Companies facing the new economic world, dominated by demographic, macroeconomic, and technological changes need to see talent management as a business priority in order to survive. At the same time, the world economic crisis ads pressure over managers, forcing them to rethink the business and HR strategies.

The object of this paper is to emphasize the importance of developing a talent management strategy and aligning it to the business strategy of the organization. Many studies and researches in this area confirm the idea that employees working in companies that emphasize talent management practices are more engaged in obtaining high performances and are more satisfied with their jobs. At the same time, these companies have better financial outcome.

Keywords: talent management, human resources, strategy.

JEL: M12

The necessity for possessing specialized personnel increases simultaneously with the emphasized lack of those that have the abilities, experience and skills necessary for the good functioning of companies. Various researches in this area have shown that organizations that confer importance to talent management practices have employees that are more involved in reaching performance and more satisfied with their jobs. As well, these organizations have better financial results.

In the current global economic context, intense demographical, macro economical and technological changes add pressure over companies, which in order to survive and to be efficient have to transform talent management into a priority. Managers must invest a lot of time in creating strategies that attract, motivate and retain talent. Although, in the current economic conditions, employees are more reticent regarding risk, being less probable for them to change jobs, on a long term, challenges remain the same for the companies.

In order to attain an efficient talent management, companies must understand what talent is and what talent management effectively implies. A talented employee is not an exceptional endowed person, but, rather, a very appropriate person for the domain in which s/he works. Every employee, no matter the job, must be evaluated according to two dimensions: performance and potential. All employees that have high performances, or high potential or, the best case being high performances as well as high potential, should be considered talented.

Talent management at a macroeconomic level

The competition for talents became acute at a global scale and at every hierarchic level, not only at managerial level. Although, the unemployment rate stays high, talent deficit becomes more and more pronounced, considering it has a critical importance for the companies. But predictions regarding the ingravescence of this talent crisis are more and more pessimistic. It is forecasted that four industries: health, production, energy and the public sector will suffer or are already suffering because of the mass exodus of the employees towards other domains.¹

1 Vasile Irina, "Criza de talente", Revista Cariere, Number 115, Bucurest, 2008, pp. 44-47

On the workforce market a complex competition takes place. On one hand companies fight for hiring specialists, and on the other - for hiring key people, those people that possess a rare resource, namely "critical" talent. The latter form a distinct category of employees that fulfil the ideal combination of: ² necessary knowledge for the job; inborn abilities and developed abilities; ideal attitude towards the assumed role; maximum availability for effort.

Two of the global surveys performed by McKinsey Quarterly bring out the companies' concernment regarding human resources evolution³. According to the first survey conducted in 2006 on a sample of 10.000 respondents, the most important managerial preoccupation for the next years will be recruiting talented employees. The second survey, carried out in November 2007 on a sample of 1.300 managers underline the fact that almost a half of the respondents consider that the enhancement of the competition for talent is a certainty, and the more and more global nature of this competition will have a major impact on companies in the following five years. No other global tendency has ever been considered so important.

In 2007, The Boston Consulting Group, together with World Federation of Personnel Management Associations, completed an ample study in 17 countries of the world. The study, based on the participation of 4.741 respondents, pointed out the importance given to talent management in the key aspects of human resources management. As a result, talent management was ranked on the first place in the top of the most important aspects of HR by 9 of the 17 countries in which the study was carried out, 16 of these placing talent management between the four most important preoccupations of HR, as it is shown in the exhibit bellow.

Exhibit 1 – HR topics classification

Source: The Boston Consulting Group, World Federation of Personnel Management Associations, *Creating People Advantage*, Boston, 2008, p.23.

The search for talented employees at global level will go through a rapid development. While the market becomes more flexible, the talented employees are more and more capable in moving there where the best opportunities are offered. Thus, one observe an aggravation without precedent of the fight for talent, a refinement of the employers' requests, an accession in complexity of the personnel specifications and even a "gap" between the market's offer and the employers' expectations. Because the talented employees are the first aimed at by the competitors, these can become the most instable employees of the company. In consequence, some companies extend their keeping strategies of the valuable employees.

