.51%, in 2002 the indicator exceeds the 1% level. In 2007, the insurance penetration in the economy was calculated as being the gross written premiums from direct insurance-to-GDP ratio and it was of 1.77%. Although recording an increase compared to the previous years, the insurance penetration in the economy stays at a low level compared to values recorded in Central and Eastern European states (between 3 and 5%) or to the average recorded in developed countries in the European Union, of over 8%.

Table 2. The evolution of the insurance penetration in Romania in 2002-2007

Years	Gross written premiums (RON)	GDP (billion RON)	The degree of penetration (%)
2002	1,914,534,300	151.2	1.27%
2003	2,673,816,291	189.1	1.41%
2004	3,476,543,926	238.7	1.46%
2005	4,417,165,819	287.2	1.54%
2006	5,729,284,541	342.4	1.67%
2007	7,175,789,699	404.7	1.77%

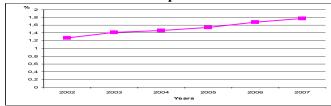

Sources: CSA- Annual reports 2002, 2003, 2004, 2005, 2006, 2007

Function of GDP, the gap compared to developed countries of EU of insurance penetration in Romania is significant. To estimate the period necessary to reach the level of countries with a developed insurance market, we have used the average growth and the trend methods.

According to *the average growth method*, the annual average growth of insurance penetration was of 0.1% in the 2002-2007 period. Using this method for forecasting, in 2008 the insurance penetration is of 1.87%, in 2009 of 1.97%, in 2010 of 2.07%, and it would follow that in approximately 62 years, we could reach, if the current trend continues, a 8% level of insurance penetration.

In the case of the *trend* method, to choose the function for adjusting we will first represent in a graphic the evolution of the absolute level of specialization function of employment (Figure 1).

Figure 1. The evolution of insurance penetration in Romania in 2002-2007

According to the graphic representation, we shall use the linear trend method, the evolution of the **insurance penetration** recording an approximately constant growth in the period analyzed. Function of the equation: $y_i = 0.093 x_i + 1,57$ the forecast of the insurance penetration indicates the following values: 2008: 1.85%, 2009: 1.94% and 2010: 2.03%. When forecasting by using this method we have reached the same conclusion as in the case of the previous method.

The evolution of the life and general insurance market was an ascending one. From table 3 we can notice that the most important contribution to the total volume of gross written premiums from insurance came on the whole period analyzed from general insurance.

Table 3. Development of gross written premiums from the total insurance activity, as well as on insurance categories 2003-2007

Years	Total insurance mil. Euro	Life insurance %	General insurance %
2003	650.29	23.19	76.81
2004	876.52	21.98	78.54
2005	1,201.26	23.50	76.50
2006	1,694.20	19.87	80.13
2007	2,033.83	20.19	79.81

Source: CSA – Report 2007

In order to study the evolution of the structure of the Romanian insurance market we have used statistical methods such as the Markov chain and by this method for 2009 the forecasted structure of the insurance market is: Life insurance 18.92%, Non-life insurance 81.08%.

In **conclusion**, we can say that even if the Romanian insurance market has recorded an ascending trend in recent years, the level of real demand is quite low in spite of the diversified supply, and the impact of the crisis on the insurance industry in Romania was so far 'relatively limited' and has mainly affected consumer trust, as the negative reaction was firstly an emotional one, influenced by the current context.

Romanian organizations generally are concerned with their financial performances, but they should pay attention for monitoring their marketing results, and if they activate on the web their online marketing results, too. The article refers to the importance of using marketing metrics, both in the offline and online world, and of trying to find ways of combining these online and offline metrics to get a realistic image of their integrated marketing activities' performances.

Keywords: online marketing, marketing metrics, online marketing performance, offline marketing performance, integrated marketing metrics

JEL code: M31

1. NECESSITY OF METRICS FOR MEASURING ONLINE MARKETING RESULTS

Romanian organizations generally are concerned with their financial performances. They use different methods, tools to asses their financial performances, their businesses' performances.

There is a need for Romanian organizations to become aware of the importance of planning, implementing the plans and evaluating the results of the implementation, the results of the different programs. This applies for all their activities, and of course also for their marketing activities and online marketing activities. Romanian organizations should pay more attention to monitor the results of their marketing activities and online marketing activities, too.

But why do organizations need marketing metrics?

Romanian organizations generally review their financial results, but they should also determine their marketing performances, by using marketing metrics that measure the contribution of customers to the organization's profits. Marketing managers should be also concerned about specific metrics that measure the contribution of the different particular marketing program elements to the profits.

Organizations use different metrics that indicate the performances of their activities, and try to find ways to create a balanced, healthy business. Through their marketing programs organizations can build and maintain an efficient organization, and therefore they need to use marketing metrics, in order to measure the performance of their marketing activities, both offline and online. Organizations set different targets, goals for their marketing activities. Marketing metrics measure their performances, so they provide important signals, feedback about the relationship between planned and obtained results. Organizations can get a realistic image about the existence of differences between the results of planned and implemented activities, actions, can identify the need of corrective actions, and can plan and implement corrective actions. Organizations cannot use any kind of metrics for this purpose, they need "good" metrics (appropriate metrics) to measure their performances.

But how can we characterize appropriate metrics?

Generally organizations use different metrics for different purposes. They should use appropriate metrics which help organizations to develop proper marketing strategies, strategic marketing activities, to set functional or departmental objectives, and to determine individual objectives for their employees. Appropriate metrics have several specific characteristics³⁸⁸: they should be easily measurable - the advantage of online metrics is that they could be easily captured and tracked on a nearly continuous basis; should be interpretable, in a unique way by all their interpreters; should be robust, they should apply equally well across different business units or products and over time; should be generally accepted - there exists a lack of defining some online units and those metrics which refer to them in a generally accepted way (for example the "Average Internet User" is not generally defined, and differences in definitions lead to differences in some measurements related to Internet users); should be linked to desired business outcomes. Metrics can measure directly a key business outcome, or can measure performance aspects linked to key outcomes.

In order to assess marketing performances marketing managers need financial, customer-based and implementation metrics. An organization's marketing performance is reflected by:³⁸⁹

a) financial metrics – which measure bottom-line results;

388 Based on: Mohammed, Rafi A. – Fisher, Robert J. – Jaworski, Bernard J. – Paddison, Gordon J.: Internet Marketing. Building Advantage in a Networked Economy, McGraw-Hill, New York, 2004.

389 Based on: Mohammed, Rafi A. – Fisher, Robert J. – Jaworski, Bernard J. – Paddison, Gordon J.: Internet Marketing. Building Advantage in a Networked Economy, McGraw-Hill, New York, 2004.

- b) customer-based metrics which capture marketing's performance in building customer-based assets;
- c) branding and implementation metrics which assess how well each element of the marketing program performs in terms of building customer assets.

These metrics offer the marketing managers the possibility of understanding which the drivers of an organization's performance in the marketplace are.

Marketing managers should assess the current marketing performances of their organization, should compare current marketing performances with previous marketing performances of their organization, and should assess marketing performances relative to competitors' ones.

2. MEASURING PROCESS OF ONLINE MARKETING ACTIVITY

Everything done on the Internet can be quantified, can be monitored, can be measured, leave tracks, evidences. Romanian organizations should be aware of the importance of using methods for measuring the results of their online marketing activities.

Organizations can monitor and measure their marketing communication activity on the Web, can follow their messages sent to their potential and actual customers.

The measuring process of the online marketing activities of an organization should follow several steps:³⁹⁰

- 1. Marketing objectives should be established. An organization can evaluate its online marketing activity, if it has set those realistic objectives which should be achieved through online marketing activity.
- 2. It must be correctly defined what is considered a marketing success for the organization, so the objectives should be transformed in quantified goals and success criteria, for example: the number of web page visitors, % of potential costumers who will probably buy the organization's products/services, number of appearances in different medias, number of online purchases, offline purchases generated by the use of Internet, number of read e-mail messages etc.
- 3. Standards for measuring and comparing online marketing results must be established.
- 4. Marketing performances must be measured and compared with planned results.
- 5. Results obtained by measuring online marketing performances must be processed, analyzed, and conclusions must be formulated based on the results of analyzing gathered data. These conclusions can be used and input data for those actions which must be initiated in order to improve online marketing activity of the organization.
- 6. Results must be sent in time for those managers who will make decisions based on the conclusions of analyzes.

3. RECOMMENDED METRICS FOR MEASURING ONLINE MARKETING RESULTS

Organizations can use different metrics to assess their websites, for example:³⁹¹

- visitor metrics (unidentified visitor, unique visitor, session visitor, tracked visitor, identified visitor);
- exposure metrics (page exposures or page views, site exposures);
- visit metrics (stickiness or visit duration time, raw visit depth or total webpages exposures per session, visit depth or total unique webpages exposure per session);
 - hit metrics (hits, qualified hits).

There exist software programs which can be used in order to indicate the number of the visitors in case of a website, how they behave during their visit on the website, which pages of the website have been visited, how long they have stayed on the website, etc.

Using online questionnaires organizations can gather information from their website visitors related to their opinion about the website, about the different elements of their websites, about their online publicity, about their image etc. Through the number of purchases made online organizations can measure the effects of their online publicity, of their online marketing communications.

The results of online marketing activity can be measured offline, for example by collecting telephone numbers of the website visitors and calling them to ask about their opinions related to the website.

Online marketing results must be compared with those which could be obtained as a result of offline marketing activity, in order to assess its effectiveness and efficiency.

Organizations can analyse the efficiency of their website from two points of view: from marketing point of view and from commercial point of view. ³⁹²

Analysis from the marketing point of view refers to checking the volume of traffic, the sales volume generated by a specific banner, the traffic volume due to a specific portal, what kind of products/services are purchased as a result of a specific banner posted on a website etc. Useful metrics for this purpose are: percentage of banner accessing, conversion rate (percent of visitors who became buyers), profit generated by investing in the specific banner. From

391 Mohammed, Rafi A. – Fisher, Robert J. – Jaworski, Bernard J. – Paddison, Gordon J.: Internet Marketing. Building Advantage in a Networked Economy, McGraw-Hill, New York, 2004, p. 700.

³⁹⁰ Janal, Daniel S.: Online Marketing Kézikönyv. [Online Marketing Handbook], Bagolyvár Könyvkiadó, Budapest, 1998, p. 153.-154.

³⁹² Pleşea, Alexandru Doru: Magazinul virtual -analiza eficienței comerciale. [Virtual Shop – analyzing the commercial efficiency], Revista de Comerţ, Nr. 10/2003., p. 41.

the commercial point of view the analyze of the online shop's efficiency covers four aspects: product variety (establish if the product range satisfies the expectations of the customers and at what degree), commercial suggestions (which refers to techniques for presenting and/or classifying products in order to increase motivation for purchasing, for example: cross-selling, promotions, recommendations), products/services searching mechanisms (which are the tools used by customers for finding the needed products/services), design characteristics of the website (which refers to: aspect of the background; design of medias used: films, images, text; typeface of characters used; dimensions, colours, placements of the different elements of the site).

Metrics are based on conversion rates used for measuring online marketing results and performances, especially for the evaluation of the virtual shop's global efficiency. The conversion rate of a virtual shop indicates the percent of the website visitors who made online purchases. In order to establish those factors, elements of the virtual shop which affect commercial performance there are used microconversion rates:³⁹³

- visit accession rate which shows how many of the positive impressions created by the webpage in which appears the product/service lead to the accession of the product's webpage;
- accession placement in the shopping-basket rate which shows how many accessions of the product's/service's webpage lead to placement of the product/service in the shopping-cart;
- placement in the shopping-cart purchasing rate which shows the percent of the products/services placed in the shopping-cart which were finally purchased online by buyers;
- visit purchase rate which shows the percentage of the accessions of the main webpage in which appears the product/service which lead to online purchase of that product/service.

Marketers should analyze these ratios to be able to make conclusions referring to the ways in which products/services should be presented on the Internet, and to use the obtained results for improving, optimising their online marketing.

Monitoring systematically the different phases of the purchasing process, the information obtained by measuring online marketing performances and efficiency, marketers can discover and eliminate those problems which could lead to abandon the online purchasing process by buyers, to attrition, etc.

4. PROBLEMS IN USING DATA AND METRICS FOR ONLINE MARKETING

Using the Internet Romanian organizations can easily gather information, data which can be easily stored in electronic format, they can use different software programs for this purpose and for data mining.

The problem is not the lack of information, because the Internet contains a great amount of information, the problem is whether Romanian organizations can find useful and relevant data for their marketing activities.

Another problem can be related to how Romanian organizations analyze and interpret metrics used for measuring online and offline marketing performances.

If Romanian organizations don't succeed to tie metrics to the desired business and marketing strategy, this can cause serious problems for them.

Also if they don't take in account the particularities of their industry or of their business when they define or choose metrics to measure marketing performances, both offline and online, organizations can face difficulties.

Organizational constraints, financial constraints and time constraints could lead to incorrect definition of metrics.

Organizations can have difficulties in defining and integrating metrics for their offline and online marketing activities.

If an organization activates both in the real and the virtual world it should measure the effects of the online activities upon offline performances and vice versa (for example online marketing can stimulate offline purchases, and offline marketing can stimulate online purchases), but this can be difficult to do.

CONCLUSIONS AND RECOMMENDATIONS

As a conclusion we can mention, that it is important for Romanian organizations to do systematically marketing research to get information about their customers, competitors and marketing environment, and to develop an efficient and effective marketing-mix in order to attract and maintain their customers.

The main challenges for the Romanian organizations can be summarized as follows: the changes generated by governmental reforms, European Union membership, changes of legal environment, reduced financial resources, needed improvements in management know-how, intensification of competition, global economic crisis etc.

The trends of the demographical, economical, cultural, social, legal, institutional, informational, technological segments of the marketing environment of Romanian organizations have impact on their offline and online marketing activities.

Based on their competencies and taking in view the mentioned challenges Romanian organizations should harvest the opportunities and avoid the threats, in order to be able to face the increasing competition.

³⁹³ Pleşea, Alexandru Doru: Magazinul virtual - analiza eficienței comerciale. [Virtual Shop - analyzing the commercial efficiency], Revista de Comert, Nr. 10/2003., p. 42.-43.

Developing appropriate marketing strategies and marketing plans, implementing them correctly are indispensable to achieve success on the market. Marketing strategies should be controlled and evaluated systematically. Marketing plans should have a measurement component, because organizations should measure their progress periodically, to be able to make the necessary adjustments, corrections.

To measure the effectiveness and efficiency of the marketing programs Romanian organizations should use a set of metrics to evaluate their website's performance, taking in view the scope of their activity, the characteristics and expects of their target market, characteristics of their marketing mix elements.

Because the online marketing environment changes rapidly, on the Internet organizations should make measurements on shorter periods of time (monthly, weekly, even daily etc.) to be able to implement the necessary interventions.

Organizations should use integrated customer metrics, financial metrics and marketing implementation metrics to evaluate their marketing performance.

If they have both offline and online marketing activities, they should use metrics to assess how they succeed to integrate their offline and online activities.

Marketing managers should:

- assess the current marketing performances of their organization;
- compare current marketing performances with previous performances of their organization;
- assess their marketing performances relative to competitors' ones.

Marketing managers should pay attention to marketing spendings in order to avoid poor financial performance.

MARKETING CHALLENGES CREATED BY THE MULTIMEDIA CONVERGENCE

Lazoc Alina

Aurelianus Street 2, Timisoara "Dimitrie Cantemir" Christian University Faculty of Tourism and Commercial Management Timisoara alina.lazoc@gmail.com, alazoc@yahoo.com 0256-221 355

Information technologies and the new media are essential for every country's development in a global, digital, knowledge-based economy. Therefore, researching the latest evolutions in media consumption is fundamental for understanding the new socio-economic relationships and market configurations determinded by the convergence of three extremely productive industries: IT, telecommunications and the media. The resulting immersive virtual environment facilitates experiences hardly accessible in the real, nonmediated world. Marketing specialists should seriously analyse this extended boundries of human imagination and learning capacities permitted by the latest technologies and develop innovative, responsible ways of communicating and interacting with their media-assisted, exploratory-minded clients. In the present article we are exploring several theoretical visions of multimediatic communicatons' propellers and effects.

Key words: multimedia convergence, experiential consumption, flow activities, telepresence state, interactivity, exploratory behavior, media literacy

JEL codes: M3, O33, Z11, Z13

1. Convergence and the new media environment

Multimedia convergence represents a process change in industry structures that translates in a combination of markets, through technological and economic dimensions, to meet merging consumer needs. In its simplest form, multimedia convergence means the uniting of the functions of the computer, the telephone and the television set. The multimedia metamarket³⁹⁴ (a complex, composed market across industries, outcome of a vertical integration process) has resulted form the convergence of three industries which were created at an interval of 50 years respectively – the telephone industry (1980s), the television industry (1930s) and the computer industry (1980s). Telecommunications, office equipment, consumer electronics, media and computers were separate and distinct industries in the 1990s, offering different services with different methods of delivery. But as the computer became an "information appliance", businesses have moved to take advantage of the emerging digital technologies and industry boundaries have blurred.

Much of the contemporary communication processes are now mediated by computers. *Computer-mediated communication* (CMC) systems use computers to structure and process information and use communication networks to facilitate its exchange.³⁹⁵ One distinct advantage of these converging computer-mediated channels is that they remove the constraints of geographical proximity and temporal differences from communication partners as well as other issues related to communicating: accessibility, distribution, storage and reprocessing. It is through these new communication technologies that virtual electronic communities are formed. Individual members now have a choice of alternative media channels to support their communication behaviors.

2. Virtual worlds and experiential media consumtion

In this paper, we focus on the marketing implications of the converging computer-mediated environments, of which the World Wide Web on the Internet is the first and current networked global implementation. For the most part, the Internet replicates the modalities of existing media, but broadband connectivity also facilitates an increasingly common combination of multiple modalities that leads to vivid (almost real) online experiences, sometimes referred to as *telepresence*. Steuer³⁹⁶ defined *telepresence* as "the mediated perception of an environment" and Lombard and Ditton³⁹⁷ described it as "a mediated experience that creates for the user a strong sense of presence". New media are designed to give its users a type of mediated experiences that seems truly natural, immediate, direct and real, a sense of complete immersion, as other authors are calling the telepresence state. This state of immersion during network navigation ca lead to a *flow* type experience, in which irrelevant thoughts and perceptions are screened out and the consumer focuses entirely on the interaction with the multimedia environment (in his/her network navigation). A consumer's action in the flow state is experienced as a "unified flowing from one moment to the next, in which he is in control of his actions, and in which there is little distinction between self and environment, between stimulus and response, or between past, present and future".³⁹⁸ We further assume that this

³⁹⁴ Pagani M., Multimedia and Interactive Digital TV: Managing the Opportunities Created by Digital Convergence, IRM Press, Hershey PA, 2003;

³⁹⁵ Rice R., Task Analyzability, Use of New Media, and Effectiveness: a Multi-Site Exploration of Media Richness, Organization Science, 3 1992 pp. 475 – 500

³⁹⁶ Steuer J., Defining Virtual Reality: Dimensions Determining Telepresence, Journal of Communication, 42 (4),1992, pp. 79 – 93;

³⁹⁷ Lombard M. and Ditton T., At the Heart of It All: the Concept of Presence, Journal of Computer-Mediated Communication, No. 3 (2), September 1997, p.2;

³⁹⁸ Cszikszentmihaly M., Beyond Boredom and Anxiety, San Francisco: Jossey Bass, p.36;

attention focus can lead to new (experiential) learning opportunities, that marketing specialist should explore and positively exploit in designing future experiences.

Moreover, Steuer also suggests that the *hypermediatic communication model*, facilitated by the Internet technology, transforms the relationship with the mediated environment with which senders and receivers interact (also called *machine interactivity*³⁹⁹) into the primary communication and interaction relationship, more important than the relationship between sender and receiver (the *person interactivity*). Thus, successful communication and interaction depend not only on the user's involvement and ongoing participation with other users, or with the content/content creators⁴⁰⁰, but also with the medium. In the present study we focus on the users' interaction with the medium and on the transformations undergone both by users and the medium during this inteaction, trying to identify some positive marketing opportunities generated by the new communication model.

In order to identify these marketing challenges we will draw upon the experiential marketing theories ⁴⁰¹, which argue that experiences provide consumers a way to engage physically, mentally, emotionally, socially and spiritually in the consumption of the product or service, making the interaction meaningfully real. Thus, new media environments are to be produced and created through the multiple experiences in which the consumers immerse. There should be a separate portion of a multimedia value chain that is focused on delivering the experience to customers in various contexts. The ability to provide this service requires an understanding of the types of consumption contexts, and the distribution channels through which this consumption will take place. Therefore the new media offerings should encourage users to use and develop their media skills by creating alternative and adaptable interfaces. When the concept of *interface* first began to emerge, it was commonly understood as the hardware and software through which a human and a computer could communicate. As it evolved, the concept has come to include the cognitive and emotional aspects of the user's experience as well. Some studies focus more on the human perception, others more on computer design. A subset of the literature that focuses on the human-side of the human-computer interaction adresses the aforementioned concept of *flow*. Flow is characterized by intense concentration and enjoyment and was found to be significantly linked with exploratory use behavior and, further, with an extent of media use, both very positive marketing effects.

3. Marketing induced flow experiences

As we could see, flow is not a permanent state. Consumers move in and out of flow – as a function of control, content and process characteristics. To some extent, all these characteristics may be influenced by marketing activities. The congruence of consumers' skills and environmental challenges is something that can be facilitated by interface design. For example, a user-specified difficulty level can be designed to avoid anxiety in novice users and boredom in experienced users. Because lack of congruence may lead the consumer to exit a computer-mediated environment, it is important to provide opportunities for consumers to actively select activities that create congruence.

Content characteristics such as interactivity and vividness lead to telepresence and can be affected directly through product design considerations. Process characteristics specifically the distinction between extrinsically and intrinsically motivated consumers, are an important segmentation basis. People who use the media in order to search information, complete a specific task or to buy a specific product are less likely to be present in the virtual environment than people who use the media without a particular goal. On the other side, on-going information searchers (*surfers*⁴⁰²) are not driven by an immediate goal, but are interested in building a bank of information for future use and are often driven by the entertainment value of communication and interaction process. Another possible motive in experiential behaviors could be opinion leadership. Thus, an opinion leader may be motivated to search and engage in experiential behaviors to disseminate product news, advice and personal experience by word-of-mouth. The Internet increases opportunities for consumers to access "third party" information – ranging from blogs to product-oriented sites to brand-focused sites. Experiential behavior is relevant for (1) word-of-mouth

399 Hoffman and Novak, Marketing in Computer-Mediated Environments: Conceptual Foundations, Journal of Marketing, Vol. 60, No.3, July 1996, pp. 50 –68. The authors distinguish two levels of interactivity: person-interactivity that occurs between humans through a medium and machine-interactivity which occurs between humans and machines.

400 According to McMillan S.J., Exploring models of Interactivity form Multiple Research Traditions: Users, Documents, and Systems, user-to-document interactivity can be seen in the ways that active audiences interpret and use mass media messages and it involves both perceived ineraction with content creators and actual creation of content.

⁴⁰¹ An extensive literature review is offered by Carù A. and Cova B. in their article A Critical Approach to Experiential Consumption: Fighting Against the Disappearance of the Contemplative Time, presented at the 3rd International Critical Management Studies Conference, Critical Marketing Stream, 7-9 July 2003, http://www.mngt.waikato.ac.nz/ejrot/cmsconference/2003/abstracts/criticalmarketing/Caru.pdf; 402 Rogers S. and Thorson E., The Interactive Advertising Model: How Users Perceive and Process Online Ads, Journal of Interactive Advertising, 2000, 1(1)

⁴⁰⁴ Richins M.L. and Root-Schaffer T., The Role of Involvement and Opinion Leadership in Consumer Word-of-Mouth: An Implicit Model Made Explicit, Advances in Consumer Research, Vol. 15, Michael J. Houston, ed. Provo, UT: Association for Consumer Research, 1988, pp. 32-36

strategies based on influencing opinion leaders, (2) providing entertainment and recreation and (3) enhancing consumers' product knowledge.

4. The new media literacy of the digital consumer

Broadband Internet and the related new media technologies appear to substantially modify the relationship of information flows in the communication process. They strengthen the role of the consumer as an independent information seeker and reduce the ability of media and advertisers to control and focus information flows. At the same time, however, greater information access can create additional information-processing demands – requiring more effort to make a decision – and risk creating consumer confusion, as long as they are not sufficiently *media literate*⁴⁰⁵ for the 21st century. Media literacy is defined as a portofolio of creative and critical skills, knowledge and understanding. This portofolio is essential to every citizen in the 21st century if they are to be fully literate and enjoy the widest range of content, and the diverse range of opportunities to communicate and be creative in the digital world.

Although technology and new media make the simple tasks of communication and social interaction easier, they also place a greater burden on higher-level skills, necessary to enter a flow state, which can lead to superior experiences. These skills are conventionally called *media literacy*. However, once they have facilitated a flow state, these skills develop into real competencies of the post-modern consumer.

These media competencies are the effects of an initial experiential, intrinsically motivated, time-passing, non-directed consumption activity. Immersion in virtual reality is for most of the users a new experience and the concentration level required for the flow state is exciting and pleasant in itself. Over time, ritualized use evolves into instrumental use (goal-directed use) as consumers accumulate experience navigating within the medium. Goal-directed behaviors are characterized by situational involvement and directed search, in which the user is usually concerned with a specific task-completion goal. Thus, consumers develop an increased exploratory and participatory behavior, which leads to superior experiential learning, more positive subjective experiences, and a perceived sense of control over interaction process with the multimedia environment. Eventually, skilled new media consumers become more effective problem solvers, risk takers, as well as active, independent (self-directed) and creative communication partners.

5. Conclusion

The pervasive, convergent media environment evolves along with consumer conduct. Users around the world have already an increasing freedom to manage their media and electronic entertainment experiences. Media literate consumers are able to compile, program, edit, create and share content; and, as a result, they gain more control and become more immersed in the media experiences. New media (and especially broadband Internet) facilitate instant interactivity and therefore instant gratifications. Consumers expect and demand instant information and transaction capabilities in an interactive hypermediatic environment. Moreover, they also decide the time and terms of interaction.

The ability to create meaningful customer experiences will hinge largely on how businesses create content and manage the content-context interface. Converging multimedia companies (as well as any other modern company in the future) should provide contexts (including a delivery of content through multiple channels wherever consumers are and whenever they want) and starting points for the consumers' own explorations. Ehanching the media experience could have interesting impacts on playfull, risk-taking and exploratory behaviors, but could also distract the user from purposes like purchase or task completion. Marketing should limit the risk of confusion and information overload and support, guide and facilitate favourable, pleasant media experiences, in order to maximize profits and customer lifetime value⁴⁰⁶ in the digital age.

THE AIR TRANSPORT AND CONSUMER PROTECTION

Madar Anca

Universitatea "Transilvania" din Braşov Facultatea de Ştiinţe Economice Loc. Braşov, Str.Moldovei,nr.6, jud. Braşov ancamadar@yahoo.com Telefon: 0745345355

The air transport represents an important component and plays a great role in the unfolding of the touristic activity. Through their spectacular developments, the benefits they provide in relation to speed travel and comfort, them simulates travel, contributing also to open new markets, as a rule, far off from the countries generating tourists and inaccessible by other means of transport. Therefore became important the consumer protection of air services.

Keywords: consumer, protection, air transport

Codul JEL: I (Health, Education, and Welfare)

1. Introduction

In accordance with the activities list proposed by the European Union, the air transport sector comprises companies operating solely or mainly in the transport of persons and goods by air, racing line or charter, and work performed by helicopters, planes taxi and private planes.

Air shipments became, after a relatively short history, one of the most important and powerful industries in the world, and is also a key element of travel and tourism industry. Globalization and trade led to an increase accessibility to this means of transport, an increase in international tourism development and a strong volume of freight transported by air.

2. Advantagaes and disadvantages of air transport

The main cause of air transport is represented by the superior aircraft performance compared with other means of transport. Due to the technical characteristics of the means used for the benefit of transport, it is characterized by: speed, stability, comfort, safety, accessibility, giving activity transport an amount of advantages.

Speed - is maybe the most frequent quality of air transport. It is due to the relative independence of air transport over environmental conditions, both natural and institutional (regulations, legislation) and technical parameters of the aircraft.

Flexibility-refers to the ability of aircraft to be converted, through minor changes, to the specifics of transporting passengers, freight and mail, or for the provision of utility services. The versatile body of the aircraft responds to requirements of facilitation and economic efficiency, the design itself being implemented for the first time in converting military aircraft in civilian aircraft. Moreover, in logistics services, their desirability stems from the need to access in real time to an act of consumption, of documentation, of production. Through the rapidity that it's customized by, air transport is the ideal mean to access appropriate persons and goods. The regularity of air transport stems from the way of organizing them. Air travel is made for the most part by flights line on certain fixed routes, frequency conditions, schedules and prices relatively stable. Compliance with these requirements relate to the reputation of the service and their position in the market.

The economy refers to the posibility of air transport beneficiaries to use the economically services under advantageous conditions. Operating costs were reduced substantially in recent years, allowing the practice of prices increasingly attractive, accessible to a increasingly large mass audience. Increase of population income has helped to this also, which potentiate the effects of technical progress over the transport efficiency and liberalization of trade in air services which allows charges to form on the basis of market mechanism.

Convenience refers not only comfortable conditions of carriage on board the aircraft, but also features the premises annexes to the ground (airport), which adds an additional motivation to selecting the plane from other transport means or option for a particular airline operator.

All these are meant to reduce the duration of tourist travel, increasing comfort, shortening the time between the decision to travel and the movement itself of it.

Using air transport for tourism presents some disadvantages also:

-dependance of the natural conditions, which puts under the sign of the uncertainty the rigorous compliance with the timetable or even the achievement of travel itself.

-large investments that are clamed by the construction and operation of some modern airports.

3. Air transport market in Romania

In Romania, low-cost market has seen a remarkable development in recent years, profile companies as Blue Air local company (3 Boeing 737 planes, 300 and 500 series), the Italian company MyAir,Spanish company Air Madrid (gave to bankruptcy end of 2006), the Slovak company Sky Europe and the polish-hungarian company Wizzair. The main destinations served are Italy, Spain and Germany, countries with important Romanian communities. With the implementation of Open Sky agreement, following the accession of our country to the EU

(the EU is implemented in 1996), the acces of any foreign companies on the Romanian market is free,including on domestic routes (this market is served only until December 31 2006 by local carriers), which will create major difficulties for the romanian airtransport companies(Tarom, Carpatair and low-cost company Blue Air). To remain competitive, standard airline companies offered passangers tariff reductions and loyalty programmes. An example in this case was that the company TAROM which relating to the cost of sales, decided to reduce the comission assigned for the travel agencies to 1% starting with April 2006.

At present, 27 of airlines are operating on the market in Romania: two from the Republic of Moldova - Air Moldova, Moldavian Airlines, five from Italy - Alitalia, Alpi Eagles, Club Air, My Way Airlines and Wind Jet, two from Germany - Condor Flugdienst , Lufthansa German Airlines, two from Hungary - Wizz Air and Malev Airlines, two from Greece - Olympic Airlines and Aegean Aurlines.

Bulgaria is also present on the market in Romania with the airline Hemus Air, Turkey with Turkish Airlines, Air Malta operator from Malta, Syria by Syrian Airlines, Air Madrid in Spain, Slovakia by Sky Europe Airlines, Switzerland by Swiss Air. Also, working in Romania from Austria- Austrian Airlines, Cimber Air of Denmark, El Al Airlines of Israel, CSA of the Czech Republic, LOT of Poland, Air France of France and KLM Dutch company.

Wizz Air is the most important low-cost company authorized to fly in Romania. Hungarian company began to operate starting with the date July 14 on route Tirgu Mures. Wizz-Air representatives expanded their business in 2007, operating on the Bucharest Airports - Baneasa, Arad and Tirgu Mures, offering direct flights to Barcelona, Rome, Milan, London, Dortmund and Budapest.

Market leader in Europe is EasyJet, from the UK and also the last low-cost company that entered the market in Romania, reached the third place in the world, with 35 million passengers per year on 318 routes, starting initial at two races a year.

4. Protection and rights of passengers

Air transport has increased and raises some problems concerning the safety of each carrying out movements in complete security. It is precisely because of particularities of air transport needed to see the development of rules as more complete, able to guarantee not only its effectiveness but also a degree of security for passengers and cargo.

In line with the Chicago Convention of 1944 which regulates international air

transport, each state has control of European airspace above its national territory. Thus, the right to fly through the air spaces, and especially to land on foreign airports require a proper permission.

The rules cover air transport in three major categories of issues:

-regular international routes, which are established on the basis of governmental agreements between the countries participating in traffic regulations concerning the routes itself, frequency, flights, transport capacities

-tariffs to regular flights, which are established upon governmental agreements between countries participant to air traffic, to avoid unjustified increase, and to ensure a match between price and quality of services

-on national ground, governments licence carriers which can operate on regular internal routes; those may be domestic or international companies

The EU has been and still is, other than net the U.S. market, both through the organization, the role of the state, technical and financial performance, as well as the intensity of integration, which implies a higher degree of regulatory type of protectionist market and a slower process of liberalisation.

The need for regulations is determined primarily by ensuring passanger safety and airline companies are licensed and supervised. For reasons of protection of the population, relgulations are necessary in areas such as noise and pollution.

Passengers travelling on routes with the origin of an airport situated on the territory of a Member State of the Union, and passengers travelling by air carriers on routes community point of origin with an airport located in a non-EU state and point of destination on an airport situated on the territory of an EU Member State are entitled to compensation and assistance for free wrongly denied boarding, cancellation or delay of a long flight.

Community Regulation provides that passengers who are wrongly refuse boarding and those which have been canceled flights can benefit both the compensation money (whose value depends on the length of the route) and free assistance under the provisions of Articles 8 and 9 of the Regulation.

In case of cancellation of flights, carriers are not required to pay financial compensation to passengers if they can demonstrates that the cancellation was due to extraordinary circumstances which could not be avoided even if they taken all reasonable measures.

For delays of more than two hours for flights of up to 1,500 km, those larger than three hours for flights taking between 1,500 and length of 3,500 km, and those larger than four hours for flights longer than 3,500 km, passengers are entitled to free assistance from the carriers consisting, as appropriate, providing food, providing hotel accommodation and transport between the airport and hotel, offering the possibility of free communication by telephone, fax, telex or e-mail.

Meanwhile, carriers are required to provide all of the check-in booths in the airport written informations regarding passanger rights concerning the events of denied boarding, cancellation or a delayed flight.

In Romania, unoffering by air carriers of financial compensation and assistance provided by Regulation (EC) no. 261/2004 and uninforming passengers regarding the rights they have in the event of denied boarding, cancellation or delay of flights is considered infrigement.

Member states of the European Union are required to designate a national authority to oversee how the passengers rights are respected and that they may address the proper authorities if those rights are violated. In Romania, this authority is represented by the National Authority for Consumer Protection.

Also, in the event of denied boarding or cancellation of a flight, passengers will be informed and regarding the contact of the national authority to oversee compliance with the provisions of Regulation (EC) no. 261/2004.

Air passengers' rights:

The refusal of boarding - Passengers have a right to claim compensation worth up to EUR 125 EUR 600, depending on flight distance and the delay caused after redirect the race.

Delays extended - If the delay is more than five hours, passengers are entitled to claim reimbursement of their ticket but only on condition waived travel.

Cancellation - Passengers have the right to receive monetary damages, except in the following situations: if they were informed regarding the cancellation of the race with 14 days before or redirected race schedule is very close to the original schedule or air company can demonstrate that the cancellation of the flight has been driven by particular reasons.

Assistance provided - by air transport companies in light of the events, where boarding passengers is refused or if the race with which they travel is cancelled or delay in doing so, passengers are entitled to assistance (providing meals, a means of communication, the overnight accommodation if necessary). If the board is refused or if the race that travel is cancelled, passengers may choose between continuing their journey or be reimbursed the cost of the ticket.

The identity of air transport companies - Passengers must know the identity of the operator of the time travelling with the race. The air carrier does not provide safe conditions for flight are prohibited or subject to restrictions within the European Union.

Liability - air transport companies responsible for the damage produced by the delay flights (up to \pm 4,800 euros) for damage and loss of luggage (up to \pm 1,200 euros) and for involving personal injuries or deaths from accidents products. They do not bear this responsibility but if they took all possible steps to avoid damage or if the products were unable to take such measures.

Packages travel - Operators of tour packages are required to submit information regarding holiday tickets reserved, to meet contractual obligations and ensure the protection of passengers in case of insolvency organizer.

5. Conclusions:

Because of the particulars of air transport, it is necessary to devise rules as more complete, able to guarantee not only its effectiveness but also a degree of security as high both for passengers and cargo. Air transport is a complex industry, which has undergone major changes without transitional period, from a strict regulations based on bilateral agreements towards a single market. Nowadays, the European industry is liberalised air transport and governed by a European framework to continue evolving.

CONTEMPORARY MARKETING PRACTICES IN ROMANIA

Maxim Andrei

"Al. I. Cuza" University of Iaşi Faculty of Economics and Business Administration FEAA, 22 Carol I Blvd., IAŞI 700505 andrei.maxim@feaa.uaic.ro 0232.20.14.06

The scope of this research is to capture a broader view of the marketing practices of the Romanian organizations, a field less investigated up to the present. This study is the first in Romania to apply the methodology developed in the international research project Contemporary Marketing Practices (CMP) and is designed to evaluate the degree in which different types of marketing, characteristic for either the transactional or the relational approaches, are used.

Keywords: contemporary marketing practices, transaction marketing, relationship marketing

The article's JEL code: M31.

Introduction

The relational perspective enjoyed a distinctive attention in the marketing literature of the last decades and represents the first theoretical development that threatens the supremacy of marketing mix. However, there are various divergent opinions regarding the place of the relational approach in the general marketing theory and practice. Some authors consider that the relationship marketing (RM) will replace or has already completely replaced the transactional marketing, while others totally reject the RM concept. There are also some that argue that the two approaches are complementary and the companies have to define their position in the context of a relational/transactional mix.

In order to support one of these points of view, it is necessary to conduct empirical investigations that provide a clear image of the real situation from the business environment. Contemporary Marketing Practices (CMP) surveys were conducted in many countries all over the world, but they are a premiere for Romania.

Research objectives

The research is focused on the following aspects:

- determine the main orientation in the Romanian business environment (transactional or relational);
- identify the types of marketing present in the Romanian business environment;
- reveal the relationships that exist between these types of marketing and the companies' performance.

The Contemporary Marketing Practices Framework

Contemporary Marketing Practices is a research program initiated by Rod Brodie and Nicole Coviello, professors at the University of Auckland. It was extended up to the present in more than 15 countries, including Canada, Sweden, Thailand, Argentina, Germany, United Kingdom and United States.⁴⁰⁷

Following a detailed analysis of previous research, the CMP group developed a classification framework that includes nine dimensions of the way companies relate to their markets:⁴⁰⁸

- exchange dimensions: purpose of exchange, nature of communication, type of contact, duration of exchange, formality in exchange;
- management dimensions: managerial intent, managerial focus, managerial investment, managerial level.

Considering these dimensions, the authors concluded that five types of marketing may be identified in the literature and in the business practice and grouped them in two main perspectives:

- transactional perspective: Transaction Marketing (TM);
- relational perspective: Database Marketing (DM), e-Marketing (eM), Interaction Marketing (IM), Network Marketing (NM).

As defined by the CMP framework, these five marketing types do not exclude each other and each organization may practice them in a smaller or greater proportion, creating in this way a portfolio of strategies.

Through *Transaction Marketing*, the firm targets a large number of customers that remain relatively anonymous, and tries to generate as many transactions as possible. It does so by offering an attractive combination of products, prices, advertising and distribution. A good example is that of supermarkets which use mass advertising to attract various potential customers. However, the salespersons have no specific information about these customers; they do not know their names, addresses, preferences and so on. Although transactions may continue over time, they are regarded as being distinct as there is no differentiation between loyal and occasional buyers.

⁴⁰⁷ Roderick J. Brodie, Nicole E. Coviello, and Heidi Winklhofer, "Contemporary Marketing Practices Research Program: A Review of the First Decade," Journal of Business & Industrial Marketing 23, no. 2 (2008).

⁴⁰⁸ Roderick J. Brodie et al., "Is E-Marketing Coming of Age? An Examination of the Penetration of E-Marketing and Firm Performance," Journal of Interactive Marketing 21, no. 1 (2007).

Database Marketing involves the approach of well identified clients. One example is that of the telephony services providers that can send personalized SMS-es to their clients, on different occasions (birthday, the anniversary of a certain number of years since they are customers, etc.). DM (as well as TM) is marketing *towards* the customer and not *with* the customer.⁴⁰⁹

Unlike the previous types, where the client could only react to the offer, *e-Marketing* introduces the dialogue, the possibility of the customer to communicate with the firm, to make proposals. Yet, the communication is not face-to-face, but mediated by technology (telephone, fax, email, Internet discussion groups, call-center etc.).

In the case of the *Interaction Marketing* there is a closer, personalized relationship between the firm's representatives and certain clients. The customer does not communicate with the company as a whole, but with a certain employees who deal with him on a regular basis and who know his needs. The interaction is face-to-face and it may also be informal. The two might have other conversation subjects than those strictly related to business. Examples could include the interaction between the sales agents and the employees of the firms that buy from them or the cooperation and the exchange of ideas between an architect and the client that wants a house.

The firm creates a network of relationships with other firms in order to gain common benefits and to better serve the final clients. The *Network Marketing* may involve relationships with suppliers (e.g. Just In Time systems) or even with competitor firms. Several producers could establish partnerships in order to have a greater negotiating power when confronted with their distributors or they could share technologies to produce more efficient.

Methodology

This survey used the standard questionnaire of the CMP project, with some changes imposed by the particularities of the Romanian study. The questionnaire was presented to five university professors, specialized in marketing, and to six managers from Iaşi. After this pre-testing, some minor adaptations of the text were made, in order to better preserve the meaning of some expressions that were initially affected by the translation from English to Romanian. Most of the questions involve the evaluation of some sentences on a 1 to 5 Likert scale.

Each of the CMP's nine dimensions presented above was operationalised with a set of variables that corresponded to the five different types of marketing. In the end, TM, DM, eM, IM and NM were evaluated by calculating the arithmetic average of the nine formative items. In order to make the results more visible, the average was divided by 5 (the number of levels of the Likert scale used), obtaining an index with values in the 0 to 1 interval.

The performance of the companies was measured with subjective indicators. A comparison based on objective indicators would not have been relevant given to the variety of the organizations included in the survey (dimension, business sector, etc.). The respondents had to evaluate the measure in which their organization uses some performance indicators and the results compared to the expectations they had for those indicators, during the previous year.

Survey sample

In selecting the companies to be included in this survey the aim was to obtain a high degree of variability in terms of size, sector, age and geographical location. However, given the complexity of the questionnaire used, convenience sampling was preferred to probabilistic sampling. This method is in line with previous CMP studies. The final sample totals 142 organizations based in Bucureşti, in Timişoara and in several counties of Moldova (Iaşi, Suceava, Botoşani, Vaslui, Neamţ, Bacău) and Transylvania (Cluj, Mureş, Alba, Bihor, Maramureş).

The small and medium enterprises are predominant (60.4% and 27.4%, respectively). Most of the companies have been present on the Romanian market for more than 10 years (48.6%) and 73.2% are owned by Romanian investors. 56.7% of the respondents claim that in 2007 their turnover increased by more than 10%.

With regard to the characteristics of the respondents, 84.4% occupy a managing position and another 10% are marketers. 61.4% occupy their current position since at least 3 years and 91.5% consider that their job is either directly or indirectly related the company's marketing. Furthermore, 84.6% of those interviewed are higher education graduates and 54.6% claim to have some form of marketing training. Therefore, it can be concluded that the data provided by them are relevant.

Results and discussion

The usage levels of the five types of marketing were estimated by calculating their indexes (values between 0 and 1, as previously mentioned). The results are presented in Table 1.

409 Nicole E. Coviello, Roger Milley, and Barbara Marcolin, "Understanding It-Enabled Interactivity in Contemporary Marketing," Journal of Interactive Marketing 15, no. 4 (2001): 22.

Table 1: Indexes for the five marketing types

	Index	Std. Deviation	Minimum	Maximum
TM	.64	.12705	.33	1.00
DM	.62	.14534	.27	.93
eM	.61	.18904	.20	.93
IM	.74	.16153	.29	1.00
NM	.71	.14660	.24	1.00

As it can be noticed, the surveyed companies use all five types of marketing. However, interaction and network marketing seem predominant.

Paired samples t tests were used to evaluate the differences between the five indexes. For each of these tests, the effect size was also computed. Field⁴¹⁰ and Pallant⁴¹¹ recommend reporting this indicator as an objective measure of the test's importance. The fact that the test is significant does not mean that the effect it measures is important.

The effect was estimated using Pearson's correlation coefficient r which was computed using the following equation:⁴¹²

The effect size was interpreted according to Cohen's recommendations: r = 0.10 – small effect, r = 0.30 – medium effect, r = 0.50 – major effect.

The tests revealed that IM and NM levels are significantly higher than TM, DM and eM levels, the magnitude of the results being either medium or large:

The IM level (M=0.74, SD=0.16) is significantly higher than:

the TM level (M=0.64, SD=0.12), t(141)=5.32, p<0.05, r=0.40 (indicates a medium effect).

the DM level (M=0.62, SD=0.14), t(141)=6.87, p<0.05, r=0.50 (indicates a large effect).

the eM level (M=0.61, SD=0.18), t(141)=7.43, p<0.05, r=0.53 (indicates a large effect). The NM level (M=0.71, SD=0.14) is significantly higher than:

the TM level (M=0.64, SD=0.12), t(141)=4.71, p<0.05, r=0.36 (indicates a medium effect).

the DM level (M=0.62, SD=0.14), t(141)=6.32, p<0.05, r=0.46 (indicates a medium effect).

the eM level (M=0.61, SD=0.18), t(141)=6.77, p<0.05, r=0.49 (indicates a medium effect).

A correlation analysis of the five indexes was performed in order to see which marketing types are practiced together. The results are shown in Table 2.

Table 2: Correlations between the five types of marketing

	TM	DM	eM	IM	NM
TM	1.000	.624**	.450**	103	.050
DM		1.000	.819**	.209*	.322**
eM			1.000	.330**	.407**
IM				1.000	.659**
NM					1.000

^{*} correlation is significant at the 0.05 level; ** correlation is significant at the 0.01 level

There is a positive, strong and significant correlation between transaction marketing and database marketing (r=0.624, p<0.01). In the opinion of Coviello *et al.* DM could actually be considered a superior, "more intense"

717

 $^{410\} Andy\ Field,\ Discovering\ Statistics\ Using\ Spss,\ 2nd\ ed.\ (London:\ Sage\ Publications\ Ltd.,\ 2005).$

⁴¹¹ Julie Pallant, Spss Survival Manual, 3rd ed. (Berkshire: McGraw-Hill, 2007).

⁴¹² Field, Discovering Statistics Using Spss, 294.

⁴¹³ Ibid., 32.

form of transactional marketing. 414 TM also presents a medium, positive and strong correlation with e-Marketing (r=0.450, p<0.01). However, companies use TM independently of their IM and NM.

All relational practices are positively and significantly correlated among them, suggesting the fact that companies use them together, in diverse combinations. A very strong association can be observed between the two technology-based relational practices, i.e. DM and eM. These indexes share 67% of their variance (r=0.819, p<0.01). Other pairs, such as DM-NM, eM-NM and eM-IM, present medium correlations. There is also a weak relationship between DM and IM (r=0.209, p<0.05).

Table 3: Correlations between types of marketing and performance indicators

	Mar	keting indic	ators	Fi	nancial indicat	ors
	new	customer	customer	sales	nuofitabilita	market
	customers	retention	satisfaction	growth	profitability	share
TM	.324**	.298**	.235**	.080	.156	.242**
DM	.369**	.430**	.339**	.099	.142	.360**
eM	.332**	.439**	.395**	.101	.121	.346**
IM	.200*	.310**	343**	.142	.152	.183*
NM	.189*	.220*	.230**	053	.058	.101

^{*} correlation is significant at the 0.05 level; ** correlation is significant at the 0.01 level

Another analysis was aimed at investigating the link between the usage of different marketing types and firms' performance. The performance indicators and the method used for measuring performance were described in a previous paragraph. The results of the bivariate correlation analysis are presented in Table 3.

First, it is apparent that the relational practices IM, eM and DM achieve their goal of retaining existing customers, as they are the only ones presenting medium-strength associations with this performance indicator (r>0,3). IM, eM and DM seem to have a positive impact on customer satisfaction as well.

Transaction marketing also achieves its main goal, that of attracting new customers. TM and the "technological" forms of relationship marketing (DM, eM) are correlated with customer acquisition (r>0,3).

The marketing practices that have the strongest association with companies' performance in securing the desired market share are DM and eM (r=0.360 and r=0.346, respectively).

An unexpected result is the lack of correlations between any of the marketing practices and the other two financial indicators (sales growth and profitability).

Conclusions

The marketing approach of the companies that were investigated is both transactional and relational. The Romanian business environment does not appear to be dominated by a single marketing orientation.

Companies use all of the five types of marketing. However, interaction marketing and network marketing are more common than TM, DM or eM. Transaction marketing is used in combination with the thechnology-based types of relationship marketing (i.e. DM and eM) but independently of IM and NM.

The use of TM, DM and eM favors new customer acquisition. Companies' performance in satisfying and retaining those customers is associated with their level of relationship marketing (IM, DM and eM). Hence, both the transactional and the relational approaches fulfill their purposes.

Pricing in the market is intimately linked with the evolution of market structure. As with many network industries, pricing to a large extent relies on two-part tariff systems. The analysis of pricing plans is complicated by the fact that it concerns competition among networks. Price setting in mobile telecommunication industry is based only slightly on cost and is designed rather to exploit market power. This is most effectively undertaken in the traffic termination services on mobile networks, in particular for traffic originating from fixed line networks. A great deal of subscribers and market growth has therefore been possible thanks to the transfer of termination payments from the fixed to the mobile network. This also applies for the Romanian telecommunication market. Moreover, due to the five important mobile telecommunication competitors, a price analysis is very hard to be made. However, mobile telecommunication companies follow almost the same scenario introducing price offers that are difficult to be compared.

Key-words: mobile telecommunication companies, retail prices, wholesale prices, roaming, interconnection pricing

JEL Classification: M31

Introduction

Pricing in the telecommunications sector used to be regulated. With the liberalization of the telecommunications sector, price regulation was left to market forces. There is the presumption that competitive forces will lead to prices reflecting the cost of providing services. This may not be feasible in all market segments of the mobile telecommunications industry, however network effects may prevent competitive forces from working in the traditional way in spite to open access to infrastructure. For instance, in telecommunications, the monopolist maintains its market power on access to the customer. New entrants on the market have to seek access to the customers via the monopolist. The access price charged by the monopolist has a fundamental role in determining the final price charged to the customer by the new entrant. This setting has been referred to in the literature as the "one-way access problem" (Gruber, 2005; Armstrong, 2002).

Regarding the one-way access pricing problem, this does not seem to reflect interactions in the mobile telecommunications industry. The appropriate framework is that of the interconnection between networks in which each network has its own access to final customers. For instance, mobile firms have their own customers and a great many calls are between customers of fixed and mobile networks. Competing networks also comprising final customers thus changed the issue to a "two-way access problem" (Gruber, 2005; Doyle and Smith, 1998).

This led to two sorts of pricing decisions for each firm: the pricing of on-network calls, when in principle all cost elements were under control of the firm, and the pricing of off-network calls where the interconnections payments were due. Competition among networks may not necessarily produce efficient outcomes. For on-network pricing it is assumed that competition among firms induces price competition.

1. Theoretical Fundaments for Pricing in Mobile Telecommunication

The one-way access problem. The standard access prices problem concerns the firm that controls a facility and thus wants to set a price for the access to the facility to recover a monopoly profit. High access prices either prevent entry or maintain a monopoly profit. To favor competitive entry, access price should be set low. But, if the access price is too low, entry of inefficient firms may occur.

The theoretical literature on establishing the appropriate access price for this "one-way access problem" has grown quite large. The general conclusion is that regulation is needed to avoid anti-competitive behavior (Laffont and Tirole, 2000; Armstrong, 2002).

The two-way access problem. Whereas with the one-way access problem only the owner of a facility (for instance, the local loop) has direct access to customers, with the two-way access case the firm seeking access also has direct access to its own subscribers. In other words, in the "two-way access" case the two networks have to be interconnected in order to give access to each other's subscribers. Two distinct two-way access situations can emerge, one without and one with competition for customers. The first situation is familiar for international telecommunications where networks are located in different countries and there is no competition for the subscriber

base (Wright, 1999). The second situation is typical for competitive domestic fixed line telecommunications or mobile telecommunications where firms fight for customers.

With the context of telecommunications networks, two parts of the service can be distinguished: originating the call and forwarding it to the point of interconnection and the termination service, which involves picking-up the call from the interconnection point and transferring it to the final destination. With telecommunications, the entire call is in most instances paid for by the originating party of the call. There may be also cases where the receiving party pays for the termination services (Doyle and Smith, 1998).

2. Mobile Telecommunications Pricing by Type of Service *Retail Prices*

The *retail mobile market* refers to goods and services sold directly to end users – i.e. the provision of access and national and international mobile telephony and "roaming" services to end users. (Harald, 2005)

There are two segments in retail service market: *access* and *airtime or usage*. From the consumer's point of view, access can be thought of as the ability to make and receive calls. From the perspective of the network firm, this involves registration and recognition by the network as well as the supply of the SIM card. Thus, three basic retail services can be identified for which each consumer can be charged separately – connection, subscription (rental) and call charges (usage). For instance, with pre-paid cards there is no monthly subscription, but there are minimum usage requirements.

Connection. An up-front fee is usually charged for connecting new subscribers to the network. The reason for this is to compensate for the costs the operator incurs to register a new subscriber and for the SIM card. In the early days of the industry, these charges used to be very high, but with increasing competition for new subscribers fees have declined significantly and are nowadays waived in several cases, and even negative.

Subscription. With post-paid subscription, a fee is typically charged on a monthly basis for access to mobile network. The charge may in some cases include a certain number of free minutes of airtime. Subscription charges are typically part of two-part tariff scheme together with calling charges, whereby a high (low) subscription charge is coupled with low (high) calling charge.

Airtime. Air charges are usually based on a per-minute charge. Price competition in many countries is reducing the metering unit from minutes to seconds. This allows users to be charged more precisely according to their effective calling time, and acts as a further incentive for lower prices. Calling charges are differentiated by time of the day (peak vs. off-peak) and by destination.

In Europe, where mobile licenses are generally granted at nationwide level, domestic calls are typically not charged by distance. Nevertheless, some firms have tried to introduce so-called "home-zone" tariffs where the user is charged less for calls placed within a certain area. This tariff scheme was adopted to encourage the possible substitution of fixed for mobile subscription. However, this is not the case of Romania.

Wholesale Prices

When a cellular subscriber uses the phone outside an area covered by the network of its mobile firm, she is said to be "roaming". Roaming services can therefore be thought of as providing temporary access to customers from other networks. There are two types of roaming, depending on the origin of customers: national and international. National roaming occurs when a subscriber uses her phone within her own country, but at a location which is not covered by the network of her mobile firm. The subscriber therefore uses the network of another, in principle competing firm. International roaming occurs when a cellular subscriber is abroad and uses the network of foreign firms.

The pricing of roaming services is undertaken in a two-step procedure. The first is *wholesale pricing*, when the visited network firm charges the user's home network firm for the calls, usually adding a mark-up of 15% on the normal network tariff. The second stage is *retail pricing*, where the home network firm sets the price for the subscriber, normally by adding 10-35% margin on top of the wholesale price set in the first stage. The roaming price to the final customer thus obtained is therefore the result of double marginalization. Moreover, mobile users typically show ignorance about the roaming costs charged by visited networks (Oftel, 2001) and this induces an absence of price competition at the retail level.

Interconnection. Interconnection pricing concerns the price of services of a given network to other networks for access to the network's customer. In the early days of the industry, mobile telecommunications firms in most countries had a special regime for determining their access prices.

In 2006 were established the maximal tariffs between Vodafone Romania and Orange Romania for the supply of the interconnection services as follows (ANRCTI, 2006):

- 7,21 eurocents / minute, beginning with 1st September 2006;
- 6,40 eurocents / minute, beginning with 1st January 2008;
- 5,03 eurocents / minute, beginning with 1st January 2009.

Fixed to mobile termination. There are several networks competing vigorously for the same pool of subscribers, but these networks have a monopoly position in providing services to their subscribers. The termination charge set by a mobile firm does not directly affect the customers of its own network, but does affect the prices set for the fixed line subscriber (Armstrong, 2002).

Mobile firms offer new subscribers handsets (mobile telephones) below cost in exchange for a minimum subscription period; however, in this case the cost of the handset subsidy is not covered by the airtime payments of the mobile subscriber, but by the fixed lines subscribers calling the mobile network (Wright, 2002). To redress this situation, regulatory actions are required to lower mobile termination charges to marginal cost (Gans and King, 2000; Armstrong, 2002).

3. The Complexity of the Mobile Telephony Services' Prices

The access to mobile telephony services grew within the last years. Technological developments permitted the rise of the services' capacities such as the possibility to send image messages, for instance. It is not a surprise if the demand exploded and the competition became ferocious in more and more countries.

However, those who paid attention to the evolution of the mobile telephony market within the recent years noticed a decreasing of the tariffs, the competition being the main reason.

A study made by the National Agency of Communication from Romania estimate that we will pay 0,05 euro for a minute of call within the mobile networks in 2010, half of the price paid in 2004 for the same service. (fig. no. 1)

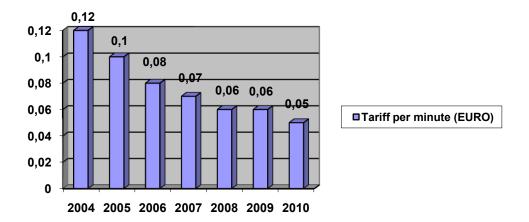

Figure 1 - Evolution of tariffs in mobile telecommunication

(Capital Magazine, No 9 / 5.03.2009)

Regarding the most sold offer, every mobile telephony provider has a wining goal. For *Vodafone*, the most popular subscriptions are those with minutes included. The cheapest subscription is Vodafone 50, which costs 8,92 euro per month and includes 50 national minutes.

If in 2007, the 3 euro subscription was the most popular beginning with the year 2008, the subscription *Orange Flexible* had the most dynamic evolution, raising five times in 2008, compared to the year 2007.

Zapp operator is preferred for the data services, the most successful subscriptions were those "entry-level" with tariffs from 0,04 USD per minute.

For *Cosmote*, the most popular subscription is Cosmote Full Option 60 (5,95 euro per month, with 60 national minutes included). The same period last year, the clients preferred Cosmote 30 (5 euro per month, 30 national minutes included).

Orange vs. Vodafone

Within the effort to adapt their services to the needs of different market segments, the mobile telephony companies put into place a great number of subscriptions that stop any comparison between the providers. These subscriptions can be international, Europeans and national. Their price varies depending on the number of minutes or hours included in the package. The minutes outside the package and the call towards other operators are more expensive. Some subscriptions permit an unlimited consumption during pick hours. The family subscriptions allow the parents and children to use their mobile telecommunication package on many telephones on the condition that the total amount of communication doesn't exceed the monthly subscription. Another alternative is the prepaid subscription which gives the possibility to the consumer to buy a telephone and communication credit when necessary. The communication duration can be calculated from the first second and the written messages can be included in the package (Table no. 1, Table no. 2)

Table 1 - Example of a subscription package with shared minutes from Orange

Subscriptio	Monthly	Call type	Tariff/	Shared minutes
n type	subscription		minut	
	(Euro)		without	
	without		added value	
	added value		(Euro)	
Shared	14	Orange + fixed networks	0,10	60 national minutes
national		Other mobile networks	0,13	
minutes	23	Orange + fixed networks	0,09	120 national minutes
		Other mobile networks	0,13	
	31	Orange + fixed networks	0,08	180 national minutes
		Other mobile networks	0,13	
	45	Orange + fixed networks	0,07	300 national minutes
		Other mobile networks	0,12	
	70	Orange + fixed networks	0,07	600 national minutes
		Other mobile networks	0,12	
	100	Orange + fixed networks	0,07	1000 national minutes
		Other mobile networks	<mark>0,11</mark>	

(www.orange.ro)

Table 2 – Vodafone's shared minutes' subscription package

Subscription	Monthly	Call type	Tariff/min	Shared minutes
type	subscription		without	
	(Euro) without		added value	
	added value		(Euro)	
Shared national	7,5	Vodafone + fixed networks	0,14	50 national
minutes		Other mobile networks	0,19	minutes
	11	Vodafone + fixed networks	0,13	75 national
		Other mobile networks	0,18	minutes
	13	Vodafone + fixed networks	0,12	100 national
		Other mobile networks	0,17	minutes
	18	Vodafone + fixed networks	0,11	150 national
		Other mobile networks	0,16	minutes
	23	Vodafone + fixed networks	0,11	200 national
		Other mobile networks	0,16	minutes
	43	Vodafone + fixed networks	0,11	400 national
		Other mobile networks	0,16	minutes
	67	Vodafone + fixed networks	0,10	700 national
		Other mobile networks	0,15	minutes
	<mark>93</mark>	Vodafone + fixed networks	0,10	1000 national
	_	Other mobile networks	0,15	minutes

(www.vodafone.ro)

Analyzing the two tables of mobile telecommunication services from Orange and Vodafone for the same subscription type (1 000 national minutes), we find it difficult to compare the tariffs. However, we can make some comments:

- The monthly subscription for the Orange provider is 100 euro without added value, whereas one has to pay 93 euro / month without added value for the same facility.
- Whereas the monthly subscription is higher within the Orange offer compared with the same type of subscription at Vodafone, the tariffs for the calls exceeding the 1 000 national minutes included into the package are cheaper for the Orange provider, i.g. 0,07 euro (in Orange and fixed networks) and 0,11 euro (in other mobile networks) than for Vodafone 0,10 euro (in Vodafone and fixed networks) and 0,15 euro (in other networks).
- Thus, a client that has to choose between the two subscriptions, he will choose the one that better fits his needs. If he thinks that he will not exceed the 1 000 national minutes included into the subscription package, he will choose the cheaper subscription from Vodafone. If he will exceed the 1 000 national minutes and the next level of subscription with 2 000 national minutes is too much for him, he will choose the Orange provider.
- There are some clients that don't pay attention to the small difference of price and choose the mobile telecommunication provider that he feels attached to.

According to an analysis of Romania's ANRCTI (The Information Technology and Communication Settlement National Authority) the national mobile telephony users have no idea of their subscription payment composition, because of the complicated offers and tariffs.

A mobile telecommunication operator – Orange commercializes voice services for prepaid cards using seven tariff plans, each one having between four and six tariffs for national calls. For the subscriptions, the same provider offers national voice services within 26 tariff plans, and for almost every one of these plans having no more than one to four combinations of 12 extra options that can be associated to them. However, many of the extra options are commercialized at different prices, depending on the subscription value, others are linked into scale combinations, while within every one of the 26 tariff plans there are at least two different tariffs for national calls. Taking into consideration the fact that Orange Romania has the biggest market share, with a turnover of 1 234 million euro in 2007, either its clients are not disturbed by the large variety of offers, or the price is not the most important element for them

According to a representative of France Telecom Group, the clients from Romania are the most informed and pay attention to costs. This type of offer was especially created for the clients' flexibility. From the sales, it was revealed the fact that this approach was successful, compared to the period with a limited number of subscriptions for the Orange clients.

Conclusion

In conclusion, the enterprises that always respond to the competition can come across the risk to fix lower prices eventhough this is not really necessary. The responsible persons don't have to fall into the trap of systematically comparing and aligning the price to the competition. They have to take into consideration the costs of every offer for the client, including financial, non monetary and changing costs. It is also advisable to evaluate the impact of the distribution factors, time and location and predict the available production capacity of the concurrence.

STRATEGIC PRICING ROLE IN SETTLING THE FIRM POSITION ON THE MARKET

Micu Adrian

Abstract: Few managers, even those specializing in marketing, think strategically about pricing. Consider your experiences and observations. Were the pricing decisions you encountered made in reaction to a pricing problem, or were they planned to exploit an opportunity? Did the company arrive at those decisions by analyzing only the immediate impact on profitability, or did it also consider how the reactions of customers or competitors might change the picture? Did the decisions focus purely on price, or did they involve alignment of a marketing program to support the pricing decision? Few companies proactively manage their businesses to create the conditions that foster more profitable pricing.

Key words: cost, price, value, customers.

JEL Code: D 40

Introduction

The difference between price setting and strategic pricing is the difference between reacting to market conditions and proactively managing them. It is the reason why companies with similar market shares and technologies of ten earn such different rewards for their efforts. Strategic pricing is the coordination of interrelated marketing, competitive, and financial decisions to set prices profitably. For most companies, strategic pricing requires more than a change in attitude; it requires a change in when, how, and who makes pricing decisions. For example, strategic pricing requires anticipating price levels before beginning product development. The only way to ensure profitable pricing is to reject early those ideas for which adequate value cannot be captured to justify the cost. Strategic pricing also requires that management take responsibility for establishing a coherent set of pricing policies and procedures, consistent with its strategic goals for the company. Abdicating responsibility for pricing to the sales force or to the distribution channel is abdicating responsibility for the strategic direction of the business.

Perhaps most important, strategic pricing requires a new relationship between marketing and finance. Strategic pricing is actually the interface between marketing and finance. It involves finding a balance between the customer's desire to obtain good value and the firm's need to cover costs and earn profits.

Unfortunately, pricing at most companies is characterized more by conflict than by balance between these objectives. If pricing is to reflect value to the customer, specific prices must be set by those best able to anticipate that value—presumably marketing and sales managers. But their efforts will not generate sustainable profits unless constrained by appropriate financial objectives. Katfrer tftan attempting to "cover costs,"fimance must learn how costs change with changes in sales and must use that knowledge to develop appropriate incentives and constraints for marketing and sales to achieve their objectives profit ably.

With their respective roles appropriately defined, marketing and finance can work together toward a common goal—to achieve profitability through strategic pricing. Before marketing and finance can attain this goal, however, they must discard the flawed thinking about pricing that leads them into conflict and that drives them to make unprofitable decisions. Let's look at these flawed paradigms and destroy them once and for all.

1. The Cost-Plus Delusion

Cost-plus pricing is, historically, the most common pricing procedure because it carries an aura of financial prudence. Financial prudence, according to this view, is achieved by pricing every product or service to yield a fair return over all costs, fully and fairly allocated. In theory, it is a simple guide to profitability; in practice, it is a blueprint for mediocre financial performance.

The problem with cost-driven pricing is fundamental: In most industries it is impossible to determine a product's unit cost before determining its price. Why? Because unit costs change with volume. This cost change occurs because a significant portion of costs are "fixed" and must somehow be "allocated" to determine the full unit cost. Unfortunately, since these allocations depend on volume, which changes with changes in price, unit cost is a moving target.

To "solve" the problem of determining unit cost, cost-based pricers are forced to make the absurd assumption that they can set price without affecting volume. The failure to account for the effects of price on volume, and of volume on costs, leads managers directly into pricing decisions that undermine profits. One particularly tragic example, for the company and its customers, was Wang Laboratory's experience in pricing the world's first word processor. Introduced in 1976, the product was an instant success, enabling Wang to grow rapidly and dominate the market. By the mid 1980s, however, personal computers with word-processing software were becoming credible competitors. As competition increased and growth slowed, the company's cost-driven pricing philosophy began

killing its market advantage. Unit costs were repeatedly recalculated and prices raised to reflect the rising overhead allocation. As a result, sales declined even further. Before long, even Wang's most loyal customers began making the switch to cheaper alternatives.

A price increase to "cover" higher fixed costs reduces sales further and causes unit cost to rise even higher. The result is often that price increases actually reduce profits. On the other hand, if a price cut causes sales to increase, fixed costs are spread over more units, making unit costs decline. The result is trften increased profit. Instead of pricing reactively to cover costs and profit objectives, managers need to price proactively. They need to acknowledge that pricing affects sales volume, and that volume affects costs.

The dangers of cost-based pricing are not limited to products facing increasing competition and declining volume. In fact, cost-based pricing is even more insidious when applied to strong products since there are no signals (such as declining market share) to warn of the potential damage. For example, an international telecommunications company with many leading technologies uses cost-based pricing only as a "starting point" for pricing. Product and sales managers review the cost-based "target prices" for consistency with market conditions and then argue for adjustments to reflect market conditions. Everyone in the organization finds this system fair and reasonable.

But does the system foster profitability? During the three years this system has been in place, marketing has frequently requested and received permission to charge prices less than the cost-based "target" in order to reflect market conditions. Now, how many times during those three years do you think marketing argued that a target price should be raised to reflect market conditions? Never, despite the fact that the company often has large backlogs of orders on some of its most popular products. At this company, as at many others, cost-based target prices have become cost-based "caps" on profitability for the most valuable products.

Cost-plus pricing leads to overpricing in weak markets and underpricing in strong ones—exactly the opposite direction of a prudent strategy. The financial questions that should drive proactive pricing are "How much more sales volume must we achieve to earn additional profit from a lower price?" and "How much sales volume can we lose and still earn additional profit from a higher price?" The answers to these questions depend on how the cost of the product changes with volume. They do not depend on whether the current price of a product, at current volume, covers the cost and profit objectives.

How, then, should managers deal with the problem of pricing to cover costs and achieve profit objectives? They shouldn't. The question itself reflects an erroneous perception of the role of pricing, a perception based on the belief that one can first determine sales levels, then calculate unit cost and profit objectives, and then set a price. Once managers realize that sales volume (the beginning assumption) depends on the price (the end of the process), the flawed circularity of cost-based pricing is obvious. The only way to ensure profitable pricing is to let anticipated pricing determine the costs incurred rather than the other way around. Value-based pricing must begin before investments are made.

If cost-based prices prove unjustifiable, managers may try to fix the process by allowing "flexibility" in the markups. Although this tactic may minimize the damage, it is not fundamentally a solution since the financial return on the product remains inadequate. Finance blames marketing for cutting the price, and marketing blames finance for excessive costs. The problem keeps reoccurring as the features and costs of new products continue to mismatch the needs and values of customers. Moreover, when customers are rewarded with discounts for their price resistance, this resistance becomes more frequent even when the product has value to them. Solving the problems of cost-based pricing requires more than a quick fix. It requires completely reversing the process—starting with customers. The target price is based on estimates of value and the portion that the firm can expect to capture given the competitive alternatives. The job of financial management is not to insist that prices recover costs. It is to insist that costs are incurred only to make products that can be priced profitably given their value to customers.

Designing products that can be sold profitably at a target price has gone in the past two decades from being unusual to being the goal at most successful companies.² From Marriott to Boeing, from medical technology to automobiles, profit-leading companies now think about what market segment they want a new product to serve, determine the benefits those potential customers seek, and establish a price those customers can be convinced to pay. Then companies challenge their engineers to develop products and services that can be produced at a cost low enough to make serving that market segment profitable. It wasn't always so. The first companies to adopt such a strategy in their industries gained huge strategic advantage. The laggards now have to learn value-based pricing for new products just to survive.

2. Customer-Driven Pricing

Most companies now recognize the fallacy of cost-based pricing and its adverse effect on profit. They realize the need for pricing to reflect market conditions. As a result, many have taken pricing authority away from financial managers and given it to sales or product managers. In theory, this trend is clearly consistent with value-based pricing, since marketing and sales are that part of the organization best positioned to understand value to the customer. In practice, however, the misuse of pricing to achieve short-term sales objectives often undermines perceived value and depresses profits even further.

The purpose of value-based pricing is not simply to create satisfied customers. Customer satisfaction can usually be bought by discounting sufficiently, but marketers delude themselves if they believe that the resulting sales represent marketing successes. The purpose of value-based pricing is to price more profitably by capturing more value, not necessarily by making more sales. When marketers confuse the first objective with the second, they fall into the trap of pricing at whatever buyers are willing to pay, rather than at what the product is really worth. Although that decision enables marketers to meet their sales objectives, it invariably undermines long-term profitability.

Two problems arise when prices reflect the amount buyers seem willing to pay. First, sophisticated buyers are rarely honest about how much they are actually willing to pay for a product. Professional purchasing agents are adept at concealing the true value of a product to their organizations. Once buyers learn that sellers' prices are flexible, the former have a financial incentive to conceal information from, and even actively mislead, the latter. Obviously, this tactic undermines the salesperson's ability to establish close relationships with customers and to understand their needs.

Second, there is an even more fundamental problem with pricing to reflect customers' willingness to pay. The job of sales and marketing is not simply to process orders at whatever price customers are currently willing to pay but rather to raise customers' willingness to pay a price that better reflects the product's true value. Many companies underprice truly innovative products because they ask potential customers, who are ignorant of the product's value, what they would be willing to pay. But we know from studies of innovations that the "regular" price has little impact on customers' willingness to try them. For example, most customers initially perceived that photocopiers, mainframe computers, and food processors lacked adequate value to justify their prices. Only after extensive marketing to communicate and guarantee value did these products achieve market acceptance. Forget what customers who have never used your product are initially willing to pay! Instead, understand the value of the product to satisfied customers and communicate that value to others. Low pricing is never a substitute for an adequate marketing and sales effort.

3. Competition-Driven Pricing

Lastly, consider the policy of letting pricing be dictated by competitive conditions. In this view, pricing is a tool to achieve sales objectives. In the minds of some managers, this method is "pricing strategically." Actually, it is more analogous to "letting the tail wag the dog." Why should an organization want to achieve market-share goals? Because more market share usually produces greater profit. Priorities are confused, however, when managers reduce the profitability of each sale simply to achieve the market-share goal. Prices should be lowered only when they are no longer justified by the value offered in comparison to the value offered by the competition.

Although price-cutting is probably the quickest, most effective way to achieve sales objectives, it is usually a poor decision financially. Since a price cut can be so easily matched, it offers only a short-term competitive advantage at the expense of permanently lower margins. Consequently, unless a company has good reason to believe that its competitors cannot match a price cut, the long-term cost of using price as a competitive weapon usually exceeds any short-term benefit. Although product differentiation, advertising, and improved distribution do not increase sales as quickly as price cuts, their benefit is more sustainable and thus is usually more cost-effective.

The goal of pricing should be to find the combination of margin and market share that maximizes profitability over the long term. Often, the most profitable price is one that substantially restricts market share relative to the competition. Godiva chocolates, BMW cars, Peterbilt trucks, and Snapon tools would no doubt all gain substantial market share if priced closer to the competition. It is doubtful, however, that the added share would be worth forgoing their profitable and successful positioning as high-priced brands.

Although the fallacy of competition-driven pricing is most obvious for high-priced products, the principie can be applied more generally. Many companies that were recapitalized in the 1980s learned that they could substantially increase cash flow simply by scaling back their market-share objectives. One low-margin, industrial company increased price by 9 percent and suffered a 20 percent loss of market share—proof, some might argue, that its market was price sensitive. On the other hand, this company retained four out of five sales. Apparently, most customers valued the product by at least 9 percent more than they had been paying! The company had been prevented from capturing that value by its market-share goal. Although some capacity was idled, the company's contribution to profit increased by more than 70 percent.

4. Asking the Right Questions

Strategic pricing involves recognizing that not all pricing problems involve changing price as the best solution. The reason why pricing is ineffective is frequently not that the pricers have done a poor job. It is that decisions were made about costs, customers, and competitive strategy without correctly thinking through their broader financial implications. Since the fallacy in those decisions is frequently not revealed until the product is launched and the pricing proves unprofitable, it is the pricer's job to work back from the price to understand the problem. Is the price unprofitable because there is a better price to charge, or because the value has been ineffectively communicated? Is the market share goal too high, or is the market inadequately segmented? Is the product and service offering overbuilt (and therefore too expensive) for the value it delivers, or has the seller simply enabled customers to avoid

paying for the value they get? The pricer's job is often less to set prices than to structure a pricing process that gets everyone to think about how best to address pricing problems. Recall the tactical questions about costs, customers, and competition that we argued often lead to poor pricing decisions. Whenever they come up, it is the pricer's job to reframe the discussions to consider over all financial profitability.

Conclusions

Progressive companies have begun doing more than just worrying about pricing. To increase profitability, many are abandoning traditional reactive pricing procedures in favor of proactive strategies. More than ever before, successful companies are building products and marketing strategies to support pricing objectives, rather than the other way around. In the past decade, traditional industry leaders in marketing and sales, such as Procter and Gamble and General Electric, made explicit corporate decisions to change their focus from growth in top-line sales to growth in profitability. In many industries, the current profit leader is a company with a very explicit pricing strategy supported by its product and promotional strategies. Southwest in airlines, Intel in semiconductors, Dell in computers, Wal-Mart in retailing, Quad in printing, Sony in consumer electronics, and the *New York Times* in publishing have all adopted pricing models that drive which customers they will serve and how they will serve them.

It is not surprising that pricing has taken its place as a major element in marketing strategy in the last decade. After all, marketing itself has been in the midst of a revolution. The meaning of marketing has been transformed from "selling what the company produces" to "producing what the customer wants to buy". Marketing has become the means by which firms identify unmet needs in the marketplace, develop products to satisfy those needs, promote them honestly, and follow with postpurchase support to ensure customer satisfaction. As selfess as all this may sound, though, the ultimate goal of marketing is not to convert the firm into a charitable organization for the sole benefit of consumers. The ultimate goal is profits for the stockholders, jobs for the employees, and growth for the organization

Perhaps it is reasonable that marketers have only recently begun to focus seriously on effective pricing. Only after managers have mastered the techniques of creating value do the techniques of capturing value become important. When companies were totally financially driven and internally focused, it was marketing's sole job to become an advocate for the customer's perspective. Today, however, marketers have won the power to make business decisions, not just advocate perspectives. With that responsibility, they must understand not only customer needs but also how and when to profitably satisfy those needs. The true test of a successful marketing strategy is its ability to create value profitably. As one marketing expert aptly stated, "For marketing strategists, [pricing] is the moment of truth—all of marketing comes to focus in the pricing decision." The purpose of this book is to make sure that when you reach that moment, you know what to do.

Abstract: In most companies, there is ongoing conflict between managers in charge of covering costs (finance and accounting) and managers in charge of satisfying customers (marketing and sales). Accounting journals warn against prices that fail to cover full costs, while marketing journals argue that customer willingness-to-pay must be the sole driver of prices. The conflict between these views wastes company resources and leads to pricing decisions that are imperfect compromises. Profitable pricing involves an integration of costs and customer value. To achieve that integration, however, both need to let go of misleading ideas and form a common vision of what drives profitability.

Key words: decision, pricing, cost

JEL Code: D 40

Introduction

Costs should never determine price, but costs do play a critical role in formulating a pricing strategy. Pricing decisions are inexorably tied to decisions about sales levels, and sales involve costs of production, marketing, and administration. It is true that how much buyers will pay is unrelated to the seller's cost, but it is also true that a seller's decisions about which products to produce and in what quantities depend critically on their cost of production.

The mistake that cost-plus pricers make is not that they consider costs in their pricing, but that they select the quantities they will sell and the buyers they will serve before identifying the prices they can charge. They then try to impose cost-based prices that may be either more or less than what buyers will pay. In contrast, effective pricers make their decisions in exactly the opposite order. They first evaluate what buyers can be convinced to pay and only then choose quantities to produce and markets to serve.

Consequently, costs affect the prices they charge. A low-cost producer can charge lower prices and sell more because it can profitably use low prices to attract more price-sensitive buyers. A higher-cost producer, on the other hand, cannot afford to underbid low-cost producers for the patronage of more price-sensitive buyers; it must target those buyers willing to pay a premium price. Similarly, changes in costs should cause producers to change their prices, not because that changes what buyers will pay, but because it changes the quantities that the firm can profitably supply and the buyers it can profitably serve. When the cost of jet fuel rises, most airlines are not naive enough to try passing on the fuel cost through a cost-plus formula while maintaining their previous schedules. But some airlines do raise their average revenue per mile. They do so by reducing the number of flights they offer in order to fill the remaining planes with more full-fare passengers. To make room for those passengers, they eliminate or reduce some discount fares.

Thus the cost increase for jet fuel affects the mix of prices offered, increasing the average price charged. However, that is the result of a strategic decision to reduce the number of flights and change the mix of passengers served, not of an attempt to charge higher prices for the same service to the same people. Such decisions about quantities to sell and buyers to serve are an important part of pricing strategy for all firms and the most important part for many. In this chapter, we discuss how a proper understanding of costs enables one to make those decisions correctly. First, however, a word of encouragement: Understanding costs is probably the most challenging aspect of pricing. You will probably not master these concepts on first reading this chapter. Your goal should be simply to understand the issues involved and the techniques for dealing with them. Mastery of the techniques will come with practice.

1. Determining relevant costs

One cannot price effectively without understanding costs. To understand one's costs is not simply to know their amounts. Even the least effective pricers, those who mechanically apply cost-plus formulas, know how much they spend on labor, raw materials, and overhead. Managers who really understand their costs know more than cost levels; they know how their costs will change with the changes in sales that result from pricing decisions.

Not all costs are relevant for every pricing decision. A first step in pricing is to identify the relevant costs: those that actually determine the profit impact of the pricing decision. Our purpose in this section is to set forth the guidelines for identifying the relevant costs once they are measured. In principle, identifying the relevant costs for pricing decisions is actually fairly straightforward.

They are the costs that are incremental (not average) and avoidable (not sunk).

In practice, identifying costs that meet those criteria can be difficult. Consequently, we will explain each distinction in detail and illustrate it in the context of a practical pricing problem.

2. Why Incremental Costs?

Pricing decisions affect whether a company will sell less of the product at a higher price or more of the product at a lower price. In either scenario, some costs remain the same (in total). Consequently, those costs do not affect the relative profitability of one price versus another. Only costs that rise or fall (in total) when prices change affects the relative profitability of different pricing strategies. We call these costs incremental because they represent the increment to costs (positive or negative) that results from the pricing decision.

Incremental costs are the costs associated with changes in pricing and sales. The distinction between incremental and nonincremental costs parallels closely, but not exactly, the more familiar distinction between variable and fixed costs. Variable costs, such as the costs of raw materials in a manufacturing process, are costs of doing business. Since pricing decisions affect the amount of business that a company does, variable costs are always incremental for pricing. In contrast, fixed costs, such as those for product design, advertising, and overhead, are costs of being in business. They are incremental when deciding whether a price will generate enough revenue to justify being in the business of selling a particular type of product or serving a particular type of customer. Since fixed costs are not affected by how much a company actually sells, most are not incremental when management must decide what price level to set for maximum profit. Some fixed costs, however, are incremental for pricing decisions, and they must be appropriately identified. Incremental fixed costs are those that directly result from implementing a price change or from offering a version of the product at a different price level.

For example, the fixed cost for a restaurant to print menus with new prices or for a public utility to gain regulatory approval of a rate increase would be incremental when deciding whether to make those changes. The fixed cost for an airline to advertise a new discount service or to upgrade its planes' interiors to offer a premium-priced service would be incremental when deciding whether to offer products at those price levels.

3. Why Avoidable Costs?

The hardest principle for many business decision makers to accept is that only avoidable costs are relevant for pricing. Avoidable costs are those that either have not yet been incurred or can be reversed. The costs of selling a product, delivering it to the customer, and replacing the sold item in inventory are avoidable, as is the rental cost of buildings and equipment that are not covered by a long-term lease. The opposite of avoidable costs are sunk costs—those costs that a company is irreversibly committed to bear. For example, a company's past expenditures on research and development are sunk costs since they cannot be changed regardless of any decisions made in the present. The rent on buildings and equipment within the term of a current lease is sunk, except to the extent that the firm can avoid the expense by subletting the property.

The cost of assets that a firm owns may or may not be sunk. If an asset can be sold for an amount equal to its purchase price times the percentage of its remaining useful life, then none of its cost is sunk since the cost can be entirely recovered through resale. Popular models of commercial airplanes often retain their value in this way, making avoidable the entire cost of their continued use. If an asset has no resale value, then its cost is entirely sunk even though it may have much useful life remaining. A neon sign depicting a company's corporate logo may have much useful life remaining, but its cost is entirely sunk since no other company would care to buy it. Frequently, the cost of assets is partially avoidable and partially sunk. For example, a new truck could be resold for a substantial portion of its purchase price but would lose some market value immediately after purchase. The portion of the new price that could not be recaptured is sunk and should not be considered in pricing decisions. Only depreciation of the resale value of the truck is an avoidable cost of using it.

From a practical standpoint, the easiest way to identify the avoidable cost is to recognize that it is the future cost, not the historical cost, associated with making a sale. What, for example, is the cost for an oil company to sell a gallon of gasoline at one of its company-owned stations? One might be inclined to say that it is the cost of the oil used to make the gasoline plus the cost of refining and distribution. Unfortunately, that view could lead refiners to make some costly pricing mistakes. The distinction between the historical cost of acquisition and the future cost of replacement is merely academic when supply costs are stable. It becomes very practical when costs rise or fall. When the price of crude oil rises, companies quickly raise prices, long before any gasoline made from the more expensive crude reaches the pump. Politicians and consumer advocates label this practice price gouging, since companies with large inventories of gasoline increase their reported profits by selling their gasoline at higher prices than they paid to produce it.

What happens when crude oil prices decline? If a company with large inventories held its prices high until all inventories were sold, it would be undercut by any company with smaller inventories that could profitably take advantage of the lower cost of crude oil to gain market share. The company would see its sales, profits, and cash flow decline. Again, the intelligent company bases its prices on the replacement cost, not the historical cost, of its inventory. In historical terms, it reports a loss. Unfortunately, even level-headed businesspeople often let sunk costs sneak into their decision making, resulting in pricing mistakes that squander profits.

4. Distribution strategy

demands.

In developing channel strategy, managers have two options to communicate value to their target customers:

"Push "strategies. The focus of communication is on the supplier's next immediate customer. Push strategies are aimed at propelling the supplier's offerings through the channel. For example, some manufacturers of overthe-counter (OTC) drugs and automotive paints do not promote these products directly to ultimate consumers. Instead, they focus on the retailer or auto-repair shops, expecting these channel firms to make the sale to the consumer. Channel firms that carry a variety of competing products may favor push strategies because they permit promoting products that are most profitable to the channel firm (the channel firm's customers frequently do not have strong preconceived preferences). Suppliers often find push strategies less expensive to implement.

"Pull" strategies. The focus of communication is on the end customer or a channel member closer to the end customer. Such strategies are aimed at pulling the supplier's offering through the distribution channel. For example, Intel maintains brand preference by advertising its chips to end consumers with the "Intel Inside®" campaign. The intent is to create a preference for computers with its chips-causing retailers to favor Intelbased computers. Channel members benefit from pull strategies when customers are "presold" for particular brands. Suppliers gain some control over channel firms because it is more difficult for channel firms to switch customers to competing brands. Push strategies depend on channel intermediaries to carry the value message through the rest of the channel. Pull strategies "presell" the offering to the target customers, who then go to channel intermediaries with brand-specific

Push strategies are essential when the supplier's product and its differential value are not apparent to target customers, or when its value delivery cannot be easily made salient to target customers. For example, most automobile buyers are unaware of the specific machine tools used in the manufacture of their automobile or of the specific brand of paint that covers it. For machinetool suppliers or automotive-paint manufacturers, convincing manufacturer that their products can make automobiles better or cheaper is more effective than trying to convince consumers to buy vehicles manufactured with a specific brand of machine tool or utilizing a particular paint. The main drawback to push strategies is they depend on the distribution channel to convey the value message to ultimate consumers. In some cases, push strategies may require managers to invest in developing the value-marketing skills of the entire distribution channel or risk having the channel not convey the value theme.

Pull strategies carry the value message directly to target customers. A pull strategy often gives a supplier greater control in communicating value to target customers. Further, pull strategies are often favored by channel intermediaries because they often create "presold" customers, thus reducing the marketing effort required by channel firms. More-exclusive retailers who compete with low-price outlets often prefer suppliers who invest in building brand image. Also, effective pull strategies can provide suppliers insurance against channel intermediaries who try to opportunistically sell competing offerings-customers arrive at the channel firm with strong brand preference.

Given these costs, it would seem that a pull strategy might be preferable, but there are three strong considerations recommending the push approach.

- 1. The costs are largeh variable-being proportionate to the amount of sales and the number of retail distribution outlets. This is a big advantage for a product that is starting out small. The cost of an effective advertising campaign could be prohibitive.
- 2. The retailers have pretargeted the market. In markets where demand is diffuse-few people are potential purchasers-the retailer (who may be a catalog or e-commerce company) has already identified them. Either the target consumers already know where to buy or retailers own a highly coveted customer list. For sales of scuba equipment, aids to the physically impaired and to people interested in do-it-yourself home repair, no advertising outlets exist to reach a majority of the potential buyers. All of the potential purchasers, however, will eventually need to visit a retailer or web site, or read a catalog which, given an adequate incentive, can promote the product.
- 3. The retailers or others in the chain "augment" the product. Few people would pay the prices for Mary Kay cosmetics if they were available on a rack in a drug store. The value is in the Mary Kay experience of being "made up" in the privacy of home. Mary Kay creates that experience with a team of independent distributors who are motivated by, among other things, high margins.
- 4. Pull strategies require sophisticated marketing, expertise that a firm may lack. Managers must know not only who might buy their product, but also understand why. They must connect their offerings to benefits and offerings that these target customers find salient, which may be difficult when channel firms augment the offering in a way that hides the supplier's components, and they must create messages that can be indirectly communicated convincingly in limited space or time.

Still, in most mature mass markets, pull strategies are preferred. They are cost-effective for high-volume, mass-marketed products, and they give the seller control over the message. Moreover, the mass-market channel partners like Wal-Mart, grocery chains, and drugstores prefer pull strategies despite lower margins. They make their money-moving inventory efficiently, not by selling. Moreover, a pull strategy creates a stronger brand identity that increases loyalty.

Pull strategies are an effective counter to brand competition for channel attention. When multiple brand competitors are competing for the same customers, opportunistic channel firms will play them against each other to extract higher margins and fees. Brands that are large enough to support the cost of a pull strategy can undermine the opportunist's ability to do this. Because customers are presold on the supplier's brand, an attempt to switch them to a competing product is more difficult.

Push strategies are essential when the supplier's product and its differential value are not apparent to target customers, or when its value delivery cannot be easily made salient to target customers. For example, most automobile buyers are unaware of the specific machine tools used in the manufacture of their automobile or of the specific brand of paint that covers it. For machinetool suppliers or automotive-paint manufacturers, convincing manufacturer that their products can make automobiles better or cheaper is more effective than trying to convince consumers to buy vehicles manufactured with a specific brand of machine tool or utilizing a particular paint. The main drawback to push strategies is they depend on the distribution channel to convey the value message to ultimate consumers. In some cases, push strategies may require managers to invest in developing the value-marketing skills of the entire distribution channel or risk having the channel not convey the value theme.

Pull strategies carry the value message directly to target customers. A pull strategy often gives a supplier greater control in communicating value to target customers. Further, pull strategies are often favored by channel intermediaries because they often create "presold" customers, thus reducing the marketing effort required by channel firms. More-exclusive retailers who compete with low-price outlets often prefer suppliers who invest in building brand image. Also, effective pull strategies can provide suppliers insurance against channel intermediaries who try to opportunistically sell competing offerings-customers arrive at the channel firm with strong brand preference.

The choice between "push" and "pull" is usually difficult. Push strategies require both costly incentives for the retail channel partners and limited distribution. In introductory and growth markets, channel intermediaries must invest substantial resources in targeting potential customers and communicating value in return for uncertain sales that may occur considerably later. As a result, suppliers have to share a large portion of their sales price with channel firms as an incentive for the selling effort. In addition, when sales are uncertain or do not follow quickly, manufacturers generally must pay high fees for promotional efforts, such as cooperative advertising and in-store demonstrations.

Given these costs, it would seem that a pull strategy might be preferable, but there are three strong considerations recommending the push approach.

Conclusions

In markets where demand is diffuse-few people are potential purchasers-the retailer (who may be a catalog or e-commerce company) has already identified them. Either the target consumers already know where to buy or retailers own a highly coveted customer list. For sales of scuba equipment, aids to the physically impaired and to people interested in do-it-yourself home repair, no advertising outlets exist to reach a majority of the potential buyers. All of the potential purchasers, however, will eventually need to visit a retailer or web site, or read a catalog which, given an adequate incentive, can promote the product.

An efficient strategy regarding the competition involves offensive or defensive actions that aim to place the company into a supportable situation related to the five forces of the competition.

As an outcome, the company management must permanently appreciate the firm vulnerability degree and evaluate the resulting risk and everything related to the life expectation and the profitability expectation as these ones are defined in its objectives.

SERVICE QUALITY ATTRIBUTES IN RETAIL BANKING SERVICES

Within the last two decades, service quality has become a main interest in the industrial world especially in the service industries. The key to success in winning the global competition now and in the future is to have high quality service. High quality of service is believed to influence over customer value and customer satisfaction, and furthermore customer satisfaction will affect customer loyalty directly. Therefore, the importance of service quality, value, and customer satisfaction seems justified to the survival of service companies, including the banking companies.

Keywords: service quality, banking, measure

JEL code: M31

This study will investigate service quality attributes along with a measure of perceived value and satisfaction to determine the direct and indirect effect on bank customer's loyalty. The study will seek to identify the most important attributes/cues in bank settings, which may be used to review characteristics of the banks as experienced by customers.

1. Service quality cues or attributes

Some studies noted that consumers organize information at various levels of abstraction ranging from simple product attributes to complex personal values.

Attributes that signal quality have been dichotomized into intrinsic and extrinsic cues. Intrinsic cues are attributes that are part of the physical composition of the product, for example flavor, color, freshness, size, fit, and style. They cannot be changed without changing the nature of the product and are consumed along with the product. Extrinsic cues are attributes that related to the product, but they are not product-specific and can serve as general indicators of quality across all types of products. Examples of extrinsic attributes include price, brand name, and level of advertising.

Other studies suggested that intrinsic attributes can be more important to consumers than extrinsic attributes in the following situation:

- during consumption of the product;
- in pre-purchase situations when consumers are actively search for intrinsic attributes;
- when the intrinsic attributes have high predictive value to judge quality.

Conversely, extrinsic attributes can be more important than intrinsic attributes when:

- consumer is in initial purchase situation, in which intrinsic attributes are not available (e.g. for services);
- consumer has insufficient time or interest to evaluate the intrinsic attributes;
- quality is difficult to evaluate.

Because services are intangible, consumers are more likely to use extrinsic cues to infer service quality prior to the actual purchase and consumption of the service. As a result, cues such as price, brand, advertising, word-of-mouth, and certain tangible service elements are important to consumers as they attempt to judge the quality of a service prior to consumption.

In a study of quality in four consumer service industries: long distance telephone, banking, credit cards, and an appliance repair and maintenance, Parasuraman et al. (1988) found consistent attributes of perceived quality across the four service industries. These abstract attributes included reliability, responsiveness, assurance, empathy, and tangibles.

In a period during the service delivery process, the customer is directly interacting with the personnel, physical facilities and other elements such as communication materials. Because services are intangible, consumers use tangible clues as proxies in evaluating the quality of services. If consumer perceives that the appearance of physical facilities, equipment, personnel, and communication materials are good, then his or her judgment will be positively affected. We refer to this as "tangibles".

The attribute termed "reliability" is associated to the ability of the service provider to perform the promised services dependably and accurately. Reliability is closely related to the concept of technical quality of service. The other attributes such as tangibles, responsiveness, assurance, and empathy are related to the concept of functional quality.

The "responsiveness" attribute of service quality refers to whether the service provider has the willingness to help customers and provide prompt service. When the service provider provides prompt service to its customers, the customer perceives that he or she is receiving good quality.

Customers frequently find difficult to evaluate the quality of the service if they have not experienced yet the particular service. It is believed that the level of the customer's trust plays important role in assessing the quality of the service provided by the service provider. The more the customer trusts the service provider, the better the customer's perception on the service quality. The attribute termed "assurance" is associated with the ability of the service provider to convey trust and confidence to the customers.

Finally, if customers perceive that they are not receiving concerned, personal, or individual attention from the service provider, then their quality judgment will be negatively affected. This is called **"empathy"**. A brief description of each attribute is presented in Table 1.

Table 1	The Definition of the Fi	ve Services	Quality Attributes
i adie i	The Delinition of the Fi	ve services	Quality Attributes

1 able 1	The Definition of the Tive Services Quanty Attributes		
Attributes	Definition		
Tangibles	Appearance of physical facilities, equipment, personnel, and communication materials		
Reliability	Ability to perform the promised service dependably and accurately		
Responsiveness	Willingness to help customers and provide prompt service.		
Assurance	Knowledge and courtesy of employees and their ability to convey trust and confidence.		
Empathy	Caring, individualized attention the firm provides its customers.		

These above five attributes are widely accepted in the literature, although they suffer from at least two major shortcomings. Firstly, they are very broad and lack specificity in serving as cues that consumer can use to infer service quality. For example, a problem with a service's "reliability" does not indicate the particular attribute that was unreliable. Secondly, the particular attributes or cues that comprise each dimension vary across service contexts. Some researchers suggested that the dimensionality of service quality might depend on the type of services under study. Many researchers conducted service quality research in retail banking setting, in which they modified the service quality dimensions to fit the bank specific characteristics, which are discussed bellow.

2. Service Quality Attributes of Retail Banking

In order to develop marketing strategy, service marketers, especially bank marketers need to understand the service attributes that are used by consumers in selecting banks. For example, consumers would use bank reputation, bank reliability, bank assurance, and physical facilities of the bank in selecting bank services. If marketers can understand which attributes are used to evaluate a service, they will be better able to manage and influence the customer's evaluations and perception of the offering.

Perceived quality of service tends to play an important role in high involvement industries like banking services. Banks have traditionally placed a high value on customer relationships with both commercial and retail customers. In the last ten years, the nature of customer relationships in retail banking has been changing, especially since the advent of automatic teller machines and internet banking.

The measurement of perceived service quality may remain a challenge. Previous research suggested that the dimensionality of service quality might depend on the type of services under study. Based on this background, studies have investigated various attributes, which determine consumers' perception of service quality of retail banking industry (Stafford, 1996; Angur et al., 1999; Bahia, 2000; Sureschandar et al., 2002).

The exploratory study conducted by **Stafford (1996)** reported the distinct elements (attributes) of bank service quality as perceived by customers. Seven attributes were found in assessing bank service quality. The first attribute, named "bank atmosphere"; included cleanliness, as well as an overall positive and courteous attitude by employees (kindness, friendliness, and pleasantness). The second attribute, 'relationship", indicates the importance of a personal relationship with the bank employees, where customers are recognized easily by long-term employee. The third attribute, "rates and charges", indicates that low costs and high interest rates can affect an individual's perception of bank service quality. The fourth attributes, "available and convenient services", indicates a full array of services that available, easily accessible and convenient. The fifth attribute, "ATMs", indicates available, convenient, and working automatic teller machines. The sixth attribute, "reliability/honesty", indicates the importance of a solid bank rating and honest, reliable employee. The seventh attribute, "teller", indicates adequate and accessible teller.

Angur et al. (1999) examined the applicability of alternative measures of service quality in the banking industry in India. Data were gathered from customers of two major banks in the retail banking industry (a leading public sector bank and a leading private sector multinational bank). The results suggested that the service quality concept in the retail banking of India as one of the developing economy is a multidimensional construct of service quality. Although the five-factor conceptualization of service quality proposed by Parasuraman et Al.(1985, 1988) did not entirely

hold, the results reinforce their proposal that the five dimensions are of varying importance, with reliability and responsiveness dimensions being the most important. In addition, the SERVQUAL scale appeared to provide much greater diagnostic information about service quality than the SERVPERF did. Although SERVQUAL is not without its critics, the result of Angur et al.'s showed that SERVQUAL is a better instrument for measuring service quality. **Bahia and Nantel (2000)** conducted a study to develop a reliable and valid scale for the measurement of the perceived service quality of retail banking in Canada. They argued that the universality of the five dimensions of SERVQUAL across different types of services had been questioned in a number of subsequent studies. They also argued that these five dimensions are not fully generic. It is often necessary to incorporate additional items to dimensions because they are particularly important for some service categories. Another critique addressed to SERVQUAL since it has focused on the first marketing mix element (i.e. product) to improve quality. Further they developed a measurement of perceived service quality with reference to Parasuraman et al.' (1985) original ten dimensions and some additional items which are important to retail banking service, then they remodeled and tested the measurement scale. Based on this procedure, they proposed a scale that was called as bank service quality (BSQ). The BSQ comprises 31 items, which span six dimensions: effectiveness and assurance, access, price, tangibles, service portfolio, and reliability.

Sureschandar, Rajendran, and Anantharaman (2002) aspired to develop an empirical model of service quality with a specific focus on the banking sector. The objectives of their study are: (1) to identify the critical factors of service quality from the customers' perspective; (2) to develop an instrument to measure customer-perceived service quality based on the identified factors with a specific focus on the banking sector; (3) to empirically test the proposed instrument for unidimensionality, reliability and validity using a confirmatory factor analysis approach. They proposed the 5 critical factors of service quality from the customers' perspective i.e. human element of service delivery, core service or service product, systematization of service delivery, tangibles of service (servicescapes), and corporate social image. These factors resulted from modifying the original SERVQUAL instrument, by adding and/or reducing other relevant factors.

The five-dimensional structure could possibly serve as a meaningful framework for tracking a firm's service quality performance over time and comparing it against the performance of competitors. The wording of some individual items may need to be customized to each service setting. Items on some dimensions should be expanded if that is necessary for reliability. Thus, the banking industries must continuously measure and improve these dimensions in order to gain customers' loyalty.

THE INFLUENCE OF MARKET TYPE AND DEMOGRAPHICS ON BRAND LOYALTY: A STUDY AMONG URBAN ROMANIAN CONSUMERS

Moisescu Ovidiu Ioan

Babeş-Bolyai University Faculty of Economics and Business Administration Teodor Mihali Street, No.58-60, 400591, Cluj-Napoca, Romania ovidiu.moisescu@econ.ubbcluj.ro

Abstract: Considering the increasing role and importance of brand loyalty in the context of nowadays fierce competition and the insufficient understanding of this brand equity core dimension by Romanian companies, this paper aims to partially eliminate this knowledge lack by investigating, among urban Romanian consumers, the influence of market type, namely consumable goods and durable goods markets, and of several demographic characteristics like age, income level, education level and gender, on brand loyalty, measured through four indicators: brand repurchase intention in similar buying contexts, brand recommend intention, brand repurchase intention in case of price increase (price elasticity of loyalty) and, respectively, repurchase intention in case of distribution decrease (distribution elasticity of loyalty).

Keywords: brand loyalty, brand equity, buying context, repurchase intention

JEL: M31 Marketing

Introduction

Considering nowadays dynamic marketing environment and fierce competition, brand loyalty, as core dimension of brand equity, is essential for any company that plans to maintain long term competitive advantages and commercial performance.

The role and importance of brand loyalty as fundamental parameter for establishing marketing strategies has been widely adopted in developed countries, but insufficiently understood by Romanian organizations. Recent studies (BrandTailors, 2008) show that many of the Romanian organizations or of those who are active within the Romanian market don't include in their marketing strategies explicit elements regarding brands or, if they do, they approach brands rudimentary, only considering their product source identification and differentiating from competition roles, without an articulate positioning strategy and/or without strategic objectives regarding long term brand value and brand loyalty growth.

If large sized enterprises or multinationals approach brands and their customers loyalty as core elements of marketing strategies, small and medium sized companies' marketing managers usually don't perceive the importance of having a strong brand loyalty and, even if they do, they lack the necessary information and knowledge in order to reflect branding within correctly underlain marketing strategies. This lack of knowledge and information is due to limited financial resources and/or poor motivation towards conducting specific studies regarding important brand equity aspects such as the impact of market types and demographics on brand loyalty. The aim of this paper is to analyze and identify, among urban Romanian consumers, the influence of market type,

namely consumable goods and durable goods markets, and of several demographic characteristics like age, income, education level and gender, on brand loyalty, measured through five indicators: repurchase intention, recommend intention, price elasticity of loyalty and, respectively, distribution elasticity of loyalty.

Theoretical background

Considering the concept of brand equity, several classical approaches can be identified within the specialized literature. Aaker (1991) conceptualizes brand equity as being a compex system including a set of brand fundamental dimensions as awareness, perceived quality, loyalty and associations. Aaker (1996) suggests a brand equity measuring system suggestively called "brand equity ten" which should consider ten analytical dimensions to be taken into consideration in order to describe brand equity, dimensions of which brand awareness and brand loyalty are fundamental. Kevin Lane Keller (1998:45) considers brand equity from a customer based view as being "the differential effect of brand knowledge on consumer response to the marketing of the brand". Farquhar (1989) considers that three elements are essential in building a strong brand with the consumer – a positive brand evaluation, an accessible brand attitude, and a consistent brand image – these elements being actually the core of brand equity.

Brand loyalty is the core dimension of brand equity, supporting his statement through several advantages of loyalty as (Aaker, 1996): barrier to competition entries, basis for price premiums, generator of time to respond to competitor innovations, and, respectively, means against unhealthy price competition. Brand loyalty can also reduce the costs of doing business through decreasing acquisition and promotion costs (Bennett and Rundle-Thiele, 2005).

Although Ha (1998) considers that brand loyalty should be described and investigated considering cognitive aspects of brand loyalty, researchers often analyze brand loyalty through behavioral aspects like repeat purchases. For example, Fader and Schmittlein (1993) investigated the advantage of high share brands in brand loyalty, measuring brand loyalty only by the behavioral aspect of repeat purchase. According to their research, high share

brands have significantly higher brand loyalty than low share brands. Bayus (1992) also analyzed brand loyalty by a behavioral measurement of probability of repurchasing.

Aaker (1996) suggests that brand loyalty can be assessed using a complex set of elements included into specific customer surveys intended to reveal customer satisfaction (the research instrument should include in this case questions like: "Were you – dissatisfied vs. satisfied vs. delighted – with the product or service during your last use experience?"), buying intentions ("Would you buy the brand on the next opportunity?"), buying habits/usage ("Is the brand the – only vs. one vs. two vs. one of three vs. one of more than three brands – that you buy or use"), while a more intense level of loyalty could be identified through brand recommendation intensions ("Would you recommend the product or service to others?").

Research methodology

The starting point in establishing the research necessary data was the main concept that brand loyalty basically represents the probability that those who have bought a specific brand would chose the same brand within the next buying decision in a similar context (simple repurchase) or a different context (price increase, and respectively, distribution decrease). Brand loyalty significance was extended towards the active involvement of loyal consumers in brand promotion (recommendations). Therefore, the necessary data to be collected regarding the two market types corresponding to durable and consumable product categories, consisted in: intention to repurchase the brand within similar buying context ("Will you repurchase the same brand next time?"), intention to recommend the brand you bought last time to others?"), intention to repurchase the brand within a changed buying context in the case of price increase – price elasticity of loyalty ("If the brand's price increased in comparison to its competitor brands, would you still buy the same brand?"), and, respectively, in the case of distribution decrease – distribution elasticity of loyalty ("If the brand were not to be found in the stores you usually buy, would you look for it in other stores in order to buy it again?"). The four brand loyalty measures above mentioned were collected in relation to the last purchased brand within each of the two market types (durables and non-durables). Demographics about the investigated subjects were also collected in order to investigate possible correlations.

In order for the research objectives and instrument to be accurate, two important factors had to be taken into consideration. Firstly, the investigated population comprised heterogeneous individual consumers not only considering their demographical characteristics (age, income, education, sex etc.), but also their vocabulary, intelligence level, technical knowledge and degree of usage regarding existing products and brands. Secondly, the data had to be collected in such a manner so that investigated consumers could describe their behavior and attitude, what they do and what they think about the analyzed product categories and corresponding brands. Therefore, the particular product categories selected to be investigated within the research were chosen so as: to be different considering their usage duration (durable/non-durable), not to be too technical (in order for most of the consumers to be able to evaluate their own behavior and express their attitudes towards those product categories) and to have a large rate of penetration into households usage or consumption. Given the established criteria above mentioned, the particular product categories chosen for the research consisted in tooth-paste, as being representative for the non-durable product category, and television sets (for durables).

As secondary data about the research issue and the target population of the research were missing, the gathered information exclusively consisted in primary data. The data was collected through an ad-hoc survey, due to the fact that statistically representative data had to be obtained, the information needed was basically unavailable otherwise, and the resources and time allocated to the research did not permit conducting a panel survey in order to investigate medium or long term evolutions of the analyzed relations.

Considering the same financial and time restrictions previously mentioned, the investigated population was limited to the urban consumers of Cluj-Napoca, one of the largest cities of Romania, although the intention of the research was to analyze the urban Romanian consumers as a whole. Nevertheless, the research could still be considered, with certain limitations, as being representative for the entire urban Romanian population as Cluj-Napoca is the second largest higher education center of Romania and, excepting the capital of the country (Bucharest), the second largest city of Romania, representing almost 3% of the Romanian urban population (INS, 2007).

The data collection instrument – namely the questionnaire – was designed using a symmetric scale, with six answering options from 1 = "Definitely no" to 6 = "Definitely Yes", so that to avoid neutral responses and to force a positive/negative attitude.

The questionnaire based interviews were conducted "face-to-face", at the household's residence of the respondents, by a group of 119 marketing specialization students, each student completing a set of five interviews. The sampling method used for the survey consisted in a mixture of classical probabilistic and non-probabilistic methods. Firstly, the population was geographically clustered considering the 474 postal areas of Cluj-Napoca. Afterwards, 119 clusters were extracted through systematic random sampling. The 119 clusters (postal areas) were assigned to the 119 interview operators (one cluster to each operator), and each operator had to complete five questionnaire based interviews on the basis of an itinerary sampling method (5 consumers from different households, located into five consecutive buildings from the assigned cluster – postal area). The data collected was afterwards verified and

validated by contacting (via phone and/or email) a random sample of respondents in order to confirm his/her answers. The interview operators identified as trying to mislead the research through providing non-valid questionnaires were fully verified.

At the end of the data collection process, from the total of 595 assumed completed interviews, only 551 were validated, therefore the research having a statistical error of $\pm 4.2\%$ ($e = 1.96 \cdot \sqrt{0.5 \cdot 0.5/551}$), with a statistical confidence level of 95%.

Results

In order to identify the influence of durables and non-durables market types on brand loyalty dimensions, the following hypothesis were investigated:

 H_1 : The intention to repurchase the brand within similar buying context significantly varies between durables and consumables

*H*₂: The intention to recommend the brand significantly varies between durables and consumables

 H_3 : The intention to repurchase the brand in the case of price increase significantly varies between durables and consumables

 H_4 : The intention to repurchase the brand in the case of distribution decrease significantly varies between durables and consumables

Table 1: The influence of market type (durable/non-durable) on brand loyalty measures

(Student - T, Mann-Whitney - Z, contingency coefficient - c)

(Student 1, Maint Whittey 2, contingency coefficient c)			
Intention to repurchase the brand	T=11,960	Z=-11,477	c=0,328
within similar buying context	(p=p=0,000<0,01)	(p=p=0,000<0,01)	(p=p=0,000<0,01)
Intention to recommend the brand	T=6,074	Z=-6,654	c=0,202
intention to recommend the brand	(p=p=0,000<0,01)	(p=p=0,000<0,01)	(p=p=0,000<0,01)
Intention to repurchase the brand	T=9,315	Z=-9,345	c=0,276
in the case of price increase	(p=p=0,000<0,01)	(p=p=0.025<0.05)	(p=p=0,000<0,01)
Intention to repurchase the brand	T=-2,889	Z=-2,234	c=0,130
in the case of distribution decrease	(p=p=0,004<0,01)	(p=p=0,000<0,01)	(p=p=0,002<0,01)

According to the statistical parameters (Table 1), all of the four hypothesis were accepted. Therefore, all of the four dimensions of brand loyalty investigated significantly vary between durables and non-durables. Thus, it can be said that the market type has a significant influence on brand loyalty at all levels. The strongest influence of market type occurs in the case of similar buying context repurchase intention and of repurchase intention when price increases. Repurchases, recommendations and price premium acceptance are more probable among non-durables, situation that can be explained by their relatively reduced impact on households' budgets and by the routine-like and low-involvement buying decision process that is specific to consumables. Nevertheless, consumers are more sensitive to distribution decreases in the case of non-durables, their brand loyalty from this point of view being stronger in the case of durables (Table 2).

Table 2: Brand loyalty dimensions in relation to market type (means)

	Non-durables	Durables
Intention to repurchase the brand within similar buying context	5,19	4,06
Intention to recommend the brand	4,60	3,68
Intention to repurchase the brand in the case of price increase	3,99	4,32
Intention to repurchase the brand in the case of distribution decrease	5,20	4,65

In order to identify the influences of demographic characteristics (age, education level, income level and gender) on brand loyalty dimensions, the following hypothesis were investigated:

 H_1 : The intention to repurchase the brand within similar buying context significantly varies within age / education level / income level / gender categories.

 H_2 : The intention to recommend the brand significantly varies within age / education level / income level / gender categories.

 H_3 : The intention to repurchase the brand in the case of price increase significantly varies within age / education level / income level / gender categories.

 H_4 : The intention to repurchase the brand in the case of distribution decrease significantly varies within age / education level / income level / gender categories.

Table 3: The influence of demographics on brand loyalty measures

(Spearman - Rho, Mann-Whitney - Z)

		Intention to repurchase the brand within similar buying context	Intention to recommend the brand	Intention to repurchase the brand in the case of price increase	Intention to repurchase the brand in the case of distribution decrease
SO.	Age	Rho=0,048 (p=0,264>0,05)	Rho=0,083 (p=0,05>0,05)	Rho=-0,054 (p=0,209>0,05)	Rho=0,07 (p=0,098>0,05)
ırable	Education	Rho=-0,051 (p=0,23>0,05)	Rho=-0,065 (p=0,128>0,05)	Rho=0,035 (p=0,407>0,05)	Rho=-0,034 (p=0,432>0,05)
Non-durables	Income	Rho=0 (p=0,994>0,05)	Rho=0,016 (p=0,711>0,05)	Rho=0,150** (p=0,000<0,05)	Rho=0,046 (p=0,28>0,05)
	Gender	Z=-0,286 (p=0,775>0,05)	Z=-2,398 (p=0,016<0,05)	Z=-0,647 (p=0,518>0,05)	Z=-0,89 (p=0,373>0,05)
	Age	Rho=-0,084* (p=0,049<0,05)	Rho=0,04 (p=0,347>0,05)	Rho=-0,001 (p=0,978>0,05)	Rho=0,022 (p=0,602>0,05)
Durables	Education	Rho=0,084* (p=0,049<0,05)	Rho=-0,028 (p=0,509>0,05)	Rho=0,066 (p=0,122>0,05)	Rho=0,038 (p=0,37>0,05)
	Income	Rho=0,076 (p=0,073>0,05)	Rho=0,059 (p=0,165>0,05)	Rho=0,061 (p=0,151>0,05)	Rho=0,051 (p=0,233>0,05)
	Gender	Z=-0,726 (p=0,468>0,05)	Z=-0,343 (p=0,731>0,05)	Z=-0,466 (p=0,641>0,05)	Z=-0,123 (p=0,902>0,05)

According to the statistical parameters (Table 1), only some of the hypothesis could be accepted. Brand loyalty significantly varies among income and gender categories in the case of non-durables, and among age and education categories in the case of durables.

Analyzing the particular correlation coefficients, some important conclusions can be drawn. Firstly, the higher the income level is, the higher the price premium acceptance lever is, but only in the case of consumables. Secondly, in the case of durables, similar buying context repurchase intention is stronger when age level is lower and education level higher. Thirdly, considering non-durables, there is a significant influence of gender on brand recommendations and, respectively, on repurchase intention in the case of distribution decrease.

Conclusions, research limitations and future research directions

The research results suggest that, in order to create brand loyalty, a high intensity level of distribution should be established and maintained, especially in the case of consumables. In the case of non-durables, brand price increases should be managed carefully as consumers more willing to switch brands than in the case of durables. When establishing brand loyalty based marketing strategies, companies should focus on income and gender driven market segments, in the case of non-durables, while with durables they should be concerned with age and education driven market segments, as these demographics are those which can influence brand repurchase intentions significantly (are correlated with brand loyalty).

Finally, certain research limitations and future research directions can be depicted. Firstly, the results' significance is limited to a certain local area of the urban Romanian market. Even though we could, with certain limitation, extend the results to the overall Romanian urban market level, a more geographical extensive research should be conducted in order to reveal certain local consumer behavior specifics. Secondly, the research method (ad-hoc survey) would have been more relevant if a panel were created and analyzed over time, so as consumer evolutions could be emphasized, as the Romanian market is a developing one. Thirdly, the research could be extended considering not only durables and consumables like those investigated, but also other specific types of tangible products and, of course, services, as significant differences would be expected to appear in that case.

It's time for the Romanian organizations to know what foreign companies have found along time. Without innovation, a company cannot survive! The innovation index is different from a sector to another, achieving, for example, even 100% in the field of read-made clothes.

Innovation is like a breath of oxygen in a world which becomes extremely exigent and materializes in a new solution from any point of view (technological constructive, creative, organizational etc.), an improvement without pretending to be unique, which the companies throw on the market to ensure success and their chances in future.

Although innovation is something more than staying on the spot, but it must be also mentioned the fact that more than half of innovations do not enjoy success.

Keywords: permission marketing, interrupted marketing, customers, advertisement

JEL classification: M31

It is nothing new if we state that marketing is so necessary in all types of activities, but the novelty comes when because of an excessive competition, of different categories of consumers, new variants of marketing approach are created, some of them being considered correct, others less correct and of principle.

Nobody has the patience to read the junk-mail or to follow the advertisements on TV, nobody is eager to find what news received on e-mail, to read notice, logos or billboards etc. Although the marketers' role is to attract people's attention on them, it is simply impossible physically and psychically for people to bear the pressure of all classical publicity messages. That is why, in an untidy and crowded world, other ways are looked for, other approaches of raising profits.

After having read the specialty literature, but especially as a result of present day practice, the present paper identifies some new successful concepts, proposed by marketers who have innovated the marketing. They are already created and it is more necessary to be known: Ambush marketing, Permission marketing, Field marketing, Shopper marketing, Blog marketing, Digital marketing and so on. We have decided to further develop the subject of Permission marketing.

The marketing people all over the world will become familiar with this concept. The sellers will soon speak about the efficient principles of the consumer permission marketing and about the optimum approaches of applying these principles.

The basic idea of permission oriented marketing is very simple: each of us is born with a limited amount of time, but the thought of using it efficiently is one of everybody's main goal.

To pay attention to a thing, whichever it may be, is in fact an awareness act which asks for a conscientious effort. So, in future, the only efficient way of selling goods to customers will be to ask his/her permission first. This can be attained by drawing the consumer into a dialogue, in a long term interactive relation to which he may take part equally. Instead of interrupting his attention by an advertisement, or violating his privacy by a telephone or an unexpected e-mail, the future marketer will try to get the consumer's permission of participating in the sale process. The consumer is likely to offer his permission because he wants to find more about a certain product. The marketer will have to offer some payment or a benefit in exchange for getting permission.

On the other hand interactivity may attract the consumers in individual dialogues which may lead to the development of some relationships to become ever stronger in the long run. Such a strategy not only shields a business against becoming trite, but also it offers a special service to consumers, a service which may value more than the access to the most recent and exact price comparison.

1. The evolution of mass marketing

1.1. Marketing crisis which cannot be solved with money

Marketers have found that the former way of making publicity and selling goods does not work as in the past, so they are continually looking for new ways by which to increase the market quota and profits.

Nobody pays attention to publicity, although important resources are wasted, but marketers have the duty to make us do it. If they did not interrupt our mind by placing a mark in our conscious or subconscious, then marketing would fail.

Nowadays publicity can be defined as being the science of creating and placing a message which interrupts the consumer, so that later it will make him act. However, the more crowded he market becomes the more difficult it is to succeed to interrupt the consumer.

Marketers have chosen to solve this problem in the least disadvantageous way, to face the disorder, confusion and the effects, more negative than positive of the marketing based on breaking, they decided to interrupt it more and more.

1.2. Interrupted marketing

The marketing of consumer goods is in a real crisis. The great diversification and specialization of media means leads to the situation in which a marketer cannot cover a large rate of population through a single message.

The important events have that capacity of bringing in front of TV screens more than half of the consumers member (e.g. football matches). Therefore, they are the ideal launcher for the messages of interrupted marketing supporters, having as a target the great number of audience caused by the event.

Besides the acquisition of a large quantity of publicity, how can mass marketers get through such an exceeding of information?

They apply one of the following four classical approaches:

- a) the first solution stands in the increase of investments in less common means of communication, not only in the traditional publicity on TV;
- b) the second technique is to make more shocking and attractive ads;
- c) the third classical approach, to maintain the mass marketing, is the frequent change of promotional campaign structure, in order to make them interesting and new;
- d) the fourth approach represents what most marketers do when they give up the mass-media ads and resort to direct marketing campaigns, to events, coupons, gratuity cards and other direct sales promotion instruments.

Making a summary of the problems with which the marketer applying the specific approaches of interrupted marketing confronts with, we can speak about 415:

- human beings can offer a finite quantity of attention;
- customers dispose of a finite amount of money;
- the more products are offered on the market the less money come to each product;
- to draw more attention and more money, the interruption oriented marketers must spend more;
- however, as it has been noticed before, spending much more money to get special results can only lead to an acuteness of the problems;
- a real vicious circle: the more money is spend the more decreases the efficiency. The less efficient, the more money must be spent.

Will the mass marketing ever have major changes? Without any doubt a new form of marketing appears in the image.

The new approach will affect the interrupted marketing in the same way in which the automobile revolutionized transport.

1.3. Mass publicity created mass marketers

Marketing has become the most profitable sector of an organization. It has been stated that besides marketing everything is expense. The possibility of attracting a large number of customers by advertising was a real revelation for the new companies.

At the beginning, they only flirted with the idea but later became dependant on the concept, rely the whole organizational and business strategy on the mass attraction.

At the beginning of the 19th century the publicity people were considered the saviors of the industrial societies, some complicated beings capable to keep a tight handle over the crowds to lead to progress. As soon as the producers started to make publicity they discovered (some of them by chance) an extraordinary truth: the more intense the publicity was the greater the sales were, and the value of sales exceeded the publicity costs. The machinery of modern trade had started to operate.

The development of mass means of communication to contain publicity information was considered a direct consequence of this discovery.

The supporters of interrupted marketing need something to interrupt people. In this way appeared new newspapers, radios and TV programs. Could the interrupted marketing have led to creation of today's media? It seems it did! As soon as the trade world tasted the mass publicity, marketers fixed on interrupted marketing. The reasons were relatively simple:⁴¹⁸

.

⁴¹⁵ Seth Godin, Marketingul bazat pe permisiune, Business Tech Publishing House, Bucharest, 2004, p. 39.

⁴¹⁶ David Aaker, Managementul capitalului unui brand, Brandbuilders Collection, Bucharest, 2005, p. 10.

⁴¹⁷ Wally Olins, Despre Brand, Comunicare.ro Publishing House, Bucharest, 2007, p. 44.

⁴¹⁸ Seth Godin, quoted work, p. 60.

- a) interrupted marketing was simple: you were creating some advertisements and they exhibited everywhere;
- b) interrupted marketing had a measurable efficiency: if you wanted the increase of sales, then you bought more publicity;
- c) the interrupted marketing was predictable: an experienced marketer could predict the profit of each coin spent on publicity;
- d) interrupted marketing was corresponding to the command and control needs of large companies. The strategy was totally under the control of the one making publicity, without the risk of some secondary effects;
- e) interrupted marketing is profitable. A good product brings great profits, superior to publicity costs.

The supporters of mass marketing have optimized their organizations to be able to approach this strategy. They created the position of mark manager, the publicity agencies and the companies evaluating the publicity impact and concentrated groups of specialists and numerous techniques to institutionalize their adherence to the system of interrupted marketing.

Permission marketing on the contrary constitutes a great threat and a great opportunity. This situation opens huge perspectives for the new companies, which have nothing to lose, which are flexible and endowed with the decision of trying a totally different way of winning and keeping its customers.

2. Customer's permission marketing

2.1. Publicity is powerful if it is anticipated, individual and relevant

Nowadays, although the confusion caused by overcrowd is great is goes on amplifying, permission marketers succeed to use it for their own benefit. In fact, the greater the confusion is, the more profitable is the permission marketing.

The interrupted marketing is the enemy of anyone who tries to take time. By a constant interruption of our activities in any moment, marketer who interrupts us succeeds a double performance of putting in danger the new product selling potential and not wasting our most precious good, the time.

Therefore on a long term, the interrupted marketing as an instrument of mass marketing is doomed to perish. An alternative might be the permission marketing which offers voluntarily to the act of sale. Being addressed to volunteers, this type of marketing brings the guarantee that the message will be received with much care. This type of marketing allows the marketers to deliver their speech calmly and to the point, without the fear of being interrupted by competition. Through this approach, both the consumers and the marketers won, between them being established a symbolist relationship.

The publicity messages specific to the customer permission marketing are *anticipated*, *individual*, *individual* al relevant. 419

Any marketer should offer a stimulus to his prospective customer for his being disposal, in fact the first meeting represents a great time and money investment, therefore it must be quite a strong reason to urge to a voluntary action

The stimuli we way offer the customers may vary from information to entertainment, contents or even a payment on the spot for the paid attention, must be direct, evident and offered clearly. Secondly, using the attention paid to consumer, marketer places at its disposal a long term program with clear marks regarding the product or the service offered. The third step implies the refreshment of stimuli and the next, which must make in the same time with the third step, constitutes the enhancement of permission level which the prospective customer pays to the marketer. The fifth step and the last constitute the transformation of permission in a profitable situation for both parties.

The permission marketing cuts victoriously way through the actual crowd and allows the marketer to address the prospective customers as a friend not as a foreigner.

This individual communication, anticipated, frequent and relevant has an infinitely greater impact than a certain message spread at random, in a moment chosen at random.

The main problem is that the permission marketing presupposes patient.

Companies led by this strategy have results in time, in opposition with what would like the marketers nowadays. Beside, permission marketing presupposes much trust.

Unlike the interrupted marketing, the permission one is a measurable process⁴²⁰. It develops in time and for any company which uses it, it becomes a more active asset. The more resources we allocate to permission marketing companies, the better they will operate in time. These stable and efficient processes represent the key of success in fight with the confusion nowadays.

The permission marketing is the one which uses efficiently the real force of Internet. The strong dynamism it brings to this environment makes from permission marketing the spear point of the following decade marketing.

⁴¹⁹ Seth Godin, Marketingul bazat pe permisiune, Business Tech Publishing House, Bucharest, 2004, p. 45. 420 Idem

2.2. Focus on customer quota and not on the market quota

At the end of 2000's Don Peppers and Martha Rogers wrote a book which completely changed the marketing image. This book entitled "The One to One Future" proposes a radical reconsideration of the way in which marketers treat their customers. Peppers and Rogers presented the model in which companies can increase their profit by selling a greater number of items to a smaller number of customers. With other words they consider that it is wiser to concentrate on sales increase to a smaller number of actual customers than to look for new clients.

The reasoning behind this concept goes straight to the target and leads to one of the principles which support the permission marketing; to get a new customer is expensive, being necessary expenses to draw his attention and efforts to educate him (interrupted marketing is expensive, the same being the process to win another customer). For the customer is expensive too, because he must to spend time to evaluate the information and to learn the characteristics and product advantages.

The authors of the mentioned book sustain with strong arguments the idea that attention must be drawn from the methods of increasing the number of clients to their keeping on a longer period of time and to getting greater amounts of money from them in the long run.

The permission marketing presupposes the concentration on a double perspective, both prior to a post-sale. The problem most of the companies confront with is that they start to analyze their customers too late.

The permission marketing has in view the changing of foreigners into friends and of friends into customers. One-to-one marketing uses the same techniques including knowledge, repetition and relevance to turn the customers in super-customers. One-to-one marketing is not in competition with the one based on permission but it belongs to the same dimension. Marketer who adopts the strategies peculiar to one-to-one approach use permission aloud after the perspective customer turned into a customer in order to turn him into a super-customer. The higher the permission level the higher the profit got.

2.3. The five permission levels

The marketing aim which uses permission strategies is to make consumers to advance on "permission scale", turning them from strangers into friends and from friends into customers. The customers are to be turned into devoted customers. Each step in this process presupposes the growth in faith, in responsibility and profits.

Permission may be classified in five different levels. The highest level is entitled the *intervene level*. The fifth, the lowest is called the *situational level*. Here are the five levels presented in the order of their importance:⁴²¹

- a) intervene level (and the model of permitted acquisition);
- b) points level (a system based on collecting points and that based on chance);
- c) personal relation level;
- d) mark trusting level;
- e) situational level.

There might be another level but placed outside permission area and practically it cannot be considered a level. It is the level of unsolicited publicity materials.

The marketer who gets the customer permission at "intervene" level, takes the decision of buying on the customer's behalf. It is a greater advantage, but risky in the same time. If the marketer makes mistakes or, even worse, abuses of their permission, will be cancelled on the spot.

The next permission level is that of points, a rigorous one, being a measurable approach in order to keep and draw the attention of the prospective customer. It is not necessary to give a great discount (generally in cash) which does not bring long-term benefits.

The seller gives only few points but what he gets is not only the customer's attention at the respective moment, but the creation of a relationship which will surely have better results in future.

The third level of permission is that of personal relations. Quite surprisingly, this follows the levels of points in the order of permission because these two levels cannot be compared. The using of a relation with a person is an efficient way of reorientation, at least temporarily, his attention and influences his behavior, but this way of approach is different from person to person.

Ever lower on the scale which measures the permission is the level of mark faith. This is the level got on product testing and researching, a kind of mantra of those marketers who are supporters of interrupted strategy.

In order of importance, the last permission level is that situational. It is a level which depends only on the moment situation, but it is very useful. Giving situational permission, is usually preceded by the question: "May I help you?". When a consumer calls a green-phone he has just given a situational permission.

On the bottom level, that is zero (the place from which starts any marketer which uses interrupted strategies) there are unsolicited publicity materials. At this level the permission problem cannot be raised.

⁴²¹ Seth Godin, Marketingul bazat pe permisiune, Business Tech Publishing House, Bucharest, 2004, p. 100.

2.4. Permission marketing in the context of Internet actual development

Jeff Bezos is about to become a billionaire because of this site Amazon.com, although on this site you can buy only books. By Amazon.com the sales are greater than the sales summed of the first printing-houses in the world. Google has a total value of shares listed at the Stock Exchange greater than some auto companies.

The Internet is the most important direct marketing media which has ever been invented. The main advantages the Internet offers to those wishing to profit from direct marketing would be:

- the dispatch of materials is free;
- the testing speed is one hundred times higher;
- the answering rate is fifteen times greater;
- the combination of off-line with on life marketing strategy;
- frequency is free you cannot identify and discuss efficiently with each person taken separately quite often;
- the printing is free.

We further present the five stages any permission marketing campaign must follow on Internet⁴²²:

- a) the marketer offers the prospective customer a stimulant so that he may voluntarily enlist in the system;
- b) using the attention paid by the consumer the marketer offers a real information program instructing the latter about his products or services;
- c) bonuses consolidates the keeping of the permission paid;
- d) the marketer offers additional bonuses to get a greater consumer's permission;
- e) in the long run, the marketer uses permission to change the consumer's behavior, turning him in a source of income.

The permission law is simple: in order to turn to account a list at maximum, it is necessary to amplify its individual, anticipated and clear character. The more the audience knows us, the messages are more anticipated and the permission character is greater and the value of a list rises.

Conclusions

The technology places at the marketers' disposal the perfect endowment and allows them to personalize the mail and send free messages on Internet. If we add to this a significant base of customers who expects to receive the marketing messages because they expressed their permission, it is simple to understand that the whole chain of book industry is in front of a deadly threatened.