Three external factors – the demographical change, globalization and the augmentation of the number of workers based on knowledge – force organizations to approach in a more serious manner talent management. These factors bind the argument of placing the planning of the workforce and talent management in the centre of the business strategy and for assigning to these practices a longer time of the superior management.

The determinant factor for the business world in the following years will be of a demographical nature. Companies confront themselves with demographic scenery dominated by withdrawal, of the so called, *baby boomers* and the lack of young workforce, especially in the developed countries. Although in the last years has been talked about the danger of overpopulating the planet, the reality is that we are assisting today at a growing under population in the developed countries, with all its economical implications.⁴

In the last decade, organizations have made many investments in implementing some administration systems for human resources, and the problems regarding talent have gained a greater importance. Although it is welcomed, this change is not enough; it is quite superficial, because many companies continue in treating talent management as a short term problem and not as an integrating part of the long term strategy that requires the attention of the top management and the distribution of substantial resources. In order to be efficient, talent management strategies must be included in the general strategy of the company.

For an efficient talent management strategy, managers must understand that the strategies in this domain cannot be focused only on the top performers. Also, managers need to understand the diverse motivations that determine employees of different ages, sexes, nationalities to hire themselves and remain in the company. In this sense, the specialists in the human resources department must develop their additional competences in order to elaborate and put into effect efficient solutions. In this manner only, talent management is going to be established in the centre of the company's general strategy.

The causes of the present crisis of talent are numerous. In addition to the demographic and technological ones there is also the most unpleasant factor: the educational standard which is in decline. While the developed countries confront themselves with the abatement of the birth rate and the increasing of the number of pensioners, developing countries produce a surplus of young talent. Although in developing countries the number of young graduates is twice as large as in the developed countries, this thing doesn't resolve the lack of highly qualified workforce problem in the developed countries. HR specialists of some multinational companies stated in a McKinsey Quarterly study that the most frequent problems regarding this segment of the workforce are: the weak knowledge of English, questionable educational qualifications and cultural problems, such as: the lack of team work experience, the lack of initiative and the abhorrence towards assuming the position of leader.⁵

_

⁴ Peter Drucker, Despre profesia de manager, Meteor Press, pp.7-8.

⁵ Matthew Guthridge, Asmus B. Komm, Emily Lawson, op.cit., p.51.

A special challenge comes from Generation Y – the population born after the 1980, of whose apprehension is influenced, among others, by the Internet, overcharging with information by too fervent parents. This generation presents some specific characteristics that contribute at the realization of a more difficult efficient management of the human resources. Human resources specialists claim that these employees demand much more flexibility, professional liberty, larger recompenses and a better equilibrium between the professional life and the private one. The perception of these employees over the professional career is different from that of the elderly employees. These see the professional career as a series of chapters of two – three years and they will easily change their job, so that the companies easily risk in losing these employees if they don't fulfil their expectations.

Together with the expansion on new international markets, companies confront themselves with another challenge – globalization. In order to gain success on the international markets, companies need managers that are willing and capable of working abroad. Also, they need talented men in the respective country, in order to posses an international thinking.

Workers based on knowledge, the talent source with the fastest accession in most organizations, have their own demands and characteristics. These employees are different because they generate up to three times more profit than the other employees, and their work requires minimum supervision. It is possible that labour productivity based on knowledge and the workers productivity based on knowledge, even though it's not the only competitive factor in world's economy, might become the decisive factor for many of the organizations in the developed countries. Workers based on knowledge have a higher mobility that the other labourers and, so, they are more difficult to "lead". These identify themselves with what they know and not with the organization of which they are a part of.

Talent management at organizations' level

Talent management responds to the challenge of recruiting and keeping the employees with high competences and providing them opportunities to achieve performance, excel and to promote in the company. Talent management process must be transparent; employees that don't understand this process will consider that they are not treated equally in comparison with the other employees.

According to the Boston Consulting Group study⁶, the most important activities in the talent's management domain in the following years are going to be the following:

- The development of some personalized career plans.
- The development of some re-compensation plans specific for the talented employees.
- The search for talented employees in the competitor companies.
- The set up of the Alumni networks.

- The relocation of businesses in order to have access to new sources of talented employees.

Companies begin to diminish the intensity of the search for talents in the local sources, orienting themselves towards a global search of talent. Although, in present, only a small percentage of 10% among the companies resort to displacement in order to have access at new sources of talent, as it is forecasted that until 2015 this percentage is going to reach 20% or even more in the case of some countries.

The most frequent activities in the talent management domain that the companies are realizing at the moment, in a proportion of 50% and which they are going to accomplish, until 2015, in a proportion of 70%, are: the development of some personalized career plans and the development of some re-compensation plans specific for the talented employees.

As a result of the companies' obsession for short term performance, in part, they are also making themselves guilty for the present crisis for talent. Managers approach talent in a reactive manner,

_

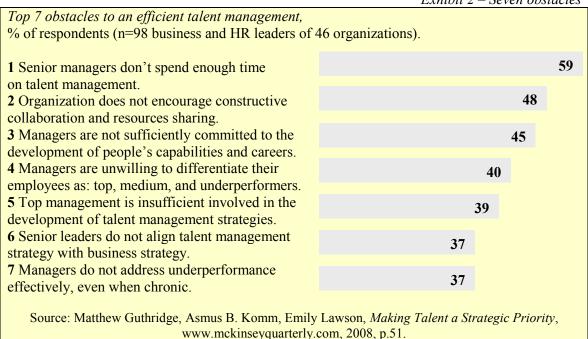

⁶ The Boston Consulting Group, World Federation of Personnel Management Associations, Creating People Advantage, Boston, 2008, p.45.

by hiring additional personnel only when a new product is launched. Short term orientation deviates management's attention from long term preoccupations, such as: identifying talent sources and career's development.

People's mind habits are real barriers in the way of achieving an efficient talent management, a human resources manager asserts. When companies make a priority out of talent, these often fall in another trap, meaning that they focus only on the human resources' systems and processes, fact that deviates the attention from the place where most obstacles can be found: people's mentality.⁷

There are numerous obstacles in the way of achieving an efficient talent management. McKinsey Quarterly⁸ realizes a ranking of the most important seven of these obstacles, presented in the exhibit below.

Another negative tendency of the last years is the diminution of the influence of the human resources department and the absence of talented individuals willing to work in this department. An analysis of the organizational structures effectuated by McKinsey Quarterly together with Saratoga Institute⁹ reveals the fact that, less than two thirds of the human resources managers relate directly to the president of the organization, and a recent survey realized by Great Britain indicates that human resources specialists earn up to 50% less that their homologues from other departments.¹⁰

Managers criticize human resources specialists for lacking business knowledge, observing that the majority is working, rather, in a narrow administrative vision, than addressing to the long term problems, such as: planning the workforce and elaborating a strategy that should respond to the company's necessity for talent. In order to consolidate the business competences of the human resources specialists and, at the same time, with the purpose of making the human

⁷ Matthew Guthridge, Asmus B. Komm, Emily Lawson, op.cit., p.53.

⁸ Ibidem, p. 51

⁹ Matthew Guthridge, Asmus B. Komm, Emily Lawson, op.cit., pp.53-54.

¹⁰ Ibid., loc.cit.

resource operation more credible, the Coca – Cola Company, for example, effectuate the high performances managers on positions inside the human resources department.

A Watson Wyatt and WorlatWork organizations study¹¹, conducted in May 2008, which is based on the answers of 1.389 organizations from 24 countries, brings out the fact that the exodus of the efficient employees can be prevented through an integrated approach of the compensations and talent management. According to this study, the companies that introduce such an approach have with approximately 20% fewer chances in facing problems in attracting and holding to the talented employees. These companies also have approximately 18% more chances to be profitable from a financial point of view.