By turning strangers in persons who gradually pay a rising permission, starting with the first contact up to the moment of allowing him to buy on the customer's behalf, the marketer may optimize the whole marketing process. By raising the evaluation capacity and marketing efficiency, the company may get considerable profits.

THE TRADEMARK IMAGE OF THE SOCIALLY RESPONSIBLE COMMERCIAL COMPANY

Murzea Cristinel

Transilvania University of Braşov Faculty of Law and Sociology 25, Eroilor Blvd., Braşov cristinel.murzea@unitbv.ro

Muresan Laura

Transilvania University of Braşov Faculty of Law and Sociology 25, Eroilor Blvd., Braşov laura.muresan@unitbv.ro, lauramureshan@yahoo.com

The social responsibility, correctly applied to the development strategies by a commercial company, can grant that much needed element of novelty to a successful trademark. All the advantages of the corporate social responsibility can add value to the trademark of the products of the socially responsible commercial companies. Thus, the functions of the trademark of certain products can be doubled by a socially responsible attitude, correctly and consistently promoted by certain commercial companies.

Keywords: trademark, commercial company, social responsibility, stakeholders, trademark image.

JEL Code of the work: K (Law and Economics)

1. The socially responsible commercial company

Many traders instinctively know that "to do what you have to" – to serve the clients, to take care of the staff's morale, to be attentive to the providers, to be good neighbours and to protect the environment – means a good commercial sense. The socially responsible activity concerns the provision of the economic success of a commercial company by including certain social and ecological reasons into its activities. 423

The social responsibility of the commercial companies must be considered from a complex perspective. We believe that the social responsibility of the commercial companies is what the community expects from a commercial company from an ecological, economic, legal, ethical and philanthropic point of view. Thus, the social responsibility includes all these types of activities (ecological responsibility, economic responsibility, legal responsibility, ethical responsibility and philanthropic responsibility).

The social responsibility of the commercial companies is a moral, voluntary responsibility of the respective commercial companies regarding the interaction of their own company with the: environment, clients/consumers, own employees.⁴²⁴

2. The trademark and its functions

The law⁴²⁵ defines the trademark as a susceptible sign of graphical representation serving to the distinction of the products or services of a natural or legal person from those belonging to another person. Thus, trademarks can be distinctive signs such as: words, including person names, drawings, letters, figures, figurative elements, tridimensional forms, and especially the form of the product or its package, combinations of colours, as well as any combination of these signs.

In ancient times, the signs identified the products produced by a certain workshop, by a certain craftsman, having the significance of a "signature". They played, for the objects in great demand, a role of the source guarantee, and thus a guarantee of the quality of the product on which they were applied.

From the initial manufacturer identification function, the trademark has evolved in the modern economy to that of the identification of the products with a tendency, at present, to evolve to a symbol, to a myth. The trademark has more and more, as a function, the conscious or unconscious connection to symbols, to genuine recognition signs, rather than the function of asserting the source and quality of the product, or services.

The trademark right is acquired by registering the sign chosen by the applicant. Registering the trademark grants the holder an exclusive right over it. The holder acquires, by registering the sign, an exclusive right to use or "occupy" it, which is restricted to the usage of this sign in relation to the designated product or service. The trademark right is a simple "occupation" right in the profile of the person who first made the registration, and that is why the validity of a trademark does not spell novelty, but originality. The occupation right granted by the registration is a particular type because the object and function of the trademark right is not to grant monopoly over a distinctive name but to favour the commerce, to provide the consumer's protection. The right does not protect the sign itself, the trademark, but the commerce is protected.

In the case of the distinctive signs, the rights of each competitor over the distinctive signs of his activity, including over the trademark, in relation to his competitors, are observed. The object of the protection is preventing the direct

⁴²⁵ Art. 3 lit. a, Legea nr. 84 din 1998 privind mărcile și indicațiile geografice.

competitors of the sign holder from using it as well, thus preventing confusion among consumers. This way, the sign holder is acknowledged the right to use it for his products or services, and to thus preserve his clientele.

The trademark is a distinctive sign used to differentiate the products and services of a trader. The differentiation can be objective to the extent to which it corresponds to the characteristics of the product (the trademark reflects the qualities of the product), or subjective, when the distinctive sign, without suggesting the qualities of the product, intends to "attract" the buyers. Sometimes, the attraction is so strong that the trademark becomes a myth and is included in the consumers' current vocabulary, turning into a generic name for a product or category of products.

The trademark proved its importance by its capacity to attract and preserve its clientele, becoming an essential element of increasing the trader's clientele. In time, the economic importance of the trademark has increased in direct relation to the development of the world commerce and international exchanges. Several products and services are sold worldwide under the same trademark, and this "commercial notoriety" has become a valuable asset of the modern enterprises. A trader can have the best products or services in the world. The clients must be able to distinguish and choose them from the products and services of the competition; the trademark has become a part of any commercial strategy.

Here are the functions of the trademark:

A. The product differentiation function has its origin in the belief according to which the trademark is a sign, a signature, which once applied on a product allows the public to identify it, distinguishing it from other identical or similar products. Thus, the trademark becomes a reference point of the searched product, for a public which no longer links the trademark to its source. In this context, the trademark acquires a clientele determination function, the manufacturer's differentiation function becoming a product differentiation or identification function. This phenomenon is called trademark objectification⁴²⁶.

B. The trademark competition function starts from its quality to be a means of individualizing the product belonging to a certain manufacturer. Thus, being an external sign of the products value, the trademark allows the consumers to easily and rapidly find the checked products belonging to the producers who have gained a good reputation. In some cases of new products, of special type, the trademark starts to identify itself with the product to such an extent that it is designated through the trademark. For instance, the example in which, in a shoe store, the buyer asks for a pair of "adidaşi" (sneakers) (sports footwear having the "Adidas" trademark), or makes Xerox copies, identifying the trademark of the copying machine ("Xerox") with the achieved action.

On this clientele attraction mechanism relies the trademark competition function, which has increased to misrepresentation as advertising has developed. By means of "violent and invading" advertising, the objective differentiation through the trademark has been replaced by a subjective differentiation, and the trademark competition function has been replaced by the monopoly function.

- C. The trademark quality guarantee function is indissolubly connected to competition. By means of the trademark, the consumer can identify a certain product which he prefers thanks to its quality or presentation manner. In certain fields, especially fashion and cosmetics, certain trademarks become a quality symbol to such an extent that they extend their effects beyond their origin field, to most various objects, to which they lend the prestige of the origin product. It can be noticed that the importance of the quality or quality guarantee function has increased. The regular consumer does not possess the elements required in order to check and evaluate himself the real quality of the variety of products sold on the market. He is informed in this respect through the advertising of the products, which means asserting the quality of the trademark products. This way, the objective differentiation based on quality turns into a differentiation based on presentation, in order to then become a subjective differentiation based on the "buyer's trust in a qualitative difference of the marked products" which makes him prefer a certain trademark, convinced that it corresponds to a top quality product.
- D. The market organization function derives from the interaction between production and consumption; the trademark is a market organization instrument, a means of correlating the demand with the supply. The increase of the economic importance of the trademark has led to the fact that "the trademark sells itself".
- E. The monopoly function of the trademark appears by the transformation (alteration), under certain conditions (with the implication of the commercial function), of the competition function and market organization function of the trademark.
- F. The commercial function is based on the attraction power of the trademark. By means of adequate advertising, the trademark can cause a real "conditioned reflex" to the consumer. Good advertising grants the trademark a selling potential, irrespective of the quality and price of the product to which it is associated. By seducing the

 427 Murzea Cristinel, Drilea Marian, Cletea Gheorghe, Miron Adriana: Noțiuni de proprietate intelectuală. Editura Romprint, Brașov. 2004, pp. 184-188.

⁴²⁶ Eminescu Yolanda: Tratat de proprietate industrială. Volumul II: Semne distinctive. Editura Academiei R.S.R., București. 1983, pp. 19-25

consumers, the trademark becomes an autonomous element of the commercial success. Thus, from an accessory of the product, the trademark has become an independent asset with its own value. 428

G. As for the consumers' protection function, the consumer has the right to be correctly informed on the quality of the products he buys, and the information must be complete in order to help his choice. The consumers' protection is achieved not only by means of correct information; the issue is much more complex, and makes the object of specific regulations, related to the consumption law. In the strict sense of law no. 84/1998 related to trademarks and geographical indications, the consumer is defined as any natural person acting with other purposes than those of his commercial or professional activities. The consumer's protection function derives from the quality guarantee function and from the source guarantee function because the source implies a constant quality of the marked product.

So the trademark is an important identification attribute of a trader in relation to his clients. The trademark of a trader applied on a product is for the consumer a proof of the individuality of that product. The trademark is thus a "guarantee" of the authenticity of that product for the client of that trader. 429

3. The trademark image of the socially responsible commercial company

The social responsibility plays an essential role in creating the reputation of the commercial company, a reputation which it enjoys among its different publics. The fundamental idea on which an identity program is based is that everything that a commercial company does/supports by means of the social responsibility actions must project a clear idea of the values in which the respective commercial company believes, a clear idea of who it is and what matters to it, of its objectives. In this respect, all developed actions must have continuity and must be consistent with the mission and vision of the commercial company, explained to the broad public through the communication action mixture.

A complex system of connections is woven around a brand, which contributes to the communication of the values which a company creates. A brand is built starting from a logo and slogan but its power consists in all the formats it is communicated and promoted: directly, through audio-video films, ad prints, online banners, posters, catalogues, direct mail.⁴³⁰

In this context, we must differentiate the trademark from the brand. If we look at each product or set of products as a person, the trademark is its image: hair, clothes, shoes, and even perfume. But the brand is a person, with a soul, vision, life principles. The image of the brand, the way it is presented in the communication with the clients, is not only the creation of advertising or branding agencies but it is a result of the "DNA" its creators have defined. 431

The image of the commercial company implies that its identity must be enriched by references and valuable attributes which will offer an advantageous psychological status and will influence the social image.

The trademark image of the commercial company has appeared as a result of the need to give coherence, foundation, credibility and durability to the main forms of communication within it: financial communication, social and internal communication, commercial communication and institutional communication. The trademark communication is thus achieved among the four types of communication. This need of unity and integration appears due to the fact that the public – including the ensemble of stakeholders of the respective commercial company – establishes with this commercial company a bidimensional relation. The bidimensional relation implies an indirect relation, where a general idea of the commercial company is formed based on the information obtained from mass media, based on the contacts established with the persons within it, based on the contact with its products; and a direct relation which directly affects the interest of the public – shares if he is a shareholder, social offer if he is an employee, position within the commercial company if he is a leader, etc.

The image plays the mediator role between the legal and natural persons, between institutions and individuals. In those previously presented, the public to which the respective socially responsible commercial company relates, is represented by stakeholders. The stakeholder notion derives from the following terms: "stake" meaning interest, and "holder" meaning owner, both English terms. Thus, the stakeholders are those categories of persons who have an interest in the development of the activity of the respective commercial company. The stakeholders are divided into two main categories: external stakeholders – including business partners, suppliers, consumers, local communities, natural environment, future generations –, and internal stakeholders – including employees, shareholders, and managers/owners.

4. Conclusions

The great trademarks are not born overnight. They constantly need a mixture of strategy, finances, legal counseling, and marketing-communication in order to maximize their values. At the same time, they need a certain understanding from the owners who must be updated on the new trends which are the object of the respective trademark, and maintain certain freshness.

The trademark plays three fundamental roles in the buying decision; helps to process the information, provides security with buying, and offers satisfaction in using the product, or service, respectively.

The trademark manages, by means of complex mechanisms, to reach several communication levels. Thus, the functional benefits (concrete, palpable), as well as the emotional ones (intangible) such as the satisfaction related to what one has obtained, status, the reason to be, the feeling that one makes the right choice grant the trademark that power of persuasion, of great deepness and complexity.

The trademark has become part of the way the commercial companies and also the consumers define themselves. It has become a socially accepted language. A means of communication.

The trademarks of the future will have to make a difference not only through the quality of the products and a desirable image, but also by symbolizing the commercial company behind the brand. According to Wally Ollins, consultant in the corporate identity field: "the following major stage in the evolution of brands is the social responsibility. It will be a smart choice to be able to say: there is no difference between our products and prices and those of the competition, but we behave nicely (to the environment and society)". 433

We notice a change in the behavior of the consumers. They no longer want to buy products recklessly. They have the possibility to choose. They choose those trademarks with solid values such as: trust, safety, authenticity, quality. The consumers want to bring meaning to their life, and trademarks can contribute to this desire by promising and offering the increase of the quality of the consumer's life.

For the commercial companies it is known that it is a long way from attracting the consumer and keeping him because the consistency is maintained by trust, and trust is the essence of the powerful successful trademarks, especially in the context of the global tendency to make clients loyal.

Almost anything can become a new successful trademark. Any product offers one opportunities to create an image in one's mind, which is unique. Almost any product can exceed the narrow, tight limits of its category. In the end, products have classical life cycles. The well-managed trademarks could live forever.

Any commercial company that wants to build a successful trademark must start from the best and real starting point, i.e. being among the consumers and finding out what they like or dislike related to that trademark. In order to keep a trademark alive during its course, in order to keep it vital, one must do something new, something unexpected. To surprise the consumer, to add a new dimension to the trademark, to reenergize it. A successful trademark invents and reinvents an entire category. A successful trademark is an unfinished story to tell. One always has something to say.

However, the wrongly conceived ecological and/or social marketing actions tend to have effects contrary to those intended. The preoccupations of the consumers related to environmental or social issues can no longer merely be exploited by ads saying that superficial changes have been made to a product, or the manufacturer complies with the applicable rules. The importance of the values of a commercial company has the tendency to equal and even exceed the importance of the characteristics of the products which they manufacture.

Thus, the social responsibility, of course correctly applied to the strategies developed by a commercial company, can give that much needed element of novelty to a successful trademark. All the advantages of the corporate social responsibility can give value to the trademark of the products of the socially responsible commercial companies. Thus, the functions of the trademark of certain products can be doubled by a socially responsible attitude, correctly and consistently promoted by certain commercial companies.

GLOBAL PROMOTIONAL STRATEGIES. THE CASE OF BENNETON COMPANY

Mușetescu Adina

Christian University "Dimitrie Cantemir" Faculty of International Economic Relations Strada București-Ploiești, Nr. 24-28, Bl. 13/1,Sc. A, Ap. 8, Sector 1, București adinamusetescu@yahoo.com 0724264310

Global companies have to make the effort to sustain advertising campaign in all the markets in which their are present, because wherever they liv, e people tend to react positively to companies and products they know about. The major objective of every multinational company is to achieve a strategic position on each market they are present in. To reach that goal companies need to differentiate its products from competitors, while holding the costs of market communication activities as low as possible. The present tendency is to combine elements of standardization and adaptation. In the international advertising strategy, brand familiarity plays an important role in the standardization issue. A very special global advertising history has the Benetton Company, one of the most dynamic marketing entities of the last decade. But it has been the company's advertising that made the company different form its competitors.

Keywords: global advertising, brand, standardization, adaptation, strategy, advertising agencies.

JEL Code: M37

The multinational companies have to obade the same rules in terms of effective marketing communicaton. However, the envirionments and the situations usually are more numerous and call for coordination of the promotional effort.

Global companies have to make the effort to sustain advertising campaign in all the markets in which their are present, because wherever they live people tend to react positively to companies and products they know about. In the U.S., for example, many consumers belive that nationally advertised products are better than only locally advertised competitors⁴³⁴.

The international marketer basically has the same communication tools at is disposal as its local counterparts. However advertising, public relations, sales promotion, sponsoring and direct communication need additional international coordination.

The major objective of every multinational company is to achieve a strategic position on each market they are present in. To reach that goal companies need to differentiate its products from competitors, while holding the costs of market communication activities as low as possible.

Not every multinational company has a high level of coordination of its market communication. The appropriate level of coordination depends on how important an internationally standardized identity is to the successs of a company and its products. The products with widespread international presence and highly mobile customers (such as Hilton for example) need the highest degree of coordination of market communication among country markets to achieve and sustain the intended position in their customers mind.

Some companies operate internationally byt market purely local products that do not have any external signs in common, such as the brand name or the package. Such products do not need any coordination of their communication activities. Potential coordination needs only arise from the goal of achieving the intended general position of the company in the minds of the customers.

Advertising is the paid communication of compay messages through impersonal media. Like local marketers, an internationally operating company uses advertising mainly to: stimulate potential customers interest in its products, make those products reach an intended position in the customers minds, continually remind the customers of the benefits to be gained by bying and using the product and prepare the ground for positive buying decisions by the customers⁴³⁵.

The first step after internalization decision has been made, is to decide the product modifications that are needed. A company has four basic alternatives in approaching international markets: selling the product as it is in the international marketplace, modifying products for different countries and/or regions, designing new products for foreign markets, and incorporating all the differences into one product design and introducing a global product ⁴³⁶.

Different approaches for implementing these alternatives exist. For example, a company may identify only target markets where products can be marketed with little or no modification. A large consumer products marketer may have in its product line for any given markets global products, regional products, and purely local products. Some of these products developed for one market may later be introduced elsewhere, including the global marketer's home market.

Standardization means selling the same product worldwide. Its main benefit is cost savings in production and marketing.

_

⁴³⁵ Idem

⁴³⁶ Czinkota, M., Ronkainen, I. – International Marketing, Seventh Edition, Thomson, 2004.

The overall advantages and drawbacks of standardization versus adaptation are summarized in Table 1.

Table 1

Standardization versus Adaptation	
Factors Encouraging Standardization	Factors Encouraging Adaptation
- Economies of scale in production	- Differing use conditions
- Economies in product R & D	- Government and regulatory influences
- Economies in marketing	- Differing consumer behavior patterns
- Economic integration	- Local competition
- Global competitions	- True to the marketing concept

Source: Czinkota, M., Ronkainen, I. – International Marketing, Seventh Edition, Thomson, 2004.

As a response to integration efforts around the world, especially in Europe, many international marketers are indeed standardizing many of their marketing approaches, such as branding and packaging, across markets. Similarly, having to face the same competitors in the major markets of the world will add to the pressure of having a worldwide approach to international marketing. Companies such as Coca-Cola, Levi's jeans or Colgate toothpaste are the evidence that the universal product and marketing strategy can work.

Standardization is recommended in general for products that have universal brand recognition and minimal knowledge requirements for use. Within consumer products, luxury goods and personal care products tend to have high levels of standardization while food products do not.

Consumer goods generally require product adaptation because of their higher degree of cultural grounding. The amount of change introduced in consumer goods depends not only on cultural differences but also on economic conditions in the target market. Low incomes may cause pressure to simplify the product to make it affordable in the market.

Another approach is to introduce new products for foreign markets in addition to the company's relatively standardized "flagship" products and brands⁴³⁷. Some of these products developed specifically for foreign clients may later be introduced elsewhere, including in the domestic market. For example, IKEA introduced sleeper sofas in the United States to fill local need, but it has found demand for the concept in Europe as well.

The present tendency is to combine elements of standardization and adaptation. A good example is Colgate that although its toothpaste isavailavle world wide, the company also markets some products locally, such as spicy toothpaste for the Middle East⁴³⁸. Another example in McDonald's that has restaurants that look the same all over the world, but the menu is not identical. The adjustments include beer in Germany, wine in France and mutton burgers in India.

Increasingly, companies are attempting to develop global products by incorporating differences regionally or worldwide into one basic design.

For a long time international marketers, advertising agencies and academicians have been debating the applicability of standardized international advertising. Although the main concern in adopting a standardized advertising strategy is the maintenance of a uniform global strategy and image, the costs and benefits associated wigh advertising standardization are more frequently stressed then maximizing the companies revenue potential.

The influence of culture is particularly important in transferrring advertising strategy across borders, because communication patterns are closely linked to cultural normes⁴³⁹.

In the international advertising strategy, brand familiarity plays an important role in the standardization issue. International advertising standardization makes sense only to the extent that the companie's international marketing strategy centers on the development of brands that are similarly posioned in every market. Well established brands have important advantages in advertisements, as consumers pay more attention and remember better product information. A brand that is familiar will tend to be favored, regardless of advertising or advertising content.

Brand names reprezent the image of a product or srvice. The term brand refers to a name, term, symbol, sign, or design used by a compnay to differentiate its offerings from those of its competitors. Brands are one of the most easily standardized items in the product offering and may allow further standardization of other marketing elements such as promotional items.

The brand name is the vocalizable part of the brand, the brand mark the nonvocalizable part (for example Camel's camel). There can be some restriction in the legislation of some countries regarding the promotion of the brand name, but the use of the brand mark has not. As an example, Marlboro cannot be advertised in most European countries because of legal restrictions on cigarette advertising. However, Philip Morris features advertisements showing only the Marlboro cowboy that is known throught the world.

⁴³⁸ Idem

⁴³⁹ Pae, J., Saeed, S., Tai, S. – Global advertising strategy: The moderating role of brand familiarity and execution style, International Marketing Review, Vol. 19, No. 2, 2002.

The international marketer has a number of options in choosing a branding strategy. The marketer may choose to establish national, regional or worldwide brands. The use of standardization in branding is strongest in culturally similar markets; for example, for United States marketers this means Canada and the United Kingdom.

The psychlogical power of brands is enormous. Brands are not usually llisted on balance sheets, but they can determine the success of the company and allow it to demand premium prices.

Brand familiarity is essential for acceptance and for implementing the higher level of advertising standardization.

Some international marketers consolidates their company's entire advertising account at one globally operating advertising agency. The coordination requirements of agency clients that operate in increasingly global industries have led major advertising agencies to strengthen their international services.

The biggest international advertising agencies were in 2006:

Table 2

	Top advertising agencies in 2006

Source: "20th Annual Global Marketers", Advertising Age, 2006.

A companywide communication system is the most basic element of global global brand leadership⁴⁴⁰. Managers from country to country need to be able to find out about programs that have worked or failed elsewhere. They also need a way to easily fibe and receive knowledge about customers, knoledge that will vary from one market to another.

Observed in the long term, one of the basic responsabilities and rights of the managing structures is creating company culture. Every company has some features which which make its culture different form others. It is possible to present company culture as the method in which a company carries out activities and the way in which it would like to carry them out despite the short term, and even to a certain extend the long term, changes or disorders on the market. One of the most widely known methods of developing and presenting company culture is with the model 7S whose creator is the consulting company McKinsey & Co. The name "7S" includes: *strategy* – company strategy, *structure* – formal and informal organisation and management levels, *system* – systematic circulation of information whithin the company, *style* – manner of management behaviour, *staff* – characteristics and features of employees, *shared value* – common values as the end goal of the company and *skills* – capabilities and skills of a company and each emploee observed individually⁴⁴¹.

This model forms a good guideline towards which all companies should aspire in determining and establishing their own culture, as a strategic characteristic.

Due to ever increasing competitive relations and changeability in the market, a company must be adaptable and should aspire primarily to the proactive approach in discovering the circumstances which can influence its success. Companies which recognise the importance of consumer orientation create a company culture which takes into consideration the interest of the customer in all activities.

In order to be successful in the global market, it is important that the advertising of multinational companies contributes to making the brand stronger. A very special global advertising history has the Benetton Company that has maintained its aggressive style for global recognition of its brand.

Today, the Benetton Group is present in 120 countries around the world. Its core business is fashion, whose style, quality and passion are clearly seen in its brands, the casual *United Colors of Benetton*, the glamour oriented *Sisley*, *Playlife* American college style. Its network of more than 6,200 contemporary stores around the world offers high quality customer services and generates a total turnover of over 2 billion euro. Established in 1965, Benetton is now controlled by Edizione Srl (a holding company wholly owned by the Benetton Family) with a 67% stake. It has

⁴⁴⁰ Aaker, D., Joachimsthaler - The Lure of Global Branding, Harvard Business Review, November - December 1999.

⁴⁴¹ Vranesevic, T., Vignali, C., Vignali D. – Culture in defining consumer satisfaction in marketing, European Business Review, Vol.14, No. 5, 2002.

been one of the most dynamic marketing entities of the last decade. But it has been the company's advertising that made the company different form its competitors.

Benetton has been in the center of controversy ever since its "United Colors" campaigns were launched in 1985 to symbolize the marketer's "commitment to racial and multicultural harmony."

It has been one of the most dynamic marketing entities of the last decade. But it has been the company's advertising that made the company different form its competitors.

In the fall of 1991, Benetton launched a new series of shocking ads, which included a priest kissing a nun; a placenta-covered newborn baby with an umbilical cord still attached; and what the company calls an "angelic" white girl and a "dark and mysterious" black boy, replete with devilish horns. The campaign was intended for 92 countries to constitute the majority of countries' promotional efforts. For example, the \$3.5 million U.S. magazine campaign represented half of Benetton's local budget. "It's fair to say that this is the most provocative campaign we have ever mounted," said Peter Fressola, director of communications for Benetton Services Corp., the company's U.S. marketing arm. "The images are more provocative, and there seem to be more of them."

Although previous campaigns showing a black woman breast-feeding a white baby had generated publicity, the storm broke with the most recent series of ads, when various governmental and industry bodies in the United Kingdom, France, Germany, Italy, and Ireland asked Benetton to withdraw the campaign. For example, in the United Kingdom, the Advertising Standards Authority (ASA) formally asked Benetton to stop using outdoor boards showing the newborn.

In the United States, magazine publishers refused to run some or all of the campaign.

In the letter rejecting the newborn ad, Mary Anne Sommers, publisher of *Child*, wrote, "Birth is still an extremely private and personal subject for Americans . . . and there was a strong likelihood the ad would not be favorably received by a good portion of our readers." At Benetton, the response was that of surprise. "We were very surprised by this general hysteria created by the new campaign," said Laura Pollini, Benetton's spokesperson in the United Kingdom.

The creator of the ads, Oliviero Toscani, was astonished by the reaction to the campaign. The newborn ad is a documentary-style bit of "ultra-reality," he said, and there is "nothing sinful" about a priest and a nun kissing. "I take pictures, I don't sell clothes." Benetton expressed its confidence in Toscani and vowed not to interfere with his provocative style.

Benetton Group has for many years sponsored the Rugby, Basketball and Volleyball teams in Treviso, highlighting Benetton's profound link with its roots and its hometown in a context that is not only competitive but also social. For the Group, sport and business have the same philosophy: passion, challenge, competition and results. Over the years this has translated into numerous victories, thanks to which Benetton Rugby has collected 13 league championships, Sisley Volley 9 and Benetton Basket 5. The company links all these societies, managing the coordination and organization of all the events, mostly meant for the sport youth. 'La Ghirada', a real city of sport in Treviso, was realized with the purpose of practicing together: amateurs, professionals or simply sport lovers.

THE ROLE OF HYGIENE IN PUBLIC NOURISHMENT

Neacsu Nicoleta Andreea

Universitatea "Transilvania" din Braşov Facultatea de Științe Economice Loc. Brașov, Bd. Alx. Vlahuță, nr. 55, sc. B, ap. 38, jud. Brașov deea neacsu@yahoo.com Telefon: 0740194425

Nourishment's hygiene is seeking accomplishing nourishment that is hygiene, rational for population in order to contribute to health's promotion and furtherance of our body's strength. Grocery are considered good to be consumed, then, when by their chemical-figure, bacteriological and biological, do not have a baneful effect on consumer's health, on the contrary, is giving play to it's nutritious role.

Keywords: hygiene, nourishment, health

Codul JEL: I (Health, Education, and Welfare)

1. Introduction

Hygiene term drifts from Hygeia, which in Greek mythology was health's gods, Asklepios's daughter, and healer godes of diseases. Asklepios has remained the curative symbol of medicine, and Hygeia has remained till our days the emblem of health.

The science of hygiene, is one of the oldest branches of medicine and has always had as a goal the preventing of illnesses and keeping human's and collectivity's health, in difference with clinical 's medicine's branches that have, as a main goal, the study of illness and curing the sick man.

Hygiene is population's health science, of keeping and strengthening people's health, being the main discipline of preventing medicine and collectivities medicine. She examines the influence of environment's factors-naturals and socials- over population's health, sanitary and ecological consequences, after environmental factors enterprise by man as well as his and collectivities ability of adaptation at the, permanently in changing, surrounding environment. Hygienic standards are seeking maintaining health and its improvement, the growth of people's capability of work, the extension of people average of life, and the active duration of life, as a general affect.

2. The role of hygiene in public nourishment

Nourishment's hygiene is seeking accomplishing nourishment that is hygiene, rational for population in order to contribute to health's promotion and furtherance of our body's strength.

Nutrition is the process throughout the human body is getting from the environment nutrient substances which are being transformed in order to assure it self the normal outgoing of the metabolism processes.

Grocery are considered good to be consumed ,then, when by their chemical-figure, bacteriological and biological, do not have a baneful effect on consumer's health, on the contrary, is giving play to it's nutritious role

Nourishment's hygiene is part of hygiene and is seeking two objectives:

- 1. Knowledge and release value of the beneficial effects of nutrition over health's spirit.
- 2. Removing and reducing the risk of food production to become noxious factors for consumers.

Nutrition hygiene is studying food, composition, properties, obtaining conditions, processing, packaging, handling, transportation and marketing in order to market, establish rules for verifying salubrity and quality of foodstuffs of animal origin as well as verifying design, construction, equipping, and operating the units processed, preserving, preparing or debiting food of animal origin.

Nutrition hygiene means all necessary measures to ensure safety and integrity of food. There are four important elements that compose UE strategy in food safety domain:

- Regulations on food and feed safety.
- Providing independent research and information available to the public.
- Verification activities for the implementation of regulations and mechanisms of control processes.
- Recognizing the rights of consumers to make choices based on complete information regarding the origin of food and its content.

3. Framework of legislation on food safety

Regulation of the European Parliament and Council (EC) 178/2002 on the general principles and food law requirements establishes the European Food Security and regulates procedures in food security.

Rules prohibit the placing on the market of foodstuffs which are not safe for human consumption and provide a uniform basis for the use of precaution principles.

Contains rules to follow to ensure food and food ingredients and provides procedure for adoption of implementing rules to enforce these principles in what concerns the specific sectors.

Regulation is transposed in the Romanian legislation through Law Nr. 150/2004 in what concerns food safety, published in the Official Gazette Nr.462/24 may 2004 and the decision nr 308 on the organization and functioning of Veterinary Agency and for the safe food and its subordinated units(Official Gazette Nr 243/19 MARCH 2004).

General rules of food hygiene should be observed when preparing, processing, manufacturing, packaging, transporting, distribution, handling and delivering for sale or supply consumer, must harmonized so as to protect human's health.

In order to implement hygiene rules for food and guides to good practice, it's recommended the applying of EN2000 series' standards.

4. HACCP system and food safety

Under the decision of government, number 924/2005, units in the food sector should identify activities which are determinant for food security and must ensure that security procedures corresponding are established, implemented, maintained and revised based on the principles used in the analysis of risks and critical control points (HACCP).

HACCP system is a system that identifies, evaluates and controls hazards that are relevant to food safety. By Codex Alimentarius, in the seven principles of HACCP system application is:

- 1. Identify potential hazards and control measure. Their possible hazards that may appear can be determined. This means that as well microbial hazards (of aging) and pollution (chemical pollution, foreign objects) is taken in consideration.
- 2. Determination of critical control points (PCC); Points in the production process where hazards can be controlled efficiently are marked as control critical points.
- 3. Establishing critical limits which must be met to prove that the PCC is under control.
- 4. Establish a monitoring system.
- 5. Establish corrective actions to be taken when monitoring indicates that PCC is not under control; Anticipated corrective measures are foreseen, which will be applied if the measurements / monitoring show deviations.
- 6. Establish procedures for verification and confirmation of the actual operation of HACCP. The complete system must be regularly controlled for efficiency and must be adapted in order to see the process changing or product's ones.
- 7. Establish documented procedures. All shares in the company must be recorded.

Sequence of 12 steps in implementing the HACCP system is:

- Quality assurance policy.
- Informing and training people to be involved in designing the system.
- Information about product.
- Information about process.
- Identifying potential risks.
- Risk evaluation.
- Control measures (critical control points-PCC and attention points-PA).
- Standards and critical limits.
- System monitoring.
- Correction actions.
- Documentary and recording.
- Checking.

5. Conclusions:

The first regulation on food safety dates back to the first days of existence of the EU. Crises that have affected the safety of food in 90's stressed it was necessary to replace of what became a mixed set of rules, chaotic, particularly in relation to food for human consuming, with a simple approach and cover.

In conclusion, the adoption of HACCP system implementation and evaluation of food industry are motivated by the following arguments: reduce the incidence of diseases due to food, providing supplies to the population of a safety products, promoting trade in food, and last but not least, tourism.

Relationship marketing involves a displacement of the organizations' attention from customer acquisition and the execution of mere transactions to the retention of profitable customers and the tacit understanding of each party's needs. The activity of going from mass marketing to one-to-one marketing is associated to a series of dimensions based on concepts such as trust, commitment, loyalty, fidelity and retention. The challenges facing many companies is to be able to create and maintain a business relying on customer relationship, and the Data Mining techniques can significantly ease this process. This paper concretely emphasizes the objectives to reach in order to "perform long-term collaborating exchanges" and the main Data Mining techniques providing solutions to execute them.

Keywords: relationship marketing, fidelity, retention, Data Mining techniques

Concepts characteristic to relationship marketing

Relationship marketing has become the key of the mechanism by means of which the organization focuses on maintaining and developing current customer relations. Although acquiring new customers has remained one of the most important issues, organizations grant more and more value to ongoing interaction with the consumers. Relationship marketing involves a displacement of the organizations' attention from acquiring new customers and performing mere transactions to maintaining the profitable customers and the tacit understanding of each party's needs according to specialist G. Day "the performance of collaborating exchanges". If, within the exchange, the product and price are deemed essential when it comes to transactional marketing, and if attention is moved to the needs of both parties, both those of the consumers and those of the organization, then the exchange is deemed to be relational.

Going from mass marketing to one-to-one marketing is associated with a series of dimensions based on concepts such as: trust, commitment (both affective and rational, fidelity, loyalty and retention. The essence of relationship marketing consists in earning competitive advantages for the company practicing it due to consumer retention for a longer period within the circle of permanent customers, by maintaining and/or increasing their level of satisfaction as to the provided performance⁴⁴². In economic terms, the retention stage is the most profitable, since the highest value level of the relation is experienced.

Trust

Both with respect to theoreticians and with respect to practitioners, trust is one of the crucial factors leading to the set up, maintenance and development of a long-term relationship between the organization and the consumers. The experience of a perceived higher value leads to a climate of trust which reduces significantly the effect of uncertainty, representing thus the basis of a solid relationship.

Affective and rational commitment

The literature of relationship marketing knows another possible factor leading to customer loyalty: commitment. Most researchers in the marketing field define commitment as the desire to continue, maintain the relationship between the parties without considering the offer of the competition. The field literature indicates two distinct dimensions of commitment: affective and rational. *The affective commitment* is an emotional factor developing through a degree of reciprocity or personal involvement, which results in a high degree of trust and commitment.

443 Garbarino și Johnson 1999; Morgan și Hunt 1994.

⁴⁴² Henning-Thurau, Hansen, 2000, pag. 3-27.

and the *rational commitment* is the cooler and more calculated dependence, with economic reasons, on the benefits of products due to the lack of alternatives or cost modification.⁴⁴⁴

Fidelity

Customers' fidelity contains the set of measures taken by the organization with the purpose of positively orienting the behavior of current and potential customers in order to obtain stability and progress in the customer relations. The loyal customer is the one who resorts frequently to the products and/or services of an organization.

Loyalty and retention

A unitary vision of specialists is that consumer retention leads to loyalty. Loyalty may have various forms only due to the idea that certain customers are more valuable than others. Loyalty clearly focuses on establishing a permanent dialogue with active customers. The aim is to build a mutually profitable long-term relationship. Thereby, we pursue operational goals like increasing usage, up-selling and repurchase rates.⁴⁴⁵

The duration, consistency and interdependence level between consumers and the organization may vary. The significant difference between a faithful and loyal customer is that the latter (the loyal customer) not only comes back frequently within the organization and resorts most of the times to its products and services, but also actively recommends the organization products, developing a positive word-of-mouth communication.

The challenge for any organization adopting relationship marketing consists in:

- -the identification and familiarization with the own customers;
- -the satisfaction and retention of existing customers.

These processes involve a detailed understanding of the consumption needs and the expectations customers have from the organization products and/or services. The best approach of such needs is an essential factor for the creation and ongoing improvement of mutual, durable and profitable relations for both parties, both for the organization and for the consumer. Due to Data Mining techniques the best approach of needs becomes doable.

Data Mining techniques - a marketing approach

Data Mining is simply a process and a serious tool that help to analyze information already collected to use it to support decisions.

In marketing, Data Mining techniques favor the understanding of the consumer behavior leading to the best decisions. Valuable models can be identified supporting marketers in the identification of the consumers' needs, the customization of products and communication adapted to their needs. In other words, by introducing the data analysis process, Data Mining, the organization can understand much better the customers' buying and consumption behavior. The models identified by a Data Mining method can be transformed into knowledge, only after appropriate validation; then, the knowledge can be subsequently used to fundament economic decisions.

The Data Mining concept is the discovery of models of useful information and/or knowledge in a large amount of data. The basis of professional data storage, finding and use mechanisms is data collection, without which their advanced analysis would be practically impossible. The evolution of information technology made it possible that at present users have direct access to sophisticated databases, which facilitates the making of correct and due time decisions, thus favoring the strengthening of customer relations.

Stages of the Data Mining process

The Data Mining process is done in 3 essential stages:

Prior to the beginning of the analysis process, within a software, an essential stage is to define the issue to be solved. The lack of accuracy within the process will lead to a waste of time and even of financial resources.

Stage 1: Initial exploration: a succession of steps is made within this stage:

data cleaning: the process to remove useless and inconsistent data;

While performing an e-mail marketing campaign, inexistent e-mail addresses can be detected (by means of the e-mail received from the organization with the message "this address doesn't exist") or addresses of consumers who are no longer interested in the company products. It is very important to remove these e-mail addresses and the database be permanently cleaned.

- -data integration: the activity to efficiently combine the data coming from various sources and their storage in a central system for analysis.
- -data selection: the extraction of data relevant for the analysis from the available data warehouses (databases, data warehouses, WWW etc.);
- -data transformation: placing data in unit formats corresponding to the analysis with a view to discovering knowledge.

Data transformation mainly concerns data description, data econding, the units of measure and data format. Data description and visualization is a key component of this stage (statistic description, correlations, graphs etc).

⁴⁴⁴ Anderson and Weitz 1992; Dwyer, Schurr and Oh 1987; Heide and John 1992.

⁴⁴⁵ Data Management in Analytical Customer Relationship Management- Dirk Arndt, Wendy Gersten, 12 The European Conference on machine learning.

Stage 2: Creating the model and its validation:

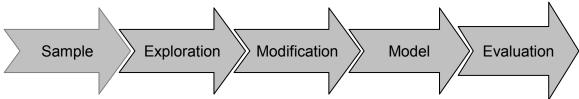

Extracting data models by applying results on data after the previous methods, generically called Data Mining techniques; this process is essential to discover useful knowledge within databases.

A model can be seen as a "transparent", coherent, intelligible structure or can be seen as a "black box", structures and rules based on which forecasts are made which are difficult to understand in full. The model validation involves its assessment on a distinct set of independent data.

Stage 3. Providing knowledge to the user

The data mining process interacts with the user through the database meant to him/her from among the data models discovered, those important to the user representing in fact new knowledge which is stored in the knowledge base in order to be presented.

Stage 4. Dissemination. Once created, a model must be able to be used whenever necessary on other data as well. In the field literature, there is a variety of models of the Data Mining process, focused on the integration of methodology in an organization; i.e. how data ca be turned into knowledge, how the most important stakeholders can be advantaged and to what extent knowledge dissemination can be made in a form which is easily convertible into resources. One of these models belongs to Institutul SAS. Within the SEMMA model, accent falls on the technical aspects of the Data Mining process:

Source: www.statsoft.com – Short course in Data Mining

The Data Mining techniques have lead to the effective and profitable use of data coming from customers. In relationship marketing, objectives such as owning a competitive advantage, knowing the customers' consumption needs, effective and ongoing communication with the current and potential customers can only be reached after the following stages: creating the "customer" database, classifying customers on criteria, filtering them, setting customers on hierarchies, selecting them depending on the level of interest, classifying them depending on the buying frequency, the preferred products, identifying the customer important data, completely visualization of the interaction between the organization and the customer, understanding the customers' individual needs, communicating in a few minutes with all the customers in the database, obtaining valuable feedback a.s.o.

The role of Data Mining techniques in creating and maintaining customer relations In order to know its customers better, a company must have a very large database so as the relations with its customers be controlled over time and the important data can allow access at any time to authorized users.

Depending on the type of the expected result, the Data Mining techniques are grouped into several categories. One of the most frequently used classification groups techniques into: supervised learning techniques and unsupervised learning techniques. *Supervised techniques* have a predictive function through the behavior of the answer variable and not only an explanatory function. In the case of *unsupervised techniques*, it is assumed that in explaining the phenomenon, all variables have the same significance, since no distinction is initially specified among them.

In the context in which customers become more and more sophisticated and demanding and the interpersonal relations in the field of marketing acquire a gradually high importance, the Data Mining techniques can be used for the planning, coordination and monitoring of segmentation, customer communication campaigns in order to become more customized and relevant, of fidelity programs, intentions which lead to consumer retention and the settlement of long-term relations profitable for both parties, the consumers and the company. The advantages of using the information technology is mostly shaped in two types of results: cost reduction and sales/profit increase.

Usually, the data resulting from cleaning and integration processes are stored in *data warehouses*, which ensure useful information for the company. The Data Mining techniques bring intelligence to such data, allowing the stored information to be turned into "useful samples", the design of new action rules, the application of new ideas and, last but not least, forecasts on the future of the company-customer relation. By using the techniques a series of questions can be answered with a significant importance for a relationship basis stable over time. Among these we can mention:

- -Which is the target market?
- -Which are the consumers likely to remain faithful and which are not?
- -Which are the reasons making consumers answer favorably to a certain offer?
- -Which are the future products or services that will be desired by customers?
- -Where should a new branch be opened?
- -Which is the accepted communication technique?

Data Mining can be used by any organization aiming to discover patterns or the existence of relations between owned data, anything that can be obtained from such owned data that could help a good exploitation of the business. Data Mining is a very powerful tool for various objectives, among which are the following:

Segmentation

It is the process to identify consumer groups aiming for the same benefit package from a product, each group with unitary and homogeneous needs. An important aspect of the database is that it does not represent the homogeneity feature, and a common message sent by all customers in the warehouses cannot be effective.

One of the most effective Data Mining techniques used for an effective segmentation is Cluster Analysis, aiming at grouping the cases (observations) into clusters (groups, categories) It can be used to sort out data (customers, companies, cities or other attributes) into homogeneous groups based on common features called clusters.

Cluster analysis can also be used for the understanding of the consumer behavior. By identifying homogeneous buyer groups, the buying behavior of each group can be observed separately, and the respondents are groups based on the importance they grant to a criterion for the selection of a product.

Fidelity

In the commerce field, prosperity comes only to those who know how to attract new customers and also keep the old ones and make them buy as many products as possible. ⁴⁴⁶ Through the effective customer management, very important data can be obtained on them and, as a result, various products and/or services with the same features as those preferred by them but unused before can be provided. Thus, knowing the preferences of the current customers, they will buy even more if their fidelity is rewarded.

In marketing in general, a fidelity card containing points or allowing access to a restricted group is used first of all for the identification of a potential buyer. In Great Britain, there is the highest number of fidelity cards, in Canada there are rewarding cards or point cards and in the USA the most frequently met cards are discount cards, club or prize cards. The appearance of fidelity cards can be explained as follows: customer information analysis. Filling in a form by the customers will significantly help the process of customer familiarization and interrelation, since it contains useful information such as: name, address, education, personal and family monthly income, buying frequency etc.

In Romania, fidelity cards are generally issued by drug stores. SensiBlu was the first to introduce on Romania's pharmaceutical market fidelity cards. At present, it has 700,000 owners. The HelpNet fidelity card is the first card in the pharmaceutical system providing a 5% discount on any product in the network, except for compensated medicine. 447

Fidelity cards are an important tool used to create a database with detailed information on the company customers (data warehouse), extremely important for the use of Data Mining techniques.

Detecting customers with the tendency to churn

The Data Mining techniques have a special role in rapidly detecting customers with the tendency to abandon the products/services of a company. The objective is to prevent the migration of existing customers and to detect the customers prone to easily abandoning the company services. The Data Mining solution is to identify the basis of common features of customers about to churn using *Neuronal networks* and *Chronologic series analysis*.

Neuronal networks are dynamic networks, made of a set of artificial neurons, the behavior of which can be characterized by the supervision of states at various time moments. The advantage of this technique consists in the rapidity with which it can provide answers to various problems, offering real time predictions for new instances.

For example, by using Neuronal networks and the Chronologic series analysis, the company France Telecom implemented "Customer Profiling" System (CPS), resulting in the rapid detection of customers with a tendency to churn by comparing certain features of such customers with features of those who have already churned. 448

In order to set the reasons for which customers manifest a negative attitude to the company products another Data Mining technique can be used, i.e. Factor Analysis. By means of this technique, emphasis is indicated on the interdependence links between the variables with the help of which a certain phenomenon is characterized, by condensing the data volume. The purpose is to discover the factors upon which rely the correlations among several variables. Therefore, the technique may be successfully used to set the reasons which form the basis of the favorable or less favorable attitude of customers to the company products and/or services.

Conclusions

Similar to the complexity of applications, the number of variables to be considered and the primary data volume have gradually increased one year to another, the need of techniques to analyze such data has significantly grown. Therefore, if previously the purpose was to obtain information, nowadays, paradoxically maybe, we have much information; so there appears the need to extract the relevant one.

⁴⁴⁶ www.marketwatch.ro.

⁴⁴⁷ www.sfin.ro - Saptamana fianciara.

⁴⁴⁸ www.mit.edu - PATEL, Nitin, "Data Mining", Course 15.062, Massachusetts Institute of Technology, MIT OpenCourseWare, Sloan School of Management, 2003.

Data Mining techniques provide the means through which each organization can monitor its customers' buying behavior changes, the modification of the company-consumer relationship and the impact of such changes on other network members. In relationship marketing, the great advantage offered by the use of such techniques is that they allow relationships between the exchange participants (company and consumer) to be able to be monitored, analyzed and developed – a significant factor in setting a long-term relationship.

The challenge facing many companies is to be able to build and maintain a business based on customer relationship. The limits of Data Mining techniques gravitate around this concept since *it takes more than Data Mining to turn a product – focused organization in a customer – centric one.* Therefore, Data Mining is a highly useful tool, but not a "magic wand", it does not implicitly provide solutions, but it needs authorized guidance.

"Relationship marketing is the mechanism through which the company attention is moved from customer acquisition towards the development and improvement of the relationship with its current customers" and in order to achieve such goal, a company must:

- -know the behavior of its current and potential customers;
- -be able to set the buying behavior changes, visualizing the customers' actions in time;
- -extract customers' important data;
- -learn how to extract knowledge from the information in the customer database;
- -act based on this knowledge in order to transform customers into profitable customers.

In conclusion, Data Mining transforms the customers' present and past actions into future actions of the company, bringing a plus of value and efficiency to the strategy for the maintenance of long-term customer relations, turning plans into practice.

Mihaela State

Universitatea "Ștefan cel Mare" Suceava, Facultatea de Științe Economice și Administrație Publică, email: s mihaela79@yahoo.com, telefon: 0723689763

This paper identifies drivers of the corporate social responsibility as a factor to create a good market position of small and medium — sized enterprises. An important challenge for a company in getting success is to respect diverse cultures and workforce environments and start forming a social consciousness. Companies that are investing in employees have as a result a growth of the work productivity and the creation of a new image of the organization in the business field.

Key words: corporate social responsibility, SMEs, image, brand value, customer satisfaction

JEL Codes: M31

Introduction

Corporate Social Responsibility is one of the important ways today in which enterprises affirm their principles and values. The impact of business on the society is often discussed in the context of "corporate social responsibility" (CSR). CSR is already an integral fact of business life for many companies. Origins of CSR are influenced by ethical concepts, religious practice, historical and cultural traditions of each country. Terms used to refer to social responsibility depending on the location. Various terms are used in relation to social responsibility in South Africa, including corporate social responsibility (CSR), sustainable development, corporate citizenship, corporate social investment, and sustainability. In the U.K., the term "CSR" is most commonly used, but some people are increasingly adopting the shorter "corporate responsibility" instead.

The European Commission defines corporate social responsibility as "a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis". It shows that a business must not be concerned only with its profitability and growth but also with its social and environmental impact, and that it must pay more attention to the concerns of its human-resources, local communities, consumers, human rights and global environmental aspects.

The World Business Council for Sustainable Development used the following definition: "Corporate Social Responsibility is the continuing commitment by business to behave ethically and contribute to economic development while improving the quality of life of the workforce and their families as well as of the local community and society at large". Activities included in CSR aim:

- corporate philanthropy;
- customer satisfaction;
- environmental stewardship;
- human rights;
- sustainable development;
- conditions of work;
- health and safety;
- respect for diverse cultures and disadvantaged peoples.

The CSR definition used by Business for Social Responsibility is: "Operating a business in a manner that meets or exceeds the ethical, legal, commercial and public expectations that society has of business". Kotler & Lee consider that "CSR is a commitment to improve community well-being through discretionary business practices and contributions of corporate resources". Philip Kotler lists practicing corporate social responsibility as one of 5 factors that help a brand become well respected globally. Others mentioned are having quality products & services, good financial track record, good management or leaders and innovations. Kotler said that the global brands that are best loved internationally have similar characteristics, such as considering the needs of all stakeholders and not just shareholders; executive salaries are relatively modest and they generally have an open door policy to reach top management. These companies seem to be able to keep their costs low while still making better than average profits.

The Organization for Economic Co-operation and Development (OECD) and the International Labour Organization (ILO) have developed various compacts, declarations, guidelines, principles and other instruments that outline norms for what they consider to be acceptable business conduct. CSR instruments often reflect internationally-agreed goals and laws regarding human rights, the environment and anti-corruption.

Philanthropy is the oldest form of corporate social responsibility and is characterized by a limited dialogue between donor and recipient. Social investment represents the evolution of traditional philanthropy from a top-down

approach to a more responsive approach based on social needs. When making a social investment, corporations view their CSR activity as an investment with a social return. In the late 1980s and 1990s, the concept of social investment became prevalent in discussions of external CSR programs. Companies are integrating vulnerable populations into their business processes by developing relationships through trainers, suppliers, distributors and even market competitors.

The concept of social responsibility as applied to business suggests that the corporation no longer has a responsibility only to the stockholder but must make decisions aimed toward balancing the interests of all clientele groups affected by actions of the corporation. These groups include managers, administrators, employees, and the general public. Investing in Employees has as a result a growth of the work productivity, an improvement of the quality and the creation of a new image of the organization in the business field. When companies are global, an important challenge in getting success is to respect other cultures and workforce environments and start forming a global profile or social consciousness. Recognize these differences with a sound Corporate Social Responsibility (CSR) plan that can simultaneously increase shareholder value, boost employee engagement and increase employer brand recognition.

1. Drivers for corporate social responsibility

Because the impacts of the business sector are so large, and with a potential to be either positive or negative, it is natural that governments and wider society take a close interest in what business does. This means that the expectations on businesses are rising; governments will be looking for ways to increase the positive contribution of business. CSR considerations can be seen as both costs and benefits (e.g., of improving brand value).

Since businesses have a role in wealth creation in society, CSR is a central management concern. It positions companies to take advantage of opportunities, especially with respect to their corporate reputation. Businesses are an integral part of the communities in which they operate. It is known that the long-term success is based on continued good relations with a wide range of individuals, groups and institutions. The general public has high expectations of the private sector in terms of responsible behaviour. Consumers expect goods and services to reflect socially and environmentally responsible business behaviour at competitive prices.

Corporate behaviour show increased levels of understanding of the link between responsible business and good business. In addition to building trust with the community and attracting good customers and employees, acting responsibly towards workers and others in society can help build value for firms and their shareholders. CSR should be seen as the way that firms—working with those most affected by their decisions can develop innovative and economically viable products, processes and services within core business processes, resulting in improved environmental protection and social conditions.

World Business Council for Sustainable Development, have suggested that companies might gain a competitive advantage from corporate social responsibility. In much of the developing world, governments and business understand that their competitive positions, increasingly depends on being seen to respect the highest global standards.

CSR is no longer viewed as just a regulatory or discretionary cost, but an investment that brings financial returns for the companies promoting it. CSR promotes trust which sustains long-term relationships. Customers are more loyal and buy those brands which they think are responsible. Companies in all sectors of activity are proving their corporate social responsibility to comply with the society's expectations and to attract a positive implication from all the stakeholders. Business executives are starting to see CSR as a sustainable growth strategy.

As the role of business in society is changing, more businesses are recognising that that they need to do more than just focus on increasing profit margins. Now there is a need for businesses to become good corporate citizens too, in order to meet stakeholders' increasing demands. Businesses are recognizing that adopting an effective approach to CSR can reduce the risk of business disruptions, open up new opportunities, drive innovation, enhance brand and company reputation and even improve efficiency. How they behave is becoming a matter of increasing interest and importance. Even companies which may have a good reputation can risk losing their hard-earned name when they fail to put systematic approaches in place to ensure continued positive performance. The effect of a bad reputation often extends far beyond that one firm: entire sectors and, indeed, nations can suffer. Major corporations suffering a reduced market position as a result of questionable behaviour, with many others subsequently finding themselves to be a part of the collateral damage. These firms frequently expend considerable time and money attempting to regain their reputation, with mixed results.

Consumers and investors are showing increasing interest in supporting responsible business practices and are demanding more information on how companies are addressing risks and opportunities related to social and environmental issues. A sound CSR approach can help build share value, lower the cost of capital, and ensure better responsiveness to markets. Citizens in many countries are making it clear that corporations should meet the same high standards of social and environmental care, no matter where they operate. In the CSR context, firms can help build a sense of community and shared approach to common problems.

2. The role of corporate social responsibility in small and medium - sized enterprises

The concept of Corporate Social Responsibility (CSR) is still new in Romania. The corporations that adopt CSR policies are mainly interested by their image. They want a socially responsible image for their clients. Corporations may include in their CSR policies a specific Human Rights commitment, respect of legal obligations, as well as charity. Romanian consumers are interested in CSR issues but it seems that they are not influenced too much in their choice of products or services by knowledge of a corporation's respect of certain values. This can be explained by the fact that most costumers are focused on price consideration.

SMEs are an important part of the Romanian economy, as well as the EU and global economy. SMEs have different characteristics and generally more restricted resources then larger enterprises (e.g. in terms of relations with their local community and ways to do business etc), hence tougher competition conditions. Small and medium-sized enterprises (SMEs) are defined as any business with fewer than 250 employees.

The motivational factors that may engage SMEs with CSR are not the same as for large companies. While the growing visibility and global impact of large companies and brands has heralded calls for greater transparency and accountability, SMEs remain largely invisible and unlikely to see CSR in terms of risk to brand image or reputation. For SMEs issues closer to home are far more likely to hold their attention such as employee motivation and retention and community involvement.

In recent years we have witnessed an exponential increase of initiatives around the concept of CSR as a direct response to the introduction of new legislations and the increased awareness of the public on societal and environmental issues. As a result, programmes to protect the environment, develop eco-friendly products, support local communities, engage in fair trade activities are now high in the agenda of many organizations.

The public attitude to business responsibility has shifted enormously in recent years, and both employees and customers are voting for companies with an ethical stance they approve of. Large companies have been encouraging smaller companies to be socially responsible, particularly if they are part of their supply chain.

There is a growing recognition that the issues that are important for CSR are as relevant for small companies as they are for large companies. As with other similar type of initiatives the rate of adoption of CSR practices has been slower within SMEs. The reasons for this slower adoption can range from the daily pressures to succeed in the marketplace to the limited amount of resources that SMEs have. In our experience however a key factor is the fact that SMEs often do not really understand the benefits of adopting these new practices.

A 2008 survey by Cone/Duke University of more than 1,000 people found that 79% of consumers were willing to switch from one brand to another of similar price and quality because it was associated with a good cause. This was up from 66% in 1993. But it is not just consumers who prefer socially responsible brands. Investors now look for sustainable businesses too. A company's environmental, social and governance reporting is now among potential investors' main interests, shortly behind financial performance. The same applies to creating a supply chain: more and more companies stick to socially responsible suppliers. Apart from meeting stakeholders' requirements, studies show that companies who adopt CSR strategies also benefit from higher loyalty from employees and enjoy a better reputation.

Research suggests that SMEs that implement CSR related activities are primarily concerned about their public image. Burke and Gaughran 2006 suggest that "compliance with legislation is the key driver" and without adequate support programmes and policies (i.e. financial benefits) sustainability would be difficult to achieve.

It is believed that the lack of rules and legislations with a non voluntary approach may create complacency and encourage companies to do as little as possible, e.g. public relation stunts aimed at increasing profit without actually contributing in a positive way to society or the environment (Pimenova and Vorst 2004).

In order to adopt any CSR practice it is critical for SMEs to understand the potential impact of CSR in business performance. From a SME perspective CSR is generally perceived as a set of activities or policies without a clear measurement process and not as an integral part of the business strategy.

Many research shows that there are plenty of socially responsible activities in SMEs, but that it looks different compared to larger firms. A large firm is likely to have a mission and values statement. The first step is to raise awareness of CSR as legitimate business practice. The best way of doing this is through trade associations.

Most SMEs are only motivated to adopt new forms of operating by legislation and supply chain pressure; in terms of CSR the former is unlikely to be readily accepted by resource constrained SMEs, and the latter in many ways just transfers the large company agenda onto the small company without accounting for the complex and heterogeneous nature of the SME sector.

While there is a great deal of optimism for the role that smaller companies can play in improving business responsibility the main focus of the debate has and continues to focus on the large companies. Despite the best efforts of various SME related organizations, this sector of business is so far way behind in CSR; however, rather than see this as a failure of SMEs to engage with CSR perhaps it is fairer to say that the CSR debate has so far failed to engage with SMEs. Socially responsible activities in SMEs are different compared to larger firms. A large firm has a mission and values statement.

Many SMEs have limited awareness of what CSR is. SME managers and owners often do not fully understand the demand coming from the stakeholders of their customers and therefore do not fully recognize the importance of

CSR to them. SMEs tend to perceive that they cannot devote too much of their management time to CSR issues. This might be a lack of qualified personnel or simply the lack of recognition about the benefits of moving towards a properly structured management system. In most countries in the region there is a lack of trained, qualified and aware staff that would be able to lead and develop CSR initiatives in companies. There is a lack of skills development in this area by most education systems.

There are some SMEs where a greater level of understanding of CSR issues and practices exist. In these cases there is often a lack of understanding about where to begin the process of implementing some kind of CSR programme. Many SMEs seem to have some awareness of the concept therefore but lack awareness of what elements of CSR might be usefully initiated in their own workplace settings. In particular, there is a significant lack of awareness of the benefits that can be derived from good CSR practices.

The reality is that SMEs probably do not have too much money to spend on CSR initiatives, but they can achieve things without spending huge amounts of money. Where money really is lacking for CSR initiatives but where companies would like to explore them, it might be that some sort of government backed fund could stimulate good CSR practice for a modest small grant.

From 2006 to 2008, the European Commission co-financed 14 projects that in different ways supported the uptake of corporate social responsibility (CSR) amongst small and medium-sized enterprises. Besides the immediate impact on the 3000 or so SMEs that participated directly, these projects contributed to increasing the capacity and motivation of many organizations across the EU to work with small businesses on CSR issues.

Conclusion

CSR can play a vital role in detecting how business impacts labour conditions, local communities and economies, and what steps can be taken to ensure business helps to maintain and build the public good. Companies should think twice before saying "no" to CSR in a recession. Those who are now cutting back on their social responsibility activities might save money in the short-term, but in the long-term they are actually holding their businesses back. In a recession it is more difficult to keep customers' loyalty, attract new investors and keep growing. Companies that show their commitment to being responsible corporate citizens will be in a better position than those companies that did not stay committed to more than just their bottom line when business economic conditions improve. CSR has to be viewed by companies as a means to make their business more meaningful to customers, hence bringing an additional dimension to customer's experience.

A successful company has to combine its active presence in technical and professional areas with social and cultural activities. Once it becomes a part of the corporate culture, CSR can be a powerful internal force and lead to increased loyalty and superior service for both customers and associates. Advances in communications technology, such as the Internet and mobile phones, are making it easier to discuss corporate activities. In the CSR context, modern communications technology offers opportunities to improve dialogue and partnerships.

The competition on the Single European Market requires to those who offer tourist's services on the Romanian seaside, either they are caterers, restaurant keepers, tour operators or specialized agencies, to take decisive measures of rehabilitation and withdrawal for the maintenance on the profile market, through diversification and correlation of the quality with the tourist's product price. The Romanian seaside tourism professionals must understand the new trends in international development of this type of tourism and to realize the fact that the increasing demands of their clients oblige them to resort to new management and marketing tools.

Key words: tourism, competition, enterprising, strategy, destination.

Code JEL paper: L83: Tourism

1. Defining elements of the tourist's demands shown on the Romanian seaside

The Romanian seaside, tourist's summery area once favorite, both for Romanian tourists and foreign ones from Western Europe has lost a great part of the tourist's interest. The seaside summer resorts are dealing with a tourist's demand decrease as the products and tourist's services offer didn't succeed to rise at the level more and more sophisticated of the demands of the tourists. This decrease is especially felt in the foreign tourists' case who prefer similar seaside destinations but where the services quality is high and the prices show the real quality of the tourist's services.

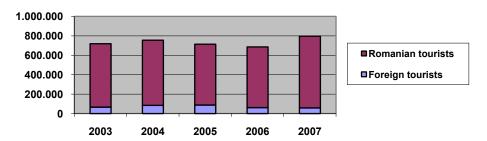

Fig. no. 1 Tourists arrived at the Romanian seaside between 2003 – 2007

In 2003 - 2007 period of time, on the Romanian seaside little fluctuation of the arrived tourists' number was registered. After an involution in 2004 -2006, the number of the Romanian who had oriented towards the inland seaside offer registered a rise of 16,05% in 2007 compared with the previous year. For the foreign tourists case, their number registered a small rise in 2003 - 2005 period of time, followed by a decrease of 30% for the year 2006 and by a decrease of 6,53% for 2007 compared with the previous year.

As for the average stay, it has decreased by 12,24% for year 2007 compared with year 2003. This fact is explained also by the orientation, for the last years, of the resident tourists towards the week-end tourism at the expense of average or weekly stay.

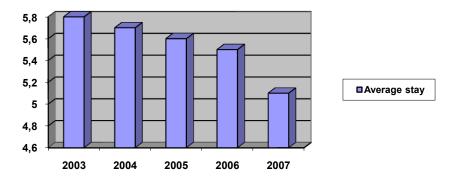

Fig. no. 2 Average stay of the tourists arrived at the Romanian seaside between 2003-2007

2. Difficulties faced by the tourism firms at the seaside

With the fragmented property and without a clear strategic direction, the seaside resorts enterprising did not managed to meet the high demands shown on the tourist's market and now are facing a number of issues.

The difficulties that the Romanian seaside tourist's firms are facing concerns⁴⁵⁰:

- accommodation places mostly of low quality in most tourist's reception structures;
- a very short high season, fact that persuades the enterprising to adopt uncompetitive prices up to the threshold of profitability level;
- the impossibility of attracting and keeping professional personnel for a short high season;
- a great competition between hotels and the lack of enterprising collaboration to attract tourists;
- tourist's services for leisure and entertainment activities are not enough to satisfy the current market demands;
- a limited vision of the caterers who are capitalizing the growing demand of the week-end visitors and they are loosing businesses with groups of tourists who are buying longer stays.
- beach erosion;
- poorly maintained public infrastructure;
- congestion in summer time mostly, and especially at the week-end and insufficient parking spaces;
- conflicting interests of the beach concessionaires and the tourist reception services providers
- loosing the most charter operations on Kogalniceanu Airport.

In the present time, the most significant threat for the seaside resorts case is the degradation of the most valuable asset, the beach. In the last twenty years was found a real decrease in the beach size, because of the general erosion engendered by the combination of the impact caused by the Danube channels and by the sea wall from Midia higher than the normal level of the sediments deposits along the seaside. Despite the various measures of remediation which were taken, the beach is withdrawing every year approximately 2 meter.²

In the last years significant investments have been done in the modernization of hotels and for ensuring some facilities within them, for example treatment and wellness, the setting up of some rooms for conferences, etc. which can contribute to the extension of the season. Still these welcome investments can not solve the fundamental issues which face the entrepreneurs of this area.

The marketing studies realized show that the present level of the services of the resorts of the seaside, is not enough to rise to the level of the position Romania should have as one of the main seaside destinations of the Eastern Europe.

At present the entrepreneurs of this area, as well as the authorities from the tourist domain, are trying very hard to re-launch tourism in this area, by drawing up and applying some strategies which have as objective the transformation of the seaside into a competitive destination.

The products traded on the Romanian seaside satisfy mainly the expectations of certain market segments, thus: the passive segment, represented by the tourists who choose this destination for the beach and amusement and the segment who practice the balneary tourism.

Although a series of investments have been done, this is the case of Mamaia resort especially, and the seaside attracts, during summer, a significant number of tourists who practice the weekend tourism, still the offer of products is not diversified and is not according to the taste tendencies and tourists' preferences. The tourists from Germany and Scandinavian Countries who used to be oriented toward the Romanian seaside, as a tourist's destination, are currently oriented to competent destinations from the Mediterranean Sea and the Aegean Sea, as well as towards Croatia and Bulgaria.

Another problem of the internal market is represented by the Romanian's tendency to go to foreign destinations, the Romanian seaside becoming less attractive. For example, the tourist who comes to the seaside expects more than sun and sea. He looks for a variety of attractions and activities beside the beach that is an offer of supplementary products. Choosing a destination by the tourists is determined, in the recent years, by a large offer of products that they can find.

Future projects which regard the establishment of some constructions in the Romanian seaside area should include, beside tourist's reception structures also constructions which should include theatres for theme shows, constructions with sport functions as golf grounds, tennis courts, football courts, recreation parks aquatic parks etc.

One of the projects which stands to be carried out in Mamaia regards the creation of a covered sea-wall which should be on top of the sea and which should contain a series of points of selling food and nonfood products. This shall offer visitors an alternative for spending time in the resort.

It should, also, to be organized or promoted excursions which should put to value the cultural patrimony of the seaside area, as well as the ruins of the Roman and Greek fortresses, to trade tourist's products which should consider ecotourism activities (for example: the Limanu area near Vama Veche).

⁴⁵⁰Master Plan for the development of the national tourism 2007 - 2026, chapters E,F,G, pg.273-274, taken from http://www.mturism.ro/fileadmin/mturism/noutati/masterplan_efg.pdf.

In order to put to value the tourist's reception structures outside the season, shall have to be developed the balneary product of the Black Sea. The entrepreneurs from the Eforie North and Eforie South, who own tourist's reception structures, should develop modern treatment areas ensuring in this way a functioning outside the summer. An especially important aspect is constituted by the communicating and proving the existence of new improvements of the tourist's products, to travel organizers from the markets under formation in order to convince them of the increase of the quality of the products and services offered.

Recovering the reputation that the Romanian seaside once had can be expensive regarding marketing and promotion budget.

The sustainable development of the seaside tourism depends not only from the attractive scenery and tourist's facilities but also from the competitiveness and quality of the employed personnel. Being one of the most competitive economic activities in the world, the tourism needs understanding, professionalism, employment and efficient strategies to develop human resources⁴⁵¹.

Competitive services can be ensured only by well trained and specialized personnel, with adequate aptitudes and performances. The creation of a qualified work force in tourism needs basic training, professional training courses as well as continue training on the job.

The Romanian seaside tourism has at present a major deficit of qualified personnel. Most of the entrepreneurs, due to the seasonal activity do not hire qualified personnel and do not invest in the professional training. This fact is reflected by the quality of the services rendered by a insufficiently trained personnel and weakly motivated by small wages.

Also, the level of competence in tourism is low, as a result of the lack of performance, work, educational and training standards. The Romanian seaside entrepreneurs should adopt, within the personnel policy, strategies to attract qualified workers in the domain, strategies to make faithful the employed personnel, strategies to increase the quality of the services rendered by them by ensuring professional training through qualification courses and strategies to increase competitiveness by granting certain facilities to competitive workers.

The success of the Romanian seaside entrepreneurs on the Single European Market "shall be determined, generally, by the measure in which they have trained to understand the costs of the integration and exigency standards they have to achieve in order to face the existing competition"⁴⁵².

Because of globalization, countries may be exposed to international economic events and economic shocks. The most convincing manifestation of this kind is a financial crisis. Vulnerabilities created by the financial system have led to the crisis at the end of 2008. Romania is certainly one of the countries affected by the effects of this crisis worldwide. Therefore, the aim of this work is to highlight the impact of crisis on the bakery industry in Romania, and a set of steps to exit the current crisis in its industry.

Keywords: economic crisis, financial crisis, the bakery industry, anti-crisis measures, tax evasion.

JEL Code: M21, M29, M31.

Financial crisis - a result of globalization

Because of globalization, countries may be exposed to international economic events and economic shocks. The most convincing manifestation of this kind is a financial crisis. In such moment, there is a tendency in the financial market to invest foreign capital in quality segments of the economy. Because o this, market economies in training and developing countries will no longer have access to international capital, in the short term. This situation is generated by real estate credit crisis in the United States and energy insecurity perceived by market. However, this did not become dramatically.

Lately there have been various proposals regarding the adaptation of monetary and financial system to these challenges. These proposals can be grouped into three categories: prevention and crisis management, regional and global cooperation, reform the institutional framework. There are concerns about the vulnerability of international financial systems from abuse. An adverse effect of globalization on financial markets is that the system has become more difficult to protect against abuses such as money laundering, financing of terrorist and criminal activities, tax evasion, and flight from the rules.

It is possible to "fall into another great depression" in the world, in terms of production and labor, as has happened in the 30's. Therefore, States should learn a lot during the 30's. First, a key element of that period was that banks were allowed to failure. Unfortunately, today we know very little about how to stop the destabilization of the banking system in the world, known as "global deleveraging". Responsibility for dealing with this major financial crisis lies with fiscal policy. Inflationary expectations put great emphasis on the dollar, and thus push trading partners to reduce interest rates and to engage in their own forms of monetary expansion and a greater appreciation of their currencies and exports decline.

Result of inflation will be higher in the world, but this is the only realistic way to persuade Member States to take the necessary measures to stimulate strong economies or to save the poor.

Financial system composed of powerful banks, but also the "Shadow" has helped to create vulnerabilities that have led to the crisis in September 2008.

This financial system, which means of not only U.S. banks, but also most parts of the global financial system, is able to manage the crisis. U.S. financial system, including the large firms is significantly better than that of emerging markets. However, after the crisis will be no more than six large banks in the U.S. The new entrants will threaten them in a very small extent.

Implications for the Euro, will be diverse, being affected in particular the poor, including those belonging to the European Union.

For example, Greece is facing the most problems with a debt of 20% of GDP and default risk exposure is significant. The propagation of the crisis came and in countries like Ireland and other smaller countries, which will need to implement fiscal austerity budgets or request support. Another country that is also likely to come under pressure because of its large debt is Italy.

Globally the focus is on the coordination of fiscal policy. Making of monetary policy in Europe will be slow, and the ECB (European Central Bank) concerns for the inflation which will follow, rather than what happens today. States must dramatically change their way of thinking in terms of fiscal policy. This should prepare for other major crises that may arise. Monetary policy and the regulatory authorities will be left behind; the responsibility for dealing with financial crises lays fiscal policy.

In order to create conditions for stable economic situation in the long term we must identify the real problem that created the current situation and likely pushed the world economy at this stage of instability.

Clearly, it is not about a set of unbalanced payments (USA, China), nor a particular set of internal regulations. The basic problem is that after 90's, "Great Moderation" of volatility in industrialized countries has created conditions

in which financing loans exceeded the GDP and could grow rapidly in any period of economic boom. In addition, globalization has allowed banks to expand ever more. Globally, economic growth in recent years was based in reality on financing and able to continue so long or could soon fall, as happened at the end of 2008.

The world financial system allowed easy movement of capital around the world. Capital flows at global level are not necessarily a bad thing, because by providing those in States where they are very useful promote economic growth, particularly in developing countries. However, globally, this system also allows to "feed" with money states located anywhere in the world, thereby aggravating the systemic risks. For example, when billions of dollars come from the richest countries in a country of 320,000 people, like Iceland, the risks of interest rate reductions are amplified.

Debt globally has also been a major factor contributing to today's recession. In this way, emerge the disadvantage that large firms in the period of crisis, instead of wasting money, go bankrupt. The ideal global growth requires a new balance in the non-financial sector, as may be industry, retail, etc. In particular, advanced economies like the U.S. and UK, financial sector has known an increase in corporate profits. However, the financial sector in U.S., despite the experiences of recent years, is still strong enough to withstand significant structural reform. To prevent the creation of vulnerability in the future and to understand the stability should be rethought how the economy works today.

Regarding the situation in Romania, companies have made massive layoffs, reductions in production and ceasing investment in 2008, but especially in early 2009, due to decreased orders on the background of economic and financial world crisis.

Lack of mortgage loans with high risk led many to hope that Romania will not be affected by the crisis that began in the U.S. since the summer of 2007. However, as the credit crisis has spread to all the powerful financial centers of the world, trust between financial institutions has been lost, Banks do not know which is the financial situation of competition and they are afraid that is very likely to give money to loan, but no longer able to recover. Thus, it has created a financial jam propagated by financial institutions in Romania. Many of them had to stop the credit lines of companies and thus were affected immediately the costs of production and investment. In this crisis from the real economy, exporters get hit the hardest because the demand and funds from the European Union and the United States, the main business partners of Romania, began to decline with the crisis extending.

Official statistics show that the Romanian economy started to be affected by the crisis in the last three months of 2008. Thus, industrial production decreased by 0.7% in October from the previous month, while over the same month in 2007 it decreased by 3% because of the decline was 4.6% in manufacturing, decline which could not be offset by increases in the utilities and extractive industry, according to data published by the National Statistics Institute. In addition, turnover of retail trade fell in October by 19% compared to the previous month. The annual growth rate has stopped at 8.6%. New orders in industry were 3.6% lower in October than in previous month because of reduction in the capital goods and household product. Imports of goods in Romania have significantly slowed the pace of growth in October to 3.6% compared to same month in 2007, while exports advanced by 13.3%, the evolution of the monthly trade deficit decreased by 9%.

Economic crisis and its impact on the bakery industry in Romania

Agriculture is among the areas that were affected by the crisis, mainly due to the grain exchange crash. The price of wheat and maize was reduced significantly at the end of 2008, approximately 30% -40% less than the previous, much cheaper than a few months before. This was because there were significant reductions in both the stock exchange in Chicago and the European exchanges.

Players in agriculture are of the opinion that in Romania cereal prices are much lower than in European countries. In this respect, an example may be that the price of wheat in Austria and Hungary is 220-235 Euros / tone and in Romania, tone of wheat can reach 111 euros. In the case of maize, it is sold in Hungary with 130 Euro / tone in Austria with 135 Euro / tone, while in Romania at 85 Euro / tone. These price decreases will lead to the elimination of stocks of cereals and implicitly, to call on imports.

In early 2008, specialists in agriculture estimated wheat production of 7.6 million tones and maize at 8 million tons. However, drought and floods in the summer of 2007 changed goes to farmers who have received only 5.6 million tons of corn.

Although prices on international markets have fallen heavily, at that time, in our country they were well below those values, which led to export about 30% -40% of total production.

Financial crisis has already affected farmers who have turned to loans in recent years and changed the development plans of some, and most of them have dropped several projects that were to run in the next period. The players in industry have delayed modernization projects as requiring large loans, and this period is not advisable to use them. In Romania are around 9.4 million hectares of arable land, of which the greatest 50 players operate about 4% working in the agricultural sector.

Agriculture has felt the effects of the crisis in 2009. Nearly 15% of farmers in Romania are out of business in 2009 because they have failed to resist the market after the financial crisis. In November, the Federation Agrostar asked the Ministry of Labor and Ministry of Agriculture as 50,000 employees to get unemployment technical and

investment in the bakery industry has been affected by the economic crisis because of the limitation of access to credit.

The internal milling and bakery reached in 2008, 2 billion euros, up 15% compared to 2007. Consumption of bread dropped in Romania in 2008 to 1.5 kilograms per capita. Meanwhile, with decreasing consumption of bread has been an increase in confectionery products.

Economic crisis since the end of 2008, has affected investments in the bakery industry, estimated at 100 million euros for 2009. Many potential investors have had to resort to loans to make investments, a possible restriction or inability to obtain credit will lead to surrender to obtain them.

Another problem faced by the bakery industry, against the backdrop of economic crisis, is that the dealers who are granted merchandise credit; in the defense of problems in obtaining credit, they are unable to pay the freight and this strongly affects industry.

At the end of 2008 in Romania bread consumption has decreased by 1.5 kg, reaching 112 kilograms per capita per year. The tendency was to place us in the European context, where the average annual consumption of bread was about 80 kg per capita per year. The internal milling and bakery reached in 2008, two billion, up 15% over 2007.

Anti-crisis measures proposed by the National Association of Industries for Milling and bakery in Romania

The current economic and financial crisis creates major difficulties for the agro-industrial sector in Romania, especially due to how extremely bad the problems were managed in this sector at home, European and international. After real and pragmatic analysis of the current situation and perspective, the National Association of Industries for Milling and Bakery in Romania identified a set of critical issues that require rapid and efficient solutions to exit the current crisis for the cereals sector. This set creates real prerequisites for entry of Romania into a competitive position that will correspond potential exploited only to a maximum of 20-25%.

Thus, the proposed measures are:

1. Tax evasion (and implicitly the non-collection of revenue in the budget) level exceeded 75%. In these circumstances, the measures in force, and any new rule of the grain may not have any application, even on the contrary, it will deepen the economic and financial indiscipline and violation of the law.

Following the evaluation of possible solutions to eliminate this situation resulted that the only real and fast solution that do not require special effort budget (which require specifying the sources of extra budgetary funds) is decreased VAT branch primary grain production, storage, and milling, bread from 19% at 5%, practiced in general in the European Union and internationally.

Given the current level of collection, this would involve an insignificant decrease in the revenue budget, while the positive effects on the most important branches of agro-industrial product in Romania (the only one with all items fully Romanian) are incomparable: maximum positive impact of interventions to support farmers, possible to monitor the real market and accurate sizing of regulatory measures, optimal recovery of the internal market and export

2. One of the major impacts on the national budget is the lack of receipts from the EU. Planning development measures, assessment and approval of projects, providing logistical and financial infrastructure, ensure resources were very good on paper; in reality they are not correlated, and the purpose is missing entirely. The effect is already known: although they were caught in the budget, there was no collection.

Currently starting any project is virtually impossible; banking system has blocked loans for investment, interest rates are prohibitive, and the exchange rate has increased significantly and evolution is unpredictable.

Commercial banks are subsidiaries and branches of foreign banks, whose main concern is to extract existing capital in the country and not supporting the economic development of the internal mechanisms of exit from crisis.

Under these conditions the Romanian government must ensure the following measures:

- Ensuring credit projects structural and rural development with interest below the level of 10%;
- Ensuring the risk of depreciation of the national currency under the acceptable level for rural development projects;
- Loans to finance exports of Romanian agro-food products.
- 3. Cereals Market in Romania, and implicitly of derivative products, is completely uncontrolled (quantity, quality, food safety and protect farmers and consumers) and dominated largely by the interests of maintaining a high level of tax evasion and the underground economy.

The certificates of deposit, passed in 2002 were intended to ensure:

- evaluating single unit (standard) products, monitoring and full traceability of seeds (at farm gate and to the processing or export);
- Ensuring an effective and credible national storage through licensing:
- Financing of farmers by certificates of deposit;
- The effective functioning of Romanian Commodities Exchange Cereals floor was not finished until now. Legislation has been updated and the building was not completed.

4. To be competitive on foreign markets, agricultural exports have quality and lowest prices on the market. Exports of food products are virtually nonexistent. Quality products and value added are not competitive in terms of price on third markets.

An important measure to boost grain exports branch is the renegotiation of EU quotas to ensure that levels of export refunds on cereals and flour in third markets.

Conclusions:

First, to stabilize the economic situation in the long term is needed to identify clearly the real problem that has pushed the world economy at this stage of instability.

As a result of the effects occurring against the backdrop of this economic and financial crises, Romanian companies have resorted to massive layoffs, reduced production and suspend investment in 2008, and in particular in early 2009.

As regards the impact on the bakery industry in our country, the effects were the reduction of investments; one of the reasons is that access to credit has become increasingly restricted. And bread consumption has decreased; the trend is that of our place in the European context, where the average is well below average in Romania.

In my opinion, the main concern of institutions able to take such decisions is proposing to implement a set of measures to make possible the rapid and efficient approach to solutions, both for the exit of companies in crisis bakery sector as and to create real prerequisites for entering them in a competitive position.

Well designed and directed, advertising is complex communication, a bridge between companies and consumers. To create an efficient advertising campaign, it takes inspiration, professionalism, and passion. New ways of marketing and advertising online prevail over traditional marketing, creating interesting experiences for consumers by means of video images. Interactivity is frequently used in modern marketing. In a new advertising era of Web 2.0 advertising online, organizational management, sales people, or customer relations representatives must take into consideration this explosion of information generated by consumers, and the way they are highlighted by means of brand-related perceptions. Web advertising uses the advantages of today's technology, so that people who create it can use their creativity and passion in moulding the cold clay, thus designing a new world full of color, light, and images.

Key words: Internet, web marketing, web advertising, advertising, web 2.0, e-business.

JEL Classification: M31

The World Wide Web is a global system of sites that are stored on servers that interconnect by means of various links containing images, texts, folders, sounds, video files, flash images etc. The Web began to exist in 1989 thanks to Tim Berners Lee, Robert Caillau and an entire team of specialists from The European Center for Nuclear Research in Geneva by writing papers on what Web actually means, namely an information system that works worldwide by means of hypertext and hypermedia. The main purpose is making information accessible for people⁴⁵³.

On the 6th of August 1991 the first Web page designed by Tim Berners Lee and based on HTML language was posted, which brought about radical changes in Internet. Tim Berners-Lee was considered one of the most important inventors of humanity and received knighthood in 2004. Berners-Lee also created World Wide Consortium – W3C, which is a non-profit organization in control of Web evolution⁴⁵⁴.

The Web generation has developed greatly since the old Web 1.0 to Web 1.5, and now we are dealing with Web 2.0. In Table 1 you can see the evolution differences between Web 1.0 and Web technologies. The most important feature of Web 2.0 that can be successfully used by marketers is the fact that the new Web made the Internet more than a software platform, considering that Internet users control and create their own data or information and they customize the online environment, which can be noticed by other users, as well.

Web 2.0, which is a high level in the development of the World Wide Web encompasses many tools, technologies, and concepts that have been recently designed (for instance, RSS, blogs, podcast, wiki, bookmark systems, LoL (by many users for many other users) web API web online services. Aiax Rubz on Rails etc.

Web 1.0	Web 2.0

³ Tim O'Reilly - What Is Web 2.0 Design Patterns and Business Models for the Next Generation of Software, November 2005

Table 1: Traditional Web Vs Web 2.0 technologies

The Web 2.0 platform is strategically positioned in Internet users' minds, as they control the information by means of the services they provide, by means of low costs, and information flexibility. Web 2.0 is actually a matter of attitude, not necessarily technology. It invests and gains the trust of its users, it is entertainement, people can do shopping online, which refers to a new lifestyle without evading normal life. This means that the Web is a collaboration platform.

Web pages are counted in real time on WorldWideWebsize.com. Currently there are about 65 billion Web pages. The .ro domain name defines over 12 billion Web pages according to Google⁴⁵⁵.

Web marketing refers to all the marketing activities online. Considered as the new efficient commercial vector within digital economy, the richest form of new rich media, web marketing is all about marketing strategies, policies in the virtual environment and about marketing activity specific to web sales (websites, virtual stores, ecatalogues, interactive databases, cybermalls, electronic payment, electronic distribution systems, direct marketing, e-business), online promotion and advertising (websites that promote company products and services, online advertising, PR, promoting brands online, campaigns, e-business model designs), online, interactive, two-way global communication. Web advertising ensures information messages, slogans, jingles, teasers. Databases such as e-mail addresses, orders, market responsiveness, online PR, interactive e-mail and web pages, sponsorship, patronage, press release, videoconferences, videomarketing, webzine, online newsletter, online marketing research, focus groups, web chat).

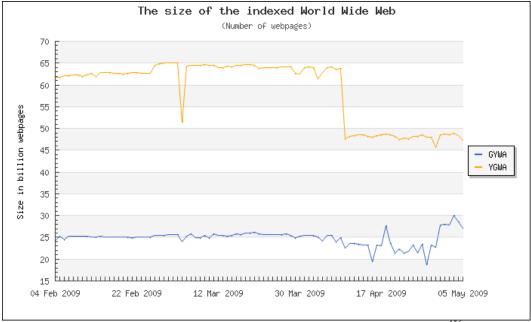

Figure 1: Recent evolution of Internt pages (in billions) 456

The main features of this media channel are the speed of sending information from source to Internet user, the great quantity of information that can be sent without considering time or geographic barriers or hurdles, hence the accessibility of Internet, its current value and importance, but its perishable status, the diversity as far as information is concerned, and competitiveness, pull strategies (persuading users into visiting websites, interactivity by synchronous or asynchronous communication must also be taken into account and thoroughly analyzed.

Online Advertising VS. Traditional Advertising

The online environment haves the significant advantage of being able to provide the means for an interactive dialog that can rise up to the expectations of every consumer. Instead of using a single message for everyone as in mass advertising the online marketing offers the possibility of using interactive and personalized messages that can be send to every consumer no matter where they are located on the globe, what language they speak and most important it allows them to see exotically the information desired at a specific date and time. Over the internet the companies can develop personalized presentations that are able to satisfy the desires of each client. The database systems together with the advantages of the modern search engines provide the much needed opportunity for the consumer to find the company he desires and the other way around, opportunity not available offline. Personalized

⁴⁵⁵ http://www.google.ro/search?hl=en&q=site:.ro

⁴⁵⁶ www.WorldWideWebsize.com

messages, one to one selling and integrating the advertisement in a large amount of information are the main rules of the game.

Because of this particular, closer customer, company relation it is essential to invest time, resources and respect into its relation with the customers or it will all be for nothing. By recording information about the interests of each registered consumer, its previous acquisitions, by personalizing the interface for each registered user and approaching him in a personal manner the company can develop a special relation with the particular consumer.

We are currently living in world dominated by virtual global markets that can be seen as local through individualization, when each and every client is understood as a unique individual, with his own personality, needs, life style, preferences and purchasing patterns.

One of the main objectives of marketing over the internet should by the development of a generous data base with detailed information about both current and potential customers. Among other things this database is responsible for the development of competitive products and services that will satisfy the needs of each customer.

The average potential web client usually haves a higher education and a bigger income than the standard offline client, also he is less tolerant with aggressive advertising that appear without being required on his computer screen. This is one of the main reasons why the internet marketing must adapt the standard marketing strategies to the specifics of the virtual environment. In a time of speed the company must reply instantly the information required by the client in order to establish a good relation with him and gain his trust. In the virtual environment the client requires supplementary information mostly when he is ready to make the purchase and the decision of doing so depends only on the quick reaction from the company and the usefulness of the information received.

The cyber consumers can also be attracted by using classic advertising techniques based on rational and emotional type messages. In the virtual environment many of the limitation of the classic environments are no longer a problem, the potential of using multimedia technologies and the relatively endless advertising space open the door for the future in advertising. Online marketing also offers another huge advantage due to the possibility to counter and monitor every move the users do on specific web pages which leads to a better understanding of the consumer, his behavior and his needs.

In the online environment there are several types of clients belonging to specific online user segments:

a. The cyber buyers: professionals that spend much of their active time online and are focused mostly on the places specific for their businesses. They are required to take complex acquisition decisions based on collecting large amounts of data in record time. The virtual technology is the perfect solution for their needs and often a new business is based on this modern environment and the initial investment proves itself profitable in relatively short time.

b.The cyber consumers: home users dependent on online commercial services. They are the gold mine that the entire commercial and the entertainment industry desire to exploit. Both marketers and various services providers must find ways to make the online shopping more and more enjoyable in order to overcome the attractiveness of the local shopping centers.

c.The cyber navigators: use the online technology in order to extend their knowledge, to test their abilities and to have some fun. They are usually young people with entrepreneurial spirit, highly dynamic and tough to satisfy. Even if there is always the risk that they will browse away if the site background is not fashionable their impulsiveness and vulnerability to advertising together with the joy of browsing make them the perfect online segment.

Online Advertising Models and Tools

The most efficient instruments used in order to communicate the promotional message and various information throughout the virtual environment are:

-Specific bidirectional communication instruments: the users are seen as development partners (as in Wikipedia, YouTube, MySpace, Hi5, Twitter, Face Book, LinkedIn, Second Life, Amazon) and this collective intelligence is a highly appreciated resource on the web;

-Viral marketing: the best method available for the exponential increase in spreading the message based on the encouraging people to communicate and use the message in their day to day life, making the initial sender irrelevant;

-Flexible mobile internet access: the possibility of accessing the internet anytime anyplace from various devices (mobile phones, mp3-players, PDA...) allowing the users to interact with the multimedia portal provided by the company;

-The impact of virtual communities and social networks over the interpersonal communications both personal or business oriented from a simple emitter receiver system to a more advanced virtual network of friends and businesses regardless of culture, geographic space, country ...(ex. www.match.com, www.linkedin.com, www.myspace.com, www. rise.com.

There are 10 basic types of banners recently adopted by the online advertising industry: square like, skyscrapers, island banner, extendable banner, overlay ad, video banner, sticky ad, extravagant ads, floating ad and leader-board⁴⁵⁷.

In his book "*Unusually Useful Web Book*" June Cohen identifies and classifies the main types of ads used on the internet into 12 categories: banners, buttons, pop-ups, leave-behinds, rich-media, links, text, endorsements, sponsored links, product placements, video ads and interstitials.

Other authors like I. V. Ruff and B. Grigore in the book entitled "Relațiile publice și publicitatea online" (PR and online advertising) use a different classification that divides the online ads in: rich media (interactive and multimedia), text links, sponsorships, advertorials, and various types like video ads, news, screensaver.

On the other hand, the Internet Advertising Bureau, one of the most important online advertising associations, offers a more complex approach on the subject, especially for the banners. The standard for the online banners, measured in pixels, is:

-Full banner: 468x60

-Full banner with vertical scroll bar: 392x72

-Half banner: 234x60 -Vertical banner: 120x240 -Square button: 125x125 -Micro-button: 88x31

The banners come in various shapes and sizes and in different places of the webpage. A fact worthy to be mentioned here is that the banners are technically measured in pixels but the IAB uses another measuring unit named the IMU – Interactive Marketing Unit. From the technical point of view the banner is a static or animated image, square or rectangle like form of various sizes. The banner type ads can contain the name of the company, a specific brand, slogans, logos, and other promotional messages. The banners act as a permanent lighthouse for the people browsing the webpage and also as a access door between them and the company.

The company can also use the banner as a business card offered to the cyber consumer, promoting its image thou it to millions of virtual surfers from every part of the world.

Video ads and the future of online advertising: the online advertising will receive limited or none damage from the economic crisis not like other types of advertising and marketing as it is mentioned in an article from the published in the economist. The reason for this endurance is that its popularity is growing exponential; enough to equalize the overall descend of the advertising industry. Practically the online advertising is the most economic type of advertising as it can guarantee the results and supervise the entire communicational process. Practically the prices requested for online advertising are more like selling a guaranteed result, a package of benefits, and fewer and fewer marketers see them as advertising costs.

In the USA the online advertising market represents more than half of the global online advertising market and is expected to rise with 8.9% in 2009 as mentioned in the magazine eMarketer. In august 2008 the same marketing research company provisioned a rise of 14.5% for 2009 but the effects of the global financial crisis brought some limitations to its development.

Different online advertising techniques are estimated to encountered the following increases: search engine ads -14.9%, rich media ads -7.5% and display type ads -6.6%. As mentioned above the online marketing advertising industry will continue to increase its profits and popularity even during the financial crisis even if it will follow a more cautious evolution trend.

Another good particularity regarding the online advertising is that the fine line between ATL and BTL advertising serves no purpose as Randall Rothenberg, manager of the Interactive Advertising Bureau SUA said. Therefore, during the crisis the marketers are cutting expenses in advertising especially in th more expensive and less efficient ATL methods (TV, radio...) and to keep the budgets for the less expensive BTL campaigns(promotions, personalized treatment...).

The online advertising joins the specific ATL and BTL actions offering their main advantages for a minimal cost for the company and with a shorter time needed to receive a certain effect from the consumers. According to Forester Research the sustained rise of the online multimedia technology with 70% over the last year makes the online advertising the new pink in communication with the customers.

What really matters in defining online advertising strategies is not the shape of the ads – pre roll or post roll, but the correspondence between them an the needs of the consumer. Not like the text only content offered by the search engines the multimedia content can offer to the user a quite unique experience. It is this experience desired or appreciated by the consumer that intrigues the marketers all over the world and is the key to more efficient and pleasing advertorials and also represents a good indicator for the receptiveness of the consumers. When It comes to

⁴⁵⁷ Gh. Orzan, Mihai Orzan – Relații publice online, Ed. Uranus, București, 2007

⁴⁵⁸ Cohen, J., Unusually Useful Web Book, New Riders Publishing, USA, 2006

⁴⁵⁹ Ruff, I.V., Grigore, B., Relațiile publice și publicitatea online, Polirom, București, 2003

multimedia type messages there are a lot of supplementary subjective/personal reasons in appreciating the advertisement and quite often these are more important than the logical connections.

Therefore, the marketers should use compartmental targeting techniques and develop quality ads hat will be more than just a support for a commercial statement. Thanks to the online environment marketers can now interact a closer way with the consumers. The video publishers the better type of publicity will win in the end both the supremacy but also a place in the life of the new society.

The main advantages for the online advertising are the relatively large number of techniques for finding and interacting with the cyber consumers with the desire to make a purchase. Another advantage is that it allows the webmasters to gain financial rewards for developing and maintaining their websites.

In these troubled times this particular type of advertising is becoming more and more popular among various types of entrepreneurs, the simple web presence being a must for the modern day manager that uses the pull type strategy Many companies are still skeptic about investing in online advertising due to the fact that their performance lever is not a true competitive one and so, their online campaigns will have n chance of success compared to the ever increasing online competition.

In Romania the internet is beyond any doubt a very strong communication channel that can and should be used in brand awareness campaigns, product advertising, ... with a unlimited capacity for surprising the consumer every time.

This paper is grounded on the premise that "the species which survived are neither the smartest nor the stronger; are those with great capacity of adaptation to change".

In the economic crisis context, companies are forced to learn the survival lesson and to find their own path through downturn. Even if two crises are not the same, the experience of previous economic crisis show that each crisis has its winners — that companies which grow in stressed times. Also the experience shows that these winners understand and adapt better to the behavior's change of their customers in downturn context. In our paper we will emphasis the reaction of the consumers in the economic crisis context and how their behavior changed taking into account two factors — risk aversion and risk perception.

Key words: economic crisis, consumer's behavior, organizational response JEL:M31

1. Introduction

The present economic crisis generates volatility, increase uncertainty and panic among consumers. In this context, the markets are contracting, and major changes appear in their structure. The consumers change their behavior: they change their purchasing habits, they move down the demand curve, postpone major purchasing, switch brands or product categories, they focus on inform process. Even if the consumption will not disappear, the average consumption was decreased in the markets.

This evolution in the markets represents major problems for some companies while for others companies represent opportunities. Thus, the downturn is seen by some managers as a risk and by other managers as growth opportunity. Beginning from two different modalities of perception there are two different organizational responses in economic crisis context.

The first response is developed on the premise that the downturn is a major threat and is adopted by the companies which are in an immediately stressful situation. In this situation are those companies which are in the luck of financial balance, have a high rate of dept or deal with the incapacity of the major customers. The management of these companies is focusing on the cost reduction and tries to reduce looses or to conserve their profits and their market position. So many of these companies cut marketing begets and chose to "be silent on the market".

The second response is an offensive one and is developed on the premise that the economic crisis is a growth opportunity and is adopted by those companies which are not in an immediately stressful situation. The executive level of these companies is focusing on growth opportunities and on the costs management effectiveness. For instance, Procter&Gamble has the philosophy that "in the stressful time is easier to build the market share. When your major competitors spend lees is time to increase your visibility, your notoriety and your market share. So, it is easier to be heard in the market when the others are silent and it is easier and cheaper to grow your market share". In January 2009, Ernst&Young interviewed over 300 senior executives from major companies from around the

In January 2009, Ernst&Young interviewed over 300 senior executives from major companies from around the word to see how they are being impacted by economic crisis and what they are doing about it. The study was focused on understanding how companies are reacting in the downturn and to see if there are opportunities to learn from their experience and best practice. The results of the study emphasized that:

- 74% companies reported that they focused on "securing the present";
- 40% expected to see a significant increase in protecting their current assets;
- 39% were seeking significant performance improvement;
- 37% expected to see reshaping of the business to meet new conditions;
- 19% expected to see a significant increase in the pursuit of new market opportunities.

These results emphasis the fact that only a small number of companies are seeing opportunities in the downturn and will adopt an offensive response. That is why any crisis has its winners.

On the other hand, the results show that a major part of the companies are focusing on "securing the present" and on the protecting their current assets. This means that these companies try to reduces looses or to conserve their profits and market position. Also the results show that some companies pass through a change process (reshaping of business) to meet new conditions.

From our point of view, the response of the company in the crisis context have to be seen as an adaptation process through change and has to be from an "outside – inside" perspective. What we suggest is the fact that, taking into account the major changes from the markets, companies have to understand how their customers react in crisis context and how their behavior was changed and to develop an response to meet these changes. This doesn't mean that companies have to put the needs and desires of their customers under microscope because this will generate an

increase marketing effort and an increase pressure on the marketing budget. We consider that companies have to focus on understanding what happened in the mind of their customers; how they react in the new context and how their behavior was changed. This will allow to the company to develop a proper response in crisis context.

2. In the mind of consumer

Growing unemployment, increasing inflation, "freezing" event the decreasing of the wages, the decreasing of the purchasing power, bed economic situation are facts that affect the consumers in almost all national markets. As long as people are reading more about economic crisis and as long as the press is focusing in reflecting the crisis effects, there is a psychological effect whit negative impact on consumers.

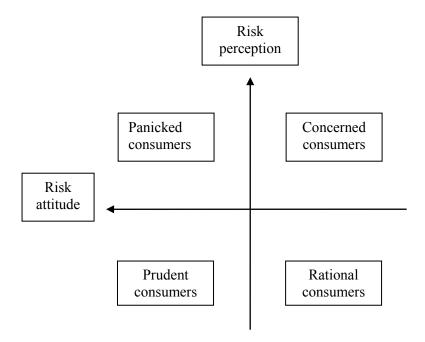

Any way the people are not the same and not all the people have the same perception about a situation with negative effects like economic crisis. We analyzed different types of crisis (economic crisis, food crisis, terrorist crisis) and we identify that the most important factors which model the consumer's behavior in such a situation are: risk attitude, risk perception and the way in each these two are interacting.

Risk attitude reflects consumer's interpretation concerning to the risk content and how much he or she dislikes the content of that risk. For instance, in a global research was shown that the anxiety of loosing the job is higher then the anxiety of unemployment situation. Also, it was proofed that people are loss averse. The unhappiness filling is higher if the wage is diminishing with \$10 then the happiness filling in case of wage increasing with \$10.

Risk perception reflects the interpretation of the consumer of the chance of being exposed to the risk content. For instance, the perception of loosing the job is higher in case of an employee from a company that made jobs reduction then an employee which is working in a company that didn't make jobs reduction in crisis context.

Decomposing the consumer behavior in the two components and analyzing the way in which the two components are interacting will allow obtaining a better image of the consumer reaction in crisis context and how its behavior was change in this context. What we suggest is the fact that in crisis context using the demographic or psychographic segmentation criteria is not the smartest choice because this type of criteria are loosing the relevance in such context. What is important for companies is to understand how their customers react in crisis context and how their behavior is change in other words we can say that companies have to understand what is happening in the mind of their customers.

Using the risk attitude and risk perception we identified for segments:

The panicked consumers are those who have a high risk attitude and a high risk perception. This kind of consumers is in an immediately stressful situation. They are high risk averse and will try to avoid the risk. These consumers tend to over react in crisis context. Any way it is expected that panicked consumers to drastically cut their spending, to reduce consumption and to move down to the demand curve switching brands even product categories. They will eliminate major purchasing and will be focused on looking for best price. Thus, they are not loyal to any brand; they are loyal only to the best price.

The prudent consumers are those who have high risk attitude and low risk perception. Even if these consumers are risk averse they consider that are not in an immediately stressful situation because they are not high risk exposed. Thus, these consumers are very prudent and plan carefully their spending, postpone major purchasing, in some cases move down on demand curve switching brands, are very well informed in the purchasing process.

The concerned consumers are those who have low risk attitude and high risk perception. Even if these consumers consider that they are high exposed to the risk content they are not risk averse and usually they assume risks. So their behavior is determined first by the risk perception. Anyway, this type of consumers will plan their spending but it is not necessary to move down on the curve demand. This could happen only in case of risk perception increasing. Also, this category will continue to do major purchasing but only if they make a "good deal". If risk perception is increasing they will tend to postpone major purchasing. They tend to remain loyal to the brands but in some cases they move down to the demand curve so, in these cases companies could introduce a lower version of the premium or middle brand in their portfolio to retain them. Also is interesting that this type of consumers is ready to try new products and innovative products and is those that will try first the innovative product in spite of the hard times.

The rational consumers are those that have low risk attitude and low risk perception. So they are not risk adverse and consider that are not exposed to the risk content. They avoid the information concerning to the crisis effects and generally they maintain their "usual behavior". It is expected that this consumers not to reduce their spending, to continue to buy their favorite brands, to try the innovative products.

Taking into account the four segments, we consider that the majority of the consumers are concentrated in panicked and prudent segments.

Such segmentation provides a better image about consumers and a better start up for planning the organizational response in crisis context. This means the adoption of the marketing strategies and tactics for responding to the new context

As we mention, in some cases developing the brands portfolio introducing a lower version of the premium brand is a proper strategy to retain the customers.

The prices are an important toll but have to be correlated with others marketing mix polices. Price reduction has to be planed carefully because can generate a prices war in the market and on the other hand could affect brad perception and the price increase in the recovery period.

The communication is also an important tool in such hard times. The message has to create empathy with the customers. Massages like: "together we will pass through these times" will create the idea of the partnership with the customers.

The philosophy of partnership with value chain system is very important in these stressful times. The Ernst&Young study emphasized two opposed strategies applied by companies:

- 46% narrowed their suppliers' base to obtain more favorable terms;
- 42% had acted to broaden their supplier base to "reduce the impact of the failure" of an individual supplier.

We consider that companies have to focus on strong relationship with their suppliers and distributors. They have to establish risk evaluation standards for their suppliers and distributors and on these bases to apply financing from and towards value chain members for sustaining the entire chain. After all the competitively of a member of a value chain depend on the competitively of the entire chain. And the entire chain creates, communicates and delivers superior value for the customers.

Conclusions:

The current economic crisis is an unprecedented one and generates high panic among consumers and put many companies in an immediately stressful situation.

In this context the consumer behavior was change in same ways radically and in some cases permanently. Thus, consumers tend to save more and spend lees. So the consumption decreased and important changes appeared in the markets. The structure of the markets was change because of the mutation of the consumers down on demand curve. An increase trend is switching the brand even the product category and the elimination or the postponing of the major purchasing. Another trend is the focusing of the consumer on information in purchasing process.

These changes don't have the same intensity in all national markets and for all consumers. That is why for companies is very import to understand the behavior change of their customers as a first step in planning the response to pass the crisis.

Focusing on gathering the information about the needs and desired of the customers will represent an important marketing effort and a pressure on marketing budget. What is important for companies in these times is to focus on understanding what happened in the mind of their customers; how they react in crisis context and how their consumers changes their behavior.

Analyzing different types of crisis (economic crisis, food crisis, terrorist crisis) we come up with the conclusion that in such situations the most important factors that model the consumer behavior are: risk attitude and risk perception. Thus, using the two factors we identify for segments of consumers, each segments having different attitude and perception about crisis and having different behaviors

We consider that this segmentation provides a better image about consumer behavior in crisis context and a start up for planning the organizational response in the downturn period.

Also, we suggest that an effective response have to be planed having in mind the outside – inside perspective. The lack of understanding of the markets in this period is, in our point of view, a mistake that could put in danger the survival of the company.

Even if the company is in an imminently stressful situation and is focusing on cost reduction we consider that the consumer perspective is important in planning the response.

On the other hand focusing on market implies monitoring the response of major competitors in crisis context that could provide some opportunities of growth. As we mention, many companies adopted costs cut tactics and reduced marketing budget choosing to be "silent" in this period. This is an effective growth opportunity for that companies which could and choose to invest in downturn period.

Present paper aims to analyze the Romanian market of services that intermediate job offers and to present the online marketing tools and the website facilities offered by the major Romanian e-cruitment portals. It also highlights the new technological trends in online recruitment and the advantages they offer to the employers and applicants.

Taking into consideration the period of crisis that affects not only Romania, but the whole world, the study can be a useful guide for the e-cruitment service providers who will only gain competitive advantage if they develop new online tools and services in accordance with their customers needs.

Keywords: e-cruitment, employers, job seekers, online marketing tools, Romanian market.

JEL Classification: M19, M31

Introduction

In recent years, the internet has provided the labor market with a set of technologies which allow the spreading and the treatment of information in a decentralized manner, in real time and at low costs; these advantages offer a great opportunity to the services that intermediate job offers, called *online recruitment portals*. Other terms used for defining the formal sourcing of job information online are: *cybercruitment, e-cruitment* or *internet recruitment*. All the advantages mentioned above, became more and more visible in the last 5 years, in Romania also, and tried to radically change the structure of the labor market; the online technologies exceeded their role of softening the process offer-demand.

The cyber space has produced a major change in the personnel recruitment algorithm, influencing radically the employment offers and demands. The classified ad boxes of the newspapers, and also the specialized magazines have lost, and continue to constantly lose ground ahead of dozen websites, dedicated to online recruitment, sites that have not lost the chance to speculate this opportunity.

The decline of the "paper" supremacy has been proportional to the growing penetration rate of the internet, in Romania, but also with the increase of the visibility regarding the advantages offered by the "virtual solution". There is no doubt that an advertisement in a regional or national newspaper will not provide the company with the opportunity to communicate accurate and detailed information regarding the job to the potential candidates; will not allow the company to self-screen and reduce the number of unsuitable applicants.

An overview of the Romanian online recruitment portals

The Romanian online recruitment market has known an accelerated rhythm of growth in the past few years due to some well-determined advantages it has in comparison with the classic means of personnel selection. The first websites dedicated to these services, have started by offering all the services for free, and only afterwards to tax certain facilities such as the appearance of company's job in the first page of results, preferential position in the results of the research or sponsored links.

The Romanian recruiting portals build their offers based on two basic services that they can offer: *posting jobs* and *searching for CVs*; the tariff paid by the employer is calculated as a multiple of the number of units bought.

As a sales channel, most of the companies that own a recruitment portal, choose to manage the relationship with the customer-companies throughout an online order form and some telephone operators who have the responsibility of managing the administrative process (confirm the order, releasing the pro-forma invoice) and also offering support and recommendations that could lead to the increase of the services bought (Galanaki, 2002). Therefore, if a company wants to buy the services of the portal, it should place an order by using the online form which allows the company to select the wanted quantities of the two basic products and sending the request to a representative of the website (Jansen, Jansen, Spink, 2005).

The model has proved to be a successful one because it managed to attract the employees to post their online jobs (they are motivated mostly by the lack of other options and instruments as efficient as this one) and the candidates to insert their CV (Kin Tong, Sivanand, 2004). Therefore, the companies owning job employment portals have operated on a virgin market, where real competition lacked and have taken maximum advantage from being the first ones on the market, and ranking themselves (also today) in the top from the point of view of the incomes and users.

Web portals can be considered software products which work on servers and use the network as a way of accessing the application by the users. This means that the facilities they offer and the ease of using them, become elements of the competitive advantage. Moreover, the introduction of new facilities and their communication to the market, towards the users, can have a marketing importance, linking the product with attributes such as innovation, vision and leader potential (Jago, 1997).

Next, there are presented the main players, in the online recruitment portals market, from Romania, with reference to the year 2008:

- *Ejobs.ro* was founded in 1999 and its stakeholders are: Liviu Dumitraşcu and Daniel Tătar (each having 35%), the Investment fund Tiger Global Management (30%). In December 2008, it had 1,1 million of unique visits (200.000 less than in October 2008). It owns a database with more than 1,3 mil CVs and it is a simple technology that offers only basic facilities; it has gained its top position by aggressive marketing and the capitalization of the no 1 position. In 2007, its income was of 2,1 mil euro.
- BestJobs.ro was founded in 2000 and its main stakeholders are: Călin Fusu (41,5%), Tiger Global Management (20,5%), Nagy Vajda Andras Peter (10,6%) and Bodo Zoltan Ferenc (9%). In December 2008, it had 730.000 unique visits and it owns a database with more than 1 mil CVs. Neogen the company that manages the portal owns other portals as well, for instance Noi2.ro. In 2007, it had income of more than 1,5 mil euro. BestJobs is appreciated by the employers especially for the easy-to-use interface and the frequent introduction of new useful options wanted by the users. It has developed its services in neighbor countries such as Bulgaria, Serbia, Croatia and the former Yugoslavia.
- *MyJob.ro* was established in 2001 and starting 2004 is controlled by the investment fund Netbridge Development. It owns a database of more than 400.000 CVs and in December 2008 had 232.000 unique visits.
- CareerBuilder is the largest online recruitment website from USA, having more than 23 mil unique visits per month and 1,5 mil jobs posted monthly. In Romania the portal was launched in August 2008 (CareerBuilder.com.ro) and its goal is to achieve the third position on the Romanian market, betting firstly on its popularity in more than 38 countries and the technology offered.
- *Hipo.ro* was founded in 2006 and its stakeholders are: Ana Giurca, Cristian Hossu and Dragoş Gheban. It owns a database of more than 70.000 CVs and in December 2008 had 77.000 unique visits (145.000 less than October 2008). In 2007, it had an income of about 50.000 euro.

Some other important players on the market are: *Jobs.Bizoo.ro*, *RomJob.ro*, *NetJobs.ro* and *Job.ro*. Lately there have appeared some niche players on the market, such as *Jobinmarketing.ro* (there are posted jobs in the marketing field), *Bankingjobs.ro* (offers jobs in the financial-banking field) or *Joobs.ro* (recommends jobs in the IT field) – even though it has not been on the market for a long time and the database and the traffic on the portal are poor, it had received the special prize offered by Microsoft at the competition Internetics.ro.

Another type of website is that formed of a job search engine, a job aggregator site, and *FindJob.ro* is a very good example of portal that indexes all the job announcements available online and offers the user results from several specialized websites.

The fact that the employers work with more recruitment portals shows that working with only one website does not solve their problem, and if it is to compare with Europe, the tendency is to increase the number of such online recruitment portals.

Tools used by online recruitment portals

The analysis of the Romanian online recruitment portals showed that there are some online tools and facilities that can make a difference when choosing the portal where you search for / post a job.

From the *candidate*'s point of view, it is an advantage to find on the portal facilities like:

- Multiple CV the opportunity to upload more CVs (in different foreign languages also), one for each type of job or field of expertise wanted;
- *Spontaneous submission* the possibility of posting the CV directly to a desired company even though it does not have any open position;
- RSS feed receiving and consulting notifications regarding the new jobs posted on the portal throughout a general RSS or, if wanted, only jobs from a particular field of activity;
- *Key competencies* an algorithm that recommends the suitable jobs according to a set of competencies the candidate holds;
- Career section editorial content, written exclusively by human resources experts and presented on the portal in multimedia format (images, animations, audio, video).

From the *employers*' perspective, the list contains innovative functionalities such as:

- Multimedia profile company text, images, audio, video or combinations of these, all created in accordance with the visual identity of the company;
 - Graphical job announcements the description of the job presented as images;
 - Advanced options to manage the candidates filter, sort, export or email the lists with the applicants;

- *Statistics* regarding *the number of page views* for the company's profile, for each job, or the number of applicants for each job as opposed to the average of the company;
- *Email marketing* the opportunity to create and send html alerts towards a specific segment of candidates from the database.

The intermediaries of job offers can include on their portals different games or contests in order to increase the traffic on the website, or to offer prizes to those candidates who submit their CVs and fill in their personal information. In order to overcome the lack of job offers, the online recruitment portals should provide high quality editorial content on the website

New trends in online recruitment

Taking into consideration the crisis period that affects Romania, it is assumed that many companies will reduce their number of employees and some of them will go bankrupt. In this case, on the market there will be instability due to the great difference between the low number of job offers and the huge number of job seekers (Birgelen, Wetzels, van Dolen, 2008). For the intermediaries of job offers to survive, they will have to develop new tools in order to attract and maintain the customers and also to gain competitive advantage.

The online recruitment field of activity benefits to a large degree by the new generation of faster instruments, more ergonomic and more effective. Next, there are presented the main trends and online tools that will be developed in this field, in near future:

- *Geo-placement:* the geographical location of the place of employment will become one of the main criteria of search of the candidates. The era when the employers did only specify a city / town or country is at its end, at least in the countries where the e-cruitment already has a solid tradition. At present moment, there are online recruitment portals that allow the candidates to sort the job offers which are posted on a map according to the zip code or a bus / tram / metro station, indicating a maximum perimeter of search or a limited distance.
- Online personality tests: the information included in the CV is limited and the employers know very well that the personality and the motivation of the candidates represent fundamental elements. For this reason, many employers prefer to include a wide range of feasible personality tests for testing their potential employees; tests that can be easily taken and assessed using the internet.
- New channels for spreading the job offers: the "push" system of sending the job offers on the email grants great results, but those taking care of the recruitment process are in a constant search of new spreading channels for their offers, and the internet provides so many innovative solutions. Therefore, more and more recruitment portals offer the job seekers the opportunity to subscribe to a RSS feed, which directly sends the appropriate job offer which might be of interest for the candidate. Lately, another facility that started to be used for spreading job offers is instant messaging for instance TotalJobs.com, from England, promotes the job offers by using MSN Messenger.

It is assumed that the next step will be the notifications sent by SMS and WAP.

- *Intelligent searching tools:* the emergence of a large number of sites which contain different job offers transforms the seeking process into a time consuming one. This has led to the appearance of a new type of portals: job aggregators. They collect the job descriptions from the online recruitment portals, index it and offer the candidates a search engine by which they can instantly see all jobs available online.

The year 2009 – going up or going bankrupt?

The effects of the world economic crisis have started to affect the online recruitment portals from Romania, starting with the first months of current year. Next, we are going to describe some of the mechanisms and effects of the decrease both in attracting candidates and companies as clients of the e-cruitment portals.

Effects over the incomes of e-cruitment portals

Traditionally January is the month with a slow rhythm in doing business. However, for the online recruitment portals this is the moment when companies negotiate the service packages they are going to use in the following year. Due to high uncertainty regarding the estimated incomes and the lower number of new workplaces, most of the large companies (which usually account for 40% of the incomes of such business) have chosen a monthly package, being determined by the punctual need for this type of services. Moreover, small and medium companies were the first ones affected by the crisis and have drastically reduced the number of new employments, the allocated budget being close to zero.

Taking into consideration the context of present market, e-cruitment portals redirected their efforts in order to attract revenues from areas less exploited until now. Such a direction was the introduction of the SMS paid service, which was implemented by the main players on the market as it follows:

Bestjobs.ro – BestJobs Direct (sends the CV to 100 employers instantly) – The service BestJobs Direct is a simple mean to increase the employment chances by sending simultaneously 100 CVs to the companies. The service is simple to use and it only costs 10 euro + VAT (BestJobs, 2009).

eJobs.ro – Paid employment ads – by using this service, eJobs can post the employment ads or services offers for 10 euro + VAT. The ads are checked and afterwards published on the home page, while companies will be contacted by those users interested in their services (Ejobs, 2009).

MyJob.ro – Top CV Myjob – by using this facility, MyJob offers the candidates the preferential placing of their CV in the list of candidates the company accesses, either when querying the database or when listing the applicants for a job. The advantage of being in the top of the list retrieved when accessing the database is that the CV is highlighted by an icon, a frame and background. For a 90 days period of validity, the candidates pay 10 euro and for just a month of subscription, they pay 5 euro (MyJob, 2009).

Another area that becomes widely used is that of incomes coming from promoting different products by using online ads or newsletters oriented both towards candidates and employers. Until recently most of the websites were ignoring these online marketing tools, but now they have started using them in order to fill in the liquidity gaps from the online recruitment market.

Effect over the policies of attracting candidates

When designing the marketing and sales budget of an online recruitment portal, an extremely important indicator is the acquisition cost of a candidate with a CV filled in into the database. There are also added operational costs regarding the website (wages, rent, hosting) and it is obtained a minimum profitability level at which the service can be offered to the employers. The high unemployment rate in the past 3 years (Wall Street, 2009) has determined the candidates to use the e-cruitment portals in their need to find a workplace, reducing the websites' investments in marketing in order to attract users.

Conclusions

To sum up, the current economic context has drawn its side important changes:

- the costs for attracting candidates has decreased (the market is assaulted by well-trained specialists, who are willing to work for lower wages than at previous workplace);
 - the costs can also be decreased by renegotiating contracts with the suppliers (hosting, renting costs etc.);
- in the period of crises, the salaries can not increase, while the employees should be more productive and results oriented since they do not want to loose their jobs;
- competition will decrease as small or niche websites will disappear due to their impossibility of attracting sustainable revenues;
 - marketing costs for attracting candidates are decreasing.

The advantages of online recruitment are obvious both for those who are searching for a job and for the companies that want to employ people and the main advantages can be stated in a word: "savings". Not only money savings (related posting, seeing or applying for the job), but also time savings. Candidates can consult more websites in the same time, the searches can be filtered, faster feedback, the CV can get more rapidly to potential employers; while companies can easily browse a database of CVs and select the most skilled candidates that fit the best with the job they offer. Besides these "quantitative" benefits, the candidate can get better documented regarding the offer, since online the job description is more detailed. Moreover, plenty of websites offer the opportunity to fill in the sections of the CV, and at the end, provide the candidate with the final form of the CV, allowing him to change information, if needed.

The main disadvantages of e-cruitment and the model presented is the fact that it does not work for those positions with specialized knowledge required (areas such as petrochemistry) or those jobs which require low or medium level of education (since many such people do not know how to use a computer or the internet); the ease in online application allows the effect of spam-applications (with the emergence need of finding a job, candidates apply for many positions even though they do not posses the knowledge or skills required).

Therefore, it is very important for the online recruitment portals to make use of all possible means and tools in order to survive on a market highly affected by the economic and financial world crisis.

Academia de Studii Economice – București Facultatea de Marketing Piața Romană nr. 6, sector 1, București nicolae al pop@yahoo.com

In the insurance industry there is a new way of thinking which determined the passage from transactional marketing to a holistic marketing concept. In this paper five key elements of holistic marketing are presented: relationship marketing, integrated marketing, internal marketing, social responsibility marketing and international marketing. In order to be successful insurance companies have to be able to convince their clients of the usefulness of their products and of the solidity of their businesses. In the current crisis situation, trust is a vital element for the insurance industry and even if on short term, liquidity is the target, as it ensures survival, on long and medium term the objective has to be the consolidation of the trust of consumers in insurance companies and the goal of the managers must be to win customer loyalty.

Keywords: holistic marketing in insurance, relationship marketing, integrated marketing, internal marketing, social responsibility marketing, international marketing, trust, customer loyalty, crisis Cod JEL: M31, G22

1. Modern marketing versus traditional marketing in the insurance industry

Today the success of an insurance company is based on the quality of the long term relationship established between the company and its "partners": customers, employees, broker dealers, banks, hedge funds etc. In the insurance industry this new way of thinking determined the passage from transactional marketing to a holistic marketing concept. The traditional transaction marketing focused on meeting customers' needs so that the company could obtain an immediate advantage. This approach wasn't always benefic for the insurance companies and for their clients. For example in the U.S. in the 1980's and 1990's the life industry was found by the regulators, courts and media to be engaging in widespread marketing and sales practices that were deemed inappropriate, unethical and, at times, illegal. Consequently, business suffered and there was movement to enact new onerous laws to impose new performance standards on the industry.⁴⁶¹

The new marketing perspective is based on the fact that a long term relationship should be established between the company and its partners. Modern marketing builds on the principles of traditional marketing, but it focuses on new elements. In the opinion of specialists, the holistic marketing concept is based on the development, design, and implementation of marketing programs, processes and activities that recognize their breadth and interdependencies. Holistic marketing recognizes that everything matters and it has four important components: relationship marketing, integrated marketing, internal marketing, and social responsibility marketing. 462 In the context of the recent events in the global economy, we consider that in the case of the financial sector, insurance products included, there is another essential component for the holistic marketing; the international marketing (see Figure 1). The crisis on the American financial market has had effects on all industries, at a global level, thus becoming a worldwide crisis. In this context, an international approach of the marketing activity is necessary, due to the fact that there are interconnections between the activities of insurance companies on different markets and the activities of their international partners. An interesting example reflecting this idea is the fact that the news regarding the buying of the majority of AIG shares by the US government so as to save the American giant from bankruptcy, as well as the announcement that the Dutch state has invested, as an emergency measure, a large sum in ING, were sufficient for causing mistrust from Romanians, the consequence being that numerous insurance contracts were interrupted.

⁴⁶⁰ The paper was elaborated based on a CNCSIS research grant (Program IDEI cod 1773)

Source: Adapted after Ph. Kotler, K. L. Keller, Marketing management, United States Edition, 12th Edition, Pearson Education, 2006, p. 18

In the next pages, we will try to describe the main characteristics of five key elements of holistic marketing in the insurance industry: relationship marketing, integrated marketing, internal marketing, social responsibility marketing and international marketing.

Relationship marketing is the ongoing process of identifying and creating new value with individual customers and then sharing the benefits from this over a lifetime of association. It involves the understanding, focusing and management of ongoing collaboration between the company and selected customers. Relationship marketing is based on the loyalty of company's customers. The company can obtain a competitive advantage by maintaining and/ or increasing the level of satisfaction of its current clients. By making customer satisfaction an ongoing priority, the focus is taken off the product (brand) and laid on added relationship values, such as trust and commitment. The company develops a genuine policy aimed at achieving customer loyalty. Loyalty is achieved as a result of repeated positive experiences related to the respective insurance company. Customers can develop company loyalty, product loyalty or loyalty for the contact person. In this approach the goal of the company is to build a strong relationship with its customers by cooperating with different parties. Relationship marketing involves creating, maintaining and consolidating a long-term relationship with all the company's partners. Relationship marketing marks a significant paradigm shift in marketing, a movement from thinking solely in terms of competition and conflict toward thinking in terms of mutual interdependence and cooperation.

An integrated marketing is a must in the insurance industry. The insurance company must have a coherent marketing mix in order to satisfy efficiently the needs of their clients. The marketing department of the insurance company must coordinate and integrate all the activities included in the marketing mix in order to maximize their joint effects: the insurance products and services offered must be conceived as a solution for the needs of the client and the setting of the premiums, distribution channels and company communications must be done in an integrate perspective.

The role of *internal marketing* is to ensure that everyone in the insurance company embraces appropriate marketing principles. The internal marketing is the task of hiring, training and motivating the employees who want to serve customers well. 464

Social responsibility marketing is a key element in the marketing activity of an insurance company due to the specific of the product. The role of the insurance is to protect the insured against different risks, but also to create benefic effects for the entire society. The marketing activity in insurance has important causes and effects in the

⁴⁶³ Philip Kotler, Marketing Insights from A to Z: 80 Concepts Every Manager Needs to Know, John Wiley & Sons Inc., New Jersey, 2003 464 Philip Kotler, Kevin Lane Keller, op. cit., p. 18

social, ethical and legal environment. The social responsibility marketing activities demonstrate a corporate culture that is designed to treat consumers fairly.

The globalization of the insurance market is a fact that cannot be contested and an international approach to the marketing activity becomes more and more important. There are two approaches to the international marketing activity in the insurance sector: multicultural marketing and global marketing. 465 The multicultural marketing accounts for differences in perception, attitudes and behavior of consumers in different cultural areas. 466 There are specialists that have noticed even the appearance of the so called *emotions marketing* in insurance 467 – a type of marketing necessary as a consequence of an increasingly sensitive consumer behavior. Nowadays consumers are trying to build an identity through various consumption activities and consequently a consumer will choose the product / service / company brand that has an image in accordance with the ideas he holds about himself – the choice being indicative of the type of image the consumer desires. 468 The multicultural marketing recognizes that the cultural heritage is a decisive factor for the success or failure on international markets and the insurance companies try to adapt their activity to the specific consumer behavior. For example, previous studies have shown that Romanians are much more skeptical than other nations in Central and Eastern Europe. One of the managers of a large multinational selling life-insurance in Romania, but also in other countries in Central and Eastern Europe stated that: 'Although insurance products on the Romanian market are similar to those in Poland or the Czech Republic, the Romanians are more skeptical when it comes to investments and tend to place their money in low risk products. That is why we concentrate now, on the local market, more on financial protection, because in Romania people need this more than investments.'

Insurance companies have many variants by which they can strengthen their position on the insurance market – for instance, there are several companies which decided to use a multi-brand strategy that will give the possibility to companies in the same group to concentrate on different market niches, also having the advantage of being able to use common competencies and capacities (for example, the same IT platform), without selling the same products and having different prices. For example, the holding Generali PPF, in addition to Generali Asigurari also owns on the Romanian market ARDAF and RAI, recently taken over from the PPF Investment Funds for approximately 80 millions Euros. Generali has chosen the following strategy on the Romanian market: the group has three companies on the market and has chosen not to merge the companies; they will function as different brands since part of the clients may be lost as a result of a merger.

2. From trust to customer loyalty – key issues in the modern marketing activity in the insurance industry

Trust is a key element in insurance marketing. Insurance companies have to be able to convince their clients of the usefulness of their products and of the solidity of their businesses. While it takes years to build trust and establish a reputation, those qualities can be very quickly damaged or destroyed. This is true of an industry, as well as an individual company and the entire life industry and its financial performance suffered as a result of the lack of trust. ⁴⁶⁹ In the current crisis situation, trust is a vital element for the insurance industry. The current liquidity crisis is the result of lack of trust. The decrease in the level of trust has taken place in the business sector and also with consumers, both reacting by a reduction of expenses.

A serious consequence of the negative evolution of the financial market is the decrease of clients' trust in the safety of insurance, especially in the case of insurance for long period. The most affected market is the investment insurance market, which can face a decrease, generated not only by the declining number of new contracts closed, but also by the interrupted contracts. Clients will cash in their policies before maturity, if decreases on the stock exchange will continue. The main factor that leads to such a situation is the mistrust in the financial market and in the solidity of insurance companies. The decision to take out insurance in the case of life insurance policies with an investment component is mainly based on trust ensuing from the reputation of the insurance company and its capacity to invest profitably, due to its experience on international markets.

The impact of the crisis on the insurance industry in Romania was so far 'relatively limited' and has mainly affected consumer trust, the negative reaction was firstly an emotional one, influenced by the current context. The greatest challenge of the entire financial industry will be in the following period regaining clients' trust in financial institutions. A positive effect of the crisis will be the fact that insurance companies will have to be especially responsive to the needs of their clients, and their marketing will be a relational one. For the insurance companies on the short term, liquidity is the target, as it ensures survival, but on long and medium term the objective has to be the consolidation of the trust of consumers (natural persons or legal entities) in insurance companies. The goal of the managers must be to win customer loyalty. The loyalty is indicated by the company's customer retention rate,

⁴⁶⁹ Brian Atchinson, op. cit., p. 2

defined as the outcome of an entire process the client goes through in his relationship with the company, moving in turn from the first purchase of a product to the repetition of the purchase and then to loyalty. The mechanism of achieving and developing customer satisfaction leads to customer loyalty. The maximum level of commitment towards a company, its products and/or its brands is described as exclusivity. The essential issues of the customer retention process are the following: 1) What is the object of the customer loyalty? 2) What are the categories of clients that are able to develop loyalty towards an insurance company? 3) What are the main ways of developing customer loyalty? 4) What are the stages of the customer retention process?

- 1) In the insurance industry customers can develop company loyalty, product loyalty or loyalty for the contact person. Company loyalty is achieved as a result of repeated positive experiences related to purchases from the respective company. Product loyalty is the consequence of recurrent satisfaction in usage of the respective products. The services connected to the product can improve loyalty (for instance, a claim solved quickly can be perceived as an additional advantage of the product). Loyalty for the contact person is related to an insurance agent or a broker.
- 2) Not any customer can be loyal to a company. The activities involved in the customer retention process need to be customized according to the features of the demand (size, structure, intensity, frequency and so on). Modern marketing recommends grouping the customers in order to form a customer portfolio (occasional clients, permanent clients, key clients, problem clients).

The crisis has multiple effects on the insured and on the insurers. One effect of the crisis may be the increase in the number of late payers, but this should not frighten insurance companies, but should determine them to find a way to help their clients honor their responsibilities, even if at a slower pace. Another effect of the crisis will be the increase in the number of insurance frauds – in crisis periods this phenomenon usually develops. Lately, the number of files with a strong suspicion of fraud has considerably increased in the case of motor third party liability insurance. The solution lies in preventing this phenomenon and trying to find methods to discourage fraud.

- 3) What are the ways to develop customer loyalty? The actions available to the organization can be grouped in two categories: development of customer loyalty based on facts and development of customer loyalty based on emotions. The first category contains marketing elements of a *contractual nature*, a *technical nature* and of an *economic nature*. The second category contains all the marketing communication tools that develop the satisfaction of the customer. An attractive price is less and less significant in switching to a new product or company. ⁴⁷¹
- 4) When assessing a product, nowadays buyers (Romanian buyers included) go through an increasingly complex decisional process based on the relationship *price quality degree of satisfaction.* ⁴⁷²

The marketing techniques used to develop customer loyalty are various and require the combination of *elements based on facts* with *elements based on emotions*. The first step in creating customer loyalty consists in identifying the customer and studying his behavior. Thus the company has the possibility of creating a client database.

More and more specialists ask the question: "What is the value of a customer?" A customer's value is primarily given by the long-term relationship with the company, which attests the fact that relationship management is crucial to the market success of the economic agent. When assessing a client's market value one has to consider the multiplying effect the customer can have on the company. A type of client can become prescriptive, assuming a decisive role in directing demand towards a certain company / product. Some of them have an important role in directing demand, while others have a certain subjective reputation among consumers. Loyal customers' willingness to recommend a certain company to other potential customers increases that company's market value. In an increasingly competitive environment building customer loyalty is an essential asset for a company that whishes to develop.

The evolution of the insurance market is closely related to economic, social and political changes, and in this context of financial crisis an increasingly important role will be played by the state, which can influence the evolution of the insurance sector through its social and economic policy. But the insurance companies and financial institutions through their marketing activity can play an important role in rebuilding the trust of potential clients in their services and success will belong to strong, financially-sound companies, which know how to gain and keep their clients' trust, with a flexible pricing policy, diversified products and impeccable customer service.

In the marketing concept an important place is occupied by the environment where organizations are developing their activities. Technology occupies the most important place in automobile manufactures industry, and we can even says that if you have not a product in compliance with technology development you disappear or you will be buy by which is most adapted to new. For the automobiles manufacturers the globalizations means the fusion between important companies like Renault-Nissan group or Daimler-Chrysler group (that functioned till recently) Philip Kotler defines the internal marketing environment The actors around the organization that influence the capacity to serve the customers: the organization itself, the marketing intermediaries, customers markets and public categories.

Cuvinte cheie: marketing, strategy, development, market

Cod JEL lucrare: M31 Marketing

The market strategy represent the most important component of enterprise general development strategy, by which is synthetically establish the report between the enterprise and the environment.