In order to elaborate efficient strategies for talent management at all hierarchic levels, a special attention must be given to the segmentation of employees in target groups, depending on different values, ambitions and expectations. For example, Generation X's values, ambitions and expectations are different from those of Generation Y's, as those of middle aged women are different from those of elderly employees. These values, ambitions and expectations differ according to cultural environment, a more specific segmentation being necessary.

The benefits of the talent management practices cannot be ignored by the companies. Talent management doesn't contribute only in motivating employees and in obtaining a bigger profit, but also in the improvement of the respective company public image. A ranking of the most admired companies for their talent management practices, realized in 2008 in USA, is only one of the proofs of this thing. Among the most admired ten companies for their talent management practices are: BMW Company, Walt Disney, Fortune Brands, Starbucks, General Electric and Procter & Gamble.

Talent management encompasses many aspects of human resources management. While a company must be able to fulfil the administrative requirements in this domain, one must not let out of sight the fact that talent management refers to the development of individuals, at their training and at the creation of leaders.

Talent management must be a priority for each organization. In order for this objective to be accomplished, inside the organizations it is necessary to persist the conviction that people really matter, conviction that must be anchored in the organizational culture of the company, together with the managers' preoccupation for the development of the employees.

CAREER MANAGEMENT PRACTICES OF THE PHARMACEUTICAL COMPANIES IN ROMANIA

Antoniu Maria Eliza

University of Pitesti Faculty of Economic Sciences Republic Blvd., No. 71, Pitesti, Arges elizantoniu@yahoo.com 0729.804.373

The current economic and social context, at both European and Romanian level, requires a reconsideration of the importance of specific human resource management of career at organizational level. Any organization interested in to develop and maintain itself on a global market, increasingly strong competitive, attaches a strategic importance of human resource management in general and of career management in particular. People are becoming more frequently regarded as an essential factor for obtaining and maintaining competitive advantage, therefore, the processes of recruitment, training, development and maintain its employees are given a great importance.

Key words: career path, Human Resources Management, practices, politics.

Code JEL: M51

1. Career management in Romania

Career management practices have taken on great importance at the level of organizations in the European Union and Romania. Entry on the Romanian market of the multinational companies, with consistent systems of human resources management, and the economic and social transformation process that Romania is involved in, led gradually to an awareness of the importance of sound management of human resources. More and more, necessary expenses of the design and implementation of an efficient management of human resources are seen as an investment; its results can be measured in terms of growth performance, improve organizational climate, increasing the stability of the staff and increase efficiency of work.

Employment in the pharmaceutical industry has been very dynamic in recent years because of the increasingly large and active business development. Pharmaceutical companies operating in the city have proved to be the most active employers in the past two years, they recruiting particularly specialists in sales and in new areas arising from the introduction of new standards of GMP (Good Manufacturing Practice) requirements in the European Union. Between 2006 and 2008 the companies focused on sales force development (increased number of *medical representatives - entry level*), diversification of the salary package (especially related to the performance) and the intensification of training and building capacity training.

A specific element of the human resource which is active in companies of pharmaceutical industry is the theoretical training, the industry requiring highly qualified workforce (physicians and pharmacists). For the jobs in sales, the pharmaceutical companies recruiting graduates of other specializations too, if they have communication skills and willingness to learn. Specialist crisis that manifested itself in recent years in the labor market in Romania (and Europe) has led to companies targeting the employees of area "entry level" with offers of posts, which on the European market, is addressed to people with a wider experience. Young people are also attracted from pharmaceutical companies' bids, mostly multinationals, because of: the salary package, their training, the clear procedures for management of human resources, development plans, European career perspective, the social recognition from membership in a known organization.

12 Magazine "Biz - review of new trends in business, No. 132/2006, p. 14 - 30.

2. Management practices on human resources

Managerial practices of the multinational pharmaceutical companies operating in Romania are deeply influenced by the origin country and the host country. Some companies place their own values of organizational culture and management practices in the countries where are active. The legislative framework, the cultural and institutional frame of the European countries influence the human resources strategies and policies of these companies. The company Pfizer13 is a multinational company operating in the U.S.A, Europe and in Romania, where self-distribution of medicines. On the Romanian market, this company has designed and implemented a coherent human resource management, with specific elements of its approach to the employees' career.