The market strategy indicates the organization attitude and behavior about the market psychology, exigencies and tendencies evolution. 473

We can say that the appropriate market strategy is that which help the organization in order to make a correct selection of the segments for which is exercising the marketing abilities, offering the appropriate product and service at the right price and place, using appropriate communication activities in order to realize the established targets for a specific period of time.

The classical theory of Ansoff from 1965 contains one of the most important strategy definition in which is showed the organization evolution in order to accomplished the established objectives, the timing trajectory of this can be characterized by multiple elements defining the relation between the products and the actual and future organization's markets which are formed by four strategically components.

The first component is formed by sphere of products and markets for which the organization concentrate all its social and economic efforts.

The second component is represented by the growing vector, being in a close interdependence with the first component, indicating the organization development direction, being in a close interdependence to the actual products and markets situation.

The third component is concurrencies advantage that's identifying the products sand markets components which generated a strong competitive position. The defining of market segments by the organization will generate the competitive advantage and also will offer a important growing potential for the products that's are offered to the market. The capacity of adaptation to the external environment is in correlation with the capacity of administrate organization's economic and social existent resources.

The last component the organization synergy is represented by the concerted action process, this process generate a total bigger effect than the sum of all the individual effect of each factor considered that being independent.

In case of product development strategy, the marketing representatives have to understand the value of a positive relation established between the client and the organization, also the client has to trust in the organization. This relation permit for the organization develops new products that will be offer in an efficient way and without many costs to actual and potential clients.

⁴⁷³ Laurentiu-Dan Anghel, Eva-Cristina Petrescu, Business to Business Marketing, Editura Uranus, 2002, pag 116.

We can give the example of Subaru Company which developed the first boxer diesel engine in the world. Subaru Company declares: The first Subaru boxer diesel engine in the world. Now on the Forester model. A veritable world premiere: for first time the power of a SUV is generating by a boxer diesel engine. In combination with Symmetrical AWD system, the new Forester equipped with Subaru Boxer Diesel engine to entire SUV experience a new dimension assuring the perfect and complete balance of the automobiles.

The appearance of this new product have as fundament the work of Subaru specialists which decided to revolutionize the art of diesel engine after a 40 years experience in boxer engine. They succeed to keep all the major advantage, and also the low vibration level, assuring in 5he same time an enormous torque and lower fuel consumption. All this innovations are made in order to develop a new product.

The Subaru Company has the principal advantages of the Subaru Boxer Diesel engine: smooth functioning, enormous torque and faster acceleration and also efficient fuel consumption.

The market penetration strategies consist in the growing of the current product volume on the current market by efficient using of some marketing activities about distribution and promotion. The intention is to influence the actual consumers by growing the consumed quantity, by growing the utilization product frequency. 474

For a growing market this strategy can be applied by growing the promotional products in order to convince the potential customers to buy this product.

The diversification strategy is represented by introduction of new products on the new markets. In order to successfully apply this strategy the marketers have to know very well the consumers needs and also the discovering of all states of the market in order to diversify the range of products. An example in this case Skoda Company which developed Roomster model. After a long period of time Skoda's engineers had diversify the range of automobiles by creating this new model.

This automobile was creating to combine the practical spirit with the drivers pleasant and the passengers comfort.

The market development strategy consists in the actual products penetration on new commodity markets by finding new consumers. This strategy can be applied when the action on the market is restricted. The applying of this strategy in automobiles domain had generate the increase the number of the available automobiles model. Jack Trout in his book Trout about strategy says At the beginning of '70 years were available 140 automobiles models. Now days are 260 models. Even on a small market – how is the sport automobiles market Ferrari, which cost 175 000 dollars for a piece – the competition is growing. Are available Lamborghini, Aston Martin models, a new sport car Bentley and a new Mercedes named Vision SLR ⁴⁷⁵

In order to select the adequate market strategy is important to make a careful study of organization environment and organization financial, material and human resources.

According to Thorelli marketing strategy is the organization reaction at the environment evolution and physiognomy; we can have two possible reactions. A first reaction consists in the modify of the actual rapport between organization and its environment. We can give as example Mercedes Company which launches a new product on a new market: Mercedes A Class. Mercedes Company was first automobile company which attacks this market share and also maintains the luxury characteristics, the comfort and the safety of his models.

Mercedes Company officials declare: Veritable luxury is when absolutely nothing is messing. You want five doors or three are enough? In case of A Class you can have booth. In Coupe case you will win more elegance and sportive. Not even the passengers from the rear seats are forgetting because of EASY ENTRY system.

A second possible reaction suppose internal changes in organization, having indirect effects for relation with firms environment, for automobiles domain we can have the example of applying more performing technology in order to create different products comparative with the other competitors products and also products having a better quality. We can give the example of Mercedes Company which develop and implement safety system PRO-SAFE for his automobiles. By implementing this safety system Mercedes Company has one only objective: vision of driving without car accidents .

Philip Kotler identify in the article The Major Task of Marketing Management appeared in Journal of Marketing (October 1973) eight strategically alternative available for organization, he make this classification by using three dimensions (the effective level of demand comparative to the wanted level, the evolution in time of the demand, the demand level of wish) of products and services demand.

As possible market strategy, the automobiles producer can apply:⁴⁷⁶

Market penetration strategy supposes improvement of automobiles producer actual position on actual markets, in situation when automobiles producer offers the same automobiles. This item can be realized by improvement marketing activity, by improvement distribution and promotion. We can say that Dacia Company constantly improves its marketing activity, distribution and promotion after it was bought by Renault Company.

Market development strategy is a strategy used by the automobiles producers in order to find new customers segments which want actual automobiles for giving them new uses. We can give the example of pick-up

_

⁴⁷⁴ Anca francisca Cruceru, Marketing strategii concurentiale, Editura Universitara, Bucuresti, 2006, pag 157.

⁴⁷⁵ Jack Trout, Trout despre strategie, Editura Brandbuilders, 2005, pag. 17.

⁴⁷⁶ Virgil Balaure (coordinator), Marketing, Editura Uranus, 2002, pag. 319.

automobiles with five places that can be use as utilitarian vehicle and also recreation vehicle. Mitsubishi Motors Company declare about L200 pick-up: Having a spectaculars aspect, an interior comfort appropriate for a SUV, the equipping level and the exceptional all road performance made this pick-up a new reference.

The reformulation strategy oblige the automobiles producer to continuous improve its automobiles in order to increase the sales on actual markets. We can give as example the improvement of fuel consumption for diesel engine made by Renault Company; the representatives of Renault Company declare that Renault diesel automobiles are the most economic diesel automobiles on the market.

The market extension strategy in case of the automobiles producers is characterize by the modify of the products and also the introduction the products on new commodity markets. General Motors Company developed Hummer automobile, as military vehicle used by American army, was then, because of consumers demands launch on the market in versions dedicate for civil consumers.

Replacement strategy means to launch to the same market of new automobile, based on improved technologies similar to the existent automobile.

Product differentiation strategy and market segmentation involves the development of new variants of a vehicle and to launch them on the market in order to satisfy certain segments of the market. French from Dacia launched the first version of Logan Berlina, and then they developed Logan MCV, Logan Van and Logan Pick-up, note that all models have continued the Logan significant successes on the market.

By applying the strategy of extending the line of products, the automobiles producing companies will follow the launch of new products that are based on related technologies and are intended for the same market segments. We have the reference A4 and A6 models issued by Audi company, even though the A6 is slightly larger dimensions, both models have engine 3 liter TDI engine and 3.2 liter FSI the only difference is the motor engine 4.2; common elements between motor are shown at models A4, A6 and A8 from Audi such as the 3.2 FSI engine, and for all three models is true the motto from A8: Comfort and dynamism at the highest level: by design exclusive and many innovations, the new Audi A8 defines the requirements of high class luxury Audi cars.

Concentric diversification strategy in the automobiles domain will mean attracting new segments of buyers, adding new types of automobile in the current line of products. The Skoda company launched the Skoda Roomster as spacious family car that offers all the comfort of passengers, with the following presentation is a car that offers, despite its compact form, a feeling of space: will wait in front of a very well equipped driving room - behind a spacious and comfortable living room . subsequently added a new variant of this car as the Skoda Praktik for a new segment of buyers.

Horizontal diversification strategy in the automobiles domain will be the development of new automotive technologies using different technologies from the current existing market segments. Because of the rising price of petroleum products for automobile manufacturers trying to develop automobiles with alternative propulsion technologies.

Lateral diversification strategy is the production of new products which are related to current products witch do not have the same technology, and market segment is quite different. Italian company producing tractors Lamborghini SpA Trattat owned by Ferruccio Lamborghini used a lateral diversification strategy when they launched on the market in 1963 the first model of sports vehicle, reaching now one of the most prestigious companies producing auto vehicles, in the sports luxury class with prices of over 200 000 euro.

the organization evolution in order to accomplished the established objectives, the timing trajectory of this can be characterized by multiple elements defining the relation between the products and the actual and future organization's markets which are formed by four strategically components.

The first component is formed by sphere of products and markets for which the organization concentrate all its social and economic efforts.

The second component is represented by the growing vector, being in a close interdependence with the first component, indicating the organization development direction, being in a close interdependence to the actual products and markets situation.

The third component is concurrencies advantage that's identifying the products sand markets components which generated a strong competitive position. The defining of market segments by the organization will generate the competitive advantage and also will offer a important growing potential for the products that's are offered to the market. The capacity of adaptation to the external environment is in correlation with the capacity of administrate organization's economic and social existent resources.

The last component the organization synergy is represented by the concerted action process, this process generate a total bigger effect than the sum of all the individual effect of each factor considered that being independent.

The product-market matrix analyses two dimensions, the market and also the product. About products we can say that the businesses are determinate by the services and products which are made to be sell.

The four quadrants of Ansoff matrix represent each of them an option which define a strategically answer for many internal and external factors.

In case of product development strategy, the marketing representatives have to understand the value of a positive relation established between the client and the organization, also the client has to trust in the organization. This

relation permit for the organization develops new products that will be offer in an efficient way and without many costs to actual and potential clients.

We can give the example of Subaru Company which developed the first boxer diesel engine in the world. Subaru Company declares: The first Subaru boxer diesel engine in the world. Now on the Forester model. A veritable world premiere: for first time the power of a SUV is generating by a boxer diesel engine. In combination with Symmetrical AWD system, the new Forester equipped with Subaru Boxer Diesel engine to entire SUV experience a new dimension assuring the perfect and complete balance of the automobiles.

The appearance of this new product have as fundament the work of Subaru specialists which decided to revolutionize the art of diesel engine after a 40 years experience in boxer engine. They succeed to keep all the major advantage, and also the low vibration level, assuring in 5he same time an enormous torque and lower fuel consumption. All this innovations are made in order to develop a new product.

The Subaru Company has the principal advantages of the Subaru Boxer Diesel engine: smooth functioning, enormous torque and faster acceleration and also efficient fuel consumption.

The market penetration strategies consist in the growing of the current product volume on the current market by efficient using of some marketing activities about distribution and promotion. The intention is to influence the actual consumers by growing the consumed quantity, by growing the utilization product frequency. 477

For a growing market this strategy can be applied by growing the promotional products in order to convince the potential customers to buy this product. The diversification strategy is represented by introduction of new products on the new markets. In order to successfully apply this strategy the marketers have to know very well the consumers needs and also the discovering of all states of the market in order to diversify the range of products. An example in this case Skoda Company which developed Roomster model. After a long period of time Skoda's engineers had diversify the range of automobiles by creating this new model.

This automobile was creating to combine the practical spirit with the drivers pleasant and the passengers comfort. The market development strategy consists in the actual products penetration on new commodity markets by finding

new consumers. This strategy can be applied when the action on the market is restricted. The applying of this strategy in automobiles domain had generate the increase the number of the available automobiles model. Jack Trout in his book "Trout about strategy" says At the beginning of '70 years were available 140 automobiles models. Now days are 260 models. Even on a small market – how is the sport automobiles market Ferrari, which cost 175 000 dollars for a piece – the competition is growing. On the market are available Lamborghini, Aston Martin models, a new sport car Bentley and a new Mercedes named Vision SLR ⁴⁷⁸

In order to select the adequate market strategy is important to make a careful study of organization environment and organization financial, material and human resources.

According to Thorelli marketing strategy is the organization reaction at the environment evolution and physiognomy; we can have two possible reactions. A first reaction consists in the modify of the actual rapport between organization and its environment. We can give as example the improvement of fuel consumption for diesel engine made by Renault Company; the representatives of Renault Company declare that Renault diesel automobiles are the most economic diesel automobiles on the market.

The market extension strategy in case of the automobiles producers is characterize by the modify of the products and also the introduction the products on new commodity markets. General Motors Company developed Hummer automobile, as military vehicle used by American army, was then, because of consumers demands launch on the market in versions dedicate for civil consumers.

Replacement strategy means to launch to the same market of new automobile, based on improved technologies similar to the existent automobile.

Product differentiation strategy and market segmentation involves the development of new variants of a vehicle and to launch them on the market in order to satisfy certain segments of the market. French from Dacia launched the first version of Logan Berlina, and then they developed Logan MCV, Logan Van and Logan Pick-up, note that all models have continued the Logan significant successes on the market.

By applying the strategy of extending the line of products, the automobiles producing companies will follow the launch of new products that are based on related technologies and are intended for the same market segments. We have the reference A4 and A6 models issued by Audi company, even though the A6 is slightly larger dimensions, both models have engine 3 liter TDI engine and 3.2 liter FSI the only difference is the motor engine 4.2; common elements between motor are shown at models A4, A6 and A8 from Audi such as the 3.2 FSI engine, and for all three models is true the motto from A8: Comfort and dynamism at the highest level: by design exclusive and many innovations, the new Audi A8 defines the requirements of high class luxury Audi cars.

Horizontal diversification strategy in the automobiles domain will be the development of new automotive technologies using different technologies from the current existing market segments. Because of the rising price of petroleum products for automobile manufacturers trying to develop automobiles with alternative propulsion technologies.

Lateral diversification strategy is the production of new products which are related to current products witch do not have the same technology, and market segment is quite different. Italian company producing tractors Lamborghini SpA Trattat owned by Ferruccio Lamborghini used a lateral diversification strategy when they launched on the market in 1963 the first model of sports vehicle, reaching now one of the most prestigious companies producing auto vehicles, in the sports luxury class with prices of over 200 000 euro.

An exhibition event should not necessarily bring benefits. It is considered an investment in terms of image. However, costs must be covered and a profit margin should exist. This would ensure funds for the next edition. A general audit of the success of an event certainly includes control of the following processes: preceding the event, implementing it and follow-up; effects generated and the assessment of the aspects of the cost-utility relation; event efficiency. In the auditing process control lists, work plans, questioning techniques and observation, and a few measurement techniques may be used, such as the silent shopper/mystery shopper procedure, the sequential events method, and the critical incident technique.

Keywords: fairs and exhibitions, exhibition auditing, auditing methods and techniques

JEL classification: M31, M39, R11

1. Why getting involved in organizing events?

Book editing, tourism, regional specialties, old objects, food, clothing, in other words, today, any specialty area has its own trade fair or exhibition.

For some, such an event aims to improve the reputation of the organizer. A municipality wishing to gain a cultural dimension, will focus on organizing a book fair, a region that wants to highlight its tourism, should be able to organize an exhibition devoted to this sector of activity. In this case, such an event should not necessarily bring benefits. It's considered an investment in terms of image. Of course, costs must be covered, and if a profit margin exists that would assure funds for the next edition, the better. For them, an event, a trade fair, an exhibition, represents an investment that has its return measured only after a certain period of time.

For some, organizing an event is simply a job. Specialist teams are involved throughout the year, organizing several events, launching new concepts, getting in touch with exhibitors, investing their time and imagination in determining people to go and visit these events, to increase the popularity and reputation of the events. They are involved in organizing the event from start to finish and are interested in making the event noticed as often as possible. Like any other activity, there's also should be really profitable.

2. Exhibition event - theme, date, location, infrastructure

Whatever the reasons for organizing an exhibition event, the topic must be defined, the date at which it could be organized and the means available, to the firm, for the project to be put into practice.

The theme depends on interests manifested in a collectivity or in a specialized federation. Work is closely related to the activity sector or to the image that a collectivity wants to promote. A commerce chamber trying to attract businesses, dealing with the development of new technologies will be interested in retaining that theme which will bring the highest value for the institution.

The location in which events, trade fairs, exhibitions are organized is often a large city, which has the necessary infrastructure to receive visitors and exhibitors: airport, station, developed road network, enough rooms, exhibition centers, hotels.

However, the fact that a city in which such an event is being held, must be large, should not represent an obstacle. Already, when a local community decides to put into practice an exhibition event, it cannot consider doing so elsewhere other than in its area of action. If a municipality wants to highlight its cultural heritage, is unlikely to hold the exhibition in another city. There are also events which are not held in large cities, even organized in small cities, but who managed to develop, over time and with patience, a national reputation, even a European one.

If a national event has a powerful image, it would be appropriate to fix a date for the exhibition event near the date of the national event. In France, for example, many regional book events are held at a date close to that of the prestigious book event which takes place in Paris.

An event dedicated to the tourism sector which aims to develop and improve business for the tourism operators, to learn ideas from visitors, should not take place near the major holidays: what good it serves to give people ideas when they already have chosen the place for the holiday and so such ideas cannot be materialized.

Wherever possible, the organizer of an event will try to avoid organizing an exhibition or a trade fair with a theme, a place, a notoriety and date fairly similar to those of other events.

Once the theme, the place and the date is established, the only concern is in organizing the exhibition event. It is an important work that will take time. Usually, for the first edition of an event, at least one year must be allocated between the moment when the idea developed and the time it is being put into practice. Finding a right a place for receiving visitors, for arranging meetings with exhibitors, for notifying the public, twelve months will not represent such a long period of time.

3. Practical organization

After the decision was taken to create a new exhibition, before anything else is absolutely necessary to think if one could develop all the services proposed for it, or whether one will need to use outside persons for the services required.

Again, a list of essential services and necessary materials will help in the endeavor⁴⁸⁰:

- has a place for the exhibition event been identified?
- has sufficient staff been identified for implementing and designing the plan for the event, writing and designing the commercial and communication documents, ensuring the marketing of the event, ensuring the welcoming committee for the exhibitors, and for the visitors, ensuring the installation and the dismantling, ensuring for the safety and technique skills during the event, realizing the financial balance of the event?
 - can one buy the essential material for the event.

After answering all the questions, it is necessary to find suppliers to complement the services so that the event could be carried out.

3.1 Services offered to exhibitors

In general, the organizer will provide support and advice in all organizational and technical issues, in particular to exhibitors at their first participation.

Because establishing contacts is one of the main purposes for participating at an event, assuming that a connection between the exhibitors and visitors is to be created 481, to increase rate of contacting, an event organizer must be able to provide data on the number of visitors attending the event, the geographic origin of visitors, the professional situation of visitors, the time length that visitors would dedicate, the visiting behavior, the time length that a visitor is allocating for a stand, the travel route in the exhibition center, the location of each stand.

In accordance with these factors the probability of establishing contacts between exhibitors and visitors in general can be determined, and also between different types of visitors (visitors of the event, special guests, visitors that are in various stages of consumer decision-making process - searching for information, evaluation of alternatives, buying decision). Also, depending on the target groups, an exhibitor must be able to formulate goals. In formulating these goals, the exhibitor should take into account both the visitor's consumer behavior, and the consequence of the purpose brought upon the activity during the event482.

Together with the conditions for participation and the confirmation for the stand, the exhibitors are given the order forms for various services. In addition to support for advertising and media, services may be requested free of charge or against payment. Also in this category issuing permits for access to stand personnel (free of charge, against payment or mixed), permits for access to the parking place of the complex, other forms of materials associated with access to various facilities and / or spaces of the complex, could be considered.

4. Finding the exhibitors

The most important aspect is to identify potential exhibitors. In the case of a trade fair organized by a foundation of local traders, a list will be quickly available.

However, if it comes to a regional event devoted to new technologies one will probably need to seek scattered information, to meet exhibitors from across the region. A time of only six months for this activity (the search for exhibitors) can seem very short. That's why, once the time length for implementing all stages of the project (finding a convenient place, making the documentation available to exhibitors, signing the contract with the exhibitors, announcing the public in time for the event), is determined, one can add a month or two, to include all operations that require time, but one has not thought about them to be important.

4.1 Constructing the list

When one determines the theme for an event, a list of potential exhibitors should be constructed; particularly those specialized in that field, but also in other fields. For example, an exhibition aimed at the winter holiday season will receive with priority offers from mountain resorts and tourism offices in countries with specific winter season sports, but also from distributors of sports goods, from stores offering clothing for the winter season, and from

⁴⁸⁰ Delecourt N., Happe-Durieux L., Lespingal-Gastide V., Reussir un salon, une foire, une exposition, Puits-Fleuri, Paris, 1997.

⁴⁸¹ F. Unger, W. Fuchs, Management der Marktkommunikation, Heidelberg, 1999, p.252.

⁴⁸² M. Bruhn, Kommunikationspolitik, 2. Aufl., Vahlen, 2003, p.146.

insurance companies whose field of activity is essential for practicing some major risks sports (mountaineering, ski).

It will be also necessarily to determine the geographical area from which these exhibitors come: a project on a national or even an international scale could be initiated (telephone and mailing costs will be higher), however, an alternative for action on regional or local scale remains, with the particular financial disadvantages. Such a choice depends on the theme chosen for the event: the more precise the theme, the more difficult it is to find exhibitors or visitors only from that area.

The first thing one must do, to manage future exhibitors, is to create a credible list, which will be the basis of any relationship. To do this, one could very simple use the Yellow Pages. It could provide in one glance, the potential exhibitors present in a given region, even before the launch of the exhibition. Obviously, if there is the possibility for printing the pages, this would lead to considerable time savings. Professional sectors yearbook publications will also provide the information needed.

In this way, complete data of the target enterprise could be obtained. This is not enough: it is absolutely necessarily to know which person, within the company, is to inform about the purpose of the event (general manager, commercial director, communication manager). From a commercial point of view, it is known that an anonymous letter is likely to go unnoticed and, implicitly, to be lost. Personalizing the list, not only our information will be received by a particular person, but in addition it will be much easier to contact it by phone.

The establishment and confirmation of the participants list, whatever the size, is a forming task for a student in the commercial sector, an internship, in which it could be developing the basis of any commercial activity.

In practice, each exhibitor will likely be the subject of lists, in which will contain all the information about it: postal and telephone data, the activity of the company, surname, name and position of contact the person, and the list of contacts established (data from telephone calls, meetings, occasional meetings, discussions). Increasingly, it will become equally necessary to have the electronic address for these contacts, a large number of companies already having such addresses.

These "identity cards" will help avoid making telephone calls twice to the same company and, especially, will help not to forget, from one year to another, the quality of connection created with other companies.

4.2 Preparing a presentation document

Preparing the brochure for an event is very similar to preparing a presentation brochure for the company, because the same criteria must be taken into account from a technical point of view.

It is very likely that this brochure will be published in several thousand copies. To limit the cost of printing and mailing, it is not necessary to achieve a level of content of more than twenty pages. Because these documents will be distributed to width scale, it will be expected that a large number of these documents will end quite quickly in the recycle bin. Therefore, it is preferable to keep the document short, attractive to the person that will receive it (and this rarely happens when a document is about 40 pages long), to spark interest in that person, to determine it in learning more about the event. In general, brochures only 4 pages long, and no more than 8, will fulfill this mission very well.

Be it a simple photocopied document, with an impeccable and specialized presentation, or a brochure with photos and colors, the presentation document for the event must contain answers to the following questions:

- why this exhibition? the theme, the economic, cultural and geographical background;
- who represents the target audience? exhibitors, visitors;
- how is it organized and by who? advertising, partners;
- how to participate? pricing, participation arrangements;
- when? the opening date and hour for the general public;
- where? the location of the exhibition center.

The brochure will contain several parts. The first part will contain information about the specific of the event and also about the target audience. It will also specify the date and location of the event, it will provide important information to the participants (in the case of a first edition event, estimates figures will be provided, if the exhibition is a re-edition, it will provide participants with the previous event figures: number of visitors, number of exhibitors, number of conferences held, number of square meters available to the exhibitors).

If one has already determined what conferences will be held, and also their schedule, this information will be included in the brochure. It will also insist on communication, to attract guests (media, cards, number of guests, posters). Also the brochure will contain, eventually, extracts from journals that talk about the previous events. It will provide information about the event organizers.

The last page is often dedicated to practical information: access, geographical location, the main routes of transport, the organizer contact information (address, phone number, fax).

If a large number of photos will be used they will enrich the general aspect of the document, especially if the brochure was designed in a polychromic format. It will enhance the fact that this exhibition is visited by a large number of people, that it hosts many conferences and/or other animations events.

To make the project more real, it is very important to include in the presentation document, in a very explicit manner, the plan of the exhibition event. The plan will be constructed either in close collaboration with the location of the event, either through the company responsible for the construction of the stands, which one has already worked with. If one owns an exhibition center, it is possible that the technical departments are able to construct such a plan. Everything should be as close as possible with the reality on the ground.

4.3 "Marketing"

Around 8-9 months before the exhibition event, will start "marketing" it. To carry out this endeavor, could be chosen between sending the presentation document to the contacts list, or inviting each of the contacts, to the company, to present them the project and to propose them a more detailed document or even a meeting. It is recommended a "pre-mailing", announcing succinctly the exhibition event together with a reply coupon in order to establish an information folder. The last two solutions appear to be the best. Practically, they avoid useless brochure dissemination, they allow to measure the difficulties of the task; as more data is obtained, the easier will it be; if the data volume is small, the organizational efforts will become more important. Of course, if the list contains fewer than 100 contacts, it could be sent directly a brochure to each of them.

After numerous actions (phone calls, faxes, meetings), one of those contacted, becomes interested in participating in the event. At this moment, will be interested to the future exhibitor, in order for him to actually reserve a stand, by signing a contract and making an advance payment.

Therefore, a reservation contract must be signed, which is a more administrative document, and stipulates the mutual commitments of the organizers and clients (exhibitors). This document should be simple: in one page, maximum two, it should contain the organizer's information data and the main elements that the exhibitor is committed to (stand size, rental price).

Also, the contract will include the description of the minimum services provided by the organizer (rental space), the cost of the stand, depending on the size and the potential services provided to all exhibitors (electricity, water, a parking map for cars). It also includes other various services which the organizer may provide in addition, and the additional price to be paid. In another part of the contract, the exhibitor states what it wants (stand size, indicating the appropriate cost, particular equipment).

If a catalog of exhibitors will be edited (which is, typically, the case), additional information will be required: the name and address of the company, telephone and fax numbers, the contact person's name, a brief business activity description (maximum 20 words).

4.4 The conferences

Within a series of specialized events, one can organize, through a program of specialized seminars for exhibitors, some papers based on technical products or processes. These papers will be announced in advance. In most cases, they do not cause additional costs for the organizer.

Very often, the events days, are animated through conferences, debates, seminars, bringing an additional benefit for the events.

In fact, these moments of sharing ideas, on a theme or another, will enhance the value of certain exhibitors. Asking them to attend in a conference, to present their products and services, will offer them the opportunity to make their presence felt in the event.

For visitors, conferences can be an important argument in deciding to come to the event. They know that exhibitors will display only part of their business. Instead, the conferences are generally intended to portray a general situation. Very often, the public will join in the debate, so making it part of the event. Attending a conference is considered a complementary training for the company staff.

These conferences may be supplemented by workshops, where the exact theme will be discussed in small groups. These workshops could be integrated in an event, but will require special organization. However, beware: conferences should not overshadow the event itself. It is important that visitors will walk from aisle to aisle, from one stand to another. If not, exhibitors will be offended. Conference must complete the exhibitor's information offer and incite the public to visit the event. Also, a conference must not be too long (maximum one and a half hour, but one hour would be better), because it is necessary for lecturers and also for visitors to have enough time to visit the exhibition. If a conference takes too long, people will rush to the exit just when the conclusions are announced.

In the case of a conference - debate, with testimony and arguments, one could propose to several prestigious exhibitors to intervene in the debate. If it comes to a debate among several participants, is preferable to use a moderator, animator, to be careful that each participant can express their arguments, that the public can take part in the debate, that the conference will be limited to a certain period of time. Very often, journalists (specialists or not in the issues discussed) will be perfect for this type of task. Also, it will be necessary for the participants and animator to meet before the conference, to establish contacts among them and to prepare the main topic of the debate.

In the case when special topics will be discussed, the exhibitor can also present products. These events are organized separately and independently of the exhibitor's company.

Participation in specialized conferences, congresses or round tables, can be beneficial to exhibitors, to the extent in which they can refresh their knowledge, so the challenge, for the organizers, to identify the most appropriate topics for these animations.

4.5 Determining the budget

Once the general plan is established, it will be necessary to address the financial issue. If the costs can be determined quite easily before the event, the earnings depend on a single factor: the success or failure of the event. When an exhibition is at its first edition, the organizers hope, obviously, that it will be profitable, but they also know that they are taking a big risk. Especially when the theme is quite specific, and when the event is supported only by a local collectivity that wants to cast a certain image to the outside world, they do not expect that the event will have a balanced budget.

Then the question arises: who will pay for the event? Two possible sources of income will come into attention, not considering any grants, on which the organizers could call upon: the exhibitors and the visitors. Exhibitors pay for their presence at the stand (and the derived products, for example the catalog that is given to the visitors). Rental price is calculated based on the number of square meters occupied by the stand and varies depending on several parameters: the reputation of the event, the number of expected visitors, the commercial endeavor or the advertising arrangements. Visitors pay for their entry ticket. But also on this plan, the first edition has the disadvantage of temptations to exempt taxing potential visitors. In such context, it should be considered also as an initial investment the amount that could be obtained from the entrance fee, and only starting at the second edition, and according to first's success, could analyze the problem concerning the quantum of the entrance fee and the estimated amount that could be obtained from this source of income.

The provisional list established will take into account inevitable costs and will be based on estimates, even more important at the first edition, or as long as the event has not yet acquired a strong image into the public's conscience. Taking into account these expenditures, how many stands with an average area of 15 sqm will be necessary to lease and what should be the leasing tariff on sqm?

5. Once the event is over

An exhibition which had some success, is likely to take place each year. Therefore, one must, each year, improve the content, the organization methods, the communication means of the event.

The first edition creates, very often, more curiosity than real interest among the general public: one must determine the event's qualities, and also its defects (in order to identify trends) and to ensure a growing interest for it.

5.1 The exhibitors' opinion

The exhibitors are the determining factors of the event's atmosphere, and more important, they alone will decide whether or not to return to the next edition. It is therefore important to take into account their remarks, before the launch of a new edition. Using the results obtained by a survey, will allow to have a different view on the event that just ended and to possibly change, a point or two for the next year (the schedule for the public, the date for the event, the services that did not satisfied the exhibitors).

5.2 Using invitations

Invitations can provide first order information for the next edition of the event: the activity sector, the geographic area and the profession of the visitors will provide a vision of their image. For example, based on this image, a change in the communication campaign could occur. If one wants key people inside companies, to participate to the event, and so far they represented only a small percentage among visitors, the communication efforts will be focused in this direction. If one realizes that most visitors come from adjacent areas from where the event is being held, and one expected to come from a much larger area, one will react accordingly.

5.3 The financial balance

In order to construct the financial balance, one will need to bring together the following elements⁴⁸³: Proceeds

Expenditure

- stands rent

- sales of attached services (telephone

- water, company posters)

- sales of advertising materials (catalog)

- stands maintenance

- other services: telephone

- installations

- printing costs

- communication expenses

(postal costs)

- marketing costs

Once this financial balance is established, one should not forget the proposed objective when it initiated this event. Consequently, has this event been a source of profit? Only after one has established that the objective was

483 Delecourt N., Happe-Durieux L., Lespingal-Gastide V., Reussir un salon, une foire, une exposition, Puits-Fleuri, Paris, 1997.

achieved, it could say that this was a "good" event. After this time one might think, or not, to diversify the efforts for the next editions.

6. Auditing the event

An general audit of the success of an event certainly includes control of the following processes:

- preceding the event;
- implementing the event;
- after the event:
- effects caused by the event;
- assessing the aspects of the cost-utility relation of the event;
- event efficiency;

In fact the control processes specific to an event represents the surveillance activities conducted in order to assure the proper progress of that event484. Thus, one will consider not only the efforts preceding the event, but also during the actual event, and thereafter. In addition to control lists, work plans, questioning techniques and observation the following measurement techniques may be used:

a. The "Silent Shopper" / "Mystery Shopper" procedure

As in the commerce and other fields, the management of the organizer may appeal to specialized companies that send people "incognito", to test the reaction of staff at the stand and their reaction regarding certain problems. These "mystery shoppers" simulate real situations, and are trying in a relatively limited amount of time, to build a more precise picture as to the quality of offers presentation, staff behavior and communication and persuasive ability of personnel. Also they are able to conduct a comparative analysis between the response times of the staff in question and that of the other stands.

b. The sequential events method

This method serves in determining strengths and weaknesses in the communication process specific to events. This process is divided into three phases, visitors being asked to identify for each phase, possibilities for improving the processes. The three phases are 485:

- the pre-event phase looking for information, travel planning, preparing the visit, arrival and hotel accommodation;
- the actual deployment of the event phase information, transaction, communication, additional services and program framework;
 - the after-event phase departure, cost utility analysis, reflections.

c. The "Critical Incident" technique

This technique attempts to reveal the degree of satisfaction or dissatisfaction of the event's visitors, taking into account especially those events that were "critical" in for the visitors – either with a positive or negative effect. Unpleasant events could be represented by the total lack of information on a specific offer or an information inadequacy of it, late invitation arrangements, no catalogs, no samples or even an inadequate catering service. The Critical Incident technique provides quantification of these events using standardized open questions, data evaluation and interpretation obtained from assessing the causes leading to failure (or success) and advice on future improvements486.

Neuromarketing is a relatively new concept which has developed as a consequence of accepting, by an increasing number of persons, the idea that there isn't an objective reality and that the entire world is actually inside our mind, it is the sum of our exclusively subjective perceptions.

The science that studies these aspects at a biological and theoretical level is neurology. Neurology and marketing have recently "met" in a series of studies resulted out of curiosity and the desire of knowledge leading to the "birth" of the neuromarketing term.

Keywords: neuromarketing, fMRI(functional Magnetic Resonance Imaging) technology, "buy button"

JEL classification: M31, M37, C91

1. What is Neuromarketing?

We ask sometimes what is the reason for which we like something and many times the answer to this question is ambiguous, unreasoned or it doesn't exist. This is because our preference for a certain good or a certain service is unconsciously realized.

There are more questions than answers about our brains. We have no access to all processes happening there and we are not able to decode many of information we can see.

Martin Lindstrom is the man that decided to find out what lies behind the success or failure brand experience nowadays.

He rides on this neuromarketing trend and promises to reveal the truths and lies of why we buy. For this purpose, he uses available knowledge about human brain that identifies different areas responsible for different feeling, like love or fear. When those areas are stimulated, they lit up but there is no explanation what kind of behavior will follow or how the environment or part experiences stimulates the reaction the scanned persons. To use that knowledge as an explanation is like "looking into people's windows from the street and trying to guess what they are talking about".

Neuromarketing helps us to understand the consumers' behavior. Why do we choose Coca-Cola instead of Pepsi? Why do women do not prefer science-fiction movies? Why do men prefer sport cars? In order to make the consumers to buy, the companies have to try to answer these kinds of questions and to always find new ways of finding out how the consumers think.

Neuroscience has appeared when the Italian psychologist Angelo Mosso tried the following experiment: the analyzed subject was lying on a balancing table which could be inclined only if the feet or the head become heavier. When the subject met an intellectual or emotional activity, the balance was inclined towards the head, as a result of the blood redistribution into the body. (Figure no. 1)

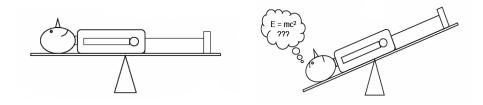

Figure no. 1: The Angelo Mosso experiment⁴⁸⁸

488 www.psych.utoronto.ca

⁴⁸⁷ www.socialhallucinations.com

If for years the marketers based, in their researches, on the study of the consumer's behavior by ways already known: questionnaire, group focus etc, the year 1990 "started" a new era in what concerns the knowledge of the consumer and of his preferences.

The company answers questions such as: How can we set strong and long-lasting preferences of the consumers? How can we better gather the communication efforts in such a way as to underline the message efficiency? How can we better match the product with the consumer? How can we make the consumer trust our trend?, with the help of the neuroscience, a study of the way in which the brain thinks, feels and motivates the human behavior.

The brain of certain volunteers watching different ads is scanned by a disposition with magnetic resonance. Therefore, the neuromarketing appeals the fMRI (functional Magnetic Resonance Imaging), technology used in order to detect cerebral tumor, allowing in the same time to read the way the brain receives, works and interprets different images which are presented to it.

1.1 "Neuromarketing is where science and marketing meet." 489

While we suppose a consumer buys a product for its features, its functions or its price, the consumer's brain tells us something different. The neuroscience shows us that this developed organ develops preferences on the basis of the intuitional relation with the product's brand and not on the basis of the advertising message. The brain cannot make the distinction between the messages of the marketing department and the rest of the messages. Each experience related to the brand becomes part of our perception about this brand, and in the end it determines the pro or against attitude regarding the brand. This explains why, for example people buy "jeans" not for the way they look with them, but for the way this product matches their life. Therefore, nowadays, we buy products for the way these define us, and our brain has exactly this vision about products. Step by step, the product will not be taken into account in the same measure as the trade-mark or as the brand, as these contain the elements the individual identifies with.

In a classical communication process, the marketers consider themselves to be the "emitter", and the customers, the "receptor". From the neuromarketing point of view, the parts should be changes: the companies are the ones who need information regarding what products to commercialize, and the consumer has to make this information be available, and not to be informed about something which already exists. The companies should learn to build relationships.

Giving the fact that we are being daily "bombed" with commercial messages, there appear questions regarding the efficiency of the communication between the companies and the consumers. Expressions such as "better", more speedy", "cheaper" do not make the public more sensitive, but a little, and have the disadvantage that they do not guarantee the consumer's trust. The deeply understanding of what motivates us represents the future, and the companies have to focus on the consumer's impressiveness instead of producing commanding goods.

Although a lot of researching ways are in evolution, there still remains the problem of the discrepancy between what the individual says and what he thinks of buys. It is known that 95% of his thinking is unconsciously realized. How do we expect then a focus group to solve a marketing problem? The neuroscience proposes to understand the motivation from the sub consciousness (positive or negative), motivation which impulses the individual to act or which stops the action, determining a preference, a purchase or a behavior.

If the companies understood the consumers and the way he is thinking, they could offer him what it necessary and would reconsider the way of communication with the consumer. The neuroscience has the key as it opens the brain, and the combination between the results of this science and the business can significantly change the purchasing way of each product or service.

The final purpose of the neuromarketing is to understand the way the brain determines the consumers' behavior and it supposes the study of the process of choosing different brands, as well as the identification of the factors determining the choice. 490

1.2 Keys to Neuromarketing

Another marketing specialist, Christophe Morin⁴⁹¹, co-author of "*Neuromarketing: Understanding the Buy Buttons in Your Customer's Brain*" emphases some keys points of neoromarketing through which the companies can improve their products, services, marketing strategies and advertising. These aspects from Morin's argument are made subconsciously, in the nether regions of the mind he calls the primal brain, areas where "basic fight-or-flight instincts kick in. We buy, he says, out of fear." Therefore, there are some human features that should be considered strong "buy buttons". These aspects help us to take the right decisions:

1. We're self-centered

 $^{489\} http://www.martinlindstrom.com/index.php/cmsid__buyology_what_is_neuromarketing$

⁴⁹⁰ www.neuroco.com

⁴⁹¹ http://neuromarketing.blogs.com/neuromarketing/

To make decisions, egotism is an important landmark. "People are completely egocentric and all they want is something that will create a difference in their lives, eliminate pain and possibly bring them more pleasure," Morin says.

2. We crave contrast

Sometimes our actions can be explained due to inedited things. Thus, the contrast is a significant way to captivate people. "The bottom line is, on any given day, we will receive about 10,000 ad messages, and only the ones that are huge contrasts will get any attention,"

3. We're naturally lazy

Simplicity is a substantial tool for advertising messages. About the message, it is recommended to keep it simple, but strong. "Most companies tend to create abstract messages and use too many words," Morin says. "Reading is much more a function of the "new brain". We recommend that, of course, companies use a lot of concrete visuals."

4. We like stories

Advertising and marketing with strong beginnings and ends create a catching reaction. That's why, Christophe Morin advises entrepreneurs to sum up and recap their strongest selling points at the end of any promotional material. He also underlines that people brain has a natural tendency to pay attention at the beginning and end of anything.

5. We're visual

Visual memory can create a higher impact then a hearing one. Appealing video and graphic presentations can make the difference at cash registers where price and reason can't. Several times we make decisions visually, without being aware of them. Only later do we rationalize decisions we made.

6. Emotion trumps reason

"Give us the right emotion to ride on, and we'll buy what you're selling". "When we experience an emotion", Morin says, "it creates a chemical change in our brain, hormones flood our brain and change the speeds with which neurons connect, and it's through those connections we memorize. We don't remember anything if there isn't an emotion attached to that experience."

2. What ethical issues does neuromarketing involve?

The use of neuroscience for marketing purposes alerted a group of consumers in the United States, who fear that this could lead to the discovery of a "buy button" that when pressed can turn us into buying robots. Recent opinions on 'neuromarketing' within the neuroscience literature have strongly questioned the ethics of applying imaging techniques to the purpose of "finding the 'buy button in the brain' and ... creating advertising campaigns that we will be unable to resist." ⁴⁹² In addition, some consider that it may lead to finding out which are the key elements in advertising that could make people become aware of certain products or brands. Moreover, it could also help identify the attitudes toward a product or the way a product is evaluated. It is for these reasons that many researchers fear that advertisements and marketing activities can be used in order to generate negative effects, such as overconsumption. Gary Ruskin, executive director at Commercial Alert - a non-profit organization, is of the opinion that if neuroscience increases, even to a small extent, the effectiveness of ads, it represents a possible danger. It is believed that once the buy button is identified, unscrupulous companies will make use of the available information in order to cause addiction for their products to the detriment of consumer's physical and mental health. Those who share this idea even consider that aggressive marketing contributes indirectly to obesity, diabetes, alcoholism, lung cancer and addictive gambling. Clinton Kilts, a scientist at the Emory University in Atlanta says that the research conducted in the field of neuromarketing have never been intended to change consumer behavior but to help those companies that must adapt to their customers. Put it other way, neuromarketing is also seen as a tool that helps companies to identify and understand the consumers' needs or as an instrument that can help companies to better satisfy the identified needs of their customers.

The main question that arises is concerned with the extent to which marketers and advertising agencies should be allowed to study the consumers and also with the power they obtain in handling the decision making process by exploring the consumers subconscious.

Most researchers reject the idea of a buying button, arguing that technology only provides a chance to observe the brain activity and not to influence the brain. As a proof, they point to the fact that many promotional efforts do not produce the expected results. Neuromarketing is a science that serves companies to improve their ways of designing and communicating the commercial messages so as to capture attention and make them be considered interesting by the target audience. The same idea is also sustained by Joey's Reiman statement: "Our purpose is to change the company and not the consumer." Still, companies like BrightHouse and its clients or sponsors try to distance themselves from terms such as neuromarketing.

⁴⁹²Nick Lee, Amanda J. Broderick, Laura Chamberlain, What is 'neuromarketing'? A discussion and agenda for future researchInternational Journal of Psychophysiology 63 (2007) 199–204

⁴⁹³ Quoted in "They Know What You Want" de Emily Singer, New Scientist, 31 July, 2004, pp 36-37.

3. Conclusions

Nowadays, marketing should move forward focus groups and other traditional marketing techniques. If companies want to obtain any feedback on a product they must get inside consumers' heads. The information that is obtained during focus groups may not be accurate while the signals issuing from the brain are more likely to point to what the subjects are really thinking and feeling.

In today's visual pollution, knowing your audience and understanding their behavior also mean understanding what simulates their attention to your advertising campaigns.

Neuromarketing offers the perspectives of a quantitative method to test the effectiveness of ads, logos and sounds before spending money on promotion. Given the existing overabundance number of ads, this new research tool is a vital instrument for those companies that want to better understand their targeted audience and to design better products for their clients.

Thus, the neuroscience is not something new; the new thing is its use in business in order to make business more "intelligent" with the help of the doors which are open to knowledge. The innovations regarding the neuroscience allow us to see and to measure what we feel and we think. If we were to synthesize the neuroscience importance, and consequently of the neuromarketing importance for a company, we would quote Joey Reiman: "NO BRAIN, NO GAIN".

On the basis of increased complexity of the exchange mechanism, at the beginning of the third millennium the contemporary marketing suffers some physiognomic changes. Holistic orientation of the contemporary marketing is imposed by the new dimensions the organization ought to take into account in its attempt to meet the costumer's needs. Marketing of luxury products constitutes a favorable environment for applying relationship marketing in particular, and requires, in general, a holistic approach.

Keywords: relationship marketing, holistic marketing, luxury marketing, residential complex, research on perception of luxury.

Cod JEL article: M31

Introduction

Marketing of the 21st century is marked by its relationship orientation. Without altering its essence, marketing is refocusing its efforts of increasing organizational performance through the development of long-term relationships with all its partners (suppliers, customers, other stakeholders). Such a mutation, takes place on the basis of shift from *transactional marketing* to *relational marketing*⁴⁹⁵, the latter requiring a new approach to business relationships among all the partners mentioned above. Customer orientation⁴⁹⁶, emphasized by relationship marketing, directs the entire controlling activity towards monitoring the profitability generated by company's relationship with its demand holders. The meaning this approach has for the organization, takes a new qualitative dimension, through two concepts, more commonly found in the theory and practice of developed countries: *customer lifetime value and customer profitability*⁴⁹⁷. Both concepts are common to *interactive marketing*⁴⁹⁸ and seek to ensure ability to identify and capitalize difference between customers.

Holistic orientation of marketing

On the background of increasingly complex exchange at the beginning of the third millennium contemporary marketing presents new physiognomy changes. Satisfying demands expressed on the market by consumers employs organization in a more diversified set of connections, not only with its beneficiaries but with its employees also, with the surrounding environment, raising ethical responsibilities, towards legislation and community to more higher levels. Thus, the *holistic orientation* of contemporary marketing ⁴⁹⁹ is shaped. Figure 1 depicts the structure of this orientation:

Figure 1. Dimensions of Holistic Marketing

Source: adapted after Kotler, Ph., Koller, K.L., *Marketing Management*, 12th Edition, Pearson Education, Upper Saddle River, New Jersey, 2008, p.61.

Based on holism theory (Gk. Holas = whole), which says that the whole always has priority, more than the total sum of individual parts, *holistic marketing* requires development and implementation of marketing programs, processes and measures with a wide spectrum and correlated with each other. Stressing that the whole is important, an *integrated marketing* concept which is at the same time relational, integrated, omnipresent within the organization and socially responsible 500. This way, on the same level of importance are placed relationship marketing (which develops a strategic and long term vision for the organization with all its partners), marketing in action (integration of all components of marketing mix), implementation of marketing – as business perspective – in all departments of the organization and marketing responsibility towards the surrounding environment, the community where enterprises operate in accordance with business ethics requirements and of the law in force. Holistic marketing is exhibited as a complex model in Figure 2.

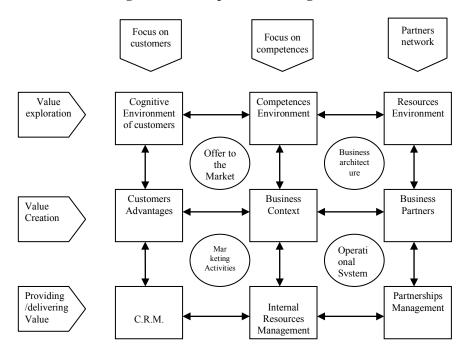

Focused around explorating the demand and delivering value to the customer, holistic marketing addresses these themes in a matrix approach, at the confluence with the focused efforts towards customers, competencies and partnering relationships. Economic environment has the ability to think in a strategic manner the *architecture of a business* and to model *supply offered to the market* in a more nuanced, fashion in relation to the motivational complex of demand, the medium and long term solvency of demand holder and the capacity to employ an efficient system of marketing activities. It is required, a rethinking of the criteria for ranking customers both in respect of their relational capacity, and the company's long-term performance in satisfying a very exacting high-demand⁵⁰¹. Under the current economic situation of Romania, affected by the outcomes of the global financial-economic

crises, marketing efforts have to be reanalyzed, especially in the area of luxury supply.

Marketing of luxury products

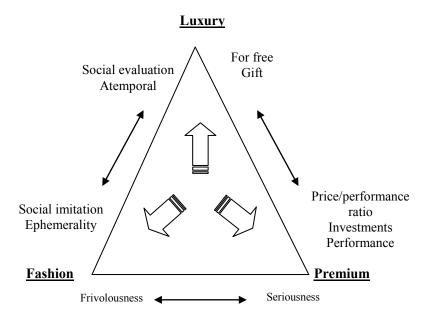

Within present economical context the perception of luxury is very different among potential buyers. The variety of expressions invented by the communication specialists have filled business vocabulary. "New luxury", "real luxury", "hyperlux", "trading up", "ultra-premium", "accessible luxury", etc. are just a few of them. Rather than clarifying luxury concept this semantic explosion creates more confusion. Luxury is not simply a word that defines a certain degree of wealth but also a *sociological and psychological complex concept*. Creation, proliferation and marketing of the luxury is not just a job, or know-how (savoire-faire) specific to selling jewelry, collection cars, unique clothing, or residential housing. It represents a distinct manner, with an emphasized *empathic nature* of understanding the customer and of service management which is called to satisfy the demands of Luxury in the contemporary society has undergone a democratization process under the influence of certain major factors that act on demand, such as: general increase of the average purchasing power, globalization of needs, communications at worldwide level available even in real time, communications etc.

Contrasting mass marketing, *marketing of luxury items* increasingly captures the attention of business people. Luxury is not merely targeted to small market niches, but rather gains more ground in the areas where persuasion is combined with medium and long term rationality. Situated at the confluence of *high solvency, fashion, art and consumer's personality* luxury attempts to position itself, from an economical standpoint, on a vector system, although such a process can be often considered ambiguous. Such a positioning test is exhibited in Figure 3, in the form of a positioning triangle.

.

⁵⁰² Pop, N. Al., Vlădoi, A.D., Marketerul - specialist complex, om de decizie si actiune, în revista Amfiteatru economic, Vol. XI, Nr. 25, February 2009, pp. 9-20.

Figure 3. The Distinction Between Luxury, Fashion, Premium: triangle of the positioning vectors

Source: adapted after Bastien, V., Kapferer, J-N., Luxe oblige, Groupe EYROLLES, Paris, 2009, p. 49.

Marketing of luxury products constitute a favorable field for applying relationship marketing concept in particular, and requires in general, a holistic approach. Customer satisfaction is central to the marketing approach and represents the starting point for customer attachment strategies vis a vis a product/a brand considered to be a luxury one. Being a complex psychological process of comparability between experience as beneficiary of a service and the representations of the manner and level to which the respective product/service satisfies a need, satisfaction is the main premise in increasing loyalty, being a real key for modeling customer buying behavior. These processes turn to three groups of variables: cognitive (based on superior quality of the goods, considering performance), emotional (based on emotions caused to the buyer) and relational (based on the interaction between provider and customer in the purchase)⁵⁰³.

Research of the demand for housing in residential complexes

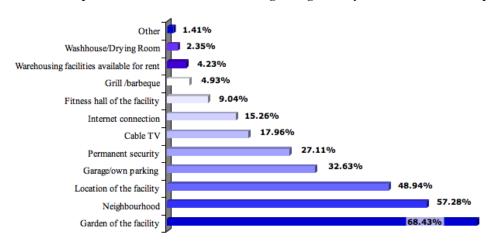

The applied part of the empirical survey undertook by the authors has focused on a market area that is situated at the confluence of luxury and rationality: residential housing facilities. In this current economical situation real estate market in general and residential complexes, in particular, have registered in last three quarters a major downturn. In order to support boost of this market it is essential that, the systematical and analytical survey of the demand to monitor the evolution of perception and willingness of the buyers to acquire luxury items. The demand for these products, perceived by the average customer as being luxury ones has a certain potential, which still has to be identified and developed using specific marketing instruments.

During the 5th to 12th of April, 2008 authors conducted a study on the local market of Oradea regarding public's attitude -potential customers- towards new houses located in residential complexes. Survey has been performed through an individual questionnaire containing scale questions, multiple choice questions and open ended questions. The questionnaire has been administered to a representative sample of 852 citizens of Oradea (of a total of 206.080 officially registered inhabitants), representing a random and stratified sample. Sample size was determined considering a confidence interval of 95% and a sampling error of 3,5%. Approximately 15% of the approached subjects refused to provide any answer.

Inhabitants of Oradea perceive luxury having a stronger emphasis on proximity than on the type of facilities provided by the residential complexes. Such facilities as TV and internet connections, warehousing space or fitness halls are perceived rather standard than luxury. Chart no. 1 gives an overview of the perceptions of luxury on residential facilities.

⁵⁰³ Meyer-Waarden, L., La fidelisation client. Strategies, pratiques et eficacite des outils de marketing relationnel, Vuibert, Paris, 2004, pg. 68-70.

Chart 1. Perception of Oradea's Inhabitants Regarding Luxury in a Residential Complex

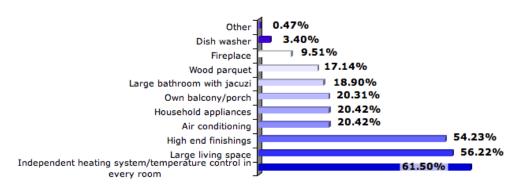

Question: Please circle first 3 elements that you associate with luxury housing in a residential facility of houses/villas or flats

Source: survey of public's attitude towards new housing within residential complexes in Oradea

Considering their own housing, luxury as it is perceived by inhabitants of Oradea is related to the nature of comfort and space provided. Environment control in respect of temperature control in each room, along with the large living space and high-quality of finishing are the main items considered luxury. Endowments in terms of household appliances -more readily available in recent years- are perceived as normal. Chart no. 2 below provides an overview of perception of luxury within the house.

Chart 2. Perception of Oradea Inhabitants Regarding Luxury Within The House

Question: Please circle the first 3 elements that you associate with luxury housing in a residential facility of houses/villas or flats

Source: survey of public's attitude towards new housing within residential complexes in Oradea

Conclusions

Perception of luxury is in continuous change and evolution in the sense that some of the elements that were hitherto perceived as luxury entered into normality by becoming increasingly available, while other new and extravagant elements replace them. In order to understand continual study and research on customers' wants and aspirations in the different stages a developing market goes through, as is the case of Romanian market in general, and real estate market in particular. Increase in average purchasing power and the globalization of customer wants impose providers a special attention as regards tailoring the offer through a holistic marketing approach so that via an integrated approach to capitalize on competitive advantages that are granted by the application of this concept.

Abstract. The present paper is a comparative microbiological and physical-chemical analysis of various types of honey (polyfloral, tilia, acacia, sunflower, and honeydew) collected from beekeepers and processors. The results have enabled us to make correlations between moisture, acidity, pH and the microbiological characteristics of the tested honey samples.

Keywords: honey, microbiological analysis, physical-chemical analysis

General aspects

Honey is a sweet and viscous substance produced by the honeybee from the nectar of floral plants. It is produced in almost every country of the world and it is a very important energy food, used as an ingredient in hundreds of manufactured foods, mainly in cereal-based products, for sweetness, flavour, colour, caramelisation and viscosity. The system of ensuring food products in sufficient amounts is on a continuous descending line. At the present time, the integrity, quality, sanitation and nutritional value of food products are paid increased attention.[1]. The concept of "food safety based on the general hygiene principles of food products and on the HACCP method adopted by Codex Alimentarius comes to reduce or control biological, physical and/or chemical contaminations [2]. Maintaining the contamination level within accessible, minimum limits leads to a linear and constant process when it comes to ensuring quality and food safety. Thus, the harvesting, collecting, manufacturing and storing of honey are a field in a continuous evolution and adjustment to the European legislation, industry needs and the harsh market competition.

Honey represents a semi liquid, yellow, sweet and flavoured foodstuff, with a great biological and caloric value (it contains sugar, vitamins and enzymes), collected and produced by the bees from nectar, manna or sweet juice that can be found in different parts of plants and trees. Being a "noble" product of the bee, honey has a wide range of action depending on its kind [3]. The physical-chemical and hygienic qualities of honey constitute indicators that offer information regarding the energetic and nutritional quality, as well as the possibility of falsifying honey. The authentication of honey is assessed through its physical-chemical parameters falling within the limits imposed by the present legislation. Falsifying agents or inappropriate thermal treatments are identified through the HMF (HydroxyMethylFurfuraldehyde) content.

The microorganisms in honey come from nectar and pollen, from the processing area, from the insufficiently washed machines or containers. The more frequently encountered sporulated microorganisms belong to the Bacillus type. The non-sporulated bacteria (Micrococcus, Pseudomonas, Flavobacterium) are less numerous, coming from the floral organs or the digestive tract of the bees. The filamentous fungi, being more spread in nature and having thermal resistant spores, with a great capacity of surviving, can be introduced in honey even by man, through dust, through the water installations or containers or even by the bees through pollen [4]. The microbes found in honey are not dangerous for the consumers' health. Even if Aspergillus flavus is found, there are no favourable conditions for aflatoxin.

The presence of microorganisms in honey can sometimes influence the stability of the product and its hygienic quality. Normal honey must lack pathogenic microorganisms or microorganisms that produce enteric illnesses.

Microbiological contamination during or after processing honey was demonstrated by the absence of the microorganisms in the samples collected from primary sources and by the presence of a certain type of bacterium (Bacillus spp) and eight types of fungi (more frequently Candida, Aspergillus, Geotrichum and Rhizopus) in the collected samples on local markets. This fact indicates the contamination from secondary sources during manipulations and previous processes. The contamination with fungi and bacteria indicate inadequate hygiene conditions during collecting, manipulating, processing and storing [8].

Experimental

Twenty bulk liquid honey samples of known origin, aseptically collected from beekeepers located in different areas of Transylvania (Romania) during 2008 and presented in table 1, were used for analysis. Each honey sample was purchased in duplicate in sterilised sealed jars of 200 g. The main *physical and chemical indicators* (hydroxymethylfurfuraldehyde (HMF), humidity, acidity and pH) that reflect the honey quality were determined according to the methods proposed in the Harmonized Methods of International Honey Commission [9].

According to STAS 784/3-1989, the main physical and chemical characteristics of honey found in Romanian stores are presented in table no. 1.

Table 1. Physical, chemical and microscopic characteristics of honey

Water, % max.	20
Acidity, ml NaOH sol.1N/100g max.	4
Reducing sugar, expressed as invert sugar, %, min.	70
Easily hydrolysable sugar, expressed as sucrose, %, max	5
Diastasic index, min.	6.5
Ash, %, max.	0.5
Specific pollen grains, with reference to the total number of pollen	25
grains examined, %, min.	
Hydroxymethylfurfuraldehyde (HMF), mg / 100 g max.	1.5 *
Colour index, mm. (Pfund scale)	max.18
Water insoluble substances, max.	0.1
Falsifying agents (artificial invert sugar, industrial glucose or another	0
starch hydrolysing substance, gelatine, gum, cereal flower or other	
starchy products, artificial colouring bodies, synthetic sweeteners etc.)	

^{*}Honey found in jars for sale allows for an HMF content of max. 4 mg per 100g.

The HMF content was determined according to the White method using a UV-VIS spectrophotometer (model T80 PG Instruments, UK).

Moisture content was determined measuring the refractive indices at 20°C by an ABBE refractometer. The corresponding moisture content was calculated from the refractive index of the honey by reference to a standard table.

The acidity of honey is the content of all free acids, expressed in milliequivalents/kg honey.

The honey sample (10 g) was dissolved in 75 ml carbon dioxide-free water and the pH value was measured using a pH-meter (Inolab level 2, WTW). The same solution was titrated with 0.1 M NaOH solution to pH = 8.30, using an automatic titrator (Titroline Alpha Plus, Schott Instruments).

Free acidity, express as milliequivalents or millimoles acid/kg honey = ml of 0.1 M NaOH x 10.

From a *microbiological* point of view, the contamination of the samples was done by determining the total number of aerobic mesophilic bacteria (NTG) and determining the yeasts and moulds. The used diluting liquid was peptonate physiological serum: 10g of sample were homogenised with 90 ml of SFP, obtaining the diluted solution 10^{-1} .

Total number of germs

Petrifilm Aerobic Count Plate is used –3M Microbiology producer USA.

Petrifilm is a reactive film covered with a dehydrated culture medium which contains standard nutrients, a jelly making agent which is soluble in cold water and a tetrazolium indicator which facilitates the enumeration of colonies.

For each sample, two Petrifilms are used, placing them on a flat surface. The upper part of the film is lifted and, with a sterile dropper we put 1 ml at a time from the diluted solution 10^{-1} on each of the two slates, the upper film is placed on the sample and is distributed with the help of the applying tool, and then some time is given to let it solidify for at least one minute. The Petrifilms are incubated at 30° C \pm 1°C for 72h. All the red colonies are counted, regardless of the size or intensity.

Yeast and mould]

Take two sterile boxes of Petri. With a sterile dropper pour 1 ml of the 10^{-1} diluted solution in every box. About 15 ml of yeast-glucose-cloramfenicol-agar extract is poured (Orgenics producer), previously melted and maintained at $45^0\pm1^0$ C in water, in every Petri box. Everything is carefully mixed, it is left to solidify, placing the Petri boxes on a horizontal, cold surface. A witness box is prepared, with 15 ml medium, in order to verify the sterility. The boxes are placed with the lid down, in the incubator, $25^0\pm1^0$ C. After three, four and five days of incubation, the colonies from each Petri box are counted. Evaluation: 100 CFU/g.

In order to identify the species and capture the images, a Hund Wetzlar H600LL microscope connected to a PC was used, using the Pinuacle TV Centre programme.

Results and discussion

Table 1 shows the physical-chemical indices: moisture content, pH, acidity and HMF of analyzed samples.

Table 1. The results of the physical-chemical analyses of the honey samples

Sample	Sample code	Moisture	nЦ	Acidity	HMF
no.	Sample code	content (%)	pН	(meq /kg)	(mg/kg)
1.	Polyfloral honey	15.6	3.72	41	12.2
2.	Polyfloral honey	16.8	3.99	23	52.3
3.	Linden honey	16.4	4.39	16	14.9
4.	Linden honey	17	4.86	11	1.0
5.	Acacia honey	18	3.75	12	4.3
6.	Acacia honey	19.4	2.89	14	8.4
7.	Forest honey	16.2	3.66	28.9	5.7
8.	Forest honey	15	3.98	43.8	21.7
9.	Sun flower honey	16.4	3.67	22.6	22.3
10.	Sun flower honey	19.8	3.59	20.9	23.8
11.	Polyfloral honey	16.4	3.6	37.3	31.8
12.	Polyfloral honey	15.4	4.01	20.6	7.4
13.	Polyfloral honey	15.6	3.9	55.6	4.5
14.	Polyfloral honey	16.4	3.78	28.5	2.3
15.	Polyfloral honey	16.6	4.04	30.4	8.5
16.	Polyfloral honey	14.6	3.8	24.4	30.0
17.	Linden honey	16.4	4.36	20.0	24.8
18.	Linden honey	16.4	4.01	23.4	14.2
19.	Acacia honey	16.4	3.9	14.3	64.3
20.	Acacia honey	16.8	3.9	14	10.7

The physical-chemical parameters values were within the reference ranges presented in UE or national reglementation. Exception is sample number 2 and 19 for HMF value and sample 13 for acidity level. In order to establish the microbiological characteristics of the honey samples, the parameters from table 2 were analysed.

Table 2. The microbiological control of the honey samples

Number of the sample	NTG/g	DM/g		
1	30	30 (Penicillium spp.)		
2	95	15 (Rhizopus spp., Aspergillus spp., Penicillium spp.)		
3	45	<10		
4	15	15 (Absidia spp.)		
5	20	<10		
6	20	20 (Penicillium spp.)		
7	40	40 (Penicillium spp., Aspergillus spp.)		
8	45	20 (Penicillium spp., Aspergillus spp.)		
9	35	<10		
10	10	10 (Fusarium spp.)		
11	30	<10		
12	25	<10		
13	<10	<10		
14	20	10 Aspergillus spp		
15	45	10 (Penicillium spp.)		
16	10	<10		
17	20	<10		
18	25	<10		
19	<10	<10		
20	20	<10		

The antimicrobial character of honey is confirmed by the results regarding the TNG (the total number of germs): in all the analysed samples it is under 100 CFU/g – value settled by the present legislation- which represents a reduced contamination with aerobic mesophilic germs. Out of the 20 analysed samples, the greatest microbiological importance was represented by sample no. 2 with 95 CFU/g.

Regarding the yeasts and moulds, we notice that there is no yeast in all the 10 analysed samples and the number of mould does not exceed 40/g in any sample. The most frequently encountered one is the *Penicillium* type (in five samples), then *Aspergillus* (in three samples). In each sample the fungi from the *Absidia (Mycocladus), Rhizpus* and *Fusarium* types were determined. We can notice that in the polyfloral honey sample fungi from the *Penicillium, Aspergillus* and *Rhizopus* types can be found. Also, fungi of the *Penicillium* type were identified in the acacia honey sample.

We can notice the presence of TNG in the samples subjected to various handling and also a variety regarding the types of fungi encountered in the honey samples. This fact confirms a contamination from a microbiological point of view during its manipulation by the beekeepers and the primary honey treatments, which indicate unsatisfying hygiene conditions.

Figures 6 and 7 present the results of the correlated log of bacterial number and moisture separately for polyfloral honey samples from other samples and except the two samples (13 and 19), where the microbial growth is lower than 10.

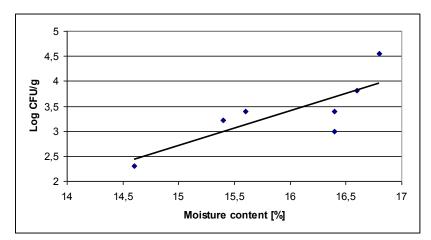

Fig. 6. Correlation between total counts in polyfloral honey sample and their moisture content

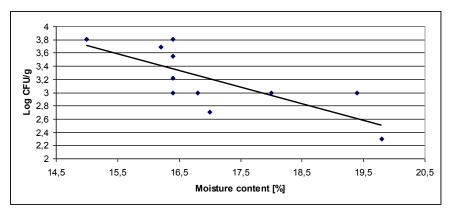

Fig. 7. Correlation between total counts in linden, acacia, forest and sun flower honey sample and their moisture content

Slope of regression line log of bacterial number over moisture is y = 0,6976x - 7,7593, $r^2 = 0,6378$ in case of polyfloral honey samples and y = -0,253x + 7,5075, $r^2 = 0,5714$ for linden, acacia, forest and sun flower honey sample.

The dependences between TNG and the water content from the analysed samples were emphasized. The correlative analysis shows that there are appreciating correlations between the microbiota and the physical-chemical honey parameters.

Conclusions

The study allowed the qualitative analysis of the honey samples collected from beekeepers in Transylvania.

The experimental values of the physical-chemical and microbiological parameters of honey demonstrate the following:

The presence of mould (especially of mould) in the *Penicillium, Aspergillus, Absidia, Rhizpus, Fusarium* types, but which cannot exceed the limit values. These facts, as well as the favourable conditions can lead to generating and developing micotoxins.

Contamination from secondary sources during the manipulations due to the inadequate hygiene conditions during the selection, manipulation and storing.

The importance of corresponding processing of honey: filtration, dehydration, liquefaction, pasteurization (70-78°C for 5-6 min.), cooling (sudden at 42°C) and wrapping in order to stop or destroy the present microorganisms.

The physical-chemical parameters were within the limits imposed by the present legislation, except for 2.13 and 19 samples.

Correlating the physical-chemical and microbiological results is necessary in order to sanitation of honey. This fact constitutes practical proof in ensuring food safety.

Positioning is a very important marketing concept. Thus, it is our opinion that any student who graduates the first 3 years cycle should know the fundamentals of positioning. Unfortunately, this concept still doesn't have a clear place in the marketing faculty's syllabus and, as a result, it's not properly taught. The research is focused on determining the students' current level of understanding regarding the positioning concept and on identifying possible solutions for the future.

Keywords: marketing, positioning, marketing research.

Cod JEL: M3

Ideas on positioning

The word "positioning" was used for the first time by two advertising executives, Al Ries and Jack Trout, in their "1969 articles published in "Industrial Marketing" and "Advertising Age""504. "Positioning is the act of designing the company's offering and image to occupy a distinctive place in the mind of the target market. A good brand positioning helps guide marketing strategy by clarifying the brand's essence. The result of positioning is the successful creation of a "customer-focused value proposition", a cogent reason why the target market should consider buying the product"505.

There are still many unclear aspects about the concept of positioning. The first problem is where to fit this concept in the marketing process as a whole. In my opinion, positioning should have its place between marketing research, with its results of segmentation and targeting, and marketing mix design. Nowadays, there are still too many companies which go straight from identifying the need to marketing mix, without taking into account and choosing from the number of positioning alternatives. This situation of "no positioning" is the worst possible.

The second problem derives from the first: what role does positioning fulfill in the marketing process? I believe that positioning has the role of coordinating the company's marketing policy. We can break the marketing process into four stages:

- the research stage: the company gathers all the necessary information related to the general environment, the market and its competitors;
- the positioning stage: after analyzing the above data, the company must select a position that offers the best chance of success on the market, but also a position it can support with its strong points;
- the marketing mix stage: upon choosing the desired position, the company's task is to communicate it through all the components of the marketing mix. The company's brand cannot occupy the desired position unless the four components of the marketing mix converge to the same image;
- the implementation stage: this stage can determine the success or failure of the above program, because process management errors can result in seriously damaging marketing mistakes.

Consumers usually choose products/services that offer them the greatest perceived value. The brand's **value proposition** refers to the full set of benefits upon which the product/service is positioned. There are many value propositions upon which a company could position its products. However, there are only five winning value propositions, that is positioning that gives the company competitive advantage. These **5 winning positioning alternatives** are:

- 1) **More for more**. This alternative involves providing superior quality, craftsmanship, durability, performance or style and charging a higher price to cover the higher costs. The strong point of this alternative is that it symbolizes status, thus giving prestige to the buyer. Yet, this alternative is vulnerable to imitations and economic downturns.
- 2) **More for the same**. This alternative is aimed at attacking the more-for-more positioning. If applied correctly, this alternative can be highly successful.

⁵⁰⁴ Enis, Ben, Cox, Keith - "Marketing classics: a selection of influential articles", Ed. Allyn and Bacon Inc., S.U.A., 1988.

⁵⁰⁵ Kotler, Philip, Keller, Kevin – "Marketing management", Pearson Prentice Hall, Upper Saddle River, New Jersey, 2006, page 310.

- 3) **The same for less**. This can be a very powerful alternative, building its success on the fact that everyone likes striking a good deal. This alternative is also applied when companies develop imitative and lower-priced brands in order to steal market share from the leader.
- 4) **Less for much less**. This alternative is built upon the idea that not everyone can afford only the best in what they buy. Many consumers will settle for a product/service that offers less and as a result costs less. One of the risks involved in applying this alternative is going beyond the lowest level of quality and performance acceptable for the consumer. A second risk appears when this alternative is used by two or more companies on the same market, which can lead to price wars.
- 5) **More for less**. If possible to achieve, this would no doubt be the winning positioning alternative. In the short run this is actually possible, but in the long run companies will find it very difficult to deliver on both of these promises. As offering more usually costs more, sooner or later companies must decide if they want to compete primarily on "more" or on "less".

Each brand must choose the positioning alternative that best serves the needs and wants of its target market. In any market, there is always room for many different brands, each successfully occupying different positions.

Once a company has selected its desired brand positioning, there is still a long way to go. There are still four marketing mix components to be harmonized, which is always a difficult task. "Thus, a firm that seizes on a more-for-more position knows that it must produce high-quality products, charge a high price, distribute through high-quality dealers, and advertise in high-quality media. It must hire and train more service people, find retailers who have a good reputation for service, and develop sales and advertising messages that broadcast its superior service. This is the only way to build a consistent and believable more-for-more position"506. Moreover, there is still the implementation stage, a never-ending battle for market supremacy. Yet all the upcoming battles are half-won if the obtained brand positioning provides a solid foundation.

The research and its findings

Positioning is a very important marketing concept. This is probably an idea that needs no more reasoning. Enough of a reason should be the very important part positioning plays in the strategic marketing planning process. If positioning is such an important concept, it should be taught in one of the marketing faculty's courses. No student should graduate the first 3 year cycle without knowing the fundamentals of this concept: the meaning of positioning, what is a positioning map, which is the positioning's place in the strategic marketing planning process. Unfortunately, at the moment positioning is barely mentioned in the introductory marketing course, and it enjoys a few other sporadic appearances throughout the core marketing courses. Having in mind the purpose of advocating for a distinct place for positioning in the marketing faculty's syllabus, we've set up the following marketing research, which should provide us with all the necessary reasons.

In order to guarantee the validity of our findings, we chose a full research. Thus, all the 3rd year students were asked to fill in a questionnaire regarding the positioning concept. The following results were just a confirmation of our previous assumptions.

Our first objective was to see whether or not the students know the meaning of positioning. Obviously, if all the student would know what positioning means, there would be no need for further study regarding this concept. Thus, we discovered that only 26% of the students don't know the meaning of positioning. We believe this result to be encouraging, having in mind that a solid 74% are familiar with the concept. Still, the results show us the need for a more profound study regarding positioning.

Our second objective was to find whether or not the students know what is a positioning map. Besides knowing what positioning means, another fundamental issue is knowing how to measure this concept. The results are surprising, to say the least. Thus, we discovered that 85% of the students know what is a positioning map. Is it possible for someone to know how to measure a concept, without knowing what that concept means? This is a paradox which will surely disappear when the students will undertake a thorough study on this concept.

The third objective was to find whether or not the students know which is the positioning's place in the strategic marketing planning process. If a student knows what a concept means, how to measure it, and where to insert it in the general theory, there is no need to further study that concept. Unfortunately, the results are disastrous. Only 20% of the students know the correct answer to this question. This result is a more than enough reason to accept the need for a distinct place for positioning in the marketing faculty's syllabus.

In the end, we wanted to see whether or not the students themselves perceive the need to further study this concept. In other words, we wanted to know if there would be a "market" for a course on positioning. Thus, we discovered that only 7% of the students think they don't need further training on this subject. 48% of the students want to know more about positioning, by making it a chapter in the marketing introductory course. The rest of 45% believe that the presence of a "Positioning" course in the marketing faculty's syllabus is highly desirable.

Based on this research, it's easy to conclude that there is a need to further study the concept of positioning. It is our belief that this need would be best addressed by a "Positioning" course at the masters level.

Spiru Haret University, Accounting and Finance Faculty, Rm. Vâlcea Rm. Vâlcea, str. G-ral Praporgescu, no. 22, tel. 0723279858

Before a company can proceed with marketing, it must first establish what markets and needs it wishes to serve.

Marketing is essential for any company seeking to take advantage of its

In the first stage, a company's task is to develop a global strategy which includes marketing strategy.

This paper starts from the importance of a good marketing communication strategy in the general activity of a company.

Key words: strategy, marketing communication, mission, budget, plan.

Starting from the role that marketing communication has in the activities throughout an organization there is necessary the marketing communication approaching from a strategic perspective.

In the context of strategic approach, of organization overall policy, the marketing strategy is an important component of it, and in the marketing strategy, the marketing communication is strategically approached.

From the studies presented by many authors, the strategy promotes coherence, consensus and continuity of communication approaches.

The Romanian Marketing school had an important role in developing the concepts of strategy and strategic marketing too. Teacher Constantin Florescu said that "marketing strategy designate lines defining the attitude and business conduct in order to achieve certain objectives. How to implement the strategy is the field of marketing tactics. It involves practical actions by which the undertaking in its potential, while adapting to the concrete conditions of the market, so that, step by step to move towards the strategic objectives that it has proposed."

Olteanu Valerica states that "marketing strategy defines the firm attitude towards the environment and its behavior in relation to its components".

Following the concept of development strategy in general and in marketing strategy, in particular, becomes necessary to explain the concept of strategic marketing. In literature there are many definitions that try to explain what it means and what strategic marketing deals. When referring to literature in the field of marketing, but also that of management was a strong resemblance to present concepts of strategy, strategic planning, strategic marketing and strategic management.

The two concepts, strategic marketing and strategic management gather several important components: the enterprise mission, business strategy, positioning the product (service), competition analysis.

Thus, in the book "Management" by O. Verboncu I. Niculescu strategy is defined as" all major objectives of the organization for long term, the main ways of achieving, together with the resources allocated to achieve competitive advantage under the organization mission".

If in this definition we replace the word strategy with "strategic marketing" we can say that it represents an approach of the long term, a component of modern management-oriented to the market. The setting of objectives, the mission and strategies to obtain competitive advantage represent the strategic stages of the approach under consideration by an enterprise.

Due to the interference of the two sciences, marketing and management, it has been possible the occurrence of a new concept, management – marketing, seen as "an interdisciplinary scientific field, theoretical foundation of the company's effective integration into the environment (external) ". This new concept, developed in the Romanian School of Marketing, demonstrates concerning for understanding and explaining the concepts of marketing and management, which creates a valuable scientific basis for those wishing to expand in these areas.

Marketing communication has to be regarded as an essential component in a company. We are witnesses at evolution in sense of increasing marketing communications role and its contribution in achieving the goals the companies proposes in their work.

Taking into account what we have presented, we can say that today: marketing communication is a fundamental dimension of the mechanism of operation of the organization.

In the way of background strategy marketing communication it must be taken into account the overall strategy of the organization and to take account of major strategic decisions which have the following:

- -Long-term orientation of the organization;
- -defining scope of work of the organization;
- -linking activities with the environment in which it operates;
- -linking activities with the resources it has available.

All items listed above represent fundamental options for the company for a period that can range from 5 to 10 years; they define the organization's overall strategy. They are designed to follow the competitive advantage of the company for long term and comes to the general management education.

As the basic responsibilities of management education, we mention:

- defining the organization mission;
- formulation of the fundamental objectives of the organization;
- determining the structure of portfolio activity;
- identify strategies to ensure achievement of the objectives;
- allocation of the resources required for implementing the strategies.

Defining the organization mission is a first phase of strategic planning that starts with establishing the mission, define the scope of activity that it will work, establishing strategic business unit and the general setting. Strategic vision will be reflected in all stages of strategic planning; through it the company is oriented to the market.

It should be noted that this step is part of the strategic planning-oriented market that is set at corporate level.

Defining the mission is a difficult task for management, because the goal involves determining what to do and what to become and where it wants to reach. In this regard, Peter Drucker outlined: "... A business is defined by the need that a customer satisfies when buying a good or a service. Satisfying the customer is the mission and purpose of any business."

As a result, a mission should be oriented to the market, to the consumers' needs.

Therefore, the mission must state:

- -products / services, the company will achieve;
- -consumer groups concerned;
- -these consumers' needs.

If the mission is not clearly defined from the start, then all the marketing planning process will suffer, couldn't be precisely determined the objectives, the strategies and the envisaged programs.

Defining mission involves consideration of four elements:

level of detail (width of the mission);

audience of the mission;

uniqueness mission;

market orientation of the mission.

Level of detail refers to the narrow or too wide of the mission, both of them not recommended because it leads to impaired activity of the enterprise. For example, a producer of natural juices, which states that its mission lies in providing refreshments for the whole market is obvious that he has too broadly defined its mission.

Audience of the mission refers to the category of persons to whom it is intended, namely the segment concerned. Here should be considered in addition to the enterprise customers the employees and the suppliers, which must be informed about the purpose and the role they can play in achieving it.

The uniqueness of the mission has the merit of achieving a higher differentiation in relation to other competitors, which will enable the company achieve a competitive advantage.

Market orientation reflects the mission of the whole strategic vision management, which allowed the inclusion of mission between the strategic marketing.

Philip Kotler believes that a mission should be defined by five distinct elements:

- -company history;
- -current preferences of the owners and of the management;
- -market situation;
- -organization resources;
- -specific capabilities of the organization.

In terms of communication approach, once defined, the mission must be made known to all categories of the public who presents interest for the organization.

From the employees' point of view, it must be motivating, so that they adhere to the objectives of the organization and have the feeling that their work is important and useful for the life of their fellows.

The formulation of the fundamental objectives of the organization is based on the mission the organization has made, taking into account the analysis of internal and external environment in which it operates. The objectives are set by the superior management and take into account all activities of the organization.

In terms of content they are divided into two categories: economic ones and social ones.

The economic objectives take into account the profit, turnover, level of dividends, the value of the shares.

The social objectives follow: the relationship with the organization's employees, the use of clean technologies, asserts an attitude that demonstrates a developed civic spirit, the assumption of social responsibilities.

Establishing the general marketing envisaged to be tracked down in a way that it will help to achieve the mission. As such, they must meet certain requirements: acceptability, flexibility, measure, staff motivation, clarity, feasibility and compatibility.

Establishing the structure of portfolio of activities. If the mission is focused on customers, then it becomes necessary to define the scope of its activity. Definition can be made in a broad sense, it is recommended that the definition of the scope of activity to be made taking into account both alternatives to avoid ignoring some advantages that would exist throughout the industry and to avoid any confusion due to the too vague scope of the work

An enterprise may carry on its activity in one area or in several related fields.

After an enterprise successfully succeeded in defining its field of activity, it must also evaluate their activities to allocate resources to the profitable ones and to discard the less profitable ones. This can be done by defining strategic business units.

Defining strategic business unit (USA) is closely linked to defining the scope of activity of the enterprise. The concept of strategic business unit was first used by General Electric, which has developed a method of analyzing the portfolio of activities (products) of the company. U.S.A. designates "a separate business within the company who has its own group of competitors and can be managed relatively independently of other business of the company.

Hence, we can deduce that U.S.A. is a distinct activity with its own mission, which is derived from the general objectives and specific strategies. It has its own competitors, and thus it acts on a target market of its own.

Kotler notes that U.S.A. may be a division, product line or even a single product or brand of the company.

Concluding, a U.S.A. may have the following three characteristics:

- is an individual or group of related activities that can be planned separately from the rest of the company;
- has its own competitors;

-has a leader responsible for planning and obtaining profits, which controls the majority of the factors, determining profitability.

Therefore, identification of strategic business units has a major importance for the enterprise, enabling them to develop its strategic plans for each unit separately.

Another issue that is related to the U.S.A. refers to the importance of appropriate allocation of resources to each activity. Some of these activities can be expanded, others maintained or even eliminated depending on their profitability or non-profitability. But those decisions may be taken only after the relevant assessment, using a series of analytical methods known in the literature as methods of analysis of the portfolio of business enterprise. The role of the portfolio analysis is to identify and exploit the competitive advantage in the market segment targeted. The best known models of analysis are: the Boston Consulting Group (BCG matrix), the General Electric (McKinsey), the Arthur D. Little.

The fourth phase of strategic marketing planning is to materialize marketing strategy in marketing programs, aiming at implementation and then, fixing a budget, finalizing with the analysis and control of all marketing activities.

The stage of resource allocation and control of the marketing program starts with a marketing program, a marketing tool that presents practical methods for implementing the chosen strategies. Another important step is determining the size of marketing budget, which is broken down for different areas: business market research, advertising, sales promotion, direct marketing, promotional events, distribution, and the months or quarters of a year. The budget should be made for each market segment taken into account, in accordance with the strategy chosen, being determined according to the developed marketing program. The marketing budget should include a statement of revenue, which specify the sales forecast, and planned expenditures related to costs of production and marketing (promotional activities, distribution, etc.)...

In determining the size of the budget, there are used various methods, starting with the empirical ones and by using computer programs.

Marketing strategies are transposing into marketing programs for each component of the marketing mix, aiming to describe tactics used by the company to achieve objectives.

Philip Kotler states that an effective marketing program should combine the elements of marketing mix in a program designed to achieve marketing objectives of the firm. Concretely, the marketing must include routes for product, price, distribution, promotion; which will be used by the company to meet the target.

Marketing programs or programs of action refers to the concrete action for the strategy to be implemented. They indicate:

- -what will be done?
- -when will be done?
- -who is responsible?
- -how much will it cost?

The marketing should describe the activities to be undertaken, their sequence, duration, and responsible persons for each activity. The marketing program is part of the marketing plan. The enterprise periodically organizes a marketing plan, which will coordinate its work and more action programs, which will describe the concrete implementation of the strategy.

A marketing plan established for a period of three months, six months or a year shall be known as a tactical plan, while a strategic plan has an average duration of 2-3 years or 5 years long.

The relationship between the marketing and strategic marketing plan can be highlighted through the objectives of the program, supporting the objectives of the strategic plan. Specifically, the contribution of marketing in the process of global strategic planning, follows the following aspects:

- definition and mission support organization
- -analysis of the environment in which the organization acts;
- -defining the organization's overall image;
- evaluating the attractiveness of different industries.

In process of background communication strategy marketing it should be started from its importance in the strategic planning process. In developing this strategy it must be taken into account the complexity, hence the need for a strategic approach, in the global policy. The period for which this strategy is determined is from three to five years and must take into account in strategy background:

global image and overall message to be sent;

main lines of action;

the possibility to decline the general message according to main directions of action so as to maintain consistency of the specific messages that will contribute to global image. Marketing communications largely contribute to the formation of the organization's overall image. Taking into consideration the image corresponding to objective reality of the organization, specialists make the desired image, which corresponds to the way in which the organization wants to be perceived by the public. This strategy is the subject of communication. Implementing the strategy issued leads to the run picture. When communication strategy is put in place well, the picture should be circulated to coincide with the desired image. Besides your formal nature, in practice the organization may give some messages that are often in conflict with the desired image and can seriously harm the image of the organization.

Information which comes from different types of public the organization comes into contact: suppliers, distributors, customers, and competitors, they expressing favorable or less favorable opinions to the organization.

As a result of the intervention of factors which has lost the sight or the company can not control, often the image made is different to the desired image, so it will act so that the image formed to match the most desired image, counteracting the informal messages that may negatively influence the formed image, taking away from the desired image.

In order to create and strengthen the image specialists have the components of communication capital: manufactured products, marketed brands, identity, vocation, enterprise culture.

The overall design strategy is extremely complex.

In substantiation of this process is started by setting the coordinates to the image desired by the global organization. Basic features of the image of the organization should consider the following:

- -be simple:
- be understood by all the concerned public;
- express reality;
- -answer to the public's expectations.

In order to obtain maximum efficiency of a communication approach there must be considered the following characteristics: specificity, comparability, communicability, reliability, feasibility and profitability.

An important step in that the global communications strategy for marketing is analyzing the current situation of the organization. At this stage there are analyzed:

- -The real situation (material resources, organization projects, the way of organization, communication with employees);
- -Macro-environment in which the organization operates;
- -Commercial context and relations with customers;
- -Relationships with suppliers and distributors;
- -The financial environments
- -Relations with public opinion
- -Current and previous communication;
- -Competitors.

After the stage of analysis was finished, it goes to the next stage, the evaluation of the desired image through results, which will be held traits characterized by attraction, credibility and corresponding to strategic guidelines of the company.

The fourth stage is the formulation of communicational objectives approach, by creating a strong identity to the organization, conferring legitimacy to organization options, emphasizing a specific image.

Final step is making the best strategic options.

Thus it can choose between several strategic alternatives, depending on the overall picture:

- -Commercial communication strategy which is choosen when the image is meant to coincide with the overall business;
- -Corporate communication strategy the company chooses for when they want the overall image to coincide with the corporate one;
- -Joint communication strategy that involves the combination of the two types of strategies, the commercial and the corporate ones.

In case of commercial communication, depending on the subject of communication, there appear as strategic options:

- -communication strategy with the sole object adopted by organizations that produce a single product. There are exceptions in the case of companies which opt for either a star product or for a single one.
- -communication strategy with multiple object used by organizations that produce multiple products and want the communicational message to be built as in center having at least two of them.

In case of corporate communications, depending on the target, we have:

- communication strategy with a single target which is used by organizations interested in one category of public.
- communication strategy with multiple target which is preferred by organizations that cover more categories of public.

In conclusion communication strategy aims to ensure coherence of approaches such as communication, the ultimate goal being that no messages will be disseminated to distort the overall picture, it is as close as possible to the desired one.

The European Parliament is made up of the representatives of the European Union member state peoples. Any citizen of a member state has the right to vote and be elected a European member of Parliament in the European Union country where he resides, for which reason he is considered an European citizen. The election of the representatives of the European Parliament is governed, in each member state, by the national legal norms. The legislative regulations in the promotion techniques field used in the political marketing are ample and varied, covering a wide range of actions or inactions which can be implemented by the political actors in their electoral "fight". The legal restrictions grant the guarantee of a fair electoral competition in order to elect the persons wanted by the Romanian electorate for the European member of Parliament mandate.

Keywords: legal norms, promotion techniques, political marketing, European Parliament elections.

JEL classification: K (Law and Economics)

At art. 38 related to the right to be elected in the European Parliament, the Romanian Constitution stipulates: under the conditions of the accession of Romania to the European Union, the Romanian citizens have the right to elect and be elected in the European Parliament.

1. The European Parliament and the Europarliament elections

The European Parliament has appeared by means of the institutive Treaties. Through the Resolution of 20 March 1958, the three similar institutions have been reunited in the European Parliament Assembly, which has produced its effects starting 1960.⁵⁰⁷ Through the resolution of the European Parliament Assembly of 30 March 1962, the name European Parliament has been established, which also exists nowadays.

The European Parliament is made up of the representatives of the European Union member state peoples.508 The representatives of the peoples thus form an organism which represents not one people but a plurality of peoples (made up of all the citizens of the European Union considered collectively).⁵⁰⁹

Any citizen of a member state has the right to vote and be elected a European member of Parliament in the European Union country where he resides, for which reason he is considered an European citizen. The election of the representatives for the European Parliament is governed, in each member state, by the national legal norms. At present, the president of the Parliament is Joseph Borrell Fontalles (from 2004 to 2009). 511

Under the conditions of the accession of Romania to the European Union, the citizens of the Union who meet the requirements of the organic law have the right to elect and be elected in the public administration authorities.⁵¹²

2. Legal conditions regarding the usage of promotion techniques in the Europarliament campaign

The electoral campaign is considered to be that period of time during which the electoral competitors develop propaganda activities in order to determine the electors to express their votes in their favour. ⁵¹³ The electoral campaign starts when the election date is made public, and ends 2 days before the voting day. Voting starts on reference day 7 June 2009, 7,00 o'clock. Voting also ends on reference day 7 June 2009, 21,00 o'clock; the electors who at 21,00 o'clock are in the room where it is voted, can express their right to vote.

⁵¹² Romanian Constitution (Republished in Monitorul Oficial no. 767 of 31. 10.2003), Art. 16 alin. 4.

⁵¹³ Potincu, C.: Ethical Aspects Related to the Political Marketing. in Proceedings of the 4th Edition of the International Scientific Conference: European Integration – New Challenges for the Romanian Economy, May 30-31, 2008, Oradea pp. 1100-1101.

The reference day of the Europarliament elections is established and made public by the Government, by decision, at least 90 days before. The reference day is established within the period decided upon with this purpose by the European Union Council. 514

Decision no. 217 of 04.03.2009 regarding the approval of the Calendar schedule of the action to be taken for electing the Romanian members in the European Parliament in 2009 approves of this calendar schedule provided in its annex, annex which is part of the decision.

During the electoral campaign, the candidates, parties and political formations, citizens, including all social organizations have the right to express their opinions freely and with no discrimination, by means of meetings, assemblies and mass information means. But in order for the means used and actions developed to be legal, they must be compliant with the rightful order.⁵¹⁵

The establishment of the timetable for the electoral campaign and the distribution of the allocated broadcasting time for the access of the political parties, political alliances and independent candidates to the public radio and television services are made after the candidatures have been confirmed.⁵¹⁶

The electoral campaign consists in an open competition, regulated by legal norms between the candidates proposed by the parties and alliances in elections for gaining the suffrages of the electorate. It is one of the key-moments of the electoral competition.⁵¹⁷

Under the conditions of expressing the political pluralism and competition between parties and candidates, the free and periodical elections are the defining element of the modern democratic system. By means of this mechanism, the democratic societies periodically elect their political leaders, or can replace them by means of non-violent procedures.

The elections take place within a well-defined framework of rules and procedures referring to all stages and operations which this process must cover, from the preliminary political conditions to the technical procedures for awarding mandates and validation of the election results. These rules and regulations are codified in a package of legislative and procedural regulations called electoral system.

The electoral systems are the ensemble of norms and procedures defining the conditions which must be met by a citizen, in order for him to be able to express his fundamental political rights, the right to elect and be elected, the guarantees which he must grant the authorities for the correct development of the elections, rules of correct organization and development of elections, rules of practical organization and development of the poll, as well as the principles and mechanisms for awarding the mandates further to the elections.⁵¹⁸

During the electoral campaign, the candidates shall benefit from the constitutional stipulations regarding the freedom of speech. Thus, art. 30 of the Romanian Constitution stipulates that the freedom of expressing one's thoughts, opinions or beliefs, and the freedom of creations of any kind, orally, in writing, by means of images, sounds or other means of public communication, are inviolable, and the censure of any kind is forbidden. Moreover, the freedom of speech cannot prejudice the dignity, honour, private life of the person or right to his own image. But these legally protected rights have also limits, the defamation of the country and nation, the urge to aggression war, national, racial, class or religious hatred, the instigation to discrimination, the territorial separatism or public violence, as well as the obscene manifestations, contrary to good faith being forbidden by the law.

We will proceed to the constitutional regulation of the right to information in art. 31. Thus, the mass, public and private information means must provide the correct information of the public opinion. The public radio and television services are autonomous. They must grant these services to the important social and political groups. We will reach the organic regulation of the audiovisual. At art. 3, law no. 504 of 11 July 2002 of the audiovisual establishes that, by means of broadcasting and retransmitting the programme services, the political pluralism is achieved and ensured, while observing the fundamental liberties and rights of the human being. All providers of audiovisual media services are obliged to provide the objective information of the public by correctly presenting the facts and events, and to favour the free formation of opinions. In this field, an important role is played by the National Audiovisual Council, which is the autonomous public authority, under parliament control, guarantor of the public interest in the audiovisual communication field.

Art. 26¹ of Law no. 504/2002 encourages and facilitates the pluralist expression of the currents of opinion, the broadcasters are obliged to reflect the electoral campaigns in an equitable, balanced and impartial manner. For the correct application of the previous provisions, the Council issues obligatory norms, controls the observance of the legal stipulations and issued norms, and sanctions their violation. Thus, the Code for the regulation of the audiovisual content adopted by the NAC in 2006 establishes the provision of correct information and pluralism in

⁵¹⁹ Published in Monitorul Oficial no. 534 of 22.07.2002.

Title IV. Art. 71 provides that within the news and debate programmes the information referring to issues of public, political, economic, social and cultural interest must comply with the following principles:

- 1. Provide the impartiality, balance and favour of the free formation of opinions, by presenting the main opposing points of view, during the period in which the issues are in public debate;
- 2. Provide a clear distinction between the presented facts and opinions;
- 3. Avoid any forms of discrimination related to race, ethnicity, religion, nationality, sex, sexual orientation or age. Presenting the main opposing points of view is usually ensured within the same show or exceptionally in the next shows; in case those required refuse to mention their point of view, this shall be mentioned on TV or radio.

In the news programmes, including sports news, out of the total time dedicated to the expression of politicians, the broadcasters shall allocate 60% to the representatives of the power, and 40% to the parliament opposition, independent members of parliament and non-parliament political parties, as well as their local representatives. The number of the power and opposition representatives who take part in debate shows, must be equal.

For the purpose of correct information and free formation of opinions, the broadcasters shall take into account the weight of the parliament parties and the importance of the issues in debate.

Section 5 of the Code for the regulation of the audiovisual content adopted by the NAC in 2006 deals with the political publicity and publicity referring to the practice of various professions. Thus, art. 155 establishes that, in the sense of this code, the publicity videos promoting a party, politician or political message is considered political publicity. This act completes this type of publicity with the interdiction of the political publicity, except for the electoral campaign periods.

Law no. 33 of 16 January 2007 regarding the organization and development of the elections for the European Parliament⁵²⁰ transposes the Council Directive no. 93/109/CE of 6 December 1993 which establishes the conditions of exerting the right to vote and to candidate in the European Parliament elections by the European Union citizens residing in a member state whose citizenship they do not possess,⁵²¹ and the Act of 1976 referring to the election of the European Parliament members, by means of direct universal vote,⁵²² with the subsequent modifications.

Art. 1. of this law establishes the general legal framework for organizing and developing the election of the Romanian members in the European Parliament. The Romanian members in the European Parliament are elected by universal, equal, direct, secret and freely expressed vote, according to the law. The mandate of the Romanian members in the European Parliament is of 5 years.

The modifications of Emergency Ordinance no. 11 of 25.02.2009 for the modification and completion of Law no. 33/2007 referring to the organization and development of the European Parliament elections must also be taken into account.

The purpose of this modification is the need to provide a correct and transparent electoral process taking into account the deficiencies found in the process of applying the dispositions of Law no. 33/2007 referring to the organization and development of the European Parliament elections, with its subsequent modifications and additions; all these aim at the public interest and are an extraordinary situation whose regulation cannot be postponed.

By "resortisant" elector, Law no. 33/2007 means any citizen of Romania, having his domicile or residence in Romania or abroad, who has the right to elect the Romanian members in the European Parliament.

During the electoral period, in case opinion surveys with electoral content are presented, according to Law no. 33/2007, these must be accompanied by the following information: name of the institution which made the survey; date or period of time during which the survey was made and the used methodology; size of the sample and maximum error margin; who requested and who paid for the survey.

The television vote or inquiries made in the street among the electorate must not be presented as representative for the public opinion or for a certain social or ethnical group.

48 hours before the reference day (7 June 2009), it is forbidden to present opinion surveys, television votes or inquiries made in the street.

Exit opinion surveys can be conducted by the public opinion surveying institutes of commercial companies or non-governmental organizations who are entitled to conduct opinion surveys and which are accredited by the Central Electoral Office, by decision, with this purpose. Their survey operators have access, based on the accreditation of the institution for which they work, to the voting station protection area, without having access inside the voting station.

On the voting day, it is forbidden to present exit surveys, before the voting has ended.

The political parties, political alliances, electoral alliances, citizen organizations belonging to the national minorities taking part in the elections, as well as the independent candidates are obliged to ask, until the date their candidatures have been confirmed, the management of the public radio and television services, for the granting of allocated broadcasting time. The requests made after this deadline are not taken into account.

⁵²⁰ Published in Monitorul Oficial no. 28 of 16.01.2007.

⁵²¹ Published in European Comunities Oficial Jurnal no. L 329 of 30.12.1993.

⁵²² Published in European Comunities Oficial Jurnal no. L 278 of 8.10.1976.

The access of political parties, political alliances, electoral alliances and citizens' organizations belonging to national minorities taking part in elections, as well as independent candidates to the public radio and television services is free of charge. The private radio and television channels shall apply the same tariff per show and time for all political parties, political alliances, electoral alliances and citizens' organizations belonging to national minorities taking part in elections, and the allocated broadcasting time offered to them must be proportional with those practised by the public channels. The failure to observe the provisions of this alignment by the private radio and television channels entails their sanctioning. The sanctions are established by decisions of the National Audiovisual Council.

It is forbidden to include electoral publicity videos in other shows than the electoral shows.

The electoral propaganda activities cannot affect in any way the green areas, natural reservations and ecologically protected areas.

The following deeds are contraventions and are sanctioned with fines between 1,000 RON to 2,500 RON:

- 1. Destroying, deteriorating, dirtying, covering by writing or any other way of the displayed programme-platforms or any other posters or printed electoral propaganda notices;
- 2. Wearing during voting by the members of the voting station electoral offices, persons in charge of security or accredited persons, escutcheons, badges or any other electoral propaganda signs.

Moreover, promising, offering or giving money, goods or any other gains in order to determine the elector to vote or not to vote for a certain list of candidates or a certain independent candidate, as well as their being received by the elector, for the same purpose, are offences and are punished with prison from 6 months to 5 years. The attempt to these deeds is punished.

3. Conclusions

As resulted from the title of the work, the role of the legal norms adopted at internal and European level is to establish certain limits in developing the electoral "fight" for the positions distributed to Romania in the European Parliament.

The internal regulations of the legal framework regarding the European Parliament elections are harmonized with the normative acts in this field. These community normative acts establish the guidelines of the elections for the positions distributed to the Member States in the European Parliament. These internal legal regulations are called electoral system and include the ensemble of rules and procedures regarding all stages and operations which must be achieved by the political actors, from the preliminary political conditions to the technical procedures used to award mandates and validate the election results.

The study deals with the existing Romanian legislation in the field of promotion techniques used in the political marketing. The promotion techniques used by the political actors during the electoral campaign are restricted by legal norms transposing elementary ethical norms at the legislative level.

As for the freedom of speech of the candidates during the electoral campaign, the legal restrictions protect it against any censure. However, the legal restrictions also action contrarily. Thus, the exertion of the freedom of speech cannot prejudice the dignity, honour, private life of the person, or right to one's own image; it cannot libel the country or nation; it cannot instigate to aggression war, national, racial, class or religious hatred; it cannot instigate to discrimination, territorial separatism or public violence; it cannot have obscene expressions, contrary to good faith.

As for the right to information of the electorate, the public and private mass information means must provide the correct information of the public opinion. In order to achieve this objective, the National Audiovisual Council benefits by an ample legislation.

The legal interdiction of the electoral publicity videos in other shows than the electoral shows is interesting. This is a limitation of the usage of electoral publicity videos, instruments used by the political actors during the electoral campaign.

The legislative restrictions in this field interfere with the environmental legislative provisions. Thus, the electoral propaganda activities cannot affect in any way the green areas, natural reservations and ecologically protected areas

The legislative restrictions refer to doing deeds of reduced or increased gravity, i.e. contraventions or offences.

Contraventions are the following deeds: destroying, deteriorating, dirying, covering by writing or any other way the displayed programme-platforms or any other posters or printed electoral propaganda notices; wearing during voting by the members of the voting station electoral offices, persons in charge of security or accredited persons, escutcheons, badges or any other electoral propaganda signs.

Offences are the following deeds: promising, offering or giving money, goods or any other gains in order to determine the elector to vote or not to vote for a certain list of candidates or a certain independent candidate, as well as their being received by the elector, for the same purpose.

As it can easily be noticed, the legislative regulations in the field of promotion techniques used in the political marketing are ample and various, covering the entire range of actions or inactions which can be committed by the political actors in their electoral "fight". Thus, a much needed legal protection is created in using these promotion

techniques. The legal regulations grant the guarantee of a fair electoral competition for the election of the persons wanted by the Romanian electorate for the European Parliament member mandate.

PROMOTION STRATEGIES FOR HEALTH-CARE SERVICES

Radoviciu Ruxandra

University "1 Decembrie 1918" of Alba Iulia Faculty of science Alba Iulia, Nicolae Iorga No.11-13 e-mail: ruxandra rdvc@yahoo.com Tel: 0724308546

Stremtan Filimon

University "I Decembrie 1918" of Alba Iulia Faculty of science Alba Iulia, Nicolae Iorga No.11-13 e mail: filimon stremtan@yahoo.com Tel: 0766109615

The paper approaches the main promotion strategies used by companies that provide health-care services. The promotion represents all the efforts of an enterprise to positively influence the buyers' opinion regarding the products and/or services that are traded at a given time, this being its main objective. The strategies laid down in this paper refer to the services' quality, to the promotion of packages of health-care products and packages which target the employees. The closing of the paper makes a few recommendations that will surely contribute to a better functioning of the medical services at local and national level.

Keywords: strategy, promotion, communication, services;

JEL codes: M 310; M 370;

The recent joining to the European Union imposes the necessity to revise/change the way health-care services are approched. These services must identify the real needs of the population and to elaborate certain programs to ensure for the population equitable access to health-care services. From this point of view, it is necessary to group and highlight the promotion strategies for health-care services.

The promotion represents all the efforts of an enterprise to positively influence the buyers' opinion regarding the products and/or services that are traded at a given time, this being its main objective. In the health-care department this means promoting health-care services of quality, which a company from this area puts at the disposal of the population.

The promotion is efficient when it has the power to create the desire to acquire the services provided by a company, with the help of its techniques. For health-care services offered by the population with the purpose to control and improve their physical, mental and social health, promotion is the process that gives the possibility to know the services offered by a firm working in the health-care department.

The promotion for health-care services must comply with the following conditions:

To supply information – a company providing health-care services must inform the population about its existence, about the services it provides and the benefits earned by a client as a result of purchasing a certain service. For example, in the case of a medical clinic endowed with a laboratory, when health problems are discovered for a patient, the clinic can add to the results of the medical tests a list with the main specialists from that area, and if the patient wants to get different opinions from more specialists from the same clinic, then he receives a discount.

To influence public behaviour – designing information campaigns about the negative consequences that tobacco, alcohol and prescription drugs consumption can have;

To remind - clients must be reminded about the advantages of purchasing the services offered by a medical clinic, in order to prevent them from changing their preferences;

Neutralizing unfavourable information – the measure is necessary for the cases when rumours with a negative impact over the clinic's image are launched;

Differentiating services – it occurs because of the existence on the market of many private clinics that provide to the potential clients similar packages of products. The content of these packages and their costs can't be known by the future clients, unless promotion campaigns are launched in order to attract the clients to a certain clinic.

To support an efficient promotion, a well defined communication system intervenes in order to help the health-care providing companies to achieve the marketing and general objectives. An efficient communication imposes the creation of a long-term relationship between client and company, creating the image of the organization which gets involved actively in the citizen's life, informing them about the fact the company honours its promises.

The promotion strategies for heath-care services are based on the use of various communication channels. They can be grouped in two major categories: personal channels of communication and impersonal channels of communication.

The personal channels of communication imply a direct dialog between two or more persons. This type of communication can be achieved through the following methods: face to face communication; phone conversation; communicating by mail; communicating on an Internet forum.

The elements of direct communication for the health-care services' promotion can be illustrated as follows:

Face to face communication – the employees of the health-care provider offer information to the clients regarding the existence of a new headquarter, closer to the client's home, as well as the introduction of a new service;

Communicating by phone – the company's employees should phone clients to communicate them the possible changes or cancellations of their schedule; this type of communication is often used to facilitate the patients' appointments;

Communicating by mail – at the request of the client or of the family doctor, the firm can send the results of the medical investigations by mail, the company can also send brochures and pamphlets to family doctors;

Communicating on an Internet forum – the new services and the price changes can be announced through this channel.

The impersonal channels of communication are characterized by the possibility to send messages without a personal contact and without a personal communication. The main mass communication channels are included in this category, such as the printed media – newspapers, magazines; the broadcasting media – radio, television; the on-line media – e-mail, web sites. Advertising is a form of paid impersonal communication, which uses elements specific to mass communication with the purpose to send a message to a large, dispersed audience, with the intent to inform about the services provided by a company in the health-care department.

The advertising's objectives for health-care services are:

- informing the potential clients about the services the company provides;
- bringing awareness about the risks a person is subjected to when he or she is avoiding to go in time to the doctor;
- promoting additional services, such as going to the person's home for medical tests and/or giving medical treatments if the person can't go to the firm to receive it;
 - promoting services of home care;
 - informing the public about shows on various medical subjects;
 - informing the public about the chance to do specialized investigations with state of the art equipment;
- informing the public about the chance to see specialists from the town of residence or especially brought to the clinic from all over the country;
 - promoting discounts and/or gratuitousness for people with low incomes;

The most used forms of advertising in the health-care department are:

- Informative advertising –is recommended if the company introduces a new type of service on the market;
- Persuasive advertising used to attract clients;
- Advertising to remind used to keep alive the clients' interest;
- Advertising directed towards the professional and business environments is used when the health-care providers want to sign a contract for the employees of a firm to benefit from certain services at regular periods of time;
- Advertising directed towards the consumers is used if a network of health-care provider exists. The targeted client is the one who is informed about the services' separation within the network (the client is informed in which clinic belonging to the network he can receive services as IRM, pneumology, neurology, laboratory, etc);
- Depending on the size and importance of the health-care provider, advertising can have different levels of geographical spreading, from local to international advertising.

The advertising used by a firm in the health-care department is done with the help of the following communication channel:

Newspapers – insure a good local level covering, but don't provide high quality in sending the messages;

Magazines – cover a larger geographical area; the quality of colours, images and texts insure a bigger impact when reading the message;

Television – through the combination of sound and motion it turns to the audience's senses;

Radio – a passing exposure with a low level of attention;

E-mail – a high control of the sent messages; a high degree of personalization;

Web sites – on-line commercials on various sites or informing about discounts, events, forums.

The following types of strategies can be differentiated depending on the media channel, the tender and the market's structure:

The tender is taken into account when structuring the strategies depends on the way the product is approached. The strategic options are:

the global product promotion strategy – of the medical services provided by health-care companies;

the strategy to promote distinct components by using means and messages specific for each component – promoting each service provided by a health-care company.

The market's structure generates three types of strategic options: concentrated, differentiated and non-differentiated.

The concentrated strategy is used when the company chooses a market segment to address to through the content of the promotional messages and the mean to communicate is chosen. For example, determining the osteoporosis level for women over 45 years old.

The differentiated strategy implies choosing two or more market segments considered as being the target segments for which are chosen the most efficient means of communication and the adequate messages. For example, hypertensive clients, children, etc.

The non-differentiated strategy – is used when the company conceives a promotional strategy that targets the irregular market. Is specific for services or organizations belonging to a local geographical area (private practices).

Promotional environments – depending on the supply at the disposal of the population, the health-care providing company must choose the most adequate promotional environments in order to send its messages. The content of the sent message, the targeted clients, the tender determine, for all the promotional environments, three strategic alternatives: intensive, exclusive and selective.

The intensive promotion strategy is centred upon the use of all the promotional channels and means. It is met and recommended for companies with a large range of services in a highly divided market.

The exclusive promotion strategy requires choosing and using a single promotional channel. This strategy is rarely used and almost only for individual practices.

The selective strategy takes into account the selection and use of only that promotional mean which insures the best way to send the advertising message for every targeted market segment.

The personnel play an important role because they differentiate and position the health-care provider on the market. The personnel insure a permanent contact between the provided services and the clients' needs. Through their behaviour, the clients influence the coming-back rate, thus contributing to their loyalty to the company. Depending on the frequency of the personnel-clients contacts, the personnel's role in promoting the services is: permanent, periodical, occasional, arbitrary. These roles divide the health-care personnel in the following categories: contractors, changers, with influence, isolated.

The contractors – insure the permanent contact between the health-care provider and the clients; it is actually the most representative health-care service. In this category are included the medical personnel (doctors, nurses).

The changers – are a category that has a regular contact with the client and helps at running the service. This category includes the registry personnel, the laboratory and radiology employees, etc.

The personnel with influence – rarely make a contact with the clients, but contribute to the good functioning of the medical services. The management personnel from different levels are included here.

The isolated – are a category that doesn't have contact with the client, but insure the necessary support to provide the services. The supply, maintenance, cleaning, cooking, etc employees are included here.

From all the personnel categories mentioned above, the most important are the "contractors" (doctors, nurses) because their training level, their behaviour, fairness and promptitude determine the way a health-care service's quality is perceived by the client.

In order to provide quality services, the strategies regarding different personnel categories from the health-care department start with the recruitment, selection and hiring of the best employees and then permanently training them. The life long learning of the personnel is mandatory for all the practice levels: general practitioners, specialists from local, regional or national organizations, and is achieved through programs of sustained medical training (classes, conferences, seminars, etc). Unlike doctors, the nurses are the biggest group of persons who provide health-care services. This requires them to have qualifications which include the ethical, cultural and professional standards; the latter will be improved and developed continuously within programs of sustained training.

The motivation represents another strategy regarding the health-care personnel. It is necessary to have a complex personnel evaluation system, so that there is a fair correlation between the performance evaluation and the awarding system. This evaluation system must determine employees to be aware of and to assess for themselves their activity, this way they will be motivated to improve their performances.

Another aspect with major implications for health-care services are the work teams. The strategy regarding the forming of the group must take into consideration the roles played by each person, depending on the complexity of the provided service (the specialization and the number of surgeons, anaesthetists, nurses, etc).

As in any area, in the health-care department communication holds a major place at a formal and at an informal level, on the inside and on the outside of the company. That's why the strategy to stimulate communication must contribute to serving the company's interests and to inform correctly the potential clients. The firm's management is responsible to create a favourable climate for the employees, but is also responsible for the climate in the entire company. The positive answers given by the clients are closely related to the existent climate.

Recommendations:

To inform the public better, the family doctors should create a data base with the patients at the level of the private practice. These data bases must include all the information about the patients' medical history (blood type, allergies, tests' results, predispositions to diseases, existent illnesses, etc.). This data base should become national and be available to be accessed in case of emergency by doctors in hospitals and clinics or even by ER services. The patient should also have access to the data base.

To consider the patient's free time and to avoid lines, the health-care providers should create a communication system (electronic, through the Internet) in order to take up on the requests made by them regarding the appointments, the vacations of the family doctors, as well as sending to the patients the results of the investigations by e-mail.

THE HORIZON OF DEVELOPINGTHE EGYPTIAN MARKETING TOURISM IN EU

Radwan Alaa El Din Hussien

Alaa El Din Hussien Radwan contact address: The Bucharest Academy of Economic Studies Doctoral School of Marketing Tache Ionescu Street, no.11 Email: alaaradwan5@yahoo.com Telefon: 0040 724 833 066

Egypt made a tremendous effort during the last few years to enhance its tourism sectors. This was reflected in the number of tourists who visited Egypt, especially form E.U. and also in the revenue from the tourists who jumped in the recent years. Related to tourists coming from Europe, we still have traditional markets especially Italy, Germany, France, U.K., but also have promising countries such as Czech Republic, Austria, Scandinavia (Finland, Sweden), East Europe (Hungary, Romania). That's why we should activate our tourism campaign in these promising countries.

In general, we should think about emotional, dreaming as motives for the tourists coming from Europe, not only historical, traditional. Promotional instruments such as participating in tourism fairs are not convenient now for E.U. consumer attraction, but we should orient to internet, periodical magazines.

Key words: tourism, E.U., Egypt, hotel, history

JEL code: M3

1. The current situation of tourism in Egypt

Tourism development

Throughout the last fifteen years, the tourism industry in Egypt has experienced significant developments, as illustrated in Table 1 which depicts the main indicators for two sub-periods (1985-1993 and 2000-2007).

For the period as a whole, the number of tourist arrivals increased more than seven-fold from 1.5 million in 1985 to 11.1 million in 2007, recording an average annual growth rate of 9.2 percent. In the meantime, tourist nights grew from 9 million to 111.5 million, at an annual rate of 12.1 percent on average, implying extension of the duration of stay of visitors from 6 nights to 10 nights over the period. Similarly, tourism earnings jumped from about \$315 million to nearly \$9.5 billion, accounting today for almost 25 percent of total tourism receipts of the Middle East region (WTO 2008).

With respect to tourism supply, lodging facilities witnessed considerable expansion in response to mounting inbound tourism flows. Total accommodation capacity of hotels and tourist villages in operation rose from 27.3 thousand rooms in 1985 to nearly 190.2 thousand by the end of 2007. An additional capacity of 156.2 thousand rooms is planned for the coming five years, particularly in rapidly growing resort areas along the Red Sea Coast and El Aqaba Gulf Coast in South Sinai, and more recently along the North Coast, West of Alexandria (MOT 2008).

Table 1. Main Tourism Indicators, 1985-2007

Table 1. Main Tourism mulcators, 1965-2007								
Tourism indicators	1985	1993	2000	2007	Average annual growth ra		wth rate	
					1985- 1993	1993- 2000	2000- 2007	
No. of arrivals (million)	1,5	2,5	5,5	11,1	6,8	11,8	10,6	
No. of nights (million)	9,0	15,1	32,8	111,5	6,8	11,7	19,8	
Average length of stay of visitors (night)	6	6	6	10	-	-	7,8	
Tourism receipts (\$ billion)	0,3	1,9	4,3	9,5	26,7	12,5	12,0	
Lodging capacity(000 room)	27,3	58,8	111,3	190,2	10,0	9,8	7,7	

Source: MOT (Ministry of Tourism), Tourism Figures (1996, 2008)

As a result of large and increasing influx of visitors, coupled with disproportionate growth in lodging capacity (less than 9 percent a year), occupancy rates displayed an upward trend. The figures indicate escalation of average room occupancy rates from 43 percent in 1993 to slightly over 63 percent in 2007 (MOT 2008).

2. How to enhance the Egyptian tourism in the E.U. market:

2.1 Long haul tourism

- Markets that already choose to visit Egypt for tourism: Germany, U.K., France, Italy, Netherlands, Spain, Austria.

2.2 Promising market in E.U.

Still there are markets where we can attract more tourists like: Bulgaria, Sweden, Slovenia, Denmark, Czech Republic, Poland, Portugal, Hungary, Finland, Ireland, Romania, Slovakia, Estonia, Luxembourg.

2.3 Number of tourists arrived from EU to Egypt in 2005 (mill.):

- 4,413 with share of 61% of total Middle East visitors from EU.

2.4 How to enhance the Egyptian tourism on the E.U. market

What the E.U. consumer prefer at the current time:

- tourism of sun and seashore: attract almost 80 million tourism. Main destination in 2006 was Spain;
- culture tourism: more important than sun and seashore; attract 70 million tourists; this kind call the Spanish government to change its strategy to make this type as its priority; big competitors in Europe like France, Germany beside Spain;
- sightseeing and journey tourism: attract 40 million tourist; main destination is Spain;
- cities tourism: attract almost 38 million tourist, connected with low cost airlines and will grow within these years to attract 60 million tourists;
- village tourism: for the persons who like to go to the mountain, like village atmosphere; attract almost 17 million tourists;
- conference and incentives: attract 12 million tourists;
- elite tourism: for people who express regardless about the cost; attract 8 million tourists; Egypt has big chance in this field:
- health tourism: people either want to lose their weight or to be more healthy; attract 5 million tourists;
- navigation and yacht tourism: growing very fast; for the people who want to rent yachts, not to buy it, attract 3,5 million.

What Egypt can attract and invest:

- sun and seashore, culture tourism;

How to market the Egyptian tourism:

Model of marketing consist of 4 components:

- customer attraction;
- evaluation system (how we evaluate the market);
- producing value (value of tourism production when we offer);
- how we attract new customers and convince them to repeat their visit

Generally we must concentrate on dreaming society tourists as it attracts almost 40% of international European tourism; it is expected to grow in the next six years and to attract 60% of that market.

We must answer these questions:

- What those new tourist are looking for?
- What are their requirements?
- How dream society works?

New market (aimed market):

- Adventure tourism: people want to experience unnormal things to pass stories about challenge, emotional, risks, efforts, achievement.
- Sport tourism: like the olympic games.
- Nature tourism: like safari, full of experience stories about animals and where risk face the tourists.
- Love tourism: birthday, honeymoon, wedding parties.
- Richest tourism: not limited to millionaires, but also to youth who have surplus money.
- Welfare tourism: for people who want to feel the luxury and difference.
- Relax safety tourism: people aim to spiritual feeding.

What promotional instruments are needed to promote Egypt in E.U.:

- Printed advertising: still sounding well.
- TV advertising: you must have direct attractive message, must be short, not more than 10 seconds.

What should Egypt do?

Must make two different advertising campaigns, everyone special in certain tourism product. For example, if you want to promote the sun, seashore, we must concentrate in that particular one, and if we want to promote the historical tourism we should make advertising campaigns about tourism.

- Magazines

It is more effective than TV if we want to attract the active passengers. We should put our advertisment in at least five different magazines.

The importance of information to promote the Egyptian tourism in Europe

The greatest challenge in the tourism industry is to change the way that we want to tell us that the product needs of tourists these days differed significantly from the requirements in the past.

Information society by:

- Rooms sellers
- A comprehensive makers flights
- Vendors
- Director of Operations

The dreams of the community:

- The experience of sellers
- Makers Stories
- The narrators of stories
- Director of stories

Emotional pyramid:

- Security and safety:

Is a very important element of the emotional elements of the pyramid in the world, especially now that terrorism is a major role, it is important to the sense of security and safety.

- Diversity:

The diversity of the product is very important because today is the tourists and visitors of various specialized and sophisticated in its demands.

- Personalization:

It means that the tourist feels that there is care and attention in a manner that he harbored a personal characteristic (and not part of a group or part of a place).

- Acceptance:

Accepted in the sense of place and presence that is acceptable to the community, who is in it.

- Development:

This means that tourists want to learn something and go to the rear, and that satisfy spiritual needs.

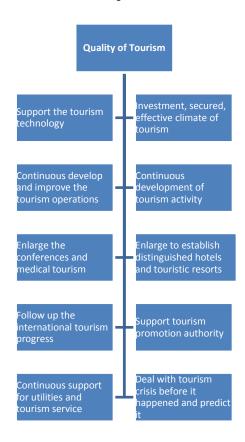

-Contributing:

Is a very important element of the emotional elements of the pyramid, there are people who want to feel when to go on a trip that is part of the money paid (in euros or pounds and one) in the flight may contribute to the cause of humanity to contribute to any human in human society (as is happening in the aircraft When the passenger donate any amount of force without the benefit of a problem or issue, such as the fight against AIDS or other).

What is the marketing strategy that Egypt should use in E.U.:

- develop new tourism resorts;
- put firm system to quality and label;
- sell experience and emotion not rooms, historical places;
- recommendation management is very important marketing instrument; recommendation from family, friends, colleagues is ranked the first between marketing instruments. Every tourist must leave Egypt with high feeling of satisfaction about the tourism place he visit and service offered to him.

Elements of tourism operation success of Egypt in EU

THE QUALITY OF COMMERCIAL SERVICES – A BAROMETER OF THE COMPETITIVE ADVANTAGE OF THE DISTRIBUTION CHANNEL MEMBERS

Ristea Ana – Lucia

"Valahia" University of Târgovişte, risteaanalucia46@yahoo.com

Ioan – Franc Valeriu

Romanian Academy, eide@zappmobile.ro

The enterprises' offensive in various markets is focused on a package of "services" that integrates — more than ever before—the observance of terms and vivid contacts between enterprises and customers. Metaphorically, we could say that services rendered to customers is a window between the market and the enterprise's value creations. From this perspective, the quality of commercial services is a key factor of success that ensures a competitive advantage to any enterprise opting for a strategy focused on expanding and developing the portfolio of services rendered to customers.

Bringing the commercial services rendered by members of a distribution channel into focus, the authors try to answer - on the basis of pertinent bibliographical sources - the following questions: What does the notion of commercial service rendered to customers mean? How can we assess the performance of the enterprise (service provider) from this perspective? How can we actually measure the performance of the commercial service rendered to customers?

Key words: commercial service, support logistics, quality of commercial services.

JEL Classification: D 3; D 4; D 18; L 67; L 8.

1. Specific features of commercial services

There are many definitions of services, relative to our analysis, but, in our paper, we confine ourselves to the concept of commercial services, i.e. services rendered by members of the distribution channel (mostly retailing) to customers.

Retailers – the last link of the distribution channel – do not confine themselves to only physically placing products at the customers' disposal. They also organize the so-called **support logistics** (A.-L. Ristea, coordinator, 2002, p. 403), materialized as commercial services for:

- facilitating the selection of merchandise by customers; information about products, consultancy;
- improving comfort and ensuring easy purchasing: extended working time, own parking area;
- ensuring the best conditions for using the purchased goods: maintenance and post-sale services.

Among the few authors who have thoroughly dealt with services rendered to customers by members of the distribution channel we find A. Tordjman (1983). He suggested a definition closer to the topic of our paper, which considers the commercial service to be the amount of satisfactions and utilities offered by a shop to customers. Certain services are directly linked to the sale of the product, others depend on the mode of organisation of the shop.

For this definition, A. Tordjman resorts to T. Levitt's idea (1969, p.52, reference taken from Maurial, 1990, p.37) according to which it is not the product itself that counts to the consumer, but rather the advantages and the satisfaction it offers. In other words, Levitt links the notion of service to utility.

In trying to adapt the notion of utility associated to service, as defined by Tordjman, to the distribution field, Alban Maurial (1990, p.38) proposes a definition of services in which the utility to the consumer is considered globally, both in the pre-decisional stage (pre-buying) and in the post-decisional stage (post-buying). Thus, commercial services are an assembly of commercial services proposed by a distributor to increase the global utility acquired when looking for, purchasing or using a product (Alban Maurial, 1990, p.38). This definition places the product in the centre of the consumer-service relation, and introduces a chronology in the process of purchasing the product and of consuming the services that accompany it.

Moreover, the above definition reveals the author's concern to distinguish between commercial services linked to distribution and services associated to the tertiary sector or services included in the product. We agree to this opinion and detail further several aspects exclusively linked to commercial services provided by distribution, just for assessing correctly to what extent various participants can involve in providing them.

Commercial services have some specific features that are important for understanding the constraints associated to the policies for rendering them through the joint effort of all members of the distribution channel.

Therefore, we should note the following **specific features of the services** that could be provided by the distribution sector (Ph. Détrie, 2002, p. 48; A. Maurial, 1990, p. 38; A. Tordjman, 1983, p.7).

1. **Intangibility**. It means that:

- a) the service is partly intangible (therefore, difficult to measure);
- b) the service is seldom specified (the need is implicit and depends on behavioural and cultural criteria and on previous experience, which impedes the understanding of the satisfaction criteria considered by the customer):
- c) the service is often included in complex services (difficult assessment of effectiveness).

2. **Simultaneity of production and consumption**. This feature explains why:

- a) the service cannot be stored (it is impossible to accumulate non-used services and also to change services);
- b) the service is based on a personal relationship (from this, the difficulty to control the behaviour of every customer):
- c) the service may be placed in a strong relational, even emotional, context (difficult to assess).

3. **Heterogeneity.** This feature is shown by the following aspects:

- a) the service cannot be renewed until being identical, as each situation is different and takes place in a unique moment (that is why it is difficult to standardize services, which explains why the production of services rarely rises in productivity, when we take intro account, on one hand, the variety of expectations and exigencies in the consumption of services, requiring a strong personalisation of rendering and, on the other hand, the variety of possible factor combinations in service production and sale);
- b) the service is equally evaluated by outcome and mode of provision (it is difficult to reduce it to basic rendering);
- c) the service requires sometimes the customer's involvement (this co-produced service hinders ensuring the product quality).

Knowing the specific features of commercial services, we understand it is necessary to deal with physical distribution from a systemic perspective, according to which the output materializes in the package of services rendered to the client. But the area of services associated to the product trading is complex and consequently not easy to define. This complexity is supported by **the variety and heterogeneity of services** to be proposed throught the distribution channel.

4. Types of commercial services

A. Tordjman tried to summerize the most common criteria for classifying commercial services (Table 1).

Table 1 Types of services

Types of services						
Services by	Services sold alone	Services by origin	Services by function	Endogenous services		
nature	Services sold with a			Exogenous services		
	good					
Hiring services: car renting TV set hiring Services for personal products: car repair footwear repair Services linked to sales: parking delivery	1. Services sold alone: insurance travel agency banking 2. Products sold with a good: deliveries working hours and days	1. Services linked to production: intrinsic services: instant soup cooked food disposable handkerchiefs services generated by modern forms of sales: conditioning presentation labelling information 2. Services linked to distribution functioning schedule	Comfort or psychological services: selection, proximity parking, credit baby sitting Technical services: delivery dispatch installation repair Financial services: crediting exchange office credit card Paracommercial	Endogenous services: delivery repair mending Exogenous services: Comfort or psychological services financial services paracommercial services		
Fields of response	to each type	exchange, crediting	services: travel agency decoration agency

of services	services sector and	competition	horizontal	organisation of the		
	of commercial		competition	point of sale		
	services					

Source: Tordjman, A., 1983, p. 18.

We find another way of dealing with types of commercial services in A. Maurial (1990, pp. 47-49). This typology is coherent with the definition he provided for distribution services, which definition we adopt for scientific reasons and promote it, as stated above. **This typology** (Table 2) **distinguishes services by four chronologically ordered stages of buying a product:**

- 1. services of access to the product;
- 2. services of information concerning the product;
- 3. services concerning the purchase of the product;
- 4. services for the utilisation of the product.

Table 2
Types of commercial services by buying stages

Types of commercial services by buying stages					
1. Services of access to the product	2. Services of information concerning the product				
 Proximity 	 Presentation by type of product 				
 Parking 	 Information labelling 				
 Extended working hours 	Quality labels				
 Freedom of movement inside the shops 	 Presence of trademarks 				
 Systems of publicity at the point of sale 	 Advice from shop-assistants 				
 Playing places for children 	 Advice for decoration 				
Brasserie	 Diagnosis at home 				
• Toilets	 Product testing at home 				
	Catalogue				
3. Services concerning the purchase of the product	4. Services for the utilisation of the product				
 Promotion 	 Replacement or reimbursement of the sold product 				
 Reception of old (worn) goods 	Assemblage at home

Source: Processed after Maurial, A., 1990, pp. 48-49.

Unlike other approaches to types of services, the typology proposed by Maurial is based on the place of services in the buying process, which offers some analytical advantages:

- It takes into account the consumer's real behaviour, in order of service consumption.
- It places the product at the core of any service policy, including the gradual evolution of the consumer/product/service relationship.
- It ensures a dynamic dimension to the analysis of services.
- It covers all range of services that can associate both horizontally and vertically.
- It is an operational tool for assessing and implementing the policies for services to the consumer.

3. The quality of commercial services

The quality of commercial services should be analysed, in accordance with the need for a systemic approach, in relation to the modules of the quality management to which it pertains. Ph. Détrie (2002, p. 24) defines four components of the quality:

- a) **The quality of definition**. It implies the identification and interpretation of the target customers' needs in accordance with the performance to be achieved as per specifications: technical characteristics, aesthetic, delivery period, security, price, etc.
- b) The quality of design. It refers to solutions for achieving the expected performance.
- c) **The quality of service provision**. It refers to solutions applied in accordance with specifications and in due time.
- d) **The quality of services**. It assesses the complementary services expected by the client: information, advice, personalisation, post-sale services, time, accessibility, etc.

This global approach is required by the paradigm of the quality management that ensures the transition from the traditional approach to quality to:

- a) mastering the quality of rendering services (the quality of management, which spreads through the whole enterprise the identification of needs, responses, the production of goods and services, the provision of a confidence environment);
- **b) the discipline of conformity** (the quality management requires four behaviours concern, creativeness, rigour of conformity, care for service) (Ph. Détrie, 2002, p. 25).

The implementation of the management of commercial services quality faces serious problems frequently caused by:

- Uneasy assessment of quality because of the specific features of commercial services (intangibility, simultaneity of production and consumption, heterogeneity);
- The postulate that a service is just a matter of behaviour; in fact we should not ignore the requirements for implementing standards, procedures, etc. in conditions of adequate endowment;
- The collective mastering of a process since most problems are actually relational;
- Lack of training in the quality field; the performance in rendering services is dependent on: professional competence, care for the customer, organisational competence. A new employee meets the requirements for professional competence, but sometimes he acquires knowledge about the customer and organisational culture on an empirical basis.

4. Indicators for measuring the quality of commercial services

For measuring the quality of services, we use several indicators, established for each of the following components of the quality of services, analysed with a view to achieving a certain quality level:

- Basic provision of services: the specifications indicating the competence, the equipment and/or material means
- Accessibility to the provider: place, working hours, parking, facilities.
- Relationship: reception, contact, listening, availability, competence, personalisation.
- Information: pertinence, clarity, accuracy, velocity.
- Consultancy: pertinence, value added.
- Observance of delivery terms: announced terms.
- Environment: equipment, room, comfort, ambient conditions.
- Cost: purchasing price and cost of possession.

An indicator for measuring the quality, in general, and services, in particular, is an instrument for assessing the achievement of an objective, the progress made in an activity, the knowledge of the influence of variations of a phenomenon. As regards the particular features of commercial services — besides essential criteria such as punctuality, absence of defects or availability — we should also opt for criteria that could be perceived by the customer. The reason is shifting from a criterion of performance/conformity of production (e.g., the proportion of durables receiving services during the guarantee period, the rate of defects, availability) to the criterion of perception of a service experienced by the customer (waiting time, the presence of an interlocutor, the perceived cleanliness of an area).

As regards commercial services, all measurement indicators should focus on the customer: number or proportion of customers who were negatively influenced due to non-compliance with service specification.

Ph. Détrie (2002, p. 375) indicates three stages for establishing pertinent and relevant indicators for measuring the quality of commercial services:

- 1. **Defining the reference service by three elements**: customers' expectations; for similar services, the quality level provided by other competitors; the strategy of the enterprise.
- **2. Establishing a level of exigence**: 100% of the customers? Or, at least?
- **3.** Establishing, possibly, a level of alertness: when reaching the threshold, an alert is called and a decision is taken for corrective and/or preventive action.

Table 3 includes a list of indicators that could become a quality barometer (for a hypermarket or a supermarket).

Table 3

A list of indicators forming the quality barometer for large commercial areas

Internal indicators

1. Ensuring the assortment

- Stock level
- Available products of the required model, colour, size and selection desired
- Proportion of stock shortages
- Proportion of obsolescent stocks
- Accuracy of sale prediction
- Proportion of damaged merchandise, of returned deliveries

2. Accessibility/Exploration

- Products available in the shop
- Reasonable time for finding products

3. Services to customers

- Adequate number of shop assistants
- Waiting time at counters
- Shop assistants'/personnel's attitude

- Observance of the regulations for consumers' protection
- Indoor aspect of the shop
- Number of disputes with customers

4. Availability and utilisation of information concerning

- Real stocks and optimum stocks
- Characteristics of the products
- Price structure
- Service conditions

External indicators

- Satisfaction to customers with regard to selling/buying and complementary services offered
- Array of post-sale services
- The global barometer of buyers' satisfaction (by panels of buyers)

Definition of strategies that are adequate to Romanian balneary tourism and implicitly, to seaside balneary tourism needs a good understanding of balneary touristic potential, of the actual degree of capitalization as well as of economic, social and political context that influences the evolution of Romanian tourism at large and the balneary tourism in particular. The main objective of development strategies for balneary tourism is to consider Romania a successful balneary touristic destination by means of identification of market needs and setting of quality products and services, as well as optimization of market potential.

Key words: balneary tourism, development strategies, quality products, balneary touristic products.

Jel classification: L8 – Industry studies: Services; L83 - Tourism

1.Introduction

Analysis and study of the weak points of Romanian tourism indicate clearly the necessary actions to raise the bid of the industry of balneary tourism and to support it reach its objectives and up-to-date framework. These actions may be summarized such as: institutional structures of the public sector that takes advantage of professional personnel and appropriate resources should work in partnership with private sector associations, a research of markets, segments, clients and communication channels, full planning of balneary tourism that can lead to modernization, development and presentation of balneary touristic products to meet the need of demands and expectations of market, also education and training with a view to provide the balneary tourism industry at every level with proficient skillful personnel that is client-oriented, a marketing with the goal to establish Romania as touristic destination in general and one of balneary tourism in particular.

Among several opportunities of Romanian balneary tourism development and implicitly of seaside tourism there are: increased attention that our country has drawn beginning with 2007 after Romanian has adhered to European Union on every field – especially that of politics and economy – from European countries, especially of the highly developed ones, that can lead to more important investments in Romanian balneary tourism or to external financing; predictable increase of the standard of living in our country, as a premise of an enhanced touristic demand, socio-cultural affinities with numerous European countries: Hungary, Ukraine, Germany, Austria, France, Spain, Italy, fact that would help to promote Romanian tourism there.

At the same time, we need to take into consideration the strong competition on European market of balneary tourism in countries like Germany, France, Italy, Spain, Austria, and even Slovakia, Czech Republic, Poland; a rather slow implementation of modern managerial practice within Romanian tourism as well as in most of the economic fields, that is an aspect that takes time until completion; poor contribution of local communities to the development of tourism because of lack of experience and a very strong centralized approach during the communist era

Generally, Romanian supply of balneary tourism is rather little known of foreign touristic operators, because of insufficient promotion on target markets (Great Britain, Germany, The Netherlands, Denmark, Norway etc.). In addition, foreign touristic operators are a bit reluctant to Romanian tourism supply because of lack of appropriate infrastructure, general and touristic, lack of modern subsidies that are common elsewhere abroad, poor cooperation with Romanian operators to provide hotel accommodation in balneary resorts during Christmas and New Year holidays, lack of investment that are meant to modernize material structures within tourism, lack of modern training of personnel in hotels and restaurants that can meet the new demands of international tourism, price continuous variation and also a general impression of Romanian "poverty" that has been exaggerated in European mass-media lately.

2. Development strategies of balneary tourism on Romanian Black Sea side

Taking the above into consideration, we may say that development strategies of balneary tourism should be achieved at both macroeconomic and microeconomic level.

As for the macroeconomic level, development strategies of balneary tourism require an integrative frame of Romanian balneary tourism that is materialized in a global strategy of development that is to be conceived at the national level by a higher capitalization of exceptional touristic potential of our country. Yet, presently, Romania does not have a national strategy of touristic development. Tourism National Authority has made a contract with the National Institute of Tourism Research and Development to conduct a study on "The Strategy for Balneary Tourism" that is not yet finalized.

Specific objective of the strategy for balneary tourism has to be the development, modernization and diversification of Romanian touristic balneary supply according to modifications of both intern touristic demand and international demand of balneary tourism. Consequently, the policy and development strategy of balneary tourism has to establish the principles and conditions that are necessary to improve competition as follows:

- development of touristic balneary product is to ensure a higher capitalization of the natural cure factors and upgrade its quality;
- touristic demand stimulation with a view to develop and adapt balneary touristic supply within a program of development and promotion of balneary touristic product;
- infrastructure modernization and development is to be set a basic condition of intern market of balneary tourism and its entrance on foreign competitive market;
- development of training and touristic research that are necessary to provide quality and diversity for balneary touristic supply and tracking of market trends in due time in order to adjust intern market in its progress;
- improvement of general economic climate;
- organization and expansion of development by coordination of capitalization and preservation of environment elements as basic components of present and future touristic supply;
- improvement of general frame of sector operation within market economy based on competition.

Completion of strategic objectives of balneary tourism should consider steps regarding as follows:

- modernization and development of balneary touristic supply that is competitive on touristic market;
- improvement and development of marketing activity and promotion of balneary tourism;
- integration of Romanian tourism and implicitly of balneary tourism, among European and world tendencies by setting of an efficient simplified legislative frame of the field that is congruent with international legislation;
- setting of a competitive business environment and of fiscal regime to encourage increase of export, investments, infrastructure and new job opportunities.

Balneary tourism represents for Romania an economic sector with a valuable potential of development that is not yet fully capitalized. Romania's advantage in the development of balneary tourism is provided by the presence of balneary natural resources of great diversity and fine display in territory that facilitate an entire range of balneary treatments and confers a high potential for Romania to develop complex touristic balneary products and increase the total number of tourists.

As concerns modernization and development of Romanian balneary touristic product, the natural component is very important (for its capitalization) and also the quality and functionality of balneary touristic subsidies and compliance of European standards as concerns the quality of touristic services and their correlation with tariffs required by entrepreneurs, the target being the competitiveness of balneary touristic supply.

Completion of strategic objectives is a vast and complex endeavor that requires organizational, material and financial efforts oriented as follows:

- reorganization of supply and product according to demand requirements and major trends especially from abroad and those of international standards;
- rehabilitation of infrastructure that is necessary to exploit mineral resources (mineral water springs, therapeutic mud) within modern resorts;
- re-engineering of existing treatment bases, modernization and increase of the comfort level of accommodation structures, expansion of specific and general entertainment subsidies;
- orientation of product and balneary services supply towards Romania's traditional extern markets and accession to new markets as well;
- elimination of all defects and negative aspects due to general political environment before 1990;
- re-thinking of promotion policy, that is an exchange of "image" promotion for a "product" promotion, where Romanian products with tradition among foreign tourists are emphasized;
- expansion of treatment touristic supply for underprivileged social categories of population;
- reconsideration of local balneary resorts along with their modernization and development;
- permanent programs, such as "A Week of Vacation in a Balneary Resort" and "The Balneary Decade" promoted by the Syndicalist Organization of Balneary Tourism in Romania, that are programs destined to all tourists' categories, in order to capitalize available rooms in balneary resorts during 1st of October 15th of December;
- an increased quality of touristic constructions and development of touristic capacity within areas where touristic demand is larger than specific supply, elaboration of zonal projects of modernization of general and touristic infrastructure in order to overcome existing difficulties of balneary tourism;
- improvement of highway, railway and air access to modern balneary resorts;

- development of balneary tourism in the context of durability, taking into consideration for all the objectives, plans and development actions the following: environment preservation in all touristic areas, development plans of construction in compliance with applicable legislation on the environment, urbanism and territory development and with the laws on tourism that concern optimization and preservation of the environment in the area of balneary resorts:
- increased standard of basic balneary services and of the complementary ones in accordance with the level of comfort and tariffs;
- diversification and development of entertainment means in Romanian balneary resorts;
- installation of special laboratories/ offices for natural treatments of Romanian tradition;
- construction of pools with thermal/mineral water within spa centers;
- development of touristic routes for jogging and hitchhiking in resort area, parks and their proximity;
- modernization means of capitalization of natural cure factors, their accessibility and maintenance;
- construction of structures for cultural events organization, both in the open and inside exhibitions, concerts, festivals etc.

3. Conclusions

The above-presented objectives determine national strategies of promotion and development of Romanian balneary tourism that can be considered as marketing programs. State policy has an active role of decision at the macroeconomic level, considering issues of touristic policy a matter of country economic policy and, by means of its central institutions, it has an influence on the development and promotion strategies of tourism.

Electoral marketing is undoubtedly among the most challenging fields for a modern day marketer and also one of the most unforgiving markets. The large amount of resources concentrated over a relatively short period of time and the remarkable speed of reaction involved are the key elements that require scrupulously plan. One of the most recently approached product strategy in electoral marketing involves the facial characteristics of the candidate and how they can influence the communication with the electorate. In order to see what faces does the Romanian electorate like for its politicians 10 groups of 12 people developed their own ideal face for a brand new politician. Those portraits were then analyzed using scientific patterns and so a number of rather interesting characteristics was obtained and compared with the results of conventional researches.

Keywords: Marketing, politics, vote, elections, social

M39 Marketing and Advertising - Other

Electoral marketing in Romania

The electoral marketing is one of the newest and most challenging types of marketing and in the same time one of the toughest on the business. This is a result of the "all or nothing" character of a competition that it doesn't take any prisoners, at the end of the day when the votes are being numbered there are only two types of candidates: the winner and everyone else.

Another particularity of the electoral marketing is the relatively short time available for the marketing campaign (30 days before the Election Day) and the numerous rules that apply to this activity, rules that are carefully monitored by a large number of observers and organizations.

Also, during this period, the fight can and most certainly will be merciful, any mistake can be the last for a certain candidate and the competition is always on the lookout in order to exploit even the slightest mistake to their advantage.

The clients, the electorate, are becoming less and less forgiving when it comes to bad choices in the campaign because the large number of political factions, because their aggressive promoting and because of the degrading social and economic condition that seem to be on a ever increasing trend.

Among the Romanian political parties marketing is a relatively new subject. Until recent events many factions, especially the large ones, centered their campaign mainly on the name of their dominant politicians and their power to generate a positive response from the electors. Most of the marketing related activities were specific to advertising and most decisions would be taken based on the previous experience.

The new uninominal poll system surprised the Romanian politicians with result that few were anticipating. The "political locomotive" system so loved by every faction failed for the first time, many famous politicians being forced to apply for a position in the countryside in order to assure their place in the parliament or senate.

Because of the very essence of the uninominal poll system, every parliament or senate candidate must compete, the accent goes from promoting the faction as an umbrella for the candidates to promoting the individual candidates that act as a representative for the faction.

This way the subject of the electoral marketing campaign is being changed from the political faction to its individual members, from an organization to an individual. Marketing a person is something relatively new, the franchise type campaign failed at the December 2008 polls drastically decreasing the number of factions present in the parliament.

The uninominal disaster, as the campaign was named afterwards, happens because the political parties forgot about or neglected the fact that most of their candidates are unknown to the electorate and thought the simple logo of the part should be enough in order to obtain the score of the party.

This situation is the perfect example for the usefulness of personal marketing, especially for the political highlife. But what does this personal marketing involves? In base lines it is about adapting the marketing mix and its components to the particularities of an individual and establishing proper marketing strategies for that person.

This particular article focuses on the product component of the marketing mix and specifically to building the image of a politician. Romania as a nation in general and its citizens eligible to vote in particular had learned a

valuable painful lesson over the past 20 years of "transition" and became immune to electoral promises launched by various politicians near the election day.

This vote of disbelief presented by electors thru the alarming low presence at the polls proved to be rather dangerous due to the fact that the ones that actually went to the polls didn't act accordingly to the opinion of the majority (majority that stayed comfortable at home). Problems like the doubting the results of the polls and the methodology itself and the general discontent of the populations are inevitable in this situation but in December 2008 a serious unprecedented problem accrued: few parties remained in the parliament the major factions joined forces and the opposition became purely formal.

The dangers this situation presents for the democratic system together with the desperate need for a position in the defeated factions calls for a new strategy, a new revolutionary way of doing things, calls for a brand new method to create and promote candidates.

Until recently the accent was on the image of the faction in general and how the entity communicates with the electorate and with relatively small exceptions (the primary political figures) their members remained unknown to the large public.

The amount of financial, human and time resources needed to promote all the members of a certain faction are enough to show us that the classic promotion is not and can not be the solution.

If one carefully analyzes what's happening in the mature democracies all over the world he can effortless observe that much too often political factions display new out of the box candidates specially created for a certain election. They are close to perfection in any way imaginable regardless how carefully they are being analyzed.

And they should be. Those candidates are specially designed for a certain position and a specific electorate. Among other things the process of designing a politician from scratch includes the Curriculum Vitae, family, system of values, friends, habits, clothing and surprisingly the face.

The social implications of facial characteristics

The face, this essential mean of communication with the electorate has just entered the list of items that can and should be correlated with the public's expectations and preferences.

Plastic surgery is currently regarded as detached as a simple haircut and as a rather "must" for the future perfect candidate. If speeches can be written by a consultant, clothes can be chosen by another, action dictated by the party the face remains the number one factor that can show some undesired facts about the past and present of a person and part of his true emotions.

The more attractive faces viewed by the electors seem to show a candidate that is more successful, content, friendly, intelligent, sociable, accessible, exciting, creative and busy than his competitors.

As Dr. Todd K. Shackelford and Dr. Randy J. Larsen from the University of Michigan show in one of their articles, the spirit, the body and the mind are all in connection and synch with each other. The wrinkles we carry on our faces are our best storyteller of our lives. Every painful and joyous emotion we have ever felt throughout our lives shows up in the wrinkles we carry with us in our older years.

The knowledge and style of living are revealed to physiognomy in the forehead region, health shows up in the region of the eyebrows, the nose reflects intimacy and affection, communication and love are all reflected within the chin, money relationships and courage are reflected in the lips, our happiness shows within our cheeks, ethical standards reflects in the chin, leadership qualities and abilities are reflected within the ears. Even the hairs texture, the hair line, double chins, floppy jowls and the placement of moles all different meanings to physiognomy.

The electorate unconsciously reads the face of a candidate and forms an opinion that will affect their judgment and their reaction to his campaign.

Facial expressions are the earliest form of communication. Experiments conducted on all ages and cultures around the globe have revealed that there is universal agreement to some basic emotional facial gestures. (happy, disgust, concerned, surprised, suspicious, sad, horrified, angry).

The most attractive faces designed as a result of special test and experiments do not exist in reality, they are created compound images you would never find in everyday live, they are unreachable for average human beings but still one can come as close as possible to them while keeping the human aspect. (Devendra Singh, researcher specializing in attractiveness at the University of Regensburg)

Over the years researchers analyzed the impact of the face over the image of an individual in the eyes of others and established there hypotheses on human facial attractiveness:

- -the "attractiveness is averageness" hypothesis (Langlois & Roggmann, 1990)
- -the 'symmetry hypothesis' (Grammer & Thornhill, 1994; Thornhill & Gangestad 1999)
- -the theory of 'multidimensional beauty perception'(the baby face effect) (Cunningham, 1986)

A different study from the University of Utah established a series of characteristics that make a face more attractive than another categorized by sexes:

-females: Suntanned skin, narrower facial shape, less fat, fuller lips, slightly bigger distance of eyes, darker, narrower eye brows, more, longer and darker lashes, higher cheek bones, narrower nose, no eye rings, thinner lids, large, round eyes, a large domed forehead and small, short nose and chin

-Browner skin, narrower facial shape, less fat, fuller and more symmetrical lips, darker eye brows, more and darker lashes, upper half of the face broader in relation to the lower, higher cheek bones, prominent lower jaw, more prominent chin, no receding brows, thinner lids, no wrinkles between nose and corner of the mouth

Men, whose photographs were judged to be facial asymmetric (i.e. not bilateral and equal), were found to be more likely to have psychological problems such as depression, stomach problems, anxiety, headaches, sleep disturbances, difficulties with concentration and lower intelligence.

Women, whose photographs exhibited facial asymmetry, were also found to have poorer health, were less physically active, more prone to emotional instability, less happy and less intelligent

Very asymmetrical faces are rated unattractive, but unattractive faces don't need to be asymmetrical, therefore, by checking the characteristic above one will not be rated attractive.

CDI technique and the development of a new politician

As a fundament for the present article a research was conducted using the CDI technique on 10 groups of 12 individuals in order to sketch out the basic characteristics of a brand new politician assuming that all the politicians in the country simply disappeared.

In order to assure the complete analysis the participants were instructed to discuss and propose characteristics regarding several face elements like: face shape, hair, forehead, eyes, eyebrows, nose, and groove on the upper lip, mouth, chin, ears and cheeks.

As showed in the previous parts of this article the elements of the face can characterize a person and on a daily basis every one judges the persons he or she comes in contact with mainly by their face and clothing.

The respondents received a standard list of facial and physical elements extracted from various secondary data analysis and the instrumental research. These components will be the puzzle pieces that the researchers will use and combine in order to develop the virtual face of the mutch desired modern politician, the visual answer to their problems.

It is this particular difference between what the electorates say they desire from a politician and what they really want that interests the authors. When asked about the main characteristics of an politician the responses go towards an ethical person, helpful and closed to the people (the all milk and honey strategy) but when they were asked to describe the candidates face some ideas were quite interesting.

The face shape was a true controversy, in 4 out o 10 groups the participants argued about it without being able to sustain one form or another. Overall two distinct face shapes emerged as the chosen ones: oblong and square. The motives used here by the participants were: strong, manly, hansom, business oriented, imposing and diplomat. Face reading studies showed that the oblong faced man is usually methodical and deliberate, hard worker, limit pusher, successful and severe with himself and others working with him.

Even if a great confusion was observed between the oblong faced man and that square faced one the groups that went for the square face shape presented their candidate as being a good specialist, hard worker, imposing but also a family person, good with the ones around him, not so severe and trust worthy. The face reading specialists say about the square faced man that he most probably is ambitious, dominating, aggressive and irritable, intimidating, sharp minded, analytical and most likely to have an exceptional dexterity.

The hair represents a truly Achilles' heel for man especially after a certain age. Our groups all chosen for their perfect candidate a short haircut and grayed hair preferable without hairless regions on the scalp and motivated their choices mainly on the aesthetics. Sociologists say that the scalp is an indicator of power and strength and as the dominant lions are the ones with biggest and darkest collars humans see their fellow men with a thick wiry hair as powerful, resilient in life, with great recuperative powers and most likely to embrace challenges.

The forehead was by far the biggest attraction of the entire session but, surprisingly almost the only part where most of the participants agreed in general. All the 10 groups went for a wide flat forehead with horizontal wrinkles. Studies reveal like in most cases people with wide foreheads are intelligent, capable of executing duties diligently, with high idealism and wealth of ideas. A flat forehead also indicates a more pragmatic nature and the horizontal wrinkles show a sustained thinking process over the years.

The eyes, this so called mirror of a person's soul, were among the most disputed elements in all 10 groups. The participants chose for their candidate prominent eyes, symmetrically disposed, with a steady look, brownish color, and with a white background (no preeminent blood vessels, no yellowish tone due to disease or smoking). For a psychologists the eyes are the most important feature in close encounters and it is important for the eyes to sit firmly whilst gazing steadily (solid and persevering nature, stability and forthright disposition). Brown eyes are characteristic to the Mediterranean and East European races and indicate a man that loves social life and meeting different people, loyalty, demonstrative nature, a good family life, hard worker and considerable generosity.

The eyebrows were a subject that all the groups agreed upon in record time without the need for negotiation as they should be thick and well contoured. Sociologically speaking the eyebrow speaks of reputation, fame and temperament, a developed brow line also shows a high degree of dexterity whilst a higher brow indicates a cautious attitude to decision making.

The nose did not represent a high priority for the participants; most of them mentioned quickly a roman type nose (long straight nose with large nose trolls) and some mentioned a light bend outwards. The intensity of physical action is related to oxygen intake, and the external instruments of the body responsible for that function is the nose. A good sized nose is certainly an indication of wealth too and the capacity to earn money, attitude, cordiality, disciplined nature (methodical) and warmth of personality prudent but anxious.

The mouth was by the most disputed part of the face between participants to different sexes, ages, residences and even domains of activity and they settled down for two types: thin lips and thick lips, both symmetrical, straight and not to wide. The mouth is mainly related to communication and speech, lips which are full, round and even convey to you that the person is caring and sensitive and the equal distribution reveal a well meaning and communicative personality. The straight lip line expresses a self-controlled person. If the lips are large it means an expensive and somewhat luxurious taste - but an expressive and generous temperament nonetheless. Small lips which are also tightly pursed warn of a self centered and mean character.

The chin was neglected by almost all the ten groups mainly because of its implication in the face type attribute. In most cases the participants choose a moderate round or square chin without any other distinctive signs. The chin together with the jaw line relates to the stamina of the individual and the stronger the jaw line the greater the degree of stamina and endurance and also to the stubbornness of the individual. The rounded or squared chin without any protruding reveals a strongly independent and determined individual.

The ears also suffered from a slight neglect and most of the participants choose normal years referring most probable to the basic Romanian ear types and to exclude certain particular features. The ears fall in the mid section of the head but represent the early, formative years of life between birth and 15 and they reflect the foundation of life and the potential for achievements at maturity. Thin and poorly shaped outer helixes may reveal diminishing health. Large years show an intellectual person, large ear lobes indicate an independent, strong minded person and the position of the ears close to the head indicate a person that plans ahead and is thrift, a person that doesn't like to leave too much to chance.

The cheeks were surprisingly heavily disputed by the participants and after long discussion they concluded that their politician should have less fat in their cheeks, less protruding, their color should be the same as the rest of the face and should not present any particular mark. Sociologists say that if status and position means anything the viewer should pay a lot more attention to this part of one's face as cheeks tell the story of industriousness, power and authority in a person's life. The attributes of the cheeks must be balanced against the position and strength of the nose, both features should harmonize with each other. When observing cheeks every king of excess is to be considered a sign of illness (overly red, shiny and red, red and rashly, blue or greenish tinge, dark or grey tinge, nodes or marks). Strong cheeks show authoritative persons in positions of control, executive power and leadership.

The developed leader vs. the desired leader

In this final part of the article all the characteristics extracted from the portraits generated by the 10 groups will be joined to establish the main attributes of the newly developed Romanian politician. First of all, as a person, the participants desire a strong powerful figure, resilient in life, with great recuperative powers, strongly independent, determined, disciplined (methodical) and severe with himself and others working with him.

In the professional life the future politician must be hard worker, limit pusher, intelligent, capable of executing duties diligently, with high idealism and wealth of ideas, successful and most likely to embrace challenges. Also this dream politician must have a cautious attitude to decision making, must be prudent but anxious, self-controlled and must be a person that plans ahead and doesn't like to leave too much to chance.

This future candidate should also have a personal life in which he must love social life and meeting different people and be a well meaning and communicative personality, caring and sensitive, loyal with a good family life, and considerable generous.

It is obvious that such a person does not exist in the real life and trying to impose such a candidate to the electorate will be a true marketing suicide. Even if one can never be perfect he can always try to be as close as possible to that image and is the campaign staff's duty to promote the good point and elegantly cover the attributes missing from the picture.

All the attributes above were extracted from the subconscious thinking of the participants but what is their opinion when asked directly about their perfect candidate? In an earlier research conducted on 783 respondents in the same geographical perimeter the participants said about the perfect candidate that he must be honest (73%), caring for the needs of the citizens (52%), a man of his word (48%), generous (various event, free meals, donations...), popular in mass-media, experienced, ambitious, intelligent, a strong leader and trust worthy.

While comparing the information gathered using the two different methods (CID technique and quantitative research) the authors came to the conclusion that the obvious difference between them is due to the experience gathered by the respondent.

The CID technique allows respondent to create their own dream politician regardless of any consequences and knowing that the entire Romanian political class disappeared while the quantitative research remembers them of the implications that electing one candidate or another will have on their future life.

This way, in the quantitative research respondents focused on avoiding the major negative characteristics observed in the present day politicians like: untruthfulness, lack of interest for society's problems, indiscipline, electoral unfounded promises, limited competence and various bad habits.

By comparing the two approaches mentioned above with the data found in the report from a press monitoring agency the researchers found that citizens desire a certain politician subconscious, have a different conscious opinion and appreciate a different set of attributes that appear in the mass-media.

In conclusion, from a marketer's point of view, which of the 3 approaches described in this article should be the one to follow while elaborating the campaign strategy? For sure each of the three options have their fans and critics but from the author's point of view the subconscious criteria seem to be the most logical solution.

TOURISM AND ECONOMIC DEVELOPMENT IN MOUNTAIN REGIONS AN ECONOMIC ASSESSMENT

Todt Horst

21029 Hamburg Germany, Hermann-Distel-Str. 38 University Hamburg, Faculty of Economics, Tel.: 0049407244477, E-Mail: horst.todt@gmx.de

The paper gives a critical assessment of the theses of UNWTO that tourism is an effective means of developing whole regions especially difficult aeries such as mountain regions. Growth Pole Theory and Economic Base Theory are used as methodological base.

Key words: Regional development, Growth Pole Theory, Economic Base Theory, Tourism

1. Introduction

The UNWTO, the organization of **tourism** on the UN-level, expects great achievements of this branch of economic activity. Tourism is supposed to play the role of a locomotive in less developed regions or countries that hauls income and economic standards on a higher level. Consequently UNWTO recommends economic development by subsidies for the tourist industry including tourist infrastructure. Two points of some plausibility support this view⁵²³:

- a) The tourist industry is labour intensive and hence provides income for many people. It is correspondingly not capital intensive, and needs not much capital investment, thus promising fast effects.
- b) The necessary labour force needs no high qualification; short introductory courses and training on the job will do.

Here we check the thesis with respect to mountain regions. Mountain regions on the whole are economically difficult areas. They often resist economic development. **Manufacturing** is not typically found in mountain areas. Mountains seem to exclude this major branch of economic activity. Most alternative branches are not very promising either. In very few cases mountain areas offer the opportunity of relevant **mining**. The difficult ground of mountains hardly allows of efficient **agriculture**; there is some chance of **forestry** – not a modern dynamic industry.

Tourism, in contrast, is a modern dynamic economic activity. Many people consider mountain regions as beautiful and appropriate for many kinds of sport like hiking, skiing, climbing, etc. The climate furthermore is supposed to be good for health, the air is clean. Hence the scenery often seems to be the only important economic resource of such regions. Tourism therefore is not only *a* chance but *the* chance of mountain areas. We will check this position in the light of economic theory, regional science, and general experience.

2. Relevant Conceptions of Economics and Regional Science

2.1 General remarks

Applied economics has provided two major pertinent conceptions to describe regional development as to tourism:

- a) Growth Pole Theory (GPT)524 and
- b) Economic Base Theory (EBT)525.

Both conceptions appear in different variants. Only some of them are important for the main line of discussion we have to conduct.

GPT is a genuine economic conception applicable to regional problems of economic development. It is an operational theory that lends its insights to practical political economy. EBT is a methodological conception which was conceived in order to tackle data dilemma regional scientists often meet. So it is rather intended as a statistical framework than a descriptive conception of regional development; yet it has been successfully used just in this sense, too.

GPT and EBT are liable to some serious objections. This must not be concealed. Nevertheless they are very popular among regional scientists. Let us try them. In any case it must be checked very thoroughly whether the conceptions are applicable.

2.2 Growth Pole Theory (GPT) applied to Tourism

GPT is due to Francois Perroux (1903-1987). GPT became part of the discussions in Regional Science worldwide with some emphasis within the French speaking world. Peter Nijkamp (1946 -)⁵²⁶ deepened the discussion about industrial complexes. Walter Christaller (1893-1969) discussed similar aspects in the context of **service industries** even earlier than these authors and paid in his later years much attention to tourism.

⁵²³ UNWTOhttp://www.unwto.org/media/news/en/press_det.php?id=2462&idioma=E

⁵²⁴ Perroux, F., Economic Spaces: Theory and application, QJE, 1950

⁵²⁵ Jung, J.-S. Die regionale Wirtschaftsentwicklung in Südkorea, Peter Lang Verlag

⁵²⁶Nijkamp, P. Handbook of Regional Economics* 1986 Nijkamp, P. & Coccossis, H. Sustainable Tourism Development, Avebury, Aldershot,

The basic thesis of GPT: To realize economic growth in a (less developed) region it is necessary to settle there an industrial core. These industries should belong to modern dynamic branches and fit together. If such a complex has surmounted a certain size (depending on the specific conditions) it forms a "growth pole", i.e. the core of a regional economy that shows sustainable economic growth.

The implicit message of this philosophy is, of course, the necessity of regional economic policy that cares about the initial planning and investment. Later on the region - hopefully - needs no exertion of influence by economic policy.

The crucial question of this conception is: how can growth poles exert such an influence? Perroux and his school think mainly of manufacturing. These firms depend on other firms that provide the necessary inputs (backward linkages) and they depend on their customers that buy their products (forward linkages) perhaps as consumers but mainly as producers of other products. Strong firms may attract providers and customers and thus create locational conditions that are the cause of further growth.

Chains of argumentation along these lines are not very convincing as to tourism. Backward linkages do not strongly influence tourist offer. It does not matter, where the goods are produced which are used in a tourist resort besides, of course, the services that must be provided in the place. Even more obvious is the absence of relevant forward linkages. No other firm requires tourism as input. The location is given. It may be improved or may decline with no or little influence on the economy around. Customers, i.e. the guests must visit the place, and can consume tourist services only in the place. There may be – this is conceded - some influence on the spatial environment since tourists stay not strictly in their recreation resort but take part in excursions e.g. The economic impact of these activities, however, is not strong.

The power of backward and forward linkages is under debate even if manufacturing is concerned, where linkages are certainly more plausible. There are case studies that support the thesis others that throw doubt on it.

In case of tourism there is no empirical support of any linkages. Insofar we are skeptical as to the optimistic hopes of UNWTO. Tourism will help to develop a place but stay without substantial effect on the surrounding area.

We may raise the question whether there might be other effects that could cause self- sustaining growth above a certain minimum level of tourist infrastructure.

Tourist supply may be interpreted as a bundle of different services that make a resort attractive for guests, i.e. a variety of different hotels with different standards, different restaurants, and different amenities of various kinds. In history of economic thought many authors have mentioned the fact that services have to be made available as suitable compound offer. This is true for shopping malls, fairs, or a whole city but also for tourism. If the supply of services in a city or a holiday resort is sufficiently **diversified** then it will be successful: The location is considered a place where there is "something on". This basic fact seems to be self-evident; yet it has not become a fix part of economic teaching before Christaller and the subsequent discussion. ⁵²⁷

These observations contradict the above supposition that tourism may be developed with a low rate of investment. It takes much time to make a holiday resort out of an ordinary village. There are quite pitfalls on the way to success that cost time and money.

As a result of this discussion we keep in mind that tourism (like a shopping mall) requires bundles of services that cling together in one location (Christaller Effect). This requires a certain minimum size. To create a holiday place requires substantial investment. This can be done e.g. by a development company provided they have much experience. More likely is a long way with costly trials and errors. Linkage effects that make a resort the locomotive for a whole region do not exist or are at most very weak.

2.3 Economic Base Theory (EBT) applied to Tourism

Economic Base Theory was developed to help out of a serious lack of data in regional analysis. Whilst national data are readily available is it difficult to receive statistical information of an appropriate regional delimitation. Even if there are regionalized data they will usually be raised for political but not for relevant economic area units. The very simple conceptual framework of EBT is the point of criticism. The conception, however, shows very flexible, and allows the use of proxy-variables and a manifold of rough assessments even for small areas where only sparse data exist.

The basic thesis of EBT: The regional product Y is used for locally produced goods C_1 and imports C_m . Imports must equal exports C_x : $C_m = C_x$. Furthermore we have $Y = C_1 + C_m$. No region is independent of imports These must be "paid" by exports C_x . $C_m = C_x$ form the "economic base" of the region. Suppose there is a known relationship between C_x and Y, say Y = 3 C_x , then it is possible to estimate the effect e.g. of tourism which is by its very nature export though happening in the place

The EBT view again supports rather the capsulated economic effects of tourism: The imports come from the "rest of the world" without preference for the immediate environment. The imports are furthermore predominantly consumption goods (for tourists and the local population) with little linkage effects.

527Christaller, W., Die zentralen Orte in Süddeutschland, Gustav Fischer Verlag, Jena, 1933

_

This simple method described is often the only way to analyze the economic situation of a region especially a small region, e.g. a single place. The alternative may be no "statement at all". If more information is at hand it can, of course, be used for refinements.

Research workers will feel encouraged to break down national data according to population statistics that are usually available even for small areas.

A local expert will be able to give quite valid estimations of the role of tourism for a region and moreover make forecasts by comparison with already successful tourist areas.

Notwithstanding all sophisticated economic reasoning the idea of an economic base has a strong intuitive appeal. The share of imported goods will usually increase the smaller (measured in population) the area is. Small areas e.g. groups of villages or even single villages have highly specialized production, and must therefore import consumption goods. One might object that villages have agricultural production and can cover most needs of their inhabitants. Actually this was reality over long historical periods. This is the picture of a very backward society with a low standard of living which we want to change by introducing a new economic base, say tourism.

Efficient modern agriculture is specialized. Mountain areas provide only a narrow base for this. The question therefore is: What can be done to improve the economic base of mountain regions. How can these regions become guided to modern standards? The economic base conception is a practicable base for competent discussion. The locomotive view of the UNWTO, however, is not supported by EBT.

3. Final conclusions

We have shortly discussed two modern frameworks of regional science with respect to development of tourism in mountain regions. This may be considered as the starting point of specific empirical research.

Two main results:

- a) Tourism may well help a smaller region to develop; it will, however, not have a locomotive function for greater region or even a country.
- b) The EBT conception is a instrument to analyze a small region with respect to its economic base and the possible effects of tourism. Tourism often is the only chance a mountain area has.

SPECIFICITY ELEMENTS CONCERNING AGRO-ALIMENTARY PRODUCT AT THE LEVEL OF EUROPEAN UNION

Ţimiraş Laura Cătălina

University from Bacau Faculty of Economics Spiru Haret, no. 8, Bacau tzimirash@yahoo.com 0234/516345, 0745/903414

Agricultural and alimentary products' marketing displays at the level of European Union a series of specificity elements resulted especially from the means of manifestation and environment variables. Among the external environment components the striking influence of legislative environment is highlighted, agro-alimentary sectors making the object of an impressive number of communitarian settlements, which regard not only the production manner, but the price stability, distribution and communication concerning the agro-alimentary products as well. In the present article there were reproduced some of the main specificity elements of agro-alimentary product at the level of communitarian market, an important part from these being the result of strict legislative measures that regard the insurance of consumers' protection, alimentary safety and security.

Keywords: quality, alimentary safety and security, alimentary additive, dietetic product, ecologic product, genetically modified product, standardization.

Code JEL: M31

Agro-alimentary products marketing displays a series of particularities that results mainly from the nature of the needs to which the agro-alimentary products address to, but also from the demand and offer characteristics for this category of products, particularities highlighted at the level of all components of marketing mix. Presenting implicitly agro-alimentary marketing specific particularities in general, at the level of European Union agricultural and alimentary products marketing displays a series of specificity elements resulted from the manner of manifestation of factors specific to different environment components. Among these the obvious influence of legislative environment is highlighted; the agricultural and alimentary sectors making the objective of an impressive number of communitarian settlements, that regard not only the production manner but the price establishing, distribution and communication concerning the agro-alimentary products.

In what the agro-alimentary product is concerned a defining element at the level of communitarian market is referred to **products' quality**, these should answer to some strict settlements that regard **the insurance of consumers' protection, alimentary safety and security**.

Therefore, at the level of communitarian market (with the purpose of insurance the consumers' alimentary safety and security, for their good information and for guarantying the transactions correctness) a special attention is paid to (official) control of alimentary products⁵²⁸, the control regarding, alike, alimentary products, alimentary additives, vitamins, mineral salts, oligoelements and other products added to aliments and sold in the same time with these, as well as the materials that have contact with alimentary products. There are submitted to control the raw materials and the ingredients used for aliments fabrication, finite and semi-finite elements, labeling and presenting manners for alimentary products and even the consumption manners and products used for cleaning and maintenance (inclusive pesticides), staff hygiene etc. All enterprises from agro-alimentary sectors have the obligation of respecting the hygiene rules during the whole route covered by alimentary product: processing, conditioning, distribution, sell.

In order to insure the population's protection on communitarian level the compulsoriness for aliments producers of specifying and sending towards analysis the chemical substances used in fabrication process⁵²⁹ is established. Also, the bottling methods and commercializing the sparkling water were settled, the producers having the obligation of insuring the chemical analysis for commercialized water's purity⁵³⁰.

On the 12th of January 2000 The White Book of Alimentary Safety was adopted, that foresees the establishing of an independent authority concerning the aliments safety – The European Authority for Aliments Safety531, whose purpose is the insuring of scientific control concerning the aliments production. This organism will elaborate scientific notices in which basis the minimum and maximum levels of vitamins and minerals in aliments will be established.

In what the **use of alimentary additives**⁵³² is concerned, the communitarian settlements⁵³³ establish that their use should answer to one of the following purposes: preserving or insuring the product's stability, the prolonging the

⁵²⁸ Directive nr. 89/397/CEE.

⁵²⁹ Commission Settlement 622/2002/CE.

⁵³⁰ Directive 80/777/CEE.

⁵³¹ Established by Commission's Settlement nr.178/2002. In Romania, the correspondent organism is Healthy Alimentation Foundation.

⁵³² Alimentary additives refer to the substances that are not consumed as aliments, do not constitute a characteristic ingredient for the alimentary product and are added in alimentary products in different stages of processing, conditioning, transport or storage, becoming therefore a compound of the products.

⁵³³ Directive nr. 1989/107/CEE, Directive nr. 2002/46/CE.

product's preservation or stability duration, the improvement of sensorial properties. The settlements regard the alimentary additive that are used or intended to use as ingredients during production or preparing of an aliment and remain present in the final product, even in the modified shape. The additives whose use is accepted make the object of a list, the specific use conditions being established. Therefore, the approval of alimentary additive is attended by an indication of products where it will be used as well as the used quantity, a minimum and maximum level of alimentary additive being established. The framing of a certain additive in a category does not exclude the possibility of its use authorization for another domain also. The additive use is allowed in the case when the technologic fabrication process of an aliment is imposed (not existing other solution) and only if does not constitute risk for humane healthiness.

In the case of **products designated to special alimentation**, respective the "dietetic" or "regime" products (designed to persons with digestive or metabolism disturbances, and to persons with special physiologically conditions) as well as the aliments designed to small age children (sucker and babies), communitarian rules⁵³⁴ that regard the exigencies concerning the products' nature and composition, raw materials quality, in the hygiene domain, a list with the substances that can be added in certain nutritional purposes whose use is allowed, labeling, presenting and publicity, such as their control manner are established. The qualifier of "dietetic" and "regime" can be attributed to current consumption products only if there can be adequate to a special alimentation and only if the proof of these properties is made.

Concerning the **genetically modified products** (that make the object of last minute vast debates on global level) the EC Council sent directives referring to the deliberate obtaining and use in environment, of genetically modified aliments and organisms. Due to humane diseases appearance, but also of animals and plants, as result of releasing in environment of genetically modified organisms, their introduction should be made progressive and permanently analyzing the long term effects⁵³⁵. The alimentary products that contain genetically modified organisms will be appropriate labeled, mentioning the possible effects that can have on the human organism⁵³⁶.

In what the agro-alimentary products' wrapping is concerned, the materials used in this purpose and that have direct contact with the product537 make the object of special settlements. These materials should be produced, in such manner that would not give to alimentary products ingredients in such a quantity that could affect peoples' safety or to lead to unacceptable changes in aliments composition, or to degradation their organoleptic characteristics. The directive is not applicable to wrapping materials that can be consumed in the same time with the product (for instance membranes used for meat rough-wrought - sausages and salamis etc.). Materials that are allowed to enter in contact with aliments are therefore established, the list of additive that can be used at materials and objects production that enter in contact with aliments, substances whose use is authorized, the purity criteria of these substances, their use conditions, migration limits of some ingredients in/on alimentary products etc. The list of the accepted materials-substances may suffer changes according to new information's existence, leading either authorization of new substances or to the prohibition of others. Special settlements regard "active" materials used for products' wrapping, respective the materials that lead to a prolonging of conservation period of alimentary products, to improving of their organoleptic proprieties⁵³⁸. Concerning the agro-alimentary products' wrapping the EU legislation regards the inscribing on the wrapping, in harmonized manner, of the contained mass and volume ⁵³⁹. In what the alimentary importation products are concerned the present settlements regard the realization of controls of products at the entrance in the communitarian space. The finding of a product (lot of products) by customs authorities that contains characteristics that may bring doubts concerning the alimentary safety, as well as the absence of a document (marker) that should accompany the product in order to respond to settlements concerning the alimentary safety, entails the right of stopping the commercialization of the respective product⁵⁴⁰. Also, in order to enter the European Union's market the agro-alimentary products should be fabricated in

Result of measures that regard the alimentary safety and security, as well as result of public opinion's awareness upon the importance of a healthy alimentation, in European Union a special importance is given to **ecological products**, increasing their average in the total of the offer of agro-alimentary products.

Actually, ecological agriculture appeared in Europe as a result of population lack of trust in measures of alimentary safety and as consequence of apparition of different diseases generated by products containing toxins. Therefore, in present we assist to a real movement on European level that militates for replacing the intensive, industrial technologies, based on the use of extra-fertilizers of agricultural terrain, hormones etc. in animals alimentation, with clean, not-pollutant technologies. Ecological agriculture places an important stress on products' natural quality

⁵³⁴ Board's Directive nr. 89/398/CEE, Directive nr. 2001/15/CE, Directive nr. 91/321/CEE, Directive 1999/39/CE.

⁵⁴¹ Settlement 852/2004/CE.

and not on obtaining of increased productivity, its cost being implicitly higher. In this frame, the evolution of ecological products consumption, in some countries from European Union registered spectacular increases; according to the available data was observed that in 1997 – 2006 period, in some countries (Belgium, Denmark, France, Holland) the consumption increasing more than 10 times.

The evolution of organic products' consumption in some of the European Unuion's countries in 1997-2006 period

Source: data processing from Euromonitor, 2004

Referring to the **agro-alimentary products' standardization** – whose main purpose is, also, the one of assuring products' quality on one side and, in equal extend, it constitutes a recognition method for consumers for quality products – at the level of EU will be altogether applied, the international standards that, generally, have a recommendation character, allowing the national standards harmonization, but also a series of specific standards that are compulsory for EU countries. Among the organisms that elaborates standards at international level we remind: International Standardization Organization (I.S.O.) and Codex Alimentarius Commission (common organism for OMS and FAO), and at the level of European Union – European Standardization Committee (CEN).

Although it has international character, in European Union *the aliments safety systems' implementation HACCP* is compulsory ⁵⁴², aspect that constitutes actually the alimentary safety guaranty along the entire technologic flux. Respective, HACCP is a method for insuring the aliments product's security from the raw material until the product reaches the final consumers' table. The purpose of this method accepted by international organizations as the most efficient control method for diseases resulted from alimentary products, is the prevention in time of problems that may appear along the route by alimentary products from agrarian exploitation until the reaching of consumers.

The basic principles of HACCP are: "the potentially alimentary risks analysis for an operation from the activity of alimentary sector's unit; the identifying of the points from this operation where alimentary risks may appear; the establishing of the identified points as being critical for aliments safety, named critical points; the identification and implementation of effective control procedures and monitoring these points; the periodical revision and every time a change in the alimentary sector of alimentary risks analysis appears, of critical points and of monitoring procedures " ⁵⁴³. In the cases where, due to different reasons the control was lost, the products submitted to potential risk will not reach the consumer. HACCP follows the assuring of product's security by biologic, chemical and physical risk control analysis from the producing, procuring and handling the raw material, until the producing, distribution and consumption of the finite product. "Units from the alimentary sector have to identify the determinant activities for alimentary safety and have to guarantee that the corresponding security procedures are established, implemented, maintained and revised on the basis of principles used in *risk and critical points system analysis* - HACCP" HACCP" **

The realization of HACCP system supposes the adopting of certain standards, which have been elaborated by Codex Alimentarius Commissions, respective:

- Agro-alimentary hygiene. General principles – regards the necessary hygiene conditions for an aliment's production, during its entire production route;

^{*} estimated data.

⁵⁴² Directive 93/43/CEE.

⁵⁴³ Processing after H.G. 1198/2002 (harmonized to communitarian aquis) published in MO 866/2 December 2002 concerning the alimentary hygiene standards approval.

⁵⁴⁴ Article 4 from H .G. 1198/2002.

- Agro-alimentary hygiene. Risk analysis and critical points control analysis (HACCP) and their application guide the risk analysis principles are established, critical control points, risks identification methods and control measures;
- Agro-alimentary hygiene. Principles for establishing the microbiologic criteria for aliments at any point from the alimentary chain.

With the exception of HACCP system, a series of standards with international character are also used by economic agents from agro-alimentary domain at the level of communitarian market, their implementation being optional:

- Alimentary safety management system- ISO 22000, is an international standard, elaborated for assuring the alimentary chains safety on global level; it comprises the HACCP principles and integrates the requires of the key standards elaborated by different distributors' associations, on global level. ISO 22000 extends the quality management system approach;
- Quality management system ISO 9001:2000, is a standard that foresees the requires for quality management system, in such manner that the organizations will assure products and services according to consumer's requires;
- Environment management system ISO 14001, is an international standard that specifies the requires referring to an environment management system that allows an organization to formulate and implement its policies and objectives taking onto consideration the legal requires and the other requires that the organization subscribes, as well as the information referring to significant impact upon environment.

At the level of European Union there exist four categories of standards applicable to agro-alimentary products:

- specification standards, with reference to composition, physic-chemical and biologic characteristics and fabrication technologies;
- standards concerning the products' "environment", referring to the labeling, wrapping, storage and products' transport;
- standards concerning the products' analysis and testing methods, that regards the products' analysis manners;
- standards with the purpose of directive, that define the hygiene requires, as well as a series of prescriptions referring to the fabrication, stocking and distribution technology.

In conclusion, the specificity of agro-alimentary product at the level of European Union, also as the specificity of all marketing mix components, results in great extend from the nature of the settlements regarding the population's alimentary safety and security, but also from the necessity of adaptation to permanent change needs and increased exigencies of the European consumer.

DETERMINING THE PROFILE OF TOURISTS IN BRAŞOV STARTING FROM THEIR CONSUMPTION AND BUYING BEHAVIOR TOWARDS PRODUCTS OFFERED BY TOURISM AGENCIES

Untaru Elena-Nicoleta

"Transilvania" University of Braşov Economic Sciences Faculty Colina Universității nr. 1 onut.elenanicoleta@unitbv.ro 0268411474

By studying consumer behavior, marketing specialists want to find out how consumers choose goods/services and what the factors that influence their choice are.

In tourism the analysis of the consumer behavior is more difficult because the structure of the product is totally different than the one of goods in general, and the decision of buying is supported mostly by subjective factors, emotional, and not necessarily on economic factors that are easier to be observed.

The present work aims to create a profile of Brasov people as tourist whose premises is set by a marketing research on observing the attitudes, opinions and behaviors of tourists towards choosing a holiday destination.

Keywords: tourist, consumption behavior, marketing research

Work JEL code: M

1. Introduction

By studying consumer behavior, marketing specialist want to find out how consumers choose products/services and what the factors that influence their choice are. The reasons for buying are less familiar to a company for which it is relatively easier to find out who, what, where from, when and how much they buy. Generally, products and services are bought in order to satisfy physical needs, but also social and psychological ones. Social environment of consumer, individual and psychological circumstances are combined to influence the decisions on what to buy.

Information concerning tourist's consumption motivation is important to marketers, along with the elements that put the basis of choosing a holiday destination, aspects regarding the usage of personal and previous experience, and other influences in choosing an attraction point.

In tourism, analyzing consumer behavior is more difficult because the structure of the product is totally different than the one of goods in general, and the decision of buying is supported, mostly, by subjective factors emotional and not necessarily economic ones, that are easier to observe.

The present work aims to create a profile of Brasov tourists whose premises is set by a marketing research on observing the attitudes, opinions and behaviors of tourists towards choosing a holiday destination.

2. Methodological considerations regarding the marketing research

In the marketing research, the population taken under consideration is formed by citizens of Brasov aged more than 18 years old. The interval of confidence is 95%. The pattern is composed by 385 subjects, and the error with which the results are guaranteed is $\pm 5\%$.

Neighborhoods in the pattern	No. of apartments in each neighborhood	The percentage of the selected apartments in the total no. of apartments (%)	The allocation of the pattern
Astra	28.019	60	363
Tractorul	9.650	21	125
Valea Cetății	8.707	19	113
TOTAL	46.376	100	600 (pattern size)

Table 1. The pattern used in the research

The reason for which the size of the pattern is 600 subjects and not 385 is that there usually is a high probability for not all subjects to answer the questions, and to assure the exactness of the pattern.

The methods used for sampling are: multistage sampling, proportional stratified sampling and systematic sampling.

3. Main results of question analysis

The statistics of the questions reveal a series of aspects regarding buying and consumption behavior of Brasov tourists. Further are presented the most important results of the questions' analysis that set the basis of the marketing research.

Most of Brasov tourists travel at least once per year in our country (see table 2) as follows: in vacations and holidays (86% of the subjects), for rest and relaxation (79% of the subjects) and for fun (44% of the subjects).

Table 2. Frequency of traveling of Brasov people during a year

Do you usually travel only once during the year?

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	no	84	21,8	21,8	21,8
Vallu	yes	301	78,2	78,2	100,0
	Total	385	100,0	100,0	

Brasov people prefer as destinations in our country: the mountains, at least twice per year, Black Sea shore, once per year (see table 3) and, few prefer Danube Delta, balneary and climatic resorts, tourist's circuits and other places.

Table 3. Frequency of Brasov people on the Black Sea Shore

Please tell us what is the frequency of your visits in our country (Black Sea Shore)?

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Once per year	200	51,9	73,5	73,5
	2-3 times per year	17	4,4	6,3	79,8
	More times during the year	3	,8	1,1	80,9
	Never	52	13,5	19,1	100,0
	Total	272	70,6	100,0	
Missing	88,00	84	21,8		
	99,00	29	7,5		
	Total	113	29,4		
Total		385	100,0		

The best sources of information in choosing a holiday destination are, in the opinion of Brasov people: friends and acquaintances (63% of the subjects) and Internet (49% of the subjects).

Brasov people do not usually buy online holiday packs (89% of the subjects), they prefer to organize the trip by themselves (85%) and they like to travel along with the family (73%) or with friends and colleagues (41%).

Generally, when choosing a vacation destination Brasov people take under consideration the opinion of acquaintances who have visited that destination in the past (see table 4), they prefer to visit different destinations each time, which they haven't seen before, but they are indifferent towards choosing between circuits and plain vacations or buying a vacation package and buying each component separately.

Table 4. Expressing the opinion towards the following statement: "I take under consideration the opinion of the acquaintances who have already visited a holiday destination, when choosing a destination"

I take under consideration the opinion of the acquaintances who have already visited a holiday destination, when choosing a destination

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Total disagreement	13	3,4	4,3	4,3
	Disagreement	18	4,7	6,0	10,3
	Neither / nor	43	11,2	14,3	24,6
	Agreement	191	49,6	63,5	88,0
	Total agreement	36	9,4	12,0	100,0
	Total	301	78,2	100,0	
Missing	88,00	84	21,8		
Total		385	100,0		

When choosing a vacation destination, Brasov people are preoccupied mainly by attributes like: price (78% of the subjects), service quality (73% of the subjects), surroundings (66%), family or friends desires (55%), and safety or security (11%). The subjects placed last the possibility of traveling (19%) and the possibility of doing sports (11%). Brasov people take decisions on choosing a holiday destination with at most three months in advance, as seen in the following table.

Table 5. Periods of time required by Brasov travelers to take decisions in choosing a holiday destination

How long in advance do you decide on a holiday destination?

					Cumulative
		Frequency	Percent	Valid Percent	Percent
Valid	one year in advance	10	2,6	3,3	3,3
	6 months in advance	49	12,7	16,3	19,7
	2-3 months in advance	114	29,6	38,0	57,7
	tops 1 month in advance	115	29,9	38,3	96,0
	I'm waiting for price reductions on holiday packages	12	3,1	4,0	100,0
	Total	300	77,9	100,0	
Missing	88,00	84	21,8		
	99,00	1	,3		
	Total	85	22,1		
Total		385	100,0		

The main reasons of the last journey were rest, relaxation and fun (as seen in table 6), for which they spent up to 14 days and up to 2000 lei, money from economies, mostly, spent on transportation to the desired destination (81%), accommodation (60%), shopping (64%), food (57%) and gifts (41%).

Table 6. The main reason for taking their last journey

What was the reason of your last journey?

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	rest and relaxation	175	45,5	58,5	58,5
	business	8	2,1	2,7	61,2
	fun	83	21,6	27,8	89,0
	treatment	20	5,2	6,7	95,7
	pilgrimage	9	2,3	3,0	98,7
	other reason	4	1,0	1,3	100,0
	Total	299	77,7	100,0	
Missing	88,00	84	21,8		
	99,00	2	,5		
	Total	86	22,3		
Total		385	100,0		

In order to get to the destination, Brasov people used in most cases their personal car (51% of the subjects) and got accommodation to friends, relatives, grandparents, pensions and three star hotels (as seen in table 7).

Table 7. Means of accommodation used by Brasov people in their last journey

What kind of accommodation did you use in your last journey?

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	1-2 star hotel	29	7,5	9,6	9,6
	3 star hotel	56	14,5	18,6	28,2
	4-5 star hotel	20	5,2	6,6	34,9
	pension	66	17,1	21,9	56,8
	rented apartment	33	8,6	11,0	67,8
	friends, relatives	85	22,1	28,2	96,0
	other accommodation	12	3,1	4,0	100,0
	Total	301	78,2	100,0	
Missing	88,00	84	21,8		
Total		385	100,0		

Analyzing the responses of the subjects we may conclude that, generally, Brasov people manifest an economic behavior in taking decisions concerning vacation/holiday, mainly because of the importance given to the price in

buying decision, cheaper accommodation and transportation, holiday expenses (that cover transportation, accommodation, meals and shopping), etc.

4. Creating a profile of Brasov tourists

Based on the results of the marketing research, creating a profile of Brasov tourists is possible. This profile is presented in the following table:

Table 8. A profile of Brasov tourist

	Features of Brasov tourist						
1.	Economics type Price is the most important attribute in choosing a vaca destination; most subjects get accommodation at friends, relatives.						
2.	Family guy	The satisfaction during a holiday can be obtained only with family.					
3.	Sedentary guy	Most of the Brasov tourists travel during the summer in order to get relaxation and rest, prefer journeys instead of circuits, don't go on vacation for sports, and don't like trips (trips are the last choices for going on vacation).					
4.	Unconfident type ⁵⁴⁵	Don't go to traveling agencies for vacations (they organize the holidays by themselves), don't buy online products, they ask close people for advice, don't take bank credits to go on vacation.					
5.	"Moderated" type	"Are willing to travel, not interested in weekend vacations, or in sports."					
6.	Light type	They focus on physical recreation.					
7.	"Sea lovers"	Most of them choose the seaside for a summer vacation.					
8.	"Mountain lovers"	Most of them choose mountain for a vacation.					
9.	"Rest lovers"	They travel to rest and relax.					
10.	"Traditionalists" ⁵⁴⁶	Appreciate safety and security and wish to avoid surprises, therefore they are looking for familiar destinations and vacations.					

Supplementary marketing research is necessary in order to emphasize opinions and attitudes of Brasov travelers towards different parts of the vacation package, as well as other components of the marketing mix (and the list goes on). This could lead to drawing a more complex profile of the Brasov traveler concerning the consumption and buying behavior.

Initially developed in order to allow human interactions in the virtual environment as online communities of people having common concerns and willing to share and exchange ideas, today social networks represent one of the online marketing tools with the highest potential employed aiming to maintain and enhance the relationships with the consumers having common interests and activities. Used daily by millions of consumers, the web-based social networks have provided an informal, personal and close to the consumer way of communication and sharing information.

The paper assesses in an exploratory manner the reasons determining the consumers to join and the activities conducted through the participation in a social network at a level of sample including respondents from what probably is the core segment of social networks users.

Keywords: social networks, online marketing, Romanian consumer

JEL Classification: M31

Introduction

Nowadays people's lives change very fast and the entire world seems to have a new shape from one day to another. That is the reason why the business environment and the companies need to be open minded in order not to lose ground in their competitors' favor. Each business person knows that it is important to adapt to the requirements of the changing market he operates in, if he wants to succeed. This is the reason why companies should adjust the instruments they use in order to attract new customers or to maintain the relationships with the existing ones.

It is known the fact that we live in a world where technology achieved a leading position, together with one of the most used devices, the computer, and in strong connection with the internet. This is the why companies have considered the online marketing and its tools as being very efficient in promoting their company and their products and services. They use all possible methods and instruments in order to communicate online: from email marketing, online advertising, search engine optimization, sponsored links or advergaming (which are intended to drive the user to the company's website) to e-newsletters, instant messaging, blogs and RSS feed, forums and online discussion groups and social networks (which are mostly used in order to maintain and develop relationships with the consumers).

The last ones mentioned are online marketing tools that can be used within the online communities. Those communities have appeared in order to allow human interactions in the virtual environment and proved to become important facilitators of social networking.

Literature review

Early in history there were attributed different definitions to the term of *community*; Hillery (1955) and Bell, Newby (1971) have given it a set of technical uses, while Willie (2000) emphasized the use of this concept in relation with social interactions, geographic areas and common bonding. Individuals and organizations acknowledged that the internet provides a low-cost environment and a place where they can meet and interact with each other and so, the phenomenon of online communities appeared and developed. They were defined as a collective group of entities, individuals or organizations that come together either temporarily or permanently through an electronic medium to interact in a common problem or interest space (Plant, 2004). Further in his paper, Plant (2004) identifies a three-dimensional model for the online community space: the degree of community regulation (unregulated and regulated communities), the degree of community openness to membership (open and private) and the degree to which a community is involved in profit activities (for-profit, not-for-profit and communities that overlap the for-profit or the not-for-profit regulated spaces).

The boost in the usage of the internet, the development of the online communities as well as the CGC (consumer generated content) are three of the main factors that influenced the launching and development of social networking. If is to consider that the online communities are the basis of social networking, since people can not network if they do not belong to a group, to a community, than the emergence of the social media, defined as a variety of new sources of online information that are created, initiated, circulated and used by consumers intent on educating each other about products, brands, services, personalities, and issues (Blackshaw and Nazzaro, 2006), has changed the way organizations communicate with customers and played a significant role in the development of the social networks.

It is to be mentioned the fact that in our research we have made a difference between the concepts of *social networks* and *social networking*. Social networking satisfies the need of the individuals to be connected in the online environment and it aims to facilitating information, knowledge, experience, opinions and documents sharing, as well as to serve entertainment or transactional purposes. Social networks (or social network sites), together with the blogs, RSS feeds, forums, discussion groups, podcasts and wikis are online marketing tools that the internet provides which have as main objective to ease social networking. Social networks have been defined by Boyd and Ellison (2007) as web-based services that allow individuals to (1) construct a public or semi-public profile within a bounded system, (2) articulate a list of other users with whom they share a connection, and (3) view and traverse their list of connections and those made by others within the system. The nature and nomenclature of these connections may vary from site to site.

Compete.com has posted on the company's blog top 25 of the most accessed social networks in February 2008, by the US internet users, and the first positions were occupied by myspace.com (65.744.241 monthly visitors), facebook.com (28.563.983 monthly visitors) and classmates.com (11.978.068 monthly visitors); hi5.com, linkedin.com and tagged.com being ranked on the 8th,9th, respectively 10th position. In the following year, there were listed the most used social networks in terms of monthly visitors and visits, by the US internet users; facebook.com has taken the lead (68.557.534 monthly visitors and 1.191.373.339 monthly visits), being followed by myspace.com (58.555.800 monthly visitors) and it is surprising to find on the 3rd position twitter.com (5.979.052 monthly visitors), since in February 2008 it was situated only on the 22nd place (629.531 monthly visitors); hi5.com has lost ground, being situated on the 15th rank, while linkedin.com and tagged.com have achieved the 5th and respectively 6th position. According to comeScore.com, at the level of Europe, facebook.com has been accessed by about 99.776.000 unique visitors in February 2009, as compared with February 2008 when there were only approximately 24.110.000 unique visitors; facebook.com is the most preferred and accessed social network in most of the European countries.

Methodological Notes

The specific objectives to be reached through the present exploratory research approach referred to the main aspects concerning the social networks: the associated degree of awareness, participation within, reasons of participation and behavioral patterns related to the social networks. Questions concerning the social networks and networking had represented only a specialized part inside of a consistent questionnaire approaching all the tools consumers are exposed through the online marketing campaigns conducted in the market. Data have been collected online in March-April 2009. The sample has included 124 respondents (61 male and 63 females), aged 18 to 29, from Bucharest. Focus on this category, called in the marketing literature and better known as the Generation Y, is motivated by the significantly higher penetration and, respectively usage of the internet and, particularly of the social networks at the level of affiliated consumers.

Major Findings

Social networks seem to be characterized by an awareness of 100% as all the respondents have answered indicating that they know about at least one network. The best in terms of the awareness networks are Hi5 (mentioned by 119 respondents representing 96.0% of the investigated sample) and Facebook (102, respectively 82.3%). It is important to specify that the awareness of social networks, as it has been defined in the context of this research approach, refers to the assisted (and not spontaneous) awareness. MySpace has a relatively good awareness among the respondents being mentioned by two-thirds of the investigated sample while Netlog appears to be characterized through an average degree of awareness (with almost a half of the sample recognizing it).

Group of the less-known social networks includes LinkedIn, Noi2, Ringo, respectively Delicious and some other networks (Ce-faci.ro, Ingeri.ro, Last.fm, Neogen, Twitter). This situation can be explained due to the certain degree of specialization of the network (Neogen) or the fact that some of these networks are Romanian (Ce-faci.ro).

Table 1. Social networks awareness and participation at the level of the investigated sample

Social Networks	Awareness		Participation	
Social Networks	Frequency	Percentage	Frequency	Percentage
Delicious	9	7.3	2	1.6
Facebook	102	82.3	45	36.3
Hi5	119	96.0	102	82.3
LinkedIn	23	18.5	6	4.8
MySpace	84	67.7	20	16.1
Netlog	56	45.2	20	16.1
Noi2	22	17.7	4	3.2
Ringo	22	17.7	1	0.8
Other	5	4.0	4	3.2

Notes: "Other" includes Ce-faci.ro, Ingeri.ro, Last.fm, Neogen, Twitter (in the case of awareness), respectively DeviantArt, Ingeri.ro, Last.Fm, Twitter (in the case of participation); networks arranged alphabetically.

Participation in the social networks appears to be maybe too low if is to consider as reference the awareness of these networks. With the exception of Hi5, with an impressive weight of the respondents owing and using a profile (82.3%), all the other networks are less used at the level of the investigated sample.

Connecting the awareness and the participation in the social networks it can be determined an indicator of penetration of the social networks as a weight of the profile owners in the total number of respondents that have heard about a certain social network. The highest degree of awareness, as well as the highest weight of the respondents having a profile makes Hi5 the social network with the best penetration rate (85.7%) followed at a significant distance by Facebook (44.1%) and Netlog (35.7%).

LinkedIn (26.1%), MySpace (23.8%), Delicious (22.2%) and even Noi2 (18.2%) form a group characterized by a rather poor penetration while Ringo (4.5 %) appears to be the network with the poorest both awareness and participation.

Participation within a social network can be motivated by different factors. Probably, the most important one is that referring to the social aspects of the respondents' day-to-day life – communication with the friends and / or relatives, dating and / or flirting, making new friends, while the second in terms of importance refers to the entertainment and informational role associated to this online marketing tool – enjoying different things, online gaming, and getting interesting information about different products, services, brands, events, etc., see Table 2).

Table 2. Reasons for participating in the social networks at the level of the investigated sample

Reasons	Frequency	Percentage	
Communication with friends	81	65.3	
Dating / flirting	9	7.3	
Enjoying different things	56	45.2	
Getting interesting information	24	19.4	
Making new friends	43	34.7	
Online gaming	17	13.7	
Personal branding	19	15.3	
Relationship with business partners	5	4.0	
Supporting public persons	5	4.0	
Supporting products, organizations, campaigns	4	3.2	

Social networks seem to be very close in achieving their mission, at least at the level of the generation Y, as two-thirds of the respondents use them as a communication platform with friends. The *networking side* of the social networks employment appears to be illustrated by the respondents' desire to make new friends, which represents a reason to participate within a social network for one-third of the respondents, or even through using the connections in the more sensitive area of the personal relations for dating and flirting. The *social side* of the social networks employment is less visible as a determinant reason for participation in a network: the desire to support the public persons, products, organizations and campaigns is characteristic for a minority of the respondents.

Infotainment, a combination of spending the time in a pleasant and, in the same time, useful way, appears to provide a relatively strong motivation for accessing and participating the social networks: almost a half of the respondents seek to enjoy the content available within the network, one out of five search for interesting information and one out of seven play online network games.

Personal branding represents another interesting reason for participation in the social networks. The percentage of respondents that have mentioned the possibility to build or enhance their personal brand can be explained, on a hand, through the intrinsic opportunities offered by the social networks (from which the most important may be the access to a community of people sharing the same interests, beliefs, and lifestyle) and, on the other hand, a kind of replication of the businesslike behavior (participation in a social network may be of the same importance for an individual like having a website for an organization).

Relationships with business partners represent a reason for accessing and participating in the social network for a small minority of respondents. The results can be explained by the demographic profile of the respondents (that are, probably, too young to have business partners and to manage communication or other type of relationships with them) and by the relatively limited employment of the social networks for business-related purposes (and when happening, this is possible in specialized networks such as LinkedIn).

What are the respondents doing using social networks? Searching for old friends (and, probably, making new ones) represents the main type of activity conducted through the participation within a social network, as more than a half of the investigated sample does this (see Table 3). One-third of the respondents use the social networks to deliver the community their ideas, to discuss and exchange them even, for one out of ten respondents, inside more specialized networks (comparable with the special interest groups).

Table 3. Behavioral patterns within the social networks at the level of the investigated sample

Patterns	Frequency	Percentage		
Accessing commercial links	16	12.9		
Activating in thematic networks	12	9.7		
Delivering/exchanging ideas	41	33.1		
Searching for a job	14	11.3		
Searching old friends	68	54.8		
Self-promoting the profile	35	28.2		
Supporting a/an brand/person, event	6	4.8		

Self-promotion of the personal profile appears to be important for almost one out of three respondents and this may be seen in connection with the opportunities for personal branding as a reason for participating in a social network. Accessing the commercial links and searching for a job represent activities done by slightly more than one out of ten respondents suggesting that although there is an important potential in these directions, the social networks have, like the concept itself implies, a rather social and not a business and / or commercial dimension.

Conclusions and Future Directions of Research

Of course, it is difficult to draw conclusions about the social networks development and employment after an exploratory research approach conducted at the level of a rather specific group of consumers. The results of the study are significantly limited by the nature of the sample and this should be one of the further improvements to be made in terms of the research methodology. Another important limit of the study is represented by the orientation of the questions towards the obvious aspects of the existence and employment of the social networks.

Still, there are several facts that have been observed based on the results provided by this exploratory approach:

- awareness of the social networks seems to follow the same pattern at the level of the investigated sample with that registered worldwide: Hi5, Facebook and MySpace are the most well-known networks for the Bucharest, 18-29 years old respondents;
- there is a significant distance between being aware of a social network and owning an account and participating effectively within the network. Hi5 is the social network with the best penetration rate followed at a significant distance by Facebook and Netlog;
- social networks seem to be very close in accomplishing their mission being used mainly as a communication platform. The *networking side* of the networks employment is more visible while the *social side* appears less important as a determinant reason for participation in a network;
- communication with the friends and / or relatives, enjoying different things, and making new friends are the main reasons for accessing the social networks; while maintaining a relationship with business partners, and supporting public persons, products, organizations and campaigns represent peripheral motivators for joining and participating within the social networks;
- searching for old friends, delivering and exchanging ideas, and self-promotion of the personal profile represents the main type of activities while supporting brands, persons, and / or events is the least conducted one through the participation within a social network. The social networks have, like the concept itself implies, a rather social and not a business and / or commercial dimension.

Further directions of research to be considered refer to the:

- expanding the dimension of the investigated population through getting out from Bucharest and covering the whole country (including the urban and rural areas), respectively through extending the demographic profile of the sample covering not only the group aged 18-29, but also consumers from other categories (at least members of the active population):
- increasing the complexity of the information generated through the research by introducing supplementary questions about joining, participating and the experiences registered within the social networks and also through the analysis conducted at the level of sub-samples including users of the main social networks.

The paper investigates the challenges and opportunities that entrepreneurial university faced in the present context, focusing on some characteristics of Romania and Lithuania. Emerged as a concept that is designated to enhance the university's competitiveness, by integrated more efficient the business environment requirements, with the particularities of the higher education process, entrepreneurial university concept still raise a lot of comments. A large literature has developed around the concept. However, countries from Eastern and Central Europe constitute a particular example, as long as their experience in a market economy is limited. It is in the intention of this paper to explain some of these characteristics and why this hybrid concept is fragile in demonstrating the efficiency of higher education.

Keywords: entrepreneurial university, higher education, competition

JEL classification: L26, L29, I23, A23

1. Towards an entrepreneurial university: some reasons

The concept of entrepreneurial university emerged as a response to a fast changing business environment and to the necessity to delivered graduates more capable to solve more and more complex problems that business face in the era of globalization.

Entrepreneurial university is, also, a mixture between a new form of management and the old style university, a combination of new and old practices in a revised, up-to-date form of organization. As Clark pointed out, "entrepreneurship, is not a management posture that serves only new ventures in science and technology; it operates throughout the university. Its remit includes the protection of traditional fields necessary for a high level of competence. Entrepreneurial transformation not only builds new foundations for collegiality and autonomy, but also new foundations for sustainable achievement across the many fields of research, teaching, and student learning that a particular university encompasses" (Clark, 2001:21).

A number of causes have determined changes in viewing universities as something else than an ivory tour in which some bizarre people is looking for the absolute true.

The society development induces major changes after the Second World War, especially starting with the '80. The crisis of that period determined new orientation through technology; new specialization emerged in the curricula of universities. Traditional areas of study entered in competition with new, attractive specialization that gave to the graduates a greater employability. Especially in the last two decades, the concepts like "knowledge based economy" imposed a strong relation between information technology and the society. Turning from fundamental research to the development of applied research and make available education in forms of delivery agreeable to companies and public sector organizations determined a new approach of the role of the universities (Gibbons, 1998). More than that, adopting "the entrepreneurial behavior", a university "...stresses a forward-looking orientation, a willingness to seek out the new frontiers of knowledge" (Clark, 2001:22). Stanford is typically featured as an example among universities generating innovations that lead to new technology-based firms; Stanford entrepreneurial activity is often treated as virtually synonymous with the birth of Silicon Valley (Lenoir et al. 2004).

A larger access to education, especially to higher education, induced a growing competition among universities, from how to attract more students to how to receive more funds. Globalization of higher education, via internet and modern technologies increased the competition.

Financing a larger number of higher education institutions started to become a real challenge for governments and private organization, imposing establishing performance criteria that should distribute limited resources to unlimited needs. The limitation of financial resources constituted an important factor that determined many universities to turn to entrepreneurial characteristics, in order to attract more funds from industry. As knowledge is becoming an increasingly important, crucial, part of innovation, the university, as an institution that produces and disseminates scientific and technological knowledge, is much more important to industrial innovation(Marquesa, Carac, Diz, 1998).

The changes that labor market has came across the last decades created new pressures on higher education activity. Graduates are asking not only for those knowledge, skill or capabilities necessary for a larger and longer employability. More than that, they are asking for those knowledge, skills or capabilities required for adapting to different jobs or for "a package" that permit to enter into the world of business. In this context, those universities

capable to demonstrate a strong cooperation with business environment are considered to be more connected to the real world, and are more attractive for students than traditional universities.

In the present context, the dynamism of the society constitutes opportunities for entrepreneurial universities. All the causes briefly examined above are, in fact, opportunities that determined universities to orient to a more entrepreneurial behavior.

Nevertheless, there are some challenges that entrepreneurial universities face, especial in the last two decades, characterized by tremendous transformations in the entire society.

One pressure is coming from the difference between the dynamic of this two domains: industry and higher education. Enterprises are more flexible that universities, and, more than that, universities are "producing for the future", as long as enterprises produce for the present. Entrepreneurial universities are more vulnerable than traditional ones, as long as the path of changes in a university curricula can't be done so easily as the environment dynamics is asking for Universities' capacity to adapt to the market requirements can imbalance its identity.

Another threat appears to come from the structure of the university. As Clark pointed out "...traditional or entrepreneurial, old or new, the university is thereby turned uniquely into a bottom heavy form of organization. The work does not get done unless the various local academic tribes do it" (Clark, 2001:22). The academics are those who have to transform the university into a functional entrepreneurial entity and they have to consider that this is in their interest, personal and professional. Without this believes, management is less power and the success of such venture is hazardous and less efficient.

Many times, entrepreneurial university concept induces the idea of profit. Seeking profit tend to be, in some cultures, less appropriate to education, that supposed to have more altruistic objectives. For the management of entrepreneurial universities, looking for profit can transform easily into a goal itself, forgetting the fact that entrepreneurial mean more an attitude, a culture than a set of indicators or abstract figures in the sheet balance. As Davies mention, "...the entrepreneurial culture is generally characterized [...] by the ability to evaluate those ventures, learn collectively from experience, and transfer the essence of experience across the university" (Davies, 2001: 27)

2. Some characteristic of the entrepreneurial behavior of the universities in Romania and Lithuania

Despite their differences in geographical characteristics, Romanian and Lithuanian higher education are not so different in their essence. Both countries are coming after 50 years of communist, a period that inhibited any form of autonomy. Starting with '90, higher education system suffers tremendous transformation. Private universities emerged, the number of students exploded and stakeholders become more interested about the performance that higher education institutions can guarantee.

Lithuania is a one of the Baltic countries, with a population of 3,369,600 inhabitants. There are 22 universities in Lithuania, and one third of them have been established after 1991, the year when Lithuania proclaims its independence after the collapse of the former Soviet Union.

With a population almost seven times larger than Lithuania, Romania's higher education system evaluated after 1990 in a similar way. Many private universities were established after the Revolution. According to official data, in Romania are 107 higher education institutions (universities): 54 state universities, 27 private universities accredited, 21 authorized private universities and 5 private universities in process of accreditation. There are around 738 000 students in Romania, comparing to 195 000 students in Lithuania. Even though there are a lot of comments⁵⁴⁷ which consider that there are too many students, it is interesting that in relative terms, Romania has significant fewer students per 1000 inhabitants (33) than Lithuania (60) and even less than the European average (38).

In both countries, the reform in the higher education introduced elements minted to develop entrepreneurial attitude for universities. Requirements established for promotion, accreditation and other assessments criteria for higher education institutions and for faculties, were choose in order to promote a vision capable to create synergy between research and learning, between industry and educational system. This synergy was consider to be powerful enough for creating a new class of graduates, more oriented to market economy principle, more competitive for the labor market, more independent for taking risks, and more willing to assume an entrepreneurial behavior.

However, many universities from both countries viewed this opportunity as a threat, as an abandonment of classical conception of what should be a university and as a threat to their job security. Fear from new, fear from competition was not only a feature of the beginning of the reform, unfortunately becomes a permanent condition that undermined the good aspects of establishing a real entrepreneurial attitude of universities.

It is not less true that for the management of some universities the concept of entrepreneurial university was misunderstand. It was considered to be similar with having a profitable activity, and gaining profits was the principal goal of their entities. Especially private universities, forced also by the legislation, transformed a qualitative concept into a quantitative goal.

⁵⁴⁷http://epp.eurostat.ec.europa.eu/portal/page?_pageid=1996,39140985&_dad=portal&_schema=PORTAL&screen=detailref&language=e n&product=Yearlies_new_population&root=Yearlies_new_population/C/C1/C11/caa10000, view at 26/04/2008

It should be mention that it is very difficult to transform, even after 20 years of democracy, universities from Romania and Lithuania into entrepreneurial institution. Entrepreneurial behavior is not only the responsibility of universities; it should be a result of cooperation, at least between industry and higher education system. In both countries, industry itself face tremendous transformation, and business environment is still in its infancy, having problems in understanding the fact that universities can be a partner for them (Zaharia, Zaharia, Gardu 2008).

The demand for knowledge is still large in universities from Romania and Lithuania, and the research is still poor. Financing research in universities is one of the most dramatic and complex aspect in higher education, not only because the funds for research have been very small, or because the culture for research is still confuse. The private business environment is not interested in research that can be developed by universities and industry is still convinced that the main purpose of a university should be education, not research (Zaharia, Zaharia, Gardu, 2008).

3. Conclusions

Entrepreneurial university is a powerful concept that determines a symbiotic link between research in universities and industry, and emerged as a result of the growing role that higher education institutions play in social and economic development. Entrepreneurial university is, also, a mixture between a new form of management and the old style university, a combination of new and old practices in a revised, up-to-date form of organization.

A lot of reasons stayed at the foundation of turning universities to an entrepreneurial culture or attitude: the growing competition in a more globalize world, the shortage of governmental resources oriented to research university, an increasing demand coming from students not only for a longer employability, but rather for an attitude that permit to enter in the world of business.

However, entrepreneurial university is vulnerable, as long as there are important differences between the two systems and the dynamic of the business environment is much stronger then that of higher education institutions. Countries like Romania and Lithuania are at the beginning of transforming this concept into reality. The transformation is imposed by the dynamic of market forces and by the necessity of reform in higher education. Though, it seems that neither universities nor, most of all, industry is prepared to act in the spirit of a fruitful, long-term relationship. Economic difficulties, the immaturity of the market economy in these countries induce a high vulnerability in what should be a partnership.

LES COURTIERS EN INFORMATION – UNE NOUVELLE TENDANCE DANS LA RESTRUCTURATION DES CHAÎNES DE DISTRIBUTION

Zait Luminita

Universitatea din Bacău Facultatea de Științe Economice Mărăsesti 156 zait.luminita@yahoo.com Tel.0747110154

The profound competitive modifications found on majority of markets, either developed or emerging, are a direct result of sectors globalization phenomena. This result is related to technological and communication progress. Restructuring of the distribution channels brings another modifications in typology and nature of specific distribution operations, one of this modification being the emerging of a new concept – informediars or information courtiers.

Mots clé : les courtiers en information, désintermédiation, le meta marche.

JEL M31

1. Les tendances actuelles - la croissance en pouvoir des distributeurs et l'impact de l'Internet au niveau des marches.

Les profonds changements compétitifs enregistrés sur la plupart des marchés, qu'ils soient développés ou en développement, représentent un résultat direct du phénomène de la mondialisation dans le cas d'un grand nombre de secteurs. Cette évolution a été alimentée par le progrès technique, mais aussi par celui de la communication qui a aussi une importante composante technologique.

En effet, le nouveau contexte a également généré, parmi d'autres conséquences, une croissance en importance des grands distributeurs au niveau des chaînes classiques. Par exemple, la distribution des produits alimentaires a connu des changements importants. Si antérieurement les stratégies de marque avaient des accents agressifs et étaient soutenus par des efforts importants de communication orientés vers le consommateur final, dans les années '90, aussi bien en Europe que dans les entreprises américaines, les intermédiaires ont commencé à devenir entrepreneurs, tout comme les fabricants, en se concentrant sur la marque drapeau, basée sur une combinaison de marques propres et de marques des producteurs.

Parmi les facteurs qui ont favorisé cette tendance, on retrouve: la concentration de la distribution qui contrôle une partie importante des revenus d'une famille; la création de véritables centrales d'achat au niveau européen qui offrent aux détaillants un pouvoir de négociation considérable; la mise en place de lecteurs optiques pour les codes de barres, l'enregistrement instantané du volume de ventes et d'autres informations qui offrent aux distributeurs un grand pouvoir; l'adoption, par les grandes surfaces de ventes, des stratégies visant à accroître la segmentation, souvent négligées par les fabricants ou trop coûteuses à mettre en œuvre; la réduction de la crédibilité des actions publicitaires grâce à la professionnalisation des acheteurs à ce stade.

Pour ce qui est du réseau de distribution, on a enregistré également à ce niveau d'importants changements. Même si maintenant, la plupart des biens et des services sont encore vendus par le biais des canaux de distribution classiques, l'Internet offre de réelles possibilités aux spécialistes du marketing d'atteindre directement les cibles visés, sans avoir à encourir les coûts élevés et les obstacles associés aux canaux de distribution classiques, phénomène appelé désintermédiation548. Par exemple, Stephen King, l'un des plus célèbres auteurs de «best-seller» en Amérique, a vendu son dernier ouvrage exclusivement par le Web, et les exemples peuvent continuer dans cette direction.

Dans ce contexte, la vente via le Web offre de nombreux avantages pour les auteurs qui recourent à cette nouvelle forme de distribution tels: le fait que les revenus obtenus ne sont plus divisés entre l'auteur et les éditeurs ou bien d'autres intermédiaires et que les clients bénéficient à tout moment et où que ce soit dans le monde, d'une livraison immédiate, étant prêts à payer les montants dérisoires afin de visualiser le contenu.

Concrètement, ce nouveau système de distribution fournit une plus grande disponibilité de l'offre, améliorant les utilités de temps et de lieu, comme composantes fondamentales de l'attitude de marketing, offrant évidemment une valeur plus élevée aux clients potentiels. Par exemple, dans le cas présenté ci-dessus, plus de 150 000 de lecteurs ont été enregistrés au moment du lancement du produit en juillet 2000. Il semble que cette nouvelle forme de distribution est utilisée avec prédilection pour la commercialisation des produits qui ont connu une forte diminution des ventes au niveau des chaînes classiques, tels les livres. Dans la même direction, un fournisseur de livres reconnu au niveau global - Random House Inc. a exprimé ses plans pour l'avenir, à savoir fournir les versions électroniques de plus de 100 œuvres pour le prix de 4,95 euros. En effet, à la vente directe, Random House a préféré sa commercialisation par l'intermédiaire des sites spéciaux tels Shakespeare.com et des détaillants ayant des affaires en ligne Ainsi, l'édition a restructuré sa chaîne de distribution bénéficiant des avantages offerts par le Web.

548 Ernst&Young, - Global on line retailing, an Ernst&Young Report, Stores, 2000.

_

Cependant, renoncer à la distribution classique ou restructurer certaines chaînes ne doit pas se faire de manière superficielle, les éléments du conflit étant inhérents au niveau des réseaux classiques. Par exemple, Levi Strauss s'est heurté à des conflits dans le canal conventionnel au moment où il a décidé de commercialiser ses produits directement aux consommateurs, via le web. En fin de compte, l'entreprise a été contrainte de retirer son offre en ligne, en grande partie à cause des protestations exprimées par les membres des canaux conventionnels.

Des préoccupations similaires ont été enregistrées dans l'industrie du tourisme, où les diverses compagnies aériennes ont essayé de renoncer aux intermédiaires classiques, en vendant directement ses billets et d'autres services aux clients, via le Web.

Toutefois, malgré ces tendances manifestées aussi bien au niveau mondial que national, il y a des partisans de la distribution classique, les arguments invoqués étant liés à la nécessité d'assurer les flux qui composent l'activité de distribution.

Les organisations qui souhaitent renoncer à la distribution des produits par le canal classique doivent identifier également la manière dont les fonctions exercées par les membres de la chaîne seront remplacées, à savoir: prospecter le marché, prendre des commandes, fournir des produits, assurer les flux financiers, etc. Dans ce cas, on devrait évidemment accorder une grande importance à la quantification en termes d'efficacité de l'entreprise, pour renforcer les arguments du choix de cette nouvelle forme de distribution.

2. Les courtiers en information

La restructuration des canaux de distribution a introduit un certain nombre de changements dans la nature et le type d'opérations effectuées, la littérature de spécialité mentionnant souvent pendant la dernière période un nouveau concept, à savoir celui **d'entremetteurs** ou de **courtiers en information**⁵⁴⁹.

Quel que soit l'objet de son activité, l'organisation moderne peut disposer de multiples façons d'aborder les cibles visés et d'atteindre les objectifs fixés, n'importe leur nature qualitative (la réputation de la marque, l'attachement des cibles visés à leur marque ou le fait d'obtenir une image favorable) ou quantitative (l'augmentation du chiffre d'affaires et du quota, l'efficacité de son activité, etc.). Les modèles d'affaires sont mis en œuvre afin de soutenir ces efforts, mais ils exigent un ajustement en fonction du secteur d'activité, le contexte dans lequel les organisations opèrent, la spécificité interne et les objectifs définis.

Un tel modèle a été proposé en 2000 par le célèbre site NetZero, comme une solution à la professionnalisation des informations sur le marché dans l'économie fondée sur la connaissance. Le modèle, connu comme le modèle des courtiers en information, a comme principe de base la capture des informations du marché et leur diffusion vers les parties intéressées, son utilisation exigeant, dans une première phase, le simple enregistrement sur un portail; plus précisément, les organismes intéressés sollicitent leur enregistrement dans le système, pour obtenir les informations qui présentent intérêt pour leur activité, ces données pouvant ensuite être utilisées pour la mise en oeuvre des démarches du marketing direct. La mise en œuvre de ce modèle a été réalisée par le même site, NetZero, qui, offrant 40 heures d'accès gratuit à l'Internet, a réussi à recueillir des informations provenant de plus de 8 millions de consommateurs.

Prenant des éléments de la pratique, la littérature de spécialité a essayé de définir ce nouveau concept. Ainsi, dans un ouvrage intitulé, The Network is the Infomediary. Shaping Markets When Customers Make de Rules, deux auteurs américains, John Hagel et Marc Singer, définissent le concept de courtiers en information comme étant "les organismes qui gèrent les informations obtenues auprès les clients pour le profit des clients' 1550. A la différence du niveau des connaissances offertes par la pratique, les deux auteurs soulignent un élément extrêmement important reposant sur la différence entre les courtiers en information et les entreprises de marketing direct: les courtiers en information sont des protecteurs de la vie privée des consommateurs.

Dans la même direction, Audrey Knauf, dans un article intitulé The Role of Infomediary in an economic intelligence process, mettait à la base de sa définition des courtiers en information la terminologie du concept. Selon cet auteur, le terme de courtier en information représente ,,un concept formé à partir du néologisme de la fusion de deux éléments – l'information et l'intermédiaire''. Le terme indique, dans l'opinion de l'auteur, "la source d'information ou de la communauté qui, à partir de l'information fournie par le client, génère des liens dans un système composé par des organisations intéressées à ce type de données',551.

Malgré le fait que la définition de la notion n'est pas stabilisée, comme démarche, au niveau de la communauté scientifique, existant de nombreuses critiques⁵⁵², relatives à la nature des courtiers en information⁵⁵⁴ - personne

physique, organisation ou portail, on peut dire qu'il y a les prémisses du développement de ce concept, à savoir le comportement des consommateurs par rapport aux activités actuelles de marketing.

En principe, les consommateurs n'ont ni le temps ni la patience ou la capacité de chercher toujours les meilleurs choix d'affaires en ce qui concerne l'offre existante au niveau du marché. Pour que le client potentiel bénéficie des meilleurs types de relations avec les fournisseurs, il faut un troisième type de structure, plus précisément de confiance, qui doit jouer le rôle de mandataire, d'intermédiaire ou de courtier en information. L'existence des courtiers en information au niveau du marché repose sur l'argument que, agrégeant les informations de la part des clients et utilisant le pouvoir de marché résulté, ils obtiennent des compétences dans la démarche de négociation avec les fournisseurs, au nom des acheteurs.

Les entreprises qui jouent le rôle d'intermédiaires en information sont, donc, des agents ou des courtiers en information spécifique du consommateur, la mettant à la disposition des entreprises sur le marché et protégeant à la fois son caractère privé. Ces nouvelles entités sont le fruit de la fusion des marques fortes et d'une cohérente gestion de relations avec la clientèle, tout cela ayant à la base de nouvelles stratégies de marketing. En outre, les mêmes entités sont des catalyseurs pour les consommateurs qui cherchent la valeur en échange des informations personnelles. En offrant une variété de services de marketing, associés à la position d'agent, les courtiers en information soutiennent les consommateurs dans leur démarche de réduire les coûts qui résultent de l'interaction de la recherche de produits à des prix favorables, dans le contexte de la prolifération des produits complexes.

Grâce à la valeur offerte aux consommateurs, en particulier sur la dimension financière, liée à la réduction des coûts d'interaction, les courtiers en information sont présents sur les marchés où, soit les lignes de produits sont rapidement modifiées et ont un caractère complexe, soit le prix est «opaque» et sa compréhension est problématique pour le consommateur.

Les produits présents sur ces marchés demandent, souvent, une activité consistante de recherche et d'évaluation de la part du consommateur, contexte auquel le prix des différents fournisseurs ne peut plus être considéré comme une norme de la qualité. En raison du fait que les individus interagiront, dans une première étape, avec les courtiers en information, sur Internet et parce que les services que ces derniers offrent sont caractérisés par un haut contenu d'information, les fournisseurs d'information trouveront un terrain fertile pour le développement de leurs activités sur les marchés où les produits et les services ont un haut contenu d'information et peuvent être livrés en format numérique.

En fait, le rôle des courtiers en information est un rôle traditionnel. Au fur et à mesure que les consommateurs prennent le contrôle sur leurs comportements et données transactionnelles, une nouvelle forme d'offre d'information apparaît. En connectant l'offre et la demande d'information, afin d'aider les deux parties dans la prise de conscience de la valeur des informations, les courtiers d'information construisent une nouvelle architecture de la chaîne de l'information, fournissant un pont de liaison qui a le rôle de réduire l'écart entre les consommateurs et les spécialistes du marketing.

Obtenir des informations sur les consommateurs et leur utilisation commerciale, ce n'est pas une idée nouvelle; de nombreuses industries, par exemple celle constituée des entreprises de marketing direct, ont eu à la base une telle idée. Mais les courtiers en information ne doivent pas être confondus avec ce type d'opérateurs ayant pour objet d'activité la commercialisation de données sur les consommateurs. Les listes et les bases de données, comme outils de la démarche de marketing direct, sont construites par des entreprises pour les vendre à des tiers, leur but principal étant celui d'aider les opérateurs à obtenir un volume élevé de ventes sur les marchés destinataires. Les risques d'abus dans ces cas, soit bénins sous la forme des junk-mails, soit sous des formes plus dangereuses, sont extrêmement élevés.

En revanche, les courtiers en information ne voient et parfois ne détiennent pas les profils de consommateurs qu'ils gèrent. Ils jouent seulement le rôle d'agents ou de dépositaires pour les consommateurs. Dans cette approche, les courtiers en information doivent agir agressivement afin de représenter les intérêts des clients par rapport aux fournisseurs, et de générer, dans les limites d'un commerce éthique, un niveau satisfaisant de la maximisation de la valeur pour les vendeurs. Pour offrir de nombreuses possibilités de choix aux clients potentiels, les courtiers en information cherchent à mobiliser le plus de fournisseurs de la catégorie de produits sollicités, ce qui donne pertinence a leur rôle d'intermédiaires.

Les courtiers en information ne détiennent pas de portefeuilles de produits, mais ils offrent des services liés à la transmission du message de marketing, afin de faciliter les transactions, recevrant en échange une remise pour mettre en contact l'acheteur et le vendeur.

C'est dans le but d'être incluses dans la catégorie des courtiers en information que les entreprises de profil devraient accomplir d'une manière cumulative les fonctions suivantes⁵⁵⁵:

- la réduction des coûts liés aux démarches d'identifier et de choisir les produits et les services qui répondent aux besoins, aux désirs et aux attentes des consommateurs;
- la détermination des meilleurs prix pour les biens et les services demandés;

55

⁵⁵⁵ Hagel, J., Singer, M., - Net Worth: Shaping Markets when Customers Make the Rules, Harvard Business Press, 1999, 313 pg., ISBN 1578512352.

- la protection des consommateurs contre les intrusions indésirables par les spécialistes du marketing et, en même temps, leur mise en garde contre les nouveaux produits et services vraiment nécessaires;
- la protection des renseignements personnels des consommateurs et, s'ils souhaitent, leur mise à la disposition des spécialistes du marketing.

Dans leur démarche de protéger les consommateurs et d'ajouter de la valeur aux fournisseurs, les courtiers en information assument trois tâches principales:

- la création d'un ensemble d'outils pour protéger la vie privée des consommateurs, ce qui permettra aux fournisseurs d'éviter l'obtention d'informations concernant les cibles visés, lors de l'exécution des transactions;
- la création d'un ensemble d'outils de profilage, afin de soutenir les efforts visant à obtenir des renseignements sur le consommateur:
- l'offre d'une grande variété de services afin de maximiser la valeur de ces profils pour le consommateur.

Les instruments destinés à protéger la vie privée des consommateurs et les instruments de profilage assurent une puissante plate-forme pour fournir de divers services. Cette boîte d'outils crée un capital unique, à savoir celui du profil détaillé et intégré du consommateur, disponible seulement pour les courtiers et leurs clients. En effet, la proposition des courtiers en information réside dans la maximisation de la valeur de ce capital pour ses propres clients, en concordance avec la nécessité de protéger leur vie privée.

Les services offerts par les courtiers en information à ses clients peuvent inclure⁵⁵⁶: le filtrage ou la sélection des produits et services offerts par les fournisseurs, services de type agent, services commerciaux d'acquisition et divers services de gestion et d'analyse des données.

Les services visant *la sélection* ou *le filtrage* se réfèrent à l'identification et à la sélection de produits et de services de marketing intrusifs ou non désirés, qui sont adressés aux consommateurs. Les courtiers en information développent un filtre à l'aide duquel ils peuvent évaluer les emails commerciaux et exclure automatiquement les spams, qui ne correspondent ni aux besoins ni aux préférences des consommateurs. Pour la mise en place de ces services, les clients doivent préciser, tout d'abord, quelles sont les catégories de produits ou de fournisseurs à inclure ou exclure au niveau des services de filtrage ou de sélection.

Si les services de filtrage s'adressent à la nécessité de protéger la vie privée des consommateurs, *les services de type agent* visent la nécessité de surmonter les difficultés résultant de l'exposition à une offre qui prolifère, de plus en plus, les produits complexes. La pratique nous a démontré que les consommateurs ont tendance à supporter des coûts de plus en plus élevés dans l'interaction générée par la recherche du produit convenable, à un prix optimal. Les services de type agent fournis par les courtiers en information visent justement la réduction des coûts de ces interactions, aidant ainsi les consommateurs dans leurs démarches à optimiser le processus d'identification et de sélection des produits. En outre, s'il est nécessaire, les courtiers en information peuvent aider à la création des opérations de type vente aux enchères, auxquelles les fournisseurs sélectionnés peuvent participer. Il faut mentionner un aspect important dans ce contexte, à savoir la possible réticence des fournisseurs à l'encontre de ces appels d'offres, mais la capacité des courtiers en information de fournir un nombre important de clients peut finalement conduire à l'élimination de ces hésitations.

Les courtiers en information peuvent également offrir des services *commerciaux de vente*; en d'autres termes, ils peuvent vendre, au niveau de ses clients, la disponibilité de recevoir des messages de marketing des fournisseurs. Les courtiers en information transmettent aux clients les messages de marketing qui correspondent au profil défini. Il este nécessaire de mentionner que l'opportunité d'adresser ces messages aux consommateurs est fondée sur leur confiance dans l'offre des vendeurs; la protection de la vie privée des consommateurs sollicite aux courtiers en information de ne pas fournir aux fournisseurs l'identité et le profil des consommateurs.

Grâce à l'ensemble des outils de protection de la vie privée, les consommateurs, qui sont les clients des courtiers, vont rester anonymes, même s'ils achètent en ligne. Les individus qui sont prêts à décliner leur identité pourront bénéficier des avantages financiers tels: ils recevront une rétribution modique du vendeur chaque fois qu'ils déclineront leur identité ou leurs emails. Ces services sont connus en tant que *services commerciaux d'acquisition*. La dernière catégorie de services offerts par les courtiers en information est celle de *la formation et de la diffusion des rapports périodiques*, qui résument les opérations et d'autres activités des consommateurs dans le réseau. Ces analyses aident les consommateurs à améliorer l'efficience et l'efficacité dans des domaines tels: le budget financier, la gestion du temps et la gestion des comptes de frais. La condition pour que ces services soient fournis, c'est de créer des profils profonds et complexes, même pour les fournisseurs.

Conclusions

_

A partir de tous ces aspects, on peut dire que les courtiers en information déclenchent un cycle fructueux: plus les vendeurs sont disposés à ajouter de la valeur aux consommateurs, plus ces derniers seront prêts à fournir l'accès aux renseignements personnels. Les courtiers en information s'adressent à des besoins non satisfaits des consommateurs, ajoutant aussi de la valeur aux différentes catégories de fournisseurs.

En ce qui concerne les prévisions de développement au niveau mondial, européen, et pourquoi pas national, de ce type d'intermédiaires, l'obstacle sur la voie de la mondialisation sera, dans une première étape, la disponibilité différente à accepter le partage des informations, dans le contexte d'hétérogénéité au niveau global; certains marchés sont plus disposés à fournir un terrain fertile pour l'émergence et le développement des courtiers en information que d'autres.

ECONOMIC INFORMATICS

A COMPARATIVE STUDY OF THE EVOLUTION OF REAL INCOMES OF PENSIONERS AND UNEMPLOYED USING GENETIC ALGORITHMS

In a market economy we can have difficulties in real income measuring, due to changes in prices and wages that may be in short intervals of time. When we want to compare real income obtained in different periods of time it is used, most often, a "trash day", element that helps in purchasing power calculating for a population. In this paper we study the evolution of real incomes of two important social categories: the unemployed and pensioners, taking into account the evolution of some categories of prices and the evolution of peoples income.

Keywords: genetic algorithm, cross-over, mutation, unemployed, pensioners

JEL:C82

1. Introduction

A model is, simply, a simplified representation of a process or a system. Although it is not necessarily to be composed by equations (there is a ricardian model), is no less true that, at present, construction of models made frequent recourse to mathematical formalization: one model appears as a set of equations, being a simplified construction of an economic system which is used mainly to show the reciprocal action, chaining, the interdependence of certain phenomena [1].

The realization of experiments with computer, which involves the construction of mathematical models describing the behaviour of a real system, in this case economic, in a given period is called simulation. Most times it does not provide exact solutions, being close to optimal, but is considered an effective research technique for complex economic problems (which are impossible to study using mathematical-economic models for optimisation). The essence of modelling method consists of replacing the real system, perceived by human senses, through a model more accessible to study.

Processed data in this study are average net revenue from pension and unemployment pay and six categories of annual average prices. Prices have been chosen for the basic categories of products. These products are fuels, electricity, gas, vegetables-fruits, breading products, and milk. They occupy a significant percentage in the private consumption of people with incomes close to the average net revenue studied.

This paper is structured over four chapters: Introduction, Method used, Results obtained and Conclusions. The second chapter provides a description of genetic algorithms, the structure of such an algorithm, operators used. We also describe the operation executed by the proposed system to solve the problem. Here are presented the technical characteristics of the system, the input data necessary to obtain a corresponding result, as well as which of the individuals is the final result.

In third chapter are presented results obtained and interpretations necessary, this chapter being followed by conclusions of this study. All values obtained are compared with those of 1991. If this year has unitary value, then if the prices taken into account will increase regard to this year with a higher percentage than the growing of the revenue from pension and unemployment revenue then, for those years we have subunitary values and if the prices increase is less than the increase of the revenue we have values greater then 1. From the results of this study we observe in which period the studied category of population had higher real incomes than in the base year and in which period these revenues were much lower than in 1991. We will highlight the minimum and maximum values obtained for the revenues obtained in this period for the categories studied.

2. Method used

Artificial Intelligence (AI) may be considered the informatic domain which has the main goal to design certain systems whose features are assigned commonly to human intelligence: human language understanding, learning, reasoning, problem solving, theorem demonstrating, etc [2].

Genetic algorithms represent an important class of search and optimization method. A genetic algorithm represents a transposition in programming of biological's principles. This thing requires the processing of a significant set of data, which requires many resources.

The developed system requires some data on input and provide on output some coefficients used in the simulation of the relationship between revenue of certain category of people and the prices of certain categories of products and services with high significance level for those categories of people.

The first stage of the genetic algorithm consists in population initialization. This boot is made for a population consists of 120 chromosomes, each chromosome having 7 genes. The first 6 genes of each chromosome are generated randomly, while the seventh gene is obtained by calculation. The values used for calculation of the seventh gene of each chromosome are those 6 genes generated randomly, as well as the revenue and prices taken into account in a given period of time.

The following steps of the algorithm will be repeated for a number of times, until the results are considered satisfactory for the simulated problem. In our case there are used 500 generations, a value considered sufficient for this problem. After different tests has been noted that if it exceeds this number of generations, the differences between the fitness function for the two generations are very small.

Because we have a small number of genes in the composition of an individual I felt that we could renounce to crossover operator, the convergence of the algorithm being possible by application of mutations to the original chromosomes. Considering the population of a generation, 50% of its chromosomes will be taken into account for any genetic mutations. The mutations are applied only for first 6 components in each individual, the seventh being calculated according to the 6 obtained.

To ensure a rapid convergence of this algorithm and efficient individuals for genetic operations is recommended to order the population depending on the values of the seventh gene in each generation.

At each step the most effective chromosomes of the old population will be kept for regeneration, and the less efficient chromosomes will be replaced with efficient chromosomes derived from genetic processing.

The input data will be stored in a file with 12 lines and 7 columns. Those 12 lines represent the corresponding value for the months from a year, while the first 6 columns represent the prices taken into account, and the seventh column the considered revenue from pension or dole.

The best chromosome, in terms of the fitness function, will be considered final result, this value representing the absolute value obtained from the difference between the actual income and the amount estimated by the model developed.

3. Results obtained

To solve the problem proposed we considered a base to comparing the results obtained later. In our case, the base is the revenues recorded in 1991. With the proposed system it was made a model for this year with an error of about 6%. The values of real income, as well as the estimated values for the average revenue for population, calculated on the basis of prices are represented graphically in Figure 1.

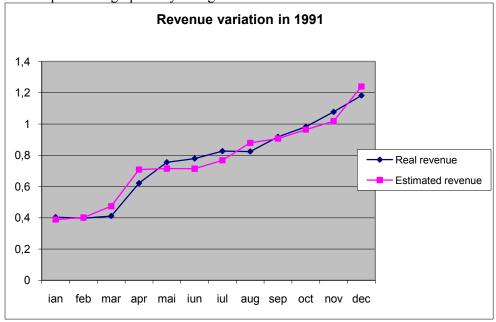

Fig.1. Real and estimated revenue variation in 1991

Because the error of the estimation of the revenue is quite small we used this model for the revenue estimation throughout the period considered (1992-2007).

In the present study, both prices and revenues use the same currency (RON). Figure 1 note that the average of the wages on the Romanian national economy was 0.4 RON in January, reaching a level of 1.2 RON in December of that year (1991). Also, the average of prices for the years studied were expressed in the same currency, prices calculated by using the price indices for the period.

Having on disposition the achieved model, considering 1991 like a base-year, the revenues calculated using the prices between 1991 and 2007 are presented in Table 1.

Table 1. The real, calculated and estimated revenue variation for pensioners and unemployed

Source:[3]-[6]

The evolution of the estimated revenue may be highlighted graphically by Figure 2.

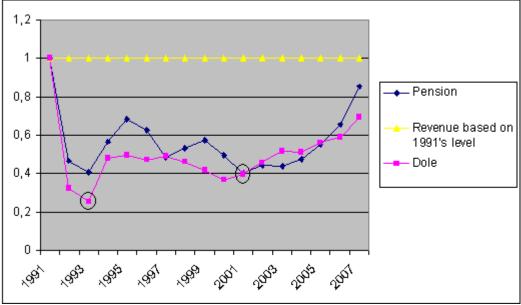

Fig.2. The estimated revenue evolution between 1991-2007

You can see that in the period between 1992 and 2006 the average of net revenue per resident was lower than the amount taken by him in 1991. Moreover, on this graphical representation we can see the crisis moments encountered at this indicator. Thus in 1993, we are dealing with a global minimum for the unemployed and in 2001 for the pensioners.

Unacceptable development during 1991-1993 is, primarily, due to low correlation between average level of income and the prices for categories studied. Thus, if revenues have increased approximately 8 times during this period, prices have a accelerated variation, with increases ranging between 24 and 68 times. All these crises were due, firstly, to the incompetence of political governance in the country and, secondly, political changes in that time. It notes that since 2000, the average of net incomes have begun to rise relative to prices, reaching in 2007 the highest levels from 1992.

4. Conclusions

The analysis of certain phenomena evolution is not doable, or even impossible using classical methods. That would be one of the reasons for the appeal to the artificial intelligence techniques to solve such problems. In addition to genetic algorithms, used in this study, other mechanisms of artificial intelligence are often used: neural networks,

intelligent agents, etc. These technologies do not always offer the best solutions, but a lot of them approximate this solution, being considered ideal in the simulation of certain phenomena whose evolution is too complex. In addition to describing the behaviour of certain indicators, these intelligent instruments can be used to forecast phenomena, based on the information from the past of that phenomenon and other phenomena that are related to the phenomenon studied.

In next work, using these artificial instruments, we will try to simulate the relationship between the different social categories incomes and market prices, in same time, trying to forecast the evolution of this relationship, taking into account the information available, the periods were achieved growth, recession and stagnation of this relation.

Forwarding the frequent usage of complex processes and the big volume of information, it is imperative to manage the automatic circuit of the document flow in a company activity. The main advantage of such a system consist in document waiting to be process in a specific order and the evidence is more strict than the classic one, where loss of information or hard finding can lead to later reports of the processes results. On the other way, the big volume of information found on paper support lead of temporary or permanent work incapacity of activities department by activity blocking (lack of personnel, lack of automatic tools). A major advantage is the electronic information archives and type of restarting processes on another management system using these documents, by reducing dead time appeared in classic process.

Keywords: information flow, IT&C continuity, maturity model for IT&C continuity, IT rationalization

JEL Code: M15

Introduction

At the entity level, an important objective to apply is preparing, planning, implementing and maintenance providing continuous information systems and services in maximum security. One of the key components in maintaining continuous IT services is to identify weaknesses within the physical Information Technology and Communications (ITC) environment and infrastructure and managing these to an acceptable level of risk. Once the various threats to the service have been identified consideration can be given to any mitigation or improvements and organization may wish to implement. But, first of all, it must be define the information flow regarding business processes.

So, the research is oriented on two components such as: first part has the basic concepts in information flow conducting to a model and the second part is proposing the IT rationalization presenting the implications of services (by internet technology revolution) in economic growth through security conditions.

1. Information flow model

The benefits to build an information flow model are major. First is to understand an information flow which provides logical documentation for the business process and the second is to present perspective for adding value through the types of analytical processing. A third benefit of the business modeling process is approaching user requirements to the implementation team. If any framework is used to describe a process, it not only eases the translation of user needs into system requirements, but also provides the manager how control migrates throughout the system and how information flows through the system – both of which, in turn, help guide the dissection of the problem into implementable components.

The model will take on two aspects – the flow of information into the data mart from its suppliers and the flow of information from the data mart to its users. The first flow is an operational flow, where data sets may be extracted and moved into a staging area where those data sets move through different processing stages. Despite the business intelligence aspect of the users' interactions, the information flow between the data mart clients may likely resemble a transactional information flow, with multiple analysts executing sequences of queries.

An information flow, as part of a business process model, provides the next benefits:

Designing Road Map for internal basic functions of the business: As tracking development against the original requirements, it is identifying the useful information to development of interfacing between the executions components.

Operational flow: The model provides a description of how any analytical data sets are populated, as well as a launch point for isolating problems in operation. The model also allows for tracking and isolating data quality problems, mapping workflow and control back to information use, and exposing opportunities for optimization.

Management Control: It is the model that provides a way to see how information propagates across the organization, identify gaps in information use or update and expose the processes involved in information integration.

Return on Investment Calculation: Allows the manager to track use of information, the amount of value-adding processing required and the amount of error prevention and correction required adding value. In this case, the manager relates the eventual business value back to the costs associated with generating that business value⁵⁵⁷.

Information flow model is used when the organization need to know how information flows around, into and out of the business. This shows how information flows work between **business functions** (within the business) and between business and external functions (as entities like suppliers or customers).

The stages in information flow model are presented in Figure 1. Identifying the **business functions** must be done for which the flow of information needs to be modeled. All business functions will come from the **portfolio** function and should be elementary business functions.

Identifying and showing the information required by the function and where it comes from the source will be another business function or an external one. If the model must be enhancing, it is recommended to refine all the business functions, but in accordance with external functions, correlated by process type.

Feedback must reply the information flow model to the business to ensure that they are correct.

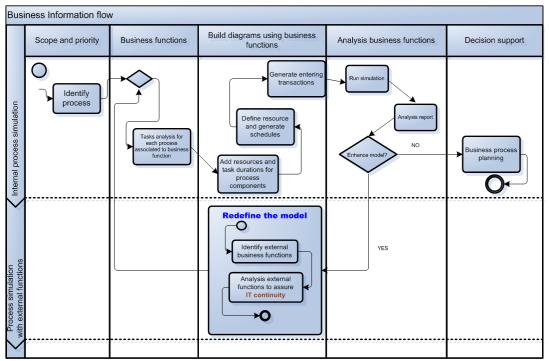

Figure 1 Information flow model example

(Update the source: http://www.onemindmanagement.com)

In case that the information is processing by distance through network technologies (internet/intranet by remote control, VPN, tunneling) the *information flow system automatically managed* must be compatible with network, by access levels, for specific user groups⁵⁵⁸. The system will contain workflow management and document management for an organization and offer solutions optimization for the next problems:

- Information report regarding to an activity in a user session work;
- Users e-mail announce, without creating spam's e-mail, regarding work execution terms;
- Procedures and methods to elaborate an electronic work for users' liability;
- Flexibility and easy usage;
- Documents sending to other departments or customers/suppliers;
- Recognizing information formats;
- Leading work process;
- Electronic signature acceptance;
- Individual or group warning for modifies work conditions.

Such a system must be adapted to business request for the company that is using it and it is very easy to integrate by tools choosing. An example is the documents "Portfolio" that has a very well establishes circuit for documents signing.

⁵⁵⁷ The Business Value of Information Flow Modeling, Knowledge Integrity, <u>David Loshin</u>, Information Management Magazine, May 1, 2003, http://www.information-management.com/issues/20030501/6630-1.html
558 www.siemens.co.uk

The information system must show quickly report for document flow journal which may be named "cover sheet for information flow" and sometimes is more efficient in solve particular cases, such as contract disputed issue, by finding information needed.

To assure the stability of the information system there must be implement a continuity model for IT&C. The methodology for the model is built around six key principles (Figure 2) and implement in a maturity model for information technology continuity:

- **Protecting** the ITC environment is critical to maintaining the desired levels of availability for an organization. The services are at threat from environmental failures, hardware failures, operational errors, and malicious attack.
- **Detecting** incidents at the earliest opportunity will minimize the impact to services, reduce the recovery effort, and preserve the quality of service.
- Reacting to an incident in the most appropriate manner will enable an efficient recovery and keep any
 downtime to a minimum. Reacting poorly may result in a minor incident escalating into something more
 serious.

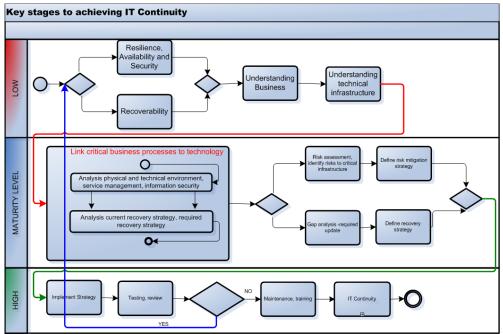

Figure 2 Maturity model for IT continuity (Update the source: www.siemens.co.uk)

- **Recovery** of services should be performed in a controlled and predetermined fashion. Identifying and implementing the appropriate recovery strategy will ensure the timely resumption of services and maintain the quality of data.
- **Resume.** Understanding the recovery priorities as well as the recovery point and recovery time objectives allows the most critical services to be reinstated first. Services of a less critical nature may be reinstated at a later time or in some circumstances not at all.
- **Return.** The process of returning from disaster mode to normal operations is often neglected by organizations. All IT Continuity plans should have an exit strategy that allows them to vacate their ITC disaster recovery centre when the time comes.

The maturity model must have six service elements that will assist an organization progress through the maturity model and achieve IT Continuity. These elements are shown in Figure 3.

		Principle				
Service Element	Protect	Detect	React	Recover	Resume	Return
Element 1 - IT Continuity Reviews, audits, and health checks	1	1	1	1	1	/
Element 2 - Recovery and resilience strategies	1	✓	1	1	1	✓
Element 3 - Solutions design and implementation	1	1	1	1	1	✓
Element 4 - Disaster recovery hosting	X	X	X	1	1	X
Element 5 - IT Continuity & recovery testing	X	X	1	/	1	✓
Element 6 - IT Continuity training	1	/	1	1	1	/

Figure 3 Services address by methodology principles

(Where: V = verify, X = not realized, source: www.siemens.co.uk)

2. Proposing the IT Rationalization

IT Rationalization focuses an organization on the services that produce the highest business value. Rationalization evaluates business needs, aligns IT services and reveals how to free valuable resources for business strategy and customer demands. From rationalization, it is introduced dynamically pooled resources that create flexibility, agility and the ability to respond to rapid change, eliminating everything that can stand between business and customer. Through rationalization there are:

- Increase service value by eliminating low value services and those that detract from the performance of higher value services.
- Improve operational flexibility by leveraging high value services in a shared environment to benefit other business areas.
- Simplify by eliminating one-off services and introducing common standards.
- IT Rationalization Services focus on the development that specifically addresses client's business challenges, including:
- Pressures to lower costs while improving service delivery through the introduction of standards;
- Adapting to changing business strategies and models;
- Adherence to regulatory obligations imposed on business;
- Incorporating innovative technologies in IT infrastructure to create business value;
- Focusing on competencies and positioning the enterprise for the future 559.

IT organizations have to optimize the business value of technology. Technology executives understand the need to standardize and rationalize disparate, redundant, or obsolete applications that are accumulated over the years through evolution, acquisition or business unit autonomy. However, rationalizing the portfolio without a clear framework can increase the risk of jeopardizing the current or future IT capabilities. By rationalization it will be dramatic cost savings through streamlined IT portfolio, optimized efficiencies by elimination of redundancy, waste, and clutter. Also, increased productivity through greater standardization and less complexity is a key component of the rationalization. Bottom line business impact by creating new "product lines" more effectively is the feedback for rationalization.

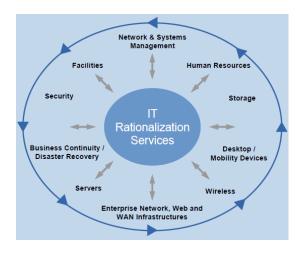

Figure 4 IT Rationalization

(source: http://www.itsolutions.siemens.com/b2b/it/en/us/Documents/publications/itr dco PDF e.pdf)

Rationalization sets the stage and virtualization ushers in the significant savings, sharing technology across business units and eliminating unnecessary or redundant hardware assets. Virtualization frees applications and data from specific hardware platforms, optimizing use of computing resources throughout the enterprise.

There are many virtualization technologies now able to dynamically provide resources in a matter of hours versus days or even weeks – reliably and with greater control. These technologies make infrastructure components more accessible to a broader set of applications. Resources are no longer dedicated to a single application, but become available based on utilization and capacity⁵⁶¹.

CONCLUSIONS

The maturity model for IT continuity must contain the information flow of the company to recover the data and information in disaster cases. Thus it must be prove experience in developing and implementing resilience, availability, security, and recovery strategies. Benchmarking is relying on IT Continuity Maturity against industry

⁵⁵⁹ https://www.it-solutions.siemens.com/b2b/it/en/us/Documents/publications/it-rationalization-transformation-services PDF e.pdf

⁵⁶⁰ Source: http://www.virtusa.com/services/portofolio-rationalization.asp

⁵⁶¹ Siemens IT Solutions and Services, Inc., www.usa.siemens.com/it-solutions

best practices and assurance that the strategy meets organizational needs. Modular approach allows selecting the service elements that match individual needs.

Confidence that organization can survive an incident or disaster must be implementing in information flow.

Comprehensive training is also imperative to assure IT continuity.

In addition, IT rationalization services meet unique business needs. IT Rationalization focuses on streamlining and optimizing processes, while reducing complexity across entire IT environment.

The World Wide Web represents a new frontier towards a global industry, leading the way for new businesses. Commerce now deals with a whole different concept: electronic commerce (e-commerce). This kind of commerce provides new means for a large variety of products to reach different markets across the world. This application was designed and implemented for a hypothetical firm called Oxygen, in order to supply a manageable website for online selling, thus reaching new customers in a whole new target market. The website has an appealing interface and allows clients from across the globe to view the company's products and buy them using cash on delivery or a credit card. The application has an administration module, permitting the owner of the shop to easily add or delete items, and to review orders.

1 Introduction

The application is intended to provide an online shop for a hypothetical firm Oxygen. However, there is no restriction regarding the products sold. The owner has the possibility of adding anything he wants, from small objects, like pens, to large ones, like a LCD TV. The app administrator can insert or remove item categories. Each category may have other subcategories, thus the task of grouping the items becomes easier and well-structured. For this application I have used the Apache HTTP Server, MySQL for working with the database and PHP as the server side script in order to provide dynamic content (Welling & Thomson, 2001). MySQL is currently the most used DMBS (Database Management System) online, being very simple to use in terms of manipulating information onto a relational schema (Timofte, 2002).

2 Website Database

2.1 Database Diagram

The database is called "magazin" and consists of eight tables. We can observe in the next figure the database diagram.

2.2 Tables Description

Table *users* - this table contains information regarding a client that has registered into the system. It stores a unique username, a password for the account, a unique e-mail address and also the address of the client. The client has the facility of paying for an order with a credit card. This sort of information is also stored in this table (Macklup, 1991).

Table *recuperari* - this table contains two fields. One field represents the e-mail address of a customer that had forgotten his/her password and the other a key generated by the application in order to check that the solicitant of the new password is indeed an actual client. This key will be sent to that e-mail address. If the client responds to the email with the key, the system will generate a password and send it to the user (Odlyzko, 2001).

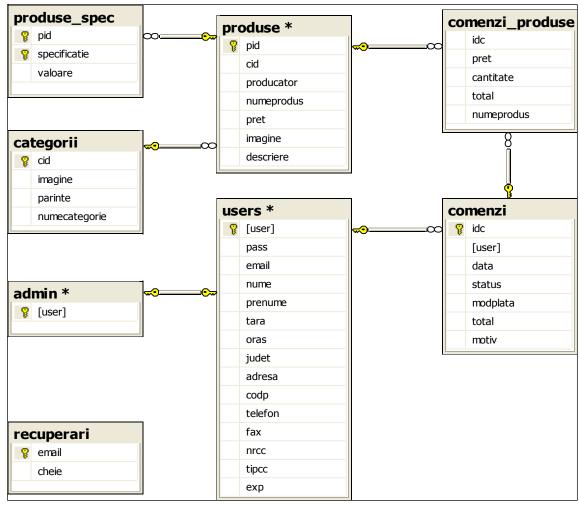

Figure 1: Database Diagram

Table *admin* - we can observe in Figure 1 that there is only one field. The purpose of this table is to indicate which of the users from the table users has administration rights .An administrator can add/delete new items or view/accept/reject orders made by users.

Table *produse_spec* - this table contains product specifications for a product. Every product can have none or many specs, which are stored in this table.

Table *comenzi* - a user can place as many orders as he likes. An order is stored here, with info like the user who made it, the date of the order, the total price and payment option. The order has a status. When placed, a new order has the status "pending". After it has been reviewed by the administrator it can have the status "approved" or "rejected" in which case we will store in this table the reason for the denial of the order, to later present it to the user.

Table *categorii* - in order for the shop to be well-structured, we have to organize the items into categories. Each category can have products or many subcategories with products.

Table *comenzi_produse* - this table stores information concerning to the product that correspond with a certain order (Rosu-Hamzescu, Mitu, 2001).

3 Structural Design

3.1 Website Module Interaction Diagram

The application has two main modules: the user interface module and the administration module. These modules depend on the existence of the database "magazin". In Figure 2 we can observe the interaction between the modules, regarding the DB (Loshin & Vacca, 2004).

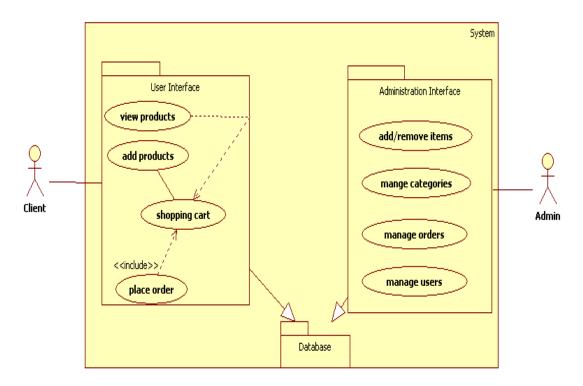

Figure 2: Module Interaction Diagram

3.2 User Interface Module Prospect

This module consists of many PHP modules (Năstase, Năstase, 2002). There are a few modules that are stored in a separate directory, INC. All off these are included in the rest of the interface. We will explain the modules first: Module *sus.php* - this module is responsible for supplying the header for the other modules in the user interface. It displays the Oxygen logo and links to the contact and how to buy page.

Module *jos.php* - this module simply displays in all the modules the footer (the copyright to be more specific).

Module *login.php* - if the user inputs in the login form a correct combination of username and password, the login form is substituted with account options links (logout, order history, account details and to change password). This operation logs in the user into the system.

Module *cosdecumparaturi.php* - I implemented here a class that symbolizes a shopping cart. This class will be used to store information on the products that the customer wants to buy. It provides methods for adding, deleting and manipulating the quantity of a product. It will store data like the products ids, their price and quantities.

Module *util.php* - this module is the most important module of the application. It contains definitions of functions that fully interact with the DB. Functions for logging in, checking if a user is logged and logging out are implemented here. There are also all the functions needed to manipulate information from the database, including functions that are needed by the administration module.

The modules that deal with the actual user interface are stored in the root directory. Their functionality is based on the *util.php* and *cosdecumparaturi.php* modules. We will explain them next:

Module *index.php* - this module displays shopping cart overview with two buttons that can redirect to the shopping cart manipulation module and one that can empty the cart, the catalog that contains the main categories, a login form or account options if the user is correctly logged into the system, and at last two buttons for creating a new user and for retrieving a forgotten password. These are present in the rest of the modules, though there are some exceptions. As we will present other modules it will be specified if any of these aren't the same.

Module *logout.php* - after a user is done with his actions, he can log out of the system using the logout link.

Module *catalog.php* - when a user clicks on a main category he will be redirected to this catalog module. The category's picture is shown. If the category contains products, they will be displayed along with a link to the *produs.php* module and add to cart button; if there are subcategories they will be displayed along with the picture and number of products contained. A subcategory becomes a category when it is clicked.

Module *produs.php* - When a product link is clicked, this module is responsible to output the product information stored in the database and a button for adding the product into the shopping cart.

Module *cosulmeu.php* - a user can modify the content of the basket. He can remove or change the quantities of a product. This page displays a schema for the operations needed to complete an order. The client can go back to shopping or he can continue the order process.

Module *comanda.php* - this is the second in the order process after viewing the cart items. This module is only accessible if the user has successfully logged in. If so, the shopping cart content is showed alongside with a button

that links to the cart manipulation module, the address of delivery with a button that links to the account details manipulation module and a form for choosing the payment option.

Module *plaseazacomanda.php* - accessible only from the *comanda.php* module, this is responsible for adding a new order into the database, in compliance with the shopping cart content.

Module *contulmeu.php* - a client can modify his details here, for example if he wants to change the delivery address or to add a credit card. This is accessible only if the client has successfully logged in.

Module *comenzi.php* - a client can view the details of his order here. He can see the actual orders or the ones he has completed in the past. If an order is denied, he can see the reason here and try to remedy the problem. Further he can reconfirm the order using the module *reconfirmare.php* or cancel it using *anuleaza.php*, both of these being available through links. This is accessible only if the client has successfully logged in.

Module *schimbaparola.php* - a client can change his account password if he wishes. This is accessible only if the client has successfully logged in.

Module *register.php* - a new client can browse the catalog and add products to the shopping basket. If he wants to place the order but he doesn't have an account he can click the link for creating one, thus leading to this module. There is a form that has to be completed with personal information, choosing a username and password and providing his email. Optionally he can add a credit card to his account for online purchasing.

3.3 Administration Module Prospect

The PHP modules needed for the administration are stored in a separate directory ADMIN. The administrator can reach this module simply by specifying the path to this directory in the URL (ex.: oxygen.ro/admin). Many of the modules just perform an action to update the database and then return to modules that also display information (Kleinberg & Lawrence, 2001).

Module *index.php* - this module displays a login form. If the user has successfully logged in and his username can be found in the "admin" table, then he is redirected to the *admin.php* module.

Module *admin.php* - this module outputs the number of products, categories, subcategories, users and orders. There is also a menu with links to the products, users and orders manipulation modules.

Module *produse.php* – the admin can see a list of the main categories alongside with the subcategories, that can be selected and deleted using the module *delc.php*. Here the administrator can specify a new category name and a picture for it, and using *addc.php* he can add the new category. Clicking on a category leads to the same module, but there are other options like adding a subcategory (*addc.php*) or adding/modifying/deleting (produs.php/addp.php/delp.php).

Module *produs.php* - a product can be modified. This module displays the product information which can be modified and updated using the PHP module *actualizeaza.php*. Specification can also be inserted here.

Module *users.php* - this module displays the list of users, and the possibility of deleting them using the module *delu.php*. Also, it is specified if the user has a credit card and if he has any orders.

Module *comenzi.php* - this module displays the orders grouped into "pending", "confirmed" and "denied". Clicking on the edit button will let the administrator use the detallicomanda.php module, responsible for outputting the order details.

Module *detaliicomanda.php* - an order is shown here. The administrator cans approve/deny//delete an order using *confirma.php/refuza.php/sterge.php*. When an order is denied the administrator can specify the reason why it was denied. When the user click on the order details in his account he can see the reason and try to remediate the problem if he wishes, or to cancel the order.

Module *logout.php* - this module logs out the administrator from the administration area, redirecting him to the *index.php* module located in the root directory.

3.4 Install Note

Copy the application files into the *htdcos* directory. Using the *phpMyAdmin* application, the database "magazine" must be created. In the SQL directory there can be found a text file containing the structure of the database in SQL language. Thus, the database can be up and running in no time (Timofte, 2002).

After the query, the administrator must visit the page and use the register.php module to create the administrator account. He must specify the username *admin*.

4 Conclusion

Computers, communication networks, and a wide variety of newer, rapidly developing technologies are increasingly important ways in which individuals, companies, and organizations of all kinds conduct business (Boboila, 2007). These technological changes present challenges that must be faced not only by technologists but also by lawyers, policy-makers, economists, entrepreneurs, ethicists, and other stakeholders. Potential topics to be addressed from both technical and non-technical points of view include but are not limited to: internet bussiness

management; web searching, as a technology and as a business; B2B, B2C, and C2C technology and business models (Camp, 2000).

The main purpose of the paper is to determine a general behavior of a multi-agent model capable of describing the process of deliberation of an investors group witch may repeatedly decide whether to buy or sell an asset. Each adaptive agent was modeled as a collection of strategies which is optimized by an evolutionary algorithm (EA). The paper investigates the implications and the effect of the learning process for the information strategies used by the agents in the process of deliberation of buy and sells order.

Key words: Programming Models, Genetic algorithms, Information efficiency JEL Classification: C61, G14

1.INTRODUCTION

Behavioral traits of market participants and their effects on the properties of markets have been under growing investigation in recent years. Much of this work (e.g. [3], [4], [5], [6] and [8]) which emphasizes deviations from efficient markets theory, tries to elicit an internal market dynamics via computational approaches, and is loosely linked to the subject known as behavioral finance. These interdisciplinary studies try to explain market phenomena by formalizing a diverse array of behavioral and psychological considerations. Shiller, [11], strongly argues against a priori excluding any behavioral information from the explanations of financial markets.

An agent-based approach contains a model for individual behavior combined with a price formation rule. Despite great emphasis on the characteristics of real market participants, however, models of individual behavior have remained rather simple. In an agent-based model, an agent's psychology as distinct from manifest behavior is often not separately represented. Further, an agent is often modeled as a unit capable of being in one of a small number of states.

We used a multi-agent model capable of describing the process of deliberation and how it leads to action. In our model, each agent is described by an internal state with an intrinsic dynamics and influenced by external events within or outside the population of agents. Actions result when the agent's state crosses a predetermined threshold in state space. Specifically, we consider a population consisting of investors repeatedly deciding whether to buy or sell an asset.

Each adaptive agent was modeled as an informational strategy which is optimized by an *evolutionary algorithm* (EA) ([1], [10]). EAs transfer the principles of natural evolution, first discovered by Darwin, to a computational setting. These algorithms have been used in the past, with considerable success, to solve difficult optimization problems (Bäck [1]). Adaptive agents learn in different ways in an evolutionary setting: by selection and reproduction of successful strategies, and by random experimentation (by "mutating" existing strategies) or by recombining or "crossing over" previously-tested strategies.

The main purpose of the paper is to determine a general behavior of the model system described before by evolutionary simulation. In the spirit of genetic algorithms methods, we classify the result of a simulation in group of strategies efficiency. A secondary important goal it will be to find some stable states of the system, states who generate a description of the wining strategies of the agents.

2.THE MODEL OF INVESTORS BEHAVIOR

2.1. Single investor mathematical model

Here we try to quantitatively capture a simple, perhaps superficial, part of a financial agent's psychology as well as its connection to actual behavior. This is kept to a bare minimum in order not to obscure our general approach. The model is based partly on results of so-called neural decision field theory (Ormutag, Knight and Sirovich [9]), adapted for financial investors.