The recruitment process is systematized and included in the career management, the company aims to attract candidates willing to build a career, flexible and able to adapt to an organizational culture that emphasizes leadership and lifelong learning.

Career management requires a coherent set of activities of the department of human resources, as follows:

1. The recruitment:

- CVs of candidates shall be completed on-line through the feature "E-recruitment" in existing company's website.
- Selecting candidates who will participate in the interview is based on "role profile" analysis, that includes the specific requirements of the job: "hard profile" (knowledge, techniques or skills, education and experience) and "soft profile" (skills).
- The interview is done using the model "Competence based interview", which involves an exploration of personal qualities and abilities of each candidate and a presentation of the salary package and career prospects from the "career ladder" (each step of career involves an additional package of financial and non financial benefits and the package of training and development related);
- 2. Integration into the company assumes formalities employment, familiarity with the working environment and team that will work. Employee will have a trial period of 3 months, after which the assessment is what will lead to indefinite-term employment, or at dismissal. During this period the company provides a mandatory training for 1 3 weeks.
- 3. The policy of benefits and compensation:
- Financial benefits: basic salary and bonuses based on achieving (achieving 120% of the target requires a premium equal to 1 monthly salary, up to 6 salaries performance based), special holiday gift, bonus for marriage (500 euro), bonus for the birth of a child (250 euro), prize for exceptional performance (equivalent to a monthly salary), electrical and electronic products; weekends in the country or abroad.
- Non-financial benefits¹⁴: mobile phone and company car, which after 5 years of activity remains in possession of the employee, medical insurance for travel outside the country for employee and his family (since 2005), life insurance, free medical services through a contract with a private polyclinic;
- 4. The training and career development system:

The company invests 2500 euro / year / employee on training program that combines internal and external preparation programs, including internships training of MBA-type for senior managers (together with famous universities). The annual training is individualized depending on job requirements, the stage of career and the development' needs of the individual. Two times a year there are meetings to achive a full knowledge of the company's strategy (10 days) and training (10 days).

It was designed and implemented the "Career Ladder" by which employees are provide training required to make career. There are 4 stages of career development for each department (Sales,

¹³ www.pfizer.ro

¹⁴ Top 50 – Best companies to work for, Capital Weekly, 2005, 2006, 2007.

Marketing and Medical), for each ensuring appropriate training programs to new responsibilities and specific salary packages.

The company encourages both horizontally and vertically promotion by internal transfers. The promotion is carried out annually and it's based on the assessment of individual performance and the level of skills' development and it's strong focused on performance and not on seniority.

In conclusion, Pfizer can be appreciated as a company that presents professional challenges, where the management is competent and efficient and it's investing in professional development programs for employees.

The company **Hoffman La Roche** is one of the major companies of the industry, globally, that are becoming one of the most important in Central and Eastern Europe, Romania default. It is appreciated for a professional environment in which it can promote fast and for conducting various activities and on long term. This company is conducting advanced programs aimed at developing employees, consisting of:

- courses for the development of sales and marketing' skills;
- personal development courses: communication, presentation, negotiation;
- trainings abroad for young employees with development potential.

Package includes salary, in addition to salary, the following: telephone service, car, computer, ticket table; subsidy for medical services, financial support in special circumstances, leave for special events, prizes awarded based on individual performance.

The company develops a promote policy based on internal advancement and on each rung of the career are carried out programs aimed at training and professional development.

The career path may be this way in the company (See Fig. 1):

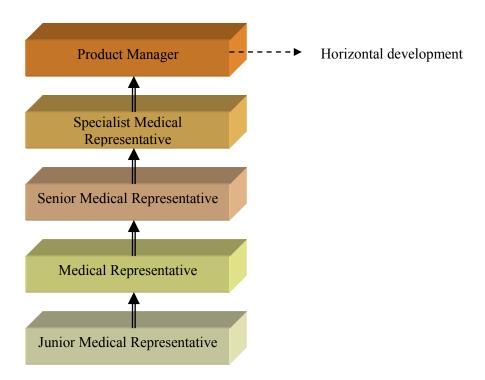

Fig. 1: The career path in Hoffman la Roche Company

KRKA¹⁵ Pharmaceutical Company is one of the most active on the Romanian pharmaceutical market, but also in Europe, on the generic drugs segment.