We assume that the state of an agent at time t is fully determined by the value of a variable x(t). This is the agent's momentary internal condition. It may be viewed, in general, as the agent's disposition or tendency to behave in a number of specific ways. 'x' determines the coordinates of state (or phase) space where each agent is represented as a point. The agent acts only when its representative point crosses a predetermined boundary or threshold in state

space. More specifically we consider an investor repeatedly faced with the problem of deciding whether to buy or sell a particular asset. The agent's ongoing process of deliberation is described by the dynamical system

$$\frac{\Delta x}{\Delta t} = -\gamma x + I(t) \tag{1}$$

where γ is the personal decision reaction speed, supplemented by the condition that at |x| = 1 the state is reset to x = 0. The reset condition constrains the state to remain within a finite interval, $-1 \le x \le 1$. The function I(t) describes the effect of external influence on the agent. This may originate from all kinds of sources information such as the news media or personal contacts. Note that, despite appearances, (1) is non-linear, due to the reset condition. If we regard x as the fraction of certainty in buying/selling, then the choice of ± 1 as thresholds appears less arbitrary.

The effect of external information arrival was reprezented by a series of instantaneous jumps of size e(k) in the state received at arrival times t_k , k = 1, 2, ... This formulation is valid so long as the time scale of the impact of information is much shorter than that of other changes in x. The agent's state is therefore driven by a term

$$I(t) = \sum_{k} e(k)\delta(t - t_k)$$
(2)

where the sum is from the last moment of reset condition (the last buy or sell action) until the curent time t. It will be assumed the existence of a large number of uncorrelated sources of information and accordingly take arrivals as being Poisson distributed in time. For simplicity each jump will be taken as positive, \mathbf{e}_+ , or negative, \mathbf{e}_- . Following this formulation, we will refer below to positive and negative pieces of information. Generalizations to jumps with stochastic size or jump size which depends on the current state are straightforward. We take the magnitudes \mathbf{e}_+ as measures of *informational impact* on a typical agent. In the special case of \mathbf{e}_+ = $-\mathbf{e}_-$, one can speak of informational impact being symmetric. The informational impact magnitudes \mathbf{e}_+ describes the informational strategy of the agent and characterize it.

In this model the dynamics of the state leads to action in the following way: the agent places an order to buy (sell) when its state crosses the boundary at x=1 (respectively -1). Accordingly, when x(t) is in the positive (negative) half of the domain, the agent has a greater tendency to buy (sell) and may be viewed as being "optimistic" ("pessimistic").

2.2. Interactions

We next consider a large collection of N agents trading the same asset. Each agent is indexed by i = 1,...,N, and its state described by the equation (1). Market participants clearly do not collectively listen to the same news and are not exposed to the same channels of information, then inter-agent differences in exogenous information are to be expected. In our model we allow every agent i to be driven by its private stream of information $I_i(t)$. Informational heterogeneity along with nonlinear dynamical evolution and possibly different initial conditions, injects a great variety of individual behaviors into the population.

The average rate of arrival of exogenous information is the same for all agents. Every agent, in addition, is affected by the behavior of other agents in the population. We denote by n the average number of agents affecting any one agent. Hence mutual interactions in the population occur through the influence of the actions of agents on the states of other agents. Specifically, if an agent places i an order to buy (resp. sell) at the moment t_k , the state of another agent j is instantaneously incremented by eji+(-)(k) if that agent is affected by the action at that moment. The stream of information characterising the agent j at the time t will be

$$I_{j}(t) = \sum_{k} \left(\sum_{i=1}^{N} e_{ji}^{+(-)} \delta(t - t_{k}) \right)$$
 Note that the $\mathbf{e_{ji}}$ term mesure the influence of the actions of agent \mathbf{i} on the agent \mathbf{j} and was taken sub-unitary. This

Note that the e_{ji} term mesure the influence of the actions of agent i on the agent j and was taken sub-unitary. This formalizes the intuition that the more an investor sees others buying (selling) the more bullish (bearish) he or she will become.

3. GENETIC ALGORITHM: LEARNING AND SIMULATION

3.1. Evolutionary algorithms method

Genetic algorithms constitute a class of search, adaptation, and optimization techniques based on the principles of natural evolution. Genetic algorithms were developed by Holland ([7]). For an introduction to genetic algorithms, see Bäck, T. ([1]).

An evolutionary algorithm maintains a population of solution candidates and evaluates the quality of each solution candidate according to a problem-specific fitness function, which defines the environment for the evolution. New solution candidates are created by selecting relatively fit members of the population and recombining them through various operators. Specific evolutionary algorithms differ in the representation of solutions, the selection mechanism, and the details of the recombination operators.

Evolutionary algorithms offer a number of advantages over more traditional optimization methods. They can be applied to problems with a non-differentiable or discontinuous objective function, to which gradient-based methods such as Gauss–Newton would not be applicable. They are also useful when the objective function has several local optima.

More formally, the GA scheme can be summarized as follows. P denotes the current population (i.e., a set of individuals), and H is the set of children. Note g the current generation number. The Genetic Algorithm can be described by the pseudocode scheme:

```
g := 1; generate initial population \operatorname{Pop}; compute fitness for individuals i \in \operatorname{Pop}; WHILE g < G DO BEGIN g := g + 1; produce children H from \operatorname{Pop} by crossover; apply mutation to children I \in H; \operatorname{Pop} := \operatorname{Pop} \cup H; compute fitness for entire population I \in \operatorname{Pop}; reduce population \operatorname{Pop} by means of selection; \operatorname{END}.
```

3.2 Genetic Representation: coding the agents population and evaluating individuals by a 'fitness' function

For the multi-agent model described in the Section 2, a valid genetic representation is given by a vector of information's about the personal decision reaction speed γ_i and the coefficients describing the influence of the others agents e_{ij} (j=1..N):

$$(\gamma_i; e_{i1}, ..., e_{iN}) \tag{4}$$

At the start of the first generation of agents, each one of this is random generated between 0 and 1, with the supplementary condition that $e_{ij}=0$, with the probability \mathbf{p} (fixed from the beginning).

For evaluating the efficiency of individual agent information strategy, a simulation of the trade activity is necessary. We consider a trade game consisting in \mathbf{m} rounds of negotiation ($t=t_k$, k=1..m). Each agent \mathbf{i} start the simulation with a fixed capital $\mathbf{C_i(0)}=10000$ units. A buy/sell action of an agent modify his capital with a value equal with the price -/+ P_k of a market "action" at the time $\mathbf{t_k}$; alternatively, the price P_k is variable in time, according to the formula:

$$P_{k+1} = P_k(1 + n_1(k)/N - n_2(k)/N)$$
(5)

where $n_1(k)$ is the number of agents buying actions at the time $\mathbf{t_k}$, and $n_2(k)$ is the number of agents selling actions at the time $\mathbf{t_k}$. This condition simulates the variation of value of the price in condition of a free market. The *fitness* function associated to each agent is defined by the value of individual capital $C_i(m)$ at the time $\mathbf{t_m}$. At the tome t_0 =0, the price was P_0 =250 units.

3.3 Crossover, Mutation and Selection

Let us assume that two individuals of the current population have been selected for crossover. We have a mother individual $M = (L_M)$ and a father individual $F = (L_F)$. Now two child individuals have to be constructed, a daughter $D = (L_D)$ and a son $S = (L_S)$, each one by the <u>2-point crossover</u> procedure, choused to increment the speed of the algorithm.

For the crossover procedure we draw two random integers q_1 and q_2 with $1 \le q_1 < q_2 \le N$. Now the daughter's activity list L_D is determined by taking the coefficient $\mathbf{e_{ij}}$ list of the positions $i = 1, ..., q_1$ from the mother, the positions $i = q_1 + 1, ..., q_2$ are derived from the father and the remaining positions $i = q_2 + 1, ..., J$ are again taken from the mother. The son individual is computed analogously. For the son's activity list, the first and the third part are taken from the father and the second one is taken from the mother.

The following <u>mutation operator</u> is applied to each newly produced individual. The mutation operator modifies the all the genes (including the coefficient of decision speed γ) of the genotype with a probability of p_{mutation} . The mutation operator modifies the value of a coefficient by a fixed fraction +(-)f (considered in the author simulation =1/10) of his initial value. The choice of sign is randomized.

The <u>selection operator</u> act on the entire populations of agents, the parents and the new agents, selecting at each generation the first *N* best evaluated individuals, grouped by pairs (first with the second etc.) in order to produce a new generation. The evaluation use the *fitness* function, computed after a trade game simulation.

4. COMPUTATIONAL RESULTS

In this section we present the results of the computational studies. The self-adapting GA for the RCPSP has been coded in Dev C++, and tested under Windows XP. We considered an initial population formed by N=50 agents, generated with the conditions $0 < \gamma_i < 1$, $0 < e_{ij} < 1$ and p=3/4 (the probability that $e_{ij} = 0$ at the beginning). The genetic algorithm computed G=250 generations.

First observation is that the simulation of the trade, at each generation, gives the possibility to evaluate the evolution of the market price P_t of one action in time. The Figure 1 give the evolution in time of the P_t for the resulting populations of agents after 250 generations. The similarity with a real chaotic market variation has a test value for the proposed model.

Figure 1. The market simulated evolution of the price of actions

The results reported in the Figure 2 are obtained after a process of learning, when the strategies have converged. It is important to note that, during learning, the number of significatives influences for each agent of new generation (i.e. number of agents j that influence an agent i, expressed by the condition $e_{ij}\neq 0$) is increasing.

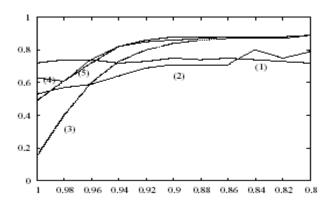

Figure 2. Statistical dependence of the information strategies efficiency of the relative number of sources Five strategies are statistically identifiable:

- first (1) is the strategy of stability of the sources (the values of the influence coefficients e_{ij} are quite stable in time);
- the second (2) is a periodic strategy (generated by a quasi-periodical rotation of the trusted sources);
- the third (3) can be called the "mimetic" strategy (the temporary tendence of the market is reproduced bu the agent);
- (4) is a combination of (1) and (3);
- -(5) is a combination of (2) and (3).

The Figure 2 show the statistical repartition of the 'fitness' for the final generation agent's strategies in dependence with the percent of the significative influence agents (reported at their total number). The 'fitness' value, measuring the efficiency of a information strategy, was reported to the best value obtained for all generations of agent's strategies.

5. CONCLUSION

In conclusion, the model described in this paper explicitly includes competition into a real options framework by using an agent-based approach of competing firms. The firms derive their investment triggers from a genetic algorithm which exploits the results of repeated stochastic simulations of the market. The best information strategies used by the learning trade agents under competition that we find are classifiable in five groups, and the mixed mimetic strategies are in top of efficiency. In other words, the combined strategy is very versatile.

INFORMATION SYSTEM FOR MODELING ECONOMIC AND FINANCIAL PERFORMANCES⁵⁶²

Boldeanu Dana Maria

Academia de Studii Economice București Facultatea Contabilitate și Informatică de Gestiune Piața Romană nr. 6, sector 1, București, CP 010374 Email: danabolde@gmail.com Telefon: 0721803603

The analysis of the most important financial and economic indicators at the level of some organizations from the same sector of activity, the selection of performance ratios and generating a particular analysis model help companies to move from the desire to obtain performance to action through better and faster decisions. Using advanced technologies like Business Intelligence and new software applications can also bring added value to the multidimensional analysis of the financial indicators.

Starting with the multidimensional design of a data warehouse fated to the financial analysis of the performance indicators the level of an economic and financial entity and continuing with the implementation of this system will reflect once more the benefits of Business Intelligence components, the importance of the decision maker in the management activity and the necessity of making correct and pertinent decisions for the continuous improvement of the economic and financial performances.

Keywords: performance, financial ratios, Decision Support Systems (DSS), Business Intelligence (BI), econometric model, information system

The article's JEL code: C51, O12, L15

1. The performance as main objective within the framework of the economic and financial analysis

The analysis of the economic and financial performances is a frequently debated matter in the economic media from the last decades, covering a very large spectrum, comprising various meanings and tendencies which will continuously capture the interest of the economists, the accountants and the IT specialists 563.

The information rising from sources both internal and external to the company, the processing of this information, the obtaining of financial statements and determination of the representative indicators apt to illustrate the real status of the factors which influence the performance of the company and the wide range of potential users (investors, managers, employees, clients, banking institutions, state authorities etc.), all of these bring into light various systems for assisting the decision in an informational environment, with favorable results for all the actors involved in this project.

The process of decision making, regardless of the size of the company, is a rather complex one, implying data processing, information and knowledge. The data warehouse (DW) and business intelligence (BI) systems, as well as the Decisions Support Systems (DSS) are designed to help the companies to answer in real time to complex questions 564. There are more different techniques in this respect, and the choice of the right instrument leads to finding the relevant answers for a certain company. The process is a dynamic one, and these answers are changing along with the business strategy of the respective company.

The business environment of today's world is driven by new concepts like stakeholder value and service management, concept which have become extremely important to satisfy employees, customers and shareholders. The way in which a service company can use different performance measurements for management control purposes is very important as it should make possible the identification of the most appropriate measures applicable for strategy implementation.

Managers and stakeholders are in need for special tools for allowing them to analyze this amount of data in a quickly and accurately manner. For this matter data mining algorithms and techniques represent one class of such tools and they are used to automatically extract predictive hidden knowledge from the raw data.

2. Econometric Modeling of the economic and financial performances

Within the economic-financial analysis, there is a series of models, methods and procedures which are either specific or borrowed from other sciences. At present there are several basic methods and procedures designed for the diagnosis analysis of a company and for setting its financial-economic performances. Such methods help to set up a direct link between the identified economic performances and the overall strategy of the company 565.

⁵⁶² The paper represents a portion of the results provided by the ongoing research for the Grant 1805 under the IDEI Program PN. II 2009-2011 with the title: "Exploratory research concerning the development of an intelligent system meant to optimize financial decisions"

⁵⁶⁴ Boldeanu, D., Gheorghe, M. "Performance indicators in multidimensional analysis", Journal of Accounting and Management Information Systems, Supplement/2007, pg. 733-747, 2007

⁵⁶⁵ Boldeanu, D. "Information system for the analysis and assessment of the economic and financial performances at microeconomic level", PhD thesis, Bucharest Academy of Economic Studies, October 2008

The mathematical-economic methods which use the various financial ratios proved their usefulness in the decision-making process of capital investors. Most of the time, these models involve linear relations between a set of financial ratios and the company return ratio.

Rees566 considers that in the financial analysis, the wide use of financial ratios is an answer to the high amount of data contained in a set of financial statements and to the issue of comparing companies of different sizes. Financial ratios may be used individually or in groups, in order to compare companies among themselves or against industry benchmarks. In most cases, the result of such analyses depends to a high extent on the financial analyst's skills and expertise.

A company performance measures in determining the financial state should not be sensitive to the choices of accounting methods and procedures, but must assess the current management decisions, the risks of investment decisions and not punish managers for circumstances that are beyond their control567. Under these circumstances a good better choice could be EVA (Economic Value Added) or any other performance measure that would consider "adding" value through previous investments. Nevertheless, ROE (Return on Equity) is often used in econometric analyses with financial data568. Due to the data accessibility and the ease in being understood, as well as to the interest granted to this ratio by capital investors, we decided to apply ROE instead of EVA in generating an econometric model to empirically investigate the relation between various ratios from the financial situation of a company and the performance thereof.

As a dependent variable used, we employed ROE, as we believed that it synthesizes best the concept of company performance if it is to synthesize it by means of one indicator only. Return on Equity is perhaps the most commonly used profitability measure 569.

The data set refers to the financial statements for the financial year 2007 and 2008. These are stock market companies having as main object of activity "pharmaceutical substance manufacturing". We considered the companies with activity in the same field, since there are factors specific to each industry and we wanted to avoid adding dummy variables for the industry. In fact, if we were to compare the rating models of various commercial banks, they would come up with quality criteria, including with respect to the industry category, in order to be able and grasp the specifics of the said field of activity.

Starting from these goals, the research carried out an analysis to identify possible connections between the data to analyze and result of an economic and financial performance characteristic to a number of 162 companies 570 from the pharmaceutical sector grouped on geographical regions, using an ordinary regression of the type of the least squares method (OLS).

The purpose of the model we want to develop is to empirically investigate the relation between various indicators resulting from the financial situation of a company and the performance thereof. Furthermore, besides the specific company factors, we also added effects related to the company country of origin (Inflation GDP deflator, GNI/capita, health expenses/GDP), as assessment through experimental analysis of their impact. We preferred this approach to adding dummy country variables.

The set of analyzed data contains a group of eight financial ratios which characterize the financial standing and performance of the companies. As to the company specific factors (included among independent variables), we decided to group them in 3 major categories:

- Risk factors (solvency):
 - -- Beta
 - -- Leverage
 - -- Cash flow/Liabilities
 - -- EBITDA/Interest cover
- Liquidity factors:
 - -- Quick Ratio
 - -- Current Ratio
- Growth dynamics factors:
 - -- ROA
 - -- EBITDA Margin
 - -- Assets Growth
 - -- Sales Growth
 - -- Value-to-Book ratio

⁵⁶⁹ Bertoneche, M., Knight, R. "Financial Performance Butterworth- Heinemann", Oxford, 2001

⁵⁷⁰ Data sources from website http://www.onesource.com

-Company size factors:

- -- Market Capitalization
- -- Total Assets
- -- Operating income

In this case, the analysis performed focuses on the explanation or prediction of the Return on Equity (ROE), using all available data within the company. The most frequently used method for this type of analysis is multiple regression, a method we will also use but with a few elements, let's call them experimental, as a variation from the traditional regressions.

```
ROE = \beta_1 + \beta_2 Beta + \beta_3 Leverage + \beta_4 (Cashflow / Liabilities) + \beta_5 EBITDA / Interestcover + \beta_6 CurrentRatio + \beta_7 QuickRatio + \beta_8 ROA + \beta_9 EBITDA Margin + \beta_{10} AssetsGrowth + \beta_{11} SalesGrowth + \beta_{12} Value - to - Book ratio + \beta_{13} MarketCapitalization + \beta_{14} TotalAssets + \beta_{15} OperatingIncome + \beta_{16} (GNI / capita) + \beta_{17} GDP deflator + \beta_{18} (health expenses / GDP) + \varepsilon
```

We do not claim that the list of the variables above is exhaustive; the ROE indicator may also be influenced by other factors besides the ones already specified, which we will gather in a stochastic variable called error by obtaining a classic regression equation.

The econometric model is interesting through the large number of factors which contribute to the changes of the ROE indicators and helps us to identify and validate the main, essential factors, in our opinion and the one of other specialists mentioned all along the paperwork, factors which determine the financial and economic performances of the company.

The regression equation obtained in the end reflects the relationship between the return rate ROE and factors belonging to the efficiency and the growth dynamic, as well as factors related to liquidity.

$$\mathbf{ROE} = -239 - 0,00400 \text{ SalesGrowth} + 908 \text{ AssetsGrowth} - 0,0205 \text{ EBITDAMargin} - 1,99 \text{ ROA} - 241 \text{ LN}^2(\text{Quick Ratio})$$

From the model presented we can state that the main ROE factors are:

- the asset growth ratio, with the highest influence, which proves that the pharmaceutical industry is a place where large players enjoy success, since they have the resources to support significant expenses for research and development.
- ROA
- EBITDA Margin
- Immediate liquidity
- Sales increase ratio

There is no predefined solution to develop a good model. A satisfactory result comes more from the application of econometric rules and from the high number of trials and the analyst's intuition regarding the factors to be added, the relationship type (linear, quadratic), the effects of the combined factors type.

The model can help the decision maker to obtain a qualified answer to at least the following issues⁵⁷¹:

- What will be the ROE evolution in the next period and which are the factors that positively influence ROE and which is their degree of influence?
- Which are the factors that negatively influence ROE and which is their degree of influence?
- Which are the other factors that influence the company performance and that may be considered in order to improve the model?

A multidimensional analysis of the financial data provides a clearer image on the "business" of decision making factors in every company, as such data may be classified according to various criteria imposed by the decision maker, statistics and even forecasts may be issued.

⁵⁷¹ Boldeanu, D. "Information system for the analysis and assessment of the economic and financial performances at microeconomic level", PhD thesis, Bucharest Academy of Economic Studies, October 2008

3. Information system for the analysis of the economic and financial performances

The system is made for the decision maker, starting with the manager of a department to a general manager (CEO), to a shareholders or a financial institution. Particularly, the system may provide a number of situations and reports depending on the final decision and the power of intervention can be achieved by actions taken as a result of consulting important situations.

We propose the system to facilitate calculation and interpretation of a set of economic and financial indicators, comparative analysis of these indicators, from a current level to a budgeted one and a time analysis of these indicators to see their trend and to make predictions for the future. An experienced manager can act on some key factors of influence, identified during the activity, may adjust a forecast automatically generated by the essential and relevant changes and decisions that have beneficial effects and long-term.

Basic structure of the database contains items of the balance sheet and the profit and loss account from a period of two years (2007 and 2008) from which processed data can cause a range of indicators.

Range of indicators that can be compiled using synthetic situations and other situations such as those related to record data on employees' rights and wages, the distribution of expenditure, the situation on the movement of fixed assets and stocks, etc. can make the subject of a complex analysis beyond the limits of decision support system and the system aims at a more limited presentation and interpretation of indicators which we generically call "economic performance indicators – financial" that include both "the financial indicators" and "non-financial indicators" of an undertaking. Indicators of economic and financial analysis are those who compose the bulk of the outcome. They are found or may be calculated in the most part are in the balance sheet, the profit and loss data information, and the cash flow feature.

The model described previously may be the object of decision making support application, may allow for a complex analysis of the economic-financial indicators that might lead to making strategic decisions for the improvement of economic-financial performances. The data file (we used an Excel file) may be processed in a relational database (MS Access, SQL Server) and may further become the data source for a data storage or warehouse, basically for a multidimensional application which may also be processed to perform OLAP cubes or undirected analyses of the Data Mining type (figure 3.1.)

The implementation of a system for supporting decisions and identifying the economic and financial performances at the microeconomic level is aimed especially for the decision maker. The system comprises a data warehouse implemented in SQL Server 2008 based on which analyses of OLAP type can be run, as well as data mining, through Analysis Services Project, the component of Business Intelligence from Visual Studio 2005.

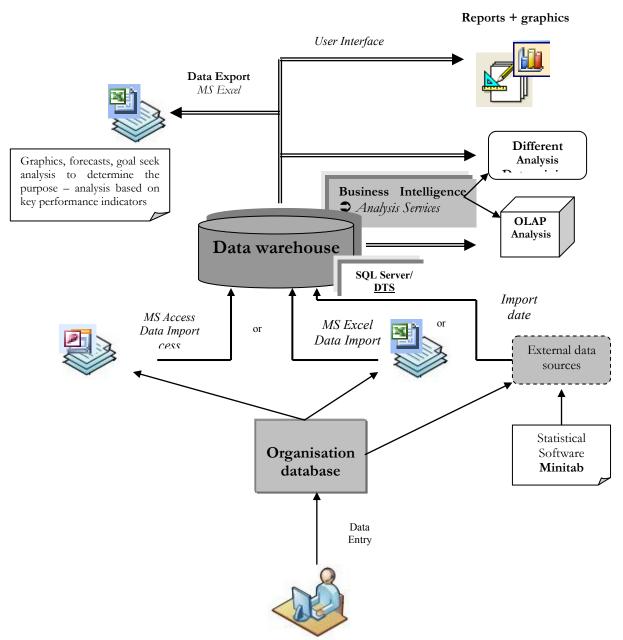

Figure 3.1. The decision support system application design structure for the analysis of the financial and economic performances⁵⁷²

Through an interface of type Visual Studio 2005 we develop the component of visualization of the final resulting data, through generation of complex reports regarding the financial statements and the performance indicators which are representative for the activity of an economic entity. One can make various comparisons between the actual and budgeted value of the selected performance indicators, interpretations of the profitability or liquidity ratios and their position within graphical limits (objects of gauge type), in order to ensure a better positioning and visualization of these indicators. Also, one can obtain graphs of comparative evolution in time between more categories of financial indicators.

⁵⁷² Boldeanu, D. "Information system for the analysis and assessment of the economic and financial performances at microeconomic level", PhD thesis, Bucharest Academy of Economic Studies, October 2008

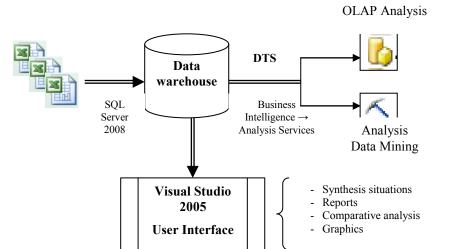

Figure 3.2. Proposed architecture for the implementation of the information system 573

4. Conclusions

The "performance" of an organization has a complex character and reflects a concrete image over the financial and economic situation of an analyzed company and the necessity of identification an intelligent and performing information systems which to support the decision makers in the strategic management process.

The information system proposed in this paper reflects once more the benefits of the components of Business Intelligence, the importance of the decision maker in the activity of management of an entity, his or hers specializations, and the necessity of making correct and pertinent decisions for the continuous improvement of the economic and financial performances.

The importance of analyzing performance ratios, to make comparisons with the companies from the same field of activity, to detect new tendencies and to make profitable changes require the use of advanced tools for multidimensional analysis, performance equipments, qualified personal for interpreting the analysis and the strengths to take important decisions for the prosperity of the company.

Abstract: Globalization represents the destiny humankind is drawing near, everybody being affected to a larger or smaller extent by its irreversible mechanism. The business environment relies on the expansion of markets globally.

Therefore it is achieved the transition from the international economy to the global one, in which transnational corporations become the main actors.

In conclusion, we witness in this eraof globalization the appearance of new types of relations between the enterprise and its environment. The existence and development of the third millenium enterprise relies on the impact of the informational and telecommunicational technology, vesting specific aspects.

Key words: virtual enterprise, virtual society, mobile Web applications

The article's JEL code: M1

1. The virtual enterprise. Characteristics.

The globalization of economyrepresents the intersection even more accentuated of the national economies, reflected in the growth, within every country, of trading, investments and foreign capitals to make the gross domestic product (GDP). This means that even a slightest mistake in a country meaning the weakening of the economic interdependent chain , can lead to the blockage of the whole mechanism because the same actors are active on all the worldwide markets.

The globalization era means at the same time the emergence of the virtual economy. In this respect, the Internet triggers the growth of efficiency regarding the activities within the actual enterprise. The enterprise benefits, on the one hand, of the growth in productivity which involves the production factors used and, on the other hand, the cutting of the production costs, especially because of the lowered prices for the purchase of the needed equipment and machines. Therefore, the enterprise makes large investments, thus keeping a growing economic rhythm.

In the globalization era, the specialists in the field talk about the « digital enterprise », « the third millenium enterprise ». This new enterprise acts in a « new » economy, based on four leading pillars :

- -informational revolution;
- -technological changes;
- -globalization;
- -demographic changes;

Within web-enterprises the organizational structure is streamlined with less bureaucracy and as such is more flexible

With this new style of company there indubitably are extant certain characteristic features that serve to distinguish from the more "traditional" company, of which namely:

- That information is the most consequential resource of modern firms while at the same time their main source of competitive advantage. Information is a commodity like any other;
- Employees change how they work. Some no longer even have a job in the acknowledged sense of the word. They carry-out their activities at home while communicating with their managers through information and communication channels, leading to significant cost reductions;
- Workforce employment is conditional on possessing the necessary skills to routinely use computers with mundane effort;
- Ever more employees are contracted for defined, finite periods of time. Maintaining one's professional competence is of higher, long-term concern now for the individual employee than maintaining a stable job;
- It has the ability to act on global markets, possibly delocalizing to lower costs and directly engage in competition with companies in disparate geographical areas;
- Due to compounding inter-dependencies it establishes its locations with regards to economic partners;
- Markets the firm is intertwined are no longer of just a physical, corporeal dimension but also a virtual one. The Virtual Market is the child of the Internet;

- Competition is more fierce. On this "webbed" planet there is practically nothing that caters only locally making it such that at any time there is the possibility that the firm might be confronting unknown competitors;
- Products / services have a shorter life cycle than they used to, imposing of present companies to afford close scrutiny to research and development. The effect: numerous alliances between businesses in various forms;
- There is more and more externalising or outsourcing of less profitable operations.

Business over the Internet is still in its infancy but the future belongs to those companies which will use this tool avidly in competition.

A Virtual Enterprise (VE) / Organisation is a temporary alliance of companies, organizations for the course a joint project to solve a certain problem or to jointly commence of certain products and services.

The rapid evolution of communications and infrastructure enabling the establishment of connections between different units and organizations gave a new impetus to the development of virtual enterprises and organizations, because the new type of interaction between participants eliminates remotes in time and space between partners.

Grounds exist for which organizations and businesses are becoming virtual in a knowledge based society. Some of these reasons are:

- a) globalization, with escalating trends of occurrence of emerging markets and global consumers,
- b) ability to quickly focus, where necessity mandates, resources of knowledge,
- c) creation of communities par excellence between individuals and organizations disjoint by great distance,
- d) the swift changes in the requirements of consumers of assurgent markets,
- e) increasing the ponderance of demand for specialised and custom products and services,
- f) increased trust among partners and the need to shared use of specialized knowledge, etc.

Businesses and organizations, great and small, are all too often discovering for themselves the fact that they have more to gain by introducing collaborative networks and the principles of virtual organisation and thus overcoming the barriers of hierarchical and functional structures of organisations descended from the industrial society.

Cooperation is continuously being enhanced by use of collaborative methods founded on digital technology. Of course, such cooperation may better be construed as more of a strategic alliance, rather than a virtual organization. An alliance is often established over a certain duration and is based on firm contracts. A virtual organization is temporary or easily reformable. It is constituted of digital connection and often based on less formal methods as pertaining to the respective obligations of the parties involved than a strategic alliance.

Romanian specialists are less accustomed with this organizational model and afford business partners limited trust. The virtual organization model is based on trust and the sharing of knowledge and skills among partners. This organizational model also requires prevailing over current conceptions regarding the computerization of firms.

The emphasis should be put on the means necessary for building networks of companies (enterprise networking), on the cooperation, the collaboration and the negotiation aspects that require more of the specialists than good knowledge of software in the economy.

Therefore, modeling and simulation will arise to be the predominant activities in the specialists' regard, in accordance with the inherent shift of more and more enterprises in our national economy to to the new, virtual organizational model.

An important factor in assuring the success of virtual enterprise is the modern informational structure, which enables functional, timely links that span great distance.

All aspects related to manufacturing and services offerings of a virtual enterprise are now integrated with Webbased protocols.

Activities such as design, continuous bidding, delivery and inventory management or services monitoring is done through automated procedures. Virtual enterprise can better anticipate requests for products, services and labor and is concentrated more on achieving the benefits of market innovation.

Under these conditions, new business models, techniques and procedures specific to virtual organizations and which are consistent with those used by companies in other countries arise with regard to opening markets for all companies in the European area. But there is also fiercer competition in these markets.

Relations in the context of virtual enterprise is based in particular on mutual trust, because in this context the legal and physical cadres lose their importance. Trust plays an important role in the optimal functioning of relationships between network partners.

- The most important features of virtual enterprises, listed in the literature, refer to:
- The ability to use temporary opportunities in some markets;
- Limited cooperation timewise;
- Complementary elemental skills, virtuality, flexibility;
- Waiving the institutionalization of the functions of centralised management;
- Trust and common understanding of the business type;
- Customer oriented and mindful;
- Using new technologies and based on organizational networks.

2. Information technology for the virtual society

Several virtual means of manifestation of the social are noticeable at the analytical level: virtual communities, virtual groups, virtual organizations etc. as well as interactions specific to the nature of the interpersonal, societal, communicational, informational, economic, cultural, etc.

Sociologist Bogdan Nadolu identifies five fundamental traits specific to the virtual society:

- 1. virtual social space is extant and manifests only within the framework of networks of computers;
- 2. computer support is man made, placed under his effective and exclusive control;
- 3. the virtual society is not an independent alternative to actual one but merely one of its manifestation modalities;
- 4. social actors involved in virtual type interactions are engaged in relations of the type individual computer network computer individual where they may control their identity but may not control or be controlled by others.

Jan Foster, Carl Kesselman and Steve Tuecke in the paper "The Anatomy of the Grid" define "the problem of the Grid" as coordinated resource sharing between authorities, institutions and resources - namely what is meant by virtual organizations.

Within these conceptual bases one discovers unique authentication, authorization, access to resources, information dissemination, etc.

In the mid-90 the term 'grid' meant an infrastructure model for the distributed computing environment, appropriate to the science and engineering environment. In fact, the concept of grid pertains to the coordinated sharing of resources and problem solving.

In fact, the grid concept is referring to the coordinated sharing of resources and problem resolution. This sharing is not just file sharing, but direct access to the computing resources, data, software and other resources, as needed by the whole range of applications indispensable to the distributed environment. It's imperative to not only clearly define the data suppliers and consumers, the shared content and who can share the resources, but also the terms of the sharing.

After analyzing the communication media and the services suppliers in the information area we need to mention and emphasize some of the complementary grid technologies:

-THE INTERNET is generally directed to satisfying the need of communication and informational exchange between computers, but it is not supplying the integrated tools for the coordinated sharing of resources on many sites ready to be connected to an integrated environment;

-The B2B (business-to-business) exchanges are focused on the information exchange, usually through central servers;

The enterprise distributed computing technologies that are increasingly being used are:

- -CORBA and Enterprise JAVA, which enables the sharing within the same organization.
- -DCE (The Open Group's Distributed Computing Environment) which supports secured sharing between sites, but which is considered to be slow and inflexible.
- -The SSPs Storage Service Providers) and ASPs (Application Service Providers) enable the outsourcing to third parties, but these types of communications are usually connected to the client using a VPN (Virtual Private Network).

Therefore, we notice that the current services on the information distribution and management market are only partially covering the scalability needs in a dynamic environment. Because the grid technologies are directed to the dynamic inter organizational sharing, they can be considered as complementary to the existing technologies.

The Grid architecture identifies the essential components of the system, specifies the purpose and functions of these components and indicates the manner in which they interact among each other. The main problem which the applications offered by the grid technologies solve, is the interoperability, which in the networks environment means common protocols. The grid architecture is in fact a protocol architecture on which the virtual organizations negotiate, establish, manage and utilize sharing relationships.

3. Strategies for designing and implementing mobile Web applications

In the current business environment and the new information technologies, the informatics systems designers are searching for and are suggesting new informatics solutions for the most diverse demands. One of these demands is the designing and implementation of a Web application for mobile devices.

A web application is a communication act, or in common terms, the path of information between a sender and a receiver communicating through a medium. In this perspective the technology choices are left in the background. In the foreground there is the target user, who has certain needs of information and is accessing the web application using an access device. Therefore, before starting the development, the application designers have to evaluate in detail what are the "access conditions" of the application or the service provided.

In other words, it is necessary to understand if the application that needs to be created will be used mainly on mobile devices, because its content is interesting only for moving users, or these devices are just one of the access means (or channels) to the application contents.

There are two strategies that can be implemented:

- creating a single version of the web application and adapting the PC version, which results in a mobile application;
- creating a mobile version of the web application, meaning a separate mobile web application

For the first scenario it's required not only to take technical precautions so that the web application will be displayed correctly on the mobile devices, but also we must define information and content structure and a graphic design adequate to mobile access. A web application, not just for a traditional application, but also for a mobile web application, consists of two fundamental dimensions: programming and developing.

The former, if created carefully can be adapted with minimal effort to the mobile device: to its display capacities, lower screen resolution and data input type. The latter is in charge of managing contents, organizing information and the structure of the information units, system usage functionality or, in short, the communication part of the application.

The developing strategy for a derived application is attempting to develop a web application using code that can be adapted without many difficulties to mobile devices and maintaining as much as possible the contents and functions of the application. In a completely different way, the development strategy for a dedicated web application starts with the idea that this has a main role and apart from the technological aspect and that they must take on the design of the service in a thoroughly way.

A "derived application" is the result of taking the following approach:

- The user is accessing the same pages (the same web address) using not just a PC, but also a mobile phone or a PALM device. Although the page structure is different, all the information and functionality will be available on both channels.

Therefore the modification of the web page components, for creating an adapted transformation when this page is accessed through a different device than the one it was made for, is required. The web technologies need to be used so that these devices can offer the users access to contents and functions in the same way to those offered to PC users. No matter which device is used, the users need to be able to not just view the dialogue, but also to have the possibility to complete the interaction with the dialogue (for example: registering for a service).

The objective of creating a derived application is, in general, the optimization of the existing code used to create the PC version. If the main application is in a restructuring faze, the design team's activity will be to make sure that the new version is solving a range of needs, that will allow new interfacing, and to be accessible through alternative devices as well. This does not mean the restriction of the version for the Personal Computer, but the inclusion of usable criterions in the design and development. It is interesting to note that these criterions do not require in depth changes and, thus, are very easy to adopt. By following this type of approach the result will be that the application can be used by mobile devices, applying to the project a greater sensibility to the multichannel information, without distorting the characteristics of the main application.

The first thing that needs to be tackled is the description of the relationship existing between the client and the server in the view of multi channeling. An important role is given to the final distribution context, meaning the multitude of hardware and software characteristics of the web access mechanism, the user's preferences and the environment (physical, cultural, social) in which the user is active. Figure 1 is illustrating the diagram of the elements involved in an HTTP transaction, in the view of multi channeling and therefore the device independence.

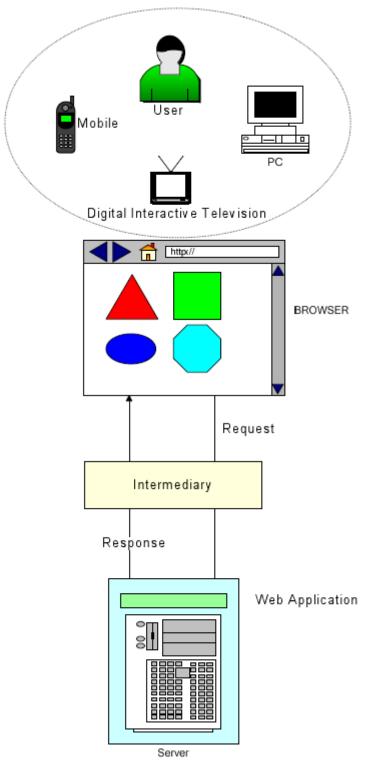

Figure 1: Elements involved in an HTTP transaction, in the view of multi channeling

4. Conclusions

The last 15 years have brought to the market a whole range of devices which, in a certain way, have similar approaches. Synthesizing, these devices can be split between the following categories:

-PDA (Personal Digital Assistant) devices – these are instruments designed to offer personal information management functionality, like agenda, text notes, meeting calendar;

-Smartphone devices – cellular phones that offer more functionality that just traditional voice and SMS messages communication. More and more individuals own mobile phones capable of working with images, managing complex data (addresses, meeting calendar) and especially can connect to a network of other similar devices;

-RIM Blackberry devices – similar to a PDA for the basic features, these devices stand out as out of office email management devices. For this purpose, even the first models included a QWERTY type keyboard and a larger horizontal display. Because of the GPRS and UMTS support, these devices can be used for internet access;

-Tablet PC devices – potential internet access devices, having the dimensions of a bloc-note. Usually they don't have a keyboard and instead include a touch screen display. These devices are very common in the business environment, although we can expect them to be used in the context of a personal user (for example to watch movies or pictures).

Generally these classes of devices have a range of common attributes:

- -The possibility to know the geographical position of the device;
- -Network connectivity (wired and/or wireless);
- -Limited processing power and memory (if compared to a desktop PC);
- -Battery power supply with the possibility of having a low autonomy;
- -Many types of platforms, hardware and software components, user interface (even for the case of the same device class)

All these issues will stimulate more and more the design of mobile Web applications, which will need to be integrated in complex and unified informatics systems. These are new challenges of out society and of the modern business environment for the developers of informatics systems.

DATA WAREHOUSES SECURITY IMPLEMENTATION

Burtescu Emil

University of Pitesti emil.burtescu@yahoo.com

Data warehouses were initially implemented and developed by the big firms and they were used for working out the managerial problems and for making decisions. Later on, because of the economic tendencies and of the technological progress, the data warehouses could also be set up by the medium and small companies. Setting up a data warehouse is a difficult and laborious operation and its security is even more difficult to achieve. The exaggerations concerning the security measures are not always beneficent to business. This is why the security measures projection for a data warehouse must be realized very carefully. The literature contains guides and lots of advice regarding data warehouse security. A substantial support can be offered by the specialized firms that are part of the present-day market.

Keywords: data warehouse, security, security architecture, performance, productivity.

Data warehouse

Data warehouse represents a collection of databases that come from different sources; they are integrated in the organization and they are used for working out certain problems and making decisions. Data warehouses contain a great variety of information which offers a coherent image of the company's economic conditions at a certain moment. Data warehouse refers to a combination of more different databases corresponding to the entire organization. This type of system is used for the supervision of the organization activity and supplies standard reports about it. It is also used for analyzing certain aspects regarding the organization's activity and some managerial decisions can be made on this analysis basis.

The data warehouse initiation was possible owing to the economic tendencies and to the technological progress. Nowadays, the new economic tendencies involve: trade globalization, the intensification of the competition, the spectacular shortening of the duration of products because of the technological evolution and also the imposing of high quality standards. The technological progress has allowed the increase of the calculation capacity and the prices reduction. We should also take into account the operating systems, the free-access to the data, the need for information that is acute, the storage capacity which is great and cheap and the software implements that are accessible. Considering all these, we can say that it's time to set up a data warehouse.

The main characteristics of a data warehouse:

- It is not focused on daily operations and transactions. Its focus is on the data that are used for analysis and making decisions.
- The main operation is data adding. Data are neither cleared nor overwritten. A data archive is maintained.
- The system is integrated. Data are collected from different sources (operating systems, databases, files etc.) and by the data warehouse they are transformed into standard reports of representation and they are centralized in the system. Data integration represents the most important problem when setting up a data warehouse.

Data warehouse costs

In most cases, the costs for setting up a data warehouse can be prohibitive and because of this aspect, many firms can't afford it. If we also consider the subsequent costs, then its image will seem apocalyptic for a medium company. On the other hand, the one who wants security for his business will allocate financial resources for the setting up and for the maintenance of a data warehouse. A data warehouse is composed of databases that contain from 1 to 10 Terabytes, in quite many cases values can reach tens Terabytes. The setting up of a data warehouse costs about 3 million dollars. The costs for its initiation and maintenance are divided into costs necessary to hardware systems (equipments and high storage media), professional services and software for the data extraction, processing, storing and analysis.

Data warehouse structure

Concerning its structure, a data warehouse has the following levels: data source, transformation, data warehouse, reporting, metadata and operations (Figure 1).

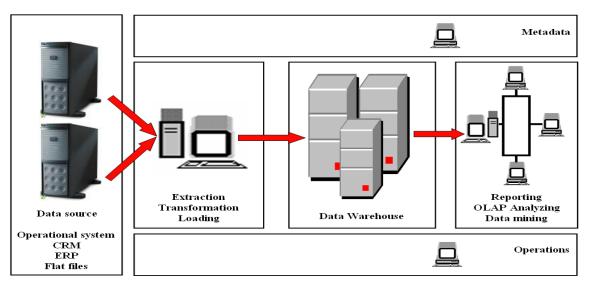

Figure 1. Data warehouse structure

Data source. Data source level refers to any information, usually in electronic format, that must be collected and stored in the data warehouse. Sources: mainframe databases (DB2, IBMS, VSAM, ISAM, Ababas etc.); client-server databases (Oracle, Informix); databases coming from personal computers (MS Access), spreadsheets and other types of files.

Transformation. This level deals with the standard transformation of the data collected at the Data Source Level. Data transformation consists in bringing them to the standard format of the data warehouse. To perform this level, one can either write special applications or use ETL implements (Extract, Transform and Load).

Data transformation may also involve data "cleaning" operations (correctness, consistence, totals, subtotals etc.).

Data warehouse. It deals in fact with data storing. For storing one can use relational databases. Data are stored for a fixed period.

Reporting. This level does the analysis and generates reports used for the supervision of the company activity. For this purpose one can use specific implementations:

- Business Intelligence Tools applications that simplify the generating reports process from the data warehouse;
- Executive Information Systems software applications created to generate complex reports for the company top level management;
- Enterprise Information Systems, similar to Executive Information Systems, the difference is that the first is more simplified for the company departments.
- OLAP (On Line Analytical Processing) allows multi-dimensional representations (cubes, hypercubes) and also allows fast and interactive analyses basing on different types of operations such as roll up, drill down, drill up, slice, dice etc., Data Mining, KDD (Knowledge Discovery in Databases), that use statistics analysis techniques and "forms" recognition in order to find correlations, rules, knowledge etc.

Metadata. This level includes data warehouse management information (the latest update, the number of the users connected to the system etc.).

Operations. The main purposes of this level are data loading in the data warehouse and also data processing and extraction. Another purpose is represented by the users management, the security, the capacity and other management functions.

Data warehouse security

Securing a data warehouse is an operation that requires much care and the concentration of the efforts because there are a few particular aspects that may appear.

The first aspect refers to a direct approaching of the security because in a data warehouse the information is stored in one location. This aspect involves multiple risks for the company. Focusing on the data warehouse is enough for an intruder and he doesn't need to waiste his time to attack the operating system because he can extract any data he wants from the data warehouse.

The second aspect refers to the fact that the access to data warehouse must be facile. The implementation of the security solutions may lead to the reduction of the data warehouse performance. According to recent studies, the period of interrogation has increased from 20% to 500% because of the security measures. The point from which the use of a data warehouse proves to be unprofitable must be established.

The experts agree with the fact that a standard method for setting up a data warehouse doesn't exist. We can conclude that a standard method for a data warehouse security doesn't exist either.

However, a few principles should be taken into consideration:

- Data warehouse team must contain a "security architect".

- The specific security politics for departments and/or users must be defined.
- One security politics for data that belong to the same category.

Security architect must establish the following aspects concerning security:

- Security roles. Data that can be accessed and modified and the type of users that can do this must be defined.
- **Security technology.** The following aspects are established: how is the access path from the user to the data warehouse server protected against address spoofing, masquerading, eavesdropping and any other threat as replay attack.
- **Security administration.** The one who administrates passwords and security roles must be established. It is also established the security mode in order to assure the copies security. The employees are communicated the new security implemented measures.

In order to ensure the security in any domain, technology and the mode of its implementation have the most important role. Security architecture for a company is exemplified in the figure below (Figure 2):

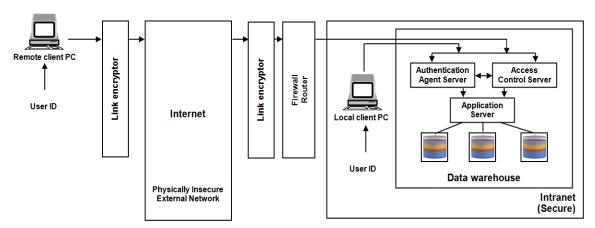

Figure 2. Security architecture for enterprise data warehouse

Another aspect that must be considered refers to the implementation security mode: whether it's done for the application which has access to the data warehouse or not. In the first case the security is integrated in the application and is specific to the data accessed by it and to the functions that operate with the respective data. The second case is when 5 points are accumulated after answering the following questions from the table (Table 1

Table 1. Security implementation table

Questions	Answer (0-No, 1-Yes)
There are more applications that access the data warehouse?	0/1
Is the data warehouse approachable by standard methods such as ODBC?	0/1
There are more than 100 users?	0/1
There are more than 4 dimensions?	0/1
There are more than 4 hierarchies in the structure of the same dimension?	0/1
Sum	05

If five points are accumulated then an internal security may be applied. In this case the security addresses to all applications and has a single checking point.

The literature are indicated seven stages for the implementation of a secured data warehouse:

- 1. **Data Identification.** The identification of all the data that are stored by the company. A total data is realized. It is absolutely necessary to take a rigorous inventory of all data to be available to users of the data store. Data warehouse has a component of its minitoring software that can provide information about data.
- 2. **Data Classification.** The classification is done considering the security. For example: Strict Secret Data, Confidential Data, Special Data, Public Data. Operation of the classification of data into different categories of data an operation is not easy sometimes. In quite many cases the data are a combination of several categories.
- 3. Quantifyind the Value of Data. It involves the evaluation of the costs caused by the data loss. Depending on the type of the incident, we can estimate the replacement (substitution) cost the cost for the replacement of the equipment that is unavailable or destroyed, or we can estimate the recovery cost the costs necessary to the recovery of the information that has been lost. Companies use both quantitative analysis and qualitative analysis to calculate the Annulized Loss Expectancy (ALE).
- 4. **Vulnerabilities Identification.** It represents the identification and the documentation of the vulnerabilities. Among the types of attacks we can mention: **Inference Attacks** involves the deduction of confidential data using

information which apparently seems public. Attacks specific to data warehouse; **Internal Attacks** – these attacks have great success because the intruders may have certain rights and knowledge regarding security architecture; **External Attacks** – Hackers, crackers, industrial spying; **Natural Factors/defects** – earthquakes, flooding, interruptions and variations of the current etc. In most cases data warehouse bases on the security based on views (VIEW based). Dump data can avoid this method. Another types is: In-built DBMS security, DBMS limitations, dual security engines, availability factor, human factors.

- 5. The identification of the protection means against the vulnerabilities and the costs evaluation. It represents the identification of the protection methods against the vulnerabilities. We must identify the vulnerabilities. As principal methods we mention: Users classification and the access control implementation, Data partition, Data cryptography, control of the software development process, the executive communication, informing and training. All these have one purpose: to ensure the security and to prevent the clearing and the modification of the information from the data warehouse. Finally, the costs necessary to the security measures implementation are estimated.
- 6. The selection of efficient protection measures that are to be implemented. It involves the selection of measures that represent the security implementation, generally speaking, basing on the implementation costs. In quite many cases the criterion of cost should not be the main criterion for selection. May be taken account of the compatibility and adaptability to new controls adopted by the old. It is well known that can achieve substantial cost reductions if they choose a control to cover more vulnerabilities not control for each vulnerability.
- 7. The evaluation of the implementation efficiency. It involves a continuous verification and auditing of the security solutions that have been implemented. A communications executive to data warehouse users of new security measures will be adopted as to increase their effectiveness and productivity of the initial losses to reduce. Before creating a data warehouse, we must know firstly very well if the data warehouse is absolutely necessary to the company. If we need a data warehouse then we must select the data we want to be stored and processed. The system will generate reports containing results that help me to make the proper managerial decisions. Storing "all that can be stored" involves supplementary costs and may lead to the reduction of the performance. On the other hand, if the stored data is insufficient, the results may be uncertain.

From the data which are supplied by the operating system, I select the data which are essential for making decisions. We have to take into account the possibility of a posterior development – we may need the data which were omitted at the beginning and later on they prove to be necessary to making decisions.

Although the initial implementation plan is well defined, during the implementation it may be modified because of the difficulties that may appear. Another reason of this decision is caused by the fact that the company which hasn't experts in security implementation wants the implementation of a paranoid security system. You should try to create a product for a certain company without referring to security. At the end, if you bring in to dicussion the security you will notice that all the attention and the efforts will be focused on security, although this can lead to the reduction of the performance application.

Conclusions

Data warehouse is a system created in order to offer an immediate access to important and reliable data which are used for decisions analysis, planning and evaluation. A data warehouse can facilitate very much the work but at the same time it can make it more difficult. An under-evaluation of the threats leads to an under-protection level for data warehouse security and business and creates possibilities of access for the intruders. An overestimation of the threats, sometimes reaching paranoid values, leads to an overprotection level that ensures an excessive security but will be as harmful as the under-protection level. In this case, the security means can be annoying and unbeneficial to the company production. It would be ideal to find out an optimal way for a data warehouse security. In quite many cases, because of the lack of funds, the companies can adopt a minimal measures level which will not be enough for attaining our supposed purpose.

Nowadays, grace of computing possibilities that electronic computers offer and namely, big memory volume and computing speed, there is the improving of modeling methods, an important role having complex system modeling using simulation techniques. These offer us information about the system before it to be correctly realized through building of mathematical and logical models which describe real system behavior or the behavior of some parts of it during long time.

In this work we purpose to analyze the main kinds of testing and validation of simulation model, starting from that to a simulation program it can assign the character of model only when its trustiness is checked and practically proved because only relying on the results of such models, decisions can be taken, these results being those which correctly represent studied system.

Key words: simulation model, validation, sensitivity analysis

JEL code: C61

1.PROCESS OF PASSING FROM REAL SYSTEM TO THE MODEL OF SIMULATION

The knowledge of evolution rules of complex systems, making a link between quantity-quality analysis and formalized representation of processes and phenomena demand application of modeling method for decision act.

The model made basing on the checking of available information about feature, behavior and functionality of a system is an active part of information resource for optimize the activity.

On the base of making every model, is mainly the exigency of its conception so to reflect simply and clearer and clearer the reality that it follow to show

Nowadays, grace of computing possibilities that electronic computers offer and namely, big memory volume and computing speed, there is the improving of modeling methods, an important role having complex system modeling using simulation techniques.

These offer us information about the system before it to be correctly realized through building of mathematical and logical models which describe real system behavior or the behavior of some parts of it during long time.

By the means of simulation, 'inputs' are generated and considering system internal states, through right algorithms, the "outputs" are established and there is shown the evolution in time of the system [1].

However simulation gives under-optimal solutions, it is an efficient technique for studying complex problems at firm level.

In simulation activity, three important elements are implied and namely: real system, the model, the computer and two relations: modeling and simulation relations. It needs the following considerations:

"real system" is the system observed using human feelings;

"real model" is the replaced real system and that generally correspond to the demands of initial real system;

"abstract model" makes the passing from "real system" to "real model". It remakes real system through system decomposition in basic parts and establishes the links between them [9].

Validation of results is made through a checking of the correspondence between the data from real system and those given by model.

Simulation allows the description of complex system behavior and makes possible experimentation of a system without expose the organization to the dangers of real world.

Simulation model, with its many characteristics, is the link between economic-mathematic model that has the possibility of modeling and reality. Searching thoroughly possible changes in real world through simulation model, we can often learn how to improve existing behavior without applying in fact the good or bad ideas about the system. In a simulation model it is possible the compression of long whiles in seconds at computer [3].

Simulation models are in most cases parts of informatic systems relied on solving system problems based on solving conversational system problems. They are used together with informational management and decision system.

2.DIFFICULTIES AND TYPES OF VALIDATION

It should be ideal that simulation model to be compared directly to the system which represents but this thing is not always possibly because the comparison is made between two "sets" of observations.

In the best case, the analysis put in evidence features equal to those of "real" system and can be considered correct if it is not negated by certain hypotheses.

In consequence, a simulation model has no universal validity but can be valid for reaching a certain target and within certain hypothesis.

Black Box Validation

For analyze the kind of model operating compared to real system these are supposed to be 'black boxes'. In consequence, operating data are unknown.

Test method of the kind 'black box" is simply. The behavior of real system is viewed in certain conditions and after that, the model is put in operation in similar conditions. If the model is valid, observations about it wouldn't have to differ from those of "real" system.

The comparison of the two sets of observations is made by the means of statistic methods, there are called checking tests for some hypotheses and test trustiness is explained through likelihood index.

Validation errors which can occur are errors of level 1, when a correct hypothesis is wrongly rejected. II-level errors appear when false hypothesis is accepted as true. Zero-type errors are very severe because who makes the test follows a series of useless aspects – it results a wrong model, ultra-sophisticated [7].

The model is statistically considered as valid but it proves to be useless because it responds to not important problems. This approaching can be made for the whole model or for a part of it.

White Box Validation

In this case, it is supposed that simulation model and "real" system are transparent. Internal features are very well known and understood. Validation of this kind is useful in model building process, nowise in final phase.

While in validation case of type "black box" prediction power of model is stressed, in "white box" validation, the accent is on internal activities of the model.

The most of simulation include a static logic which shapes system behavior. In a discrete simulation these are rules of the kind if (conditions) – then (action). Thus, real system can be controlled. In a continuous simulation, there is more probably to be rules which control system behavior in extreme conditions. If simulation has been base on statistical rule of system behavior it wouldn't be longer useful because simulation is used to mirror the system's dynamic behavior. In fact, dynamic performance (of action) of the model during running must be validated [8].

The materials (support), the animation (dynamic exposure of model features) are integrated in simulation program. System variables and states can be observed while the programs run, so the errors in action logic can be found.

As how it is possible, ultra-sophistication of the model which harms in a dynamic approaching must be avoided because a lot of changes appear in system wherefore the model must answer favorably.

Ultra-simplification is another extreme case that must be avoided, because it doesn't pass to surprise important aspects, useful details.

Zero errors avoidance can be realized either through the fast establishing of the target purposed through the model or through the adoption of a kind of approaching explicit and evolutive for the model.

3.SIMULATION MODEL TESTING AND CHECKING

We assign to simulation program the character of model only when its trustiness is validated and practically proved. Because only relying on the results of such models it can take decisions, they are those which correctly represent studied system.

In the case of a wrong structured problem, a wrong computer program can be made or baffling results can be reached. Hence there is useful model checking through testing step by step.

There are two components and namely: checking (refers to the rightness of process building, of model programming) and validation itself (refers to concept checking, there are checked the component parts and the relations between them).

Narrow linked to model validity is its sensitivity to outside influences. From the study it results the way of configuration the same time with the ease of model feature.

For checking right making of model, there were developed a series of software-engineering methods that find and remove programming mistakes (structured programming, top-down programming, Program-design).

Relevant especially for simulation programs, "trace" method is known which consists of the showing of event effects over corresponding status changes. Presentation of key-messages and message of pointing error causes in

the case of some procedures or methods "a structured walk through" used in team working case (every command is jointly explained and checked).

Generally, it considers that in every growth of complexity, the model is tested again. For program codes checking there are recommended methods of viewing them. Because the importance of validation, in the followings we'll show some characteristics of it.

The validation is characteristic to every model. Depending on the problematic of each studied model, there are established the specific validation criteria for deliver a real results. Validation is a gradual category. In the case of a decision of the kind "either-or", the model is considered valid only how it reaches real problem core. In certain cases, the growth of model validity can be realized only using very big costs. In these sense there was established a function of the relation between edge value of information and edge cost in the case of the increasing of model validity degree. [9]

Validation is the result of a negotiation process. A model is useful when beneficiary believes in its validity. As negotiation process, validity can be viewed considering used validation criteria and methods.

Practically, this thing is realized as collaboration between implied parts filled in by analytical and methodological competencies of expert consultants and with beneficiary's experience.

Validation acts during running of the whole project. It is considered even in the phase of element definition till model concept framing and model experimentation. Project phases occur interactively.

In dedicated literature [6] evaluation methods are grouped according to certain criteria. For user there are important: functional validity (checks model acceptability, reaction degree of simulated model, model behavior), result validation (gained results are compared and there is analyzed how they are near to reality and/or they improve real system) and theoretical validation (validation of simulation results through comparison to theoretical results computed using other methods).

4.SENSITIVITY ANALYSIS FOR A SIMULATION MODEL

Sensitivity analysis allows experimentation of models for follow system reaction under conditions of controlled variation of external parameters or of internal processes from system.

There is not the subject of simulated system validation but of generation scenarios of results running and evolution. There are established possible limits of overrunning results and also of deviation and dispersion of these results. For this reason, sensitivity analysis is considered to be an analysis of kind "what-if", "what happens if...". For this, there is built a system of values intervals relied on forecasting efficiency computes [10].

Sensitivity analysis is used especially when input data are not valid, when repartition of input data is subjectively established, when information about inputs are related, when they can be given only fuzzy hypotheses about system relations especially in cause-effect relation.

In all these cases there are so-called "critical points" which strongly lead to the emission of alternative premises and the result is got as scenario [11].

The scenario will be so built that to be also considered occasional influences wherewith the system could fight in the future.

The capacity to fast and efficiently test the most interesting combinations offered by this scenario, also supposes real collaboration with system beneficiary.

CONCLUSIONS

Validation process and sensitivity analysis have an important role in the foundation of easing a simulation model. It can be cancelled a series of features and relations that have minor influences over the model and also the description of the states of the system having too big number of variables.

As a consequence of complexity reduction, the effects are turned into simulation costs decreasing, a smaller volume of input data, decreasing of the expenses of model implementation, easy interpretation.

Complexity decreasing for a model is possibly only as how the reality allows this thing. But there are a series of simplification principles of a model possibly to be applied and namely:

When input values repartition is a repartition function of empirical values, there is checked the existence of a family of repartition functions that could lead to a better approximation (thing possible to be realized through a sensitivity analysis);

The parameters which have small variations during simulation can be considered as constants;

The size which equally troubles all the alternatives can be cancelled.

All the relation that can be represented through mathematical functions will be included into the model;

Sensitivity analysis can be used for building the possible combinations between input and output values of for evaluation the consequences of doubt premises;

For models having hierarchy structure, there are especially validated the models having easier feature, then it also follows an extension over those more sophisticated.

It results that the heaviness of testing process refers to the model wherein we understand and dimension the reality, because economic-mathematic model or simulation one, is the creation of an analyst by whose means it represents in a kind or other, a certain system.

Romania has a huge tourist's potential, but currently it is too little valued and exploited. As a result, one of the strategic developments of the economy aimed the tourism industry. The strategic decisions are based on different trends obtained from sophisticated analysis of data. Data mining helps businesses sift through layers of seemingly unrelated data for meaningful relationships, where they can anticipate, rather than simply react to, environment challenges. The aim of this paper is to present two models of data mining systems, considering that the data is processed from a distributed database.

Keywords: tourism industry, data mining techniques, distributed databases

JEL code : C89, D89

Introduction

Tourism is a great income generator due to an increased demand for its services. Their components range from quality and wide range of transportation to infrastructure, accommodation, food and beverage, support services and travel distribution services.

Romania has a huge tourist's potential, unfortunately, too little valued and exploited. As a result, one of the strategic developments of the economy aimed the tourism industry. But strategies are based on different trends obtained from sophisticated analysis of data. Providing the managers in the tourism industry with information about and insight into the existing data is the key function of the data warehouse systems [1].

Data mining - techniques for exploration and analysis of large quantities of data in order to discover meaningful patterns and rules - helps businesses sift through layers of seemingly unrelated data for meaningful relationships, where they can anticipate, rather than simply react to, environment challenges.

A system which enables the use of data mining techniques on data stored in a data warehouse is ideal for high quality analyzes to support strategic decision. But designing and implementing a Data Warehouse is a complex and expansive process [2], so we can apply the data mining algorithms on large volumes of data from relational databases.

The aim of this paper is to present the opportunity to use data mining methods on data from tourism and also to present two models of data mining systems, considering that the data is processed from a distributed database.

Data mining

Data mining is the exploration and analysis, by automatic or semiautomatic means, of large quantities of data in order to discover meaningful patterns and rules. So, data mining is defined as the process of extracting interesting and previously unknown information from data, and it is widely accepted to be a single phase in a complex process known as Knowledge Discovery in Databases (KDD).

This process consists of a sequence of the following steps [3]:

data cleaning – to remove noise and irrelevant data

data integration – where multiple data sources are combined

data selection – for retrieve from the database only the relevant data for the analyze

data transformation – where data are transformed or consolidated into forms appropriate for mining

data mining – the phase where the algorithms are applied in order to extract data patterns

pattern evaluation – to find the interesting patterns who representing new knowledge

knowledge presentation – when the visualization techniques are used to present the mined knowledge to the user

In order to ensure that the extracted information generated by the data mining algorithms is useful, additional activities are required, like incorporating appropriate prior knowledge and proper interpretation of the data mining results.

Figure 1 presents these phases and the most important interdepencies between them.

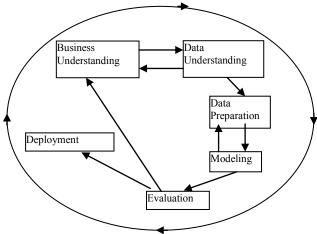

Figure 1. The steps of the CRISP-DM process (adapted from Wirth and Hipp)

Information Systems Used in Tourism Industry

Information technology was initially viewed by the tourism industry as a back-office function that supports the finance and accounting areas. The industry has advanced far beyond this view during the past decade. As information is vital for tourism industry, effective use of Information Technology is necessary.

An Information System regarding tourism activity should have some characteristics. It should collect, select and process information that is internal to the tourism activity coming from entities related to this sector such as National Tourism Agency and it should have subsystems that receive data from other business sectors, such as passengers landed from regular and nonregular flights, passengers flying with low-cost. It should support the decision-making process via integration of data from various sources, integrating them in a manner that permits analyses and comparisons between tourism indicators for the different regions of the countries and for different time periods. Also it should include historic information, such as the amounts of overnight stays per country of residence and for all types of hotel establishments throughout the 12 months of the year for every region [4]. It should also support the specialists who process and use tourism demand forecasts. As such, it detects the 10 countries with the highest tourism demand in the previous year. Taking into account the 10 countries listed and the forecasting methods suited to the specificity and nature of the data, the system prepares the necessary data to be processed by the specialists who create forecasts for tourism demand. [5]

Currently, the most used information systems in Romanian tourism industry are the *front-office systems and the reservation systems*.

Front-office information systems are those data processing systems that provide reports in visual or written form. They are used mainly in the management of tourist accommodation (hotels, motels, hostels or cruise ships) or in the travel agencies activities. These systems may be used for: tourists registration when the personal data about tourists are collected; marketing of various tourism products, such as rental cars; rooms management, when are collected and processed data regarding the rooms status, (allows instant viewing of room availability for all room types, indicates whether rooms are dirty or clean, allows rooms to be placed out of inventory or out of order to restrict rental) and tracks of revenues, providing transaction processing and obtain information about any debts and credits in relation to customers

Information Systems Used for Reservations provide rapid access to information and ensures the accuracy of this information. They bring information services, booking and selling and are used both by individual tourists and travel agents or commissioners. Most often this type of systems uses Web technologies. These systems use hardware and software specific to conduct them activities. Although providers of tourist services in Romania currently use such systems for ticketing most, is well to remember that these systems can be used for marketing or management activities.

In the tourism industry knowing the guests - where they are from, how much they spend, and when and on what they spend it- can help a company to formulate marketing strategies and maximize profits. Due to technological development touristic companies have accumulated large amounts of customer data, which can be organized and integrated in databases that can be used to guide marketing decision [6]. Since identification of important variables and relationships located in these consumer-information systems can be a difficult task, some companies have attempted to raise the power of information by using *data mining technologies*.

How can use Data Mining Technologies in Hospitality

Hospitality is used to describe hotels and similar accommodations as well as restaurants and catering organizations (Holloway, 2006) and represent a very important aspect of the tourist industry.

If hospitality organizations want to compete successfully, they must do so by using technology to drive value to both the customer and to the firm."[]

In this area Information Systems have been used to assist the delivery of hospitality services. Some of the key ways are (Buhalis, 2003): improved capacity management and operations efficiency; central room inventory control; last room availability information; yield management capability; marketing, sales and operational reports; tracking frequency flyers and repeat hotel guests; internal management of operations from transactions to human resources.

Most of the items on the above list apply only to hotels and accommodation providers

In order to make high quality marketing research and planning data-mining technology allows hotel companies to predict consumer-behavior trends, which are potentially useful for marketing applications.

The tasks performed by data mining can be grouped into the following five categories.

Classification arranges customers into pre-defined segments that allow the size and structure of market groups to be monitored. Also, predictive models can be built to classify activities. Classification uses the information contained in sets of predictor variables, such as demographic and lifestyle data, to assign customers to segments.

Clustering group customers based on domain knowledge and the database, but does not rely on predetermined group definitions. This function is beneficial because it aids hoteliers in understanding who their customers are. For example, clustering may reveal a subgroup within a predetermined segment with homogenous purchasing behavior (a subgroup of holiday shoppers within the transient segment) that can be targeted effectively through a specific ad campaign with the scope that the members of the subgroup will increase their number of stays or become more loyal. On the other hand, clustering may indicate that previously determined segments are not parsimonious and should be consolidated to increase advertising efficiency. Information such as demographic characteristics, lifestyle descriptors, and actual product purchases are typically used in clustering.

Deviation detection uncovers data anomalies, such as a sudden increase in purchases by a customer. Information of this type can prove useful if a hotel corporation wants to thank a guest for her or his recent increase in spending or offer a promotion in appreciation. Marketing managers may also attempt to draw correlations between surges in deviations with uncontrollable business-environment factors that are not represented in the database.

Association entails the detection of connections between records, driven by association and sequence discovery. For example, a possible detected association may be that a particular segment's average length of stay increases after a specific advertising campaign. Another association task could be employed in an effort to determine why a specific promotion was successful in one market, but ineffective elsewhere. Specific information regarding customer-purchase histories is necessary to formulate probabilistic rules pertaining to subsequent purchases.

Forecasting predicts the future value of continuous variables based on patterns and trends within the data. For instance, the forecasting function can be used to predict the future size of market segments. With forecasting one can also use data trends to project which hotel amenities are of growing importance to consumers and will be key drivers of the future perception of value of consumers.

Distributed Model for a Data Mining System

Data Mining systems have the following characteristics: they must not limit the size of data sets, the performances are optimized for large data sets and they are enough flexible to use various techniques of data mining. Also they offer support for multi-user access and requires a total control over data access. Finally they provide management and maintenance at a distance.

The basic elements of a data mining system of data are: user interface, the specific data mining services, data access and data itself.

Usually, Data Mining systems are built using client-server architecture, with different distribution on the two components of the items listed above.

In order to achieve a prototype of a data mining system for hotel industry of Bucovina, we proposed two models of system architecture and we have studied some of their advantages and disadvantages.

We started from the reality that each accommodation establishment manages its own data. Passing over specific needs all these work with databases containing data on customers, on services requested, on the amount spent, so on... If these systems allow a part of their data, in terms of ensuring data privacy, to be used for analysis, then it is possible that projections by necessary attributes of the tables to be available for sharing. If individual systems are connected through a communications network can assume that we are dealing with a heterogeneous distributed database, as shown in Figure 2.

In order to study the two models we chose ten accommodation establishments that have agreed to share the data available for this purpose.

The first stage was a selection of required data. For that we have applied a projection by a list of fields with the same meanings of the tables, corresponding to the following model:

$$\prod_{c_{1k}} {}_{c_{2k}} {}_{c_{nk}} \left(T_k \right) \tag{1}$$

Where $(c_{1k}, c_{2k}...c_{nk})$ represent the list of n atributes required from table T_k .

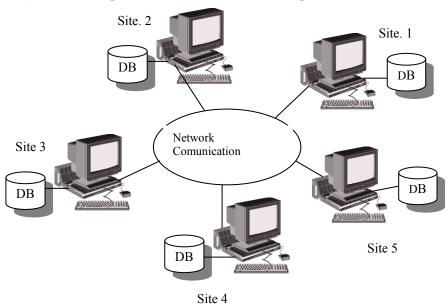

Figure 2. Distributed Database Architecture

The set of all these projections in a site form a fragment of the distributed database. Starting from this condition were analyzed the following situations.

In the first case, were installed in each site user interfaces and services suitable for data mining. Thus it was possible to apply local data mining methods (e.g. discovery of association rules). Local results were replicated in a single node and were combined to obtain the global solution. It is obvious that in the site where data were replicated were required additional operations in order to verify and validate the final results.

For example, for association rules was necessary to calculate the global support and confidence. In this case there are two major disadvantages. The first is related to the small volume of data processed on the local sites, which may lead to partial results inconclusive. The second disadvantage is the need to conduct further operations in the site where the results are collected.

The other option is a replication of all fragments in a single site where the specific components for data mining systems are installed. On these aggregated data we apply different methods of data mining.

The advantage of this approach lies in that additional operations for further validation of the global results are eliminated. However, there is a drawback related to large volume of data transferred on the network.

Conclusion and Future Work

In this paper we have shown that data mining techniques can be applied successfully in the field of tourism, especially in connection with strategic marketing. We also kept in mind that these techniques can be applied to data sets from various sources, which can be successfully treated as fragments of a distributed database. In this context we have examined two models of distribution of components of a data mining system and how we can apply specific methods and we have underline their advantages and disadvantages.

TRACEABILITY IN STOCK MANAGEMENT SYSTEMS

Demian Horia

Str. Universitatii nr 1 Faculty of Economics University of Oradea

Abstract. This paper presents traceability of a product if we are using a stock management system which uses FIFO or LIFO discharging methods. In the first part there is a little presentation regarding the four types of inputs and outputs and the side effect to the system. In the second part I present an example of traceability.

Keywords: traceability, stock, management

In stock management systems, we need the calculation of the stock value for any product, at any particular moment in time. This means that we have to calculate the value of input and the value of the output based on FIFO or LIFO methods. Because we can have for a product a few inputs at different acquisition prices and quantity, and a few outputs, we need to create links between the outputs and inputs, to know for a specific output which is the specific inputs. This links are very important in traceability to find for a specific product, the raw materials which have participated.

1.Inputs and outputs registration

In any stock management systems inputs and outputs will be stored inside a database, in my case a relational database. We have four types of movements from suppliers and to customers: Acquisitions, Buy Back, Sales and Sales Back.

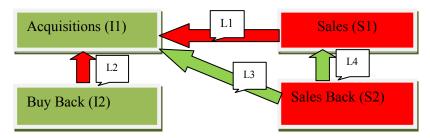

Figure 1. Schema of discharges inside a stock management unit

In figure 1, acquisitions are identified by I1 and means inputs to the system, sales are identified by S1 and means outputs from the system, buy back are identified by I2 and means returning of inputs, and sales back are identified by S2 meanings returning of outputs. Links between different types of inputs and outputs are identified by LN, where N is a number from 1 to 4.

Input and outputs							
ID	Туре	Quantity	Product	<i>IDPrec</i>	Discharged		
					Quantity		
1	<i>I1</i>	5	Product 1				
2	<i>I1</i>	5	Product 1				
3	SI	6	Product 1	1	5		
				2	1		
4	S2	-1	Product 1	3	1		
5	<i>12</i>	-1	Product 1	2			

When we record an output of 6 items of Product 1, this items comes according to FIFO method, 5 item from input with ID=1 and 1 item from input with ID=2.

When we need products from one stock management unit in another stock management unit, we need to transfer the products from one to another. In figure 2 I present the schema for transferring products.

Figure 2. Schema for transferring products from one stock management unit to other

ID	Туре	Unit	Product	Quantity	idPrec	Discharged	Price
						Quantity	
1	<i>I1</i>	First unit	Product 1	5			1
2	II	First unit	Product 1	5			2
3	<i>T1</i>	First unit	Product 1	6	1	5	1
					2	1	2
4	<i>I2</i>	Second unit	Product 1	5	3	5	1
5	12	Second unit	Product 1	1	3	1	2

In the preceding example we have one input with ID=1 for 5 items and another input with ID=2 for another 5 items of the same product named **Product 1**, in the first stock management unit. Because we need 6 items of Product 1 in the second stock management unit, we need to transfer this quantity of Product 1. This transfer will discharge according to FIFO methods 5 items from input with ID=1 and 1 item from input with ID=2. Based on this transfer an input will be made in the second stock management unit. The value discharged from the first stock management unit is 5*1+2=7, and the value of input in the second stock management unit is 5*1+2=7. We can observe that this movements move not only the same quantity of product but also the same value.

Another situation is when we produce some goods. For goods production according to a receipt we have to consume one or many types of materials in different proportion. In figure 3 I will present the schema used for goods production.

Figure 3. Schema for goods production

ID	Туре	Product	Quantity	Discharged	<i>IdPrec</i>	IdNext		Price
				Quantity				
1	<i>I1</i>	Material l	5				In	1
2	<i>I1</i>	Material l	6					2
3	<i>I1</i>	Material 2	5				In	3
4	CI	Material 1	2	2	1	6	Out	1
5	CI	Material 2	4	4	3	6	Out	3
6	12	Product 1	2				In	7

In this example we have an input of two different materials Material 1 and Material 2. For producing one product named Product 1, according to its receipt we will need 1 piece of Material 1 and two pieces of Material2. In our case for two items of Product 1, we have consumed 2 items of Material 1 and 4 items of Material 2. In this example because I used FIFO method for stock discharging, that two items of Material1 which I used in production, came from first input of Material 1 identified with ID=1. The four items of Material 2 came from first input of Material 2 identified with ID=3. This materials participated in production for Product 1 identified by ID=6.

The value of raw materials = 2(items of Material 1) * 1(Price of Material 1) + 4(items of Material 2) * 3 (Price of Material 2) = <math>2+12=14.

Because we produce 2 items of Product 1, the value of raw materials will be divided by 2, to obtain the value of 1 item of Product 1. This means that the value of 1 item of product 1 is 7.

2. Traceability

Traceability is the procedure which discover for a specific product, which are the raw materials and from where did they come. Also traceability can be the process which discover for a specific raw material which are the products which used that material, and where did they go.

The production process may include one or more technological phases, which may be inside one or more stock management unit, which means that our traceability can be like a graph in which inputs and outputs are represented like nodes, and the discharging links are represented like links between nodes. In this graph we can find all types of inputs and outputs.

One to many links problem.

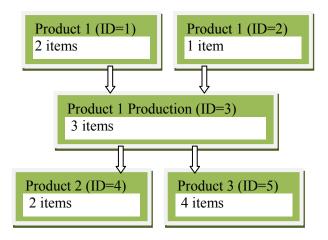

Figure 4. Breaking links problem

In figure 4, we have a production of 3 items of **Product 1**. We consume 2 items of **Product 2** and 4 items of **Product 3**. If we are interested to see the traceability for Product 1 (ID=2), we have to receive 1 item of Product 1 (ID=3), and 1/3*2 of **Product 2** (ID=4) and 1/3*4 of **Product 3** (ID=5). 1/3 means 0.(3) which cannot be represented by a computer with a finite number of decimal. To solve this problem we can apply n-1+1 method which means in our case that ID=2 uses 0.33 percent of ID=3 and ID=1 uses 1-0.33 which means 0.64 percent of ID=3. According to this procedure we have a side effect, the same type of products, in our case Product 1, can have different production cost. In our example we have a deviation of 0.005 percent for cost calculation. Level problem

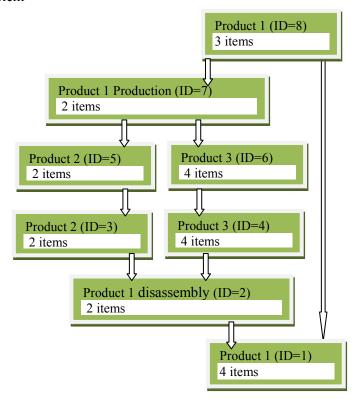

Figure 5. Level problem

In figure 5, is presented a possible situation, when at beginning (ID=1) I have 4 items of product 1. Because 2 of this items are not in the proper situation we need to disassembly, then to repair, and then to reassembly these products (ID=7). Also we send to a client 3 items of Product1 (ID=8), which came 2 from ID=7 (Level 2) and 1 from (ID=1) (Level 6). According to this example, one node can have links to nodes situated on different level. To calculate the percent of participation for each node first we have to put each nodes of the graph on level, to order them level by level and then to calculate the percent.

Figure 6. Example of traceability

Conclusion

Traceability is very necessary in the food industry to identify for a batch of finished products, the source of raw materials

One to many type of links can cause cost calculations errors.

The entire process of traceability needs to reorder nodes and links to be displayed correctly inside a table.

VASCO Data Security lancement du Digipass un lecteur de cartes à puce offrant des fonctions d'authentification multiples en combinant la fonction "ce que vous voyez est ce que vous signez". Le DIGIPASS peut être utilisé pour de l'authentification, la signature digitale, et l'accès au réseau de l'entreprise. Il offre une authentification forte pour la banque en ligne, la banque par téléphone et les environnements de e-commerce. Le DIGIPASS peut être utilise tant en mode connecté que non connecté. En mode non connecté, le lecteur devient EMV-CAP et offre les fonctionnalités de mot de passe dynamique et de signature électronique du DIGIPASS.

Mots clée: accès sécurisé, authentification, signature digitale, crypté.

Présentation

VASCO Data Security International Inc., la société leader mondial en programmes de sécurisation spécialisé en produits d'authentification fait partie des leaders mondiaux de l'authentification forte avec plus de 10 millions de Digipass vendus.

VASCO conçoit, développe et commercialise des solutions « d'authentification de l'identité des personnes » basées sur l'utilisation de mots de passe dynamiques, à usage unique, générés par un token toutes les 36 secondes et modifiés à chaque utilisation, donc virtuellement impossible à pirater ou à forcer.

VASCO sécurise les réseaux d'entreprises et permet l'authentification forte DIGIPASS pour l'accès à distance (firewall, protocole Radius et serveurs d'accès) et aux utilisateurs de réseaux VPN ainsi qu'aux applications Web et personnalisées.

Le logiciel d'authentification de VASCO est intégré sur la "calculette" DIGIPASS de l'utilisateur final, ou sur son PC, son GSM ou d'autres appareils portables.

Côté serveur, les produits VACMAN de VASCO limitent l'accès de l'application à l'utilisateur DIGIPASS désigné. Le marché cible de VASCO couvre les applications –et leurs centaines de millions d'utilisateurs- ayant recours aux mots de passe statiques.

Avec plus de 3.65 milliards d'utilisateurs de téléphones mobiles au niveau mondial, ces petits appareils sont devenus omniprésents dans la vie quotidienne. Les banques sont également conscientes de l'étendue de l'impact qu'a le téléphone mobile au niveau mondial et veulent tirer avantage de cette situation pour offrir de nouveaux services à leurs consommateurs. En conséquence, les applications de banque mobile sont devenues des solutions de plus en plus souvent mises en avant pour le retail banking. Avec le déploiement d'applications pour la banque mobile, un certain nombre de challenges sont mis en places. Parmi ces challenges, la sécurisation de l'application ou la facilité d'utilisation, permettant d'obtenir à la fois un niveau élevé d'acceptation auprès du consommateur et en même temps, générer un revenu suffisant pour la banque.

Avec le Digipass pour Mobile et le Digipass pour Java C API, VASCO offre une réponse aux questions de la sécurité d'acceptation par l'utilisateur des opérations de banque mobile. Le Digipass pour Mobile offre deux applications d'authentification. Le première est le code d'authentification «response only», la seconde application peut être un code d'authentification «Challenge/response» ou la signature électronique. VASCO est la première société qui offre une gestion du temps complète et automatique dans un système d'authentification mobile. Le Digipass pour Mobile se synchronise avec le server sur base de l'horloge, offrant ainsi une authentification encore plus sécurisée que les solutions d'authentification basées uniquement sur l'évènement. Le Digipass pour Mobile offre également une fonction d'adaptation automatique aux changements d'heures et une synchronisation automatique, facilitant l'utilisation de l'authentification forte pour les voyageurs chevronnés.

La facilité d'utilisation est un élément clef pour l'acceptation par l'utilisateur de l'application de banque mobile. A travers les années, VASCO a développé une large expérience en déploiements de grandes quantités pour les utilisateurs finaux. Cette expérience se traduit par les meilleures solutions disponibles. L'installation (disponibilité)

est rapide (moins de 2 minutes), sécurisée (totalement crypté) et peut être fait dans un univers en ligne (utilisant le HTTP ou SMS) ou en mode non connecté (manuel).

Les banques peuvent customiser le Digipass pour Mobile et le Digipass pour Java & C API à leurs propres couleurs. Les logos, couleurs, icônes, caractéristiques, et menu peuvent être facilement adaptés afin d'augmenter la reconnaissance de la marque aux yeux de l'utilisateur final. De plus, le Digipass pour Mobile et le Digipass pour Java & C API supportent toutes les langues ? La customisation offerte offre à l'utilisateur final une expérience mobile riche et facile d'utilisation.

Le Digipass pour Mobile permet l'authentification à deux facteurs et les fonctions de signatures électroniques pour les combinés Java, Palm et Blackberry et supporte plus de 400 types différents de téléphones mobiles. L'utilisation du Digipass pour Mobile ne requiert aucun déploiement ou programme additionnel côté utilisateur final et peut être utilisé en combinaison avec d'autres solutions Digipass afin de mieux servir les besoins et désirs des clients.

Le Digipass pour Java & C API a été développé pour les banques et intégrateurs. Il offre la possibilité d'intégrer la technologie bien connue du Digipass dans quasi tout environnement. Le Digipass pour Java & C API intègre de manière totalement transparente les fonctions d'authentification forte et de signature électronique dans les applications de banque mobile tout en se basant sur l'infrastructure «backend» existante et en la maintenant.

Le Digipass pour Mobile et le Digipass pour Java &C API sont des produits qui se basent sur la technologie côté server qui a déjà fait ses preuves de VASCO, le VACMAN Controller. L'utilisation du Digipass pour Mobile ne requiert que peu ou prou de mise à jour du server.

Grâce au VACMAN et au DIGIPASS, vous bénéficiez d'un accès sécurisé à diverses applications Internet, de l'entreprise et du VPN (Virtual Private Network).

Le VACMAN Middleware est une gamme de programmes qui rendent l'authentification possible. L'utilisateur s'enregistre avec son nom d'utilisateur et le mot de passe généré par le DIGIPASS. Le VACMAN vérifie la requête d'authentification de l'utilisateur avant de lui accorder l'accès. Avec le VACMAN vous pouvez également gérer l'administration centrale des différents utilisateurs. Simple et facile d'utilisation donc!

Le VACMAN Middleware: une plateforme, plusieurs applications différentes

- Une authentification sans histoire;
- Un développement tenant compte des demandes des petites, moyennes et grandes enterprises;
- Une integration, une maintenance et un contrôle facile;
- Pas d'installation de programme nécessaire sur le PC des utilisateurs;
- Des coûts extrêmement bas pour l'intégration et l'utilisation;
- Une seule plateforme d'au thentification pour différentes applications;

Le principe du DIGIPASS: un mot de passe dynamique unique

Presque la totalité des applications dans l'environnement professionnel quotidien exigent une authentification. La plupart de ces applications utilisent encore toujours un mot de passe statique simple (p.ex.: le nom de votre animal familier préféré). Ce type de mot de passe peut être facilement cracké par des hackers et rendent donc votre information non sécurisée.

Le DIGIPASS en fini totalement avec ce problème. Il calcule pour vous un mot de passe dynamique qui ne peut être utilisé qu'une seule fois. Vous utilisez le mot de passe pour vous enregistrer. Votre nom d'utilisateur et votre mot de passe sont ensuite vérifiés par le programme placé sur le server, le VACMAN. Si les données sont correctes, vous pourrez accéder à vos applications sécurisées.

Le DIGIPASS fonctionne sur le principe du temps. Toutes les 36 secondes, un nouveau mot de passe est généré. Cette combinaison entre le principe du temps, le mot de passe dynamique utilisable une seule fois et la vérification par le server des codes générés par le DIGIPASS, rendent l'accès à vos informations confidentielles, aussi vrai qu'impossible.

Jeton de l'authentification basée sur la plate-forme

DIGIPASS est une authentification à deux facteurs plate-forme qui permet aux utilisateurs de s'authentifier euxmêmes à des systèmes (tels que les permis DIGIPASS-bancaires sur Internet ou E-commerce sites) en utilisant les identifiants générés par les appareils de poche. Le système est basé sur la combinaison de matériel jetons possédés par l'utilisateur et des outils logiciels d'authentification sur le serveur du côté de reconnaître que la génération des clés d'identification généré par l'utilisateur jetons.

En bref: un utilisateur d'authentifier un DIGIPASS-système de permis en fournissant leur nom d'utilisateur, en combinaison avec une seule fois le mot de passe qui est généré à la volée par le matériel qu'ils possèdent symbolique.

Autre identification comprennent défi / les mécanismes de réponse, lorsque le serveur génère un code qui est inscrit sur le matériel, avec un code de réponse a ensuite présenté sur l'appareil que l'utilisateur retourne à la salle d'attente du serveur, ou une signature numérique dans lequel le processus de utilisateur entre de multiples pièces

d'informations sur les transactions relatives à la tâche qu'ils exécutent (tels que le numéro de pièce, la quantité et le montant en dollars dans une transaction de commerce électronique) et du matériel périphérique génère un code unique qui peut être confirmé par le serveur.

Dans tous les cas, le logiciel serveur est capable de reconnaître que la condition ID généré par le matériel périphérique comme faux ou authentiques, permettant l'identification basée sur l'ID utilisateur est connu et le matériel qu'ils possèdent. Acès par l'utilisateur de l'appareil lui-même peuvent aussi être protégés par un utilisateur PIN

Les jetons eux-mêmes - appelés jetons Digipass - sont offertes par le vendeur dans une variété de saveurs, de petits seule touche keychain dispositifs qui génèrent une seule fois les mots de passe, à la pleine taille de poche avec clavier alphanumérique complet et un soutien pour les cartes à puce. En outre, le vendeur propose un Pocket PC, Palm, JavaPhone, Windows et des logiciels basés sur les implémentations de logiciels permettant la génération d'un temps de clés d'identification sur les PC ou ordinateurs de poche, un "Virtual Digipass" processus dans lequel le composant serveur envoie les identifiants de l'utilisateur via SMS et le Digipass pour WEB (DP4WEB), dans lequel l'utilisateur registres en ligne et reçoit un login sécurisé applet (Java-based) et un cookie qui stocke leur DIGIPASS secret sur leur PC lui-même.

Qu'est ce qu'un eID?

Votre eID est votre carte d'identité téléphonique. Cette carte contient les mêmes informations que celles qui se trouvent sur votre ancienne carte d'identité. Mais l'eID est bien plus que ça!

Que fait l'eID?

La carte d'identité électronique à 2 grandes applications:

L'Authentification: vérifier que la personne qui s'annonce est bien celle qu'elle prétend être. L'eID vous permet donc de vous identifier (à distance) et vous donne accès à différentes applications à l'intérieur de votre entreprise, organisation ou commune.

La signature digitale: grâce aux certificats présents sur votre eID, vous pouvez signer de manière électronique des documents électroniques sans vous déplacer physiquement. Cette signature digitale a le même poids légal que la signature traditionnelle écrite.

Le processus suivi lors du passage des transactions: a chaque fois que vous effectuez une transaction, vous devez passer par plusieurs étapes qui représentent autant de contrôles :

- -tout d'abord, vous devez remplir le premier écran qui est un **écran de saisie**. Après l'avoir complété, vous avez le choix : soit vous annulez l'opération, soit vous envoyez vos données;
- -vous vous trouvez maintenant devant un **écran de confirmation** qui vous offre le choix entre trois options : annuler, modifier et confirmer
- -si vous confirmez, le système vous demandera de valider votre opération en encodant le ID. A ce stade, vous pouvez soit encore annuler l'opération, soit l'envoyer pour qu'elle soit exécutée.

Après envoi, vous recevrez un **écran de notification** reprenant la référence sous laquelle la transaction a été enregistrée. (Si la communication a été interrompue avant l'apparition de ce dernier écran, votre transaction n'a peut-être pas été enregistrée. Pour vous assurer si votre transaction a été enregistrée ou non, contrôlez votre Order Book (en cours) pour voir si votre transaction a été enregistré ou non.

Les avantages du Digipass:

Une sécurité accrue: le Digipass offre une solution d'authentification forte, d'accès et de transactions sécurisées. Il est parfaitement adapté pour protéger l'accès aux ordinateurs de bureaux et pour sécuriser les données par le biais de la signature digitale. Chaque opération de signature demande un code PIN. Ce petit appareil personnel génère pour vous une signature électronique qui vous permet de vous connecter, de signer vos opérations. Il calcule une nouvelle signature à chaque utilisation, ce qui vous garantit une sécurité optimale.

Réduire les coûts: le Digipass offre les mêmes capacités qu'une carte à puce avec l'avantage de ne pas avoir à investir dans un lecteur de cartes à puce. De plus, il a été développé pour les déploiements de masse. Il suit les standards en matière d'envois postaux ce qui rend les envois postaux plus faciles dans les cas de déploiements de masse.

Facilité: le Digipass a été développé pour simplifier les opérations dans la complexité des environnements PKI; le Digipass est facile d'utilisation. C'est un Digipass de petite taille et léger ce qui le rend ultra-portable, et ainsi, améliore la mobilité de l'utilisateur. Il peut également être utilisé par des utilisateurs sur différents postes de travail.

The development of a common syntax for EDI (Electronic Data Interchange), XML (eXtensible Markup Language), opened new formalization perspectives for interorganizational data exchanges over the Internet. Many of the organizations involved in the normalization of EDI are now concerned with the reporting of financial data over the Internet proposing an open and free standard called XBRL (eXtensible Business Reporting Language), based on XML and focused on the financial reporting in accordance to IAS/IFRS norms and Basel II directions. The use of a unique reporting format over the Internet namely XBRL, allows the optimization for financial communication and superior data exploitation within financial reports, consolidation, analysis, control and regulation processes. The present paper enrolls on the research line regarding the adoption of XBRL in the financial reporting processes (both internally and externally) within the european and international convergence context, and proposes an architectural framework for a XBRL platform at the national level.

Keywords: EDI, IAS/IFRS norms, financial reporting, XBRL, taxonomies specifications, document instance, strategic alignment, XBRL platform.

JEL Code: M15

Introduction

The evolution of information technology and communication (IT&C) has created opportunities for optimization of interorganizational information flows using e-business processes and generating activities in the regulation area for EDI standardization. Web and EDI synergy allowed to the SME's users to choose for the EDI using the universality of Web and to develop interorganizational information systems within an extended enterprise context (Amza 2006; Florescu & Tamaş 2006). Accounting normalization was the base for elaborating XBRL (eXtensible Business Reporting Language) as an open and free standard for financial reporting over the Internet. The XBRL is based on a common conceptual foundation being in accordance to the IAS (International Accounting Standards) and IFRS (International Financial Reporting Standards) simplifying communication, analysis and financial information exchanges (internal and external reporting) and recently banking supervision regulations. The adoption of XBRL as generalized standard for financial reporting answers to the transparence, fluency, reactivity and convergence exigencies at an international level. A global XBRL standard would impose an important rethinking of information systems on the organizational and interorganizational dimensions.

Our paper (1) introduces fundamentals of XBRL, (2) systematizes the advantages of XBRL adoption for different user's types and (3) analyzes the issues and evolutions of XBRL projects.

1. XBRL Fundamentals

1.1. What is XBRL?

XBRL is an international open international standard based on XML (Extensible Markup Language) and used especially for reporting financial data and defining financial reports in order to transmit them over the Internet. The XBRL allows organizations to structure and encode their financial information by the use of XML labels. According to the XBRL standard, financial reports (internal or external) are made in accordance of the IAS/IFRS regulations (see the image below) and are presented into a structured manner into an uniform electronic data format namely XBRL and is transmitted over the Internet toward interested organizations (Figure 1).

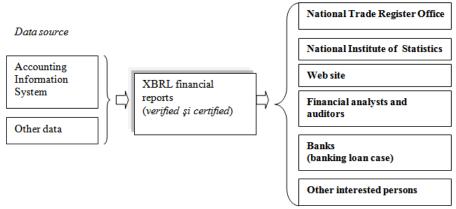

Figure 1. XBRL pilot format *Source*: adapted from Hamon (2007)

The mechanisms for exchange, integrity, confidentiality and non-repudiation can be assured through techniques defined and accepted for XML. XBRL allows taking into account of the new regulations and norms of Basel II. Any organization, especially those that are listed, could use XBRL in order to reduce costs and improve the efficiency of financial and business information processing conditioned by the existence of an information communication infrastructure that implements XBRL standard (Richards, 2002). Because it is open, XBRL could adapt to any context of use. The development of XBRL contributes to the emergence of a new web services generation specialized in processing financial data.

1.2. What are the concepts used by the XBRL?

The XBRL standard allows organizations to structure and qualify information by using tags. It uses a specific set of concepts the most important of them being: document, taxonomies, XML schema, linkbases, and discovery taxonomy set (DTS), instance document and XBRL document.

The taxonomy document defines the elements that are to be reported according to the IAS/IFRS norms. The term of element defines any basically piece of information that must be included in a report. The taxonomy includes the definitions of elements and the relationships between those elements. Besides elements, a taxonomy document could include tuples. A tuple represents a special type of element that includes other elements. For example if we want to store an address this would be stored in the taxonomy document as follows:

```
<element name="Adresa" substitutionGroup="xbrli:tuple" type="xbrli:tupleType">
<element name="Strada" substitutionGroup="xbrli:item" type="xbrli:stringItemType">
<element name="Nr" substitutionGroup="xbrli:item" type="xbrli:integerItemType">
<element name="Localitate" substitutionGroup="xbrli:item" type="xbrli:stringItemType">
<element name="Judet" substitutionGroup="xbrli:item" type="xbrli:stringItemType">
```

The taxonomy document does not contain any value of those elements (the values of the elements specified by the taxonomies are contained in the instance document and are called facts). The taxonomy document allows the classification of the elements usually specifying hierarchies established among those concepts. In the case of XBRL, taxonomy consists of an XML schema and linkbases contained or directly referred by that schema. From a technical perspective, an XBRL schema is actually an XML schema modified in order to serve to the specific requirements of reporting for a certain area of activity. The role of taxonomies is to provide information to the applications regarding the way that financial and accounting terms should be interpreted. An XBRL taxonomy document uses the namespaces technique in order to identify different XML technologies that should be used in the final report. Among the XML namespace tags used we could enumerate:

- **Schema XML** namespace tag used in all XML schema documents specifying the syntax in which the standard is expressed. The xs or xsd sequences are mostly used as prefixes in those documents;
- **XBRL** (*xmlns:xbrli*) namespace tag that specifies the instance of an XBRL schema that defines a vocabulary that would be used in taxonomies;
- XLink (xmlns:xlink) namespace tag that offers a complex framework for specifying references in an XML document;
- XBRL linkbase (xmlns:link) namespace tag that specifies the linkbase as an document that contains links among the concepts of an taxonomy and inter-taxonomies, as well as external references. This namespace is a subset of the XLink specification that allows XBRL documents to be built from a taxonomies collection, specialized as Presentation linkbase, Calculation linkbase, Definitions linkbase, References linkbase, Footnotes linkbase).

The links between the elements of a schema, known also as linkbases, are the elements of a taxonomy that offers information regarding the existing relationships among concepts of an taxonomy putting them into correspondence with external resources. Mainly, linkbases have the following goals:

- Elements labeling in order to make those elements intelligible for humans;
- Making references toward detailed resources related to a certain concept;
- Defining relationships among elements according to certain criteria.

The extension of taxonomy must be realized in the case that the local regulations of a specific geographical area do not have a correspondent within public taxonomies as IAS or IFRS for example. One of the main characteristics of XBRL is extensibility. The addition of a new element can be only done through the mean of a new taxonomy.

Discoverable Taxonomy Set (DTS) is a grouping way of the taxonomies of an XBRL document in a structure also known as set in order to be possibly used for data presentation in a report. The DTS is directly involved in the possible extension of taxonomies representing an instrument to be used by any XBRL documents processor for accessing taxonomies.

An **instance document** is an XML document that contains the values of an organization for the elements defined in the taxonomy that is referred. It is actually an electronically report created accordingly to the XBRL rules. Instance documents contain only data that will be included in the report. The data from these documents are arranged in a predefined order, their retrieval and arrangement in the final document being made exclusively by interpreting the content of the instance document from the perspective of the attached taxonomies. An instance document could contain elements or tuples. An element is the correspondent for a single concept while a tuple could represent a bidimensional table with a predefined number of columns and rows within taxonomy. The instance document defines a lot of the parameters that describes characteristics of the document as period of time for which are the data reported, the organization that emits the report, currency and so on. An XBRL document is obtained by combined processing of data and information contained in the taxonomy and instance documents.

What are the information technology solutions for migrating to XBRL?

The use of XBRL involves mainly a rigorously taxonomy to be defined and secondly an information system that allows the communication of financial data in XBRL format. The producer of the financial reports should ensure:

- In order to organize and store XBRL documents, it is necessary to have a solution that should be able to convert financial data from the information system into the XBRL format and eventually into an internal reporting form (this is the case of multinational companies that have branches and subsidiaries geographically dispersed);
 - External communication of financial reports in XBRL format over the Internet in a secured manner.
- The receiver of the financial reports should have an XBRL platform that should mainly ensure next functionalities:
 - Taxonomies reading;
 - Management of XBRL reports repository;
 - Conversion of reports received in XBRL format in different data formats;
 - On-line feeding of reports elaborated XBRL format;
 - Manual operation from the financial reports received in the classical form of papers;
 - Comparisons among the different published data;
 - Technical and financial validation of XBRL reports.

In the figure 2, we propose an architectural framework for an XBRL platform at the national level.

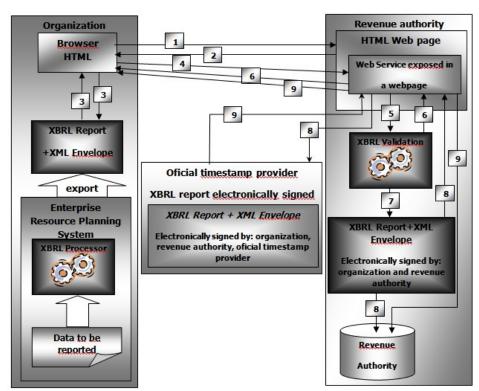

Figure 2. Proposed architecture for XBRL implementation

The sequence for semi-automated transmission of a financial statement in XBRL format (automation involves the use of web services both sides). The numbers of the actions figured in the above mention are explained as follows: (1) The assignee person of the organization connects to the webpage exposed, in order to collect XBRL reports by the revenue authority; (2) The web server of the revenue authority answers to the client request; (3) The assignee person of the organization specifies by using the browser the exported report in XBRL format; (4) The browser of the assignee of the organization uploads the XBRL formatted report onto the web page of the revenue authority. If there are sensitive data to be transmitted over the Internet could be used encryption with the public key of the financial authority; (5) The web service validates the received document (in the case that this is encrypted it is firstly decrypted); (6) The report does not respect the XBRL specifications and an error answer is sent back to the assignee of the organization; (7) The report respects XBRL specifications and is electronically signed by the revenue authority in the form that it was received; (8) and (9) A synopsis of the signed report by both organization and revenue authority is sent for time stamping by the official timestamp provider (both ends should have web services so the entire process could be automated). The report electronically signed both by the organization and revenue authority is stored in the revenue authority database.

The official timestamp provider issues a digital receipt that includes, besides the XBRL report synopsis, the moment when it was received. All those data are signed with the electronic signature of the timestamp provider. The receipt is stored together with the report that was saved in the step 8. A copy of the digital receipt will be sent to the assignee person of the organization as a proof of the accepting and transmitting of the financial statement. The digital receipt will be opposable to the third parties.

2. The advantages of XBRL

The adoption of a common financial reporting taxonomy based on the accounting standards and XBRL format offers many advantages both for the "producer" companies of the financial reports as for the "consumers" of those reports. The XBRL labeling offers the opportunity for rapid assembly of the information without needing to manually reenter the data. At the same time, it is easy to verify and certify those reports by the information systems. The "consumer" organizations of these reports in XBRL format get a greatly improvement of the receiving, comparison, analysis and decision processes regarding the financial state of health of the producer. Within the XBRL reporting context, the reported data become "intelligent" allowing rapid identification and exploration by the specific needs under different processing models. XBRL improves the analysis process of the reports and facilitates consolidation of data gathered from different data sources. The advantages offered by the XBRL are systematized by the different user types according to Johnson (2006): enterprises that produce financial reports, regulators organizations, stock exchange market, analysts, banking, financial information, auditors, experts and accountants. From the Teller (2008) point of view, the improvements brought by XBRL could be analyzed by the measure that this offers answers to the financial reporting: getting and publishing information, sharing comparing financial information, verifying financial information, analysis of financial information. It's obvious that the emergence of XBRL constitutes an important factor for making researches that should address on one hand abstraction the accounting concepts and on the other hand abstraction of the accounting norms that should equally take into account syntax elements (base concepts, actions that could be performed over the base concepts) and semantic elements (concepts and concepts dependencies) that gives sense to the syntax elements. Semantic abstraction could form the base for building semantic search engines of de financial information stored in financial reports Data Warehouses.

As a response to the necessity of alignment to the international or regional general accepted accounting standards, and to assure the compliance with the adopted practices in enterprises, XBRL standard is periodically supplemented with new taxonomies that can be regarded as language extensions for better responding to particular situations. Among the most popular, and, therefore, the most common taxonomies, four of them are distinctive: XBRL – GL (General Ledger), used, especially, for internal or group financial reporting information modeling; XBRL - IFRS, for preparing, structuring, and presenting the financial information together with its context, in compliance with the most common IFRS standards; XBRL - COREP, in respect to the Basel II reporting norms for financial reporting; XBRL – GAAP, addressing financial statements reporting, complying with USA GAAP rules. While all aforementioned taxonomies are important, XBRL – GL benefits, lately, from increased attention both in the research area, and practitioners and financial accounting information systems developer's circles. The latter perceive the opportunity of integrating the XBRL standard into their systems, as a formal support for the financialaccounting information transfer, not only for external destinations, but also at intra-organizational level. XBRL – GL standardizes the presentation of internal financial statements based on the periodic accounting journals, in order to improve information communication and transparency between different reporting entities. The GL extension provides the ability of accounting consolidation that can be detailed to the lowest level, because of the XML format hierarchical structure, thus, permitting, equally, the preservation of information context before consolidation. The proliferation of integrated financial-accounting information systems based on an open, service-oriented architecture (Tudor, 2006), may constitute, in our opinion, an important premise for the adoption of XBRL technology, which can better answer to the conditions of such architecture. Thanks to the open standard, generally accepted language, platform-independent or report-independent characteristics, XBRL may constitute a distinctive business service for any accounting information system. The integration of such a standard in the financial-accounting information system architecture, acting in collaboration with bugetting, forecasting, reporting or analytical analysis, may open, from our point of view, new valences in the field of the corporative performance management.

3. The XBRL projects

The success that XBRL encounters in financial reporting makes that XBRL (closely related to the IFRS) projects to be of strategic importance for all the involved parties. Depending on the established goals, we'd like to distinguish among the next types of XBRL projects:

- -Projects of establishing an XBRL committee or organization at national, regional or international level that aim to adapt, develop, encourage and promote the use of XBRL;
- -Projects for XBRL taxonomies that aim for a rigorously classification of financial reporting concepts so that the same data to be used for printing and publishing or on-line publishing (both internally and externally), including here the data warehouses for XBRL reports managed by the revenue authorities;
 - -Projects for adopting XBRL standard by the companies and organizations that "produce" financial reports;
- -Management and exploitation of data warehouses that stores data in XBRL format within the "consumer" organizations of financial reports in XBRL format.

The projects of establishing the XBRL national entities (maybe soon XBRL Romania) are the correspondent for an explicit will of partnership in order to create an representative entity for promotion of the national projects, (projects for taxonomies creation/development; XBRL accommodating projects and so on) and to stimulate the dialogue with other regional entities (XBRL International for example).

Conclusions

The migration to the financial reporting over the Internet using the XBRL format it's a strategic decision within the global context and in accordance with accounting and financial reporting norms (IAS/IFRS, BASEL II, etc.). The use of financial and business reports in a XBRL format offer to the interested parties an important advantage but could also involve specific issues related to the training of users and securing the information exchange. The XBRL is about to become the universal language for financial reporting and a core component of the information systems that deals with automated information exchange between systems according to a taxonomy that answers both internal and external reporting requirements. XBRL takes part to the nucleus of ESG reporting (Environment, Social, and Governance) within a lasting development context. Publishing data in XBRL format on a website opens opportunities for use of search engines for financial information and clever use of the found information.

THE ELECTRONIC SIGNATURE

Gramada Dragu Argentina

University "Titu Maiorescu" Senior Lect. Voiculescu Madalina Irena Phd. University "Titu Maiorescu" Faculty of Economics

Cuvinte cheie: digital signatures, electronic commerce, secured devices to generate electronic signatures

Article refers to significance and the digital signature in electronic commerce. Internet and electronic commerce open up many new opportunities for the consumer, yet, the security (or perceived lack of security) of exchanging personal and financial data is still a major concern amongst all kinds of users. We believe that only digital signature technologies based on public-key cryptography can guarantee the necessary security and consumer confidence.

The exigency in the conclusion of a written legal document, ad validitatem or ad probationem, is satisfied by the electronic document with an incorporated electronic signature, based on the acknowledged certificate and generated with a signature creation device.

The Internet has become a commercial means, with its own legal regulations. The new technologies allow for more widely spread and cheaper access, storage and transmission of *information*. The current economy is built around the information, and especially around the information on the internet, and the promotion of **electronic commerce** is connected to an appropriate legal approach.

The <u>digital information</u> can be transformed into new social and economic value, creating immense opportunities for the development of new products and services. The information becomes thus a **key-resource** for the <u>digital economy</u>.

The electronic signature is a new challenge, given the EU integration aspirations. It comprises electronic data which are attached to or logically associated to other electronic formatted data, and serves as an identification method

Digital signatures — a message signed with a sender's private key can be verified by anyone who has access to the sender's public key, thereby proving that the sender had access to the private key (and therefore is likely to be the person associated with the public key used), and the part of the message that has not been tampered with. On the question of authenticity, see also message digest. ⁵⁷⁴

The international practice and the attempts to regulate the issues related to the yet fragile security of the electronic documents have found a remedy: the Certification Authority. Mainly this body should be a public service (the city hall, the government) or a private service (company).

The American Bar Association ABA has described the in "Guidelines for Digital Signatures", the *conditions* an electronic signature should comply with so as to be accepted legally, the technical means to implement the electronic signatures as well as the imposed requirements of the Certification Authority (to be in the possession of the financial resources to maintain the operations as per the declared obligations, to have the capacity, within reasonable limits, to take the risk of the responsibility towards the subscribers, to the individuals and companies that rely on the certificates it issues)⁵⁷⁵.

The International Chamber of Commerce has recommended the use of a cyber notary as an important element, also called trusted third party, in the safe management of the electronic documents. Recently, the CyberNotarySM project, supported by Scrivener Notaries, Notaries Society, The Union of International Latin Notary and ABA considered the trusted third party as well as the authentification, encryption and the digital signatures in detail. 576

The legal value o the electronic signature

The electronically written document that comprises the extended electronic signature has the judicial value of a privately signed written document. If the document is acknowledged by the opposing party, (the party with whom the contract has been concluded with), in the event of litigation, the document will be given the status of an authentic judicial document. The legal regulation applicable to the electronic signature is treated under Law 455/2001 and the Technical and methodological regulations regarding its execution.

The exigency in the conclusion of a written legal document, ad validitatem or ad probationem, is satisfied by <u>the electronic document with an incorporated electronic signature</u>, based on the acknowledged certificate and generated with a signature creation device.

The lack of acknowledgement of any of the parties of the written document or of the signature will force the court to which the litigation has been submitted to instruct for the verification of the contested facts, by means of the

⁵⁷⁴ http://en.wikipedia.org/wiki/Public-key cryptography

⁵⁷⁵ Digital Signature GuidelinesTutorial-American Bar Association Section of Science and Technology Information Security Committee-www.abanet.org/scitech/ec/isc/dsg-tutorial.html

⁵⁷⁶ National Conference Of Lawyers & Scientists- www.aaas.org/spp/sfrl/committees/ncls/

specialized technical appraisal. The expert will request the qualified certificates, documents that identify the author of the documents, the signatory or the owner of the certificate.

The party who will call to its defense an extended electronic signature must make proof that the signature:

Is connected only to one sole signatory;

Provides for and is sufficient for the identification of the signatory;

Is created through means controlled solely by the signatory;

Is connected to the electronic data that it relates to, so that any ulterior modification of the former is identifiable.

Technical aspects

<u>The private key</u> is a unique digital code, generated by a hardware and/or special software device, with whose support the electronic signature is created. <u>The public key</u> is the pair of the private key, indispensable to the verification of the electronic signature. <u>The document print</u> is obtained with the hash-code function. The electronic signature is configured through an algorithm by overlaying the private key and the document print.

How to electronically sign a contract?

The party who initiates the endeavor uses his/her *private key* to sign the contract and sends it, and the addressee of the offer decrypts the transmitted document with the *public key of the addressor*. The acceptance of the sent offer is made if the contract is signed by the addressee with his/her private key and sent to the addressor, who will be informed of the acceptance through the public key of the addressee.⁵⁷⁷

Certification services

Providing electronic certification services consists of issuing a certificate or furnishing ancillary services to the electronic signature. Making such services available to customers is not conditioned by a previous authorization, as it takes place in a free and loyal competitive environment. The future supplier of certification services will inform the Authority for the Regulation and Supervision of the Certification Services Providers (ARSCSP), in writing, of the intention to act as an electronic signature certifier 30 days prior to the inception of such activities. All the information related to the security and certification procedures in use will also be transmitted.

Voluntary accreditation

The certification services suppliers who wish to be accredited suppliers can apply for an accreditation from the ARSCSP. Acquiring the voluntary accreditation implies complying with the conditions required for the issuing of qualified certificates and the use of the secured devices to generate electronic signatures, accredited by an accreditation agency agreed by the authority. The validity of the accreditation is 3 years and can be renewed.

The qualified certificate mentions

That the certificate has been issued as a qualified certificate;

The identification data of the supplier, its citizenship (individuals) or nationality (juridical bodies);

Name of signatory or the pseudonym, as well as other relevant attributes;

The personal identification code of the signatory;

The verification data of the signature;

The exact indication of the validity of the qualified certificate;

The identification code of the qualified certificate;

The extended electronic signature of the supplier that issues the qualified certificate;

The limits to the use of the qualified certificate of the value limits of the operations it can be used for.

Certificate suspendibility:

At the request of the signatory, after checking his/her identity;

At the final court request;

The information in the certificate no longer coincides with the reality.

Certificate cancellation:

At the request of the signatory, after checking his/her identity;

At the death or when an interdiction has come into effect on the signatory;

At the final and irrefutable court request;

The essential information in the certificate no longer coincides with the reality.

The encroachment upon the confidentiality of the signature creation data;

⁵⁷⁷ Atreya, Mohan; Hammond, Benjamin - Digital signatures - McGraw-Hill - New York, 2002

The fraudulent use of the certificate;

Upon the proof that the certificate has been issued based on false or erroneous data.

The obligations of the certificate supplier:

To comply with the declared security and certification procedures;

To provide the access to all the necessary information for the correct and safe use of its services (the steps to take for the creation and the validation of the electronic signature, the prices charged, the ways and concrete conditions to use the certificates, the obligations for the owner of the certificate and for the supplier, the existence of an accreditation, the contractual conditions to issue the certificate, the ways to solve litigation, other information required by the authority);

To keep an electronic register of the issued certificates accessible on-line as well (date and time of the issuing/expiry of the certificate, suspension and cancellation policy mentions, as well as their potential causes);

To keep the secret of the information given in relation with their professional activity and not to disclose it unless the owner of the certificate accepts to have them published to third parties; as per art. 196 Penal Code, lack of compliance with this obligation has penal consequences for the disclosure of a professional secret, unless the information is transmitted to a public authority when the latter acts to perform its public and legal competencies;

Not to collect personal data from other persons than the one who requested the certificate and only in the measure that the information is useful for the issuing and preservation of the certificate; the use of a pseudonym does not allow the supplier to disclose the real identity of the owner, unless agreed so for reasons related to the public interest.

The supplier of qualified certification services should possess the financial means to cover legal damages that may arise in the course of its activity. The insurance is made either through an insurance contract with an agent or through a letter of credit from the specialized financial institution.

Conclusions

Implementing the technologies, as with any new technologies, is a step towards their security. The option to wreact win the information domain is justified by the existing risks to the security.

Law 455/2001 translated the Directive norm no. 99/93/EC of the European Union Council and the European Parliament into the Romanian legal system. 578 It is a step forward. May it be fruitful!!

The attention of economists, managers and other professions is retained by a newly emerged domain, called artificial intelligence. The systems based on knowledge, the expert systems, the systems based on genetic algorithms, the fuzzy systems, the hybrid systems and the neuronal systems are systems of artificial intelligence which are on their way to occupy a more and more important place in the professional life. The expert systems constitute one of the most important areas of the artificial intelligence.

Keywords: artificial intelligence, expert systems, business administration, intelligent systems, knowledge base

Cod JEL:M2

Introduction

In the Romanian scientific literature there are some works which offer a great number of pertinent information in the expert systems domain – a particular category of intelligent systems with a great sphere of applications in management, accounting, finance-banks, insurances etc.

P.G. Pigford and G. Baur show that "the expert system is a program product which emulate the human experts' behaviour who solve problems from the real world, associated to a particular domain of the knowledge"[5].

The expert systems (ES) are systems of programs based on the artificial intelligence techniques (IA), which register the human experts' knowledge in a well defined domain and then they use them for solving the problems from this domain.

In a detailed analysis of the expert systems we can identify the following [9]:

- from a conceptual point of view, the expert systems aim to reconstitute the human reasoning on the basis of the examinations obtained from the experts
 - The expert systems dispose of knowledge and of the capacity of carrying on human intellectual activities
- They dispose of methods of investigating the knowledge and the expressing of the expertise, behaving like an "intelligent system"
- they are able to memorize the knowledge, to establish links between knowledge and to infer conclusions, solutions, recommendations, advices on the basis of the facts and of the processing of uncertain knowledge
- As for the level of informational realization, the expert systems are based on the principle of separating the knowledge (knowledge basis) of the program which treats it (inference engine).

In all the cases, the researchers agree on the fact that under the title of expert systems there are the programs of artificial intelligence or machines based on the high level knowledge, comparable with those of the more competent specialists from an applicative domain and in which these programs can realise performances of thought and intuition similar to the human experts.

Methods of research

The central element of the intelligent processing is constituted by the artificial reasoning, able to imitate the human reasoning. The expert systems reproduce the human experts' reasoning on the knowledge put at their disposal in a certain manner, possibly multiply this knowledge and explain their own lines of reasoning.

However we may call them, cognitive or intelligent systems, the expert systems constitute a domain of the artificial intelligence technology and many applications have already become remarkable. The expert systems, the expert systems generators and even the neuronal systems generators are already available on the market and contribute to the full to modelling the enterprise of the future.

So the expert systems are a modern instrument in the businessmen' hands for obtaining acceptable solutions, which bring profit to the problems with which they confront daily.

From the implemented expert systems, over 60% are business oriented for enterprises and their administration, and the rest cover the utilitarian, medical and educative domains.

The expert systems integrated in the multimedia applications constitute the most spectacular realization for businesses because they allow the watching of videoconferences from the specialized networks, very useful for managers who can address to their subordinates, they can evaluate their answers, following their mimic with the aim to establish the most adequate persons for certain tasks.

The industrial expert systems can offer process diagnostic services for maintaining and repairing the robotized production lines or just-in-time instructions for the security and safety of the industrial installations.

The business administration is a very important domain for the expert systems, because the policies, the procedures and the techniques used in tackling the current matters are favoured by these intelligent instruments.

For the accounting, as well as for the administration domain in general, the expert systems present interest due to the performances in processing the knowledge – data and information – especially in quality, correctness and efficiency, better accomplishing its objectives. There are already viable implementations in the managerial accounting as well as in the financial accounting.

The financial-banking domain is, at present, the best covered with expert systems in exploiting for placing the credits, administrating the portfolios, detecting the frauds, planning the taxes, the financial diagnosis, the banking planning.

The insurance and investment companies already use expert systems with the aim to improve the services compared to the concurrent companies.

The management domain is the most receptive and the best equipped with expert systems in current usage, because all the technological, economic and social conditions necessary to their introduction were already created. The expert systems develop with the help of an information technology which follows main objectives as well as derived objectives. Among the main objectives we can enumerate [3]:

- The easy acquisition of the knowledge by expressing as directly as possible the expertise obtained by the human experts
- The efficient exploiting of the knowledge collection through: combining and linking the knowledge for inferring new knowledge by judgements, plans, demonstrations, decisions and predictions; considering the manner in which new knowledge is inferred
- The easy support of the whole game of operations on the knowledge (their adding, modification and elimination). From the derived objectives we can mention:
- reducing the risks
- increasing the productivity
- learning.

The expert systems do not act independently of the other components of the exterior environment in which it is installed. It can be appealed by other external programs or it can send results by other programs. The majority of expert systems are interactive in the sense that their interface offers means of communicating with the human users, ensures the obtaining of data and information from the special sensors, from systems of administrating the database, from systems of tabular calculation or even from the program which administrates the classic files. The expert systems can also create and update databases, can imprint reports or can control the most diverse devices and instruments.

The development of the interface and of the integration with their action environment is not the same for all the expert systems. That's because we need different interfaces according to the inputs and the outputs necessary to the environment in which they operate.

The main characteristic of an expert system is to dispose of expertise, which is in fact the ability to execute at least at the level of the human expert a well determined work. This includes not only the capacity to solve a problem, but also to make this in a time as short as possible (shorter than the human expert would do it). The expertise means at the same time that the thesaurus of knowledge about the domain of the problem which is owed by the expert system has to be all-embracing and profound. Comprising the knowledge refers to the competence which it has to owe in the domain. An expert in a certain domain has always a great competence as regards its knowledge compared to a beginner in this domain. The past experience is probably an important factor which contributes to the increase of the competence.

In the case of the economic agents the expert systems, as intelligent systems, present the following attributes:

- the ability to assist experts to the projection of their own expert systems, and the users to the developing of the specific activities
- the ability to render sensitive the management on changing the operations and the relationships between the functions of the different departments
- the auto-organization and the restructuration of the knowledge base by the automatic activation in the conditions of the critical factors and the generation of signals on the operations provoked by changes in the direction of the reequilibration
- the integration between the system of collecting the data with the operational modules and procedures with intelligent specific for the economical-financial analysis and the audit activities.

All the characteristics make from the technology of the expert systems a new source of increasing the productivity due to the fact that it is able to offer security and the necessary experience with their intelligent usage in making the decisions.

Table no. 1. The comparison between the human expert and the expert system

The factor	The human expert	The expert system
Time	Working days	Any time
Localization	Local	Anywhere
Information security	Irreplaceable	Replaceable
Perishableness	Yes	No
Performance	Variable	Permanent
Work speed	Variable	Rapid
Cost	Big	Acceptable

Undoubtedly, the experts are the most valuable resource of a company. They can offer creative ideas, they can solve difficult problems or they can execute in a very efficient manner routine activities. Their contribution can increase the productivity of the enterprise, in the sense of improving the competitive position on the market.

There are two reasons for which the construction of an expert system is decided, following the comparison of the table from above:

- 1. replacing an expert system
- 2. assisting an expert in his activity

The main reasons for replacing a human expert are:

- making the expertise available also after the schedule and in any of the point of work of the enterprise
- automatizing a routine task which needs an expert
- the expert retires or deceased
- the expert is very expensive
- the expertise needed in dangerous environments for the man's health or in periods of prolonged strike

The most actual opinion is that of P.C. Trealeven, who shows that the intelligent systems software has reached the maturity and it is represented by three categories:

- oriented on application (dedicated to a certain applicative domain)
- oriented on algorithm (it supports one or several important algorithms in the inference engines)
- with general task

The development environments oriented on application are destined to domains with economic specific or for administrating the enterprises, which the professionals can successfully use because they offer a large scale of possibilities; they have excellent interfaces with databases, with tabular calculation programs, with other external programs for statistic or for analysing the data.

The development environments oriented on algorithms support one or several algorithms, fact which offers a very good flexibility or easiness in their usage. The algorithms are offered in libraries of parameterized code, fact which allows the integration with the users' applications. The majority of algorithms are among those which are specific to the neuronal networks.

The environments with general task are mere kits which contain simulator libraries of algorithms, interfaces and other instruments of programming. They are destined to the experienced programmers and they are famous for the flexibility of the interfaces and of the control mechanisms. Some of them need even specialized equipment by the parallel computers type.

In all the cases, when we decide the usage of a developing environment must be carefully controlled and all the possibilities offered. So, we must have in view the following:

- a) the hardware compatibility (for what type of station of labour it is available);
- b) the software compatibility (for what operation systems it functions);
- c) the inference engine characteristics (where we must take into account the allowed searches type, the control strategies type, the limits regarding the rules, strategies of solving the problems);
- d) formalities used to the knowledge representation;
- e) the knowledge administration (models of calculating the certitude factors);
- f) mechanisms of applying the reasoning's:
- g) the characteristics of the variables (types of variables: entire, real, range, number of variables);
- h) possibilities of calculation with predefines functions;
- i) number of commands and their power;
- j) interferences of dialogue (easiness in usage, presence of menus, windows, icons);
- k) helps to development (instruments of tracing, trouble-shooters', instruments of verifying the database coherence):
- 1) documentation and assistance ensured by the company.

Automatizing and improving the decisions is the natural vocation of the IT in general. When this processing aim to obtain information, advices and recommendations or notices, aiming even to improve the decisions, the expert

systems already constitute the most efficient solution. There are appreciations according to which 80% from a human expert's work can be automatized. We talk about the simple, repetitive, procedural operations, in which the expert system behaves like a normal computer, but also about the more complex operations, great consumers of time and energy, specific to the deductive, inductive or mixed reasoning's which the expert systems produce easily, rapidly and effectively. Foe example, the BEST system (Baking Expert System Tool) implies a certain expertise which is automatically made, gaining time in the most difficult cases of according the credits.

For example, an expert system is specialized in selecting a method of calculating the costs in direct correlation with the peculiarities of an economic agent.

The selection of the method will take into account the following peculiarities:

- the dimensions of the society;
- the process of production;
- the type of method (total or partial);
- the classification of expenses in fixed and variables, direct and indirect;
- the type of production;
- the determination of certain deviations from the standard;
- the domain of activity;
- the interest of the leadership in certain aspects.

The pieces of knowledge acquired from the experts will be taken over in the knowledge of the system with the help of a generator of expert systems. We will effectuate a correlated synthesis of the main characteristics specific to each calculation method. The generator used in this case in EXSYS Professional which allows the representation of the knowledge with the help of the rule production method.

After the transposition through program of all the conditions using the relationships IF...THEN the advices given by the expert system with the aim to choose the method of calculating the costs will be displayed.

Conclusions

But what the future has in store for us in the expert systems domain? In this sense we foresee the following directions of development:

- the massive developing of expert systems and neuronal systems generators, through which the experts themselves will be able to conceive new applications in the most different domains. The cognoticians will have them too an important role because they will concentrate less on the editions of developing the expert type applications and more on the applicative domains;
- the developing of some new methods, more performing of acquisition and representing the knowledge, which will become more and more available and accessible. This is the most interesting sector for the cognotician of the future;
- the most promising future belongs to the neuronal systems, which inspires from the structures of the human brain and the originality of which takes into account the distribution of the knowledge. The neuronal systems will not be dissociated by the expert systems, these ones implying one another.

We already have on the market generators of expert systems which use the description of objects, which make integrant part of the knowledge base, but these are only precursors because we will reach the intelligent systems which surpass many generators of expert current systems in the sense that the software integral in the neuronal systems will be available in a near future as hybrid instrument of conceiving the systems associate techniques oriented to the objects from the classic programming, fuzzy techniques.

In synthesis, if there is a modern and motivated management, when there are the possibilities of realising an operational expert system, and a team of experimented projectors, to which we add competent and motivated users, then the problem of realising an expert system becomes similar to that of realising an investment which must be conduced by inspiration and by the desire that the expert system which will be projected and useful for the economic operator.

In conclusion, an expert system can be created for simple problems, by little dimensions, as well as for complex problems. The problems of little dimensions solicit less the human expert, the construction of the knowledge base is made quickly enough. For the complex problems the human expert is solicited a greater period of time and for elaborating the knowledge base we need more time. From here we can get the idea of elaborating an expert system for problems of little and medium dimensions.

The concept named e-ScientRoChair proposes searching for new informing and documentation opportunities, on fundamental structure in academic scientific research, meaning the chair or the research team, anabling the possibility to publish and as well as to disseminate some related information, research grant competitions, conferences, symposiums, workshops, various scientific publications. By summarizing and by pondering all the research activity components one can obtain the scientific profile of a researcher who activates in the academic environment. This concept tries to approach the university research as market whose participants are members of academic community.

Keywords: Online Database, Chair, Scientific Exchange, Scientific Research Components

Jel Classification: O32

Introduction

In a knowledge based society, where the information and communication technology evolution is a continuous dynamic process, fast finding of information has become a fundamental criterion for users of scientific information. One of the fundamental human rights concerns the right of being informed which become operational through unlimited individual access to information. The information seen in the completeness of denotation and concept is one of the major trends in modern society. Today, in the era of information technology, virtual information spaces are the most complete, efficient, fast, diversified and easy to access ways to get informed. Ideas on developing such virtual information spaces are one of the most stable pursuits for today modern society, in its way towards an information society. One of the aimed fields, challenging a growing interest is the educational and research field. The interaction of the two fields leads to fundamental and applied research development, which in turn become more visible by using virtual information spaces.

In a world governed by knowledge, the science is universal. In this context, the main goal of scientific research is that starting from data towards information to reason out knowledge in the informational pyramid of knowledge (Mihai, 2005). Without disseminate the research results to further use them, this role played by science in contemporary society is annihilated.

Moving to a knowledge based economy is a fundamental strategic option and this will have a high impact on human durable development. Universities play a primary role in knowledge based society development by their contribution to information creation, release and use, in the process of transforming data into information and knowledge. The main role of the university consist in training highly qualified human resource, which is a process that implies the symbiosis of education and research, the educational system performance making its contribution to a great extent to society development. University scientific research is an inseparable part of an efficient education system and it is imperative for higher education development. In this way the higher education system can accomplish its role requested by economic and social development at a national, regional and local level.

In this context, the researcher's profile must be defined as good as possible in order to make the research visible, efficient, specialized but also interdisciplinary.

The Chair is seen not only as the primary provider of scientific resources gained by research but also as the final consumer of the research results which feed the scientific appetency demonstrated by research through new subjects and research themes. The primary expression of scientific research at a chair level means revealing of scientific skills of its members and this occur in the context of Romanian universities aiming to become research centers

If this segment was valued from an informational point of view, by increasing visibility through attributes defined for researchers, teams, chairs or departments, it would bring great benefits in terms of increasing research efficiency. This would be done not only on the vertical axis of knowledge, by identifying similar preoccupations of

the researchers which could define the current stage of the research on a certain field, but also on the horizontal stage (in the final part of the segment), by corroborating dissemination sources of scientific preoccupations.

1. Analysis of the available information on the degree informing as concerns the research which are promoted by the entities making the science policy in romania

The analysis of current stage of research in the field of promoting science policy and scientometry concerns the identification of the main entities visible at a local, national or international level and requires the analysis of the way in which they can offer descriptive information about these research project, white papers, conferences, books, etc., and how can one obtain the profile of a researcher and the scientific potential of chairs or departments whose members are involved in research.

Romania, the entities that perform the research and development activities are included in a national system (Dumitrache, 2006). The research national programs launch research topics, offers research grants by competition considering the science policy in each country.

The research activity approached by competition is functionally made up of two informational flows, at the borderline between information demand and supply. Thus, ANCS (The National Agency for Scientific Research), CNMP (The National Center for Management Programs), CNCSIS (The National Council for Scientific Research in the Academic Educational System), or other national entities involved in the science policy publish periodically information on launching of research competitions. This approach represents the demand of the academic scientific community interested in research work and, at the same time, the supply of the national entities that draw up, launch, apply, monitor and assess the policies in the research, development, innovation and science fields, according to the national strategy. This data flow comes from the entities that dictate the science policy, and goes to research suppliers – "the makers of knowledge". At this level one can know data about the scope of the topic, the research fields, subfields, themes and topics.

Once the competition is launched, the flow is reversed, the researcher thus becoming bidders of projects, while the entities involved in science national policy change into representatives of the demand. At this level there are three types of information, as follows: those referring to an accurate description of the research projects and their inclusion in the scope of the topic, those referring to the human resources de involved in research work (the university, the faculty, the chair, the research institute) and those which would describe the competences outlining the profile of the researchers or of the research team. Juxtaposition of the three types of available information is poorly turned to account from the informational standpoint.

One may say that the national entities involved in the science policy don't have in view the connections existing between the research resources at different level stages of the research resource suppliers (along the informational line - researcher - research team - academic chair - faculty - university), as against the respective fields, subfields, scope of the topic. At a higher level, governed by the scientific research management principles there are three coordinates to be used: the interrelated use of the project information; framing-in of the project according to the scope of the topics; use the information describing the team members.

The break through channel identified at this level might informationally distribute all the eligible projects or the projects declared winners in the grant competition based on other criteria than those based on the activity fields, the universities or the research institutes. The mix-up of the complex information that describe the research through grants and competitions, stored at this level, might be recursively drive in to the constitution of a profile of the researcher participating in the research competition, supported by grants. It also may lead to the connection of this profile to the chair they depend on. From its level, it may produce some other information as well (articles, books and manuals) that meant to fully describe the researcher's profile.

This information corroborated with the purpose of dissemination, nationally and internationally, of the research results might become the object of a database, as a solution of unifying the informational resources, determined by a heterogeneous participation in competitions and research grants. From the latter one can draw out data which would outline both the scientific profile of the researchers, their field of concerns, their competences, and information describing and quantifying the institution involved in the research activity (at the level of different organizational stages including chair and department).

Equally database might contain information on the research projects submitted for certifying purposes to the authorities that perform the science policy at a national level, but declared ineligibles or even non-winner. This information is useful to the university researcher community in order to further resuming the competition and recalibration of the informational contents of the suggested topic, depending on the remarks of the assessment commission.

On using efficiently the information stored in the database, one can carry out statistics according to certain scope of topics or scientific fields of interest that aroused the interest of the scientific community and represented a national priority promoted by the entities that determine the science policy in Romania.

2. Analysis of scientific research activities involving the academic entities stages

Universities in Romania promote the science policy at an academic level. The components of the research activity in academic institutes, as research entity, can be found in multiple organizational forms: articles published in scientific journals, articles indexed in scientific databases, treaties, specialized literature, applications and case studies, inventions and innovations, student research.

In most cases, the Chair, the primary storage of the scientific potential in a university doesn't provide significant elements from the stand point of the scientific research activity transparency. The chair is presented only historically as a component from the administrative standpoint (subordination) or from the didactic point of view. Some chair publish their research themes depending on the scope of the topic or on the field the respective topic is part of, without leaving aside the human resource under research. There are also cases in which one can see the scientific concerns, materialized from the quantitative: books published (authors, publishing houses, publishing date, date of issue), articles, scientific contributions etc.

Even if the chair research activities are becoming transparent in faculties or universities, there is no possibility at present to include this information in national database, which is indexed on a multicriterial bases. This database should include the research resources provided by each chair, research team or individual. The concept called **e-ScientRoChair** suggests the interconnection of these research resources (by Web services, under all possible ways) for each chair.

All the chairs should be transparent in all research components: national or international competition, supported by research grants, articles published in scientific journals, participation in conferences, symposiums, workshops, participation in devising bibliographic material (books, compendiums, case studies, printed course stuff), invention and innovations, doctoral research, student research, didactic activities adjacent to research work.

The above components are elements defining, both the profile of each researcher, and the potential of the chair or of the department they are part of. All of them can be found distributed to the entities that organize actions and scientific events - research projects of the national entities responsible for the science policy, scientific articles published in scientific journals or in scientific databases; symposiums and conferences published in tomes or scientific annals, supplements of journals or of scientific activities, editorial publications, in libraries, on the Internet or the book network; inventions and innovations published in OSIM.

The concept e-ScientRoChair unifies these scientific activities provided by each researcher and it circumscribes them to the chair. By combining the components that provide potential to the research work one can develop a break through channel project in the science policy, so that it may intersect the scope of topics, fields, subfields, subjects matter and research themes, to add a value to the development, turning to account and use of the scientific information.

3. Designing an online database with the purpose to interconnect all components of research from a scientific portofolio.

The concept e-ScientRoChair purposed is intended to create a database that should interconnect the specialized chairs of the universities to the convergence of the interests of the creators and users of scientific information. The database will contain all the descriptive information about the research concerns of the chair members. The information will be labeled and indexed according to various criteria from which different components can be extracted. These components describe the research activity of each individual, research team or specialized chair.

Practically, any researcher in Romania or elsewhere will be able to have access to this portal and obtain information concerning the scientific activities from the portfolio of the academic chairs. They also can have information about the scientific profile of the researchers, depending on the scientometric quantification criteria. The database will be loaded by the system's users.

Thus, each academic chair wishing to promote the ideas of their researchers for the purpose of their scientific participation in research projects, articles published in scientific journals, conferences, symposiums, etc. or for the purpose of distributing the results, can do this by providing descriptive information about the potential or their own research portfolio. In order to be registered in the database the researchers should publish their scientific concerns according to categories (books, articles, research contracts, etc.). They receive from the system registering time delay. Until the potential users are given access to the online program they will be checked by a scientific committee regarding their scientific works. After being checked, depending on the result and the degree in which the works declared are identified they will be given a score of authenticity. If a minimum number of points is achieved the user is allowed to access the program.

In parallel with the facilities of consulting the research concerns of the academic scientific community the references to the paper sources will become available as a full-text or abstract.

The database of the system e-ScientRoChair should reunite all research components (articles, books, contracts, etc.) issued by the entities concerned to make visible the undertaken efforts to conduct research activities and the dissemination, analysis and quantifying the effects arising there from. The system will frequently update the database through decentralized level by approaches taken by researchers or by departments or academic departments.

The exhaustive transpose of the disseminating demands of research results for individuals or groups, in a relational model that would provide the completeness for an on-line database is centered on a table with the results of research, with relationship to all the components of a portfolio research provided by scientific papers.

Scientific papers are included on the model of relational database as components of research portfolios (books, articles published after participation in conferences, articles published in scientific journals, books, patents of inventions, products made after research thesis of PhD, etc.). The flexibility of adopted the model consists in the possibility of adding any components of research, in relation to a scientific work, as a result of scientific research. Thus, the model can be extended by defining other activities related to teaching or research: Symposium, workshops, participation to bibliographic material (books, collections, case studies, and media training), Doctoral Research (doctoral essays), student research, etc.

Conferences are part of the model of relational database, classified as national or international, with the date on which they are scheduled, the university where are organized and usually associated with magazines or publications identified by ISSN or ISBN codes).

Scientific articles published in magazines are associated with the research results. Considering the fact that magazines are evaluated periodically by the forums that implement science policy at national and international level, qualifications fluctuates in time, the same magazine can be quoted differently in time. Therefore, the relational model contains a special designed relation that specifies the magazine's quotation for each occurrence.

The association of scientific papers with scientific research grants has a reverse sense to the articles and conferences, considering that a research grant may have more results disseminated in the form of scientific papers. Very important for the e-ScientRoChair concept are the teams or groups of researchers. The teams bring together several competitor researchers participating to a research project. The efforts of the researchers who participate are evaluated as results of research and become visible in scientific papers that have full connections with all components of a research portfolio.

The model design is influenced by the concept of unification of research components and by the need to disseminate the portfolio of these components and reveals the hierarchic structure of research domains. The main areas of scientific research in the database are those stated by the organizations involved in science policy. Each field can be divided into several domains (eg in the area economy, there may be sub-domains as accounting, management, finance, management, etc. Also, within these sub domains, there can designed several classifications in the form of research themes, and the sub-classifications can drill down on topics.

Based on the association made between the research subject - as a primary classification (which follow the theme, the sub domain and the domain of the research) and the "Scientific Papers", all the research results can be spread according to classification and hierarchy of science domains. In this way, the concept of e-ScientRoChair, implemented as an online database allows the assignation of each researcher or group to any component of a result of research, on the main categories of science domains. In fact, this concept allows developing a social infrastructure for researchers.

The human element in the concept of e-ScientRoChair is materialized in tables describing the researchers as individual subjects and as subjects of interest in which they manifest their skills. The relationship between scientific work carried out as results of individual research and researchers is done through a connection tables. The database e-ScientRoChair unifies the scientific interests of each researcher or group and assigns them to the institutional hierarchy. The institutional component defined by the concept e-ScientRoChair is materialized in tables which refer the researchers belonging to different faculties, departments or chairs

The relation between the institutional and the human element is realized by a table that stores the association between the researchers and departments.

The implementation of the scholarship concept in the e-ScientRoChair database is the result of the association of research results (as implemented by all the scientific works) with the human element, institutions and table describing the subjects of scientific interests that assign a researcher associated to a classification domain of science (domain, sub domain, theme or subject). According to this association between the each researcher and scientific topics in which he describes his research skills, could be designed a market research which can reveal a hierarchy of the most wanted researchers, themes, contracts, scientific publications on various fields and scientific domains.

The concept e-ScientRoChair, which can be seen in all its forms of manifestation, propagation and implementation, determines the fact that the scientific research should be considered as a market ruled by the scientific demand and supply.

According to the portfolio principles, the supply of information may include the entities that provide the research contracts (national, international or even business environment), as well as, individual researcher or research teams who wish to attract collaborators concerning their scope of topics in their scientific concerns. The demand of information may come from any member of the scientific community (if a minimum guaranty is assured from the point of view of their scientific concerns). At the borderline between demand and supply, the research project may solve some interdisciplinary problems, identified in the scientific concerns of the research teams, namely finding competent person from the scientific standpoint working at chairs having other profiles than that of the research team.

The concept e-ScientRoChair presumes the integration of the research team concerns from the chairs into a unitary and coherent information system. Initiation of such an approach leads to the harmonization of the interests shown by the creators and the consumers of scientific information who can communicate directly concerning topics of common interest.

The importance for the area regarding the way the scientific research is treated, as a portfolio of resources is located in the following coordinates:

- One can identify ideas and connecting scientific concerns of other research teams or other academic chairs (these elements may represent strong points of eligibility in national or international grant competition);
- One can identify problems complementary to the research topics outlined by the research team in order for them to participate in research consortiums. The research ideas which are complementary can be placed on a horizontal line (e.g.: between the close fields of the same scientific field) or on a vertical line (between sciences belonging to different fields):
- One can identify the potential users of research work (e.g.: the members of the business community can show their interest in some research topics, or on the bases of the analysis of the research market: the symposium and conference organizers who have the possibility to become more selective when they send the invitations.

By the e-ScientRoChair database one can make a list containing the most wanted researchers, topics, contracts, scientific publications of various subjects and subfield. The scientific community can have such information concerning certain fields of interest.

Implementation of the stock exchange principle in the database e-ScientRoChair is the result of the combination of research results (as implemented by all the scientific works) with the human, institutional component and with table describing the subjects of scientific interest that a researcher associated with each field classification of science (domain, subdomain, theme or research subject). According to the association between the presence of each researcher and scientific topics that he describes his research skills one can stand out a market research which can be a hierarchy of most researchers looking for, research themes, contracts, scientific publications on various fields and scientific domains.

Another consequence derived from the concept e-ScientRoChair is the informational building of an academic researcher profile through the analysis of their scientific research portfolio. The research activity has become the main component of the assessment system of the teaching stuff activity according to Bologna guideline. The academic assessment system for the teaching stuff is ruled by the well-determined norms. It would be interesting to know if those norms defining the teaching stuff research portfolio are unanimously accepted by the entire academic scientific community.

The original elements of the concept e-ScientRoChair derive from the parallel development of the assessment criteria excepted by the academic scientific community as against the normative approach and as well as from the description of the scientific profile of an academic researcher, according to their scientific portfolio.

By exploiting and query the online database can bring the research results to individual, team or chair level with a system containing the individual and collective reports concerning their research work. The starting point of this system is the Chair. The database manages all the research components, made by individuals, research teams and chair/department according to various normative criteria of assessing the science of quality. These criteria being flexible, the system will be able to adapt quickly to any normative changes which contribute to the qualification of a scientific researcher. This approach can facilitate the adaptation of the academic assessment norms to the requirement and to the research potential of the academic scientific community.

A final element regarding the impact of the e-ScientRoChair concept is studying, designing, developing of a scientometric reporting system for the members of the scientific university community of the research activity at an institutional level.

According to the requests of Bologna process (1999), research activities have become basic components of professors' evaluation systems. The research evaluation and audit system of universities describe only a part of the activity research. When they manage to obtain the whole activity this is describe only at the university or faculty level and information are not related to the components of other research entities (nationals and academics).

Starting from the online database that preserves the research resources disposed by category and entities involved in research, data aggregation can be done from individual researcher towards chairs and also towards superior university structures (faculty, university).

This uphill approach concerning research information aggregation can offer to every academic entity a score for each of its components using various criteria (ISI papers; B or C category; grants; etc). Likewise, the results of this project can offer to academic managerial staff from every university that wish to implement it reports that will allow the research quality assessment not only at the individual level but also at a chair and faculty level.

Conclusions

The **e-ScientRoChair** concept proposes to search new opportunities of information and documentation by exploiting the scientific potential offered at the basis unit of scientific university research - the chair (in fact, the individual researcher, the chair itself or the research team), offering this way the possibility of identifying,

publishing and disseminating of information that concerns the scientific research, in all its forms and components (research grants, conferences, journals, and so on).

Turning to account of the online database e-ScientRoChair will arise a major interest from the part of the young researchers, editors, as well as, from the part of scientific information users who in their turn are researcher, practitioners, representatives of the business environment, etc. Such a database will underline the transparency of the universities on a national or international plane, bringing about quantifiable benefits concerning image. This may influence the research results in this academic institution. The impulse given to the scientific activity through the database, as well as, the exchange of ideas promoted by the scientific community, developed by the chair will stimulate the scientific research and document work for all structures.

Statistics show that the IT expenditures recorded a constant growth during the last 20 years, which shows a continuous growth of the effort of the companies or states dedicated to the extension of the IT sector. Unfortunately, these efforts have not always resulted in a similar growth of the competitiveness and performance of the organizations. In the the authors' opinion, in the large IT projects (more than $1,000,000~\epsilon$) the success rate does not exceed 1/7 in Romania and $\frac{1}{4}$ - $\frac{1}{5}$ at the world level. The causes should not only be searched in the way these systems are designed and implemented, but also inside the beneficiary organizations, where the information systems subject to updating cannot always successfully adapt themselves to the level of performance of an IT solution. This paper tries to prove that the management of IT activities in a company is not only a problem of the IT department, but one of the top management, and its ampleness justifies the usage of the term "governance" instead of "management".

Keywords: IT Governance, Maturity model, Maturity levels

GOVERNANCE VS. MANAGEMENT

Taken over from politics, where its common meaning is "capacity (art, from some points of view) of ruling a state, a province, or a geographic region which has a certain degree of autonomy", the word "governance" still causes disputes when it is used in different fields of knowledge. It seems that the first step in extending the meaning of this term was taken by the specialists in the field of organizational management, who considered that other terms, as "piloting" or, simply, "management", are not comprehensive enough for describing the ruling act of such an organization⁵⁷⁹, because of the complexity and multitude of the processes performed in a company, and because of the strong interaction between these processes and the economic, social and political environment they belong to. The term *Corporate Governance* appeared at the beginning of the 1990's and, shortly after, it was extended downwards to the components of the management system, whose greater and greater complexity demanded, in the opinion of some specialists, management techniques similar to those used in ruling of states or regions.

Probably one of the most used terms of this family is *IT governance*. There are, in our opinion, four major attributes of this notion which distinguish it from "management of IT activities" or "management of the IT Department" in an organization:

- -holistic and integrated
- -synergic
- -strategic
- -sliding

The *holistic feature*, defining for this collocation, refers to the subsidiary of the IT system to the institution's management and to the fact that the main goals of the IT system must represent a subset of the secondary goals of the whole organization's strategy. The goals of IT governance are often found among the strategic options of the company board. For example, implementing the specific Business Intelligence technologies inside the Management Information System of the firm and integration of the existing applications and data in the new information system as a goal of IT governance represents a way to achieve a management-specific goal, which increases the quality level of the decision making process by a more rigorous substantiation.

The *synergic feature* regards the unitary coordination, at the level of the IT system, of all its components and the orientation of each of the components and of the relations between them to achieving the common goals, established at the system level. Excessive focusing inside the management processes of the IT activities on the development of one of the system components can only be accepted in some support activities as, for example, the management of the local network, but not at the top level. At this level we speak about IT governance as a management philosophy according to which each of the component entities exists and develops only to support the synergic activity of achieving a unique goal of the whole set of components.

In our opinion the leading *strategic feature* of IT governance is also defining. Practicing the prevision function of management on long periods of time (3 to 5 years), dramatically distinguishes, with regards to managing IT activities, "management" from "governance" and so does the way the objectives of the company's strategy generate average and long term objectives for the IT system. Even if, during the dispute between the French-speaking and the Anglo-Saxon specialists on the paternity of the term "governance", an "equal" sign was sometimes drawn between the terms "governance" and "management", we believe that the difference between the two refers both to

579 BURLAUD, A.; GERMAK, P.; MARCA, J.P. – Management des systemes d'information, Editions Foucher, 2007. ISBN 978-2-216-10575-5 pag.34-35

the ampleness of the managed system, to its complexity and the time scale of the decisions made, and the approach in correlation with other systems with which it interacts in a synergic manner.

Another typical element of *IT governance* is the fast development of IT specific tools and concepts. So, when it is about designing wide systems, or when strategic objectives for the IT system are established, it can happen that, not long after these objectives were stated, they become obsolete or, by emerging of new instruments and concepts, to lose their character of major and long term demands. Under these circumstances these goals and objectives must slide on the vertical axis of the technological progress, being always subdued to the global mission of the organization.

THE NECESSITY OF IT GOVERNANCE

If, until not very long ago, the expenses with development and maintaining the automated information systems of a company usually represented a relatively low quote of the total costs of that institution, once these systems started to migrate fast from the automatization of execution processes to the management ones, a great demand for complex information system implementations occurred, first from the managers of the most important companies and afterwards from the management of medium and even small firms. The costs of design, implementation, running and maintaining of these systems became comparable with the budgets of large departments, as marketing, or even production.

Emerging of new integrating technologies, which started from the premise that the value of an IT integrated system is normally greater than the sum of the component subsystems' values, while the relation between their costs is inverted, led to a massive orientation of IT investment to achieving turn-key systems. Specific to these systems, usually built on a multilevel philosophy, was that, starting from the top management requirements, functional specification and interface levels were developed vertically in a top-to-bottom manner, on a common data and business process backbone, rendered by a content management system. Subsequently other groups of interrelated applications were developed horrizontally for each level so that, based on the initial specifications, they met the requirements of their level and also synchronized one another with modules belonging to other levels by means of the two basic elements: the data deposit and the business flow.

Besides the increase in performance and productivity of the system developers and the impact of these features on the company management, this approach also created two big groups of problems whose solution is the key to IT systems' success: organizing the company and even some processes and major business rules, as well as organizing and management of all IT structure development and running activities, which have meanwhile grown extremely complex.

A study⁵⁸⁰ developed by the well known consultancy company Gartner shows that during the last few years, we have witnessed an unprecedented growth of the companies' expenditures for re-engineering and maintaining of their own IT systems, with a rate of 5-8%. Only in 2007 these expenditures exceeded \$3 trillion. Under these circumstances, the design errors, budget overflows, security breeches and incoherence caused losses of more than \$600 million⁵⁸¹ in 2006. An even clearer image of the disaster is given to us by Rubenstein, in "Standish Group Report" ⁵⁸².

Consequently, the lack of a high performance control exerted at all levels and coordinated by the top management of the company, the lack of a coherent ruling of the whole range of IT activities, the lack of coordination between these activities and the other categories of activities run in the company and especially the lack of an intelligent strategy of the firm, containing elements of the IT strategy in all its components, can turn the IT investment into a huge loss of resources, trust, performance and competitiveness.

In the above statements we identify the features of IT governance as they were described at the beginning of this paper. As shown in 583 we can briefly emphasize the main classes of needs which determine the IT governance processes:

-need of increasing the company's efficiency or, as stated in the above mentioned article, the need of getting more by paying less;

-need of innovation and completing several initiatives in parallel, which is a common IT governance problem, given that requests for system modification exceed the IT response capacity, causing dissatisfaction;

-need to keep large projects on track, which normally occurs at non-experienced companies which try to develop ambitious IT projects (as, for example, ERP's) without having the expertise in avoiding or recovering after major failures;

⁵⁸³ HAINAUT, J.; WALKER, P. - Getting Serious About IT Governance; Can You Afford to Put it Off? DM Direct, February 8, 2008

-need to avoid recurring of data security incidents;

-need to meet compliance deadlines, taking into account that compliance initiatives can result in overlapping or conflicting demands, which can sometimes make the use of multiple drivers necessary.

From another point of view, the role of IT governance is to balance the requirements of the investors and of the rest of the stakeholders, by focusing the efforts of the organization on adding value, under an adequate control and with high accountability.

Regarded as a system by which the IT resource is controlled and driven, IT governance must first consider the roles and accountability of each person or group in the firm as, for example, the board or second level managers. In order to adopt the fundamental decisions concerning the IT system, it also has to take into account the set of all the business rules and processes. Finally, IT governance must build and consolidate an effective structure and use it to establish the IT goals, to carry them out and to monitor their development, starting from the company's general objectives.

In our opinion, in order to reveal all the senses and meanings of the term "IT Governance", we must simultaneously consider the following two dual aspects of this item:

- -using IT as the main governance tool of the enterprise;
- -managing the entire IT system in the same manner and using the same methods and techniques as in ruling the company.

This point of view also gives a helping hand in answering the question "what training, what knowledge and what skills must an IT manager have, and in what proportion?". The answer is obviously not simple, and in our opinion it depends both on the level of management/governance techniques used in managing the IT system and the IT structure complexity, as shown in Figure nr. 1.

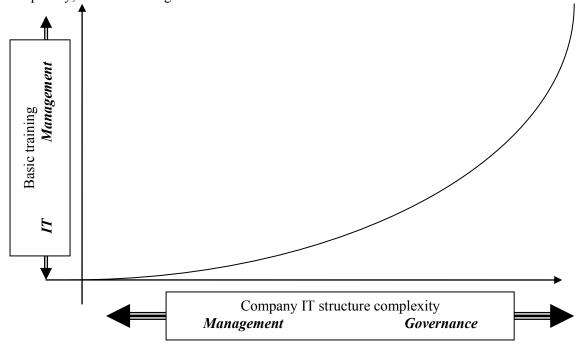

Figure nr.1 Basic training and the level of knowledge necessary for the IT manager of an organization

According to the above diagram, for a low complexity IT system, with an infrastructure of low extension and complexity and within an approach which considers IT as a support activity for other departments, the IT manager must mainly have an IT training, with some entry level knowledge of management. As opposed to this, in a larger IT structure with the extension of specific functions of the IT system to the top management level and implemented IT governance concepts, the leading person or group in charge of coordinating this activity must mainly have manager skills.

IMPLEMENTATION OF IT GOVERNANCE TECHNIQUES AND METHODS

Specialists consider that an IT solution, whether it is a simple application or a complex system, has as much strength as it has the capability to satisfy the needs of its beneficiaries. Speaking about the implementation of IT governance as the main management system of the IT resource, the success of this enterprise is given by the coherence between the solution itself, the implementing manner, the level of the IT and management culture of the organization and its close environment and the extent of performance-focusing of the company management.

In other words, the balance between the technological and performance level of the solution and the level of organizational, management and technical knowledge and culture of the personnel of the firm and of the companies

and organizations with which the firm communicates regularly is the key factor which makes the difference between really successful solutions and costly (often resounding) failures.

As a consequence, when we look for the best and most efficient solution for IT Governance, we must consider two important aspects: one is the level of the organizational culture, the capability level of the IT and management system and the maturity and performance of the entire company, and the other one is the range of appropriate solutions offered by the market for the given situation. For a correct valuation of the existing solutions, there are a lot of instruments and information sources available (both scientific and commercial) which can perform a very refined analysis. For the estimation of the general level of the organization, an adequate and as objective diagnose as possible is necessary.

For this diagnose we recommend a method known as Capability Maturity Model⁵⁸⁴ - CMM, which, based on identification of some features of management, respectively IT governance, and on their comparison to a series of preset levels, shows the maturity degree of the IT system.

In a nutshell, CMM tackles five different aspects which can determine one of the five possible levels of the model where the IT structure can be situated.

- 1. Maturity Levels (ML). They consist of a layered framework which gives the steps to be followed by the organization to the stage needed to engage in continuous improvement.
- 2.Key Process Areas (KPA). These are groups of related activities which lead to achieving a set of objectives of utmost importance, when performed collectively.
- 3.Goals (G). The goals of a key process area are regarded as a sum of conditions to be fulfilled in order to state that the group of activities was implemented in an effective, long lasting way.
- 4.Common Features (CF). They refer to the practical ways of implementing the key process area. They include: Commitment to Perform, Ability to Perform, Activities Performed, Measurement and Analysis, and Verifying Implementation.
- 5.Key Practices (KP). They describe those infrastructure elements or processes which significantly contributed to implementing and institutionalization of the key processes.

When we wish to identify the state of the organization and the most suitable approach in order to implement IT Governance, the five levels we can refer to are as follows:

Level 1 – Initial. At this level the processes are usually not documented and their modification is based on the user or event It is assumed that, at this level, the organization does not have a steady environment and it may not know all the environmental elements or their interactions.

Level 2 – Repeatable. A series of application development processes are repeatable and generate positive results. Yet, they are not used in all projects running in the organization. In some cases, low complexity project management techniques are used. Level 3 – Defined. The set of standard processes within the company, which is the basis of the 3rd level, is established and improved every now and then. The organization's management establishes process objectives for its set of standard processes, and monitors the proper addressing of these objectives.

Level 4 – Managed. By using process indicators, the board of managers in the company can actually control the running processes and, when applicable, they can find means of adjustment of processes to certain projects, without recording significant drops in quality or deviations from specifications. At this level, the firms set quantitative quality goals for the design and maintenance of IT programs⁵⁸⁵.

Level 5 – Optimized. This maturity level focuses on achieving continuous improvement of the process performance both in "steps" (incremental improvement of technology) and in innovative leaps. The organization sets quantitative goals for process perfecting, which are permanently adjusted to the changes in its objectives and used as criteria for the managing action improvement.

As described above, one of the first activities to be done with a view to implementing the new methods of IT Governance is estimating the company situation at the beginning of the reorganization process. Identification of the typical elements of the company and its level is also necessary within the Maturity Model. On this purpose specialists recommend a systematic approach based on examining a few distinct stages, such as:

- Identification of the range of operation of the existing IT system
- Localization of the critical spots for the business development, which are to be tackled priory. The validity of the Paretto principle is also proven in this case, namely in order to eliminate or diminish 80% of dysfunctions, one must take action over the main 20% of the causes to the weak points inside the system. The five levels of the Maturity Model are schematically described in Figure nr.2.

-

⁵⁸⁴ HUMPHREY, W.,S.; - Managing the software processes. Addison Wesley Professional, Massachusets, 1989.

⁵⁸⁵ http://wikipedia.org

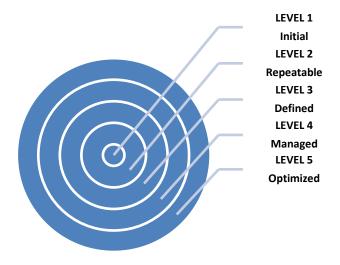

Figure 2. The levels of the Maturity Model

situated and how high it should be? How helpful is it for the business and what is wanted?

After this preliminary analysis, due to the Maturity Model, it is necessary to determine the key process areas. For this, one normally develops a simple framework that focuses on high-level factors covering the IT performance areas that are of critical concern to the business. The maturity of critical performance areas will help diagnose where governance improvement efforts could help the most.

Determination of the actual maturity level of the company can be done by taking into account all the key performance areas and their individual estimated levels. It is very important at this stage to set up in a professional manner the maturity level which is optimal for the business. Higher-level stakeholders need to identify which performance areas are important to rate and where they should be on the maturity model — not in theory, but in practical terms. It may also be a good idea to qualify the rating by a planning horizon such as one to three years.

Finally, the strategy of implementation of a new model of IT governance is a result of comparing the desired level of maturity to the perceived level of maturity, the business and IT should be able to agree on an acceptable set of required improvements. Setting up the goals and developing an action plan that addresses the largest gaps prioritized by business must be followed by planning periodic reassessment, recommended for helping the organization measure improvement or refocus efforts based on changing needs.

WEB MINING IN E-COMMERCE

Istrate Mihai

University of Pitești Faculty of Mathematics and Informatics No.1, Stadionului, Țicleni, Gorj, 215600, Romania mihaifrance@yahoo.com +40 745 775 935

Recently, the web is becoming an important part of people's life. The web is a very good place to run successful businesses. Selling products or services online plays an important role in the success of businesses that have a physical presence, like a retail business. Therefore, it is important to have a successful website to serve as a sales and marketing tool. One of the effective used technologies for that purpose is data mining. Data mining is the process of extracting interesting patterns from large databases. Web mining is the usage of data mining techniques to extract interesting information from web data. This paper presents the three components of web mining: web usage mining, web structure mining and web content mining and the main data preprocessing tasks for web usage mining.

Keywords: E-Commerce, Data mining, Web mining

JEL M

1. E-Commerce and Retail websites

In e-commerce instead of having your business in a limited physical place and a limited sector of customers who are usually near to your store or business, you have it in the web. In e-commerce websites you have the ability to sell, advertise, and introduce different kinds of services and products in the web. E-commerce websites have the advantage of reaching a large number of customers regardless of distance and time limitations. Furthermore, an advantage of e-commerce over traditional businesses is the faster speed and the lower expenses for both e-commerce website owners and customers in completing customers transactions and orders.

Because of the above advantages of e-commerce over traditional businesses, a lot of industries in different fields such as retailing, banking, medical services, transportation, communication, and education are establishing their business in the web. But creating a successful online business can be a very difficult and costly task if not taking into account e-commerce website design principles, web engineering techniques, and what e-commerce is supposed to do for the online business. Understanding the requirements of both e-commerce website owner and customer is an important aspect in building a successful e-commerce website. There is a lot of information need to be defined before starting building the e-commerce website such as identifying business goals and how the website will target those goals, if the website supposed to attract new customers or increase the sales of current customers, identify if the proposed website will increase the business overall profit, and identify the most suitable tools and techniques need to be used/followed in order to target those requirements.

Retail websites aim to inspire, reflect a good image about the business and improve it online. An important factor in having a successful retail website is to know your competitors. On one hand, by identifying their points of strongness and trying to get benefit of them by improving those strongness points and adopting powerful strategies. On the other hand, identifying weakness points of your competitors and avoid them is a good practice in having a successful retail website.

2. Web mining

The usage of data mining to maintain websites and improve their functionality is an important field of study. Patterns extracted from applying data mining techniques on web data can be used to maintain websites by improving their usability through simplifying user navigation and information accessibility and improving the content and the structure of the website in a way that meets the requirements of both website owner and user which will consequently increase the overall profit of the business.

Web mining is the use of data mining techniques to extract useful patterns from the web. Those extracted patterns are used to improve the structure of websites, improve the availability of the information in the websites and the way those

pieces of information are introduced to the website user, and to improve data retrieval and the quality of automatic search of information resources available in the web. Web mining can be divided into three major categories: web usage mining, web content mining, and web structure mining.

2.1 Web Usage Mining

Web usage mining or web log mining is the process of applying data mining techniques to web log data in order to extract useful information from user access patterns. Web usage mining tries to make sense of the data generated by the web user's sessions or behaviors. The web usage data includes data from web server access log, proxy server logs, browser logs, user profiles, registration data, cookies, and user queries. Web usage mining tries to predict user behavior while user interacts with the web and learns user navigation patterns. The learned knowledge could then be used for different applications such as website personalization, business intelligence, usage characterization and adaptive websites. There are two approaches for web usage mining process:

- Mapping the log data into relational tables before an adopted data mining techniques is performed.
- Using the log data directly by utilizing special preprocessing techniques.

The Web usage mining process consists of three phases: data preprocessing, pattern discovery, and pattern analysis. Pattern discovery is that set of methods, algorithms, and techniques used to extract patterns from web log file. Several

techniques are used for pattern discovery such as statistical analysis, clustering, classification, and sequential pattern mining. After patterns are discovered they need to be analyzed in order to determine interesting and important patterns, besides the removal of redundant patterns. Pattern analysis has several different forms such as knowledge query mechanism, visualization techniques, and loading usage data into a data cube in order to perform Online Analytical Processing OLAP operations.

A web server log file records users transactions in the web. Usually, the web log file contains information about the user IP address, the requested page, time of request, the volume of the requested page, its referrer, and other useful information. The web log file can have different format, but there is a common log file format that is mostly used. The common log file has the following format:

remotehost rfc931 authuser [date] "request" status bytes

where *remotehost* represents remote hostname (or IP number if DNS hostname is not available), *rfc931* represents the remote logname of the user, *authuser* represents the username as which the user has authenticated himself, [date] represents dateand time of the request, "request" represents the request line exactly as it came from the client, *status* represents the HTTP status code returned to the client, and finally *bytes* represents the content-length of the document transferred. The WWW Consortium (W3C) presented an extended format for web server log file that is able to record a wide range of data to make an advanced analysis of the web log file. Web log file is the main source of data analysis in web mining but a lot of preprocessing efforts need to be performed in order to prepare the web log file to be mined.

2.2 Web Content Mining

Web content mining is mining the data that a web page contains. The contents of most of the web pages are texts, graphics, tables, data blocks, and data records. A lot of research has been done to cover different web content mining issues for the purpose of improving the contents of the web pages, improving the way they are introduced to the website user, improving the quality of search results, and extracting interesting web page contents.

Web content mining is still a large field. It constains:

- structured data extraction;
- sentiment classification, analysis and summarization of consumer reviews;
- information integration and schema matching;
- knowledge synthesis;
- template detection and page segmentation;

A large amount of information on the Web is contained in regularly structured data objects which are data records retrieved from databases. Such Web data records are important because they often present the essential information of their host pages, lists of products and services.

Two of the most used methods for extracting structured data are *wrapper induction* (given a set of manually labeled pages, a machine learning method is applied to learn extraction rules or patterns) and *automatic extraction* (given a set of positive pages or given only a single page with multiple data records, generate extraction patterns).

2.3 Web Structure Mining

Links pointing to a document indicate the popularity of the document, whereas links coming out of a document indicate the richness or the variety of topics covered in the document. Web structure mining describes the organization of the content of the web where structure is defined by "hyperlinks between pages and HTML formatting commands within a page".

Understanding the relationship between contents and the structure of the website is useful to keep an overview about websites. One of the approach allows the comparison of web page contents with the information implicitly defined by the structure of the website. In this way, it can be indicated whether a page fits in the content of its link structure, and identify topics which span over several connected web pages. Thus supporting web designers by comparing their intentions with the actual structure and content of the web page. Other studies deal with the web page as a collection of blocks or segments. By partition the web page into blocks and by extracting the page-to-block, block-to-page relationship from link structure and page layout analysis, a semantic graph can be constructed over the WWW such that each node exactly represents a single semantic topic, this graph can better describe the semantic structure of the web. Structure within a web page can be used to help machines understand pages.

3. Web Usage Mining Techniques

In this section, we discuss data mining techniques that are mostly used in web usage mining such as statistical analysis techniques, clustering, classification, association rule mining, and sequential pattern mining.

Statistical analysis is the process of applying statistical techniques on web log file to describe sessions, and user navigation such as viewing the time and length of a navigational path. Statistical prediction can also be used to predict when some page or document would be accessed from now. It makes use of the N-grammer model which assumes that when a user is browsing a given page, the last N pages browsed affect the probability of the next page to be visited.

Clustering is the process of partitioning a given population of events or items into sets of similar elements. In web usage mining there are two main interesting clusters to be discovered: usage clusters, and pages clusters. An approach is to cluster web pages to have a high quality clusters of web pages and use that clusters to produce index pages, where index pages are web pages that have direct links to pages that may be of interest of some group of website navigators.

Classification is dividing an existing set of events or transactions into another predefined sets or classes based on some characteristics. In web usage mining, classification is used to group users into predefined groups with respect to their

navigation patterns in order to develop profiles of users belonging to a particular class or category.

Association rule mining is the discovery of attribute values that occur frequently together in a given set of data. Association rules mining techniques are used in web usage mining to find pages that are often viewed together, or to show which pages tend to be visited within the same user session. A re-ranking method with the help of website taxonomy is to mine for generalized association rules and abstract access patterns of different levels to improve the performance of site search. Another approach for predicting web log accesses is based on association rule mining. Association rule mining facilitates the identification of related pages or navigation patterns which can be used in web personalization.

In sequential pattern mining a sequence of actions or events is determined with respect to time or other sequences. In web usage mining, sequential pattern mining could be used to predict user's future visit behaviors. Some web usage

mining and analysis tools use sequential pattern mining to extract interesting patterns such as SpeedTracer and Webminer.

4. Data Preprocessing for Web Usage Mining

Before data mining techniques are applied to web log file data, several preprocessing steps should be done in order to make web log file data ready to be mined. Web log file contains data about requested URL, time and date of request, method used, etc. The main data preprocessing tasks are data cleaning and *filtering, path completion, user identification, session identification,* and *session formatting*.

Data cleaning is the first preprocessing task. It involves the removal or elimination of irrelevant items that are not important for any type of web log analysis. Elimination of irrelevant items can be accomplished by checking the suffix of the URL name to filter out requests for graphics, sound, and video hits in order to concentrate on data representing actual page hits. For example, all log entries with filename suffixes such as gif, jpeg, and jpg can be removed. Another cleaning process is removing log entries generated by web agents like web spiders, indexers, or link checkers. Filtering out failed server requests, or transforming server error code is also done. Merging logs from multiple servers and parsing the log into data fields is also considered a data cleaning step.

Path completion preprocessing task fills in page references that are missing due to local browsing caching such as using the back button available in the browser to go back to previously visited page.

User identification is a complex step due to the existence of local caches, corporate firewalls, and proxy servers. If the agent log shows a change in browser software, or operating system, a reasonable assumption to make is that each different IP address in the log file represent a different user. If a page is requested that is not directly reachable by a hyperlink from any of the pages visited by the user, a heuristic assume that there is another user with the same IP address. Another assumption can be made is that consecutive accesses from the same host during a certain time interval come from the same user. In some cases it is difficult to identify users, for example, when two users use the same machine and the same browser with the same IP address and look at the same set of pages.

Session identification. A user session is defined as "the set of pages visited by the same user within the duration of one particular visit to a website". Session identification is dividing the page accesses of each user into individual sessions. One approach to identify user sessions, is by using a timeout threshold that is if the time between pages requests exceeds a certain limit, then the user is starting a new session. Another approach assumes that consecutive accesses within the same time period belong to the same session.

Session Formatting. A final preprocessing step could be formatting the sessions or transactions for the type of the data mining technique, or algorithm to be applied. The Webminer, for example, formats the cleaned web server log data in order to apply either association rule mining or sequential pattern mining.

5. Discussion

From previous, it is clear that making changes and adaptations to websites with the help of extracted patterns using different data mining techniques is very effective, but doing that in the maintenance phase can be costly and time consuming and suffers from different drawbacks. In commercial companies which are companies that sell different kinds of products on the web, in order to make an effective maintenance to their websites, the companies have to wait some period of time, for example one year, in order to have a representative log file that reflects customers transactions in their website and can give a clear image about their behavior. This amount of time is considered very big especially for the companies in which the time factor plays an important role in their success strategy, and have many competitors who can attract their customers if they have no solid marketing strategies in order to keep their customers as loyal as possible.

On the other hand, most businesses gather information about internet customers through online questionnaires. But, many customers choose not to complete these questionnaires because of the amount of time required to complete them as well as a lack of a clear motivation to complete them. Several companies use cookies to follow customers through the WWW, but cookies are sometimes detected and disabled by web browsers and do not provide much insight into customer preferences. This is because customers are feeling that their profiles are not secure so a number of customers choose to give incorrect information about themselfs.

Furthermore, in web mining different strategies are implemented to identify sessions such as defining a time threshold that a session should not exceed or assuming that consecutive accesses within the same time period belong to the same session. In some cases, it is difficult to identify users, for example, when two users use the same machine and the same browser with the same IP address and look at the same set of pages. We can conclude from that, that those session and user identification strategies can not give a guarantee that those identified users and sessions represent the actual users and sessions.

The problem of building an ill-structured website for some company/business can be solved by applying data mining techniques such as clustering, classification, and association rule mining on the contents of the information system of the company/business. Then, from the extracted patterns, the information needs to be considered in the website building process is gained and invested during the design phase in the process of website design which yields to a better designed retail website. The main advantage of this method is that it reduces maintenance time and budgetary costs for websites if they are built taking into account the extracted interesting patterns from the transactions database of the company/business. This approach also permits the sales manager to focus on the core business and gives him a better view about his products and customers which is very helpful in designing retail websites.

In conclusion, patterns extracted from applying web mining techniques on web data can be used to maintain websites by improving their usability through simplifying user navigation and information accessibility and improving the content and the structure of the website in a way that meets the requirements of both website owner and user which will consequently increase the overall profit of the business.

Ambient Intelligence (AmI), as a new vision and concept of the tomorrow, gathers a few features regarding both the integration of technology in the environment and the capacity technology has to recognize the user and its context, the system capacity to intelligently answer users' requests.

The purpose of the present paper is to describe this emerging field of research and development which is rapidly gaining wide attention in that last few years, from an increasing number of researchers worldwide, especially from Europe.

Ambient Intelligence is considered the next step for Artificial Intelligence, in the context of supporting people in having a better access to the essential knowledge for taking better decisions when interacting with modern environments.

Keywords: Ambient Intelligence (Aml), ubiquitous computing, scenario, artificial intelligence (Al)

The article's JEL code: O14, O33

1. Conceptual framework of Ambient Intelligence

Ambient intelligence (Ambient Intelligence - AmI) is a basic concept for normative visions for information technology development in the European Union, a general framework for the future European information society. The European Commission's Information Society Technologies Advisory Group (ISTAG) ⁵⁸⁶ worked since 1999 on the vision of IST development in the 5th and 6th Framework Programme ⁵⁸⁷. These visions and ideas are summarized by the concept of AmI.

During the last few years, AmI has been present in almost all discussions on the future of communication, a fact which is proven by the over 15 international conferences organized only within European frontiers: European Symposium on AmI - Eidhoven; Smart Objects Conference – Grenoble; International Conference on Concurrent Enterprising – Leiden (Netherlands); International Conference on Pervasive Computing - Linz and Vienna, to mention just a few of the most relevant.

The ambient intelligence expression is only on European version. Big companies like IBM are talking about "Pervasive Computing", HP about "cooltown", MIT about 'Things that Think" and Xerox about "ubiquitous computing". The giant Dutch electronics company Royal Philips opened in 2002 the doors of a HomeLab, an ambitious experiment in developing ultra-modern living systems and consider that what's driving the research: "Ambient Intelligence," is a 21st century cousin of artificial intelligence.

The ISTAG reports define AmI at a conceptual level and identify important technologies for achieving it. In the paper called "Ambient Intelligence: From Vision to Reality", ISTAG refers to the specific AmI components: smart materials, micro-electromechanical systems and sensor technologies, embedded systems, ubiquitous communications, I/O device technology, and adaptive software. 589

Regardless of the term used, the competition is strong when it comes to defining a brand that will rule over anything that is related to communication and lifestyle in the decade that follows.

Ambient Intelligence brings a special perspective to the on-going research associated with technical fields like ubiquitous computing, pervasive and proactive computing, ambient computing, embedded computing and smart objects.

Ambient Intelligence has become well-focused by putting people and social contexts at the centre, while at the same time aiming to distribute, embed, coordinate and interactively deliver computing intelligence within the surrounding environment. The notion of Ambient Intelligence, as described above, is becoming a de facto key

dimension of the emerging Information Society, since many of the new generation industrial digital products and services are clearly shifted towards an overall intelligent computing environment. 590

Ambient Intelligence without invasion of privacy represents a long-term vision for the EU Information Society Technologies Research program, with the aim of bringing together researchers across multiple disciplines: computer science, social sciences, physics, biology, engineering, design, architecture & philosophy to name a few⁵⁹¹.

Shortly, ambient intelligence is a future information society environment with intelligence embedded anywhere but in an unobtrusive fashion, with the emphasis on 592:

greater user-friendliness; more efficient services support; user empowerment; support for human interactions.

2. ISTAG Scenarios for Ambient intelligence

As a result of a European program the aim of ambient intelligence involves the convergence of several computing areas and is meant to describe in different scenarios what living with AmI might be for the ordinary citizens in the year of 2010. In order to answer to an important question bounded of critical aspects of AmI, meaning "What aspects of AmI would people soonest buy?" ISTAG asked the Institute for Prospective Technology Studies (IPTS) from Seville to develop a series of "scenarios for ambient intelligence".

There are four principal scenarios described in details in the ISTAG Report are referring to the relationships between humans and personal communication devices in a business environment, the necessary technological requirements and technologies to use for travel and commerce and global resources for social learning, group dynamics and so others. The suggestive names of these scenarios are the following:

Scenario "Maria" – road warrior

Scenario "Dymitrios" – digital Me (DMe)

Scenario "Carmen" – traffic, sustainability, commerce

Scenario "Annette and Solomon" - an ambient for social learning

The AmI scenarios are not predictions. They describe plausible present and future and do not forecast specific trends in technologies. The aim of the scenarios is to improve the people general understanding and vision of the development of AmI and its possible future impact.

The main structuring differentials between the scenarios are⁵⁹³:

- Economic and personal efficiency versus sociability/humanistic drivers (goals)
- Communal versus individual as the user orientation driver (actors).

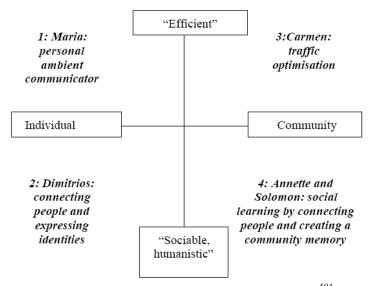

Figure 1. Paths and alternative developments of AmI⁵⁹⁴

⁵⁹¹ G. Riva & et.al. "Ambient Intelligence The evolution of technology, communication and cognition towards the future of humancomputer interaction", IOS Press, 2001, available online at http://www.ambientintelligence.org

⁵⁹² Wierzbicki, Andrzej P. "The concept of ambient intelligence and decision support for telecommunications", Journal of Telecommunications and Information Technology, no. 3/2002

⁵⁹³ ISTAG, "Scenarios for Ambient Intelligence", European Commission, 2001, available online at www.cordis.lu/ist/istag.html 594 ISTAG, "Scenarios for Ambient Intelligence", European Commission, 2001, available online at www.cordis.lu/ist/istag.html

The Figure 1 shows a cross of two axes which delimit the AmI scenarios and provides a structure that isolates some of the main features and alternative development paths for Ambient Intelligence. Very interesting are the critical factors for the implementation of the above scenarios, specified in the IPTS-ISTAG report. These factors are sociopolitical, business-economic, technological and others. The main technological factors are listed as following:

very unobtrusive hardware (miniaturisation, Nanotechnology, smart devices, sensors etc.)

seamless mobile-fixed communication infrastructure (interoperability, wired and wireless networks, service-oriented architecture, semantic web etc)

dynamic and massively distributed device networks (e.g. service discovery, auto-configuration, end-user programmable devices and systems etc.)

natural feeling human interfaces (intelligent agents, multimodal interaction, context awareness etc.)

dependability and security systems (self-testing and self repairing software, privacy ensuring technology etc.)

3. Ambient Intelligence versus Artificial Intelligence

The two terms, "intelligence" and "ambient" suggest a change of perspective: if the technology goes to the background, the user gets to occupy the forefront; in the user-system interaction, the system is the one that must adjust to the user's peculiarities and not the other way around. This new vision provides interfaces with "intelligence".

The intelligence contained in the information components is expressed via:

- the social nature of the user interface expresses the degree in which the system behavior is appropriate for the user's customs, knowledge, intuition and situations;
- the system's adjusting capacity with respect to the user and the environment is done by understanding the context and learning as a result of interactions with the user.

The main target of the interfaces of the future is multimodal communication (sometimes called "multi-sensor"), a communication that effectively combines the adjusting capacities of ambient intelligence systems and the natural perception and expression possibilities of the individual (speaking, handwriting, gestures).

The concept of ambient intelligence gathers a few features regarding both the integration of technology in the environment and the capacity technology has to recognize the user and his/her context, the system capacity to intelligently answer users' requests⁵⁹⁵.

Ambient Intelligence technologies integrate sensing capabilities, processing power, reasoning mechanisms, networking facilities, applications and services, digital content and actuating capabilities distributed in the surrounding environment. While a wide variety of different technologies is involved, the goal of Ambient Intelligence is to either entirely hide their presence from users or to smoothly integrate them in their surroundings as enhanced environment artifacts rather than technological gadgets. This way, the computing-oriented connotation of technology essentially fades out or even disappears in the environment, providing seamless and unobtrusive interaction paradigms. Therefore, people and their social situation, ranging from individuals to groups, be they work groups, families or friends and their corresponding environments (office buildings, homes, public spaces, etc) are at the centre of the design considerations as we can see in Figure 2.

⁵⁹⁵ Aarts, Emile, Marzano, Stefano (editors) The New Everyday: Vision on Ambient Intelligence, 010 Publishers, Rotterdam, The Netherlands, 2003

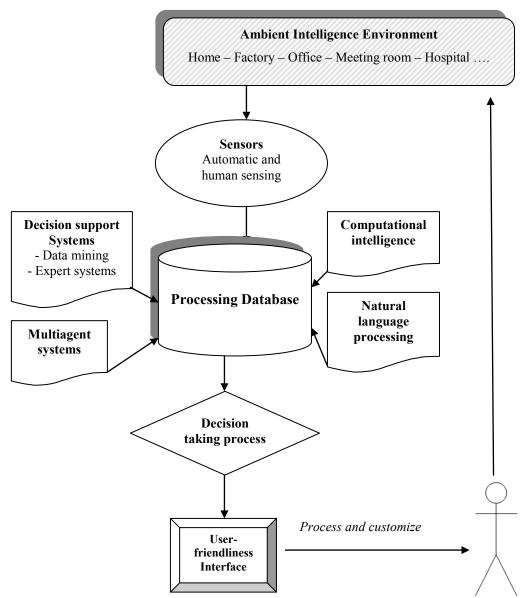

Figure 2. The structure of Ambient Intelligence system

Figure 2 shows the importance of Artificial Intelligent (AI) component within an AmI system. AmI environment is seen and sent through different sensors (human, net sensors like GPS for example, raw sensors, audio and speech image, etc.). To offer decision maker models of action and pertinent decisions, AmI system includes both an operational, technical component (hardware, operating systems, communications, databases, computer graphics, etc) and an intelligent one which includes methods and techniques of AI (processing language natural, text mining, expert systems, machine learning, etc). Human component plays an important part next to the previous components, both decision taking and perceptions sent will interact with the AmI environment.

According to Ramos and his colleagues in 2008 AmI systems should be able to interact intelligently with humans and this interaction requires context awareness. In AmI systems, context awareness will involve such factors as mixed-initiative interfaces, adapting to users and situations, learning by observing users, consciousness of the current situation, and scalable intelligence⁵⁹⁶.

The system capacity to intelligently answer users' requests gathers three defining features of ambient intelligence, namely:

customization (to the perceived specific needs of the user); adjustment (in order to consider the time modification of the user's knowledge and behavior); anticipation of the user's desires.

4. Conclusions

The present development of the informational environment is a natural one in which business environment has to adapt, to integrate the best techniques and tools (Data Mining techniques, statistics algorithms, artificial

596 Ramos, Carlos, Augusto, Juan Carlos, Shapiro, Daniel "Ambient Intelligence - the Next Step for Artificial Intelligence", IEEE Computer Society, Volume 23, Issue 2, March-April 2008, Page(s):15 - 18

intelligence, neural networks, fuzzy logics, genetic algorithms, etc.) that will allow a data analyze in real time. Also, it will be the foundation for multidimensional analysis of financial data to provide pertinent answers to relevant decision makers within a specific organization. Moreover, centralized and synthetic information which provide the best decisional support is a *sine qua non* condition for an efficient management system.

The research underlines the necessity of using methods and techniques like multiagent systems, fuzzy systems, logic programming and other tools to develop an AmI system. AmI can't be completely achieved without AI. The structure of system activities through particularizing of actors (users) rolls which will diversify the variety of AmI systems.

Tourism is adapted field of information technologies since the first tourist product is the product that requires more and involve many risks

Tourist behaviour is considered as one of the reasons that led to the development and spread theory usability sites. The paper set out the title track is a first of a comparative radiography related to the ratio between the degree of user satisfaction and technologies used in a tourist site, in particular, tourist portal, in general In this first study have undergone some review sites on the tourism market in Romania online.

Keywords:e-tourism, usability,Internet, web sites

Cod JEL: M, M15, L, L86

1. Introduction

Because of the continuous increase in the number of the Internet users, as well as because of the increase in the value of the transactions made online, the electronic businesses are present today in various fields of activity and divided into various categories, of which, the most important are: E-auctioning ,E-banking; E-commerce (one category is e-Tourism), E-directories; E-ingineering E-gambling E-learning, E-mailing, E-marketing; E-supply; E-trading (e-brokering) E-service,; e-procurement,e-leasing, e-government, e-working, e-health.

Paraphrasing [15], we may say that the introduction of "e" in tourism "is like a conceptual and instrumental revolution. As any revolution, it is characterized by a strong discrepancy between promise and hope, between plan and achievement, between theoretical and real situations".

Tourism is known as the largest industry and because the trip is simple to match the expectations of tourists with different range and variety of options provided by millions of tourism providers.

Because millions of tourists travel each day, communications accurate, current and relevant information are essential for effective operations in the tourism industry. [17].

One can appreciate that the exchange of information is very important in every stage of the cycle of the product sales touristy. Information must be able to move quickly and securely between clients, brokers and suppliers of each travel involved in meeting customer needs.[17]

Passengers can receive information from a variety of sources. In recent years more and more used for information and to "purchase" various sites of tourism business.

We can say that a user who uses the site for a reservation is an "evolving consumer needs, tastes, preferences and predispositions marked by a pronounced dynamism" [7].

Because globalization increases competition. Companies need to encourage tourism for the consumer and create a tourist product on the Internet to buy and use the same distribution channel.

So, tourist behaviour's and tourist need's are considered as one of the reasons that led to the development and spread theory usability sites. The paper set out the title track is a first of a comparative radiography related to the ratio between the degree of user satisfaction and technologies used in a tourist site, in particular, tourist portal, in general.

In this first study have undergone some review sites on the tourism market in Romania online.

2. Related Work

The testing of the usability offers the chance of a clear image of the visitors' behaviour on a website and of correcting the possible infrastructure errors in order to obtain a maximum profit for each visit.

The specialists say that term itself is a usability lesson. As in the case of other concepts of data processing, as it comes from the English term "usability", there are disputes related to its translation. There are authors who recognize it in the term "uzabilitate", others in the term "usabilitate" and other translate it with "accessibility".

A short definition recognises by usability the efficiency of and ease with which people may use an Internet page, to the users' satisfaction. [16]

A broader definition accepts that usability is the efficiency of and ease with which people may use a webpage or an electronic interface (sometimes, the purpose for which the webpage is accessed is different from the purpose for which it has been created) – definition taken from Wikipedia and processed. [3]

3. Work methodology and some results

We have used 45 websites of tourism, from Romania, according to the criteria mentioned in [11]. These criteria have been divided into three categories:

A. - standard criteria

Navigability

- ease in the user authentication;
- visibility of the menus and ease in the access of menu items;
- identification of the positions in the site and access of each page, irrespective of the position.

Design

- first page visibility of the authentication area;
- layout colours;
- methods to catch the attention;

Information

- number of information levels;
- support area;
- contact data.

B Personalized criteria

- ease in the achievement of a transfer / payment;
- joining of security and anti-fishing elements, being easy to use;
- ease in the access of the "demo accounts" and other helping elements for the user;
- contact data in the case of loss / theft the authentication data;
- transparency of costs covered by the client.

C Criteria for HOME PAGE

identity and mission of the organization;

- logical and hierarchical access to the information;
- possibility to search the information;
- "teasing" elements;
- special offers, novelties;
- shortcuts to the most visited areas of a site;
- users' registration module.

Of the sites of our study we mention following (18): www.iloveromania.ro, www.promoturism.ro, www.veltravel.ro, www.calibratravel.ro, www.kartagotours.ro, www.pantravel.ro, www.eximtur.ro, www.tunisiana-travel.ro, www.atlassib.ro, www.normandiatransport.com, www.filadelfia-group.ro, www.blueairweb.com, www.infoturism.ro, www.marshal.ro, www.paralela45.ro, www.aerotravel.ro, www.perfect-tour.ro, www.christiantour.ro.

Ten persons on all websites have made the analysis. After the centralization of the individual observations, we have obtained the following results:

Services offered by these websites we can summarize:

counselling related to holiday plans;

reservation of hotel rooms or boarding houses in Romania;

reservation of hotel rooms or boarding houses abroad;

tourism packages that include the charter air transportation or bus transportation to Antalya, Kusadasi, Istanbul, Hurghada, Sharm el Sheick, Barcelona (for Barcelona, Costa Brava and Costa Dorada), Tenerife, Ibiza, Corfu, Crete, Salonic (for Paralia-Katerini and Halkidiki), etc.;

tourism packages without transportation – hotel rooms and meals, visa, trips, medical insurances;

special offers related to certain events as Christmas, New Year, Easter, sports competitions, folkloric festivals, etc.;

tourist circuits abroad, both by plane and by bus;

plane tickets for any destination with traditional companies, with low cost companies (cheap tickets) and also charters.

Other services:

organization of conferences, symposia, team-buildings, special meetings, company party;

organization of training camps or recovery holidays for sports teams;

organization of personal events, as weddings, baptisms, anniversaries, name days parties, family parties.

Standard criterion:

Criterion				
Navigability	- horizontal menu, for the ease in the navigation by accessing a destination; they maybe arranged on the whole page; references to a new page with more details only for the selected destination (service) or			
	- vertical menu, which includes all the destinations (service and the horizontal menu, with general – informative character			
	- with / without authentication area			
	- with / without site map or map for destinations.			
Design	- on some websites there are predominant foundation colours (as white and blue, yellow and pale orange, etc.) – there are no two websites of the analysed ones that have the same foundation colour; of the colour analysis we may say that some transmit the atmosphere that persists in the destination countries.			
	- we may say that other sites are "without colour", as there is no dominant colour, the foundation is formed of images.			
Informational	- organization from two up to nine informational levels			
content	(services / categories / subcategories).			

Home Page Criterion

erion	
Criteria	
Identity and mission of the organization	- is specified very clearly for all websites.
information	- presentation of the website purpose, contact data, authentication area, support area for users, possible search area and even shortcuts for the most accessed information (a kind of top).
module	 creation of an account for the completion of certain compulsory fields, respectively optional fields, or introduction of the e-mail address for subscription to the newsletter; it needs the creation of an account only in the case of concrete service requirement (tourist destination, ticket reservation)
"Teasing" elements	- it does not present any teasing element at the moment of analysis
Special offers, novelties	 the menus present columns as "special offers" or "discounts of X% for Easter (New Year)"; some do not stand out among the other columns, as they have the same colours and size; they stand out by being placed on the page and capturing the attention by animations and colours.

4. Conclusions

As we are aware of the limits of this article (the number of persons who have tested the websites, the test used), we think that it is needed to extend the study by using the split a/b tests, proposed by [14].

The A/B split-testing is an advanced marketing principle; more exactly the webmasters use it to test various versions of a webpage or website, to determine which of them would be sold better, which colours would lead to a better promotion of the site from the user's point of view.

The success of a website is connected to the observance of the usability criteria – navigability, design, informational content.

The purpose of an on-line tourism business should be that of attracting clients who are offered quality services. In this regard, we have noticed that those websites that offer many destinations and many services are not very easily used, and their quality is very low. It is recommended that they should choose a strong point that they may use and specialize in. the specificity of each tourism agency may be adapted for all categories of tourists, without needing the offer for all destinations.

In conclusion, the tourism portals should focus on originality, specificity and should regain their credibility related to the price – quality relationship.

Up to a certain level, the usability degree also depends on the purpose and target public of the site. There is a general agreement related to the web usability, which takes into consideration that the site should be accessible, attractive, consistent, clear, simple, navigable and tolerant to errors.

For the best results, it is recommended to use a variety of methodologies in order to create websites and to treat the design as a repetitive and active process.[14]

A site as much taste should be the user should answer the criteria of usability, not alone to raise the value of services a company's e-tourism

Conversion of ordinary business into e-business has forced organizations to be redesigned and reshaped Today's business owners are more dependent on applications than ever before. Application software automates key business processes - from payments, funds transfers, and order placement and fulfillment to customer service inquiries. It is challenging and costly to integrate systems between business units or trading partners and to orchestrate business operations between entities. Open Source Software is for many small and medium companies, an opportunity to develop efficient e-Business IT systems. In this paper we try to survey the advantages and risks of this solution and the way to achieve an acceptable level for the quality of the IT free solutions by using the IT system audit process.

Keywords: e-business, open source software, IT quality, IT audit

JEL classification: M15

Introduction

Today's business owners are more dependent on applications than ever before. Application software automates key business processes - from payments, funds transfers, and order placement and fulfillment to customer service inquiries. Because application downtime and performance problems can have serious business impacts, line-of-business owners are demanding that IT deliver greater application service levels and faster problem resolution when problems do occur. Application owners are responsible for making sure that applications do everything line-of-business owners need. Business requirements for applications typically include availability, performance and data accuracy.

Beyond e-Business, enterprise borders will change, or even disappear. Leading organizations will provide open access to infrastructure services, data and applications. Partners, suppliers, customers and, in some cases, even the competition, or "coopetition", will be able to peer into corporate nervous system' firm, including traditional systems— not just the ones with an "e" in front of them.

Moving to next generation application development solutions help organizations reduce or eliminate application backlog while aligning business and IT units and reducing the strain on their IT resources.

Although technology continues to advance, business innovation and application needs far outpace advances in technology. In fact, in the past few years, the gap between business and technology has lead to enormous application backlogs, increased dependence on time and resources and outsourcing.

Enterprise Software faces a set of challenges in meeting the needs of today's enterprises. Some of the challenges have always existed, some are very new. They include ⁵⁹⁷:

- Most existing technology assets are not modular, reusable or easy to integrate.
- Many useful applications of business technology are not available to an increasingly mobile work force.
- It is challenging and costly to integrate systems between business units or trading partners and to orchestrate business operations between entities.
- Changes in implementation technologies often force very costly migrations that offer no specific business benefit other than moving from one technology stack to another.
- Business software is implemented with technologies that are too fine grained in control for the level of granularity needed to implement business solutions.

This causes long and unpredictable release cycles and expensive and inflexible application maintenance.

- Companies are forced to build and manage their own technology platform that sits between the software they license and the software they build
- Software development as a whole has suffered from an inability to respond to requirements changes without significant budgetary impact because the implementation and deployment strategy is brittle.

Evolving business needs and technology innovations are driving continued changes in every aspect of the software delivery industry as a whole. We think that are four areas of innovation strategic areas of IT innovation: methodology, architecture, interface, and implementation.

⁵⁹⁷ Skyway Software – NextGen Whitepaper, Next Generation Application Development, The Rise of the Business Application Platform, 2006,p.6.

Methodologies are becoming more iterative, software architectures are becoming more modular, software interfaces are becoming richer and more flexible, and software implementation is becoming more adaptive and productive.

Open Source Software – advantages and risks

Not long ago, open source software in the enterprise was a contentious topic. Conference panels and industry experts questioned the integrity of mixing open source with commercial and proprietary code. Would it unlock a Pandora's box of developer pain and sub-par software? Last year, a Forrester study showed 75% of large enterprises surveyed were either using or planning to use open source software. That was up from 60% the year before. In a study from InfoWorld magazine, 87% of respondents said their companies were already using open source in several projects—even for mission-critical applications. In 2007, The451 Group confirmed it: open source software is gaining worldwide adoption in commercial software companies. Organizations' need for greater agility and flexibility, and more control over their software costs, coupled with their fear of technology obsolescence, is driving them to loosen the ties to individual software vendors and traditional software licensing models.

Open source has proven that it can often more efficiently deliver high-quality software, throwing down the gauntlet to old models of software development and maintenance. As a result, use of OSS has now spread from infrastructure and middleware to business-critical applications, including business intelligence, enterprise content management and customer relationship management. Against this backdrop, the third Annual Actuate Open Source Survey⁵⁹⁸ confirms that Europe in particular is forging ahead in widespread adoption of OSS, having recognized early on the lower cost of ownership and the flexibility it offers for future application expansion and development. An in depth exploration of organizations' use of and attitudes towards open source, across four important territories – North America, the UK, Germany and now France - the report confirms once and for all that OSS is no flash in the pan, but has been broadly recognized and embraced as offering organizations sustained competitive advantage. The survey findings support Gartner's projections that, by 2012, at least 80% of commercial software solutions will include substantive open source components⁵⁹⁹.

The following figure shows Europe forges ahead of North America in its preference for open source platforms, particularly in the deployment of new applications, and replacement of outdated systems, with France and Germany at the forefront.

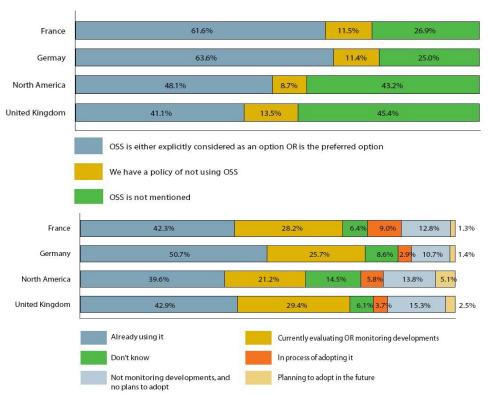

Fig.1. (Source: ACTUATE: ANNUALOPENSOURCESURVEY, 2008, Conducted on behalf of Actuate by Survey Interactiv.p.4)

_

⁵⁹⁸ Actuate: Annual Opensource Survey, 2008, Conducted on behalf of Actuate by Survey Interactive

⁵⁹⁹ Gartner Highlights Key Predictions for IT Organizations and Users in 2008 and Beyond', January 31, 2008.http://www.gartner.com/it/page.jsp?id=593207

However, just because open source is ubiquitous doesn't mean it's risk-free. Many businesses widely use open source in commercial projects, but are blind to what's at stake when they distribute software that includes open source code.

Some of the biggest names in software development and manufacturing use open source software in their projects—Microsoft, Toshiba, even the U.S. Navy. There are many good reasons to do so such as:

-open source languages decrease the expense of software development considerably;

-the ever-improving, extensible nature of open source languages appeals to developers;

They know the code is constantly adapting, evolving and stabilizing.

-another advantage of open source is being able to tap into the global open source community when things go sour. When problems arise— as they often do—enthusiastic members of the open source community see your headache as a riveting weekend project. They love the code; they fix the code; they are the code.

Despite all the benefits, any development team using open source for enterprise software development projects knows it's not perfect⁶⁰⁰:

- -Programmers in their basements can't fix your problem fast enough. The community of open source coders isn't on the clock, or your company's payroll. That means free 24/7 support doesn't exist for open source projects. When you are on a tight development schedule, a lack of formal support or training can jeopardize a development project.
- -As a commercial software vendor, you must stand behind your product. That gets tricky if your software uses open source, because you don't have complete control over the entire code base. Yet, your company becomes accountable for the total quality of your product.
- -If the open source software you're using is not top quality, it can cause a ripple effect that destabilizes your product and reflects poorly on your business.
- Most companies don't have policies in place to address administrative complexities that go along with using open source languages—like how to license your product. InfoWorld's⁶⁰¹ survey indicates that only 41% of respondents had a policy in place for deploying and managing open source in their companies.

The confusion begins with terminology. When developers call software "free," they mean users are free to run it, change it and redistribute copies with or without changes. As Richard Stallman—author of the first GPL open-source license—puts it, when you think of open source languages, "think of 'free speech,' not 'free beer 602.""

Sounds like free software, but it's not. Open source code must be licensed. Although open-source licensing terms may have nothing to do with money, they will put restrictions on how you can distribute your product.

The theory behind open-source licensing is a good one. It ensures that open source languages are not exploited by organizations that use them in their projects, but otherwise would not give anything back to the community.

Today, nearly every sort of business software product, from e-mail servers to ERP tools to voice over IP, are available as open source. But many companies begin using open source on the Web side of their business, where a number of industrial-strength, long-used applications exist. These tools are commonly referred to as the LAMP stack (standing for Linux, Apache, MySQL and PHP—or Perl or Python, depending on the situation.) Linux is a well-regarded, widely used Unix-like operating system. Apache is the most popular Web server in use today. MySQL is a database product that competes favorably with expensive commercial tools. And PHP, Perl and Python are programming or scripting languages commonly used for open-source Web development. Java-based open-source websites also often use the JBoss Java application server. Once you become familiar with using open-source tools and the differences—and similarities—between them and commercial products, you'll likely find other opportunities. You may also be surprised to find that your developers have been using open source under the radar for some time.

The IT System Quality Ensuring through the Audit Process

In the Knowledge Society, the organizations use Information Technology to process their information in order to accomplish better their mission. The audit process development plays a critical role to assure a high level of information system quality. The organizations want to carry out audit processes because they need to assure a high level of the information systems, to know what and where are their vulnerabilities, to develop security policies and risk management plans and to implement measures with positive effects on their information systems. The audit results must correct some aspects concerning the information systems security.

Detection of the security vulnerabilities in an information system based on web application is a critical activity to give the confidence in that system and, also, to assure a high-level quality of the system to prevent the system crashes and sensitive data theft. If the vulnerabilities are exploited by external users, this thing may cause big loses for all partners that use the information system.

⁶⁰¹Survey: Open source is entering the enterprise mainstream, may 30, 2008 (http://www.infoworld.com/t/applications/survey-open-source-entering-enterprise-mainstream-943).

⁶⁰² Stallman, Richard. "Why "Open Source" misses the point of Free Software" (http://www.gnu.org/philosophy/open-source-misses-the-point.html).

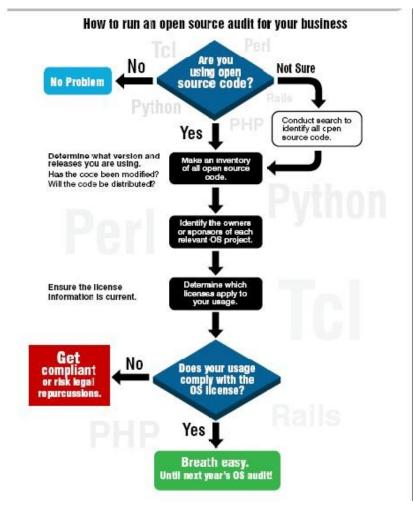

Fig.2. (Source: License to Code: Indemnifying Your Business Against Open Source Licensing Liabilities, white paper, January 2008, p.7)

Typically, an audit (fig.2) follows these steps⁶⁰³:

- 1. Evaluate the scope and nature of how your organization uses open source software. Where and how are you using it? Are you using it internally, or will it be distributed? Is it modified or unmodified? Has it interacted with other code—proprietary or open source?
- 2. Make a detailed inventory of which open source languages you're using.
- 3. Research and learn about the licenses for all the open source projects your organization is using. Make a library of the names of all the licenses, and get copies of all these licenses

Conclusions

Enterprise Software faces a set of challenges in meeting the needs of today's enterprises. Some of the challenges have always existed, some are very new.

Evolving business needs and technology innovations are driving continued changes in every aspect of the software delivery industry as a whole.

Methodologies are becoming more iterative, software architectures are becoming more modular, software interfaces are becoming richer and more flexible, and software implementation is becoming more adaptive and productive.

In these trends, open-source software fits

very well with its advantages and disadvantages. Developing of an e-Business IT System based on the open source software is a costless recommended solution in the actual context of the global financial crises. To be sure about the quality level of the solutions we must understand and use the operational procedures to run the IT System audit for our business.

ONTOLOGIES REPRESENTATION AND MANAGEMENT, AS A SEMANTIC TOOL FOR ORGANIZATIONAL MEMORY CONSOLIDATION

Mangiuc Dragos Marian

The Academy of Economic Studies in Bucharest Faculty of Accounting and Management Information Systems Bozieni 8, Bl. 831, Sc. A, Et.9, Ap.906, Sector 6, București mangiuc@gmail.com Tel. 0723 – 22 78 76

The present paper is a component of an exploratory research project focused on discovering new ways to build, organize and consolidate organizational memory for an economic entity by means of the new "Semantic Web" technologies and also encloses some of the results of a previous doctoral research in the field of information technology assistance for the financial audit. The paper is an attempt to synthesize the ways "Semantic Web" ontologies definition, description and representation may be improved by the use of the Unified Modeling Language (or UML). The use of a modeling tool for ontologies description and representation is, in the author's opinion, a way to further interconnect human-level knowledge and machine-level data in order to "get the best of both worlds", which is the final objective of the Semantic Web.

Keywords: organizational memory, unified modeling language, semantic web, ontologies

JEL code: M15

Introduction

The essence of an ontology (at least, according to the interpretation the new "wave" of the Semantic Web imposed) is tightly related to vocabularies (as collections of terms) and the completion of the terms' significance by means of expressive, explicit and well-defined semantics. The involved semantics should provide enough structure and contents so as interpretation of an ontology by an information system (a machine) should be regarded as a tangible goal for the very near future (Davies *et al.*, 2006). In order to get a realistic and quite complete view of the ontologies' place and role in the wider landscape of the Semantic Web, one should be familiar with quite a comprehensive set of concepts (including semantics, knowledge representation, truth function, intension, extension, axiom, theorem, theory etc.). In the absence of these concepts, the actual tendencies and trends of semantic technologies are extremely difficult (if not impossible) to understand.

Research Methodology

The paper is a component of a wider research project called "Research in the Field of Modeling And Building Organizational Memory. *OMCAAF* – A New Methodological Framework for Financial and Accounting Cognitive *Acquis* Capitalization", and also continues a previous doctoral research in the field of computer-assisted financial audit tools and techniques, whose final results were publicly defended in order to be validated by the scientific and academic community. The main goal of the aforementioned research was the identification of some new areas of applicability for the modern knowledge-based information technologies in the field of financial audit.

In order to provide a set of valid and well-documented opinions about the realistic ways of augmenting the use of organizational memory by means of the modern information technologies, the author's proposals were preceded by an ample process of documentation and analysis of the field literature, allowing to get into terms with the main schools and opinion trends in the area, as well as the actual level of interconnection among the disciplines contributing to the present content of the "organizational memory" and "Semantic Web" concepts. When possible, practitioners' expectations identification was attempted, both by means of questionnaires and direct interviews. In case some other author's opinion was enclosed, whether in exact quotation or synthetic form, a complete mention of the source identification information was made.

In the author's opinion, the main limitations of this research work may be synthesized as follows:

- Some of the technologies taken into account for both design and implementation of financial and accounting organizational memory management systems are still in some early development or adoption phases, as others are in the specifications refinement phase, and, as a result, their current versions may have a set of serious limitations as opposed to the users' expectations.
- Due to the special status and confidential or "classified" contents of the detailed and complete financial and accounting data, the author was not able to access an exhaustive set of real-world data, most of the design and implementation iterations being performed on a set of test computer-generated data.

By defending the research results at the proceedings of such a scientific conference, attended by both scholars and practitioners bearing some interest in the research area, the author attempts to get further validation of his opinions, both confirmation and rejection of the aforementioned opinions' scientific and practical importance being welcome.

Ontologies Representation and Management, As a Semantic Tool for Organizational Memory Consolidation According to its common definition, an *ontology* defines terms and concepts (or meanings) employed to describe and depict an area (or domain) of knowledge. In order to get a first idea about the meaning of the term *ontology*, an explicative dictionary may be consulted. This attempt usually leads to one of the two related definitions: "a branch

of philosophy studying the most general attributes of *existence*" or, "the theory of *existence*" (www.dexonline.ro, 2009). The two definitions place the term in the field of philosophy, as a branch oriented towards the study of the principles underlying an object of thought. The term was also employed in the field of information technology, in order to describe the field of knowledge design, description and organization outlined during the last decade. Even if the relevant literature has not yet provided a unanimously accepted definition, in the author's opinion there are at least three definitions which need to be taken into account:

- "An ontology defines the language elements, along with the underlying concepts (or meanings) used to describe a domain of knowledge" (Hendler, 2001).
- "An ontology is an information systems design product, enclosing a specialized vocabulary employed to describe an aspect of the reality, together with a set of explicitly assumed premises (explicit assumptions) regarding the aforementioned vocabulary's purpose and goal" (Guarino, 1998).
- "An ontology is a way to exhaustively and rigorously organize knowledge form inside a domain. Organization is usually performed in an hierarchical manner and encloses all the relevant entities pertaining to the modeled domain, along with the relationships arising among the entities themselves" (WordNet, 2009).

A comparative analysis of the three aforementioned definitions emphasizes the terms "description", "organization" and "knowledge". Any description of a knowledge domain assumes that sufficient explanations are provided, concerning both the entities inside the domain and relationships arising among the entities. The domain description may also include a set of domain rules that may be employed as a basis for new knowledge generation. As a consequence, we may be able to conclude that any complete and rigorous description may represent an ontology. The following table (Table 1) provides a comparative presentation of the elements considered (according to the author's opinion) to be of main importance for the content of an ontology, along with proposals concerning the Unified Modeling Language (or UML) elements which optimally comply with each item's representation needs.

ELEMENT NAME		DESCRIPTION	UML DIAGRAMS PROPOSED
ONTOLOGY	UML	DESCRIPTION	FOR PRESENTATION
Class	Class	A general element pertaining to the modeled domain.	 Class diagram Component diagram Object diagram Package diagram Composite structure diagram
Instance	Object	A particular element pertaining to the modeled domain.	Class diagramComponent diagramObject diagramAny interaction diagram
Relationship	Dependency, Association, Aggregation, Composition, Generalization, Participation, Message (Call)	A semantic relationship among two or more (general or particular) elements.	- Class diagram - Package diagram
Propriety	Attribute	A characteristic of a general element able to receive a value for each of the pertaining particular elements.	- Class diagram
Function	Method	A behavioral item or a phase of a process involving general or particular elements.	- Class diagram - Activity diagram - Statechart diagram
Process	Process	A collection of interconnected treatments designed to fulfill a single goal.	- Activity diagram (for the business process level) - Use case diagram
Constraint	Guard, Condition	A condition that needs to be satisfied by an element or a behavior.	- Object constraint language (or OCL)
Rule	Restriction Table 2. O	A principle governing a behavior or a part of a behavior.	- Object constraint language (or OCL)

Table 3 - Ontology versus UML elements comparison

In order for the *description* of a knowledge domain to be complete, the description should also be *represented*. The *representation* involves structuring the description in a manner which renders it usable bay all the stakeholders (both humans and information systems or computers). In its broadest sense, *representation* involves the *definition* of terms, followed by an *integration* of the terms defined, so as a larger part of the modeled knowledge domain is rendered accessible for the user (Barry and Welty, 2001). Although, in the field of information technology, *representation* has a more complex meaning: it involves building a model which is complete and rigorous enough to be used not only by a human being, but also by a machine or an information system (Rodriguez *et al.*, 2004). In the author's opinion, the Unified Modeling Language optimally complies with the aforementioned requests and, by consequence, may be used on a wide scale to represent the content of any ontology from within the Semantic Web, becoming an important tool for the organizational memory building and configuration.

UML models may enclose both information and decision elements regarding the semantics of the modeled domain and, as a consequence, they may be employed for the understanding, browsing, configuration, maintenance and control of the described domain (Evans *et al.*, 2000). The Unified Modeling Language is the quintessence of all the previous experience in the field of modeling techniques, an attempt to integrate all the best practices in the field into a unique standard and set of specifications. The UML has quasi-unanimous support from the visual modeling tools nowadays, mainly because it does not define a particular process, but is rendered compatible with any of the modern development processes, particularly with the iterative and incremental object-oriented ones. According to the author's opinion, the unified modeling language suits well the purpose of the present research and, as a consequence, may be successfully employed for an ontology's content representation and description.

The Unified Modeling Language specifications allow the modeler to collect data concerning the static structure and also the behavior related to a knowledge domain which is modeled in the form of a collection of interconnected objects able to interact in order to fulfill the needs and requests of an external user. The UML static structure defines the object types required for the description of an ontology, along with the attached relationships, while the behavior (the knowledge domain dynamic) defines the timeline evolution of the elements and also the communication network the elements employ in order to fulfill the system's goals. Modeling and presenting an ontology from different, but interconnected perspectives allows for a deeper understanding of the way the ontology addresses the functional requests of the underlying domain. Moreover, the UML provides a universal tool for grouping elements in the form of packages, allowing for the division of large-scale ontologies into manageable components and also for the control of inter-package dependencies and components versions management inside a complex development environment. And, in order to complete the picture, a set of comprehensive implementation decisions description and executable elements or components organization tools is provided.

The Unified Modeling Language is by no means a programming language, but a large set of software applications provide the tools needed to translate UML visual representations into modern logical or object-oriented programming languages source code (*direct engineering*) and also to automatically construct UML models based on the source code analysis (*reverse engineering*).

In order to provide an example for the representation of an ontology by means of the Unified Modeling Language formalism the author has chosen a section of a human resources related ontology (applicable for any economic entity or, at a more general level, for any organization). The example depicts the basic concepts (like *person*, *employee* and *organization*), their derivatives or subclasses (like *management employee*, *company*, *group*, *division* and *department*), along with the relationships arising among the aforementioned elements, represented by means of the UML inter-class relationship types (dependency, association, aggregation, composition, inheritance). The result is presented in Figure 1.

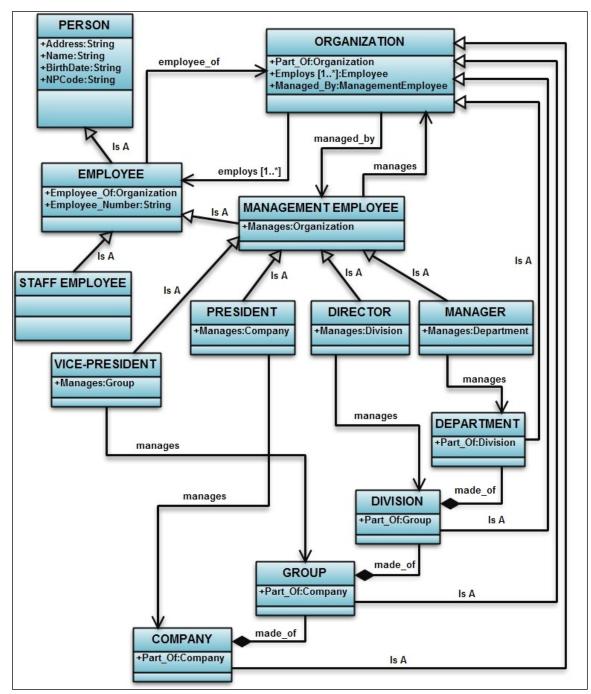

Figure 5 - A fragment of an ontology described by means of the Unified Modeling Language

The wide spread and adoption of the ontologies depicting both domain knowledge and inter-domain knowledge, as well as the improved of such ontologies with UML-based representations constitutes, according to the author's opinion, an important step forward in the development of information technologies, as they allow computer systems to interact with the users more at a human knowledge level and less at a machine-specific non-semantic data level. The ability to perform an significance exchange (not only a data exchange) with a machine may represent a revolutionary concept whose effects are already beginning to appear and are able to develop exponentially in a (very) near future.

Conclusions

The present research is an attempt to identify the ways that the Unified Modeling Language may be used to represent (define and describe) ontologies, which are looked at as a fundamental element of the new semantic-content technologies and, by consequence, as the basis for organizational memory design and management at the organization level. In the author's opinion, the Unified Modeling Language may be an appropriate tool for the representation of ontologies, as its specifications already enclose elements able to represent the mandatory concepts in the field of ontologies: syntax, structure, semantics, definition and use. By a set of complex elements (like visibility) the UML allows for the representation of some essential elements, like the distinction between labels (or terms) and the concepts (or meanings) underlying those terms. The multi-level structure of the UML specifications

also fits the multi-level structure of an ontology, as both have a meta-language level, a language level and also a specifications (domain) level.

Above all the resemblance and differences, the final goal has to be taken into account, and an answer should be provided to a legitimate question: "Which is the real advantage in using ontologies?". In the author's opinion, the real advantage in using ontologies is that for the first time in the history of information technology designers and users are able to describe the meaning of their data collections, document collections and information systems, based on a single mechanism, which is understandable both for humans and machines. As a consequence, the recourse to the Unified Modeling Language may offer another major advantage: the ability to reuse the own ontologies and also the ontologies created by others, to extend them and to implement them in related domains of knowledge, and, as a consequence, in related areas of an economic entity's activity. Setting a common semantic at the organization level may be regarded as a solid foundation and a first important step for the building and consolidation of the organizational memory.

THE ROLE OF THE SEMANTIC WEB IN STRUCTURING ORGANIZATIONAL KNOWLEDGE

Mangiuc Dragoş Marian

The Academy of Economic Studies in Bucharest Faculty of Accounting and Management Information Systems Bozieni 8, Bl. 831, Sc. A, Et.9, Ap.906, Sector 6, București mangiuc@gmail.com Tel. 0723 – 22 78 76

The present paper is a component of an exploratory research project focused on discovering new ways to build, organize and consolidate organizational memory for an economic entity by means of the new "Semantic Web" technologies and also encloses some of the results of a previous doctoral research in the field of information technology assistance for the financial audit. The paper is an attempt to synthesize the ways organizational memory and organizational knowledge management may be optimized by means of the new "Semantic Web" philosophy. This paper offers a picture of where the typical organization is, and where it needs to be, in order to become a knowledge-aware organization and leverage the technologies of the "Semantic Web". As a consequence, a knowledge-centric process was defined, along with a "how-to" roadmap for crafting a company's way to the Semantic Web.

Keywords: organizational memory, organizational knowledge, semantic web, knowledge management

JEL code: M15

Introduction

In order to benefit from the "new wave" of semantic technologies, any modern organization must have a strategic view and also a reasonable understanding of the Semantic Web, XML, Web services, RDF, taxonomies, and ontologies. Each of these technologies has its distinct role in the build of organizational memory and the structure of organizational knowledge. It is the purpose of this paper to provide an opinion on how a company could be driven to take advantage of these technologies now so that it could start gather the rewards of the Semantic Web and prepare for the future. The paper focuses on three areas: diagnosing the problems of information management, providing an architectural vision for a modern organization, and providing some hints of how that vision may come true.

Research Methodology

The paper is a component of a wider research project called "Research in the Field of Modeling And Building Organizational Memory. *OMCAAF* – A New Methodological Framework for Financial and Accounting Cognitive *Acquis* Capitalization", and also continues a previous doctoral research in the field of computer-assisted financial audit tools and techniques, whose final results were publicly defended in order to be validated by the scientific and academic community. The main goal of the aforementioned research was the identification of some new areas of applicability for the modern knowledge-based information technologies in the field of financial audit.

In order to provide a set of valid and well-documented opinions about the realistic ways of augmenting the use of organizational memory by means of the modern information technologies, the author's proposals were preceded by an ample process of documentation and analysis of the field literature, allowing to get into terms with the main schools and opinion trends in the area, as well as the actual level of interconnection among the disciplines contributing to the present content of the "organizational memory", "organizational knowledge" and "Semantic Web" concepts. When possible, practitioners' expectations identification was attempted, both by means of questionnaires and direct interviews. In case some other author's opinion was enclosed, whether in exact quotation or synthetic form, a complete mention of the source identification information was made.

By defending the research results at the proceedings of such a scientific conference, attended by both scholars and practitioners bearing some interest in the research area, the author attempts to get further validation of his opinions, both confirmation and rejection of the aforementioned opinions' scientific and practical importance being welcome.

The usual organizational issue: too much information, too little knowledge

The most significant issue today for a typical organization is that information management is mostly chaotic. One important cause for the *status quo* is the huge amount of information coming in—from a wide variety of information sources (Berners-Lee, 1991). Making matters worse are the various formats of the data (paper, email, along with a wide variety of electronic media formats). Due to the amount of information coming in from various sources, its management gets more and more difficult. The "standard" organization is usually enclosing a lot of people getting overwhelmed with information (Fensel, 2007). Along with a missing cohesive information management vision, the typical organization has lots of information, but very little knowledge. The typical knowledge management process in an organization is depicted in the following figure (Figure 1).

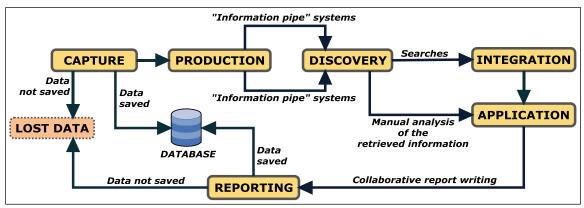

Figure 6 – The typical knowledge management process

The stages of this process usually are:

- The information capture is the first stage in information management. Usually, an employee of the organization takes information from somewhere (newspaper, radio, Internet, database, phone call, customer contact, email) and brings it to the organization in some way. Many times, this is where the process stops (Ewalt, 2002). The employee may send it via email to someone, where it is lost in the "constellation" of emails that overwhelm the organization. If the data isn't lost in this way, a paper, a presentation, or a status report is usually written.
- The information production is the second stage, (if information gets that far), where the data is put into a database, recorded to a digital file, or indexed into a search engine. Entering information is always the first step, but the problem is that each division, group, or project in the company enters the information into different systems. But a large-scale organization may enclose tens or even hundreds of different software systems dealing with information. Moreover, a financial database with the company's invoices, bills, and collections may add information to that total. Finally, the corporate human resources database must be taken into account. All the aforementioned software systems work like "information pipe" systems, able to perform a specific task, at the expense of "trapping" the data and reducing the organization's business agility and the capacity to adapt to new situations (Heflin et al., 2002).
- The information integration is the third stage, but it can also be missed, depending on the complexity of the organization's information architecture. Because of all the "information pipe" systems, there is usually no good way to gather all the information providers into a coherent picture. That is, any attempt to combine information in any way is a tiresome process, involving data conversions, incompatible software systems, and frustrated systems integrators (Patel-Schneider *et al.*, 2006). There is no repeatable process for integrating the systems, because each database and software system is designed differently and has different interfaces for communication purposes. As a result, there is usually little or no integration of the databases, because it is both prohibitively difficult and expensive. When there an integration solution arises, organizations usually pay a (very expensive) systems integrator to create a new and expensive "information pipe" system that integrates with the existing systems (Biezunski, 2003).
- The information search is the fourth stage, depicting the process of "discovery" of the corporation's internal resources. This is usually random and time-consuming, involving many different systems. The user may have to log in to multiple databases and search engines, and manually compare and distinguish the information to get a big picture or coherent answer (Obrst and Liu, 2007). Even the results from search engines are usually based on keywords and Boolean logic, so they may or may not be relevant.
- The application of the search results is the final stage of the process. After the tiresome search process, the result is usually a presentation or paper report. Many times, this process of creating the report involves several employees. The approval process is done by manual reviews and is slow. After the new product is created, the information may or may not be filed somewhere; it may be sent to a wrong or non-existent destination. If the report is filed, perhaps it is filed onto a Web server that may or may not be indexed by all (or even one) of the corporate search engines. If the new document is integrated into one of the corporate databases, there is no way to tell if the information has been superseded or is obsolete, which parts of the document are authoritative, and if the current version of the document has been approved by the organization. Lastly, there is information reuse the ability to discover months or years later, and to refine, annotate, and incorporate past knowledge (Baader and Hollunder, 2001).

If any of these challenges are every day phenomena for an organization, then the organization may be in need of the Semantic Web. A well driven and well managed company will leverage the Semantic Web technologies to craft an information architecture vision, effective over every part of the organization life cycle.

The Knowledge-Centric Organization – A Big Step Ahead

A knowledge-centric organization will incorporate Semantic Web technologies into every part of the work life cycle, including production, presentation, analysis, dissemination, archiving, reuse, annotation, searches, and versioning. This section is a hint on how the semantic-oriented knowledge management process should be (see Figure 2):

Discovery and Production

The discovery and production phase is where an individual receives information and intends to translate it into organizational knowledge. The process should be an integral part of the corporate workflow process. This is an area where organizations should be aggressive an greedy in capturing information, because the effectiveness of reuse will be directly proportional to the quantity and quality of information captured. It is important that any new piece of information is marked up with XML, using a relevant corporate schema. Moreover, the individual should digitally sign the XML document using the XML Signature specification to provide strong assurance that the validity of the information has been verified. The annotation process may further arise, the employee may want to use RDF to annotate the new information with own notes or comments, adding to the XML document, but without breaking the digital signature seal of the original material. Finally, the author should digitally sign the annotation with XML signature. It is of main importance that before the information is integrated, its contents to be mapped to topics in the taxonomy and entities in the corporate ontology so that pieces of the information can be compared to other pieces of information in the corporate knowledge base. Once this is done, it is time to store the information in an application with a Web service interface, and any new Web service should be registered in the corporate registry, along with its taxonomic classifications.

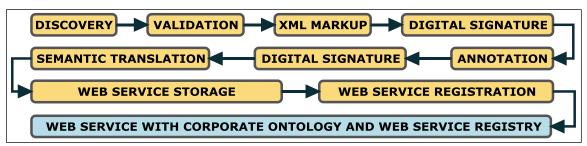

Figure 7 – The semantic-oriented knowledge management process

Search and Retrieval

As data is stored in an easily accessible format (Web services) and is associated with an ontology and a taxonomy, retrieval of information is much easier than the random process described in the previous section. Integration of all the Web services is not difficult because they all have a SOAP interface, and are registered in a corporate Web service registry; it is easy for an application to find what it is looking for (Berners-Lee *et al.*, 2001). Because of the hard work performed during the discovery and production process, the search and retrieval process is simpler and provides important functionality:

- Discovery of knowledge via taxonomies this is the newfound power and possibly the killer app of the Semantic Web the mining associations. In the field of electronic commerce, associations offer additional buying opportunities to customers.
- *Pattern-based searches* all data can be semantically linked by relationships in the ontology, so patterns that would only be seen in the past by old data mining techniques that did not directly utilize meaning, can now be dynamically found with semantic searches.
- *Manual and agent-based searches* although all of the searches can be manual, software agents can be endowed with rules to continually search the knowledge base and provide users with up-to-the-second results and alerts.
- *Rule-based orchestration queries* Web services can be combined to provide modular functionality, so rules may be used to merge various searches from different Web services.
- Automated inference support the corporate ontology explicitly represents concepts and their relationships in a logical and machine-interpretable form, so automated inference over the ontology and its knowledge bases becomes possible. Given a specific query, an ontology-based inference engine can perform deduction and other forms of automated reasoning to generate the possible implications of the query, thus returning much more meaningful results. The inference engine may discover inconsistencies or even contradictions in the ontology or knowledge bases (Wreder and Deng, 2007).

Application of Results

The final information production stage of the knowledge-centric organization's knowledge process is the application of results. If a new report has been created the responsible person should use the production process, depicted earlier in the "Discovery and Production" section. Another application in the last stage of the knowledge

process may be simple data annotation, requiring that the author of the annotation should digitally sign the annotation. Before the new annotation items are added, version control should be added to the document, and finally the document should be stored in the corporate information base. If an organization has a content management and workflow process that includes version control, annotation, and trust assertions, it will be easier to find information and apply the conclusions that were made earlier.

How could the "semantic" vision come true?

Most companies need to change their business process in order to take advantage of Semantic Web technologies. Luckily, these changes can be gradually implemented, and the organization can easily evolve into a knowledge-centric organization. The most challenging aspect may not be the technology; it may be changing the mind-set of the employees. Changing behavior and the ways that all levels think about accessing, integrating, and leveraging knowledge is critical:

How to Prepare for Change

The organization needs to be prepared. The stakeholders impacted by the change must be identified and led through the change process. A clear purpose and some clear goals and milestones are needed:

- A clear purpose for changing your information management process needs to be developed.
- Clear goals must be set.
- Stakeholders must be identified and a change plan must be developed.
- A core team that will help communicate the vision must be picked.

How to Begin Learning

In the author's opinion, a major time investment should be made in understanding the ideas and technologies behind the knowledge-centric process and all the implied technical staff must get to a reasonable level of knowledge. The following actions should be taken:

- The management staff must understand the main concept of the Semantic Web and the benefits of its adoption for the organization
- The technical staff to should be able to master the details of the soon-to-be-adopted technologies.

How to Create an Organization's Strategy

Now that management and the technical staff are "on board", it is time to design an organizational knowledge management strategy:

- Detailed technical goals must be set. For example:
- Corporate documents must be marked-up in XML.
- Applications should be exposed as Web services.
- Web services orchestration tools should be built.
- A corporate Web services registry should be established.
- Ontologies should be built.
- Tools that will help the production process should be used.
- Search tools should be integrated
- An enterprise portal should be used as a catalyst for knowledge engineering.
- A plan with a workflow change strategy must be developed.
- Appropriate staff must be set in place.
- A schedule must be set.

Conclusions

The present research is an attempt to identify the role of the Semantic Web in structuring knowledge at the organization level. The paper is an attempt to present an accurate view of the place where most of the typical large-scale organizations are today, and also the author's opinion on the place they need to be in order to become knowledge-centric organizations and leverage the technologies of the Semantic Web. As a consequence, a knowledge-centric process was defined and a "how-to" roadmap for crafting an organization's path to the Semantic Web was proposed.

In the current economic and socio-demographic context, the pressure exerted over the informatic departments by the top management in order to have them offer a high volume of information in a short time, efficient for maintaining and developing the business, can lead to migrations to geo-business informatic systems through which to adopt the indicators that would justify the costs. European integration demands that societies access performant informatic and telecommunications solutions for modernizing the economic and ecologic environment which supposes a rapid assimilation of geo-informatic technologies specialized on the management of geo-spatial data. The concept of high quality real time spatial data reprezents key theory for minimizing the risk of busing data in a certain context during the process of decision taking. Geoinformatics is more and more incorporated in the business community, reprezenting a ey aspect in the development of the business, in the management of distributed equipments, in geomarketing and also in organizing the web space.

Keywords: geo-business informatic systems, indicators cost, european integration, management of geo-spatial data, geomarketing.

Jel classification: D80, D87, M31,Q55

Introduction:

The multitude of new concepts that appeared in recent years (e-management, neuro-management, neuro-marketing, neuroeconomics, e-business, e-commerce, e-marketing, geomreting etc) have generated, on their turn, more and more complex informational technologies as a result of the necesity of finding solutions so that the comercial message could get to the new type of consumer.

The Geographical Informatic Systems(GIS) are software solutions for presenting data with a spatial component. The GIS transpose data referring to clients, market and corporate data in informative maps that are easy to understand and use.

Starting from the real world of business and IT, *Geo-business* shows how should a business develop spatially with the aid of IT solutions that offer a unique advantage for fighting the competition on the market, for wining and eeping clients, for developing the business and for taing good decisions, for developing new products and services and for optimizing the work space. The IT solutions use databases on the basis of which are made two types of analysis:

public statistical data and proprietary data of the companies about the clients and the distribution network.

In general, the IT solutions offered to the Geo-business provide answers to questions like: Where are the clients located? How large is the are covered by the company? Where should a new shop, branch be opened? Where should the advertising campaign be directed in order to obtain the highest efficiency? Such informatic applications for selling and marketing use information about clients from databases, but there are also functions that are specific to this system:

- -establishing a list of potential clients;
- -eliminating overlapping and verifying the addresses;
- -modeling motivation and behavioral propensities;
- -market segmenting;
- -the complete history of the clients;
- -reporting offering information about clients, sales, marketing activities and the market.

Geoinformatic analysis based on statistical data, maps and didgital databases help monitoring the spacial development in time of the clients, and the coverage area of the company.

1. Geomarketing through geoinformatic solutions

Geomarketing is a new technique for identifying where are the points where a company will have the maximum impact, representing a spacial segmenting of a market based on studying the characteristics of the comercial areas and of the population that lives in a certain area of the market, in order to ajust the asortment and the mechandising of the points of sales corresponding to the needs of the clients. This technique is based on processing information offered by classical management system based on databases of the companies and their marets, as well as the

systems of geographic informing that have data for characterizinf in details the studied areas. The geomarketing envisages three components: software, data and digital maps.

GISs refer to collecting, extracting all data in the territory and grouping them in models that describe the way the market works, representing an important resource for an efficient marketing and business and a basis for the further strategic targeting.

Approaphing a strategic global marketing which executes at the locl level creates new challanges in the analysis and the maketing decisions that the management has to take. Besides, the available resources, which are always limited and in many cases almost insufficient, require decisions of identification of the best opportunities, such as: How can be identified the areas that deserve a significant investment effort and those that have to be avoided? The demographical information often helps, but in many situations these are hard to access and moreover hard to corelate and process. The geo-informatic solutions for geomarketing focus on the following aspects:

The marketing on the Internet and the geo-marketing emphasise on the marketing that appeals to specific behaviors and interests, rather than an undefined marketing from geographical point of view. The online marketing as well as the classic one segment the targets function of age, sex, geopraphical location and other general factors, including the activity and the geolocation of the websites. (eg. a company that sells bicycles can display of the websites having as topic motocycles and light motocycles, so that the audience of these websites becomes interested in the products of the company).

2. Geomarketing budgets management

The geomarketing budget management is usualy the most unpleasant activity for the marketing people, because creativity and the capacity of quantitative and qualitative analysis are key points, very demanded and a must.

The necesities of business require keeping under control the most concrete aspect of the correct way, that is the quantitative aspect of the budget. At the intersection of these two qualitative and quantitative needs stays a *business intelligence* solution that allows a rapid access to structured financial information on a project basis and other relevalt dimensions such as:

- a) **Product position** compared to the competitors which means a good visibility ensured by a good position in the way of the potential clients.
- b) *Following advertising* campaigns (the TV audience levels) in detail, but also in a multi-year perspective. The management og advertising campaigns supposed correlating some activities that depend on more departments, among which can be found the Information technologies(IT) department. Marketing is the one that manages the concept and then the advertising campaign, the press releases, broadcasting the TV spots, the location of advertising. Next in line come the sales and merchandising that execute the campaign at the points of sales level, with a certain logistic that ensure dsitributing the products in the promotion to the points of sale.
- c) *Following the relationship* with the media, the articles that appeared supposes using multidimensional analysis instruments, because monitoring the press releases is for many agencies that offer PR services the biggest consumer of its main resource: the time of the PR team. The monitoring solutions, for the employees as well as for the company are represented by the instanteneous and in detail analysis possibilities (up to article and/or keyword level) or by searching and measuring on random criteria.
- d) *The instanteneous access* to the current sales results of the company (achieved versus budgeted and/or planned) as well as coordinating the sales activity supposes IT capabilities for sales directors. Spread-sheet applications (MS Excel) represent a convenient solution for many of the necesities of a sales coordinator, but as the number and structural variety of the sales team increases, these analysis become more and more bulky.

3. The comparative management of budgets

The structural variety, the internal and external manipulation stimuli for large volumes of information come from various sources, internal and external, with the purpose of elaborating models of the market segments or of the

comercial behavior, often suppose comparative approaches and analysis for following the rapid expansion that rises problems such as:

- a) **Simulation and forseeing** is ensures through IT for extrapolating and predicting results before the currently planed period is over, ensuring the sales management with additional means, of great value, for obtaining and overtaking planned results.
- b) *Complex analysis* based on answers to quantitative market researches, including following the evolution in time. The results of the market analysis, especially the quantitative ones, can bring information of a new quality, besides the expertise of the research agents, if the structured information obtained are re-analysed by the client with Business Intelligence(BI) tools.
- c) *Following a comparative analysis* of competitors, their adevertising movements on a daily basis, given that there is a strong correlation betwee the allocated budgets and the obtained results, and the careful monitoring of the activities of the competition is mandatory for BI solutions especially for ready-to-run applications.
- d) *Monitoring market prices*. The price is a key factor in any buying decision and the politics and te success can depend on the dynamics of the prices of an entity compared to those of the competitors. To achieve this a collecting and market prices analysis instrument is used, that can be in the same time flexible and intuitive, as for example diagrams based on tables.

4. Informatic solutions for e-management

Identifying development opportunities for businesses has moved in the virtual world. The management and marketing priciples in the real world find correspondent in *Cyberspace*. Thus the optimal sales locations suppose a good visibility. For achieving this goal one of the options is *localizing/hosting* on a proprietary server or using a service provider for hosting. For using service providers that host on a e-commerce platform, the interested companies in implementing a virtual shop can choose one of the following options:

- -Availability of a unique Web site, when the client owns a site and can have a unique Uniform Resource Location (URL). In this case, the transactions are off-line, but there is also the possibility of using the electronic email (email).
- -The existence of a unique page for presenting the virtual shop, when the client holds a single virtual shop on a single server of the host. The presentation page of the virtual shop has a unique URL and databases.
- -Mall, is the option corresponding to which the client has a couple of pages for presenting the virtual shops in a mall environment at the same URL address and databases.
- -Multihome, localizes several presentation pages for virtual shops on a server, each having its own URL address, databases and forms necessary for transactions etc.
- -On-site and server *product presentations* is characterized by the fact that the presentation pages for the virtual shops without databases are hosted in a multihome configuration with the transactions made on the host server of the trader. For transmitting information necessary for transactions in the same environment, but to separate servers of the host, creating these sites is achieved through a buy button.
- -Presenting off-site and server products for on-site transactions which hosts presentation pages for virtual shops without databases, which are outside the service provider, the transactions being done by a remote server of the host. These sites have a buy button that allows the product and the transaction information to be sent to the remote server of the host.

The actual management is confronted with a consumer that is more and more demanding and better informed (in this respect the forums, blogs, Linked-In networks etc, become to be more and more influent) which prefer communicating through a keyboard to other ways of interraction and which has developed a behavior of ignoring the huge number of new marketing messages with which he is daily bombarded and that is why the creation of new strategies for multiplying the interaction channels is required, that would include a complete solution of Customer Relationship management (CRM) type, with a strong means of Marketing Automation. Finding the "right channel", the one through which maximum results can be obtained from a certain category of potential clients, is very important. Identifying the optimal interaction means is a continuous "fine tunning" process, achieved on the basis of the colected feedback. The cost of using different communication channels (telephone calls, e-mails, promotional offers, SMSs, agencies, direct email etc) and the way in which the current or potential client is answering, are important parameters of the efficiency of the management activity.

These needs are usually transposed over the requirements and objectives of the informatics systems that traditionally can be divided in two categories: *functional requirements*, that describe what should the system do, and *non-functional requirements*, that describe the restrictions, the constraints to which the system is subjected. For example, a functional requirement for a website is the fact that it has to have a well defined virtual identity. A non-functional requirement could be the fact that any visitor in the pages of the website should be capable of answering quickly to a couple of question, such as: Where should be the pages of the site? What information is on this page? How did I get here? Where can I go from here? How can I come back where I was a few minutes ago? How can I

give up? What is new or specific? The correct answers to these questions lead to a return to the website and to transforming the simple visitor in a client.

In the modern informational society, the marketing activities are strongly connected to the computing power, starting from the simple activity of communicating through e-mail, of research of the seondary resources of the market (electronic journals, reports of the marketing research companies etc) of consulting the practices specific to current activities documented in the Intranet or the Extranet of the organization (for example the advertising through Internet, promoting the sites of the organization through search engines, filling the reports about the daily activities, auditing the sales, etc). Thus for the target user that navigates on Internet the marketing messages get to him directly, and this approach is used for the marketing of searches, where the advertisings are adapted to the keywords introduced by the user for searching.

5. The characteristics of the e-location in the e-commerce

Studying the location of the comerce companies can be achieved also by adapting the principles of location of the traditional commerce units to the specificty of the electronic commerce.

The *principle of interceptation* refers to the potential of a location to attract users that move from one site to another. This process supposes locating on a frequently visited domain, popular for Internet surfers (for example yahoo.com). Intercepting is based on two distinct elements, a "source" zone, from which the consumers are coming and a "destination" zone to which they move, any point between these two elements having the potential of becoming an intercepting point. In this respect promotional techniques are used that are specific to the electronic commerce by publishing the web address on printed promotional materials (id cards, papers with header), subscribing to search engines, using afiliated programs, banner comapnies etc.

The *principle of accesibility* in the traditional commerce looks for eliminating from the way of the consumers of any obstacle that could limit the traffic and the sales in the shop. The accesibility on e-commerce refers exclusively to technical aspects related to navigation possibilities of any user no matter what browser it employs, the resolution or the dimensions of the screen, the settings and capacities of the computer and eye troubles.

The *principle of cumulative attraction* refers to attracting consumers as a consequence of influences exerted by oher commercial units located nearby the sales point. In the case of electronic commerce, the cumulative attraction can be done by grouping in a common site of a couple of sales points and using the variants of Mall and Multihome for implanting shops. The cumulative attraction is tightly connected to the principles of interceptation, a virtual shop benefiting from the attraction created by other shops, as a result of hiperlins from zones with intense traffic.

The *principle of compatibility* refers to the degree in which two entities can interchange clients, as a result of common factors such as the complementarity of the traded idems or of the prices practiced and of the competitivity of the points of sale of the same type. In the electronic commerce the principle has in mind the compatibility of the suports and the technical systems used by the partnets at virtual transactions (seller – buyer).

Localized targeting (in the Internet marketing) and the geomarketing are methods for determining a geolocation (physical location) of visitors of a webside with the aid of the software for geolocation, and providing the content to visitors depending of their geographical location (country, region, state, city, postal code, organization, IP address, ISP, other criteria, as is done for example by the site FedEx.com). In the e-commerce the layout refers to design, to the formating of the web page, a process that unifies elements of content, graphic, links, navigation system and media elements, in whose design it is recommended to focus on the following principles:

- -establishing the *theme* of the site and designing the entry page;
- -conveying marketing messages representative for the company, products and their image, with an emphasis on professionalism, ethics, credibility, quality, emphasizing the advantages of the offer saving time, money and getting bonuses etc.
- *-personalizing* the site with *logos* and *graphical* elements specific to the choose theme, keeping in mind not to overload the site, which could annoy the user and stress his eyes;
- -maintaining the same style of presentation in all pages of the site, of a representative color for the traded brand or a color that would be considered pleasant by the user;
- -avoidance overloading with promotional messages, the optimum ratio between information content and advertising being 75/25;
- *-emphasizing* the site, together with the hyperlinks with *words* written in small letters that provide information for facilitating the navigation;
- -using a *pyramidal structure* of the contents: providing the principal aspects at the beginning and developing them; -organizing the contents in well delimited sections.

Taking into account the formatting of the web page, there is a strong relation of interdependence in the electronic commerce between design and layout.

One can choose from the following types of design: *simple design*, not personalized, consisting in free graphical elements; *classical design* – personalized, specific to the beneficiary image and for whose design it is necessary to use specific technologies; *special design* – created by using technologies like Macromedia Flash, Corel Draw, Adobe etc.

The presentation of the products in the electronic commerce sites can be achieved in the following ways:

- a) Developing a site in which are presented the products, without elaborating a large catalog, managed through a *database*, a situation in which *transactions* will have to be done *offline*.
- b) supposed presenting a catalog of products/services including technical and commercial descriptions, for which is necessary an indexing of the catalogs of products and providing them with graphical elements (animated graphics, sounds and multimedia spots), as well as establishing a Databases Management System (DBMS) which will manage the online or offline transactions. The most usual form of exposing products is on a simple HTML (XML) page. When the number of products and the frequency of purchases is high, more complex solutions are needed, which could be:
- -JavaScript or CGI (freeware or shareware), cheap solution, less dynamic, harder to install and maintain from the point of view of updates, with limited possibilities of displaying the products;
- -special packages of application offered by providers of web hosting that can provide complex reports for the follow up of the clients.

6. Extending the CIG solutions

The GIS business services can be used not only for geomarketing or in a direct advertising campaign, but it also completes the business plans with cartographic material and are used for controlling and the development of the sales and distribution network, of the chans of shops and the optimization of the sales forces. The applicability of the GIS solutions can be also noted in:

- -localization dynamic services (LDS asisence in choosing the travel routes, following transporter routes and the safety of automobiles);
- -insurances (during floods). Thus, of the majority of romanians would have an insurance for their goods, he insurance companies would use a specialized GIS for monitoring floods and for evaluating and adapting the payments of compensation of losses:
- -financial (studies of coverage area for banking companies, for placing the ATMs, for opening new branches);
- -geological offering scientists a strong nalysis tool of the terrestrial environment;
- -communications becoming almost a routine extension of GIS and the web technologies in the mobile media and in various other domains such as metheorology, military, agriculture, urban planning or ecology etc.

Conclusions:

- 1.Geoinformatic solutions are offering practical information specific to each market (for example in the farmaceutics, medicare, real estate etc) as well as in multidimensional analysis.
- 2.Integration of GIS of a company can bring a multitude of beneficies that can lead to the development of a competitive strategy in the efficient and practical analysis of data.
- 3. The results of GIS integration in business generates new perspectives for strategic decisions, market niches, strategic and operational marketing and in the activities of development and sales.

VULNERABILITY AND E-CRIMINALITY OF IT

Mareş Valerica

Economic Studies Academy of Bucharest Faculty of Accounting and Management Information Systems Piaţa Romană nr.6, sector 1, Bucharest, Romania maresvalerica@yahoo.com 0721906108

Mares Marius Daniel

SPIRU HARET University Faculty of Management, Finance and Accounting str. Ion Ghica, nr 13, sector 3, Bucharest, Romania maresmariusdaniel@yahoo.com 0722704696

The development of an informational society requires consolidating trust in information and communication technology (ICT), the protection of personal data and of the right to a private life, but also promoting a world and national unification of the informatic safety in the context of a growing dependence on ICT of societies throughout the world, which become vulnerable to e-criminality. The development, difusion and the consequences of computers are a part of a larger context – the one of informational society and of the era of knowledge.

Keywords: informational society, information and communication technology, informatic safety, vulnerable to e-criminality, knowledge

Jel classification: L86, D80, K20

Introduction:

Communication is natural to human beings and differenciates us from the rest of animals and so everywhere in companies, organizations, agencies and at home, communication increases in breath, intensity and frequency of utilization, under a number of forms.

Together with the intesifying of communication, unsolicited communication also intensifies, bringing a harming content or phishing attacks, transforming communication from challange into an impossible mission. Internet, which is is the informational "network of networks" that unites a couple of thousand networks of different ranks which come from tens of countries of the world, is strongly affected. Despite the fact that Internet is a virtual network, which combines a growing number of interconnected *Local Area Networks or LANs* – public and private, *Wide Area Networks* or WANs, regional and national networks. Internet is the largest quarter of *Cyberspace* and provides the users with several major services: *World Wide Web, Electronic Mail, Messenger, Usernet, Internet Relay Chat* etc, and this diversity of communication makes it vulnerable.

By definition vulnerability represents that state of exposing a valuable thing to a particulat threat, for example a PC disconnected from Internet is not vulnerable to an Internet Worm. The threats represent a sum of unpleasant events that can cause losses to a firm's values. We can include here a list of natural threats as fires, floods, earthquakes, but also human intentional threats as hackers and the inevitable human errors.

Nowadays threats change continuously in form and the mechanisms and security solutions that have to protext the users againsts spam of many kinds, phishing, makware, viruses and even against concertated attacks against the email servers. Few technologies are capable of providing protection against all these phenomena, that continue to grow. Thus, in december 2007, a study was showing that 80% of all e-mails were spam, while 84% of respondends were recognizinf that they had viruses sent by email.

It is well known that, through the services it provides, Internet has brought and brings many advantages to scientific research, education, administration, business, inter-human communication, but in the same time it was and is exposed to dangers that reside in the fact that the network, miraculous through the benefits it provides to man, also represents a media that is extremely favorable to those who commit indesirable social acts, acts that can spread from terorist acts to sexual harrasment or spreading pornographic images. By connecting to this network with a computer (on which was installed an adequate software program) and a modem, through a simple telephone line or cable, any individual can be one *click* distance from a crime. Those who are interested in it, acting relatively anonimously, haven't hesitated to make this small step. More precisely, many criminals from the most diverse types and ranks have immediatel "moved" their business on the virgin territory of Internet, succeeding to become, in a very short time, more efficient than ever in comitting socially dangerous acts. Many companies don't have the capacity to adapt to these attacks by using solutions that are hard to update or by rigid procedures.

1. Exchanges of information. Opportunity and risk

Any organization is confronted with the necesity of achieving a good mnagement of resources: material, human and infromational. In more and more activity sectors, informatization and the existence of computer networks which manage great part of their activity, allow executing economic and financial operation (for example electronic payment systems) that have seen a spectacular development.

The importance of data processed with the aid of the personal computer can transform security in a key element. Security is the junction of four poles of divergent interests: the *decident responsibles*, the *techniciens* that serve the system, the *users* that use it and the audit which controls. We can note that the lack of security is the fruit of lack of

interaction and common reflexion between parts. In our country, at least theoretically, many companies wish for a strong and easy to control security of the "accounting and financial area".

The exchange of accounting and financial information, by using new technologies, can be done relatively easily, but there will have to be a proof of quality and of the degree of protection ensured. The lack of concern for information security will lead to major risks and disfunctionalities. Companies with a reduced financial strength can be taken out of the market by a security event. The lack of an informatics system can lead to a temporary halt of the business which implies stopping sales and thus it leads to losses. Here we can raise a couple of questions: "By improving the informatics accounting, is there also an increase in its insecurity?" "What risks are due to new technologies and what are due to financial and accounting information itself?" "What is the connection between the quality of the informatics security and that of the financial and accounting information and the accounting segment in general?"

Any modern entity incorporates *Informatics and Communication Resources* that include all devices of printing, display, storage and all the activities associated to the computer that imply using any device capable of receiving email, navigating on Web, in other words, capable of transmitting, storing, administering electronic data, including but not limited to: mainframes, servers, personal computers, notebooks, pocket books, *Personal Digital Assistant* – PDA, pagers, distributed processing units, laboratory and medical equipment connected to the network, telephones, facsimile, printers and other accessories that have to be managed and securitized. To these can be added the procedures, the facilities of the programs, the data that are designed, constructed, made operational and maintained in order to create, collect, register, process, store, receive, display and transmit information necessary to the internal and external media entities.

The risk represents the intersection between threat and vulnerability and can originate from the internal and external media. The external risks of the organization impend the activity and are related to:

- -political risks (conflicts, alliances etc);
- -financial and economic risks (prices, inflation, stock market);
- -informatics and techno logics risks;
- -risk products (medicines, automobiles);
- -new frauds;
- -blocking of communication ways;
- -epidemics and epizootics;
- -natural hazards (floods, storms, heavy snows, earthquakes) etc.

The attempt to quantify the risk is a challenging and interesting task. In the majority of the cases, the risk is associated with the effective costs of acquisition, maintenance and development of the protection mechanisms. Most representations of risk use:

- -Annual rate of occurrence this represents the number of times in a year a treat can occur. It is achieved by reporting estimates over a past period, taking into account the improvements to the system.
 - -The probability of a loss represents the sum that an organization looses when a disaster occurs.

Movement of criminal "businesses" to the Internet ground did not occur randomly, but from reasons as pragmatic as possible, which take into account that this world network has at least three important advantages:

- -Distance removal.
- -Minimal costs.
- -An "anonymous".

Unfortunately, all the domains of the Internet, so beneficial for the majority of honest users of this informational network, are at the same time some of the most profitable infractional fields for those interested to use them for other purposes. Nowadays, when the minimal technical means and financial expenses are extremely low, any user can connect to Internet in order to access a series of databases from around the world, we can expect at any time that a person with evil intentions of a psychically ill person, from anywhere on the globe, to cause immense damage to individuals, communities or even states situated at tens of thousands of kilometers away. Specialists estimate that "the terrorist of tomorrow will be able to cause more damage with a keyboard than with a bomb". It is more and more evident that, nowadays terrorist groups use informational technology to achieve their subversive purposes.

Electronic attacks through viruses and "informatics bombs" created by informatics pirates reconverted to the economic warfare or to manipulating the stock exchanges and destructive sabotage represent major dangers for informatics systems.

In the current conditions, when there is a large number of databases which grace to the Internet can be consulted from any part of the world, informatics spying widens and diversifies. Information threat is a concern for many companies from various fields. Commercial information, as are the lists of products, prices, clients, providers, product promoting methods. Fabrication methodologies, personnel training methodologies, know-how, inventions that are on the way to be patented or marketing studies, are among the most exposed to criminals.

2. Security of information systems and e-criminality

The impressive development of technology led to an increase in profts, on the one side, and to an increase in dangers and fearfulness on the other side. As the electronic media become more accesible to the general public, the informatic criminality is developed and diversified, becoming more than traditional fraud or falsification. On Internet, information became the cheapest weapon in the world, but the problem of its security gives headaches to the world's powers, as on Internet every computer is like a leaf of a tree and the network components are like branches. It is enough to cut a branch and its result is equivalent to cutting the leaf.

The sofisticated world of the informatic systems is extremely alluring being a digital world where are possible electronic businesses, efficient documentation over Internet, distance learning, instanteneous communications, but apart from that the information technology is not lacking in risks – one of the most important being the **e-criminality**.

The notion of informatics criminality is now more than the traditional definition referring to criminality against informatics systems, and also includes most crimes that can be done over the Internet using information systems. Informatics criminality has a very high price in economic terms as well as from a human security perspective.

Before the age of developing informational technologies, the main concern in regard to informatics data was keeping their confidentiality, something that could not be achieved by simply protecting them physically (for example, by locking them with a key in the rooms were information was being stored).

Nowadays, along with the confidentiality there are the important aspects of security of the IT that have become a complex and concerning problem for all organization types, being in the same time a legal requirement. In order to ensure the security of the IT and of the personal data, the authorities and public institutions with competences in the field, the service providers, nongovernmental organizations and other representatives of the civil society have common activities and programs in order to prevent e-criminality.

Criminals can launch massive attacks with informatics viruses against telecommunication networks for defense, electric power, gas and water or against the systems for traffic control for aeronautic, naval and terrestrial industries, against informatics systems of banks, stock exchanges, insurance societies, that can disturb the activities in these fields.

The security requests of the informatics systems are based on a number of operational and integration, legal, social, moral and human aspects with other informatics systems. Informatics criminality can have severe consequences that can extend to heavy financial and reputation losses that also come together with the security events, and in these conditions the security management of the informatics systems becomes extremely important.

In respect to criminality in the field of data networks, especially Internet, one can distinguish the infractionality that aims at paralyzing the entire system or a part of it or a structure that works with it, through virus programs or attack of the type *Denial of Service*(DoS).

The age in which hackers wanted to prove their programming abilities has passed. Meanwhile they discovered opportunities to make profit over Internet, as through Phishing. There are numerous traps through which criminals can get rich in the virtual space, as by cloning the sites of banks, when the client receives an e-mail in which it is required to enter on the site of the so called bank, the account data, the username, the password and the secret access codes, and all the thief have to do is to empty the account. According to the estimates of the Organization for Security and Cooperation in Europe (OSCE), the informatics criminality produces an annual loss of 100 billion dollars. The German association of the commercial society claims that in Germany, in 2007, the total value of the damage amounted to 13 billion euro. Other studies say that e-criminality has become even more profitable than drug traffic. The international authorities for legal pursuits have identified three regions in the world from which come the majority of the trap e-mails: Russia, China in Brazil, areas in which the illegal businesses flourish. The interest of the hackers is mainly focused on the passwords of top-managers, in order to obtain extremely valuable information.

In the current crisis conditions it is to be noted that e-criminality is done more frequently through:

- -a larger number of viruses, worms and trojans that attack computer networks;
- -sending by email of false deduction coupons in the name of well known companies;
- -an intensification of attacks caused by spyware, scanning ports, informatics sabotages, pornography, computer thrift (desktop and mobile), abuses of employees;
- -an increased incidence of attacks from within organizations;
- -attacks executed from outside that are aimed at countries like: USA, China, Russia, Nigeria, South Korea, Germany and India.

More and more attacks are done through zombie computers grouped in networks called botnet through which criminals' pirate computers, without the knowledge of the owners of the computers and use them for sending spam or for destroying other computers. Programs can be distributed in different ways, one of them being as attachment to e-mail or downloads from certain sites.

Few technologies can provide protection against all these phenomena that continue to increase (e.g. in December 2007 approximately 65% of all e-mails were spam) and a solution is being searched which would solve the current

challenges. The concept of Unified Threat Management (UTM) offers a global approach to the problem of the security of IT, by protecting the clients against attacks of versions types as:

- -scanning IP Reputation;
- -antispam based on patterns of messages;
- -white lists and blacklists;
- -antivirus based on signatures of families of viruses;
- -protection against "zero-hour outbreaks";
- -intrusions prevention systems at the e-mail level.

The informatics criminality does not comprise only spam and viruses, it can also strike other aspects of the economic and social life. There have been cases when the adepts of different terrorist organizations, on certain occasions, as the success of some of their actions, build site of sympathy for such groups, presenting details for preparing them and congratulating the courage and the mastership of terrorists as if it was a game. Other sites provide updated information for creating bombs or instructions for manipulating explosive substances.

Another category of terrorist activities over Internet is the dissemination of messages of hate and incitation to violence through the Web pages and unfortunately things don't stop at such activities, which in most cases are a precursor of real terrorist actions and can get to incitation to attack and finally to organize grave criminal acts. Criminal organizations have converted with an amazing speed to the most sophisticated technologies and they use encrypted software for communicating over Internet with a high degree of security. Network is a formidable means also for organized bands that deal with drugs and arms traffic, as well as medicines, with washing black money etc, because these bands understood that Internet is an ideal communication means, cheap, fast and pretty secure when using encryption software.

In many countries of the world, displaying and distributing obscene materials in public is against the law. There is no doubt that Internet, through its open nature, has become such a place. Thus, performing such activities through a mega-network, is most of the times prone to breaking the law. Nevertheless locations that contain materials for adults are very numerous and the growing number of these sites and the negative impact of disseminating obscene materials, of popularizing child pornography on Internet have led to an increasing concern of the public opinion regarding the multiplication of such an activity over the network. The fact that deviant behavior has moved their place of action does not change their criminal nature.

Apart from the older forms of e-criminality related to Internet, there are also some new ones like: "offers for adoption" that cover selling of children or organs for transplant.

Despite the sustained efforts of a company to protect its clients, a growing number of users of the Internet have lost their faith in the efficiency of the security methods and that's why a new culture of security is required in the contemporary society.

Pirating computer software represents another form of criminality related to Internet. It is achieved by downloading programs spread over the Internet, on a computer, when this operation is not authorized by the titular of the author rights.

3. Investigating e-criminality

The investigation of e-criminality has a series of particularities that differentiates it fundamentally from other types of investigation due to its nature that supposes using scientific and certified instruments for insurance, collection, validation, identification, analysis, interpretation, documentation and presentation of digital probes, obtained from informatics sources, used in order to facilitate discovering the truth.

The investigation of e-criminality has to have a series of specific characteristics necessary for ensuring a high degree of correctness:

- -authentication (proof of the source of the probes);
- -credibility (lack of doubts concerning credibility and solidity of the probes);
- -completeness (acquiring all existing probes and keeping their integrity);
- -certitude;
- -lack of interferences and of contamination of probes as a result of the investigation or of the probe management.

In the process of e-criminality investigations, the following steps will be followed:

- 1. Identification of the incident supposes recognition of the incident and determining its type.
- 2. Preparing the investigation which supposes preparing of the instruments, verification of procedures, obtaining documents that allow the inquisition.
- 3. Formulating a strategy of approach function of the involved technology and of the possible consequences for the people and institutions involved. The aim of formulating this strategy is to maximize the potential of obtaining relevant probes, while minimizing the negative impact on the victim.
- 4. Insuring the probes isolating, insuring and storing digital or physical probes.
- 5. Collecting probes recording the physical ambiance and copying of the digital probes, by using specific practices and procedures.

- 6. Examination of probes that suppose a deep visualization of the probes in order to search for elements that are connected to the respective offence. This supposes localizing and identification of probes as well as the documentation of each step in order to facilitate the analysis.
- 7. The analysis of probes by determining the significance of probes and drawing the conclusions related to the incriminated offence.
- 8. Inquiring the victims and the offenders.
- 9. Presenting the probes drawing the conclusions and presenting them in an intelligible way for no specialists. This synthesis has to be accompanied by a detailed technical documentation.
- 10. Returning the probes returning the objects retained during the investigations to their owners or in some cases confiscating those objects.
- 11. Advertising the crime in order to intimidate future offenders.

Informatics crime investigations can be helped by certain institutions, national and international organizations, associations and private persons.

There is the concern that hackers will go further and will modify price lists, juridical texts or even scientific research results, which would have grave consequences. Nevertheless as there is no security system entirely secure, it is recommended to be aware of the risks that exist when running a business that uses informatics systems

Conclusions:

- 1. Internet was and is subject to dangers that originate in this network which apart from advantages also represents an external media favorable for those who commit social and economic offences.
- 2. In order to increase informatics safety, to reduce to a minimum the use of services for illegal purposes and to consolidate trust in informational technology, it is essential that the Internet service providers and the authorities that supervise the application of law to cooperate efficiently, taking into account the role of each party, the cost of the cooperation and the rights of the citizens, until an Internet traffic laws system of legal system is created. Thus, people will be concerned not only with the correct use and the continuous development in the domain of informational technology and Internet, but also to establish the legal framework in which the interactions will take place.
- 3. Informatics criminality is a phenomenon that negatively affects the international image of a country.

IMPROVING THE QUALITY OF THE DECISION MAKING BY USING BUSINESS INTELLIGENCE SOLUTIONS

Maria Dan Stefan

Academy of Economic Studies, Faculty of Accounting and Management Information Systems, Uverturii Street, no. 43, bl. 1, ap. 35, district 6, Bucharest, e-mail: danstefanmaria@gmail.com, Phone: 0722684069

On the basis of the decision making stands information, as one of the main elements that determine the evolution of our-days society. As a consequence, data analysis tends to become a priority in the activity of an organization for decision making. The diversity and the dynamic evolution of tools and technologies from Business Intelligence category, represent a positive factor, with a decisive role, in the evolution of decision making systems and implicit in increasing quality of decisions. For an organization, Business Intelligence technologies are strong and complex tools for analysis, reporting and prognosis in which the core is data warehouse. This paper aims to highlight the essential role of Business Intelligence in order to increase the quality of decisions, in the context of using data warehouses, and the main areas where Business Intelligence solutions offered by Microsoft SQL Server 2008 can be applied successfully.

Keywords: Business Intelligence, Data Warehouse, decision making, SQL Server.

The article's JEL code: M15

Introduction

Nowadays, on business market, data analyze is a fundamental request for taking decisions in order to obtain performance. Gross information, which in many cases presumes a large volume of data, is not very useful because of the impossibility to make detailed and efficient analyses. Things can change when we talk about synthesized and grouped information that offer a better support for data analyses and decision, a must condition for performing an efficient management.

Usually, to make decisions, organizations must access at the right moment exact and complete information, from various domains of activity, in the right format for the specific purpose, but the operational systems are not the adequate environment for obtaining all this information. Essentially, this type of support is known as Business Intelligence (BI), and the technologies for this support depend on a complex and powerful entity known as data warehouse.

In accordance with information technologies evolution, advantageous regarding the quality and the price, Microsoft SQL Server 2008 solutions are capable to respond to complex data analyses, including advanced Business Intelligence technologies.

1. Business Intelligence

The term of Business Intelligence was introduced by Gartner Group in the middle '90s. As a concept, Business Intelligence existed for a long time before, from the '70s, when it was used in reporting systems using mainframes. In that period, the reporting systems were statically, bi-dimensional and having no analytical capabilities⁶⁰⁴.

Development of Business Intelligence systems type was determined by requests of dynamic multidimensional systems able to support the intelligence decisional processes and having predictable abilities. These systems became more and more complex, performing multidimensional analyses of data, having statistical and predictive analyses capabilities in order to serve better for decisions analyses.

Business Intelligence systems have an architecture composed from a collection of applications and integrated operational databases, and from decisions assisting systems that facilitates access to data. Decision assisting systems supports, in a business, several activity sectors, including multidimensional analyses, data mining, prediction capability, business analyze, query facilities, reporting and graphical representation, geospatial analyze knowledge management and more⁶⁰⁵.

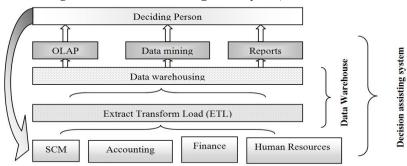

BI presumes rise of business performances in an organization. Electronically extracting, stocking, transforming and using of data necessary for business represent laborious activities that presumes complex and adapted to business purpose infrastructures and information applications.

Business Intelligence is an iterative process: it starts from the operational medium from where the data are extracted and deposited in data warehouses; then the deciding person uses decision assisting systems to extract data from the data warehouse. Detaining this information, a deciding person can create action plans. The change of the operational information level induces to a new iteration of Business Intelligence cycle. The cycle is represented in the following figure:

⁶⁰⁴ Zaman, M., Business Intelligence: Its Ins and Outs, 2005.

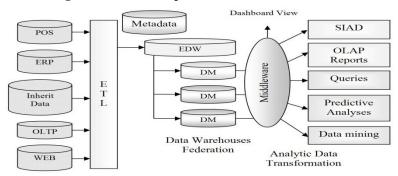

⁶⁰⁵ Moss, L.T. and Atre, S. Business Intelligence Roadmap: The Complete Project Lifecycle for Decision-Support Applications, Addison Wesley, Boston, 2003.

Figure 1. Business Intelligence Cycle (Source: Giovinazzo, 2002: 6)

Collecting data and analyzing them were and still are considered by companies as a fundamental activity for long term strategic planning. Before the information technology era, making decision process was based mainly on estimation and on empirical approximation practices. But companies turn their attention towards information administration systems for detailed data analyses trying to obtain a considerable advantage on market, compare with the competition. The structure of an information system dedicated to Business Intelligence is presented in the following figure:

Figure 2. Basic components of a BI dedicated information systems

Business Intelligence data sources are formed from operational data bases, including inherited (OLTP), external Web documents, sale point - POS (Point Of Sale), data from the supply chain from the enterprise resources planning – ERP. Data from these sources are loaded in data warehouses by an ETL application (extracting, transforming and loading).

Data warehouses federation is made of data warehouses of enterprise type EDW (Enterprise Data Warehouse), metadata, data shields – DM (Data Marts) for various administrative domains of the organization (marketing, management, finance, accounting, and so on).

The final component of a BI process is design for business performance management (BPM), to corporate performance management (CPM). This component is based on score methodology of type "balanced scorecard" that represent a work frame destined to define, implement and management business strategy for an organization thought binding objectives to practical measures. So, there are connected top level indicators like financial information with actual performance indicators regarding the low-levels of the economic organization.

The main objective of BPM is to optimize the global performance of the economic organization. BPM works usually with dashboard that insure a global view of company performances with suggestive graphic presentations. The dashboard presents the economic organization performances, trends, exceptions and integrates information from various business domains.

2. Data Warehouses

The data warehouse is considered the "hart" of the Business Intelligence and is based on combining data from several or even all business systems. Data warehouses are a product of a more competitive, globalised, dynamic and complex economic medium in which the organization is activating and that has needs for relevant, actual information in a consistent and very flexible manner for the decision fundament process.

From methodological perspective, data warehouses represent a branch of information systems applied in the domain of decision assistance information systems, as SIAD or DSS, which insure: complex management of business and access from outside, in an efficient and opportune mode, of information and knowledge needed for businesses.

Data warehouse is a conglomerate of data special produced to support management decision making for business performance. Data warehouse contains historical and current data with potential interest for managers inside de

organization. Usually, data are structured to be available any time for online analytic transformation activities (OLAP), Data Mining, queries, reports, other applications that allows obtaining results for decision making⁶⁰⁶.

Data warehouses are a unification of operational data, special structured for queries and analyses and represent the "vertical bone structure" of decision assisting systems based on data synthesize and analyses, or in other words, data warehouses contain the "raw materials" for decision assisting systems based on data synthesize and analyses allowing managers to take correct fundament decisions⁶⁰⁷.

Most of the projects dedicated for assisting the managerial decision are based on the new technologies Data Warehouse. OLAP technologies imposed themselves as frequently utilized solutions for data analyze, and the multidimensional analyze concept, together with the new methods of exploring data (data mining) gained step by step more terrain in assisting businessmen decisions.

Online Analytical Processing (OLAP) is a technology for aggregate the data stocked in data warehouses in a multidimensional manner with facilities regarding information access for managers in an interactive and facile way. The link between OLAP and data warehouses is that OLAP transforms the huge volume of data stocked and managed in the data warehouses in information useful for the decisional process.

Applications that uses these technologies are based on rapid analyze of multidimensional data dispersed in multiple locations but with access for a large number of users. For using these facilities, OLAP rely on the efficiency of multidimensional data bases and on the possibility of building alternatives for diverse decisional problems. OLAP solutions are based on the principal of data restructuration in a multidimensional format known as a hypercube. Basic notions of the hypercube are: dimension, attribute, hierarchy, facts tables, and dimension tables.

Data Mining technologies have various applicability domains. So, in risk analyses, it can be establish profiles adapted to the organization in difficulty, while in commercial domain is possible to put in evidence characteristics of a certain type of costumers or of existing trends on a market segment in a specific situation.

Through the data mining technology there are transformed data that refer to previous periods (historical data), that are examined and are already known, based on which is build a model or a template that can be applied to the new situations of the same type with the already known ones. The specialists in the field of data warehouses consider the data mining instruments as a evaluate form of OLAP instruments.

The Data Mining concept define the process of discovery the knowledge models and / or utile information from a large quantity of data, which are collected and stocked in various types of data warehouses, in order to use them as fundament for managerial decision on all the competence levels inside an organization. As a fundamental difference from the OLAP instruments, it must be said that while the usage of those is based on initiative or intuition of the decision factor to establish the aspects subject to analyze, data mining technologies have the role to realize automated observation over data without an explicit intervention from user.

2.1. Data warehouse characteristics

Data warehouse is an integrated, timeless, historical and persistent, subject oriented data collection for supporting the process of fundament a managerial decision, from where result the main characteristics of a data warehouse, which are: **Subject oriented, Integration, Non-volatility and Time orientation**⁶⁰⁸.

2.2. Data warehouse objectives

The main objectives that must by follow in order to make a data warehouse are as follows:

- *support in decision assistance:* data warehouse must contain data that will assist management of any level in the decisional process;
- fast and facile access to information: the access must be realized in the shortest time possible, to any request and to be a performing one;
 - data consistency: data warehouse must offer the certainty that data are correct;
- flexibility and adaptability: data warehouse must be built so to be capable to answer quickly and correct to the always changing informational needs of the users;
- *confidentiality*: data warehouses stock information critical for enterprise activity, information that must be available only to the right persons;
- acceptance: users of data warehouses must trust the information received from exploitation of data warehouse.

3. Business Intelligence solutions offered by Microsoft SQL Server 2008

The Business Intelligence solutions can be used with success in:

⁶⁰⁶ Turban, E., Aronson, J.E., Liang, T.P. and Sharda, R., Decision Support and Business Intelligence Systems, 8th edition, Prentice Hall, New Jersev, 2007.

⁶⁰⁷ Kimball, R., The Data Warehouse Toolkit: Practical Techniques for Building Dimensional Data Warehouses, Wiley & Sons, New York, 1996.

⁶⁰⁸ Inmon, W.H., Building the Data Warehouse, 4th Edition, Wiley & Sons, New York, 2005.

- marketing analysis demographical analysis using information regarding clients and sales data, price sensibility, preferences regarding the products. Using this information the marketing campaigns can be better planed and their effect can be measured;
- sales analysis identify the tendencies, seasonal analysis, and links between the products. Using this information, sales objectives can be set and it can be measured the progress regarding these objectives;
- *analysis for distribution chain (retail)* data analysis regarding the orders in the distribution networks, delivery analysis, stocks analysis. As a result, it will be possible to plan better the stocks, the price promotions for certain products and the delivery calendar;
- balanced scorecard there are defined performances indicators, calculated using the information in the existing systems. This way, it can be watched the company performance on its whole or the performances of some groups relative to others that are similar;
- financial analysis profitability analysis on departments, category of products, geographical locations, seasons. A particular case is represented by the financial institutions banks, insurance companies where the financial analysis plays a key role in the activity progress: define the services packages, portfolios analysis, and so on;
 - budget planning variances analysis, planning the following fiscal year.
- *support centers and client relations* analyze the incidents with the clients, analyze the success rate for the telemarketing companies;
- geospatial analysis combines the geographical and demographical information to identify the tendencies;
 - analyze in the projects management analyze the resources allocation, analyze the project portfolios.

A Business Intelligence solution, optimal from the quality-price point of view, used in decision making is Microsoft SQL Server 2008, due to its performances in managing a large volume of data and to the facilities for reporting and multidimensional analyze, available using its components. Microsoft SQL Server 2008 offers to the users an extended set of tools that can be classified in the following categories, according to their functions:

- support for client-server environment;
- specific facilities for data storage in warehouses and multidimensional databases;
- tools for OLAP and Data Mining multidimensional analysis;
- tools to transform and import/export data;
- integrated security, configurable and easy to use;
- tools for data advanced presentation and reporting.

For the development of application for decision making, Microsoft offers Business Intelligence Development Studio, a development environment built on the productive framework of the development system Microsoft Visual Studio, which incorporates debugging facilities, together with a favorable environment for building cubs, reports, extracts, transformation and package load (ETL).

Conclusions

Considering the present evolution of information technologies and of the tools related to them, as well as the importance of information, which represents one of the most important resources of an organization, I underlined the essential role of Business Intelligence solutions, in the context of using data warehouses, in increasing the quality of the decision making in order to obtain business performance.

At the end of the paper I emphasized the main areas in which Business Intelligence solutions offered by Microsoft SQL Server 2008 are successfully used.

More and more organizations use Business Intelligence solutions and are aware of the utility of information, knowledge and models that can be obtained from data warehouses and used in the decision making process to increase the business performance. In the future, these Business Intelligence solutions will represent a common, and in the same time vital, resource for business continuity.

It remains to see how it will be assured the access to data, given that the organizations that will have important information on the business market will make opportune decisions and will obtain business success.

A COLLABORATIVE PERSPECTIVE OF CRM

Mărginean Nicolae

Bogdan-Vodă University, Faculty of Economics, Cluj-Napoca, Spinoasa 14 street, e-mail: nicolae1976@yahoo.com, telef: 0745/318321

Today, companies are becoming more customer focused, trying to adapt their business systems in order to be more responsive to the ever-changing needs of customers. CRM software gives a new face to the relationship with the customer, using the new technology. We propose to include a collaborative component in CRM, a multi-agent system that will automate and optimize some tasks specific to a CRM. We will use the ontologies to store the knowledge about our domain of interest: relationship with customers. These ontologies will be incorporated in the website of the organization and within all websites of the customer. So, handling the ontologies, agents' community will change information between organization and customers in an automatic manner, in order to support all activities implied in the relationship with customers.

Keywords: ontology, software agents, collaborative, website, CRM, OAA, OWL, facilitator

Cod JEL: M15

Introduction

Nowadays, IT&C support all activities of the business. Therefore, e-business technology enables companies to link their IT systems in an efficiently and flexible manner, being closer to business partners in order to better satisfy their needs and expectations. Among the business partners there are the customers. Because companies try to increase their revenues and because these revenues are the result of the business relationships with customers, today, companies are becoming more customer focused, trying to adapt their business systems in order to be more responsive to the ever-changing needs of customers. CRM software gives a new face to the relationship with the customer, using the new technology.

Customer Relationship Management

In accordance with [Fotache, 2004], Customer Relationship Management (CRM) is an integrated sales, marketing and service strategy who can help organizations to manage better customers' relationships. On the same idea, [Pulevska, 2008] says that CRM integrates sales, marketing and service strategies in order to optimize the customer benefits and relationships at long sight. Also, CRM technology is used to learn more about customers' needs and behavior in order to develop stronger relationship with them. CRM software supports all the previous ideas, allowing to the employees from the company departments to share and access pertinent information about customers (like products owned, prior support calls and so on) and their interactions. Interactions with the customers are generally stored in a customer contact histories, in a database format. Using this database, it is eliminated the need to obtain information directly from the customer.

As you see in the Figure 1, in the architecture of a CRM, between customers and database, we propose to include a collaborative component, a multi-agent system that will automate and optimize some tasks specific to a CRM.

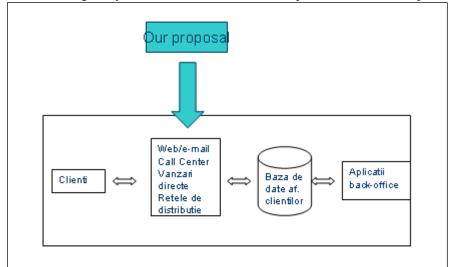

Figure 1 A simplified architecture of CRM + our proposal⁶⁰⁹

_

⁶⁰⁹ adapted from Fotache D, Hurbean L, "Solutii informatice integrate pentru gestiunea afacerilor-ERP", Ed. Economica, Bucuresti, 2004, pag. 103

The architecture of the proposed component = OAA agents + OWL ontologies

We have developed our component using Open Agent Architecture, a framework developed at the Artificial Intelligence Center of SRI International, an environment that allows creation of a flexible and dynamic community of software agents, providing a mean for integrating heterogeneous applications in a distributed infrastructure.

We have chosen it due to its facilities for agent interaction based on delegation to a special agent named facilitator. This agent coordinates the agent community allowing parallel execution, error treatment, detection of conflicts that can occur in problem solving and so on. Also, the facilitator provides a global data store for its client agents, which allows them to adopt a blackboard style of interaction. A system configuration is not limited to a single facilitator. The facilitator maintains a knowledge base that contains all the capabilities of the agents' community [Martin, OAA].

The client agents are usually specialized in providing a set of services and acts as a client of some facilitators. These services are named the capabilities of a certain agent. The declarations of the capabilities are referred as solvables. It is distinguished two types of solvables: procedure solvables and data solvables. A procedure solvable represents a procedure that acts in some manner whereas a data solvable offer a connection to a collection of data. A procedure solvable is handled by a declared handler whereas this is not necessary for a data solvable. Data solvables represent a dynamic collection of facts, which may be modified at runtime.

All the client agents inform its facilitator about the services they can provide. When is needed a service of a certain client agent, the facilitator send a request to it, expressed in ICL. The agent takes the message, parses it, processes it using his capabilities, and returns an answer to the facilitator [Martin, OAA].

When a client agent requests a services offered by the agents community, it send an ICL message to the parent facilitator in order to solve his requirement. With other words, the agent delegates his task to its facilitator. Thus, is not necessary to specify an particular agent to handle the call, the facilitator controls that aspect, obtaining the response to his requirements.

In OAA, the agents can be developed using many languages as Prolog, C, Java, Visual Basic and so on. Every developed agent must incorporate in his code an agent library. For all reminded language is available a specific library.

Also, OAA provides a mechanism of triggering some actions or procedures when some set of conditions is met. Thus, using triggers, each agent can monitor either locally or remotely some events that can appear at its facilitator or peer agents.

We will use the ontologies to store the knowledge about our domain of interest: relationship with customers. We will use OWL because allows us to publish and share ontologies in the WEB. It has a XML-based syntax, is an extension of RDF Schema, using the RDF meaning of classes and properties, having incorporated many primitives to support the richer expressiveness. All the concepts of the domain, the relationship between them and their instances will be located in the ontology. The knowledge of the system will be represented using OWL ontologies because it can be incorporated in websites, so that web resources becoming more accessible to automated processes achieved by the agents.

In accordance with [Horridge, 2009], OWL is a language for defining and instantiating WEB ontology. The main components of OWL ontology are classes, properties and the individuals. Individuals, also known as instances, represent objects in the domain in which we are interested. The links between individuals or relationship between them are named properties. There are many types of property:

-Object properties are relationships between two individuals. Object property may have a domain and a range specified. Properties link individuals from the domain to individual from the range. Also, there are many types of object property. If some property links individual "a" to individual "b", then inverse property links individual "b" to individual "a". If a property is functional, for a given individual, there can be at most individual that is related to the individual via the property. If a property is transitive, and the property relates individual "a" to individual "b", and also individual "b" to individual "c", then we can infer that individual "a" is related to individual "b" is related to individual "a" to individual "a". A property P is reflexive when the property relates individual "a" to itself. If a property is irreflexive, and individual "a" is related to individual "a" and individual "b" are not the same.

- -Datatype property links an individual to the data values.
- -Annotation properties are used to add information to all components of ontology (classes, individuals, properties).

The classes are concrete representations of the diverse concepts and describe all conditions that must be satisfied by a set of individuals that will become the member of the class. Classes are organized in the form of superclass-subclass hierarchies, named taxonomies. It must note that some classes may be disjoint, so that an individual cannot be an instance of more than one of these classes.

One way to describe a class is to define it as a subclass of the existent classes. Another way to describe a class is represented by the restrictions. It can be distinguished three main categories: quantifier restriction, cardinality

restriction and "has Value" restriction. Quantifier description can be divided in existential restrictions and universal restrictions. Existential restriction describes a class of individuals that have at least one relationship among a specified property to an individual that is a member of a specified class. Universal restriction constrains the relationship along a given property to individual that are members of a specific class.

Regarding cardinality restriction, it can be distinguished a minimum cardinality, a maximum cardinality and a specified cardinality.

A hasValue restriction describes the set of individuals that have at least one relationship along a specified property to a specific individual.

OWL ontology is processed by a reasoner and offers the next services: testing whether or not one class is a subclass of another class, the building the inferred ontology class hierarchy and the verifying the consistency checking of a class.

Also, one class may be obtained through applying intersection, union or complement operators against the existent classes. The same OWL allows classes to be defined by listing the individuals that are the member of the class.

A little part of ontology that presents the software licenses as merchandise traded by the organization, and which will be incorporated in the website of the organization, is listed below.

```

<owl:oneof rdf:parseType="Collection">
<owl:Thing rdf:about="Microsoft">
<owl:Thing rdf:about="Borland">
</owl:one of>
<licentalimbaje rdf:ID="Prolog">
```

In order to develop an ontology we must follow the next steps⁶¹⁰:

determine the domain and scope of the ontology; consider reusing existing ontologies; enumerate important terms in the ontology; define the classes and the class hierarchy; define the properties of classes;

create instances;

The functionalities of our agents' community will be achieved using the multi-agent platform Open Agent Architecture, with one facilitator, with delegation style, and the language Sicstus Prolog for creating every agent. The OWL ontologies will be built using Proteje 4 and the Prolog-style quering will be achieved using the PrologTab plug-in of it. OWL ontology will be processed by a reasoner named Pellet.

⁶¹⁰ http://protege.stanford.edu/publications/ontology_development/ontology101.pdf

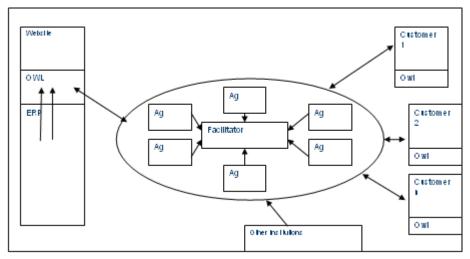

Figure 2 The proposed framework

According to the previous framework, the mechanism of proposed architecture gravitates to the virtual community of agents, which, in a collaborative manner, tries to solve the problems regarding the relationship with customers. We have identified a lot of agents, all connected to a facilitator, everyone having a specific role within the system:

Task agents – solve one of the next task specific to a CRM:

- -support for planning of the marketing campaigns;
- -support for designing and executing the marketing campaigns;
- -sending campaign-related material to customer;
- -tracking, storing and analyzing campaign statistics, including tracking responses and analyzing trends;
- -scheduling sales call or mailings;
- -tracking responses to/from the customers;
- -generating many reports;
- -the analyzing of the customer behavior in order to make decision regarding the products and services, -data mining technology being a good alternative for this aim;

financial forecasting and customer profitability;

support for analyzing the sales performance;

support for analyzing the customer trends;

Customer collector agents – gather all possible information from the website of the customers — where is present an OWL ontology. Within ontology we can find out much information that — identified each customer and characterized him.

Provider information agents – takes all possible information from the ontology developed by the organization in order to provide them to the customers. In this ontology will be presented all information and services provided by the organization in relationship with customer.

Conclusions

Relationship with customers is one of complex problem that an organization is confronted. Every complex problem can be easily solved if it is split in subproblems or modules. The paradigm of collaborating software systems is a good alternative to tackle large and difficult problems. The collaborating-software paradigm is a "divide-et-impera" approach to the development and maintenance of large and complex software applications.

The delegated computing ability of OAA enables both human users and software agents to express their requests in terms of what is to be done without requiring specification of who is to do the work or how it should be performed. Programming with delegation is very advantageous because reduces the dependencies among the agents of the community. Thus, is reduced the complexity for users and agents. Also it is encouraged reusing across applications and domain because interagent interactions are not pre-defined.

A CRM software developed with a distributed agent architecture allows the construction of systems that are more flexible and adaptable. In any moment it can be activated, deactivated, added, replaced and deleted agents that have associated specific task, in any moment agents can be created in multiple programming languages and interface with existing legacy systems, the solving problems are achieved using distributiveness and parallelism.

The presented OWL ontologies assure adequate knowledge at the right place and right time. That is the noble purpose of the modern knowledge management. The change of organizations management vision by giving information the role of main source will lead to major changes in the structure of any computer system. Software agents can query these ontologies and find out the desired information in order to solve the associated tasks, conferring to the CRM system more automation. Also, an OWL ontology can be incorporated in a web page, so

that all the knowledge are available for all interested persons or capable software, conferring to the CRM system more transparency and opening.

A CLUSTERING OF DJA STOCKS - THE APPLICATION IN FINANCE OF A METHOD FIRST USED IN GENE TRAJECTORY STUDY

Moldovan Darie

Babeş-Bolyai University of Cluj-Napoca Business Information Systems Department Str. Theodor Mihali 58-60, 400599, Cluj-Napoca, Romania {Darie.Moldovan, Gheorghe.Silaghi}@econ.ubbcluj.ro

Silaghi Gheorghe Cosmin

Babeş-Bolyai University of Cluj-Napoca Business Information Systems Department Str. Theodor Mihali 58-60, 400599, Cluj-Napoca, Romania {Darie.Moldovan, Gheorghe.Silaghi}@econ.ubbcluj.ro

Previously we employed the Gene Trajectory Clustering methodology to search for different associations of the stocks composing the DJA^{611} index [4] with the aim of finding different, logic clusters, supported by economic reasons, preferably different than the classic, "by industry" classification. In this paper we enter the insights of the clustering results from a financial and business perspective, to see if the clustering results are validated by the market knowledge and history.

Keywords: clustering model, data trajectory, cluster analysis

JEL Classification: G10, C61

1. Introduction

The behavior in time of a single stock can't describe the evolution of the entire market, but studied alongside with other ones, weighting their importance, one can tell the main direction of the group. For this reason stock indexes were created. In reverse, it is easier to forecast the price evolution of a single stock, taken away from a group where most of the stocks have a similar behavior.

A stock market index is a method for measuring a section of the market. In the last few decades, indexing has been a strong preoccupation for every fund manager, raising the performance expectations [1]. Created by financial services companies or news providers, the indexes are the first benchmark for the performance of a portfolio.

There are many types of indexes, based on the size, specific sector, type of management or other criteria considered useful by their creators. Indexes are usually built by financial experts or by investment companies and their structure is more or less subjective. The literature consists of several attempts [6, 7,8] to automatically obtain the structure of a stock market objectively, without human intervention, only from historical data. In line with this trend, we employed an artificial intelligence approach [4] to obtain groups of stocks, considering only their price evolution during the same period of time. In this paper our scope is to further investigate the results obtained in [4], to see if the stock groups and the associations determined by the clustering methodology are validated by the financial and business knowledge present at that time in the market. We worked with the the 65 companies (traded on the New York Stock Exchange and NASDAQ) composing the DJA index, analyzed between years 2000 and 2007.

The paper is structured as follows: in section 2 we describe the gene trajectory clustering methodology applied in [4] for clustering the DJA index stocks. Section 3 presents and explains the clustering results by an economic point of view and section 4 concludes the paper.

2. Gene Trajectory Clustering for structuring the DJA index components

Gene Trajectory Clustering [2, 3] is a method implemented into GNetXP software and developed to extract the Gene Regulatory Network from gene trajectory data The proficiency of the hybrid algorithm (using a mixture of Multiple Linear Regression models) in clustering was first demonstrated by tests on time series containing hundreds to thousands records. The methodology consists in two steps in clusters determination: first, local centers for the clusters are determined with the help of a Genetic Algorithm and second, by using a local-learning method to refine the initial centers selected. The likelihoods of the solution are then used as objective function for the Genetic Algorithm. Even this approach is time consuming, it relies on temporal information between data and the results are considerably improved, compared to the standard Expectation Maximization algorithm and it is unlikely to be trapped in the local optima.

In [4] we successfully applied the Gene Trajectory Clustering method on financial data. The data analyzed consisted of the daily adjusted closing prices of the DJA stocks for the period 2000-2007. The data was divided into 8 natural periods for detailed analysis. As recommended by the financial investments literature [5], we calculated the daily logarithmic returns. Moreover, for the data to fit the rigors of the GNetXP software, and to obtain a global vision on the price evolutions of each stock, we needed to scale the trajectory of each stock, considering a start of 100 points and applying the daily logarithmic returns computed at the previous step. In this way we obtained a dataset, in appearance very resembling to the gene data originally tested.

*(*1

For every year, we obtained a clustering of the stocks, clusters that acknowledge more or less the division of DJA in the 3 sectors: industrial, services and utilities. We found out that running the clustering methodology for 8 successive years, the clusters remains quite stable, with a kernel of stock classified in the same cluster during all years. This sign was a first theoretical indication that the clustering methodology was successful from the algorithmic point of view and some useful insights might be obtained out of the clustering procedure. Table 1 presents the number of clusters obtained for each successive year.

	No. of clusters	
2000	5	10779.22
2001	5	14632.35
2002	5	12763.99
2003	3	19978.61
2004	5	15974.88
2005	4	14582.66
2006	5	12092.22
2007	5	11087.16

Table 1. Number of clusters obtained for each year using the hybrid GTC algorithm [4]

3. Results

Since approximations were used in cluster formation, a refined analysis is welcomed. After obtaining the clusters for every data set, we measured the intra-cluster distance between its components. This is important, for being able to observe the correlation between stocks in a cluster, especially useful when finding unnatural associations, apparently hard to correlate. If a small distance is shown, one can be sure the stock is not misclassified, and will look for a logic explanation. The method proposed for this computation is the measure of the Euclidean distance (L2-norm), proposed also by [6],[7]. For each year we drew a dendrogram showing the internal adhesion inside clusters. An example of such dendrogram is shown in Figure 2, based on year 2000 clusters: on the (X) axis we have the cluster components while on the (Y) axis are shown the Euclidean distances between stocks.

Next, we present the economic cluster analysis, describing the most interesting correlations found between components for the above mentioned period of time.

Table 2 presents the clustering results for year 2000. Year 2000 was the end of the largest economic boom in US history. Stocks were volatile, with Centerpoint Energy (Utilities) doubling it's market value, but Microsoft (Technology) dropping 55%. The first cluster obtained contains the stocks(11) who dropped most during the analyzed period, a strong correlation being shown between Alcoa and Du Pont(both from Basic Materials industry), McDonalds and Wallmart(both from Services sector) and CSX(Services-Railroads) and Caterpillar (Industrial goods). The only IT representative of this cluster was Microsoft.

Cluster number two incorporates the companies (14) with a volatile evolution, but all of them rose during the whole year. Most closed were Dominion Resources, Duke Energy, Exelon (Utilities), GATX (Services-Rental) and Landstar System (Services-Trucking). An interesting association is created between Citigroup (the only representative of the financial sector in the cluster) and Pfizer (the only Healthcare stock in the cluster)

Cluster	No. of	Cluster components
no.	stocks	
1	11	AA, CAT, CSX, DD, EIX, HD, MCD, MSFT, NSC, PG, WMT
2	14	AES, C, CHRW, CNP, D, DUK, EXC, GMT, LSTR, LUV, OSG,
		PCG, PFE, WMB
3		BAC, CNW, DIS, GM, HPQ, IBM, INTC, JBHT, JPM, R, VZ
4		AMR, AXP, BNI, CAL, CVX, ED, EXPD, FDX, GE, JNJ, KO,
		MMM, MRK, T, UNP, UPS, UTX, XOM, YRCW
5	9	AEP, AIG, ALEX, BA, FE, FPL, NI, PEG, SO

Table 4. Year 2000 cluster components

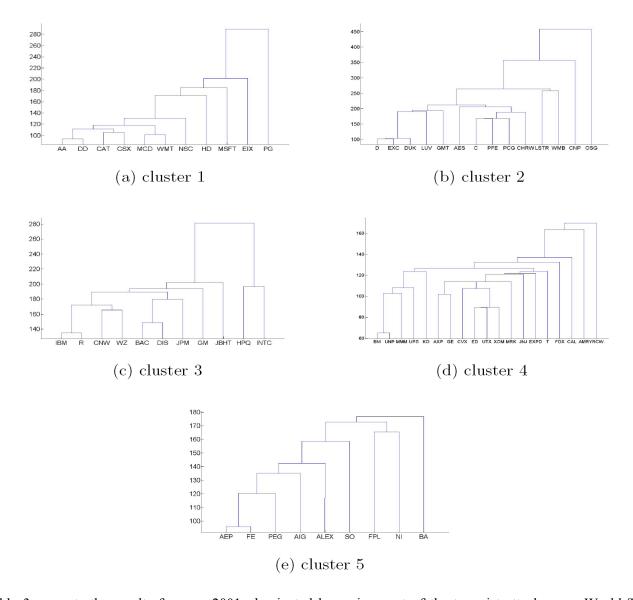

Table 3 presents the results for year 2001, dominated by main event of the terrorist attacks over World Trade Center and Pentagon, which caused a major drop of the indexes in September. Also, Microsoft was accused of the violation of antitrust laws. The first cluster contains 20 stocks who had a descending trend during the year and decent rebounds. We can find alongside AIG, Boeing and other five utilities companies, proving the association between them in the previous year was not by mistake. A closer evolution had the energy companies Chevron, American Electric Power, Edison, First Energy and, more surprisingly with Johnson&Johnson(Healthcare). Caterpillar and General Motors evolve together in this cluster, too. Companies (16) in the fourth cluster, even they rose in the last quarter of the year, didn't have the chance of a positive year-end close. As in the previous situations, the utilities companies are among those who perform closely. The diversified technology company 3M is in this cluster, together with Wal-Mart, P&G, Pfizer and Home Depot.

Cluster no.	No.of stocks	Cluster components
1	20	AIG, AXP, BA, CNP, CNW, DIS, EXC, FPL, GMT, HPQ, INTC, JPM, KO, LUV, MCD, MRK, NI, T, UTX, WMB
2	14	AA, AEP, CAT, CVX, ED, EXPD, FDX, FE, GM, JBHT, JNJ, UNP, VZ, YRCW
3	5	AES, AMR, CAL, EIX, PCG
4	16	ALEX, BNI, C, CHRW, D, DD, DUK, GE, HD, MMM, PEG, PFE, PG, UPS, WMT, XOM
5	9	BAC, CSX, IBM, LSTR, MSFT, NSC, OSG, R, SO

Table 5. Year 2001 cluster components

Figure 8. Dendrograms for the clusters, showing the adhesion between the individuals

At the beginning of 2002 (results presented in table 4) the Justice Department in US launched it's investigation of Enron and WorldCom filled for bankruptcy. The market dropped and didn't recover till the end of the year. The stocks in the first cluster (16) started to drop in the second quarter and at the end of the year the losses were in the [-12%,-38%] interval. Strongly correlated were AIG and Pfizer. The car manufacturers GM and Caterpillar are in the same cluster, along with Boeing, but also energy and shipping companies. The fourth cluster belongs to the companies who spectacularly dropped, from 60% to 90%: AES Corporation (Utilities), AMR Airlines, Continental Airlines, Centerpoint Energy and Williams (Oil and Gas).

Cluster no.	No.of	Cluster components
	stocks	
1	16	AEP, AIG, BA, CAT, CSX, CVX, DIS, EIX, GM, GMT,
		LUV, MCD, NI, OSG, PEG, PFE

5	13	AA, C, DUK, GE, HD, HPQ, IBM, INTC, JPM, MSFT, PCG,
		T, VZ

Table 6. Year 2002 cluster components

Our algorithm fit best for three clusters in 2003 (Table 5). First cluster incorporates 12 stocks, most of them on a strong ascending trend, who began in the second quarter. Best correlation was achieved between Caterpillar and Edison and PG&E(utilities) and JB Hunt Transport. We can also find McDonalds alongside JP Morgan, Intel and Home Depot. Second cluster's stocks dropped at the beginning of the year, and after recovering evolved almost flat for the rest of the year. The year end performances are at best +20% and at worst -20%. Good correlations were found between Du Pont and AIG. Merck and J&J, the drug manufacturers are in this cluster, but Microsoft and Verizon too.

Cluster no.	No.of	Cluster components
	stocks	
1	12	AES, CAL, CAT, EIX, HD, INTC, JBHT, JPM, MCD, OSG,
		PCG, JBLU
2	15	AEP, AIG, BA, CNW, DD, DUK, ED, GMT, JNJ, MRK,

		CVX, D, DIS, EXC, EXPD, FDX, FE, FPL, GE, GM, HPQ,
		IBM, KO, LSTR, LUV, MMM, PEG, PFE, PG, R, SO, UNP,
		UPS, UTX, WMB, WMT, XOM, YRCW

Table 7. Year 2003 cluster components

First cluster of 2004(Table 6) includes stocks that were in the negative zone for the most of the year. Strong correlation was found between Pfizer and Coca-Cola. General Motors and HP are here, too. In the second cluster, the stocks(20) are not very volatile, evolved flat until the last quarter, when most of them ended the year higher. As expected from previous observations, the utilities companies are among the strongest correlated: Consolidated Edison, Nisource, Dominion Resources, Southern Company, AES, Public Service Enterprise. Technology companies Microsoft, IBM, 3M and AT&T are incorporated in the cluster, too. Citigroup, AIG, JP Morgan are the representatives of the financial sector. The third cluster presents stocks with outstanding performance during the year, with price increases between 20% and 80%. CH Robinson Worldwide, Expeditors International, FedEx, Overseas Shipholding (delivery services) and Lanstar Systems and YRC(trucking) are strongly correlated. Companies in the last cluster rose smoothly, all of them ending the year in the positive zone, with 10-30%. American Express and Bank of America are correlated, but also Chevron and Exxon Mobil. Procter&Gamble, Johnson&Johnson, Home Depot, McDonalds are also found here.

Cluster no.	No.of	Cluster components
	stocks	
1	10	AA, CSX, GM, GMT, HPQ, KO, LUV, PFE, UNP, JBLU

		HD, JNJ, MCD, PCG, PG, VZ, XOM

Table 8. Year 2004 cluster components

In 2005(Table 7) the US stock markets were dominated by concerns regarding Iraq war, New Orleans floods and rising interest rates, all of these keeping the indices bellow 5%. We found a strong correlation between the financials Bank of America, Citigroup, JP Morgan, General Electric, American Express and Home Depot stores and P&G. The utility companies go together, as well, but in a different cluster, but with a decent performance. Stocks in the fourth cluster poorly performed until the last quarter of year, when a rebound came. Stocks in multiple domains are found here, most correlated being the shipping companies Fedex and JB Hunt Transport, and the chemical company Du Pont and the conglomerate 3M.

Cluster no.	No.of stocks	Cluster components
1	12	AMR, BA, BNI, CHRW, CNP, EIX, EXC, FE, GMT, HPQ, PEG, WMB
2	18	AEP, AES, ALEX, CAT, CSX, CVX, D, DUK, ED, FPL, INTC, JNJ, KO, NI, OSG, PCG, SO, XOM
3	20	AXP, BAC, C, CAL, CNW, EXPD, GE, GM, HD, JPM, LSTR, LUV, MCD, MRK, MSFT, NSC, PG, T, UNP, UTX
4	15	AA, AIG, DD, DIS, FDX, IBM, JBHT, MMM, PFE, R, UPS, VZ, WMT, YRCW, JBLU

Table 9. Year 2005 cluster components

The results of the companies in 2006 restored the confidence in the markets. The benchmark indicator for the US markets, the Dow Jones Industrial Average rose by 16%. The performers of 2006 were the stocks in cluster2 (Table 8), strongly correlated being Boeing, General Motors and Caterpillar and the technology companies HP, Verizon and AT&T. The semiconductor maker Intel was between the stocks with the poorest evolution, alongside with transportation companies ConWay, Jet Blu, Alexander &Baldwin, YRC Worldwide. The situation wasn't better for the companies in cluster 3, who began the year by a small drop, than recovered and ended the year in the positive zone. Here are included, with strong correlation, some major financial stocks (American Expres, Citigroup, AIG), but also the technology companies Microsoft and IBM.

Cluster no.	No.of	Cluster components
	stocks

		OSG, PCG, PFE, UTX, XOM

Table 10. Year 2006 cluster components

Even the market ended the year with modest gains, some quarterly losses reported by the banks in the fall were the first signs that the economy is shrinking. The first cluster of the year 2007(see Table 9) contains very volatile stocks, the majority being from energy and transportation domains. The airlines companies from cluster 2 had a difficult year, ending the year in the negative zone, alongside Citigroup, one of the first banks affected by the subprime crisis, who lost almost 50% of its value. Most of the technology companies (cluster 4) rose,, offering a solid performance during the entire year. The energy and transportation companies were again correlated, even they had volatile prices (cluster 1) or a fair positive evolution (cluster 3).

Cluster no.	No.of	Cluster components
	stocks	•
1	17	AEP, BA, BNI, CHRW, CNP, CNW, D, DUK, EXPD, FE,

		LUV, PCG, PFE, R, SO, UPS, WMT

Table 11. Year 2007 cluster components

4. Conclusion

Our aim in this paper was to investigate whether the results obtained by applying the Gene Trajectory Clustering methodology to cluster financial data are worth from the financial and the business perspective. More specifically,

we wanted to determine whether the clusters obtained have logical and economic importance, besides the mathematical values of the performance indicators and to determine if an alternative grouping of the stocks is welcomed

Considering the business cluster analysis, we conclude that the GTC algorithm applied in [4] was appropriate for clustering the financial data and that there are many cases when the natural division of the stocks by the company profile is not a solution for grouping them, finding the technology companies uncorrelated with each other, and the banks correlated only in the last three years.

The involvement of informatics has become more profound and even indispensable, providing full coverage of the space business accounting, starting from the collection of data from primary documents, obtained by electronic means and conclude with preparation of documents for review.

Keywords: informatic methods, situations synthesis, databases, integrated system of accounting

Cod JEL: M4

At the accounting organization of the unit are general rules and its unit provided by the Accounting Law and established by General Direction of Accounting and Advisory Board of Accounting of the Ministry of Finance, such as: Regulation regarding application of Law of accounting, General accounting plan, Methodological norms of account use, Nomenclature regarding register models and printed forms, Rules for the preparation and presentation of the balance sheet.

The coverage of the financial - accounting activity is determined, in part, by the financial – accounting function of the unit. This activity is carried out by the Financial - accounting compartment[1].

Operations' recording in accounting is done systematically according to the general framework of the Plan accounts, on the basis of documents which binding on the people they have drafted, endorsed and approved.

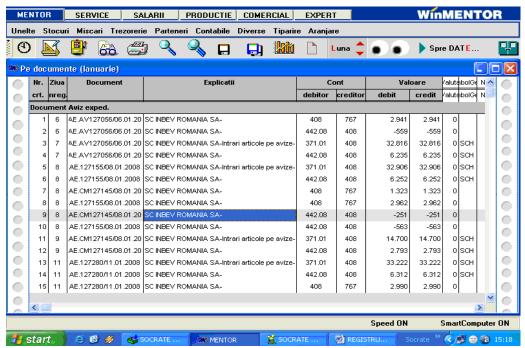

Fig.no. 9 Journal Register

According to the accounting law no. 82/1991 to accounting return duties, tasks expression of great importance to the completion of balance sheets, management and balance control.

All improvement introduced in time in accounting field are serving with priority the financial fiscal and management interests.

Accounting benefits, at present, by the principles of systems theory, cibernetics principles and informatic methods, for the construction of integrated systems of big performance because of the potential "transfer of intelligence" from human to informatic products with accounting specific[1]. Programming of new technologies for data processing produced outstanding quality mutations in the accounting information system.

The involvement of Informatics has become more profound and even indispensable, providing full coverage of the space business accounting, starting from the collection of data from primary documents, obtained by electronic means and conclude with preparation of documents for review.

Thus, they improved software for sales (customers), for purchases (suppliers), for receipts and payments, for management of stocks and approved, for staff payroll, for financial accounting and for management accounting, situations synthesis, analysis and economic - financial forecasts[4].

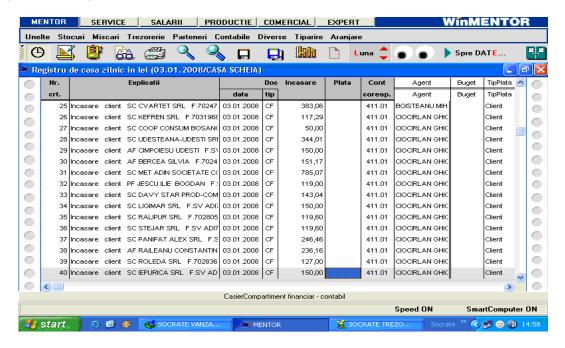

Fig.no. 10 Cash Register daily in lei

Current accounting information systems, using relational databases, provide a full and comprehensive processing of data, addressing all the requirements to assist the decision [3].

User-oriented, they offer a friendly working environment, ensuring the conduct of all works related to financial and management accounting, through multiple checks over the correctness of reimbursements made on primary documents (it is about correctness checking of used accounts and correspondences set on accounting plan, role that falls on so-called assistant of operations accounting), and carrying automatic accounting operations (closing the accounts of income and expenditure at the end of the month).

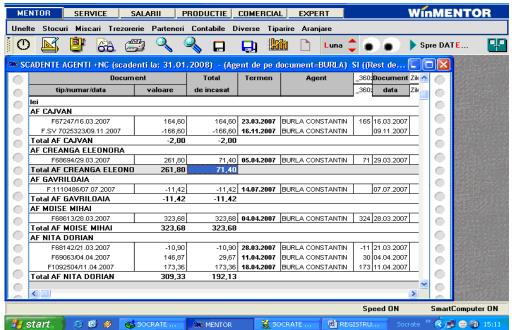

Fig. no. 11 Due agents

This perfect mix between accounting and computer science is showing its full benefits in the form of performances achieved in the processing of information, particularly in the quality plan, fairness and efficiency, in this way achieving better accounting objectives.

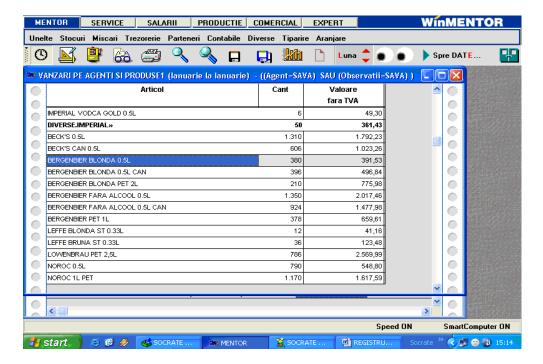

Fig. no. 12 Sales per agents and products

At present, the computerization of accounting ensure effective manifestation of the principles and accounting method, of systematization, processing and reporting on the path of balance and other reports and the financial accounting situation.

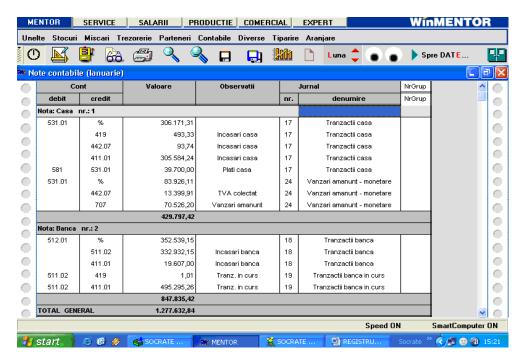

Fig.no. 13 Accounting Notes

Widespread use of informatics and the possibility of exploitation of databases in interactive regime (computer networks) have opened new perspectives to preparing of operative information regarding costs, framing in the budgets of revenues and expenditures and emphasizing the value of the provisions function of accounting.

In fact, the system can be considered as a group of people, information, data and processing procedures, calculation and communications equipment. Every computer system is associated a system of data processing, in which it is presented on different media storage, and processing processes are resulting in procedures performed by various equipments of calculation technique and specialized personnel. "The main purpose of the informatics system is to serve the information requirements of managers at different levels of decision-making and to minimize human intervention and human effort in carrying out some processes of design, production, and decision-making"[1].

System components for processing by computer of accounting data are[2]:

- Identification of economic financial operations and preparing source documents;
- Conversion on support the entry into the system;
- Internal processing, with automatic distribution of data on accounts;

- Calculation of values and saving the obtained accounting information;
- Publishing the reports for management and selection of the necessary information to future use;
- The transmission of reports and financial statements to users inside and outside the company.

According to this components, an integrated system of accounting must be identified firstly any economic-financial operation, to analyse it from the dual point of view, in terms of debt or credit, spreading sums over accounts that enter in correspondence and processes selected data with bug precision, for preparing of financial reports.

Any operation has at the base a source document which contains detailed data. Source documents must be projected thus to offer o good relevance of economic-financial operations. On their base are prepared the entries in the informatics system of the accounting. Any source document must contain at least the account or accounts to debit, the sum or sums that are written in debit, the account or accounts to credit and the sum or sums that are written in

credit.

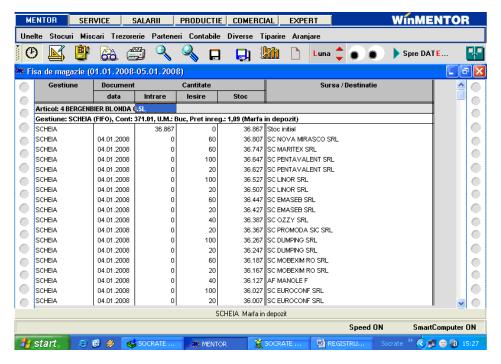

Fig.no. 14 Special store

Conversion on support and introduction of data in informatics system of the accounting involves use of some special procedures, and also a calculation system properly equipped with appropriated software.

Internal processing refers to the processing, based on automated procedures, the accounting data, compiled on the basis of current accounting technique and accounting principles. All operations of calculation and editing takes place automatically, achieving in the final the exits, resulting in various reports and financial statements, as well as other information that is saved for the purpose of further processing or use[4].

In fact, the central theme for any modern system of accounting is not the simple data processing, but the complex selection process of processing information after accounting principles, attaching to the values at each economic transaction and preparing of significant reports for decisions making, because in modern management a large number of decisions refer to the forecast of financial results, and information of accounting helps best in this

regard.

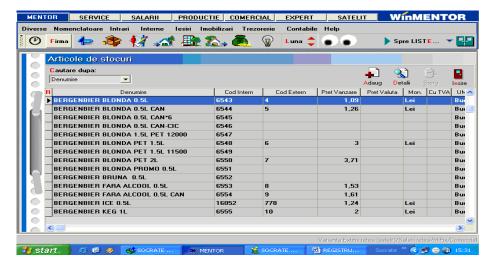

Fig.no. 15 Nomenclature

Conclusions

The conclusion seems to detach from economic reality is that, soon, we will not be able to speak about accounting without referring to informatics also. It is clear, accounting tends towards full computerization, which will have to join all the operators.

The trend of computerization of accounting is evident, slowly but surely in our country. According to the law, physical and juridical persons that use automatic processing of data are required to ensure compliance with accounting rules, storage, preservation as technical support and monitoring of data recorded in the accounts. IT units are responsible for processing with accuracy of the data from documents, and the beneficiaries are responsible for the accuracy and reality of the data they transmitted to processing.

All these modern technologies, through their implications on accounting information system, threatens to change practices, methods and traditional vision of the status of the accounting profession. Because the automation and computerization are taking increasingly complex tasks, carried out so far by the accountant.

INTERACTIVE SYSTEM FOR ON-LINE CONSULTING

Negoescu Gheorghe

"Ovidius" University Constanta Faculty of Economics Galati, Port street, no. 47, Jiul block, the 4th flat, code 800 025 negoescugl@yahoo.com 0723 528 182

Liberal professions, developed after 1990, require an historical casuistry that enable them to reach a pertinent conclusion to another similar case. Where there is not a similar case tried, it is required the need for a procedure for resolving differences, based on the existing legal framework in Romania to the date of the analysis of the case.

Human resource in training, especially graduates of economics, law, administrative sciences and technical sciences could benefit by a casuistry in real terms and practical examples from real economy. At the same time the teachers from several universities in the country could also benefit by an actual training program in order to obtain a certificate for management business trainer in Europe.

1. Project description

"Interactive System for On-line Consulting" is a project which aims to provide answers to fundamental current or future questions of employers of companies, employees, pensioners, unemployed and other disadvantaged persons, and also to collaboration needs for the liberal professions (such as accountants experts, assessors, liquidation experts, financial auditors, lawyers, doctors, teachers) through an online platform, which, on the one hand, collect the questions, and, on the other hand, spread to be solved these questions to the experts performers, who are responsible to answer to these questions taking into account a model of response and some hypotheses which, once introduced in the model, solves the problem raised by the client (Figure 1).

To be able to answer to these questions the performer expert needs specialty and common (general) knowledge. For specialty knowledge is developed a specialized model for each client category which is validated with the opinion of a committee of models based on a protocol analysis and model validation. The models are analyzed within 7 committee for analysis and validation, as follows:

- Commission 1: auditor.
- Committee 2: assessment.
- Committee 3: liquidators.
- Committee 4: financial auditors.
- Commission 5: lawyers.
- Commission 6: doctors.
- Commission 7: teachers.

Each member of these committees, in addition to specialty knowledge, must know in the following modules:

- **Module 1 Foreign Language**: Business English that broadens specialized vocabulary business. English language develops business skills from the spoken English on the phone and written simple reports (at lower levels) to business presentations, teamwork and negotiation (advanced levels).
- **Module 2 ECDL** (European Computer Driving License) with the seven modules⁶¹²: Module 1 Basic Concepts of Information Technology, Module 2 Using computers and files (Windows), Module 3 Processing text (Word), Module 4 Spreadsheet (Excel), Module 5 Databases (Access), Module 6 Presentations (Power Point), Module 7 Information and Communication (Internet and E-mail).
- **Module 3 Legislation**: Law no. 31/1990 of companies, republished and updated in 2009, updated Labor Code, Law no. 85/2006 on insolvency proceedings, updated, the Tax Code, updated.
- Module 4 Creating a business: Opportunity study, feasibility study, business plan, european projects.
- Module 5 Managing a Business: Report of management, balance sheet, profit and loss account, financial annexes, statements.
- Module 6 Redesigning Business: Strategic diagnosis, assessment report, the redesign of management.
- Module 7 Closing a business: liquidation, audit, merger, division, ethics, communication, conflict.

612 http://www.ecdl.org.ro/.	

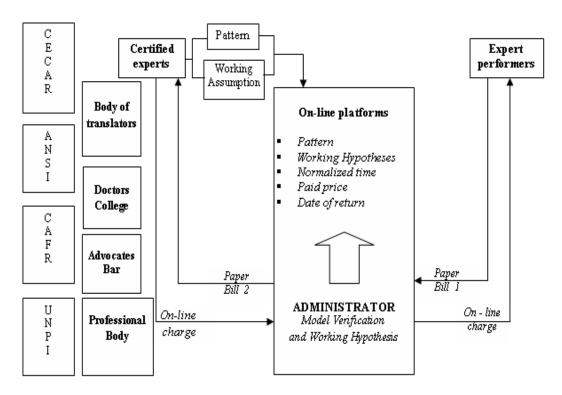

Figure 1- Interactive System for On-line Consulting

The overall objective of the project belonging to the Sectoral Operational Program Competitiveness Economic Growth is the awareness of the members of liberal professions associations for specific business transparency through the use of labor resources in training for designing work to the detriment of the work routine.

The specific objectives of the project are resulting from the general purpose and consist of:

- Increase the information period and continues processing throughout life for a significant part of the liberal members of associations such as CECCAR, UNPI, CAFR, ANEVAR, financial advisers, translators body, and for specialists interested in rapid resolution of administrative or routine service less important for them (doctors, lawyers, notaries, teachers).
- Standardization of papers with periodic character realized by experts in order to promote the best practice in the development of works and specific services under conditions of extreme rigor and quality in accordance with the update law at attractive prices to both experts and for human resource training.
- Preparing a platform to facilitate the exchange of works and services among members of liberal associations such as CECCAR, UNPI, CAFR, ANEVAR, financial advisors, translators body and other training specialists in human resources for processing in accordance with the law. Identification of areas of concern regarding the use of online advice, and identification of the main problems with periodic or administrative character which faced with liberal associations.

The project is a complex operation which aims higher economic, legal and technical education, near to requirements of employers in Romania⁶¹³. For example, in our opinion any education graduate needs general competencies (knowledge of foreign languages, computer knowledge: Word, Excel, Power Point, Internet, communication and law knowledge of: Labor Code, Tax Code, Commercial Code and specific knowledge to liberal profession that wants to practice (accountant expert, financial auditor, technical expert, expert in insolvency, assessment expert, tax expert, expert in construction, expert in energy balance of buildings, etc.).

By standardizing the routine work needed for the regular work required by the market such as reports of judicial expertise, evaluation reports, reports of merger, liquidation reports, audit reports, etc., our project aims to outline in a standard the skills required to a future economist, lawyer, engineer.

By standardizing the work routine in order to realize the expert, appraisal, liquidation etc. reports it can be achieved a national casuistry that can represents models to solve specific issues with which are facing the institutions and enterprises, in particular small and medium enterprises which can not afford to develop research - advice activities inside their companies (for lack of funds).

Main activities generated by the project are:

- Identification of a space for rented for the project team and procurement of necessary equipment.
- Identification of financial statements with the periodic character specific to expert accountant activity.

⁶¹³ www.fse.romania.ro.

- Organizing a symposium by 12 accounting experts in order to present the opinion of experts concerning the financial statements suitable for execution on the Internet.
- Identification of financial statements with periodic character specific to financial auditors activity.
- Organizing a symposium with 12 financial auditors in order to present the experts' opinion concerning the financial statements suitable for execution on the Internet.
- Identification of financial statements with the periodic activity specific to ANEVAR members activity.
- Organizing a symposium with 12 assessors in order to present the experts' opinion concerning the financial statements suitable for execution on the Internet.
- Identification of financial statements with the periodic character specific to UNPIR members activity.
- Organizing a symposium with 12 liquidators in order to present the experts' opinion concerning the financial statements suitable for execution on the Internet.
- Preparing of a computer platforms to view the request of the experts performers.
- Organizing a summer school for 30 people, preferably students, to present the user manual of the platform for the purpose of obtaining the certificate of an expert performer.
- Organization of summer schools with 30 representatives of CECCAR, ANEVAR, UNPI, CAFR in order to promote the platform and the opening of the applicant experts catalog.
- Organizing a final conference with the participation of 50 experts and performers applicants in which is validated the IT platform and it is presented the further development strategy of the project.
- Study of feed-back from the experts and applicants in human resource training.
- Organizing an annual conference with locality representatives of the subscribers to on-line platform for the approval of the development strategy of the company during the period 2011 to 2016 (5 years after the project ends).

2. Computing Platform

Platform Computing which is to be achieved through subcontracting on the basis of tender and specification meets the following requirements:

- Management platform has a single administrator.
- Manage a database system with MySQL (Structured Query Language).
- To allow a flow management information between a number of around 100 000 unique users.
- The basic software platform should enable in real-time the resolving of only standard situation (situation which are resolving automatically by the program without the intervention of an expert performer). From technically point of view, the platform must run on-line, to be accessed from anywhere by the user, authentication being required to access the information.

Information platform will be written in the following languages and programming environments:

- PHP main programming language. Will be used to connect to database, for security, for user authentication, etc.
- MySQL SOL client used to store data in relational system, tables for users, files evidence and their connecting by different requirements, etc.
- HTML the programming language that will be generated from the code written in PHP in order to be used by the browser and to be posted to the user ⁶¹⁴.
- CSS the creation of a style classes and so to a friendly interface for the user.
- XML store of a various settings and communication channels (such as between PHP and Flash via AMFPHP).
- MXML and ActionScript 3 (or AS3)- languages used in creating applications in Flex 3 to provide real-time dynamics for the platform and other facilities in real time that the PHP can not provide. Also, compiled programs in Flex (SWF files), are running on the client machine, reducing the risk of overloading the server.
- Adobe Flex 3 technology used to implement the two languages mentioned above. This technology offers the Flex Framework, necessary to define different components and classes needed to implement the platform information (such as Text Input, Array Coliection, File Reference, etc.) and creating a RIA (Rich Internet Application) for quick and simple interaction.
- **Flash** ultra known technology and used worldwide web and beyond. It is the environment for the running of the applications in Flex, written in Action Script 3, using ASVM (Action Script Virtual Machine).
- **AMFPHP** PHP library that enables communication between PHP and Flash using Flash Remoting method, communication being very fast, the information being binary negotiated. In practice, AMFPHP allows call PHP functions and variables within the applications written in Flex. This library is required to "care" of information from and in the database (for verification, display, recording, etc.), the Flash environment having no support for such operations.

⁶¹⁴ To see Pavel Nastase, Floarea Nastase - INTERNET World Wide Web JavaScript - HTML - Java, Economic Publishing House, Bucharest, 1998, p. 77-124.

3. Project management

Are directly interested members of professional associations CECCAR, ANEVAR, UNPI, CAFR, students of economic, technical and legal faculty profile who want to acquire professional skills recognized by the labor market.

The project is coordinated by a project manager assisted by a team consisting of an economic manager, a legal advisor and an executive director. During the project it will be used a number of 48 type A and B experts by whom it will be finalized the financial statements which shall be made periodically within the liberal professions. Will also be involved in the project and a number of 500 students from 10 university towns across the country who will learn and deepen throughout the project, the knowledge needed to attain professional competencies specified in the project. The project *duration* will be 24 months.

The project generates a series of standard forms that contribute to the uniformity of the activity of auditing, accounting expertise, technical expertise, legal expertise at country level, which allows the development of knowledge in the field. By providing a rich case, the project contributes to decreasing the time of making a new case and also allows the updating of knowledge throughout life. The project has no impact on exhaustible resource materials, and therefore, the development of the project ensures the compliance of the principle of sustainable development.

One of the *main objectives* of the project is to promote the mainstreaming and policies in the field of education and national training, and to allow all vulnerable groups, particularly subjects with physical disabilities, to enjoy the same education and training as the subjects without disabilities. According to the Human Development Report 2004 of the United Nations, Romania deals with the fifty-sixth position concerning the index of gender inequality. The situation of women in the labor market in Romania presents many critical issues that, on the one hand, are referring to employment and on the other hand, to working conditions. According to EUROSTAT data for the period 1999-2004, the employment rate in Romania was reduced from 63.5% to 57.9% while the share of employed women has dropped from 46.2% to 45.6%. Our project aims to attract both men and women, employees and employers, young people more than 14 years, and elderly up to 70 years old, fully healthy people and people with disabilities.

GENERAL INFORMATION AND MAIN CHARACTERISTICS REGARDING WEB SERVICES. PROTOCOL SOAP AND REST

Pîrnău Mironela

"TITU MAIORESCU" University, Faculty of Science and Technology Information, Bucharest, Romania; 22, Dâmbovnicului Street, sector 4, 040051, Bucharest, Romania mironelapirnau@yahoo.com, tel:0723210205

A web service represents a communication interface offered by the server, through that the clients (programs on other systems) may require different information. The customer may vary, may be present on the same computer server, may be in the same local network or it may be located in the opposite part of the country. It is a method by which applications can communicate with each other through asynchronous messages or calls on remote procedure (RPC Remote Procedure Call). So it can be concluded that a Web service is a software application that can be accessed remotely using XML-based languages. Web services are just two programs that change data between them on the Internet or Intranet in XML format called SOAP (Simple Object Access Protocol).

Key-words: Web Service, B2B, protocol, XML, SOAP, REST.

Cod JEL: M15

Introduction

The Web services are based exclusively on the W3C standards that define the SOAP (Simple Object Access Protocol), a XML message structure for transporting the coding scheme of the message body, WSDL (Web Services Description Language) the description language of the service, which defines the service and its connections with various schemes for transporting and coding the message, UDDI (Universal Discovery, Description and Integration) that provides a distributed deposit for 'traffic' of the definitions service. Because a web service can be described in WSDL, Axis has included a feature that produces the WSDL file for the web service. http://localhost:8080/axis/NumeServciu?wsdl

Having the WSDL file of a web service it is very simple to write the programmed client to access the web service. In the programmed client the following must be changed:

- 1. URI for the web service;
- 2. The method name; 3. The input and output parameters;

The Web Services should be easily extended and reused in new applications; this is achieved by adopting the orientated programming object as well as for the modeling usage. The Web service must offer interoperability regardless the platform, the operating system and programming language, the problem that was solved by using XML language (extended Markup Language) used in order to transmit data through the network. Because XML is a very general vocabulary, a customization has been decided, achieving the SOAP result (Simple Object Access Protocol) in a role of imposing a set of rules for formatting the XML-message that contains the transmitted information. All Web services must contain a standard of Open Standard type in order to allow the communication between written components in different languages or existing on different platforms. The costs for realizing a Web service are low, because based they are based on an already infrastructure, formed by the communication network, the protocols used these, etc., Web services allow the communication between B2B applications. Running a service can be made independently of platform (standalone) or in the context of a server. Running the independent service of the platform is allowed by the .Net platform. In reality it is not entirely independent. This type of service is composed of two main classes: the class that contains the interface offered by the service (as well as the implementation) and the class that launches in execution the service. This class is in reality the server; it has a standard form and announces the .NET platform that wishes to register a service to a certain address of the certain system and port. The functioning of these classes follows the stages:

- 1) The .NET platform receives the request from the client in the form of a SOAP message and sends it forward to the Web services register;
- 2) The register de-serializes the message through SOAP engine;
- 3) Based on a decoded message, the register loads the service desired by the customer and appeals the required method;
- 4) The register receives the result of the requested method;
- 5) Register serializes the result of the method through the SOAP engine;
- 6) The register sends to the client the serialized result in a SOAP format.

Running the service through a server allows the configuration of certain files to locate (deploy) and removal (undeploy), of the service. Such routine operations to take place automatically. These special files are specific to each server separately. For this type of running it is used the running on a server supporting services (for example ll represents IIS and the .NET services) or the running the service through a web application installed on an application server (e.g. Apache AXIS running on a Tomcat or Orion server). The solution most commonly used for servers that support services is the IIS combination with .NET services (offered by Microsoft) or Apache server with the .Net module. In these cases, the server has available (usually extern) facilities offered by the .NET

platform, meaning the SOAP engine is not capsuled into the server. Unlike the standalone variant, in this case the server is responsible for managing services and running them replacing the poor variant with a Web Services Registry. By installing an application server (for example Tomcat), inside it will be installed a Web application which takes the place of the services server. Through this application it is made the management of services installed and the loading and their execution.

The route that a SOAP request follows, in this case is: The application server receives a request from the client. It has no relevance what kind of demand it is (it could be HTTP Post from a script page or a SOAP message). Based on the addressed URL, the message is sent to the Web application that is registered at that location. We suppose that we got a SOAP message addressed to the Web Server SOAP application installed on the server.

In this case the message is sent to the entry point of the application (in our case the processor of demands that contents the Server SOAP application). The requests processor de-serializes the message using the SOAP Engine contained by the Server SOAP application. The contents processor locates the service that must be used, loads it and executes the method required by the client. The application processor receives the result of the executed method. The requests processor serializes the result of the method using the SOAP engine. The demands processor application sends the application server the answer already serializes. The applications server sends to the client the reply.

Tools used for Web services

Since not all application servers support the installation of the SOAP service it is required the usage of a secondary application which aims the implementation of the functionality required by the SOAP specifications. There exist many utilitarian programs aimed the creation and the maintenance with minimal effort of the web services such as:

- Apache SOAP Developed by Apache Organization;
- Apache AXIS. Developed by Apache Organization, the successor project of SOAP. It offers much more functionality, rebuilt design, working speed and better use of the memory;
- Net Platform. Developed by Microsoft. It could also be found a Ximian implementation and for Linux operating system:
- Visual Net. Developed by Antarctica. The module for Apache Server, offers among others and .Net services.
- kSOAP. Developed by Enhydra. It provides support only for the client.

SOAP Protocol Characteristics

The SOAP protocol is destined to develop applications based not only on simple applications of B2B or eCom. and it is a standard method of the technology of infrastructure for the calculation distributed by the multi platform based on XML. The SOAP technology is focused on common issues to all scenarios of the distributed calculation and follows the mechanisms: a mechanism for defining the communication unit that capsulates any message sent in an envelope with a pre-settled structure; an extensible mechanism with the role of adding new functionalities, a and a flexible mechanism for data representation, allowing exchange of data already formatted (text or XML) and conventions for the representation of abstract data structures in a programming language mechanism, a convention mechanism for RPC (Remote Procedure Calls) representation involving definition of structures to a standard procedure call and remote procedure for sending the response, a linked mechanism for the SOAP messages related to HTTP, which is the most used communication protocol.

SOAP messages are encoded in XML documents being comprised of a wrap (SOAP envelope - demanded), a header (SOAP header - optional) and a body (SOAP body - required). SOAP messages are also XML documents, the protocol specifications providing details for a standard strong encryption of data in SOAP messages. Figure 1 contains the structure of a SOAP message.

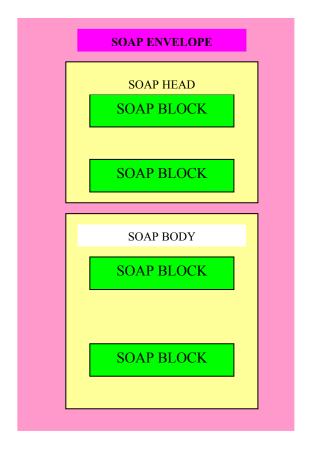

Figure 1. SOAP Message Structure

The SOAP message header is a primary mechanism extension of the SOAP protocol functionality. The specifications require only headers sent through the certain area to be XML valid elements, without adding other restrictions.

The header area is represented by the SOAP-ENV: Header and it is optional. If present, it must be the first child of the of SOAP-ENV element: Envelope and includes any number of entries (called headers). So a header is a XML element is a direct descendant of the SOAP-ENV element: Header.

The elemental SOAP-ENV:Body contains directly information representing the base of SOAP messages. All the children (descendants) of the direct element Body are called bodies. The bodies may contain arbitrary XML such rules are specified in connection with calls to the remote procedure and they will be presented in one of the following subchapters. The SOAP specifications contain information referring to the model that the objects are included in the SOAP XML language.

REST architectural model

- REST stands for the Representation State Transfer and is an architectural model for creating web services. REST describes an architecture oriented on resources. REST applies the web architecture services web, it is not a standard, it uses the standards:
- HTTP (Hypertext Transfer Protocol)
- URI (Uniform Resource Identifier)
- XML /HTML/GIF/JPEG

Basically REST supposed to build a web service using HTTP, XML and URI as it was built and the web. In a REST architecture the data on which the client tells the server to operate are in the URI and the operation server makes the data to be described directly by the HTTP method. From a technical point of view, the REST type architecture is described by the notion of "resource", "URI", "representation", "uniform interface". Binding these components in a more effective manner results in the creation of a REST architecture, presented in figure 2.

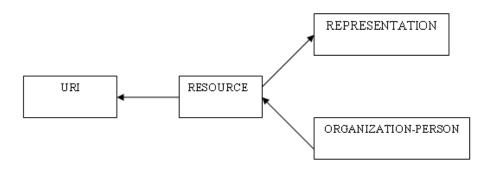

Figure 2. Items of REST architecture

In a REST architecture everything represents a resource. Everything may be referred to as an object is a resource. In general, everything that can be stored in the computer and represented as a stream of bytes is a resource. Each resource is associated with a URI. which represents the name and address of a resource. URI is the short term of the English "Uniform Resource Identifier", an identifier of a resource on the Internet, such as a document or a website. Often the URI of a resource is the same with its URL, the URL is short term for "Uniform Resource Locator", an early identifier. If some information does not have an URI then it is not a resource and is not practical on the web. An URI of a resource should be descriptive.

The "Uniform interface" is the basic principle of REST. In the entire web there are few operations which can be made on a resource. HTTP provides four basic methods for describing the most common operations:

The receipt of the representations of a resource: HTTP GET

Creating a new HTTP PUT resource for a new URI or HTTP POST to an already existing URI - The modification of an existing resources: HTTP PUT - The deleting of an existing resource: HTTP DELETE

The REST architecture is one without constraints and allows calls to functions, methods invocation, distance call procedures, such as and other messages that are understood by a certain server or a small subset of the components of the architecture.

Conclusions

The multitude of protocols and available standards from the end of the last century in the sphere of the Internet have enabled the possibility of communicating between applications on the system at large distances, with Internet access. Thus, there are systems that provide information services and information processing that in general are independent of the hardware platform, the access to them is made through the web services. A web service is a collection of protocols and standards used for exchanging data between applications or systems. Software applications written in different programming languages and running on various platforms can use Web services to exchange data network (Internet), in a manner somehow similar to inter-process communication on a single computer. The interoperability is due to the usage of adequate public standards. Based on XML, Web services have allowed the definition of standards and widely accepted technology for the IT industry. The web services have become today a necessity because it simplifies a lot the Internet by providing a distributed architecture. Basically, now, a company is not obliged to implement each of its already existing applications but it can access a web service to obtain the desired information. It results the re-usage of web services. Web services have a modular architecture, becoming a scaling one. The RPC (SOAP) architecture is a complex architecture that uses many protocols to make the connection between the client and the web service, but at the same time is more easily used by the client for it has a well-defined contract. Google uses SOAP type services. REST architecture is a simple one, but REST services, is more difficult to use by the client. The client must understand the uniform interface of the service. All services from Yahoo use REST. Any chosen architecture must be well documented for an easy usage by the client.

Business performance management (BPM) is a key business initiative that enables companies to align strategic and operational objectives with business activities in order to fully manage performance through better informed decision making and action. Effective business performance requires an organization to model and monitor not only its tactics but also its strategies and the assumption on which these strategies are built.

The aim of this paper is to examine the processes, methodologies and technologies underlying BPM, the relation between BPM and business intelligence, and to propose a framework for integrating corporate performance management and business intelligence in a holistic approach of managing business performance.

Keywords: Business Performance Management (BPM), Business Intelligence (BI), business processes, strategy, integration

Code JEL:M21

Introduction

During the last years, companies have understood the importance of enforcing achievement of the goals defined by their strategy through metrics-driven management.

Finance organizations have vast technology assets to assist them with day-to-day operations, regulatory compliance, and financial reporting. Such systems record transactions and manage operational processes, automate compliance and controls, and roll up financial performance data. To varying degrees, these systems populate data warehouses (DW) that are exploited by advanced business intelligence (BI) systems. The DW process, though supporting bottom-up extraction of information from data, fails in top-down enforcing the company strategy. The missing element — one that finance and IT teams are now pursuing — is the integration of these systems into a unified source of performance information and analysis capability.

Early adopters of business performance management have focused on making the finance function more strategic – mainly because people have tended to trust data coming out of a financial system more than other corporate systems, such as ERP or CRM. Almost every major business function has a performance management element that can be realized. To enable this requires organizations to put in place the right data platform and source data and ensure that strategic thinking is driven by the wider needs of the business. Nowadays, organizations of all shapes, sizes and markets are under pressure to conform to increased regulatory compliance pressures and have a need to link corporate performance to the decision-making process. BPM can be the right answer – leveraging what you already have and aligning the various aspects to move in the same direction. It helps organizations translate their strategies and objectives into plans, monitor performance against those plans, analyze variations between actual results and planned results, and adjust their objectives and actions in response to this analysis.

In the business literature, performance management has a number of names, including BPM, corporate performance management (CPM), enterprise performance management (EPM), and strategic enterprise management (SEM). Although different terms are used, they all mean essentially the same thing. The BPM Standards Group (2005) has defined BPM as "a framework for organizing, automating, and analyzing business methodologies, metrics, processes, and systems to drive the overall performance of the enterprise. It helps organizations translate a unified set of objectives into plans, monitor execution, and deliver critical insight to improve financial and operational performance".

1. Business information technologies

Business Information Technologies are seen as cutting edge Information Technologies made on purpose to support business information engineering. Management methods, techniques and support tools could be seamless integrated with Business Intelligence components in special tailored or customized Performances Management systems. The main functions of these systems are:

-To gather and store different measures of the business on a regular basis (current state indicators of the business performances).

- -To gather and store benchmarks and targets (threshold values) and business rules (interpretations of comparison results between current performance's indicators and etalon values).
- -To facilitate roll-ups and drill-downs of analyzed indicators along hierarchical aggregation criteria (structured Performance Measurements).
- -To keep the ongoing analysis alert allowing decision makers to quickly evaluate which business processes are successful, and which need their attention.

To summarize, an effective Business Performance Information System is built and maintained by business users to support the decision-making process especially at strategic level, making use of various indicators – quantitative and qualitative, lagging and leading – balanced against targeted objectives and/or industry benchmarks. Lately, with performance measurement periods becoming shorter, management must have the capability to more proactively influence the outcome. That requires monitoring and tracking capabilities that can generate current, complete and accurate information upon which they can act in real time. Business information technologies must respond to that need of proactively managing business performance.

2. Business intelligence and business performance management

Business performance management (BPM) can be considered as being the final component of business intelligence – the next phase in the evolution of decision support systems, enterprise information systems and business intelligence. If BPM is an outgrowth of BI and incorporates many of its technologies, applications and techniques, than why BI itself can't deliver the insight needed to improve overall business performance? From a theoretical viewpoint, it can. From a practical standpoint, it hasn't (table 1).

Like decision support, BPM is more than a technology. It involves the processes, methodologies, metrics and technology used to monitor, measure sand manage a business. Once selected the business process that has to be improved, and the business methodology to be implemented, there are the metrics (to monitor, measure and change) to be established. These metrics (key performance indicators) are defined and selected by the business and not by the IT. The final step is to choose the business performance measurement technology. We can say that business intelligence it is just business measurement and not business performance management.

BPM is not a single technology, but rather a combination of elements – BI, scorecarding, profiling. BI looks at and analyses the past and what has happened up until today – this is useful, as planning requires knowledge and you can set planning goals based on the past. Scorecarding enables you measure how you are performing against those planned goals. Every organization has processes in place that feed back to the overall plan. What's new with BPM is the integration of these processes, methodologies, metrics and systems – an enterprise wide strategy that seeks to prevent organizations from optimizing local business at the expense of overall corporate performance.

Factor	Traditional BI	BI for BPM
Scale	Departmental	Enterprise-wide
Focus	Historical	Timely
Decisions	Strategic and tactical	Strategic, tactical and operational
Users	Analysts	Everyone
Orientation	Reactive	Proactive
Process	Open-ended	Closed-loop
Measures	Metrics	Key performance indicators
Views	Generic	Personalized
Visuals	Tables / charts	Dashboards / scorecards
Collaboration	Informal	Built-in
Interaction	Pull (ad hoc queries)	Push (alerts)
Analysis	Trends	Exceptions
Data	Numeric only	Numeric, text, etc.

Table1. Differences between traditional BI and BI for BPM

Source:Ballard, C, Business performance management meets Business Intelligence (2006), http://www.ibm.com/redbooks

Any BI implementation is aimed at turning available data into information and delivering it to the decision makers. BPM is focused on a subset of the information delivered by a BI system – the information that shows business performance and indicates business success or failure and enables organizations to focus on optimizing business performance. BPM involves a closed-loop set of processes that link strategy to execution in order to respond to that task. Optimum performance is achieved by:

- -Setting goals and objectives **strategize**
- -Establishing initiatives and plans to achieve these goals **plan**
- -Monitoring actual performance against the goals and objectives **monitor**
- -Taking corrective action act and adjust

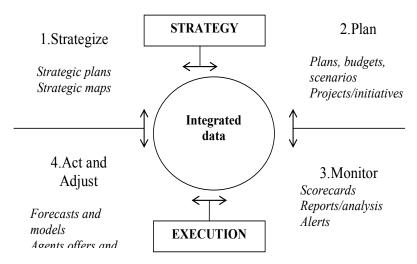

Figure 1. BPM processes

Source: Turban, E & Aronson, J.E. & Liang, T.P. & Sharda, R. (2007), *Decision Support and Business Intelligence Systems*, New Jersey, Pearson Prentice Hall

The key to effective BPM is tying performance metrics to business strategy, and that means a melding of two areas of technological functionality: *strategic management systems* and *performance metrics*. The first are systems that manage the key business processes that affect strategy execution, including objective management, initiative management, resource management, risk management and incentive management. The second is essentially a business intelligence platform for automated data exchange, reporting and analysis.

BPM should produce three core deliverables:

- -Information delivery to enable managers to understand the business.
- -Performance oversight to enable them to manage the business.
- -Performance effectiveness to enable them to improve the business.

Business performance management must be an enterprise-wide strategy that seeks to prevent organizations from optimizing local business at the expense of overall corporate performance

3. Integrating performance management and business intelligence

Most organizations already have a mix of packages and custom built business intelligence applications, including: strategic performance management (on top of front office), enterprise analytics for tactical analysis, operational reports and analytics used to support operational decisions. The problem is that these three decision levels are separated (in terms of applications, users, data sources) when what is really needed is for them to be integrated. Strategic planning is based on stand-alone scorecard, budgeting and planning applications that use scorecard databases that hold only summarized data. There is no detail to allow executives to drill down and find out why a problem occurred in a key performance indicator. Tactical analysis is based on analytic applications, reporting and OLAP tools delivering analytics based on summary and detailed data stored in data marts and data warehouses. Operational reports that support operational decisions are based on detailed databases.

What is needed to manage a business is the combination of strategic and near real time operational analytics- the integration of objectives driven business management using scorecards and dashboards at the strategic level with the business intelligence tools and analytic applications that support business measurement at tactical and operational levels (figure 2).

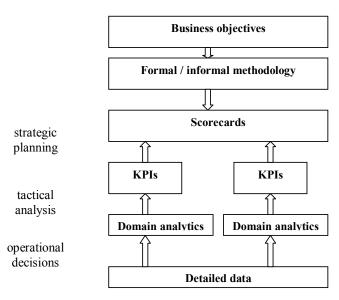

Figure 2. BI integration

Business intelligence projects must be related to strategic, tactical and operational business objectives and BPM, enterprise analytics and operational BI must be integrated into an overall BI framework in order to effective manage business performance.

4. BPM framework

The integration of business and IT process management and BI is a key enabler for BPM. It provides the ability to effectively manage the business and achieving business goals. The BPM framework presented below is based on the integration of business and IT processes at all decision levels (strategic, tactical and operational).

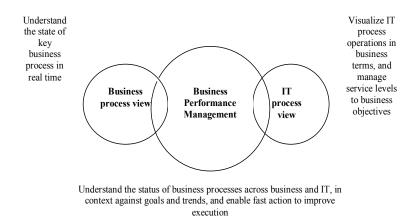

Figure 3. BPM framework

Business flexibility and agility require continuous monitoring of the business processes and support of an appropriate BI environment. An environment that provides information sufficiently current (near real time) to support the requirements for both operational and strategic decision making. BI technologies and products are evolving in order to provide such an environment, and we can list only some of the new trends:

- linking business process data to operational activity data for a complete for a complete view of the enterprise;
- implementation of business rules and Key Performance Indicators to enable consistent management of the business activities;
- automatic alert generation for proactive problem avoidance rather than reactive problem impact minimization;
- real time data flow to enable monitoring and proactive management of business processes.

A BI environment that include these capabilities enables companies to proactively manage their businesses, rather than just react and adjust to business situations as they arise.

The main objective of BPM is to help companies improve and optimize their operations across all aspects of their business. But implementing BPM is much more than just about choosing new technology – it suppose a constant analyze of business environment to determine if changes are required to existing business processes. To be successful with BPM, a company must fully understand it's own business processes and activities that support each area of business.

CONCLUSIONS

Managing and optimizing business performance is a critical requirement not only for maximizing business profitability but even for remaining in viable in today's fast moving and competitive business environment. Effective business performance management will blend business intelligence with elements of planning, budgeting and real time monitoring as well as providing a window on performance. The integration of business and IT process management and Business Intelligence is the first step in managing business performance. Finally, BPM is all about taking a *holistic approach* for managing business performance. The holistic approach enables the integration and use of *business intelligence*, *process management*, *business service management*, *activity monitoring* and *corporate performance management* to achieve a single and complete view of the enterprise.

THE ENTERPRISE INFORMATION SYSTEM AND RISK MANAGEMENT

Rădut Carmen

Universitatea Constantin Brâncoveanu — Pitești Facultatea Management Marketing in Afaceri Economice Rm. Vâlcea Rm. Valcea, Al. Cocorilor, nr. 5, Bl.25, Sc.D, ap.2, cod 240210, jud. Vâlcea c_radut@yahoo.com 0723245092

The yield of enterprise can be accretion by integrating systems to business partners to create highest competitive advantage in the time of run. System integration can be done by adopting the e-commerce technology and Business-to-Business models that will connect with external organizations. With this complication of system integrations, risk management is often supervised because project managers are overwhelmed by the occurring problems and deadlines. If risks are properly identified and handled, the integration project can be even more smoothly implemented. The theoretical section provides understanding objects system integration and risk management while the empirical data is gathered via interviews with people who have experience and knowledge about the system integrating implementation. The results of the study present the major areas of risks that should be considered.

Keywords: Enterprise, System, Integration, Business, Risk.

Cod JEL: C81, D81, G39, M29.

1. The Enterprise Information System

Enterprise entities take advantage of the efficiency from Enterprise information system. Some of this enterprise information systems (are software packages, such as ERP system) are relatively expensive to implement, and also inflexible and costly to customize (Sarkis & Sundarraj 2006). Enterprise entities find themselves competing in the global market either cutting costs or improving efficiency. Having integrated Business-to-Business e-commerce technologies to the enterprise systems, business environment tend to stay competitive over others. The primary drive for these movements toward efficiency gains has been the use of enterprise systems to streamline internal operations and Business-to-Business e-commerce technologies that facilitate the tight linkages with external organizations (Sutton et al 2006). The inter-organizational systems should be implemented to facilitate the integration business process such as the electronic exchange of information flows (Themistocleous et al 2002). Type of Enterprise Information System. Enterprise resource planning software systems attempt to integrate all departments and functions across a company onto a single information system that can serve all those different departments' particular needs. Typically, a department with specialized functions and needs may have its own information system, customized to its particular procedures and duties. Nonetheless, the main effort of an ERP implementation is to combine as much functionality as possible into a single, integrated software program that runs on a single database, in order that the various departments can easily share information and communicate with each other (Tarantilis et al 2008). Enterprise resource planning systems are a one big vendor software package that helps provide best-practice business process functionality running on a single database (Light & Wills 2001). Currently SAP and Oracle are globally accepted as leading Enterprise Resource Planning vendors on this market. The enterprise information systems need to be flexible and adaptive to respond to the changing business needs. Evgeniou (2002) describes four types of organization that relate to their enterprise system types. The first one is standardized enterprise which is lack of inflexibility. The second one is steady state which has low requirement to be flexible. The third one is decentralized enterprise which requires the flexibility to change in the organization but has limited of visibility to global business. The last one is adaptive enterprise which has high visibility and flexibility. This type of enterprises has the system that can support internal process and also provide inter-organization processes such as electronic supply chain system.

Enterprise Integration. Recently many organizations use the process called enterprise integration as a key technique to transform their business processes to pursue the e-business benefits. Integration is the organizations linkage of their systems to partner systems. The enterprise integrates its own business processes with those of its business partners to increase efficiency within a collaborative value chain (Wing & Venky 2004). The e-business current solutions mostly rely on enterprise integration requirements to integrate web-based systems to each other and heterogeneous legacy systems which belong to the organization, its business partners, or other service providers.

The figure 1 gives an overview of enterprise integration methodology. The three concentric rings represent the **key management aspects** of enterprise integration project which are **inner**, **middle**, and **outer rings**. The inner ring represents the process you follow to solve an EI problem, while the middle ring contains the deliverables you produce by following the process, lastly, the outer ring lists risks you must manage during the process to ensure the project's success (Wing & Venky 2004). The six sectors overlaid the rings represent an enterprise integration project's phases.

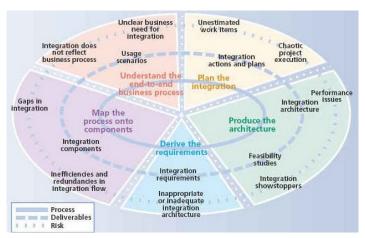

Figure 1. The enterprise integration methodology

Important Factors of System Integration. There are various risks that have potential to arise, such as losing or missing data, or the system processing failure. These risks come from the inconsistency of computer-based systems, for example, a system infrastructure is not properly planned by system architects and developers will lead to unsatisfied reliability of the Business-to-Business technologies (Dean et al 2003). Assurance over risks is related not only to technical and application issues, but also business integration, which are critical to consider. Imed (2000) states that the criteria of the effective functioning of extended enterprise are as the following factors:

- Autonomy of partners which supposes that each one is free to manifest and to take initiatives
- Added value there is no exchange unless each partner finds it beneficial; the value added by each one must be appreciated precisely.
- Adapting to change in so far as it privileges the functional links between its members, the network must facilitate their adaptation to change.
- Mutual aid mutual aid between the members is fundamental.
- **Reciprocity** is an essential rule that the network can only function if each partner receives and gives.
- **Shared values** networks presuppose strong adhesion of each member to a system of values, network quality being a function of the quality of the values quality uniting its members.
- **Common vision** poses many questions, for example, how members plan the future of the network, what the future collective goals are, etc.

There are some issues that should be examined for the larges-scale extended enterprise system implementation. Westone (2003) mentioned that these following issues have potential to cause failures of proceeding with an extended enterprise planning and execution of the system.

2. Enterprise Risk Management

Risk is the net negative impact of the exercise of vulnerability, considering both the probability and the impact of occurrence. Risk management is a framework to classify risks, assessing risks, and mitigate risks to a tolerable impact. Risk management for enterprise is important that it provides useful information for management levels. It is how to handle uncertainty and how risky the management should make a decision with fewest impacts on the business. Uncertainty can be either risk or opportunity for the business, but opportunity can be maximized when strategy and goals are set by balancing growth, return of investment and risks. Enterprise risk management composes of aligning risk appetite and strategy, enhancing risk response decisions, reducing operational surprises and losses, identifying and managing multiple and cross-enterprise risks, seizing opportunities, and improving deployment of capital. These characteristics of enterprise risk management help management to achieve the enterprise performance and profitability targets and prevent loss of resources.

Risk Management Models. The process of risk management basically involves identification of risks or uncertainties, analysis of implications, response to minimize or mitigate risk, and allocation of appropriate contingencies. There are many effective risk management models that can be adopted, depend on suitability of each company or type of the implementing project. For example, the major processes of the supply chain risk management are identify risk, determining the risk management strategy and actions, executing and implementing actions, and monitoring the risk management process and the results, as shown in the figure 2 (Deloitte 2008).

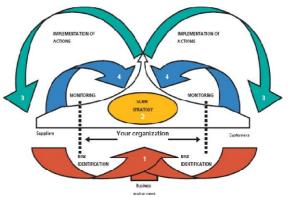

Figure 2 Supply Chain Risk Management Process

In any system integration projects that adopt framework of system development life cycle (SDLC), risk management can be used efficiently and differently for each phase. It can be summarized as the table 1.

Risk assessments can be used as a means of providing decision-makers with information needed to understand factors that can harmfully impact operations and products, and giving concerns about the degree of actions needed to reduce risk. As the consequences of the growing technology, information security risks can be no longer overlooked by the government or business. The risk assessments generally include *identifying threats, estimating the possibility, estimating the potential losses or damage, and identifying cost-effective actions.* Cooper (2005) explains the descriptions of assessment approaches in the step of assigning priority to the risk as following:

- Qualitative analysis is based on descriptive scales such as low, medium, high for
- describing the likelihoods and impact of risk. This is approach useful when the
- enterprise wants to do quick assessment reviewed or initial review.
- Quantitative analysis uses numerical ratio scales for likelihoods and impact, rather
- than description scales
- **Semi quantitative analysis** is the combination between quantitative approach and qualitative approach. The number will be assigned for descriptive scale.

SDLC Phases	Phase Characteristics	Support from Risk Management Activities
Phase 1— Initiation	The need for system integration is expressed and the purpose and scope of the integration is documented	Identified risks are used to support the development of the integration requirements, including security requirements, and a security concept of operations (strategy)
Phase 2— Development or Acquisition	purchased, programmed,	The risks identified during this phase can be used to support the security analyses of the IT system that may lead to architecture and design trade-offs during system development
	The security features of the integrated system should be configured, enabled, tested, and verified	The risk management process supports the assessment of the system implementation against its requirements and within its modeled operational environment. Decisions regarding risks identified must be made prior to system operation
Phase 4— Operation or Maintenance	performs its functions. Typically the systems are being modified on an ongoing	Risk management activities are performed for periodic system reauthorization (or re-accreditation) or whenever major changes are made to the integrated system in its operational, production environment (e.g., new system interfaces)

Phase 5—	This phase may involve the	Risk management activities are performed for
Disposal	disposition of information,	system components that will be disposed of or
	hardware, and software.	replaced to ensure that the hardware and software
	Activities may include	are properly disposed of, that residual data is
	moving, archiving,	appropriately handled, and that system migration is
	discarding, or destroying	conducted in a secure and systematic manner
	information and sanitizing	
	the hardware and software	

Table 1 Integration of Risk Management into the system development life cycle

Stoneburner (2002) has illustrated a sample of risk assessment methodology for IT systems as the following steps (in the figure 3).

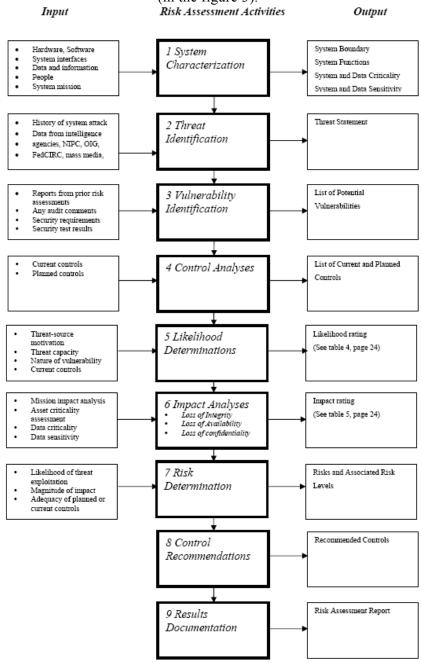

Figure 3 Risk Assessment Methodology Flowcharts

A threat is any agent such as person, activity or event that has potential to damage a system such as type of data processes, stored, and transmitted. Vulnerability is a weakness in the information system design, implementation, internal controls, security control that could be exploited by threat which accidentally triggers or intentionally exploited (Stoneburner et al 2002). The vulnerability is the potential weakness in the system that may be attacked or exploited by threats. The vulnerability in the systems may be found in system design, physical layout, administrators, procedure, personnel, management, hardware, or software.

Risk Determination step will assign risk priority to each risk by comparing the likelihood level (high, medium, low) and impact level. Risk management in extended enterprise systems composes of using risk sharing, control and prevention and financial instruments to lessen the effects of the integrated operational chain risks and their financial consequences.

Conclusions

The integration between partners along the supply chain is a complex and difficult task. Because there is complexity of the exiting systems on both sides of partners which are complicated systems, in many cases they are fixed, reconfigured, or lacking of documents. Moreover, the incompatibility problem and integration problem among systems of those parties such as different standards, computing languages, or platform and operation systems also make it more difficult for integrating task (Themistocleous et al 2004). The risks that derive from the technical factors, has essential impact to other risks (Sutton et al 2008).

Interest is growing among IT executives in the benefits offered by relatively new developments in the business integration arena such as service oriented architectures (SOA). By improving communication and integration between IT systems regardless of the underlying technology, SOA is just one factor that is making it increasingly easy and quick to share information and reproduce best practice, not only internally but also within an extended business partner community.

Business integration, Service Oriented Architectures, Electronic Data Interchange, Enterprise Service Bus.

Introduction

Most large businesses introduced EDI (Electronic Data Interchange) many years ago to enable them to exchange business critical information electronically with their trading partners. EDI was expected to eliminate the manual processes that result in increased order processing and lead times, introduce human error, and cause lost information due to incomplete fax transmissions, mislaid paperwork and unanswered phone calls. In reality, the technology has struggled to fulfil its true potential.

Traditional EDI relied on transforming information into an agreed message format and exchanging it between trading partners via dial-up connections over a VAN (Value Added Network) – a third party mailbox system. Implementing EDI solutions, maintaining the skills needed to produce data in the correct format for exchange and sending data over a VAN has proven to be expensive. Large organisations that can afford to take advantage of the technology's undoubted benefits have failed to see their ROI fully realised because there was no cost-effective solution available for their smaller trading partners, limiting the success of EDI as take-up rates were much lower than initially forecast.

Today this situation is rapidly changing. The international availability of the Internet, the 'commoditisation' of technology, plus related universally accepted data structures such as XML are transforming the way that data is exchanged, opening up the benefits of business integration to all.

Assessing where your organisation is today and identifying where you can make effective changes is an obvious first step to maximising the benefits to be gained from business integration.

Figure 1 indicates a range of integration stages that organisations across various industries can find themselves at from traditional EDI to current best practice. In order to reach best practice, businesses can take two main routes, they can rely on B2B gateway applications (developed inhouse or by a specialist vendor) or they can find a trusted partner to provide integration as a service.

Developments in technology are undoubtedly making it much easier to benefit from business integration by reducing the traditional barriers to entry previously faced by smaller businesses.

The adoption of the Internet, in particular, represents a turning point as it provides a robust, more flexible and cost-effect alternative to traditional EDI based on VANs. However, there are still challenges to be faced. As typical trading communities continue to increase in size, for example, managing them efficiently can become a drain on inhouse skills, resources and time.

	Traditional EDI	Transforming	Best Practice	
Communication Services	Soure, relable electronic delivery is possible botwern larger trading partners using a limit ad number of traditional capabilities such as agendronoushi syndronous, X.25 and X.400 protocols in common use. Data is exchanged in batch mode overnight with slow data exchange speeds	Point-to-point communications based on dist up protocols deliver security using frame relay or leased lines. ISDN emerges as a high-speed option for the batch exchange of data	Soure, reliable, near resi-time electronic delivery of information is possible between all trading partners and application systems. Can work with traditional and emerging expalitiles such as ASC, web services and RosettaNet.	
Trading Partner Management	EDI uptake within the trading community is low. Berriers to entry are high. Trading partner management is handled in-house by EDI teams	In-house EDI management teams are expanded to cope with increasing numbers of trading partners and more complex relationships.	Software tools or outsourcing are used to assist with trading partner management, including community development services, billing operational reports and deathoards. Easy-to-use, customisable portais mean that trading-partners can self-provision and access B2B gat eway applications.	
Integration	Basic integration is delivered through simple file exchange in local directories over a LAN.	Tightly coupled integration using API's (Application Program Interfaces) or ODBC (Open Database Connectivity) links.	Complex integration to many internal applications using many different protocols over LANs and WANs.	
Application Services	No application services offered.	Web-forms available to electronically exchange data with low technology trading partners	Applications deployed to deliver advanced web-forms processes, online reports, archiving of documents, tracking of all documents and maintenance of product catalogues.	
Business activity monitoring and event management	Not Available	Smple error/exception reporting.	Events and information about events captured and stored for analysis. Dashboards graphically display real-time and historic dat abased on the user's profile. Key performance indicators show trading partner interactions from a business point of view (such as response times to POs).	
Service Oriented Architecture (SOA)	Not Available	Not Available	B2B gateways developed using service- oriented design methodologies to enable full interoperability with IT strategy.	
Business Process Management	Not Avail able	Business process management delivered through complex coding or scripting usually created by internal IT departments providing interfaces with EDI software.	B2B gateway enables workflow to be defined within the gateway based on trading partner profiles, business rules and requirements. Basy to configure with low cost and low skill base.	

Figure 1: Business integration development model

Figure 2 shows how, as the traditional barriers to business integration have fallen, the number of trading partners able to become e-enabled has risen. It also shows the range of capabilities enterprises need if they wish to make the most of the opportunities available to them.

By employing the correct business integration strategies, organisations can implement solutions that help optimise and support critical business processes. A tight coupling between ERP systems, e-business and other applications combined with the ability to exchange data in multiple formats with customers, suppliers and partners leads to a collaborative, business process based, virtual enterprise.

Processes and supply chains become visible from end-to-end, business activities can be closely monitored to provide an early alert to potential problems and rules and workflow can be built-in to provide greater control.

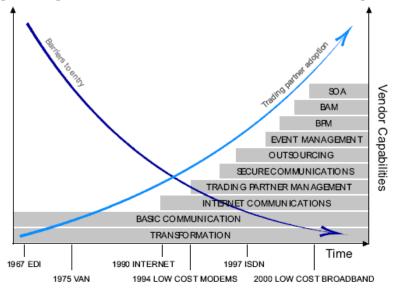

Figure 2. The traditional barriers to business integration

Using just a web browser, data from even the smallest business can be seamlessly created, transformed into the correct format and transmitted to a partner as easily as sending an email. Likewise, small businesses can receive

and manage documents just as simply. No matter how small or where in the world a company is located, it can become part of a global supply chain hosted by a major organisation.

The business benefits of effective business integration include:

- **Improved customer service** shorter lead times for order fulfilment, a reduction in errors, improved tracking and visibility of orders and better communications throughout the supply chain.
- Reduced costs more efficient processes, improved productivity and lower inventory carrying costs.
- Increased profits reduced costs, quicker product development and a shorter time to market.

As business integration evolves, many early adopters of EDI technology – large enterprises - find they have an inflexible solution that has been in place for years and has suffered from under investment over time. There is probably a monolithic ERP system at the centre of the organisation onto which an EDI or B2B gateway solution has been bolted. Often a great deal of complex custom code is required to deliver business process management and provide the capabilities needed to get data into legacy applications. It may be necessary to convert data from EDI formats into XML and back again simply to pass it around the organisation.

In this typical scenario, the speed and accuracy with which data can be moved is compromised. The increasing volume and variety of data produced today becomes a challenge. Add to this the fact that old technologies may no longer be supported, the skills associated with them are becoming scarce, and existing knowledge within the organisation is likely to be held by a small number of ageing experts and you have a situation that makes it difficult to integrate new protocols, message types and services. Managing trading communities in today's fast changing, international environment is complex, especially when it is no longer unusual to have to cope with data from thousands of partners.

Smaller organisations face a different set of challenges. Most will be considering EDI or business integration solutions in response to a request from a major customer and will naturally feel reluctant to change their existing technology or business processes. Many perceive significant barriers as they are unlikely to have a large – or indeed any – in-house IT resource.

The business integration solution

Over time, the information technology landscape inside of and amongst companies changes in fits and starts with new applications, products and technologies coming and going. Ideally, information would flow between applications like electricity through some equivalent of standard wall outlets and plugs. While things continue to get easier and despite what product vendors have promised over the years, significant challenges remain in sharing information services without significant costs, risks and brittle custom development.

Part of the challenge lies in keeping up with changes to the IT landscape. Changes occur as businesses seek efficiencies and improved services to customers and partners and because of drivers, such as company mergers and upgrades to packaged and custom enterprise applications. The business need, business value and technical ease of integrating disparate internal and external systems are growing as the capabilities, costs, standardization and ease of implementation of commercial products are improving.

Historically, when enterprise applications needed to share information with other applications, custom one-off or other proprietary approaches were implemented for each specific case. Over time, these point solutions create a myriad of stovepipe custom connections between components with many moving parts, each requiring different specialized skills. Without a central architecture, reuse strategy and business integration solution, the following problems will emerge:

- **a) Interdependencies** between applications and integration code make upgrades and enhancements expensive, time consuming, risky and unsupportable.
- **b)** Hidden dependencies and bypassing of security and business rules through direct data access results in erratic and incorrect results and difficult-to-diagnose problems.
- c) Lack of discipline and standards in developing point-to-point integration solutions leads to maintenance and management nightmares with different languages, tools, incompatible versions and approaches.
- **d)** Security is largely unmanaged connections between applications are controlled within each custom developed connection with no ability to effectively manage access.

Part of the solution to integration problems lies in architectural governance over the selection, design and development of integration products across all applications. Achieving central control is more difficult than it sounds. In addition to understanding internal enterprise applications, awareness of industry products, trends, standards and best practices are all key requirements for designing and implementing a corporate integration strategy.

A second part of the solution lies in the architecture and implementation of a business integration technology platform. Enterprise Service Bus (ESB), message broker and business process management products from vendors, such as IBM, Microsoft, Tibco and WebMethods provide an integration framework for:

a) Data translation (e.g., to and from various XML and non-XML, standard and custom formats).

Use of software adaptors that can connect to a large variety of commercial packaged applications and technologies, such as SAP, Peoplesoft, Ariba, CommerceOne, CICS and others over a variety of protocols via standard plug-in interfaces.

Routing of messages between applications based on content or availability.

Central management of message flows (including security and failure detection).

Live central monitoring of key corporate metrics (e.g., number of orders flowing through a hub).

Security of message flows between applications.

Tenets of long-lived enterprise scale system design are easily realized with a well- architected integration solution based on products such as WebSphere Business Integration Message Broker, Microsoft BizTalk Server or WebMethods. Design principles used in the implementation of integration solutions are: loose coupling between applications; short and asynchronous transactions; service-oriented interfaces (focus on use/reuse of business services of a system vs. via direct access to data); and reuse through use of industry standards and best practices.

The combination of ESB and message broker products, XML and Web-based standards, and a SOA-based approach to application and commercial product implementations sets the stage for efficient and standardized integration architecture.

Conclusion

Unfortunately smaller businesses unable or reluctant to move with the times find themselves increasingly disadvantaged in the global market.

Without the ability to easily exchange data and integrate it into back office systems they are forced to rely on costly, error prone manual processes that affect business agility. A reluctance to adopt new standards and practices will drastically affect their ability to trade in the future.

The implementation of sustainable development in Romania and the abrupt increase of prices for fussil fuels have imposed more serious activies for the examination of the energy consumption in different industrial sectors. Here, the asynchronous electric motors represent the main loads; therefore the energy consumption in electrical drives has to be careffuly watched. The achievement of various procedures to improve energy efficiency, compulsory imposes an energy balance who aims to illustrate the existent profile of energy consumption.

The study presents an industry case study about estimation of operating systems functioning that use variable speed motors, highlighting the necessity and appropriateness of using informatic instruments that provide calculations needed to elaborate energy balance and by that, to determine the measures to increase energetic efficiency.

Keywords: energy efficiency, electric drive, energy balance, power factor, informatic instruments.

Cod Jel: M15

Energy and Sustainable Development

Along with complex phenomena such as the explosive rate at which the world's population continues to increase, the associated and inevitable increase in energy consumption and the reality of the environment's decline, humanity is faced with three very perilous problems:— Economic Growth, Energy and Resource consumption, and Protecting the environment—in other words, the world is faced with an unprecedented dilemma.

For the world consumption of primary energy forecast, several important studies have been done in the last years by prestigious world organizations in developed countries.

An example of such a study is that conducted by the World Energy Council (WEC) and named Energy for Tomorrow's World. Within this study, at which specialists and organizations of tens of countries took place, were analyzed four scenarios of world primary energy consumption evolution until 2020, compared to the situation of 1960 and 1990, both on a global level, and geographical areas.

The main results of this study are summarized in Table 1.

Table 1.the World primary energy consumption structure(Gtep)

	1960	1990	Scenarios in 2020			
			A	B1	В	C
Coal	1,4	2,3	4,9	3,8	3,0	2,1
Oil	1,0	2,8	4,6	4,5	3,8	2,9
Natural Gas	0,4	1,7	3,6	3,6	3,0	1,5
Nuclear	_	0,4	1,0	1,0	0,8	0,7
Hidro	0,15	0,5	1,0	1,0	8,9	0,7
Traditional Sources	0,5	0,9	1,3	1,3	1,3	1,1
New and regenerable Sources	_	0,2	0,8	0,8	0,6	1,3
Total*	3,3	8,8	17,2	16,0	13,4	11,3

^{*}Differences owned to approximation

Scenarios: A – High economic development; B – reference; B1 – reference to lower energy intensity; C – .organic You can notice the following:

– While the world primary energy consumption increased 2.7 times between 1960 and 1990 a substantially smaller increase for the 1990–2020 period (28 95 %).

According to these scenarios, in the year 2020 the hydrocarbon consumption will increase to

5.4 - 8.2 Gtep compared to 4.5 Gtep in 1990 and 1.4 Gtep in 1960; we can conclude that from the total increased consumption mentioned for 2020, the hidrocarbon ratio will reach 47 - 51% compared to 51% in 1990 and 42% in 1960, denying the pessimistic forecast made a decade ago.

In any of the scenarios, the nuclear energy does not exceed 1 Gtep in 2020, compared to a total consumption of 11.3 - 17.2 Gtep.

Energetic efficiency reflects the relationship between the production of a system and imputed energy. Improving of energetic efficiency means achieving the same effect with a small amount of energy and involves the allocation of material and human resources, whose efficient use must be analyzed. Major sources of energetic inefficiency and loss of energy that occur in materials, devices, equipment, technologies, due to their low quality (thermal insulation, building materials, heat exchangers, pumps, compressors, fans, burners, heating boilers, electrical equipment, appliances, lighting, metering, energointensive technologies, facilities, stolen energy).

Favorable factors for promoting energetic efficiency in Romania are represented by the law, institutions and existing regulations, the relatively high price of energy and fuels. Unfavorable factors (which paradoxically outperforms favorable factors) are owned to the fact that energetic efficiency is downplayed, the responsible institutions are not very active, the energetic efficiency programs are only declarative, without any practical outcome, energy audits are formal, unstimulating penalties, bad management, difficult financing.

The study presents an industry case study about estimation of operating systems functioning that use variable speed motors, highlighting the necessity and appropriateness of using informatic instruments that provide calculations needed to elaborate energy balance and by that, to determine the measures to increase energetic efficiency.

The balance of electric power to act asynchronous short circuit electric motor

An electric drive system (SAE) is represented by all elements that converting electrical energy into mechanical energy, in order to carry out a technological process. As a rule, a SAE is composed of three main components, shown in Figure 1.⁶¹⁵

Figure 1. The structure of an electric drive system

- electric engine (ME) sub-assembly which performs mechanical conversion;
- the transmission (OT) sub-assembly which ensures transmission of motion from the electric motor to involved car:
- machine work (ML) sub-assembly making technological process;
- other items included in supplying device (DA) equipment such as power devices, switching, control, regulation and protection, and in which, usually, loss of significantly electricity does not appear.

General equation of energetic power balance of a SAE is expressed as ⁶¹⁶:

$$W_i = W_u + \Delta W_p + W_r \quad [kWh], \tag{1}$$

Wi – the input energy in the contour balance, representing the amount between outside induced energy and that generated within the contour, [kWh];

Wu – useful energy consumed for the technological process [kWh];

 ΔWp – losses of energy inside the contour, [kWh];

WR – energy released outside contour, [kWh].

Where the energy losses have the expression:

$$\Delta W_p = \Delta W_{da} + \Delta W_{me} + \Delta W_{ot} \qquad [kWh], \qquad (2)$$

 $\Delta \dot{\text{Wda}}$ – loss of energy in power supply device, made by supply equipment, switching, control, regulation and protection, [kWh];

 Δ Wme – energy losses in electric motor, the sub–assembly which ensures mechanical conversion [kWh];

 Δ Wot – energy losses in the transmission, the sub–assembly which ensures motion transmission from the electric motor to involved car

In previous relationship, the engine power losses consist of the following elements:

 $\Delta Wme = \Delta WCu + \Delta WFe + \Delta Wmot [kWh], (3)$

 Δ WCu – losses in wrapping [kWh];

 Δ WFe – losses in the magnetic circuit, [kWh];

 $\Delta Wmot$ – losses in engine power, [kWh]; Since in practice, losses in the machine and in the transmission are difficult to be determined separately, they are regarded as global mechanical losses:

$$\Delta W_{\text{mec}} = \Delta W_{\text{ml}} + \Delta W_{\text{ot}} \quad [kWh], \tag{4}$$

⁶¹⁵ Carabogdan I. Gh. S.a. – Bilanturi energetice. Probleme și aplicații pentru ingineri. Editura Tehnică, București, 1986.

^{616 ***-} ARCE.ICEMENERG. Ghid de elaborare și analiză a bilanțurilor energetice, București, 2003.

In some situations it is difficult to separate mechanical losses in the SAE from the losses in ferromagnetic circuit of electrical machine; in these cases total energy and mechanic losses in iron and electrical power system are highlighted:

$$\Delta W_{Fe,m} = \Delta W_{mec} + \Delta W_{Fe} + \Delta W_{mot} \qquad [kWh], \qquad (5)$$

Energetic losses in wrapping are calculated by the relationship

$$\Delta W_{\text{Cu}} = 3 * K_{\text{f}}^2 * I_{\text{m}}^2 * R_{\text{e}}^2 * \tau_{\text{f}}^* * 10^{-3} * k_i * k_u * k_s \text{ [kWh]}, \tag{6}$$

KF – form factor of the current;

Im – average intensity of electric current within the time frame to which the balance refers;

Re – equivalent resistance of electric current wrapping, $[\Omega]$

Where the equivalent resistance is:

$$R_e = R_1 + R_2 \qquad [\Omega] \qquad (7)$$

R1 – the resistance on phase of stator wrapping, $[\Omega]$;

R2 – the resistance on phase of rotor wrapping reported to stator.

The equivalent mechanical energy losses in asynchronous motor with rotor in short circuit are determined as the sum of the losses in the magnetic circuit (ΔWFe) and of mechanical losses in the engine(ΔW_{mot});

$$\Delta W_{\text{Fe+mot}} = \Delta W_{\text{Fe}} + \Delta W_{\text{mot}} = \{ P_0 - 3 * R_0 * I_0^{-3} \} * \tau_f * k_i * k_u * k_s [kWh],$$
 (8)

while the energetic equivalent of mechanical losses in transmission and the working car has the expression:

$$\Delta W_{\text{mec}} = \{ P_{0m} - 3 * R_e * I_{0m}^2 * 10^{-3} \} * \tau_f * k_i * k_u * k_s - \Delta W_{\text{Fe+mot}}[kWh], \quad (9)$$

Losses of electricity in the power cord are determined by the expression:

$$\Delta W_{\text{linie}} = 3 * K_{\text{f}}^{2} * \tilde{I}_{\text{m}}^{2} * R_{\text{linie}}^{1} * \tau_{\text{f}} * 10^{-3} * k_{\text{i}} * k_{\text{u}} * k_{\text{s}} [kWh],$$
 (10)

Useful energy is calculated from the expression (1), where incoming energy is determined by measurements made at the supply panel jacks of electric actuators and losses are calculated using the expressions outlined above. Thus:

$$W_{u} = W_{i} - \Delta W_{p} [kWh], \qquad (11) \text{ and}$$

$$\Delta W_{p} = \Delta W_{linie} + \Delta W_{Fe+mot} + \Delta W_{Cu} + \Delta W_{mec} [kWh], \qquad (12)$$

Analysis of implementing energy efficiency measures

To highlight the possible measures that can be implemented in order to improve energetic efficiency of an asynchronous electric motor a case is presented of foundries. For the considered contour an actual active energy balance is established so that input energy is the energy absorbed from electric network, energy that can be measured, and the useful energy is represented by mechanical energy developed at the end of the kinematic chain, determined by the expression (11).

On base the results obtained of energetic power balance, proposed to improve power factor

Power factor is defined as the ratio of active power P and apparent power S of the system (fig. 3). In the sine curve system, we can define the cosine angle between voltage and current (fig. 2). Line current of AC machine contains two components: magnetism current (produces the magnetic flux which occur in the machine, but creates a reactive power Q) and the power producing current (which is a current interacting with the magnetic flux to produce the torque of the machine).

The torque of the machine:

 $C=K_{C*}\Phi*I_P$

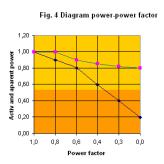

Where:

Kc is the constant torque

 Φ is the flow of magnetism between the iron

Ip is the current which produces the torque, the power

For an electrical installation of an established apparent electrical power, the maximum of active power, i.e. efficiency maximum, is obtained at a power factor as high as it can (closer to unity), a de-phased between voltage and current as low as possible, so to a reactive power consumption of distribution network as low as possible 617.

From the relationship $\cos \varphi = P/S$ appears that the problem of improving the power factor is actually the problem of reducing reactive power absorbed by the consumer of a network.

⁶¹⁷ Zobaa A. F., Comparing Power Factor and Displacement Power Factor Corrections Based on IEEE Std. 18-2002, ICHQP 2004.

A low power factor has a number of negative consequences for the functioning of electrical installation, including: – increasing active power loses; – extra investments; – increasing voltage loses in the network; – reducing energy capacity installations.

Power factor improvement is achieved through:

- technical and organizational methods (natural methods/ways) that consist in the application of measures for streaming the operation, with reduced costs and without being equipped with additional facilities;
- methods of compensation of reactive power by using specialized sources of reactive power.

The most popular method to improve the power factor to a system of distribution with low voltage is to use the power condensers.

The condensers for improving the power factor are available in a wide range of rated reactive powers. The reactive power Q_c which has to be installed to raise the power factor from a value $\cos \phi_1$ to a value $\cos \phi_2$ is based on the active power absorbed by the consumer⁶¹⁸.

$$Q_c = P(tg \varphi_1 - tg \varphi_2)$$

The studied consumer that absorbs an active power P=1000kW at a natural power factor $cos\phi_I$ =0,6. Apparent power is S_I =P/cos ϕ_i =1000/0,6=1667 kVA and current I_I = $P/\sqrt{3} \cdot U \cdot cos$ ϕ_i =1000·103/ $\sqrt{3} \cdot 380 \cdot 0$,6=2532 A. The reactive power Q_c needed to improve the power factor to a neutral value cos ϕ_i =0,92 is Qc=1000(1,333–0,426)=907 kVAr. Increasing the power factor to a value cos ϕ_i =0,92 leads to an apparent power S_2 =P/cos ϕ_i =1000/0,92=1087kVA and a current I_2 = $P/\sqrt{3} \cdot U \cdot cos$ ϕ_i =1000·103/ $\sqrt{3} \cdot 380 \cdot 0$,92=1651 A, both values well below the previous ones. A battery of condensers is chosen Qbc = 920 kVAr. The improved power factor becomes cos ϕ_i =1000/ $\sqrt{10002}$ +(1000·1,333–920)2=0,924

Following the improvement of power factor from $\cos \varphi_1 = 0.6$ to $\cos \varphi_2 = 0.92$

- reduce the apparent power with $(1667-1087)/1667=0,348 \rightarrow 34,8\%$
- reduce loss of power with 1-(1651/2532)2=0.575 $\rightarrow 57.5\%$

Is an analysis technical—economic analysis of reactive power compensation. The economic efficiency of reactive power compensation is pointed out by the method of updated total expenditures. Choosing the best method and development in time of the facilities to compensate the reactive power in the consumer 's installations is made by comparing the total updated expenditures for each variant (natural ways/solutions, specialized sources, solutions for placements), analyzing the situation without compensation (corresponding to the natural power factor), and compensation solutions at different levels of the power factor.

Example of calculating the costs

Three things are taken into account in the payment bill:

- 1. The cost of consumed energy Cec = 0.38 lei/KWh
- 2. The cost of the total required power Cpc = 41.8 lei / KW
- 3. The additional costs due to the power factor below 85%

The paid penalties depend on the minimum power factor η_m , the actual power factor η , and the total required power Ptc⁶¹⁹.

$$C_{\rm sfp} = (\eta_{\rm m} - \eta) \, \text{Ptc* Cpc} / \eta$$

The factory used in a month 240000KWh x 0.38 = 91200 lei

The demand of total power was $1700kW \times 41.8 = 71060 lei$

The paid penalties for a low power factor (70%) 15 x 1700 x 41,8/70 = 15227 lei

For processing experimental data and implementing mathematical relations presented above, we have developed a computer application which purpose is to calculate the necessary elements of the energetic balance according to the electric drive; based on the results, the application displays the corresponding graphs.

The application was made in the Access program. Input data, consisting of the catalog characteristics of engine and experimental determinations are stored in tables, and the results are presented in table reports and diagrams⁶²⁰ (fig. 5).

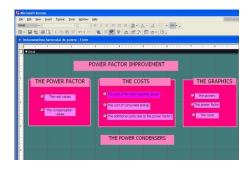

Fig. 5 Update interface

Conclusions

The concept of sustainable development of energy sector has become lately a main concern of our country specialists. As a result, actions have been initiated in order to align to European legislation in the field and also practical activities to implement the energy management principles both in industry and tertiary ⁶²¹.

In industry, the most widely spread electric receptors are the asynchronous motors, so that energy consumption in electrical systems they are integrated in should be carefully monitorized. The implementation of energetic efficiency improving measures mandatory requires an energy audit, which to highlight the real status of consumption way.

In this circumstance, the electricity balance is being developed chiefly to obtain necessary information to determine quantitatively the various components that characterize in terms of energy the operation regimes of electrical installations. Based on these experimental data and on their processing, solutions are established and measures that can be taken for a more efficient use of electricity.

The study presents a computer application that allows to determine components of balance of energy for electric drive systems with asynchronous motors with rotor in short circuit.

The results provided both in table and in diagrams, allow to analyze the actual consumption way and to determine measures to improve energy efficiency in order to reduce consumption.

In our paper we build a reccurence from generalized Garman equation and discretization of 3-dimensional domain. From reccurence we build an algorithm for computing values of an option based on time, momentan volatility of support and value of support on a spot market of an exchange.

Keywords: financial derivatives, Black-Scholes PDE, Garman PDE, reccurence, algorithm

JEL classification: G13, C69

1. Garman functions attached on generalized model with stochastic volatility

In Black-Scholes model⁶²² we supose that volatility is a constant value. Unfortunately, volatility is not constant, and more, can not be predicted for periods greater than several months or even can not be observed directly. For these reasons, it seems natural to present itself as the volatility of a random variable that satisfies a stochastic process. Assume that the variation rate asset support satisfy a stochastic differential equation (SDE) of the form:

$$dS(t) = A(t,S(t),V(t))dt + B(t,S(t),V(t))dW_1(t)$$
(1)

but in addition we assume that the square of volatility (v), follows the stochastic process:

$$dv(t) = C(t,S(t),V(t))dt + D(t,S(t),V(t))dW_2(t),$$
(2)

where the two *Wiener processes* $W_1(t)_{t>0}$ şi $W_2(t)_{t>0}$ are correlated:

$$(dW_1(t))(dW_2(t)) = \rho dt.$$

In this case the value of an option is a function of three variables, V (t, S, v) and because we have two sources of risk need to build a portfolio of coverage to include the option in question and two other components. Assume the existence of a derivative financial unca on the same support, so that the value of this option is a function of three variables, V1 (t, s, v) to check with a law counterparts of V (t, S, v). After applying extended lemma of Ito^{623} , we obtain the existence of a special value β named as the market price of volatility risk⁶²⁴, where:

$$\beta = (-rV + V_S rS + V_t + AV_S + CV_v + \frac{1}{2}B^2 V_{SS} + \frac{1}{2}D^2 V_{vv} + \rho BDV_{Sv} - AV_S)/(DV_v)$$
(3)

If β is known, (3) rewrite as:

$$V_t + rSV_S + (C - D\beta)V_v + \frac{1}{2}B^2V_{SS} + \frac{1}{2}D^2V_{vv} + \rho BDV_{Sv} - rV = 0$$
(4)

⁶²² see [Black1973].

⁶²³ see [Socaciu2009a].

⁶²⁴ see [Moodley2005], p. 8.

is known as *Garman equation*. Note that (4) is a partial differential equation (PDE), like *Black-Scholes* equation, obtained from SDE of model.

2. Particular cases of Garman functions

1. Black-Scholes; in conditions:

$$B^2 = vS^2$$

 $C = D = 0 \Leftrightarrow dv = 0$ (constant volatility)
 $v = \sigma^2$

we re-obtain Black-Scholes equation⁶²⁵:

$$V_t + rSV_S + \frac{1}{2}\sigma^2S^2V_{SS} - rV = 0$$

2. *Heston*; in conditions:

$$A = \mu S$$

$$B = v^{1/2}S$$

$$C = k(\theta - v)$$

$$D = \xi v^{1/2}$$

$$\beta = \lambda v^{1/2}$$

we re-obtain⁶²⁶:

$$V_{t}+rSV_{S}+(k(\theta-v)-\xi\lambda v)V_{v}+\frac{1}{2}vS^{2}V_{SS}+\frac{1}{2}\xi^{2}vV_{vv}+\rho S\xi vV_{Sv}-rV=0 \quad (5)$$

3. *other cases* for particular models can be obtained via particular A, B, C, D and β . An incomplete list of models ⁶²⁷ can be retrieved from [Sundaresan2000] ⁶²⁸.

3. Garman equation on domains' frontier

Equation (5) has on frontiers⁶²⁹:

$$V(t, 0, v) = 0$$
, with $0 \le t \le T$, all v. (6)

and:

$$V(T, S, v) = payoff(S), with 0 \le S, all v.$$
(7)

We need add a new condition on v axis. Simplest condition is based on zero-volatility. In this case, (2) is vanished, and (1) will be rewrite as a regullar BS equation with a specific solutions like⁶³⁰:

$$V(t, S, 0) = BS(t, S)$$
 (8)

4. Domain's discretization and reccurence obtained from Garman equation

We will apply a *Finite Element Method* (FEM⁶³¹) for resolve (5). We know that FEMs are main method for resolve PDE⁶³². First step is to reduce initial domain D_i :

$$D_{i} = [0,T] \times R_{+} \times R_{+}$$

⁶²⁵ see [Black1973].

⁶²⁶ see [Lazăr2006], [Mikhailov2003].

⁶²⁷ with specification of A and B.

⁶²⁸ an other incomplete list can be retrieved in [Lazăr2006]).

⁶²⁹ like in [Socaciu2009b].

⁶³⁰ Numerical solutions will be presented in [Socaciu2009a], [Socaciu2009b] and [Socaciu2009c].

⁶³¹ see [Gârbea1990].

⁶³² see [Coman1994].

to a *limited domain* D:

$$D = [0,T] \times [0,MaxS] \times [0,MaxV],$$

where MaxS is a *big number* that cover all values of potential quotations, and MaxV is an big number that cover all potential volatilities. After discretization with Δt , ΔS and Δv *steps* we will obtain a grid of points. We denote:

$$V[i,j,k] = V(i(\Delta t),j(\Delta S),k(\Delta v))$$
, with $0 \le i \le M$, $0 \le j \le N$, $0 \le k \le P$

where number of points on axis:

M := MaxS/(
$$\Delta$$
S)
N := T/(Δ t)
P := MaxV/(Δ v)

than (4) will be rewrite as:

```
 \begin{array}{l} (V[i,j,k] - V[i-1,j,k])/(\Delta t) + rj(\Delta S)(V[i,j+1,k] - V[i,j-1,k])/(2(\Delta S)) \\ + (C - D\beta) \ (V[i,j,k+1] - V[i,j,k-1])/(2(\Delta v)) \\ + \frac{1}{2}B^2(V[i,j+1,k] - 2V[i,j,k] + V[i,j-1,k])/(\Delta S)^2 \\ + \frac{1}{2}D^2(V[i,j,k+1] - 2V[i,j,k] + V[i,j,k-1])/(\Delta v)^2 \\ + \rho BD(V[i,j+1,k+1] - V[i,j+1,k-1] - V[i,j-1,k+1] + V[i,j+1,k+1])/((\Delta S)(\Delta v)) \\ - rV[i,j,k] = 0 \end{array}
```

That can be rewrite as:

where:

$$\begin{split} a &= (\Delta t)(\Delta S)^2(\Delta v)^2 \\ b &= \frac{1}{2}rj(\Delta t)(\Delta S)^2(\Delta v)^2 \\ c &= \frac{1}{2}(C-D\beta)(\Delta t)(\Delta S)^2(\Delta v) \\ d &= \frac{1}{2}B^2(\Delta t)(\Delta v)^2 \\ e &= \frac{1}{2}B^2(\Delta t)(\Delta v)^2 \\ f &= \rho BD(\Delta t)(\Delta v)(\Delta S) \\ g &= r(\Delta t)(\Delta v)^2(\Delta S)^2 \end{split}$$

But (9) can be rewrite in explicit form:

$$V[i-1,j,k] = pV[i,j,k]+qV[i,j+1,k]+rV[i,j-1,k]+sV[i,j,k+1]+tV[i,j,k-1] +uV[i,j+1,k+1]-uV[i,j+1,k-1]-uV[i,j-1,k+1]+uV[i,j+1,k+1]$$
(10)

where:

$$p = (a-2d-2e-g)/a$$

 $q = (b+d)/a$
 $r = (d-b)/a$
 $s = (c+e)$
 $t = (e-c)$
 $u = f/a$

Note that coefficients p-u are based on t, S and v, and we must rewrite all of them in spirit of (i,j,k).

5. Numerical algorithm based for Garman equation based on triple reccurence

Numerical algorithm is based on (10) reccurence with supplementally (6)-(8) frontier condition is:

```
For i:=MaxM downto 0 do
  For j:=0 to MaxN+MaxM do
    For k:=0 to MaxP+MaxM do
      If i=MaxM then
        V[i,j,k] := payoff(j(\Delta S))
      ElseIf j=0 then
        V[i,j,k] := 0
      ElseIf k=0 then
        V[i,j,k] := BS(i,j)
        V[i,j,k] := pV[i+1,j,k] + qV[i+1,j+1,k]
        +rV[i+1,j-1,k]+sV[i+1,j,k+1]+tV[i+1,j,k-1]
        +uV[i+1,j+1,k+1]-uV[i+1,j+1,k-1]-uV[i+1,j-1,k+1]
        +uV[i+1,j+1,k+1]
      End If
    End For
  End For
End For
```

where BS is a function that call a numerical solution of Black-Scholes like equation on zero-volatility condition. Note that iteration will be computed for j to MaxN+MaxM and for k to MaxP+MaxM because we have some "out of range" problems if we compute V[0,MaxN,MaxP] and cheap resolvation is to compute a supradomain of D.

6. Further works

We work on obtaining parallel version of this algorithm with slicing of D like in [Socaciu2009a], [Socaciu2009b] and [Socaciu2009c]. We try to obtain similar formulae for a multi-SDE model, like Chen⁶³³. We want to start a parallel project for obtain on symbolic way an extendended Ito type lemma⁶³⁴ and from this lemma to build an Garman-type equation.

SERVICE ORIENTED ARCHITECTURE SERVICE ORIENTED ARCHITECTURE -L'ARCHITECTURE ORIENTÉE SERVICES

Stănculea Liana Olimpia

Universitatea Spiru Haret Facultatea de Finanțe și Bănci Blaj Adresa de contact Str. P. Maior Nr. 12 Email lianastanculea78@yahoo.com Telefon 0258711784

Service-oriented architecture (SOA) supply methods for systems development and integration where work interoperable services. A SOA suppose application functionality distribution in distinct units called services that communicate with each other. This services can be delivered in a network or used together for business applications. Pproperties of SOA are a great cpacity for reuse in different application and quick adaptability of market needs.

Keywords Service oriented architecture, interface, coplage, loosly cooplage, services, consummer, orchestration, metadata, programming, programming lanuage.

Cod JEL C8

1. Introduction

En informatique, service-oriented architecture, SOA ou bien l'architecture orientée services AOS fournit des méthods pour le dévéloppement des systemes et integration qui functionnent commes des services interopèrable. L'infrastructure SOA permet à different application de changer de donées antre elles. La paradigme Service-orientation a le but de créer des services avec le couplaje faible loose-coupling, avec des systèmes d'operation et de languages de programmation et d'autres techonologies qui soulignent ces applications. SOA sépare des functions en unitées différentes ou services qui sont accessibles au network et leur utilisaterus peuvent les combiner er les réutiliser in application de production. Ces services communiquent enter eux en passant des donées une à l'autre ou bien en étant coordonateur sur une activité des deux ou plusieurs services. Plusieurs commentateurs voient les concepts SOA construites sur des concepts anciens du calcul distribé et de la programmation modulaire.

L'achitecture orientée services est un group des services qui communiquent un avec l'autre. Le processus de comunicassion implique passer des donées simples entre le fourniseur des services et les consumateurs ou des systémes très compliqués qui fournisent deux ou plusieurs services. Grâce à l'intercommunication il y a la nécessité por trouver des moyens pour connecter deux ou plusieurs services chaqun avec d'auters.

La SOA bâtit ses applications sans appeller au softwere des services. Les services ont comme une partie compsanete des unité de function avec faible cuoplage looasely coupled qui pérmet de n'appeller pas chaque service du système. Un service peut appeller autre service dans son proper code source, en utilisant des protocols qui le pérmet de parler entre eux. Le programmeur, l'ingénieur software ou un expert dans le procès d'affaires associe des objets SOA individuels en se sérvent de l'orchestration. Dand le process d'orchestration l'ingénieur software met ensamble des larges parts de function software-services- dans des arrangements pas hiérarchiques à l'aide des spécials outils qui contiennent des listes des services, leur prorietés et le moyène d'enregisrter les choix de projet pour être inclus dans le système software et utilisé dans run-time.

La SOA peut être utilisée dans des applications d'affaire, des applications guvernamentalles ou des applications militaitres.

La SOA utilise des métadonnées qui décrivent les proprietés des services te les proprietés des donnée qui conduit ces services.

Le but de SOA de mettre ensamble des utilisateurs pour des applications ad-hoc bâtu entierement sur ces services. La grande promesse de SOA est la diminution du coût marginal.

L'achitecture orientée services vient de la langue anglais Service Oriented Architecture est une architecture de mediation , un modèle applicative cet a dire une application informatique qui realize plusieurs tâches ou functions qui active des services (les components logiciels).

Ces services ont une puisante cohérence interne utilisent un format d'échange pivot d'habitude XLM. Elles utilisent aussi des liesons externs faibles "loose coupling" par l'aide d'une interface interopérable qui peut être un service web WS.

Un peut définir le service comme une operation éxecutée d'un fournisseur ou d'un producteur pour un client ou un consommateur ajoutée par un médiateur rsponsable de la relaton des composants.

Le service peut être traté comme un systeme ouverte qui englobe et est responsable de la founctionalitée des ces components. Ces systèmes peuvent être décrit par des couches des applications. L'architecture orientée services répond au problématiques encontrées par les enterprises en ce qui est la réutilisabilité, l'interoperabilié et la reduction des couplages entre systèmes qui implementent leur systèmes d'information.. L'architecture SOA ou AOS ont été rèpandu avec l'aparition des Web Services ou d'e-commerce (B2B ou B2C-business to business ou business to consumer) ayant comme soupport des platforms comme J2EE. Elles appliquent les principes d'urbanisation. Au noyau de l'architecture orienté services on trouve des notions d'anuuaire, de bus, de contract et

de service ce dernier étant la clé de l'architecture orientée services. L'implémentation de la SOA est basée sur Internet et sur WOA (Web Oriented Architecture-l'Architecture Orientée par des Web Services).

2. Les notions défitoires

Le service est la pièce plus petite et plus importante de l'architecture SOA. L'aplication est formé de plusieurs services qui communiquent un avec l'autre par des messages.

La liaison des services est faible autant que les communications peuvent être synchrones ou asynchrones.

Le service peut être programmer à l'aide d'un langage et il peut être mis en practique sur une plat-forme matérelle où virtuelle.

Le service offer plusieurs operations, chacun opération ayant une interface publiée et doit étre autonome c'est à dire il doit mêtre à disposition de consummateur toutes les informations qui sont necessaries pour être execute. Il doit respecter des règles de fonctionnement pour se mentenir en fonction au niveau d'enterprise ayant le but d'aligner l'informatique au niveau des changements des decisions strategiques et techniques.

3. Les caratéristiques du service

Le service est la plus important partie d'une SOA. Il est une partie autonome qui ne depend d'un contexte ou d'un fait externe. Il est composé par des opérations qui represent actions spécifiques que le service peut réaliser. On peut faire un parallèle entre les opérations des services et les méthodes et les classes du monde oriené object.

L'architecture orienté services est formé en essence d'un anssamble de services integés qui communiqué un avec autre. La communacation peut être seulement un retour de données une une coordination de services.

Un service répresent une entité qui a les fontions suivantes:

la large granularié (coarse-grained) qui répresent la prorieté par la quelle les opératins d'un service encapsule un ensemble des functions et opèrent sur un aire de donées large qui contradit la notion technique ;

l'interface peut être commune pour un enssamble de services ou bien un service peut être présent sur un multidude d'interfaces.

la localization : on doit savoir où on peut le trouver avant de l'appeler ;

unique instance : les services ou différent composants peuvent functionner dans lusieurs places au même temps quant même le service est unique. Ils coresponde à la conception "pattern Singleton";

le couplage faible (loosely-coupled) est une proprieté qui montre la liaison des services c'est à dire services connectés aux autre services ou aix clients à travers des documents standards. Ces documents sont réalisés en XLM de la même manière que les web services et ils assurent le découplage ou autrement dit la reduction des dépendances ;

le Synchrone et l'asynchrone.

Le role de l'architecture orientée web (WOA-Web Oriented Architecture)

Pour réaliser SOA à l'interieur d'un système informatic on peut utiliser le web, il étant l'unique support de service sans appeller à un bus pareque le web a une routine et les functions nécessaires à une SOA des quelles on rappèle la sécurité, le routage, etc. L'architecture dont on parle oblige les services d'être exposés sur un web et d'être accessés depuis un URL favorisant les services web. On souvient de pouvoir mêtre des sérvices sur le web sans appeller aux services web. En utilisant ce principe on a le bénéfit que le cadre support des messages d'où on appelle un service —le web- ne doit être configuré, maintenu etc. Quant même cette solution n'est pas la meilleure parceque les performances sont un principe discriminant en rappellons ici les inconvénients des services web. En considérand cette solution du poit de vue architectural on rémarque de convénir aux principes des SOA. La problemme est neuve et ouverte aux débas.

4. Les normes et les protocoles utilisés pour réaliser une SOA

Pour réaliser une SOA on utilise en essence une interface de référence SOAP, Simple Object Access Protocol, le vocabulaire qui decrit les doneées WSDL-Web Service Description Language et un language dr programmation XML-eXtensible Markup Language qui appartirnt aux agents, y compris les béneficiaires des services et les fournisseurs des services.

Le protocole SOAP est construit à l'aide du langage XML et il est orienté object. Il accepte la communiction entre des objects situés à la distance par des messages. D'habitude le transfert est possible à l'aide d'un protocole HTTP ais aussi par d'autre protocole de type SMTP. Le protocole SOAP a deux components. La prèmiè consiste dans une enveloppe qui contiène des informations qui décrivente le message par les quelles est possible la transmition et le traitement du message. La deuxième partie est formée par le modèle de données qui détermine le format du message, l'information à transmettre. SOAP represent une référence découverte par Microsoft et IBM qui est utilisé sur tout pour les architectures de type SOA déstinés aux Services Web.

WDSL réalise la déscription de l'interface publique qui permète l'access à un Service Web plus suvant dans l'architecture SOA. Le programme a à la bese le langage XLM et montre comment on doit communiquer pour employer le service.

XML c'est un language informatique de déscription qui sert surtout à stoker te transférer des données de type texte unicode structuré en champs arborescents.

Avec ces troi objets on réalise l'intreface d'invocation SOA un disositif qui permet la réutilisation des applicatif métiers ayant le but de permettre à l'enterprise de s'adapter rapidement aux echanges du marché.

The use of information and communication technologies in education offers new means of evaluation and examination. e-Testing is a valuable evaluation tool that teachers can use during final exams and students can exploit for self-assessment, in order to gain insight of their level of understanding the course content.

Keywords: e-Learning, online assessment, e-assessment, web based learning

JEL codes: C-88, I-21

1. Introduction

The information and communication technologies development in recent years facilitates the integration of technology with every field, education being no exception. Within the last years, e-Learning, applying the concept of delivering education through technology, explosively developed all over the world. e-Learning is seen as changing the future of education and training, promoting life long learning by enabling learners to learn anytime, anywhere and at any pace.

Assessment plays an important role in the educational process, providing means of recording students' progress and supplying valuable feedback to them. Technology, viewed as an integrated part of education delivering, has increased the availability of effective assessment tools to be used by students, encouraging self-assessment at all stages of the learning process. Therefore, the use of computer based assessment and online evaluation tools has rapidly increased within higher education, often incorporated into learning management systems.

Online assessment is not a simple combination of assessment and technology. The development of technology enhanced evaluation tools brings both opportunities and challenges for the educational process. It has many advantages such as cost effectiveness, time efficiency, unlimited geographic distance, immediate feedback etc. But there are also limitations, one concern being the impact that an inappropriate user interface could have on student performance [1]. On the other hand, although no one is contesting that some aspects of the assessment can be performed much more efficiently and accurately by a computer, there are many other aspects that still require human involvement. However, the general opinion is that both students and teachers benefit when online evaluation is implemented appropriately.

2. e-Testing – an Online Assessment Tool

e-Testing is an evaluation tool, developed as an alternative to traditional methods of examination. Using such software brings a plus to the educational process, improving both learning and examination. The perceived benefits for the teacher or course manager include automated grading and student progress recording, facilitating robust data analysis, reporting, and flexibility. The benefits for the students usually focus on the opportunity for instant feedback, allowing the long-term improvement of their performance [2].

The software product aims to achieve the following functionalities required for an efficient teaching-learning process, namely:

-assessment and self-assessment – based on previously stored questions, assessment tests can be generated, so that students can solve them online;

-recording the students' performance – the results of the evaluations are stored in a database and can provide the history of each student.

As an online evaluation tool, e-Testing can provide important information for both teachers and students regarding the students' progress, being a valuable tool in the learning process. The idea is to use the web to deliver assessment opportunities that allow the students to gain a measure on their understanding of course content. Immediate feedback on test results also helps teachers to identify both students' level of understanding and those areas that they might need to concentrate on.

The product is a Web Application project developed in C# .NET and is able to support two operating regimes:

-administrator – intended for teachers use, allowing for questions and tests administration, users management, and establishing users rights over the application functionality. In addition, the teacher has the possibility to track each individual student's evolution and can obtain various reports and graphical representations of the stored results;

–user – intended for students use, allowing for their online assessment and self-assessment, using a tests generator. The online tests, in the form of multiple choice questions, provide feedback through automatic grading and results recording, also providing the correct answers to the students.

3. Teacher Role

The administrator regime allows the teacher to manage the application users (personal data, test results, users rights), and to administrate questions and tests (updating multiple choice questions, number of questions per test, examination time). For the classical paper assessment method, there is a possibility to generate tests that can be saved in Word format for later printing.

In addition to users management, the teacher can obtain a series of reports that offer the following information:

displaying students having grades that meet certain restrictions; counting and displaying students from one class / year; displaying students from one class that passed / failed; displaying students from one year that passed / failed; searching a student by name.

Fig. 1. Student reports

The teacher can choose to visualize the complete data of a student, including the results from previous examinations.

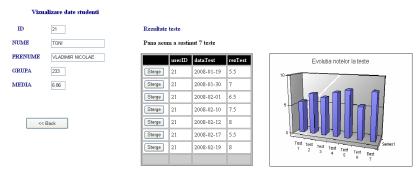

Fig. 2. Student history

Graphical representations in different forms provide more relevant and useful information about various statistical situations:

- -students graduation rate;
- -students graduation rate by years of study;
- -students graduation rate in one class;
- -students distribution by years of study;
- -students average results by years of study.

The second feature of the administrator mode is managing tests; this involves administrating the multiple choice questions stored in the database and setting different characteristics of the generated tests, such as the number of questions or the examination time.

Exiting the administration mode and returning to the login page allows switching between the two operating regimes.

4. Student Role

The student mode allows access to testing the application for both authenticated and non-authenticated users.

Authenticated user is directed to his personal page containing information about his previous tests and his evolution, the student having the possibility of generating a new test. If the student does not have a user account he can still use the software, but the application only allows generating self-assessment tests without saving the results.

The test contains a number of multiple choice questions determined by the teacher; the questions will be randomly chosen from the database without recurrence. For each question five alternative answers are provided, also in random order.

Fig. 3. Test generator

User is allowed to scroll between questions and can rethink an answer. For a more effective evaluation, the time interval in which the test should be done is determined by the teacher.

In order to manage the remaining time, two JavaScript functions running on client were defined, combined with a C# sequence running on server.

```
JavaScript:
                                                  C#:
<script language="JavaScript"</pre>
                                          private void Page Load(object
     type="text/JavaScript">
                                           sender, System.EventArgs e) {
                                                 . . . . . . . . .
function startTime() {
                                           if(!IsPostBack) {
 var x
                                            GenTest();
 x=document.getElementById("LbTMin")
                                            int i=Global.NrIntrTest*
      .innerText
                                                  Global.TimpIntreb;
 document.getElementById("LbTSec")
                                           LbTMin.Text=i.ToString();
       .innerText=x
                                             DateTime d=new DateTime();
 checkTime()
                                             d=DateTime.Now;
}
                                            d=d.AddMinutes(i);
                                            LbTimpMax.Text=
function checkTime() {
                                                  d.ToLongTimeString();
 x=document.getElementById("LbTSec")
                                            }
       .innerText
                                            DateTime d1=new DateTime();
 if (x>0) \{x--\}
                                            d1=Convert.ToDateTime
 var s=x%60
                                                 (LbTimpMax.Text);
 var m=(x-s)/60
                                            TimeSpan
                                                          dif=d1.Subtract
 if (s<10) s="0"+s
                                               (DateTime.Now);
 document.getElementById("LbTSec")
                                                      jt=Convert.ToInt32
                                                  (dif.TotalSeconds);
       .innerText=x
 document.getElementById("LbTimp")
                                          LbTMin.Text=jt.ToString();
     .innerText=m+":"+s
                                           if (jt<0)
 t=setTimeout('checkTime()',1000)
                                            Response.Redirect
                                                ("WebEval.aspx");
</script>
```

When time expires the user is automatically redirected to the evaluation page. The test result is saved in the database and feedback is provided immediately by allowing the student to see the correct and wrong answers he has chosen during the test, and by automatically calculating the grade he obtained. The student can also see a graphical representation showing the quantum of correct and wrong answers.

The test, the selected answers and the correct ones, can be saved in a Word file on the client computer, in order to be consulted later.

The user also has the possibility to generate a new test, to return to his personal page or to logout.

5. Conclusion

The transition from the classical methods of evaluation to the new assessment practices enhanced by information and communication technologies, has been shown to be not only effective but also have benefits for students, teachers, and course administrators. Some of these benefits can be synthesized as follows [5]: improve student learning by identifying their strengths and weaknesses; review and improve the effectiveness of different teaching strategies or curricular programs; improve teaching effectiveness; and provide useful data that will help decision making.

e-Testing is a software program intended for educational use, being designed to be utilized as auxiliary teaching and learning material for any subject in the curricula. Its functionalities allow generating and managing of students' self-assessment and examination tests, and tracking each student's performance.

The software improves, but does not intend to replace the traditional evaluation system. The auxiliary is a useful and practical tool, for preparing self-assessment and examinations tests, coming to support both students and teachers. But, like any other auxiliary, it cannot replace some aspects of the evaluation process, such as the efficiency of the dialogue between teachers and students during the exam and the individual work students need to perform in order to acquire deeper knowledge.

DEVELOPMENT AND IMPLEMENTATION A PLATFORM FOR E-LEARNING WITH MULTIMEDIA TECHNOLOGY

Serbănescu Luminița

University of Pitești Faculty of Economics Sciences Pitești, str. Negru-Vodă, bl. D3, sc. a, ap. 1, Argeș luminitaserb@yahoo.com 0745030906

The e-learning system provides the development of the learning process by organizing and correlating the following: general managerial activities, organizing activities of the learning process, sustaining activities of the learning process. This article contents a detailed analysis of the application conception way for the management of the students' activity in a faculty(data structures, functionalities, projecting and realizing the application). E-learning platform implemented(which allows the student to access the didactic material anytime and anywhere, this way developing mobility and easiness in the theoretical activity) offers a support for teaching and learning, for testing and evaluation, for administrate the curriculum area and for monitoring the whole learning process The platform has four types of users, of which three of them playing administrative roles (administrator, secretary, professor) and one of them is for the students.

Keywords: Internet, multimedia technologies, e-learning, professor, students

JEL Classification: C88(Other Computer Software), I23(Higher Education Research Institutions)

The present quality of education needs improvement, and the education institutions should be receptive to the economic and social realities and exigencies, the european problems, the labour market requirements.

One should not omit the fact that the education institutions in Romania has to run on a competition education market and this requires a higher managerial autonomy of each institution, a flexible normative background and a proper financing, in order to face competition. To be competitive means more opening, transparency and competition, a revision of services and marketing culture according to the realities and values of the European education system (as the cultural diversity, the research orientation).

As the information technologies are widely used, the actual problems in Romania referring to e-learning are technology development and joining the educational standards on Internet, and on the other hand, their proper application by as many users as possible. The user of the present society (based on knowledge) is any person willing to be trained in a certain field, according to his/ her knowledge degree and cognitive need in a certain context

This article provides a solution to improve and make efficient the management of students from a faculty, using the Web technologies. The application is divided into 5 modules:

- the public module provides a series of information regarding the distance learning (the profiles of each faculty, how to register, the admittance methodology, the educational offer);
- the administrator module provides the necessary functions to manage the organizational chart of the university and the account management;
- the secretariat module provides the necessary functions to manage the organizational chart of the profiles, as well as the necessary functions to manage students' activities;
- the teacher module provides the necessary functions to manage the organizational chart of courses, laboratories and examinations, as well as the necessary functions to manage students' activities;
- the student module offer the students the possibilities to get note books and courses, information regarding the activity during the courses, or to discuss with their colleagues and tutors through chat or e-mail.

The main aim of this system is the development of a medium easy to be used both by the students and the teachers. The success of the application depends on the teacher's availability to make known this system provided with a qualitative educational content and with a questions set relevant in number and content[1]. By means of this system, the teachers may offer the students learning unities in digital format as well as questions for self-evaluating. The created e-learning platform is developed on the Microsoft Active Server Pages technology and can be used in any network based on a Windows server. The database is created with Microsoft Access Aplication and contains 30 tables and in 16 of them there are different types of relations.

1. The public module provides information regarding the educational, the admittance methodology and the user's guide. The model also provides information regarding the faculties that run within the university, the profiles of each faculty and the number of positions, the tuition and what to do to become a student.

This module offers information regarding the education plan of each profile for each university year, the students registered for distance learning and their school records. All events of the university the students and teachers may participate in (conferences, seminars) may be found here. If a student does not access the pages of educational resources for 30 consecutive days, then he/ she will receive an e-mail that he/ she has to participate in the educational process, when a user of the public module access it.

2. The administrator module. The functions offered by the administration module are very important, because the other modules and functions depend on them. The functions of the administration module may be grouped into the following categories: functions necessary to the organizational chart of the university: faculty updates, profile updates, teacher update; functions necessary to account management: updating the administrator's personal account, updating the teachers' and secretaries' accounts; functions necessary to communicate: forum administration. The administration panel of the forum is the place where most configurations are made. The administrator controls here the forum and category organization, and may configure the forum names and self cleaning settings.

Figure 1 Administrator Module – Listing the existing specialization

The administrator having an account for the application may introduce in a form the account name and password, and when clicking OK the application will check if there is such an account and password. According to the testing results made by the application, the administrator will be allowed to access the functions of the respective module corresponding to his/ her account, otherwise an error message will be displayed.

I will choose the operation of profile update to exemplify this. The administrator is allowed to do the following operations(see figure 1):

- list the existing specialization;
- add new specialization;
- change a specialization;
- delete a specialization;
- update secretary account.
- **3.** The secretary module provides functionalities necessary for the administration of the organizing structure of specializations as well as functionalities necessary for the administration of the students' activity(updating of university and learning years, of students and studying plan).

The data is organized on calendaristic years. There are links to the study years for every calendaristic year. On the first adding of a calendar year the Ist study year is created automatically.

Since there are no major structural changes from one year to the next one, all the data from the past year is transfered to the newly created year in order to help the secretary. This data is about the curricular areas copied for the first year, the eventual differences are to be manually operated by the secretary later on. Even more, the students which accumulated a certain amount of credit points established by the secretary, are going to be automatically transfered to the new study year. This is the reason why the operation of adding a new study year is possible only from the moment of finalizing the previous calendar year. The students in the final years are going to be transfered to the next year wich does not exist in the educational system so for these students is going to be automatically generated the registration certificate after the graduation of the licence(degree) exam.

The creation of a curricular area involves establishing the study subjects for every study year, the specific credit points, the manner of evaluation(exam or preliminary examination), the universitary term of study for each subject, the teacher in charge of the course and the tutor. The actualization of teachers is made by the administrator, the secretary being able to choose from a given list the teacher and the tutor in charge of every course. The secretary can display all the existing subjects in the curricular area, each being provided with modify and erase/delete options.

The secretary can display all the students taking the specialization he is in charge of, as well as the data containing the registration number, student's class, e-mail address, acount username and password. The acount username and the password are given to the student in the moment of registration. These fields are automatically generated by the application and are no subject of alteration by the student or the secretary.

- a). Academic status (situation). Always, before passing to a new calendaristic year, in order to execute the right data transfer, the secretary has to access the "Academic situation" page. When this page is accessed, the data of each student are updated in the tbl calculstud table as follows:
 - the number of passed (taken) exams is calculated;
 - establishing the number of the not passed exams;
 - establishing the number of credit points acumulated:
 - the calculation of the year's graduation average mean

There are two information cathegories offered:

- a statistical situation concerning the number of passed exams, the number of not passed exams, the graduation mean of the previous study year, the total amount of credit points acumulated by the students registered for the distance education. The data can be displayed using the following selection cathegories:
 - students in alphabetic order
 - students in decreasing mean order
 - students grouped in classes (study groups)
- searching students by their names (this option is particulary useful for the people knowing students registered to the distance education such as parents, mates, friends)
- the academic situation of a student in a specific universitary study year and the graduation mean for the year. Here are also available the credit points obtained for for each subject in the curricular area, the university term of study and the manner of evaluation. This information is available in a printed version as well. (as seen in figure 4)
- b). Registration certificates. For the graduates, the academic situation for all the study years is contained in the diploma/certificate supplement. The secretary is filling data in this supplement only in some specified fields, the rest being automatically generated according to student's academic results. The supplement may be filled on line and printed or saved as a Word document, saved completely and printed eventually. In order to save it as a document, the secretary has to choose the "Save As" option from the "File" menu, to choose the position on disk to keep the file, to name the document and use the .doc extension. This second option is recommended, this way the data is going to be saved and easily used at a later time.

To generate the registration certificates the annual mean was calculated using two exact decimal places without rounding up, the annual sum of credit points, the general mean of all the study years, the total of credit points, the position of the graduate out of the total of graduates.

- c). Centralizing records. This option is usefull for the secretary to display the students' results both for printing as well as keeping them in the registration certificates. Using the centralizing records, the secretary is able to provide more and quicker information for the students concerning their academic situation. The students are displayed by classes. For every student is displayed the academic situation as follows:
 - the marks/grades of passed exams in black;
 - the not passed exams in red;
 - missing/absence of an exam in green

We choose this manner of displaying data in order to assist the secretary in producing various statistics about passing exams, absences or not passing exams.

Figure 2. Centralizing records

4. The teacher module provides functionalities necessary to administrate the course organizational structure(the materials divided in chapters), the examination schedule, evaluation forms and students'activity. This module includes the students'communication by chat or mail. Functionalities offered by the teacher module are grouped in the following categories:

- functionalities necessary to the administration of the organizing structure of the courses: the transmission of the course materials, presentations of the chapters from the material
- functionalities necessary to the examination of the students: the establishing of the evaluating form, of the on-line tests of the chapters which come across in the examination
- functionalities necessary to the administration of the students' activity during the courses: pointing the students' activity at the examinations
- a). The hand filling in of the catalogues. Taking into account the groups of students, the teacher can complete the catalogues by introducing the marks in a form. First of all, each student has 5 spaces for marks (the student can repeat the examination 5 times). The teacher must first choose the date for the examination and the number of marks of which the final mark is formed (a mark if the teacher chooses only one summative evaluation or more if more examinations are wished).

For each student in a group there are three columns representing the obtained mark, date of examination as well as the possibility of improving the mark. This last column after the first passed examination, appears a cassette of validation. If the student asks for improving the mark, the teacher fills this cassette of the respective student, giving him this possibility(see figure 3). This is an important aspect because after the first exam session, the teacher can mark only those students who haven't passed the exam or who have chosen to improve the mark.

At a new examination, the teacher has the possibility to mark only those students who haven't passed the examination or who wanted to improve the mark, if the validation cassette was filled, the teacher having thus a clear situation of the passed examinations and of the re-examinations. After each exam session, the teacher has the possibility to list the catalogues and to save them in a file on PC.

Figure 3. Filled in rolls

b). The automatic filling of the catalogues. The teacher has the possibility to complete the catalogues in accordance with the obtained grade sat the on-line tests at the first exam session or at the re-examination sessions. Thus, after filling in the date of the examination and the number of marks, the teacher must fill in the dates when the examinations took place and the percentage of each mark(see figure 4). At the first examination, all students will be listed who didn't pass the on-line examination or the missing students, and at a new examination all will be generated automatically in the catalogue only for those students who haven't passed the examination or asked the improving of the grade.

Figure. 4. The form for filling in rolls with many marks

If the student tries to sustain the examination for several times at the established date because he is not satisfied with the grade, all his marks are saved in a table in the data base, and when the catalogue is generated, the obtained mark of the first testing is taken into consideration.

5. The student module offers the students the possibility to acquire note books and courses, information regarding the activity during the present courses, self evaluating tests for each chapter of the course, or to discuss with their

colleagues and tutors through chat or e-mail and see the project topic they have to do, as well as the structure of the group they are part of. The student module offers to a student (who has an account for the application) the following functions:

- the possibility to access all course materials for all the subjects studied in the respective semester;
- chapter presentations for each subject;
- the possibility to access the virtual an online laboratories (for certain subjects):
- online testing and self testing for each chapter;
- listing the final marks for each subject of the current semester;
- communicating with their colleagues and subject tutor.

Conclusions

The Web application aims the improving of the teacher's work in administrating the students' activity at the courses which these attend in the present semester. By the means of the web application, the students have access anytime at the information referring to their activity at a certain course, and the natural errors and the losses which could appear because of the human mistakes, are completely eliminated.

The most important functionalities which are available for the administrator, the secretary, the tutors or the students of this application are:

- the possibility of saving and updating the specializations in a faculty, as well as the disciplines of each specialization (year and semester organized courses the school program) administrator account
 - administration of the teacher's and students' accounts by means of the administrator account
- the possibility to set each course, the list of teachers and tutors as well as the of students attending the courses the secretary account
- the possibility to save the information offered by the teachers about the students during the semester (partial marks, final examination mark) teacher and secretary account
- the automatic calculation in accordance with the established settings, final marks of the student sat each course in the semester
- the possibility to access in real time the information about the students activity at a certain course student account

Business Intelligence is the combination of the information from several sources, and presenting results in a form that can be used in taking business decisions. Processed and presented in an intelligent way, this information gives the company the advantage necessary to face competition. Implementing a BI solution is more than simply applying technology to achieve a particular business objective or to address a problem. Business Intelligence allows end users to interact with business information and answer ad hoc questions without advanced knowledge of the underlying data sources. These tools support query generation and basic report authoring, as well as integrated analysis. In this article, I will present a BI solution, implemented through OlikView Application, thanks to which it is possible to monitor the company personnel.

Keywords: human resouce, business intelligence, QlikView, monitoring, analysis

JEL Clasification: M12(Personnel Management), M15(IT Management)

We can define Business Intelligence as the platform for the presentation of information in a correct, useful and specific manner to decision makers in due time to help them make efficient decisions.

Even though most applications offer an easy reporting system, a BI application does not analyze the information from one source but from different applications. At the basis of a BI application there is a common data warehouse for all applications that makes 80% of the time to be used for data analysis. The key to understanding BI is to figure out the way in which data is transformed in information and then analyzed and integrate it in BI architecture, tools and applications. BI does not produce data; it uses the data created by enterprise applications: ERP, CRM, SCM etc.

Even though in Romania the interest in such solutions cannot be compared to that on developed markets, the situation has changed lately. In spite of this, at a world level, new changes appear in the basic philosophy of "business intelligence" software solutions.

Due to the increase in the rhythm of business development in today's world, the managers need more and more to exercise a more precise and sophisticated control, giving up outdated practices and trying to base their decisions on more accurate information. What is more, delegation in decision making could not function properly without adequate access to information.

The effects of installing a BI system are amazing, since it produces the needed information exactly when it is needed, ensuring at least one of the ingredients of business success. BI can offer answers to the essential problems of an organization. Answers are found based on the analysis and comparisons of historical data, both of those within the organization and of those from external sources. Collecting and analyzing the data allows managers to understand business tendencies, the weak points and strong points, to analyze the competitors and the market situation.

The labor force is no doubt the most important resource within a company. The efficient use of the labor force and the possibility to evaluate employees, the optimal development of the recruiting processes, the development of programmes for personnel training – are only some of the elements that contribute to the business success. Human resource management plays the most important part in increasing the profitability of a company. In this context, the use of BI solutions to carry out informational and analysis processes related to human resources is a compulsory requirement.

In Romania the management centered on internal processes still prevails over the management centered on customer and finally, on the human resources. Thus, in the context of the revolution experienced by the Romanian economy with regard to the cost and human resource fluctuation, the lack of a strategy for all employees results in huge loses, difficult to measure and prove.

A good administration of human resources allows not only a decrease in the costs of personnel management but also the increase in individual profitability. The final aim should be to place the employee at the centre of the enterprise strategy and to integrate him in the totality of traditional functions for the management of human resources.

More and more companies that use ERP solutions have developed specialized modules to analyze and synthesize of management information. The integration of advanced BI technologies, with solutions based on reference data on the market, allows companies to implement functions for an efficient processing of the data collected by the means of this kind of solutions.

In order to build the monitor of personnel application we made use of the QlikView application, a strong and complete pack of Business Intelligence software and of data analysis which offers a better means of handling the data of a business.

Qlik View is the business intelligence solution that extends the concept of simplifying the analysis for everybody, further than ever. The extended facilities for personalizing and visualizing information, combined with advanced co-operative work abilities make QlikView easily adapted within organizations (companies and public institutions) that use intensively electronic data stocks.

Qlik View offers:

- personalized dashboards;
- a powerful reporting engine fast and easily combines and distributes data from multiple sources;
- flexible solutions Qlik View users can connect to the internet;
- personalized applications the possibility to develop very fast 100% personalized solutions.

Data referring to human resources is processed in due time and analyses such as: the analysis of labour force, absenteeism, productive hours, personnel expenses, training days etc can obtained. The simple and comparative analyses, the examples and statistics shown in a corresponding chart are important means to support decision, the solution meeting the needs of the company in the short, medium and long term.

For exemplification I have built, by the means of QlikView application the following three calculation pages:

1. Gross income analysis: where the departments of the company and the positions are shown in a table(see fig.1). For each function and a period of time of four months the following information is calculated: the number of employees holding the same position, the total sum and the monthly average of the gross income for taxation as well as the minimum and maximum gross income assigned over a month. Of course the graphic can be changed with only a few clicks to obtain the same sheet for each employee. Thus the differences in salary from one month to another and between two employees with the same position can be noticed. The monthly evolution of these parameters is easy to follow, and comparisons can be made between two consecutive months.

Figure 1 – Gross income analysis

2. Salary expenses that contains, for the company, the total sums regarding the standard wage, the gross salary, total cost, net salary and the total number of employees per month. This analysis is very important as it presents the salary and personnel fluctuations for each month. The report can be modified, by changing the parameters to offer the same information for each department..

Figure 2 – Salary expenses

3. The supervision of employee activity. Is done by recording the days with sick leave and holidays, the number of training days, extra hours, the hours with normal work regime, the hours worked in the night shift or on holidays, for each month(see figure 3).

A simple click can change the chart to visualize information on sick leaves and holidays, the number of extra hours, the number of hours worked in the night shift or normal work regim per employee or change the period of time(one month or nonconsecutive months).

The same information on leaves can be displayed in a chart but grouped on a department, on positions or on budget groups.

The charts show the monthly evolution in the number of working hours, the absenteeism or personnel refresher courses.

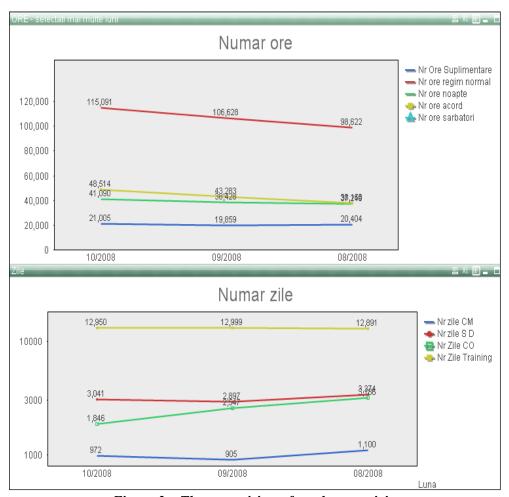

Figure 3 – The supervision of employee activity

4. Bonus calculation includes, for each department of the company, the total number of extra hours, the value of extra hours and the sums of money from the bonus category awarded to employees every month(see fig. 4). The bonus is one of those elements that increase motivation and influence the productivity of the employees' work. Motivating employees improves their spirits and the individual development of the employees, and creates an organizational climate that encourages work and high performances in the organization. The efficient use of motivation by managers requires inborn qualities and special training. In fact, these elements represent the content of leadership which has been highly stressed lately with substantial economic results in the competitive companies of developed countries. The report can be used to create statistics regarding the bonuses awarded to the company employees in a month or over a certain period of time. At the same time, the sums in the incentive category given

by company to its employees can be compared, for the whole company or for each department and there can be gathered information regarding each employee, to know exactly the degree of satisfaction of the economic expectations of the employees.

Figure 4 – Bonus

5. Evolution of pay rise contains for each employee the minimum standard wage and the maximum standard age the difference between maximum and minimum, the percentage of the difference and the average standard salary over a three month period of time. (See fig. 6). The last column shows the number of months with pay rise. The actual analysis of the salaries can be done when it is needed, for the whole company or only for a small group of employees.

Figure 5 – Evolution of pay rise

This report offers the informational support to control pay rises in a company with decentralized decision, with many employees (the increase percentage of over 20% are automatically signaled – colored in red). In the present example the increases are due to the change of position as well as the pay rise decided directly by the employer.

Conclusions

If Romanian companies wish to survive the pressure of European competitiveness, business intelligence solutions can provide them with the necessary means to achieve it.

The benefits of using some BI systems to monitor human resources can be divided into:

- providing a comprehensive perspective over the labor force and thus foreseeing the impact of HR decisions;
 - monitoring employees' performances;
 - data security and protection;
 - fast access to different information and actions;
 - personnel management within the organizational structure of the company;
 - the possibility to simulate multiple variants of salary alteration to ensure a proper budget allocation;
 - preserving the history of the employee's activity and the material benefits received;
 - monitoring the efficiency of the employees' activity and their progress;
 - the management of the advance of wages, prizes, salary growth, and deductions,
 - cost cutting and increasing activity efficiency within the human resource department.

The list of benefits, compared with the ERP systems ca continue with: saving the time spent with the periodical reports (report collecting, diverse consolidations and adjustments, reducing the amount of time spent on repetitive activities, reducing the part played by the IT department in generating reports in favor of the end-user and, the most important thing, reducing the time for decision making. When the decision is better documented due to the quality of the available information we can finally talk about an organization ready to face any changes that might occur on the market no matter how fast or sudden they are.

Electronic learning (or e-Learning or eLearning) is a type of Technology supported education/learning (TSL) where the medium of instruction is through computer technology, particularly involving digital technologies. E-learning has been defined as "pedagogy empowered by digital technology". In some instances, no face- to- face interaction takes place. E-learning is used interchangeably in a wide variety of contexts. In companies, it refers to the strategies that use the company network to deliver training courses to employees. In the United States, it is defined as a planned teaching/learning experience that uses a wide spectrum of technologies, mainly Internet or computer-based, to reach learners. Lately in most Universities, e-learning is used to define a specific mode to attend a course or program of study where the students rarely, if ever, attend face-to-face for on-campus access to educational facilities, because they study online.

Keywords: e-learning, virtual classrooms, learning technology, online learning, online education, m-learning

Market

The worldwide e-learning industry is estimated to be worth over thirty-eight (38) billion euro according to conservative estimates, although in the European Union only about 20% of e-learning products are produced within the common market. Developments in internet and multimedia technologies are the basic enabler of e-learning, with content, technologies and services being identified as the three key sectors of the e-learning industry. ELearning is a catch-all term that covers a wide range of instructional material that can be delivered on a CD-ROM or DVD, over a local area network (LAN), or on the Internet.

Growth of e-learning

Many higher educations, for-profit institutions, now offer online classes. By contrast, only about half of private, non-profit schools offer them. The Sloan report, based on a poll of academic leaders, says that students generally appear to be at least as satisfied with their online classes as they are with traditional ones. Private institutions may become more involved with online presentations as the cost of instituting such a system decreases. Properly trained staff must also be hired to work with students online. These staff members need to understand the content area, and also be highly trained in the use of the computer and Internet. Online education is rapidly increasing, and online doctoral programs have even developed at leading research universities.

Technology

Today many technologies can be, and are, used in e-Learning, from blogs to collaborative software, ePortfolio, and virtual classrooms. Most eLearning situations use combinations of these techniques.

Along with the terms *learning technology*, *instructional technology*, and Educational Technology, the term is generally used to refer to the use of technology in learning in a much broader sense than the computer-based training or *Computer Aided Instruction* of the 1980s. It is also broader than the terms *Online Learning* or *Online Education* which generally refer to purely web-based learning. In cases where mobile technologies are used, the term M-learning has become more common. E-learning, however, also has implications beyond just the technology and refers to the actual learning that takes place using these systems.

E-learning is naturally suited to distance learning and flexible learning, but can also be used in conjunction with face-to-face teaching, in which case the term Blended learning is commonly used. E-Learning pioneer Bernard Luskin argues that the "E" must be understood to have broad meaning if e-Learning is to be effective. Luskin says that the "e" should be interpreted to mean exciting, energetic, enthusiastic, emotional, extended, excellent, and educational in addition to "electronic" that is a traditional national interpretation.

In higher education especially, the increasing tendency is to create a Virtual Learning Environment (VLE) (which is sometimes combined with a Management Information System (MIS) to create a Managed Learning Environment) in which all aspects of a course are handled through a consistent user interface standard throughout

the institution. A growing number of physical universities, as well as newer online-only colleges, have begun to offer a select set of academic degree and certificate programs via the Internet at a wide range of levels and in a wide range of disciplines. While some programs require students to attend some campus classes or orientations, many are delivered completely online. In addition, several universities offer online student support services, such as online advising and registration, e-counseling, online textbook purchase, student governments and student newspapers.

ELearning can also refer to educational web sites such as those offering learning scenarios, worksheets and interactive exercises for children. The term is also used extensively in the business sector where it generally refers to cost-effective online training.

Goals of e-learning

E-Learning lessons are generally designed to guide students through information or to help students perform in specific tasks. Information based e-Learning content communicates information to the student. Examples include content that distributes the history or facts related to a service, company, or product. In information-based content, there is no specific skill to be learned. In performance-based content, the lessons build off of a procedural skill in which the student is expected to increase proficiency.

Computer-based learning

Computer Based Learning, sometimes abbreviated to CBL, refers to the use of computers as a key component of the educational environment. While this can refer to the use of computers in a classroom, the term more broadly refers to a structured environment in which computers are used for teaching purposes. The concept is generally seen as being distinct from the use of computers in ways where learning is at least a peripheral element of the experience (e.g. computer games and web browsing).

Computer-based training

Computer-based training (CBT) services are where a student learns by executing special training programs on a computer relating to their occupation. CBT is especially effective for training people to use computer applications because the CBT program can be integrated with the applications so that students can practice using the application as they learn. Historically, CBTs growth has been hampered by the enormous resources required: human resources to create a CBT program, and hardware resources needed to run it. However, the increase in PC computing power, and especially the growing prevalence of computers equipped with CD-ROMs, is making CBT a more viable option for corporations and individuals alike. Many PC applications now come with some modest form of CBT, often called a tutorial. Web-based training (WBT) is a type of training that is similar to CBT; however, it is delivered over the Internet using a web browser. Web-based training frequently includes interactive methods, such as bulletin boards, chat rooms, instant messaging, videoconferencing, and discussion threads. Web based training is usually a self-paced learning medium though some systems allow for online testing and evaluation at specific times. Recent years have seen an explosion in online training for educators by content providers such as Knowledge Delivery Systems, Atomic Learning, PBS Teacher line, and more.

Computer-supported collaborative learning (CSCL)

Computer-supported collaborative learning (CSCL) is one of the most promising innovations to improve teaching and learning with the help of modern information and communication technology. Collaborative or group learning refers to instructional methods whereby students are encouraged or required to work together on learning tasks. It is widely agreed to distinguish collaborative learning from the traditional 'direct transfer' model in which the instructor is assumed to be the distributor of knowledge and skills.

Pedagogical elements

Pedagogical elements are an attempt to define structures or units of educational material. For example, this could be a lesson, an assignment, a multiple choice question, a quiz, a discussion group or a case study. These units should be format independent, so although it may be implemented in any of the following methods, pedagogical structures would **not** include a textbook, a web page, a video conference or Podcast.

When beginning to create e-Learning content, the pedagogical approaches need to be evaluated. Simple pedagogical approaches make it easy to create content, but lack flexibility, richness and downstream functionality. On the other hand, complex pedagogical approaches can be difficult to set up and slow to develop, though they have the potential to provide more engaging learning experiences for students. Somewhere between these extremes is an ideal pedagogy that allows a particular educator to effectively create educational materials while simultaneously providing the most engaging educational experiences for students.

Reusability, standards and learning objects

Much effort has been put into the technical reuse of electronically-based teaching materials and in particular creating or re-using *Learning Objects*. These are self contained units that are properly tagged with keywords, or other metadata, and often stored in an XML file format. Creating a course requires putting together a sequence of learning objects. There are proprietary and open, non-commercial and commercial, peer-reviewed repositories of learning objects such as the Merlot repository.

A common standard format for e-learning content is SCORM whilst other specifications allow for the transporting of "learning objects" (Schools Interoperability Framework) or categorizing metadata (LOM).

An excellent example of e-learning that relates to knowledge management and reusability is Navy E-Learning, which is available to Active Duty, Retired, or Disable Military members. This online tool provides certificate courses to enrich the user in various subjects related to military training and civilian skill sets. The e-learning system not only provides learning objectives, but also evaluates the progress of the student and credit can be earned toward higher learning institutions. This reuse is an excellent example of knowledge retention and the cyclical process of knowledge transfer and use of data and records.

Communication technologies used in e-learning

Communication technologies are generally categorized as asynchronous or synchronous. *Asynchronous* activities use technologies such as blogs, wikis, and discussion boards. The idea here is that participants may engage in the exchange of ideas or information without the dependency of other participants' involvement at the same time. Electronic mail (Email) is also asynchronous in that mail can be sent or received without having both the participants' involvement at the same time.

Synchronous activities involve the exchange of ideas and information with one or more participants during the same period of time. A face to face discussion is an example of synchronous communications. Synchronous activities occur with all participants joining in at once, as with an online chat session or a virtual classroom or meeting.

Virtual classrooms and meetings can often use a mix of communication technologies.

In many models, the writing community and the communication channels relate with the E-learning and the M-learning communities. Both the communities provide a general overview of the basic learning models and the activities required for the participants to join the learning sessions across the virtual classroom or even across standard classrooms enabled by technology. Many activities, essential for the learners in these environments, require frequent chat sessions in the form of virtual classrooms and/or blog meetings.

E-Learning 2.0

The term e-Learning 2.0 is used to refer to new ways of thinking about e-learning inspired by the emergence of Web 2.0. From an e-Learning 2.0 perspective, conventional e-learning systems were based on instructional packets that were delivered to students using Internet technologies. The role of the student consisted in learning from the readings and preparing assignments. Assignments were evaluated by the teacher. In contrast, the new e-learning places increased emphasis on social learning and use of social software such as blogs, wikis, podcasts and virtual worlds such as Second Life. This phenomenon has also been referred to as Long Tail Learning.

The first 10 years of e-learning (e-learning 1.0) was focused on using the internet to replicate the instructor-led experience. Content was designed to lead a learner through the content, providing a wide and ever-increasing set of interactions, experiences, assessments, and simulations. E-learning 2.0, by contrast (patterned after Web 2.0) is built around collaboration. E-learning 2.0 assumes that knowledge (as meaning and understanding) is socially constructed. Learning takes place through conversations about content and grounded interaction about problems and actions. Advocates of social learning claim that one of the best ways to learn something is to teach it to others. There is also an increased use of virtual classrooms (online presentations delivered live) as an online learning platform and classroom for a diverse set of education providers such as Fox School of Business for Temple University, Minnesota State Colleges and Universities, and Sachem School District.

Computer-aided assessment and learning design

Computer-aided Assessment (also but less commonly referred to as E-assessment), ranging from automated multiple-choice tests to more sophisticated systems is becoming increasingly common. With some systems, feedback can be geared towards a student's specific mistakes or the computer can navigate the student through a series of questions adapting to what the student appears to have learned or not learned.

The best examples follow a Formative Assessment structure and are called "Online Formative Assessment". This involves making an initial formative assessment by sifting out the incorrect answers. The author/teacher will then explain what the pupil should have done with each question. It will then give the pupil at least one practice at each slight variation of sifted out questions. This is the formative learning stage. The next stage is to make a Summative Assessment by a new set of questions only covering the topics previously taught. Some will take this even further and repeat the cycle such as BOFA which is aimed at the Eleven plus exam set in the UK.

The term *learning design* has sometimes come to refer to the type of activity enabled by software such as the open-source system LAMS which supports sequences of activities that can be both adaptive and collaborative. The IMS Learning Design specification is intended as a standard format for learning designs, and IMS LD Level A is supported in LAMS V2. ELearning has been replacing the traditional settings due to its cost effectiveness.

Benefits of eLearning versus traditional classroom settings

ELearning can provide for major benefits for the organizations and individuals involved.

Reducing environmental impact: eLearning allows people to avoid travel, thus reducing the overall carbon output. The fact that it takes place in a virtual environment also allows some reduction of paper usage. With virtual notes instead of paper notes and online assessments instead of paper assessments, eLearning is a more environmentally friendly solution.

Quality education, made affordable: The fact that instructors of the highest caliber can share their knowledge across borders allows students to attend courses across physical, political, and economic boundaries. Recognized experts have the opportunity of making information available internationally, to anyone interested at minimum costs. This can drastically reduce the costs of higher education, making it much more affordable and accessible to the masses. An internet connection, a computer, and a projector would allow an entire classroom in a third world university to benefit from the knowledge of an opinion leader.

Convenience and flexibility to learners: in many contexts, eLearning is self-paced and the learning sessions are available 24x7. Learners are not bound to a specific day/time to physically attend classes. They can also pause learning sessions at their convenience.

EXTENDED ENTERPRISE AND INFORMATION SYSTEMS GOVERNANCE IN AN INTER-ORGANIZATIONAL CONTEXT

Tudor Cătălin Georgel

Flexibility, openness, and cooperation are fundamental tendencies that positively mark the ensemble of private and public sector organizations. For a sustainable development in a more and more complex globalized and competitive business environment, the enterprises tends to multiply their alliances and partnerships, in order to develop new organization forms, like Extended Enterprises (EE). As a response to the management visible needs in the field of inter-organizational processes, a new typology of information systems arises: inter-organizational information system (IO-IS), integrating IT&C and extended enterprise resources, in respect to fundamental principles like strategic alignment, performance and compliance. The present paper (1) clarifies the subject-affiliated concepts, (2) analyzes the IO-IS typology and IT&C implementation solutions, and (3) debates the IS governance issue in an inter-organizational context.

Keywords: e-business, extended enterprise, inter-enterprise cooperative information systems, workflow, corporate governance, IS governance

Cod JEL: M15

1. Conceptual considerations

Information and communication technologies (IT&C) potentialities have enabled enterprises to choose from o considerably range of support solutions for sustainable development in a globalized and extremely competitive environment. As a consequence of adopting IT&C (figure 1), management and governance research preoccupations focus, especially, on emergent concepts delimitation, ontologies definition, best-practices contingent rules proposal, or elaboration of analysis models related to the incidence of IT&C use at organizational and inter-organizational level

E-business is a generic concept embodying the ensemble of IT&C means and resources, based on Internet and web servers, used for functional amelioration, in order to create value for the enterprise, for its costumers or other partners. We can affirm that e-business defines the enterprise capacity for exploiting the potentialities of on-line service concept, regarding the partners' relationships optimization (figure 2).

Figure 1. Adopting IT&C in an inter-organizational enterprise context

Business-to-Business (B2B) is the base for the extended enterprise and aim at using IT&C for the (partial or total) information sharing between enterprise and business partners: suppliers, entrepreneurs, customers, services providers or financial organisms. The e-business adoption:

- Allows a better internal process articulation;
- Forms an interface between enterprise business processes and customers, entrepreneurs, suppliers or other partners processes;
- Emphasizes enterprise business model, in respect to the value creation mechanisms.

The recent advent of Smart Business Network concept extends the traditional enterprise area and opens new challenges, especially in the modular and dynamic business process management field. The inter-organizational process management refers to a business strategy for optimizing the extended enterprise collaborative business processes, forming the base for the inter-organizational information-systems (IO-IS) development. An IO-IS

signifies the ensemble of knowledge, human resources, procedures and technical means, concerned with the automation and coordination of data exchange between two or more distinct organizations (Amza, 2006). From a capitalistic point of view, inter-organizational information systems create electronic links between different organizations that collaborate one with the other. These systems actively participate to the creation of long-lasting competitive advantages for all the enterprises from their supply area. From the point of view of accomplished functions, an IO-IS associates the classical functions of an information system (collection, storage, processing, extraction, distribution) with additional essential functions (like conversion, security, audit, validation, journalizing, structuring, synchronization, simulation), and, eventually, with specialized functions for reaching the goals that IOIS was developed for (for example, a system created for "electronic market" may integrate functions like: intermediation, negotiation, catalog, logistics, legal framework). In many cases, in the attempt to optimize and integrate the organizational and inter-organizational value chain informational flow, IO-IS activates as a bridge between individual enterprise information systems, connecting the business solutions (like ERP or Extended ERP) in an integrated vision (Tudor, 2006).

The e-business organizations adoption generated the emergence of new inter-organizational networks forms, permitting the advent and development of the Extended Enterprise (EE) concept. An Extended Enterprise can be described as the ensemble of juridical independent enterprises, organizing progressively new cooperation forms, thus structuring their activity complementarity, with the main goal of producing finishing goods or services for an identified specialized market customers (Florescu&Tamaş, 2006). The ensemble behaves like a unique enterprise, being settled on alliances and partnership relations. Although many forms of Extended Enterprise may be identified, the present paper portrays, mainly, the EE model coordinated by a pilot enterprise (the interorganizational network leader). In this particular perspective, the Extended Enterprise enables its actors to share, effectively:

- Values, relationships and trust for a medium and long time horizon;
- Common goals and market objectives, or inter-organizational relationships capitalization, in order to obtain strategic advantages;
- Enterprises information/knowledge, for process and decision improvement purpose;
- Business resources and collaborative workflow tools, in regard with their commitments keeping, and a better business network knowledge management.

Building an Extended Enterprise is not an easy task. This involves partnerships agreements concerning the active participation of each enterprise for the common established goals achievement, in compliance with transparency, confidentiality, security and performance principles. Corporate governance, a topicality term originated from organizational theory, is perceived as the ensemble of rules, principles and articulation mechanisms between the shareholders and enterprise managers. Furthermore, as the field of value creation in a sustainable collaboration business network moves to an inter-organizational context, a new vision about corporate governance comes forward, taking into consideration both stakeholders and shareholders roles and privileges (even if the shareholders interests have priority). According to Kumar &Van Dissel (1996), corporate governance in an interorganizational context "can be interpreted as the ways in which inter-organizational work is divided among the partnering organizations by assigning specific roles to them and the ways in which coordination is achieved among these roles". The information system (IS) governance (or IT Governance, for English literature) is described as a component of corporate governance, moving its principles and rules into the IS field (Florescu&al., 2007). IS Governance Institute (IGSI, 2004) defines IS governance as an ensemble of command and control structures and processes, designed for aligning the IT support to the organizational strategy, in compliance with enterprise objectives. Therefore, IS Governance can be described as "effective, efficient and controlled management of IT, while achieving business alignment and value delivery" (Source:www.cronos.be). The IS governance provides a reasonable assurance for the external actors that the IS function of an enterprise is well managed. When discussing the touching points between IS and Corporate Governance the "compliance" and "performance" aspects must be balanced (as described in figure 2). The business performance management researches relating to the interorganizational context dissociate the internal performance from the global system performance (Rascol-Boutard&Eggrickx, 2007).

The governance approach bases on two important corporate strategic mechanisms:

- *Control and Audit*, with the main goal to assure the compliance of business activity with the legitimate authority interests and strategy, thus, minimizing, as much as possible, the exposure to risks.
- *Strategic management*, using a specific tools and techniques measurement system for the enterprise performance overseeing.

The international COBIT standard, elaborated by ISACA (System and Audit Control Association) provides a set of measurements, benchmarks, processes and generally accepted best practices usable by IT users, managers and auditors willing to maximize the benefits of using information technology and implementing strong IT governance through an organization (Tudor & Mangiuc, 2008). IS Scorecard can be understood as an adapted version of Balance Scorecard developed by Kaplan&Norton (2003) for building a performance indicators system for the strategic achievements electronically surveillance.

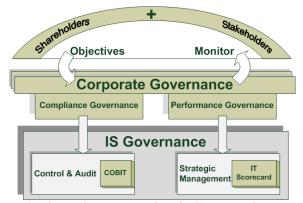

Figure 2. The IT Governance place in Corporate Governance

2. The IO-IS typology and IT&C solutions

When reviewing the literature born from scholarly concern in the broader extended enterprise information system area (Florescu&Tamaş, 2006; Aubert &Daussort, 2002), someone can distinguish several IO-IS classification criterions: the organizations agreements regarding the IO-IS, the involved organizations' strategic objectives, the participants' legal ownership form, the cooperation direction and the independence degree of the inter-connected organizations. For the purpose of presenting an IO-IS taxonomy related to the present paper context, we adopt a classification based on the organizations independence degree into the accepted system (table 1).

The practice outlines a diversity of IT&C conceptual and technical solutions for IO-IS implementation and enterprise adoption: Electronic structured data exchange on Internet (EDI-XML); Extranet functionality; Interenterprise Cooperative Information Systems (ICIS).

Electronic Data Interchange (**EDI**) on Internet benefits of XML (eXtensible Markup Language) advantages, involving a protocol existence between two involved entities: the message initiator and the receiving unit. The receiving unit can, thus, store data in the internal database without being necessary any additional data re-collection actions. The messages transmission on Internet benefits of advanced techniques for the data confidentiality and for the assurance of dataflow security.

• 01 444410 11 50001110			
	Shared information IO-IS	Supply Chain IO-IS	Network IO-IS
The independence type	Grouped	Sequential	Reciproc
Configuration	9 000	$\Diamond \Diamond \Diamond \Diamond \Diamond$	
The conflict potentiality	Low	Medium	Important
Example	Electronic Market (<i>E-marketplace</i>), Extranet	Tranzactional System EDI/XML Extranet	Inter-entreprise Cooperative Information Systems

Table 1: The typology of IO-IS

The aforementioned development practice adopted for structured data exchange-based IO-IS enables a tight integration of HTML, XML and Web service solutions. The web services advantages (concerning the field of inter-connecting enterprises business processes) open the road to another important conceptualization for the IO-IS area: Service Oriented Architecture (SOA), referring a popular design paradigm for adaptive and flexible information systems development. Currently, the use of web services in the context of extended enterprise is recognized as a universal solution for supporting cooperative processes through the use of advanced technologies (Tudor, 2006). Recent researches give particular attention to financial-information electronic exchange, by the means of XBRL standard (eXtensible Business Reporting Language). The XBRL success is due to the coherence and compliance with financial communication international norms (like IFRS, Basel II, etc.) and to the fact that it is founded on the XML platform.

The **Extranet** enables the partner companies to share information and knowledge using the web site. (Florescu&Tamaş, 2006). For industrial enterprises, the Extranet-based inter-organizational information systems address, especially, to sub-contractors, important suppliers, or loyal customers. The Extranet IO-IS solution can, also, be adopted for sharing sensitive data and information between accounting expertise cabinets and their customers.

The Inter-enterprise Cooperative Information Systems (ICIS) represents one of the key points of the good working of an extended enterprise. ICIS offer a shared environment for common, synchronous or asynchronous activities

communication and collaboration, in conjunction with security and confidentiality principles compliance. This particular type of IO-IS fosters both the agents mobility (individuals, services, business units, or, even enterprises) and organizations integration (by connecting data, applications, processes or knowledge) at extended enterprise level. According to Boughzala (2001) considerations in the area of cooperative information systems, extended enterprise can be perceived as the ensemble of partner agents, sharing resources and complementary competencies, in order to attain a set of common objectives. One of the cooperative agents plays the role of the pilot (leader) entity for the ICIS. Such a system encloses not only information and knowledge, but also a common syntax and semantic for the shared data, in order to become intelligible to all extended enterprise members. For a better coordination between business partners, one common practice consists in the integration of ICIS with complementary IT&C solutions such as: workflow systems (for business activities modeling capabilities in conjunction with the management of these activities and their associated different actors involved in the interorganizational processes execution) or common management document systems (combined, presently, with the team work systems). Both the practitioners and scholars research studies asses the opportunity of ontologies use for the treatment of coordination problems, in the area of inter-organizational business process workflow.

3. The IS Governance in an inter-organizational context

According to Weill&Ross (2004), there is a consistent difference between IS Governance and IS Management: governance determines who makes the decisions, while management is the process of making and implementing the decisions. The evolution of using information system in a business environment based on externalization and partnership concepts, contributed to a visible grow of business processes complexity, in regard with IS management and governance. By developing inter-organizational relationships, the IO-IS can be considered a strategic asset, liable to generate a competitive advantage, mainly for its capacity of capturing resources. This asset must be use in compliance with both performance and conformity principles.

The IS Governance finds its roots on corporate governance general principles (IGSI, 2004):

- *Strategic alignment* focuses on ensuring the linkage of business and IS plans, on defining, maintaining and validating the IS value proposition, and on aligning IS operations with enterprise operations;
- Value delivery is about executing the value proposition throughout the delivery cycle, ensuring that IS delivers the promised benefits against the strategy, concentrating on optimizing costs and proving the intrinsic value of IS;
- *Resource management* is about the optimal investment in, and the proper management of, critical IS resources: processes, people, applications, infrastructure and information. Key issues relate to the optimization of knowledge and infrastructure.
- *Risk management* requires risk awareness by senior corporate officers, a clear understanding of the enterprise's appetite for risk, transparency about the significant risks to the enterprise, and embedding of risk management responsibilities into the organization;
- *Performance measurement* tracks and monitors strategy implementation, project completion, resource usage, process performance and service delivery, using, for example, balanced scorecards that translate strategy into action to achieve goals measurable beyond conventional accounting.

The inter-organizational context imposes an extension to governance principles, which will enable the governance equation to include the stakeholders' points of interest, in accordance with IO-IS typology. The research concerning the field of IO-IS governance concentrates on two directions: IS governance specific elements presentation and IS governance performance analysis in an inter-organizational context. According to Weill&Ross (2004) the IS Governance for an inter-organizational context flows, also, in two directions:

- The decisions domain regarding the IS functions, which includes: decisions related to IT&C-based infrastructure, IS management decisions, and IS projects decisions;
 - IS Governance modes for the decision-specific domains.

Harguem&al.(2006) proposed an IS governance performance analysis model, which can be further adapted for the inter-organizational context. In the attempt to enlighten the problem-specific aspects, this model assorts the decisive factors, required for a representative analysis, into three main categories: organizational, technological, and inter-organizational (figure 3).

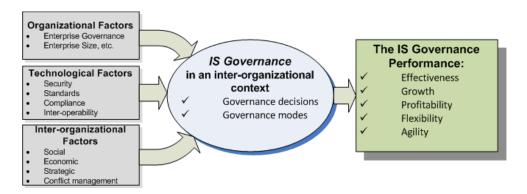

Figure 3. The significant factors impact on IS Governance performance in an inter-organizational context (*Source*: Adapted from Harguem&al., 2006)

- Organizational factors refers the characteristics and organizations behavior relative to the IS adoption and internal IS management;
- Technological factors approach the IS infrastructure assessment, selection, installation and proper use for supporting internal and external activities;
- *Inter-organizational factors* enclose the ensemble of collaboration relationships (grouped by economic, strategic, social, or conflict management considerations) between organizations sharing the same IO-IS.

Conclusions

Guided by the continuous concern to achieve the sustainable development in a globalized and competitive business environment, the enterprises choose to multiply their collaboration/partnership relationships, in order to add business value and to increase the overall performance in terms of transparency and compliance. The aforementioned relationships find their expression in information/data sharing and exchange or collaborative work inter-organizational processes. Nowadays, IT&C market offers solutions for inter-organizational information systems development, supporting the management and automation of business processes that intersect the physical boundaries of the organizations. The financial-accounting domain has predilections to IO-IS domain, from the financial structured data electronic exchange point of view. Recent researches bring to our attention the standardization of financial information transfer, by the use of eXtensible Business Reporting Language (XBRL), based on XML and international general accepted norms in the field of financial communication (IFRS, Basel II, etc.). The IS Governance moves now to an inter-organizational context, comprising new specific elements and characteristics, that will open up the field to a wide range of future research streams. A further research direction could aim to formulate a system of metrics for assessing the organizational, technological and inter-organizational factors incidence for the IO-IS governance performance.

In order to be competitive in the current competitive environment is essential for a company to consider the necessity to enter the online market and into the digital business environment. Entering on electronics market is not an easy decision to make. There is a series of internal and external factors that need to be taken into account. On one hand, issues that ensure achievement of the objectives need to be considered, and on the other the obstacles for effectively implementing the e-commerce option. Proportion of the companies that are engaged in e-commerce in Romania is still low in comparison with other European countries. Due to this fact, present study reveals the obstacles that impede a more accelerated development of e-commerce in Romania.

1. INTRODUCTION

Nowadays, IT technologies and communications represent an important economic development interest. The use of IT&C at a large scale in the economic field, leads to getting and processing information in a cheaper and faster way.

Recognizing the essential role of communications and information technology in empowering the competition potential of a company is not a recent issue. Different research and production fields promoted a lot of solutions that are mainly new in organizing the companies, but that are compatible regarding the base-principles level: flattening the decisional hierarchies, orientation on business processes, making organizational structures virtual. In this situation are: virtual enterprise, holonic enterprise, agile enterprise, liberated firm, fractal company, the learning enterprise, extended enterprise, that are capable of a prompt response to changeable conditions in business environment and to face new business opportunities.

Using the information technologies and communications, these new organizational forms, allow:

- the growth of the enterprise's flexibility, configuration and robustness to both disturbances and inside and outside variations:
- quickly and in time reconfiguration of the company, but also respecting the economic conditions, as a response to sudden and unpredictable changes in the needed production's composition and in the evolution of the environment:
- the cooperation in projecting, developing, costs-determining and production programs coordination of many individual and independent enterprises;
- to achieve the convergence of the objectives, commitments, resources and competences of many individual enterprises. The aim is to supply, in synergetic conditions, high competitive products, projects and services;

Because enterprises were confronted with more and more competitive markets, with more and more severe consumers and market segments more and more limited, it was necessary for them to find new methods to get competitive advantages and profits. Many enterprises realized that the use of information technologies and communications can determine the growth of sales' volume, the costs' decrease, the diversification of services for clients, getting new clients and clients' fidelity.

2. Which is the reason why an enterprise is using a website?

The explosive development of the Internet that happen in the latest years has the consequence of free access to international resources and practically unlimited communications.

According to a study conducted by Internet-WorldStats⁶³⁵, almost 60% of the European Union's total population uses the Internet. Romania takes the tenth place, with about 54% of total population. As it can be noticed, Romania is still bellow the European Union average.

More and more companies take advantage of this new environment in order to make market researches, to contact clients from which can get a very useful feedback, to promote their image, products and services, or for online sales.

635 www.internetworldstats.com

The use of Internet technologies has a significant impact in achieving some of the significant goals of a company: productivity growth, stock level decrease, decreased market entry costs, commodity markets growth and increased transactions efficiency.

According to the Statistical Office of the European Communities⁶³⁶, in some of the European Union's countries, such as Sweden, Denmark, Finland, more than 80% of the companies have their own website. Unfortunately, in our country the situation is not as good as in these countries: only 24% of the companies have their own website.

For some enterprises, the website has only the functions of a static or dynamic electronic "shop-front". These enterprises develop their own webpages in order to present and promote products and services, to deliver news, to attract new clients and to develop the loyalty of the existing ones. In such situations, the enterprise presents its offers on the Internet and the important issue is the quality of the offered information. For a static shop-front, the commercial offer is shown using static information presented in a web-page. This information is not permanently updated but from time to time, and these intervals can be shorter or longer. Such a situation can generate the risk that the clients will get obsolete information. On the other hand, for a dynamic shop-front, the commercial offer is generated by displaying the information directly from a database structured similar to a products' catalogue, permanently updated by the company's informatic system. This way, the clients will access up-to-date information. Other companies use their own website as an online store used to sell products and to get orders. The buyers are allowed to consult the online catalogues of products and services the company offers. This way, the clients are allowed to compare the offers from different companies by passing from a company to another, to order and to buy in seconds. In this case, the essential thing is the quality of the offered services that is mainly expressed by how much the commercial transaction is guaranteed, by the offer's availability and by the flexibility offered to the clients when they choose their orders. The client, except the qualitative aspects mentioned before, is attracted by the facility offered by this way of shopping.

An online store covers all the facilities offered by a classic commercial transaction, and also offers others more: the possibility to register information about the clients in order to store identification data and to personalize the interface between the store and the client, the possibility to store data about the buying options, to offer and manage clients accounts that can be supplied with bonuses for loyal clients. An online store assures a proper interactivity level with the clients by promptly reacting to their actions and also gives the possibility to customize the offer with elements of attractiveness.

3. The online market – a necessity for companies that want to be competitive in the current competitive environment

In order to be competitive in the current competitive environment is essential for a company to consider the necessity to enter the online market and into the digital business environment.

The option for electronic commerce gives a lot of advantages to a company, such as:

- The possibility to get new clients. The store is open all the time and oriented to global-market. The geographic border disappeared, the transaction can be "anywhere and any when".
- The possibility to get feedback from clients. The information about clients is stored in company's databases, processed, updated and used for making efficient decisions and to quickly adjust company's activity to the changeable business environment conditions. The clients are actively involved in the process of projecting and designing the products.
- The efficiency of the promotional activity grows because of using the multimedia content and because of the facilities to update information. This allows customizing the content for each clients' category.
- The costs are reduced. An online store has a cheaper maintenance. The products storage costs are reduced by using the just-in-time stocks management.
- The reconsideration of time factor importance. Customer is granted with real time access to the offer, also orders processing time is reduced by up to 90%. Transaction speed is also enhanced.

Despite this, the economic and social impacts of electronic commerce development are different in different EU countries. For instance, the Nordic countries consider the electronic commerce as vital for being competitive. Favourable atitude of the companies is determined by the high level of development of the IT & C and, on other hand, by the advantages granted by e-commerce. These strengths are especially to be considered when there is a long way between suppliers and their customers, and also during challenging climate conditions The South Europe countries are more reserved and the reasons are mostly social. This refers to the direct relations between the seller and the client, and also to the relations between the clients as community members. In these countries there still is the preference for the classic type of commerce. The social importance of the transaction as a commercial act between supply and demand, client and producer, generates a slowly development of the e-commerce.

⁶³⁶ http://epp.eurostat.ec.europa.eu

Entering on electronics market is not an easy decision to make. There is a series of internal and external factors that need to be taken into account. On one hand, issues that ensure achievement of the objectives need to be considered, and on the other the obstacles for effectively implementing the e-commerce option.

Proportion of the companies that are engaged in e-commerce in Romania is still low in comparison with other european countries. Due to this fact, present study reveals the obstacles that impede a more accelerated development of e-commerce in Romania.

4. Data analysis and interpretation

In order to collect all necessary data, 200 questionnaires were sent via e-mail and 200 questionnaires were printed and distributed to 200 random selected group of companies headquartered in the west side of the country. 238 questionnaires were returned and only 217 were valid and used for information analysis. This means a response rate of 54.25%.

The questions were grouped as follows:

- Questions related to the company's field of activity. The companies were structured in three fields of activity as follows: manufacturing, services, other activities.
- Questions regarding companies' options in using websites, referring to the following issues: the existence of the company's website
 - the website functions. Is the website limited to a static "electronic front-shop"?
 - is the website limited to a dynamic "electronic front-shop"?
 - the existence of an online store
 - Questions about how much the companies think their clients use the Internet.
 - Questions referring to what the companies think about their clients' trust in:
 - the offered services
 - confidentiality protection for the information they provide
 - security protection for the performed transactions regarding an online store
- Questions about how much the companies think they need to form or to hire qualified employees for the e-commerce activity.
- Questions about the existence of a e-commerce necessary infrastructure and the company's availability to invest in it.

Among the companies whose questionnaires were returned, 76 are production companies, 106 are companies dealing with services, and 34 companies are dealing with other activities.

For the beginning, the study analyzes the following aspects: are the questioned companies using a website and, if yes, which is the aim of the website? Regarding these aspects, analysis of the collected data revealed that:

- the companies that have manufacturing as field of activity use the websites mostly to present and promote products and services. Most of them (75%) use static electronic front-shops;
- the companies that supply services use the websites mostly for online sales (58.97%).
- most of the companies that are dealing with other activities, do not have a website (76,47%);
- for 42,85% of the questioned companies that have their own website, the functions of the website are limited to the functions of a static electronic front-shop;

Results are synthesized in the tables below:

The aim of the website / Fields of activity	N	Do not have a website	Website used as a static "electronic front-shop"	Website used as a static "electronic front-shop"	As an online store
Manufacturing	%	60 78,95	12 75	2 12,5	2 12,5
Services	%	68 63,55	9 23,08	7 17,95	23 58,97
Other activities	%	26 76,47	6 75	1 12.5	1 12,5

It can be noticed that only 29% of the questioned companies have a web site, this value is very close to the value that is estimated at country level (24%). 41,27% of the companies mentioned above have an online store, the other are using the website just to show and promote the products and services.

The further aspects that were analyzed refer to the difficulties encountered by the companies. These difficulties impede a more accelerated development of e-commerce. Regarding this, the collected data showed that:

- the production field companies consider that the customers which use Internet are quiet few. The services providing companies consider that customers which use Internet are many, but they also consider that customers use websites only to get information and not to shop online;
- 27% of the production field companies consider that they own the technology and necessary infrastructure for e-commerce, but 42% think they still have to improve and invest in it, but not very much;
- 76% of the providing services companies think they have the e-commerce necessary infrastructure, and this proves that these companies already invested more than the others in this kind of technology, and that these companies are more opened to use online platforms for shopping;
- the companies, no matter in what field of activity they are involved, think that the customers are still reserved to provide their personal data and also they are afraid to deliver the credit card and bank account information. Many of these customers prefer to order by phone or e-mail and also they prefer to not pay online;
- 69% of the production field companies think they should hire professional employees or to such trainings for their existing employees in order to be able to enter the online market, meanwhile 87% of the companies which provide services think their employees are trained enough to enter this market. Results are synthesized in the tables below:

Difficulties / Fields of activity	N	A	В	С	D
Manufacturing	%	21	27	11	31
Services	%	92	76	14	87
Other activities	%	36	31	12	26

- A Low Internet connection of clients
- B Company's technology infrastructure
- C Clients' trust in the provided services
- D The availability of trained employees

5. Conclusions

The Internet Romanian users prefer to use the Internet to get new information and to communicate, and very few of them use Internet for online shopping. They visit web sites more for getting information about the offers and prices and less for real online shopping.

Many of the questioned companies already have or are interested to invest both in the IT infrastructure, and also in a necessary e-commerce security platform, in order to develop an appropriate environment for online businesses.

They are also interested to hire professionals, or to invest in training their existing employees in order to be able to use these online technologies.

It seems that, the main impediment against the development of online shopping is the customers' fear to use this online shopping system.

In general, all the companies, no matter the activity field, should work more to improve their customers' trust in the online shopping system.

Ovidius University from Constanta, Mechanical, Industrial and Maritime Faculty, Mamaia Ave., no. 124, ilie.ctin@yhoo.com, +40 721 205325

The present paper has the objective to inform the public regarding the use of new techniques for the modeling, simulate and forecast of system from different field of activity. One of those techniques is Artificial Neural Network, one of the artificial intelligence branch, is widely use in several field and the researchers are trying to extend these fields, considering new types of networks. Considering the financial crisis the authors concentrate the attention on specific field from the economical domain. After a short presentation, several types of ANN are presented and also a few examples are revealed.

Keywords: artificial neural network, economics, simulate, artificial intelligence

C51

1. Introduction

1.1. Artificial neural network (ANN)

First researched in 1943, the real use of ANN starts in 1959 with the development of computers and the incipient models ADALINE and MADALINE (Multiple ADAptive LINear Elements, Bernard Widrow and Marcian Hoff - Stanford). Even with the setbacks determined by not trusting the artificial intelligence, the ANN gained step by step their place between the new techniques of simulating and forecast certain problems that involve a rate amount of heterogeneous data characterized by the nonlinearity [1].

The ANN tries to copy the human brain capacities and behavior considering the smallest unit: the neuron (figure 1) who is replaced by mathematical relations characterized by different function (figure 2) [1].

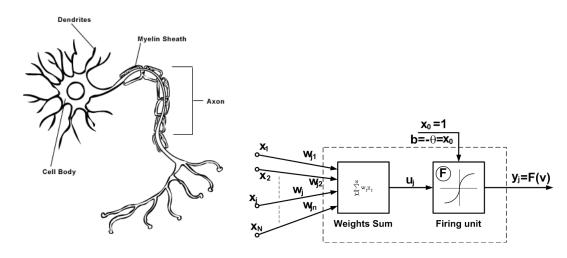

Figure 1. Human neuron.

Figure 2. Artificial neuron.

Were: xi - input vectors;

- wii weights vectors (synaptic);
- wjo = +b bias (tendencies) constant weight;
- $\Theta = -b \text{firing value}$;
- V artificial neuron potential;
- F(v) activation function.

$$v = u_j + b = \sum_{i=1}^{n} w_j x_j - \Theta = \sum_{i=0}^{n} w_j x_j$$

The activation function can vary depending on the algorithm used for training.

The ANN consists in several layers build from many artificial neurons connected by weights in different combinations determined by the ANN type and the data considered (figures 3.). Thus the ANN is trained in order to learn or to find the relations between the input data and the output data and to use those results for the future sets of data in order to simulate or forecasts [1].

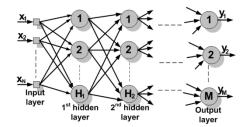

Figure 3. ANN example.

Whatever the objectives of ANN use is the next phases are always presented:

- a. *data analysis* represents the process that organizes the data in conformity with the user specifications based on the data characteristics and problem type;
- b. *preprocessing of data* consist in the use of several methods that prepare the data in order to be much easily used by the ANN in the training process;\
- c. *ANN structure* the structure of ANN is defined: the number hidden neurons and hidden layers are calculated or simulated in order to determine the best training;
- d. *training process* process in which the ANN determines the internal elements and values of structures like weights.
- e. *testing* the last phase consist in validating and testing the result of training using new sets of data.

ANN types are determined by various criteria but the most common clusters are: feedforward ANN, recurrent – feedback ANN and cellular ANN. Another important way to divide the ANN's type is based on the algorithm that is used. The most used algorithm is Levenberg- Marquardt's backpropagation used for the feedforward ANN.

1.2. The economical applications of ANN

For the last few years the ANN is mostly used in patter recognition and forecasting especially in the fields of economics (financial) and medicine, but also in other fields. A better presentation of ANN usage follows:

- pattern recognition and identification: oil extraction, imaging, identification of fingerprint and car number;
- classification and appreciation: medical diagnostic, credit risks, fruits classification, nondestructive testing, product price sensitivity analysis, quality control for stocks exchange;
- monitoring and control: medical instruments, dynamic processes, chemical manufacturing, bioprocesses control;
- forecast and prevision: stock exchange dynamics, prevision of holyday preferences, forecast of future business requests;
- sensors and visual analysis: automatic industrial inspection, postal envelope sorting, visual inspection of railway or bridge structure.

Current, ANN demonstrates more and more the superiority of ANN over the classic methods and techniques used for forecast and simulation of economical activities. The huge number of data that can be processed and the *synthesis quality* that offer the possibility that ANN trains itself even in the presence of incomplete data or the presence of noise.

In the economical field the ANN are present in activities such as:

- tendencies of the market;
- market exchange dynamics;
- decision making based on the forecast of the clients demand or the market tendencies;
- price evolution for certain products;
- the risks regarding the offer of credits and loans;
- financial forecast;
- other economical activities with major impact over the company's activities.

In the following some examples will be shown.

2. Examples

Use of ANN in the credit card fraud.

The ANN was used starting from the early 90's in order to determine the possible credit card fraud. After the usage of the ANN software (Falcon Fraud Manager) the frauds were in significance reducing as shown in figure 4 [1].

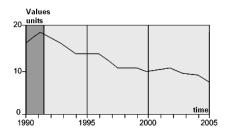

Figure 4. Card fraud evolution.

Forecast of the closing stock exchange.

Using a simple feedforward ANN (NeuroXI – AnalyzerXL LLC) and the backpropagation algorithm the next day stock exchange value were provisioned with a error of 3.28 units (points) or 6.21% of the real value. The results of the training are presented in figure 5 and the difference between the simulated value and the real value in figure 6 [1].

Use of ANN for the sales analysis [2]

The ANN demonstrates to be useful for the management decision considering the dynamics of market when it is necessary to react to the sales reduction. The manger must consider facts and information like prognoses and predictions, what-if analyses, calculations and optimizations. The ANN is capable to learn from the past evolution of business' indexes patterns, rules and models, to compare them with the actual situation, to find the proper one and to offer to the manager a possible future evolution and even to give him a possible and virtual decision that can be implemented.

ANN can be, in some cases, the ideal tool for a manager trying to solve a business problem.

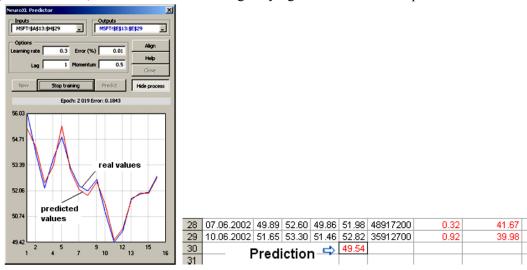

Figure 5. Target vs. Output.

Figure 6. Target vs. Output - Values.

Consumer choice prediction using ANN [3]

The subject of the prediction was the consumers' banking choices between electronic banking and non-electronic banking. Starting with an analysis obtained through a mail survey sent to 1,960 household in New Zealand the ANN was trained using as input data as service quality dimensions, perceived risk factors, user input factors, price factors, service product characteristics, and individual factors, in addition to those the demographic variables including age, gender, marital status, ethnic background, educational qualification, employment, income, and area of residence are considered were considered. The result of the prevision is shown in table 1.

Table 1: Out-of-Sample Forecast

	Non-electronic	Electronic	Overall
	banking users	banking users	(n = 105)
Correct (%)	96.00	100.00	99.05
Incorrect (%)	4.00	0.00	0.95

Since neither the consumers' choices are always binary nor the neural network is limited to the binary choice classification problem, the research on the predictive power of the neural networks on the multiple level classifications would be an area for further research, particularly on the consumers' choice prediction

Consumer Loan Classification Using ANN [4]

The network was used as a "second level" filter, by supplying it with data of loans that already had been approved by the bank officers. To train an ANN were presented 400 loan applications cases and their corresponding repayment history. The ANN thus configured is then used for the evaluation of the risk of 600 loans, where the prediction of the ANN is compared with the loan repayment history. The ANN classifies 597 of those loans correctly detecting 35 of them (that the bank had granted) as having problems in their repayment schedule. In figure 7 and figure 8 are shown the input and output variables and respectively the loan classification by ANN.

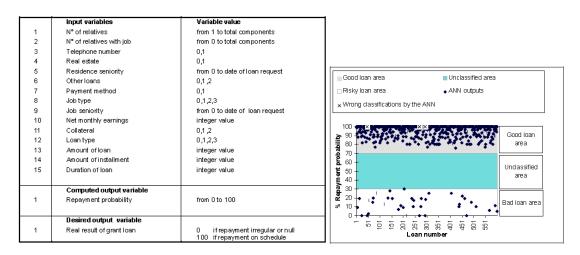

Figure 7. Input and output variables.

Figure 8. Loan classification by ANN.

This research showed that an ANN can be a valid tool to discriminate among loan applications.

While the purpose was that of providing support to bank officers, the results were so promising that the ANN could be used autonomously in cases. By leaving a sufficiently wide band of uncertainty, one can make sure that human intervention is required only for borderline cases. In this case, the ANN would provide a first level filter, granting or denying most loan applications autonomously. Since the ANN evaluation (once it has been trained) is not computationally very expensive, the entire process could be carried out on a computer at the store location where the customer is submitting his application, resulting in immediate approval or denial of most cases, with only a fraction of the applications having to be referred to the bank officers for more in-depth analysis.

Computation of the daily of bank share [5]

The goodness and the accuracy of techniques based solely on the neural network estimates of the conditional quintile is illustrated throughout the computation of the daily VaR (Value at risk) of a holding consisting of one share of DEUTSCHE Bank. As explanatory variables, we use the daily closing prices of BASF, SIEMENS, COMMERZBANK and DAX30 traded on the stock exchange of Frankfurt. Beside the fact, the simulation takes relatively longer time before delivering the ANN VaR estimate, the proposed method provides better back testing results compared to the historical simulation VaR approach.

3. Conclusion

The examples provided above are just an insignificant number from the real economical applications that ANN are implemented in, but offer information about the importance given to new more efficient and cheaper than other techniques or software generally, and to ANN importance especially. The effectiveness of implementation and accuracy of results are also good reasons for the continuous research and implementation of the ANN in various activities and several fields.

Working with ANN made as understand the future possibilities and applications, but also the need of future research in order to find new types of ANN, new training algorithms and even new artificial neurons for a better implementation and for new perspectives of use.

The activity of the financial auditors is regulated by International Standards of Revision for financial situations and information, through which the fundamental procedures and principles for this kind of missions are established.

CIEL Audit and Revision application has been conceived as a support for financial auditors and expert accountants in Romania, offering help in the domain of informatics for the audit and accounting revision activities, since it is adapted both to the legal requirements and to the needs of professionals, covering the whole range of financial audit.

Keywords: informatics systems, financial audit, revision

Cod JEL: G: Financial Economics.

1. General considerations regarding the regulation and objectives of the audit mission

The objective of the audit has evolved from the detecting of frauds and errors, a process which implied a detailed verification of all patrimonial operations and accounting recordings, to the expression of an opinion on the image of the patrimony, of the financial situation and of the results obtained by the society. In this sense, one follows how the information recorded in accounting reflects the economic events that take place in a certain period, and the efforts of the auditor are intensified for the identification of possible manipulations of information provided by the financial system, in order to prevent cases of creative accounting or fraud.

The activity of the financial auditors is regulated through the International Standards of Revision of financial situations and information, through which the procedures and fundamental principles of this type of missions are established.

The range of activities performed by a financial auditor consists in general of the following:

- a. mission of limited exams (revisions);
- b. exams on the base of agreed procedures:
- c. measures of compiling financial-accounting information.

The objective of this kind of mission is that of allowing a financial auditor to offer a reasonable degree of safety, if he discerns something that determines him to think that the financial situations are not performed under all the significant aspects according to a frame of financial reporting, if the procedures used don't offer the necessary obligatory probes which are required by the accomplishment of a current financial audit.

The auditor has to plan and perform the mission of revision of financial information by respecting the principle of professional scepticism, admitting that there can be circumstances which can express financial situations or financial-accounting information significantly denaturised.

For the accomplishment of this audit mission, the auditor had to obtain sufficient and adequate audit probes through investigations and analytical procedures which allow one to formulate objective conclusions.

Through the obtained audit probes, the auditor has to provide a moderate level of insurance, according to which financial-accounting information doesn't contain significant misrepresentations, the opinion expressed by the auditor being a type of "negative insurance".

The main aspects followed by a financial auditor are:

- a. the objective and fundamental principles of a limited mission of examination;
- b. the analytical procedures of accomplishment;
- c. the reporting of the results of this kind of mission.

The objective of the mission consists in allowing the auditor to draw the conclusion that, on the basis of the obtained audit probes, no event was discovered in order to make him believe that the financial situations/financial-accounting information have not been established in all the significant aspects according to an accounting referential, which is defined through the notion of "negative insurance".

2. Principles and procedures of an audit mission

The financial auditor has to respect, irrespective of the audit mission, the following principles:

- a. independence;
- b. integrity;

- c. objectivity;
- d. professional competence;
- e. confidentiality;
- f. professionalism;
- g. the respecting of professional norms of the organism it is a part of.

According to these professional, fundamental principles, the auditor has to perform the mission of limited exam, under the circumstances in which the mission might not discover significant anomalies in the financial situations or the financial information required to be audited.

During the audit mission, the auditor makes use of the professional reasoning in order to determine the nature and area of the limited exam procedures. Regarding this matter, the following elements can be taken into consideration:

- a. the audit probes obtained during some missions;
- b. knowing the activity of the audited entity;
- c. knowing the activities and significant domains.

The main procedures of this type of mission are established by the financial auditor according to the complexity of the mission and the professional reasoning of the auditor's person, but the central elements can be structured as follows:

- -knowing the activity of the economic entity and the sector it belongs to;
- -analyzing the accounting principles, methods and practices used by the entity where this mission is performed;
- -analyzing the internal procedures of the entity in what concerns accounting, and realisation of synthesis documents and reports specific to this type of mission;
- -analyzing the analytical procedures concerning the identification of unusual elements and activities met during the activity of the economic entity.

During this type of mission, the report must give a conclusion under the form of a negative insurance that the situations afferent to this kind of mission don't contain significant errors. Through this conclusion one does not express an opinion, but insurance that the afferent economic-financial situations do not contain significant misrepresentations.

3. Updates brought by CIEL Audit and Revision – 1.2 version, March 2009

A series of informatics applications have been developed, such as the CIEL Audit and Revision application – 1.2 version, March 2009. This application is designed for financial auditors and accounting experts in Romania, offering a strong informatics support for the audit activity and accounting revision, being adapted not only to the requirements of the law, but also to the necessities of specialists in the field.

Top features of the application:

intuitively and easy to use;

does not require implementation;

an unlimited number of companies can be administered;

offers the possibility of taking over data from various formats (TXT, Excel, DBR, Access etc, applications)

one can work with an unlimited number of recordings in data basis;

all the obtained reports can be exported in TXT, RTF, PDF, DBF, XLS format;

the audit risk is automatically calculated and proposed, on the base of indicators, according to minimal norms of audit;

the application automatically calculates the significance threshold on the basis of the form for evaluation;

proposes the sampling according to the minimal norms of audit;

calculates work probes on sections – G – corporal and non-corporal immobilizations;

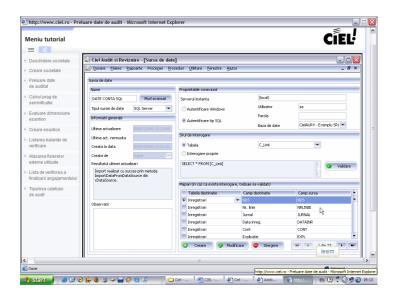

allows adding new files to the data base;

works in the network with an unlimited number of work stations and users;

always updated to the current legislation.

The application is delivered with an "Example" company, in which one can perform tests and exercises. Functionalities:

- -allows the use or creation of an unlimited number of companies;
- -works in the network with an unlimited number of work stations;
- -data can be imported from various sources: TXT, Excel, DBR, Access etc, CIEL applications;
- -the possibility of selection/configuration of information from the imported data base;
- -an unlimited number of recordings, documents and partners can be imported;
- -for the audited firms which have various branches, the data basis for each branch can be imported;
- -data coming from different processes can be gathered in a central data base.

One can import:

- -the journal on the entire audited exercise, from a single data base or sequentially, -scales, accounts plans, stocks and inventaries, accounting recordings, documents and partners;
 - -stakeholders the defining of the company's structure of share holding (rate of participation);
 - -list of suspicious persons- (coming from the Official Monitor)- allows the
 - -identification of suspicious transactions with persons from the respective list;
- -series of documents one or more series of documents can be defined and then one verify their uniqueness in the accounting recordings;
 - -list of inactive companies -coming from the Official Monitor

A concerning reports:

- -on account of the imported data one can get the analytical and synthetic Scales on the required period for certain currency and budgets;
 - -financial analyze along the predefined reports, the user can make his own reports;
 - -the scales for fixed means the situation of commissions and immobilizations Form;
 - -the stock scales situation of the stocks entrance exit:
- -financial situations Balance, Profit and Loss Account. These situations can be configured printed comparatively on maximum two financial exercises;
 - -verification of suspicious transactions;

Conclusions

Financial audit is a complex activity and there still doesn't exist a consensus with respect to the way in which this problem should be dealt with. Experts mainly use the model offered by international standards, although this is often criticized in literature, the main arguments against it being the simplified way in which it deals with the problem and its incapacity of satisfying all the requests of the auditors.

A solution to this problem was the development of software, which, on the basis of theoretic models, to offer experts easy-to-use solutions and a correct evaluation of risks in financial audit and not only. This thing has led to the overcoming of the subjectivity that characterized most of the audit missions and has set free the auditor in a certain measure from the task of estimating risk only on the basis of his experience and knowledge.

The advantages offered by the presented application are:

- -legislative updates and functional improvements are provided for 1 year for no additional price, being part of the Subscription Contract;
- -CIEL offers the possibility of updating your applications directly from the Internet a simple and quick procedure, thus bringing efficiency to the user;
 - -Any of the CIEL applications can be used, regardless of the user's level of knowledge;
- -The network variants of the programmes function on an unlimited number of stations, without any additional price, and the security of data introduced in the application is ensured;
- -For each of CIEL application an unlimited number of users can be defined regardless if the variant, and for each user can be defined right, according to their necessities.

E-learning is learning based on information technologies, and particularly based on the Interne educational system has a lot of advantages, such as flexibility, availability, time and resources savings and it respects the individual learning rhythm of each of the employees. According as IT area advanced, training's possibilities of employees were diversified, interactive lessons and training devices on demand, replacing classical lessons. The most competitive sectors of Romanian economy are those which use e-learning solutions. The portfolio of competences, the level of employees' information, the models and the work methods are essential pre-requisites for the companies' success. In this context, the investment in training of employees can prove most profitable for company.

Keywords: e-Learning benefits, e-Learning platform, blended learning, business environment

Cod JEL A: General Economics and Teaching.

Overview of the advantages offers to company's by E-learning

The advances informational technologies contributed to the motivational increase towards the study of some disciplines, which have nothing in common with informatics, because they facilitate learning, due to the fact that the individual particularities of the student are taken into account, also his/ her capacities and preferences, assuring the existence of feedback between the student and program, increasing the efficiency of the learning process. Thus, the informational technologies are used more frequently in the diversity of the human activities' spheres: medicine, finances, mass-media, in education and science.

The Romanian business environment adopted step-by-step this modern way training, adapting the general notions to default compulsions business environment. In keeping with "elearningeuropa.info" site programs, e-learning means to use new multimedia technologies and Internet, for improving the quality of learning, to facilitate the access to resources, services and cooperation. E-learning is available for a large spectrum of activities starting from the computer-assisted training as online education. E-learning services evolved from the introduction computers in the educational process. In this context there is a tendency to integrate educational services, through using activities as regards computer in practical situations or in classroom. As for e-learning in Romania is necessary to notice that the most universities from the country have special web interfaces for to publish information to each discipline, whence the students can download them.

The e-learning benefits are:

- permits the quick integration for new employees;
- the employees choose the moment for training and have anytime access to information;
- the knowledge offered is divided and easy of access;
- assures training for a great number of employees and diminish transport costs for training;
- the costs of delivery are low;
- the questions post-training can be elucidated anytime;
- reports about learning process are offered;
- the training effect as regards organization's performance is estimated.

E-learning offers to company's substantial advantages and its perfect adapted to specific and exacting training in business. The stages in development e-learning system are:

- 1. **Analysis needs**: The identification of target group, analysis needs of training, solutions for online education, comparative analyses.
- 2. **Design and projection instruction**: specific training models, type of contents, learning styles, the objective settlement, standards of quality.
- 3. **Development** e-learning system: the settlement of content and its structure, visual design, demonstrations, simulations, laboratories, tests, support materials, specific methods of training, interaction methods (synchronous: chat, asynchronous conferences: discussions forum, e-mail).
- 4. **Implementation** of system requires: Analysis of context, the settlement responsibilities, the check of contents, the activities program, the evaluation of performances, barriers in implementation.
- 5. **Management** of e-learning systems: necessity, marks management of education to distance programs.
- 6. **Evaluation** e-learning programs which will contains: comparisons between evaluation of e-learning programs and classic variant of evaluation, strategies of evaluation, the material evaluation of courses, self evaluation. An

important instrument for evaluation course represents the date concerning student's performances, the rate of achieve the individual tasks.

Recording continue of the way which the students achieve their works, delivers an important statistical instrument, which can be correlated with the content of learning sequence. For the business world, the e-learning development meant the creation standard programs for training, which assure knowledge and abilities to employees faster than the traditional solutions used by now. The advantages of these programs are speed of answer, offering training in real-time, and the possibility as this training to be accessed anywhere and anytime.

E-learning applications analysis in business environment

E-learning market is in development throughout in the world, although some countries are stronger advanced than others. E-Learning records an increasing development also in the business environment.

A recent study performed by the specialists from Global Industry Analysts (SUA) estimates that, by 2010, elearning market at an international level will exceed 52,6 billion dollars.

In Romania, if the market of educational software will be a free-competition market, is estimated that the number of companies which develop e-learning solutions will increase very much. Also, this increase will contain the training online by reason of the pressures which appear into companies concerning quickly and simultaneous training of new products, procedures and settlements for all employees. Thus, the training market for adults shall continue to increase, and e-learning shall cover more and more interest for training. Directing to the estimations made for Daily-business by main e-solutions providers on Romanian market, market's average increase will be 20% in 2008.

For most companies, investments in human resources are very important, not only through their value, but also through the significance that the training of the staff has on the organization. The investment in training existing or newly hired staff is a long-term one and therefore the monitoring of this process is very important.

Projects of proportion presuppose complete solutions, which are the result of partnerships between important players on this market, and SIVECO Romania is already a recognized name at international level, providing components and even integrated educational solutions in Europe, Asia and Africa.

Technologies used by E-learning platforms

At present, the whole industry related to education has a high standard of complexity; e-learning is associated with on-line courses support and the current technologies put at command systems for organization and deliver the courses (LMS Learning Management System) guided to the appearance and development e-learning platforms used-up mainly in education but also in the firms which offer courses of improvement in business environment.

For online courses a solution represents the open source platforms of learning, for example:

MOODLE (http://www.moodle.org),

Atutor (http://www.atutor.ca/)

Blackboard (http://www.blackboard.com).

Typo3 (http://edu.typo3.com),

LogiCampus (http://www.logicampus.com.

Because they are free cost and available specific code source, the open source platforms are successful concurrent for the commercial plat-forms. They are fitted for any type instructional and permit the updating and desirable modifications. E-learning platforms in Romania:

AEL platform (Educational Assistant for High-Schools, http://portal.edu.ro) for computer assisted training, main product of SIVECO, offers the support for teaching and learning, testing, evaluation, administration content, recording the results of learning process. The company offers e-business solutions, elearning and e-health. It applies high technologies as Enterprise Java Beans, jdbc, Java servlets, jsp, Java applets, and uses intensive XML. AEL is optimized for synchronous learning, the teacher checking up the lesson, creating, coordinating and recording the educational process. **AEL platform** is easy to adapt to any training's any management area of education. In this moment the platform is used in universities, and type or for also in societies for training their employees. AeL Enterprise is a modern instrument of training monitoring the improvement of staff inside a company, through which all the employees of a irrespective of their location (central headquarters, branch offices, etc) to benefit from the same course, same information, to be trained alike. In other words, they should apply the same procedures and be influenced by the same culture of the firm or institution, irrespective if they meet in a classroom or they remain in their own offices, because they are united thorough a training platform: Advanced eLearning.

ACADEMIA ONLINE (http://www.academiaonline.ro) e-learning system is achieved by InsideMedia Srl, with the support of specialists from Institute of Science Education and Association for Excellency in Career. Academia Online contains material and contents supports, sequential presented in specific rhythm of student, placed in a form and optimum design for on-line learning using visual content. The methods, proposed by Institute of Science Education, are created in constructive manner. These distinguish

fundamentally this e-learning system of other systems of learning to distance. The training is sustained by continuous evaluation and self evaluation.

EDUCATIA.NET (http:www.opensoftware.ro) e-learning platform offers courses in text, chart and multi-media format and contains elements for synchronous and asynchronous communication as well as advanced systems of testing. The courses, from different areas, are offered into a complex format and easy to approach by users. The structure of the courses is modular.

TIMSOFT ELEARNING (http://www.timsoft.ro) assures the development of online courses, hosting for online workshops, consulting and e-learning training, and development of incorporate systems for e-learning. The main product developed is the environment for online education eLearnTS with variants both Romanian and English language. Another products: IntraTS (intranet application what assures the organization and quick access to information, management of documents, cooperation) and eTests (application for online testing, dynamic producing of questionnaires and training modules).

Statistical instruments for implementation e-learning systems

More than a new type of education, an e-learning system is a business solution, a successful option for institutions which offer courses of training. Most studies show us that e-learning helps very much to decrease the costs of training but for reducing the costs, the solution must be complex and contain many components. From among the most important are: Learning Management System (LMS), which assures a better management of training process, and an electronic courses set for areas in which the necessity of training employees is priority. The optimum solution training which can work best on Romanian market, for companies, is a mix between classic learning and introduction online modules, mainly for the programs which involve using evaluation instruments.

In feasibility studies for implementation e-learning system the comparison between different solutions from the market can be made using a series of statistical instruments, as:

- -flexibility to improve the program;
- -costs- expenses made by a student for to reach established objectives;
- -scale- the number of students involved in learning activity in a period time;
- -perception- the technical quality of documents received by students;
- -symmetry- the desirable level for each student;
- -check from student looking the cooperation with another students or teacher for to accomplish learning objectives;
 - -interactivity- minimum time in which is obtained an answers from interaction;
- -the capacity of integrate the possibility to present information in different ways and from sources;
 - -necessary times for to reach an learning objective by student.

An e-learning solution is specific for companies which exceed 300 employees, distributed on a big territory, because in these organizations is noticed best the advantages. Theoretically, the prices of courses begin from 30 euro for individual users and can reach thousands euro for companies, but also there are free courses, subsidized by European funds.

Concerning Romania post- integration in UE, which generates a fast need to put with different procedures and working processes, e-learning is the best online instrument learning for European legislation and its procedures. Specialists in the educational area and from INTUITEXT (part of Softwin Group) estimate the blended learning (a combination classic training with e-learning) represents the future training for employees.

Other firm which offer online courses is SIVECO; AeL Enterprise is designed after a flexible model, not only from an organizational point of view, but also from the point of view of training materials (one can organize interactive sessions with the help of multimedia facilities and/or of video-conferences, and during the presentations one can integrate most types of MS Office documents, films and other interactive materials).

AeL Enterprise ensures a unitary training, a better monitoring of the process and of the results obtained by the students and instructors, evaluation of the didactic methods used, connections with related domains, careful planning of resources, time economy and optimization of the training process.

Conclusions

The transformation of knowledge in an essential element of social activities, its multiple functions and economic roles – a quasi-universal raw material, a capital and essential way of work with the tendency of having a prevailing role in firms and product – is normally reflected in the permanent attempt to intensify the processes of obtaining them. Maybe the most conclusive expression of this tendency is represented, in the last decades, by the permanent lifelong learning outline or by the whole period of life as an essential component of realizing a favorable environment for the economy based on knowledge.

In this context, e-Learning is having a substantial impact on personal development and citizenship, and it can do even better, provided that the human factor is not neglected within e-Learning, since this is a necessary (although not sufficient) condition to achieve enriching e-Learning experiences.

This means concentrating investment, research and practices on two priority areas: the personalization of e-Learning solutions, encouraging such developments as the bottom up production of content, the capacity of e-Learning to fit many different learning styles and the emergence of technologies that increase the flexibility in fruition, and the "humanization" of e-Learning, embodied by such developments as the diffusion of game-based elements, new possibilities for learners' interaction and empowerment, the community building aspect of e-Learning.

In Romania, as for evolution of e-learning, the prospects are good but can offering a really virtual learning environment, completely and interactive, is necessary to make a serious investment in virtual platform. The costs for Web systems and software are big, and the investment is retrieved very difficult. Because the development costs recover later in paid price by student, the online modules will become more expensive than classic training. In Romania, e-learning for companies is a market in forming. In future, the utilization of e-learning solutions will become a compulsory development component of our society.

E-BANKING- MODERN BANKING SERVICES

Vlad Miranda-Petronella

"Dimitrie Cantemir" Christian University Bucharest Faculty of Economic Sciences of Cluj-Napoca, 56. Teodor Mihaly Street Cluj Napoca, 400591 mirandapy@yahoo.com Phone: 0741-121551

E-banking is the first of those banking services that really economize time, because it allows to the user to accomplish from behind the computer many operations in the bank account, represents the computational solution that allows to the holder to have access at distance at the capitals from his account, purposing to obtain information about his account situation and the situation of the effected operations, of the payment and of the capitals transfers over a beneficiary, by a computational application, of a authentication method and of a communicational average, the e-banking is absolutely necessary in the integration conditions.

Keywords: e-Banking, Mobile Banking, Home Banking, risk, comparative analysis

JEL codes: M

Internet Banking, Mobile Banking or Home Banking are modern banking instruments, intended to the banks' customers, natural or legal juristic persons, for the payment of bills, accomplishment of transfers, money transfer from an account to an another and so on.[[7]].

The Internet-banking can be used from any computer connected to Internet, no matter where it is. Practically, in the most of cases, the user of this service doesn't need to have his own computer, an I-Cafe being useful for him. There are the same operations as for E-banking: transmission of payment orders, transfers, exchange, view of the accounts' situation etc. Banks started to jump over the primary stage of E-banking, directly to Internet Banking.

The E-banking services subsist from more than 20 years, and in Romania, beside ING Barings and ABN Amro, they are the founders of this kind of services. The operations that can accomplish by E-banking are starting from the view of companies' account balances, arriving to payments, transfers and exchange, creating term deposits etc.

The Electronic-banking or E-banking is the first of these banking services that really economize time, because it allows to the user to accomplish from behind the computer many operations in the bank account, without being necessary to go to the bank, to wait at the office, to complete forms, to sign it, to stamp it, to allow it to the clerk, all these needing many time.

To exemplify, we will refer to the order ticket, that is a payment instrument and credit title, under private signature, by which a person, named under-writer or issuer, in quality of debtor, must pay to a person named beneficiary, in quality of creditor, a sum of money, in a certain term or at presentation.

The obligation of the under-writer (the issuer) of a ticket at order is identical with that of the acceptant draw of a bill, because it must absolutely pay at term the sum inscribed on the title, so the order ticket must contain the following obligatory mentions:

- a) the name of order ticket. The absence of the name of order ticket attracts the nullity of the title;
- b) the unconditional promise to pay a determined sum (sum that must be mentioned in ciphers and letters). The issuer (the under-writer) must absolutely pay a sum of money. Any conditions, limitations or anti-performances that add to the promises to pay the order ticket attract the nullity of the title;
- c) the name of the person for which or at the order of which the payment must be accomplished (the beneficiary). The banks only accept order tickets where the name of the person for which or at the order of which the payment must be accomplished- the beneficiary of the order ticket- is indicated very clear.
- d) the date of issuance. The date of issuance must be unique, possible and certain.

The order tickets will wear clear mentions respecting the day, the month and the year of the issuance, to admit:

the estimation of the date of payment on a certain period after the issuance;

the finding of the legal capability of subscribers at the moment of signing on the title;

the determination of the subscribers' rights for the bill action against the bill obligators (protest, regress

e) the signature of the issuer (under-writer), and, for legal juristic persons, the stamp.

The comparison between the necessary time for the manually complement and the time necessary for the electronic complement is not necessary, because, in fact, there is many time economised: time with the complement, time to go to the bank, time to waiting at the pay office and time necessary to the office operator.

The services offered by E-banking are the following:

payment orders in lei;

scheduled payment in lei;

global payment orders used for the employees salaries;

intra-banking transfers between the own accounts of card and/or current;

intern or extern currency payments;

exchanges;

the visualisation in any moment of the account balances opened information about different appreciations possibility to visualise and to print the statements definition of the beneficiary of the payments, directly by the client.

The banking transfers, the payment orders, the banking changes and the operations' historical consultation can be applied directly from the mobile phone. Demirbank has introduced, for the first time in Romania, the service Mobile-banking. The bank doesn't collect any tax for this service, and the client need only a mobile phone with WAP (Wireless Application Protocol) and a subscription for this service. To use Mobile-banking, a client of the bank must sign a contract with the bank. He receives a "user-name" and a password, and after this he can use his mobile phone for baking operations. There is only one constraint- the money from the account can be transferred over a predefined list of companies. In the case in which the mobile phone is lost and, hypothetically, the person who found it would know the "user name" and the password, he could transfer the money only over a company from the predefined list.

A successfully system is that system that evolve, that adapts the faster to the needs of every customer, so the customer must analyse the hard and the poor points at the banks' offers and to choose what corresponds to his demands.

In this sense, we took over some information from four banks, to create a comparative analyse of the opportunities.

1. The Transilvania Bank [6]

Transilvania Bank, conscious of the dangers that result from the informatics identity robberies, firmly engage to assure the dates' privacy of it's customers and of their transactions. At the same time with the bank's efforts for the dates' security, because of the risk development of the illegal attacks, online or otherwise, and of the sophisticated methods, it is necessary that the customers be conscious of the potentially menaces, that he can identify a malevolent action and to apply the adequate protection measures. To keep the privacy of the personal information and of the security of the on-line activity, the bank demands to the customers to NOT communicate any information regarding the personal identity, the accounts, the card number, the expiry date, the code PIN or other banking produces and services detained. If the method used is the e-mail, than an electronic message is send to the customers, pretending being sent by a lawful source (in this case, the bank), message which demands some confidential information, which can be introduced using a link over a site indicated in the message text. This link directs the customers over a false site that reproduces very well the original page of the bank or of the e-Banking product used. By introducing the personal and confidential data and validating it, the attackers take possession of these information and they can use it to scroll operations in the account of the identity attacked by them. The fishing-attack can be realised also by the phone: a person pretends that he calls from the bank and, by inventing technical problems (for example in the payment system), he demands confidential data as: the PIN code, the account number, the password. Transilvania Bank will never admit e-mail messages that contain links over different sites where you must introduce information about the personal identity, the accounts, the card number, the date of expiry, the PIN code or other banking products and services that you use.. Transilvania Bank engages it-self to assure the higher security standard in its own systems, but you, as final user, you are playing a very important role in the assurance of the information security sent by internet.

2. The Commercial Romanian Bank:

The service Home banking MultiCash BCR admits the realization of banking operations in lei and currency, convenient and in totally security, directly at the customer's seat, by an application that will be installed on the customer's PC. The Internet service Banking e-BCR/e-BCR+ offers the opportunity to effect convenient and in maximal security of the banking operations in lei and currency, from any computer connected at the Internet.[7] The customer signs the Convention for authorized legal and physical persons, regarding the accomplishment of banking operations by MultiCash and e-BCR/e-BCR+; he must dispose of a minimal technical endowment, consisting in: a computer compatible IBM, Pentium II, modem/connection at the Internet and operation system WINDOWS 2000, XP, ME etc.[6]

The operations that can be effected by the service MultiCash/e-BCR/e-BCR+ [6]:

payments from the accounts/undercounts in lei and currency, in intra and inter-banking system; sale/buy of currency;

visualization of the statements for the own accounts (inclusive Maxicont) and for under- accounts (in lei and currency);

constitution of deposits at term in lei and in currency;

consultation of the informative report of the Treasury Direction, which contains information about: appreciation, interest rates of deposits at term, the quotations of the deposits Certified with discount, the quotations of the Stock Exchange;

the import/export of payment Orders/ statements in/from other applications; liquidation of deposit before the term;

buy/buyback of deposit certificates with discount ACTIV BCR.

Customer's advantages [6]:

the program installation (only for Multicash), the training for the customer and the technical assistance are free;

permanently electronic link with the bank with intention to transfer the payment orders and to obtain financial-banking information;

rapid and secure transfer of the sums in currency for and from Romania;

security and privacy of the transactions effected;

operations control from distance by using the electronic and/or dispensed signatures or the facility of subscription, using the function Sign;

control over the rights of access and operation of users of the company and/or the facility to decide over the users' rights of operations, inclusive sum limits on day/operation.

The collection and the payment operations in intra and inter-banking system are commissioned according to the price list in force. [6]

The level of commissions can modify making allowance of the bank policy, and the modifications are posted at the BCR centres.

3. Uni Credit Țiriac Bank [7]:

Uni Credit Țiriac Bank started an age group for the use of the services Online Banking and Business Net, that address to the physical persons, respectively to little and middle companies. For contracts concluded until 31 March 2009, the banks offer gratuity in using the appliance "digipass" for six months.

After these six months, the customer can choose the take-back of the access appliance at the accounts of the issuer branch office and the closure of the account for Online Banking, or he can choose to use it on, paying the guarantee.

"In 2008, the number of transactions realised by internet banking by the bank customers physical persons and little and middle companies doubled relative at 2007. It is certain that the banking operations at distance are more and more appreciated and they will probably continue to develop, considering also the costs advantages. The company new-launched is one of the measures that regard the amelioration of services quality, in this case by offering to the customers who want to manage their banking accounts from distance the most advantageous access at internet banking", has declared Zoltan Major, vice president Uni Credit Tiriac Bank, responsible of Retail Division.

The bank perceives commissions 50% lower for the operations realised by internet, comparative with those from pay box.

4. ING Home'Bank:

Description:

- ING Home'Bank is your own bank, to which you can dial at any hour and from anywhere in the word;
- ING Home'Bank- you can effect banking operations 24 hours from 24, 7 days from 7, wherever you are in the word, as long as you have access at a computer connected at the Internet;
- you have total security by: the most advances date encryption algorithm and by the certificate VeriSign SSL, for the website identity and authenticity verification.

Benefits [6]:

- with ING Home'Bank, you can verify the balances of all your accounts opened at ING, debit accounts or credit accounts, as well as the deposits and the assurances afferents to credits;
- your on-line bank from ING allows you to effect payments and transfers in lei and currency over the accounts opened at ING Bank or at other banks from Romania and in foreign countries;
- you use and reimburse the credit lines;
- you pay the utilities bills;
- you effect exchanges, without commission;
- you verify the transactions effected during the last six months.

On the BCR site, at a simple search, you can find information about the benefits of this kind of transactions and how you can realise them, what do you need for such a transaction. Unfortunately, there are too few information about security, or even at all, and this is the reason for which it is questionable the election of this bank services.

The third offer of UniCredit Țiriac Bank in an offer in process, but we can't find anything about the benefits and the security of these services. We also find articles about robberies from this bank by the fishing method, but this can not convince us to choose this bank as new customers who care about their money.

From these banks, the most preferable is Transilvania Bank, because it specifies the security measures for the financial cash of customers, the operations that can be effected and protection measures for the customers.

On the BCR site, at a simple search, you can find information about the benefits of this kind of transactions and how you can realise them, what do you need for such a transaction. Unfortunately, there are too few information about security, or even at all, and this is the reason for which it is questionable the election of this bank services.

We also find articles about robberies from this bank by the fishing method, but this can not convince us to choose this bank as new customers who care about their money.

Conclusions

By making a comparative analysis, on concrete situations, over the four banks taken in our study, we can note that the problems opened by e-banking, are:

- the risk of fraudulent attacks;
- comfort in using the application;
- the customers' option behind the multitude of e-banking applications and the criterions that lie at the bedrock of the choose of one application;
- the commissions and the taxes that banks perceive for these applications;
- the diversity of the operations offered by the application;
- the rapidity in the information transfer from the payer over the bank;
- the transfer rapidity between the banks;
- the rapidity to actualize the information after having finished the transfers;
- correction possibility in the case of the introduction of some incorrect information or some possible mistakes;
- the compatibility with financial- bookkeeping systems, those that belong to the banks and also those that belong to the companies;
- the way in which this kind of operations answer or fold on the customers' needs.

Consequently, we consider the these problems resolution supposes first of all a marketing study on the banking market and a comparative analysis of the banking offers, so that the decision for one version can be the best and folds on the beneficiary demands.

Starting by the e-banking definition, given by the ORDER no. 389 from 27 June 2007, as a payment instrument with access at distance, represents the computational solution that allows to the holder to have access at distance at the capitals from his account, purposing to obtain information about his account situation and the situation of the effected operations, of the payment and of the capitals transfers over a beneficiary, by a computational application, of a authentication method and of a communicational average, the e-banking is absolutely necessary in the integration conditions.

The analysis of the computational commerce indicates us an ascending evolution from the view point of the clients, but also from the view point of market transactions until October 2009, date after which, because of the economical crisis, the situation will change: the value volume on the first trimester of 2009 diminish in comparison with the same period of the year 2008, but the transactions number in the same period grows up.

We consider the these problems resolution supposes first of all a marketing study on the banking market and a comparative analysis of the banking offers, so that the decision for one version can be the best and folds on the beneficiary demands.

FINANCIAL DEPENDENCE AND BALANCE – NEW CHALLENGES OF THE PUBLIC SERVICE DECENTRALIZATION

Petru Filip

University of Oradea, Faculty of Economics

Abstract: The paper intends to analyse a model of decentralization specific to Continental Europe, which shows that a transfer of responsibility to the local authorities has not always been appropriately followed by a transfer of resource, the consequence being the appearance of budgetary imbalances at the level of local communities. In this situation, the local communities are forced to identify the funding source and, therefore, they have used the most rapid instruments provided by the law and the financial institutions – the borrowed sources. As long as the borrowed funding sources have been used to the restoration of the public infrastructure and, therefore, to the public investments, the solutions identified by the public manager are not to be blamed, the problem being the use of borrowed sources in order to cover certain consumerism needs which illegitimately charges, in our opinion, the public cost, the obligation to finance the maturity rates including the interest falling back on the future generations.

Key words: public service decentralization, financial balance, public manager, funding policies

JEL Code: M1, H3, H4,

Decisional and financial decentralization of public services

The financial management problems are diverse, from the income and expenditure budget, the management modern instruments, the basis for the decision capitalization, the local economic development or of the management of the public debt service are some examples that the **public manager** must study in order to be able to solve the perpetual "conflict" between the limited character of the resources and the population's diversified needs for public services.

The decentralization of the public services is also a problem preoccupying Continental Europe, the local and central authorities being interested – applying the principle of subsidiarity (of closeness to the citizens)- in transferring the decision concerning the services to that level of authority which satisfies the best and most promptly the public needs so that the services provided have as high as possible quality and utility level.

The decentralization model specific to Continental Europe shows that not always a transfer of responsibility to the local authorities has been appropriately followed by a transfer of resources, the consequence being the appearance of budgetary imbalances at the level of local communities which, forced to identify the **funding source**, have used the most rapid instruments provided by the law and the financial institutions – the borrowed sources.

As long as the borrowed funding sources have been used to restore the public infrastructure and therefore the public investments, the solutions identified by the public manager are not to be blamed, the problem being the use of borrowed sources to cover certain consumerism needs which illegitimately charge the public cost, the obligation to finance the maturity rates including the interest falling back on the future generations.

The consequences of the implementation of the decentralization model mentioned do not stop here. Worried by the impossibility of the local communities to face the funding needs, the central authorities have practically adopted two funding policies (in the relation with the local authorities):

- a) **the first** corresponding to transfers, has the form of the sums broken down from some revenues of the state budget, having or not a special destination;
- b) **the second** corresponding to the sums for balance; the purpose being to ensure the cover of the funding needs of those local authorities that do not have an appropriate financial capacity.

Intensely manifesting, both the decentralization of the public services and the financial decentralization and together with this the **financial dependence** on the resources of the state budget, the specialists have been interested in indentifying some indicators to measure this dependence and also to characterise the financial policies of the central authorities in the relation with the local authorities.

The Hutner coefficient-a measurement indicator of the financial imbalances

A first indicator studied was the Hutner coefficient which measures the horizontal imbalance too at the level of local authorities, established according to the relation:

Coef.H=1-Revenues not controlled by the local communities/Total expenses local communities

For the informed reader, the revenues not controlled by the local communities have the form of levies from the state budget, the values of the coefficient having different meanings:

- a) Coef $H \rightarrow 1$ indicates a favourable situation, corresponding to a state of financial independence of the local communities;
- b) Coef $H \rightarrow 0$ indicates an unfavourable situation, the majority of expenses being financed based on the levies from the state budget.

In the figure below it is presented the evolution of the Hutner coefficient during 1998-2003, at the national level:

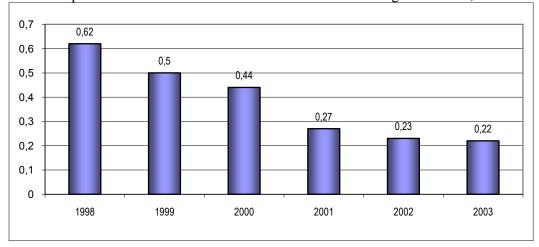

Figure 1– The evolution of the Hutner coefficient

It can be seen that, every year, the value of the Hutner coefficient indicates the existence of a more and more accentuated financial dependence on the central budget, a situation explained by the fact that, even though public services were decentralized, their funding has been made through conditioned transfers from the state budget so that in certain situations, the local communities had a decorative role in the management of services.

Global income tax – a measure of the vertical imbalance

In the same time, the indicator of the global income tax $I_{\rm IVG}$, characteristic to the vertical imbalance (between the administrative-territorial units) in its calculus form as a ration between the global income tax transferred to an administrative-territorial unit and the income global tax levied at the level of an administrative-territorial unit $I_{\rm IVC}$ has also different meanings:

- a) When **I**_{IVG} **is improper**, it indicates the fact that the local authority cannot cover from its revenues its own funding needs, the transfer of resources from the state (central) budget being necessary;
- b) When I_{IVG} is proper, the local authority will have to benefit from transfers from the central budget, no matter the form it has (transfers or sums for balance).

From the financial manager's perspective it is important to study the **combined interpretation** of the two categories of indicators in order to characterise the financial policies of the central authorities in relation to the local authorities.

The following situations can be distinguished:

- a) Coef H \rightarrow 1 and $I_{IVG} > 1$, corresponds to a situation of a very good financial autonomy, the local community being in the situation to record resource surpluses which can be transferred to other local authorities, according to the balancing rules;
- b) Coef H \rightarrow 1 and I_{IVG} < 1, corresponds to the same situation of financial autonomy, the transfer of resources being already made because the local authority collected more than it had been transferred to it;
- c) Coef H \rightarrow 0 and $I_{IVG} > 1$, is a situation corresponding to a limited financial autonomy, the local authority being in need of transfers in order to cope with the funding needs of the public services;
- d) Coef $H \rightarrow 0$ and $I_{IVG} < 1$, a situation of limited financial autonomy, the local authority has the necessary resources transferred to cover the funding needs, so that the indicator of the global income tax is proper.

Knowing the particularities of the **funding policies** gives the possibility to the financial manger to study and capitalize certain financial strategies concerning the relation with the state budget, beyond the complexity of the transfers from the central budget, according to certain criteria such as:

- the transfer of a quota from the revenues levied based on a principle of derivation;
- the use of formulae;
- ad-hoc decisions;
- reimbursement of the costs of public services provided.

Types of financial transfers between the public authorities

Methods to determine the volume of transfers to the local public administration Methods to allocate the transfers between the eligible local authorities	A proportion (quota) from the revenues of a state tax	Ad-hoc decision	Reimbursement of the expenses approved
Transfers established based on a principle of derivation	Type A transfer	Type E transfer	N.A.
Transfers established based on a formula	Type B transfer	Type F transfer	N.A.
Transfers established based on reimbursement of costs	Type C transfer	Type G transfer	Type K transfer
Transfers established based on an adhoc decision	Type D transfer	Type H transfer	N.A.

Table 1 – Classification of the administrative transfers, according to the method of revenue sharing

Source: Fiscal Decentralization, Roy Bahl, April 2000

Characteristic to these types of transfers are the following:

Type A transfer – anti-equalizer, it favours the rich local administrations with a high fiscal capacity.

Type B transfer – is based on the ensurance of the horizontal balance between the administrative-territorial units.

Type C transfer – conditioned transfer, it is based on the reimbursement of the costs of public services.

Type D transfer – is based on the allocation of sums based on ad-hoc decisions, being about discretionary criteria.

Type E transfer – unconditioned transfer with a general destination, the sums being allotted between the administrative-territorial units based on a principle of derivation.

Type F transfer – is also an unconditioned transfer based on an ad-hoc decision, but which is assigned between administrative-territorial units based on a formula.

Type G transfer – comes from the central level based on an ad-hoc decision and it is assigned between the active territorial units based on reimbursement of costs.

Type H transfer – is based only on ad-hoc decisions, being the most centralised, conditioned or unconditioned.

Type K transfer – is a transfer with a special destination, between the eligible local authorities the sums being assigned based on reimbursement of costs.

These types of transfers, usually, are used in a combined way, at the national level resulting the following funding scheme:

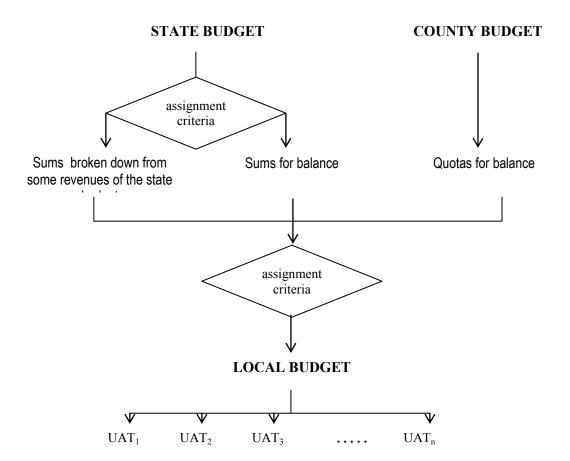

Figure 2- The flows of transfers and sums for balance assigned from the central budget to the administrative-territorial units

The financial flows represented above emphasise two particularities of the funding policies currently used in Romania in the relation between the central and local authorities:

- a) the first is determined by the existence of conditioned transfers based on the reimbursement of the cost of public services provided (exp. Public Services in pre-university education);
- b) the second is based on the quotas and sums for balance assigned according to certain criteria between the administrative-territorial units.

From the perspective of the financial management it is interesting to study the criteria applying to assign balance sums between the state budget and the county budgets and then between the county budgets and the local budgets.

The first category of criteria is based⁶³⁷ on the financial capacity made on average per inhabitant for each county in a percentage of 70% and the surface of the county in a percentage of 30%.

The balance funds allotted to each county are established according to the formula:

$$FdEj = C_1 \times \frac{1 - \frac{IVG / loc j}{IVG / loc med}}{\sum_{j=1}^{n} \left(1 - \frac{IVG / loc j}{IVG / loc med}\right)} + C_2 \times \frac{Sj}{Sn}$$

where:

FdEi – balance funds at the level of each "j" county

C1 – the criterion afferent to the financial capacity in a percentage of 70%

IVG / loc j – global income tax per inhabitant at the level of each "j" county

ITL / loc med – average global income tax at the level of counties

C2 – criterion afferent to the surface of the county in a percentage of 30%

Si – surface of the "j" county

⁶³⁷ Art. 29, paragraphs (1), (2), (3) of GEO 45/2003 – concerning local public finances, published in the Romanian Official Gazette no 403 of 19 June 2003

Sn – surface of the territory obtained by summing up the surfaces of each "j" county

The financial flows described above, which are generated between the state budget and the state budget and the county budgets in relation to the balance sums "admit" for financing all the counties, being about a "socialised" balance without taking into consideration the principle of concentration, which implies the acceptance for balance only of those counties which are under a certain limit established nationally.

In turn, the financial flows generated between the county budget and the local budgets based on the quotas and sums for balance are assigned according to the four criteria regulated by law⁶³⁸:

- financial capacity

30%

- the surface of the administrative-territorial unit

30%

- the population of the administrative-territorial unit 25%

other criteria established by Decisions of the County Council 15%

Applying these criteria, the fund for balance which will be assigned between the county budget and the budget of every administrative-territorial unit are based on the formula:

$$FdEu = C_{1} \times \frac{\frac{IVG(j) : P(j)}{IVG(u) : P(u)} \times \frac{P(u)}{P(j)}}{\sum_{j,u=1}^{n} \left[\frac{IVG(j) : P(j)}{IVG(u) : P(u)} \times \frac{P(u)}{P(j)} \right]} + C_{2} \times \frac{Su}{Sj} + C_{3} \times \frac{Pu}{Pj} + C_{4} \times Ac_{J}$$

Where:

C1, C2, C3, C4 – are the percentage wise quotas corresponding to criteria: financial capacity, surface of territory, population and other criteria established by law

Su, Sj – the surface of the administrative-territorial unit and of the county

Pu, Pj – the population of the administrative-territorial unit and of the county

Aci – other criteria established by the County Council

IVG(u), IVG(j) – global income tax at the level of the administrative-territorial unit and of the county.

Conclusions

The complexity of the calculus may discourage the financial manager when trying to understand the balance mechanism, yet it is important from the perspective of completing the funding sources of the local budget with sums resulted from balance. In practice, there have been frequent situations when not knowing the assignment criteria and their non-compliance have led to assignments according to discretionary criteria of the sums and quotas for balance by the county councils.

These balance criteria between the county budget and the local budgets do not comply with the principle of concentration in order to eliminate from balancing those administrative-territorial units which exceed a certain average level of IVG and do not take into consideration the structuring of the population on age groups, for example until 18 years old and over 65 years old, in order to ensure the financing of social expenses (education or social assistance and protection).

In the end, knowing these mechanisms – either it is about the measurement of financial dependence or independence or the budgetary balance – is necessary in order to consolidate the so much desired and requested by the local authorities financial autonomy.

THE ECONOMETRICS OF THE FORECASTING OF FINANCIAL RESOURCES, A MAIN COMPONENT OF THE FINANCIAL MANAGEMENT

Petru Filip

University of Oradea, Faculty of Economics

Abstract: The paper intends to emphasise the importance of budget resources forecasting for long periods of time, within the financial management. An as accurate as possible forecasting of the volume of financial resources will represent the basis for the future projections of the expenditure of local communities, as they are regulated by law, knowing that one of the principles representing the basis of budget making is that of the balanced budget. To the same extent, the volume of the budget liquidities will depend on the rigorousness of the design of the volume of financial resources. Beyond the abstract character of the mathematic calculus made by specialists in econometrics, the financial manager is also interested to know the forecasting techniques so that he/she can draw up the income and expenditure budget, the basis for the implementation of the economic-social development strategies of the local communities. The financial management remains a fundamental component of the public management through the theoretical-methodological arsenal made available for the loan officer.

Key words: resource forecasting, econometrics, financial management, stochastic methods

JEL Code: M1, H3, H4,

Without economic mathematics, there is no philosophy of the financial management. Without financial management, there is no philosophy of economic mathematics. Without both of them, the manager lacks the power and the accuracy of decision.

This is why an essential component of the financial management is the **budget resources provisioning** for long periods of time, the basis to make the income and expenditure budget. Why is it necessary to accurately know the current and future evolution of the structure of financial resources?

The answer to this question has different meanings on the cash flow and their balance for each local community! **First of all,** an as exact as possible forecasting of the volume of financial resources will represent the base for the future projections of the local communities' expenditure, as they are regulated by law, knowing the fact that one of the principles on which the drawing up of the budget is based is that of the **balanced budget**.

Second of all, the volume of the budget liquidities will depend on the design of the volume of financial resources. Any over-dimensioning of the revenues will have as a consequence the over-dimensioning of expenditure which will endanger both in the present and in the future the liquidities, the budget mechanism being simple, yet dangerous: the budget credits approved and open ensure the financing of the public services and if over-dimensioning the revenues the risk of payment default is major.

On the contrary, an under-dimensioning of the revenues will lead to an under-dimensioning of the local communities' expenditure, the immediate consequence being an increase without foundation of the volume of liquidities.

Then existence of some liquidity surpluses is not useful for the local communities as long as their obligation is to keep them in the State Treasury without paying interest.

The implications of the surpluses are much more profound, they can be the result of some under-financings of public services, a fact which will lead to an ill-judged increase of debts to the goods and services suppliers which unpaid on settling day will attract the payment of some compensatory financings and penalties.

Isn't it true that the budget resources forecasting becomes extremely important when making the income and expenditure budget, due to its different implications on the budget execution?

That is why in order to help the public manager, the latter should have at his/her disposal an entire portfolio of instruments helping him to make the decision to draw up an as rigorous as possible income and expenditure budget. What has the science given to the budget so far? The classical and modern methods in the specialty literature are witnesses, out of which we mention:

- **the automatic method** evaluates the indicators regarding the incomes and expenditure starting from their execution in the period t-1;
- the diminishing method evaluates the same indicators starting from the budget execution on a five consecutive year interval previous to drawing up the income and expenditure budget;
- the direct evaluation method is based on the evaluation of each income or expenditure, taking into
 consideration the preliminary executions for the current year and the predictable evolutions with budget
 implications for the following year;
- **the planning, programming, budgeting method (PPB),** considered as a modern American method, is based on the restructuring of the budget following the succession: "structure-objectives-programme";

⁶³⁹ Iulian Văcărel (coordinator) – Finanțe publice, ediția a III a, Ed. Economică, București, 2003, p. 725

- the management by objectives method is also an American type method which emphasises the finality of
 each field of activity, being the starting point in the implementation of the budget on programmes;
- the Zero Base Budgeting method, known also as "cost-advantage method", the intention being to critically examine all the expenses considering their necessity and opportunity;
- the method of rationalisation of budget choices (Rationalisation de Choix Budgetaire) a method based on the use of calculus, analysis, forecast, organization and management techniques, of French inspiration.

The income forecast methods, both classical and modern, in order to be useful for the local communities must comply with the following criteria:

- to be clear and simple, so that the specialists without high mathematic, statistic or economic education can use it within the budgetary process;
- to require only easily obtainable data or information in due time from the recordings drawn up at the level of local administration;
- to be possible to manually perform the calculus, for there are still local public administrations which do not have computers.

Beyond the methods studied and commented in the specialty literature, we can analyse the "arsenal" of methods that the modern science provides. The forecasts, as finality of the financial econometrics, ensure for the financial manager the answer to the question: Which will be the provisioned level of the financial resources in the current and future period?

"And if you must forecast, forecast often", Paul Samuelson said in one of his papers.

The inertial or adaptive behaviour of economic processes and phenomena, and moreover of the budgeted revenues' (resources) evolution is presented in the specialty literature ⁶⁴⁰ with the help of forecast stochastic methods:

- **autoregressive methods** (AR) of order 1, AR(1), $y_t = a_0 + a_1 \times y_{t-1} + u_t$ of order 2, AR(2) $y_t = a_0 + a_1 \times y_{t-1} + u_t$, regard the distance in time of the past values of the variable which determines the present and the future level;
- **moving average models** (MA) of order 1, (MA(1)), $y_t = y b_1 \times u_{t-1} + u_t$ of order 2, (MA(2)), $y_t = y b_1 \times u_{t-1} b_2 \times u_{t-2} + u_t$, regard the distance in time where the influence of the perturbation "is felt":
- **mixed models** (autoregressive and moving average) ARMA (pq) representing a combination of both sources of growth:

$$y_{t} = y_{t-1} + a_{0} + a_{1} \times y_{t-1} + a_{2} \times y_{t-2} + \dots + a_{p} \times y_{t-p} - b_{1} \times u_{t-1} - \dots - b_{q} \times u_{t-q} + u_{t}$$

- **autoregressive integrated moving average models** ARIMA (pdq) – representing a variant of the mixed models by which the existence of the trend within the series is specified, indicating by the size "d" the order of the difference which has brought stationary values. Usually, the 1st order differences among the

terms of the series $dy_t = y_t - y_{t-1}$, at most the 2^{nd} order differences, $d^2y_t = y_t - dy_{t-1}$ manage to eliminate the trend in the data.

The statistical characterisation of the stochastic methods is made with the help of media, dispersion and covariance, an example being the autoregressive model in its simplest form:

$$y_{t} = a_{0} + a_{1} \times y_{t-1} + u_{t}$$

The average of the AR(1) process is:

$$M(y_t) = M(a_0 + a_1 \times y_{t-1} + u_t) = a_0 + a_1 \times My_t, \quad M(y_t) = \frac{a_0}{1 - a_1}$$

The dispersion of the y(t) process:

$$\sigma^{2}(y_{t}) = \sigma^{2}(a_{1} \times y_{t-1} + u_{t}) = M[(a_{1} \times y_{t-1} + u_{t}) - M(y_{t})]^{2} = a_{1} \times \sigma^{2} \times y_{t-1} + \sigma^{2}u$$

Taking into account the fact that the process is stationary $\sigma^2 y_t = \sigma^2 y_{t-1}$, it results:

$$\sigma^2 \mathbf{y}_{t} (1-\mathbf{a}_1) = \sigma^2 \mathbf{u}$$

.

⁶⁴⁰ Eugen Ştefan Pecican – Econometrie pentru Economişti, Ed. Economică, Bucureşti, p. 137

$$\sigma^2 y_t = \frac{\sigma^2 u}{1 - a_1}$$

The covariance of the y(t) process, in its turn, for the AR(1) autoregressive model is determined as such:

$$C_{OV}(y_{t}, y_{t-1}) = M[(y_{t} - M(y_{t}))(y_{t-1} - M(y_{t-1}))]$$

$$M[(a_{1}y_{t-1} + u_{t-0})(y_{t-1-0})] = M(a_{1}y_{t-1}^{2} + u_{t}y_{t-1})$$

$$a_{1}M(y_{t-1}^{2}) + M(u_{t}y_{t-1}) = a_{1}M(y_{t-1}^{2}) = a_{1}\sigma^{2}(y)$$

$$a_{1}M(y_{t-1}^{2}) = a_{1}\sigma^{2}(y_{t-1})$$

$$a_{2}M(y_{t-1}^{2}) = a_{2}\sigma^{2}(y_{t-1})$$

Because u_t and y_{t-1} are not correlated and $\sigma^2(y_t) = \sigma^2(y_{t-1})$

$$C_{OV}(y_{t}, y_{t-2}) = a_{1}^{2} \sigma_{y_{t}}^{2}$$

$$C_{OV}(y_t, y_{t-k}) = a_1^k \sigma_{y_t}^2$$

Conclusions

Beyond the sobriety of the mathematical calculus made by the specialists in econometrics, the financial manager is interested in knowing the forecasting techniques in order to draw up the income and expenditure budget, the basis for the implementation of the economic-social development strategies of the local communities.

The financial management remains a fundamental component of the public management which through the theoretical-methodological arsenal that offers to the loan officer, helps to totally or partially solve the balance equation:

NEEDS FOR FINANCING SOURCES OF FINANCING

(in continuous growth and diversification)

(with a limited character and under the pressure of diminution)

It remains to be seen to what extent the managers will use these levers capitalised by the science of management so that the public service users can fully feel the usefulness of the services that they benefited from.