The ambition to gain more knowledge is a constant of all employees and company Krka contribute to this through education programs and special education programs, encouraging teamwork and creating good interpersonal relationships.

Human resources policy puts emphasis on personal development of employees and the accumulation of knowledge and it is applying a systematic plan for recruitment of new forces.

Thus, the company invests in developing skills and knowledge through programs that are conducted in its own training center. The courses aimed at developing managerial skills, language learning, providing information on technological progress and quality (for production personnel).

On average, each employee participates in four different forms of training which aggregates 30 hours, time allocated as follows:

- 92% for internal seminars;
- 6% for abroad seminars (Slovenia);
- 2% in other locations.

An essential element in career management is the formal and informal assessment (discussion between managers and employees) used to identify the objectives of employment, responsibilities and expectations of employees, related to professional and personal development. In order to ensure an effective communication with employees there is the site of the company KRKA-net, accessible to all employees, where they can learn about company news, vacancies etc.

The management of career began with *the recruitment and the selection* that takes place in the company's assessment center, using both internal staff and consultants. Since this stage, the new employees are familiar with job requirements and main responsibilities.

After recruitment, people employed in sales as medical representatives enter in *the first training program* that includes: the company presentation and its business code, its product portfolio presentation, the presentation of job descriptions (duties, responsibilities, targets). New employees will enter in a training course of 1 week that will train them on promoting drugs in pharmacies and doctors, there will be simulations of situations (as the stages of a doctors' visit) and "role-play". Probationary period lasts 3 months, range in which work is evaluated on the ground by the company's trainer, district manager or product manager), give a test for assessment of knowledge about products and to prepare a summary of the visits to the doctors. At the end of the period it is made an assessment of sales objectives, of the results and it is decided on the employment contract with unlimited period / waiver. Programs that company undertakes to develop professional skills of the sales force include taking advanced courses of sales that aimed at the developing of communication' skills and building training of management capacity (strategy, time management, marketing). The promotion policy of the company is focusing on the promotion of the employees (See *Fig. 2*).

Salary package has the following composition:

- The basic salary (for the medical representatives varies between 1000 2000 USD).
- Bonus sites to overcome objectives, as follows: 110% 10% bonus, 130% 30% bonus, 150% 1 salary in addition.
- Meal vouchers, car service, telephone, computer.
- Expenditure account (from 1500 USD): petrol, accommodation, protocol, stationery and office supplies, the company paid holidays (for management-level and higher).

 $^{15\} www.krka.si/2006/AR_2006_Sustainability_Report.pdf$

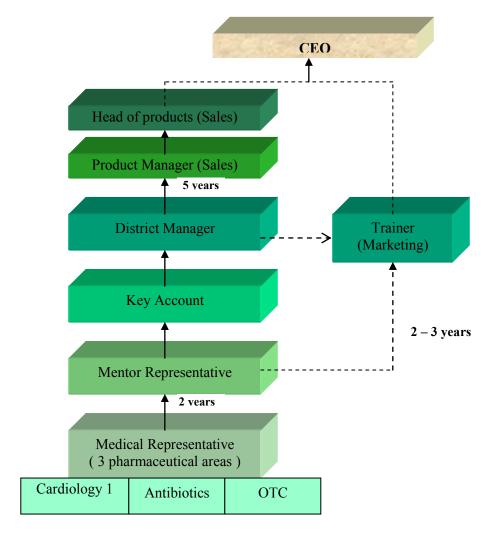

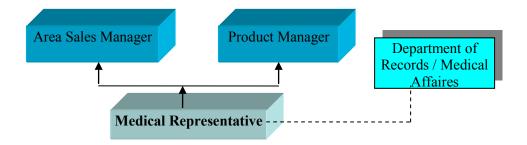

Fig. 2: The career path in KRKA Company

Terapia Ranbaxy16, the largest producer of generic drugs in Romania, has a self-specific career management to ensure the recruitment and professional development of the employees, related to business needs. The policy includes succession promote plans, the career plan and retention and staff development. Employees are promoted based on their performance and the requirements of the company. Each department of the company are entry level positions requiring specific skills, from which can evolve depending on skills and development potential of each employee. To be a medical representative, the career path may have come the following:

¹⁶ Guide of Pharma-web.ro

The policy of benefits and compensation:

- Financial benefits: basic salary and monthly bonuses based on achieving specific objectives, meal vouchers; prizes at holidays; special prizes during the day of the company;
- Non-Financial Benefits: car and mobile phone service (for the sales team and top-level managers), leave for personal events (marriage, transfer). The company has set an annual budget of 500,000 euros for the conduct of training and development and the major activities include: specialized training for field sales (selling skills, negotiation, etc.); training to develop managerial skills; participation in specific technical conferences for the pharmaceutical industry production personnel.

3. Conclusions

Analyzing the career management practices in Romania, particularly those of pharmaceutical companies, we have identified several common elements:

- Streamlining the recruitment and selection process in purposes of employment persons (especially in sales) other than those who are specialized studies of medicine and pharmacy, a situation which was due to shortage of skilled labor in the field.
- In most cases, the entry into the pharmaceutical companies is in the sales department, the post of medical representative. The advancement depends on organizational policy, but frequently is a result of attaining the forecasted sales objectives.
- Time required for advancement to another position is different within the companies (in terms of organizational policy, financial strength, level of development etc.). But the pace of advancement is more accelerated than in European countries with the economy strengthened, so for Pfizer it moves in 3 years on medical representative position and in 5 years can reach a managerial position, in KRKA after 2 years etc.
- Career counseling is usually done by the boss or line manager (presents the disadvantage of time consumption of the manager and / or lack of adequate preparation) and less often by specialists from the department of human resources or mentors. Some companies include this activity in the methodology for assessing performance or it's externalized.
- Pharmaceutical companies on the Romanian market are investing in developing skills and professional knowledge of the workers, taking training courses and training a prerequisite to obtaining a competitive workforce.
- Professional development programs aimed at all employees of the company, although most companies are still paid close attention to employees with high potential for development (specialists in various fields and middle / top managers).
- Salary packages have been updated regarding the financial and non-financial aspects to achieve a correlation with their position in the organization, with the needs and aspirations of individual and business opportunities.
- Bonus sites are also differentiated according to position within the company, the objective and the financial power of the company: Pfizer target 100% yet one salary; KRKA 150% target yet one salary, GlaxoSmithKline 120% target yet one salary.
- Conduct activities regarding the loyalty and retention of staff considering that is more costeffective the investment in training, employee training and development than their replacement

- Prevalence of conception and implementation of the succession plans with very important role in ensuring an adequate substitute for items that affect business management generally.

"Learning is a treasure that will follow its owner everywhere." Chinese Proverb

The rise of the service economy, the increasingly rapid flow of global information, and the growing recognition of the importance of intellectual capital and intellectual property rights are turning Knowledge into a key critical resource and a source of competitive advantage in the modern global economy and determine enterprises to develop a Knowledge Management framework, making from KM an evolutionary rather than a revolutionary development. Knowledge is bound to human beings and it is therefore impossible to digitalise. Once it is captured in an explicit form, it becomes information, which has no value by itself, in the absence of human interpretation. Knowledge workers generate outputs according to their internal structures as individuals rather than according to external rules or procedures. The present paper describes an approach of KM to HRM as a social creation emerging at the interface between people and information, structured on a five dimension view.

Key words: knowledge management, human resources management, knowledge workers, knowledge work analysis, explicit knowledge, tacit knowledge, inhibitors of knowledge management

1. Information in the Context of Knowledge

Improving the productivity of knowledge workers is one of the most important challenges for companies that face the transition from the industrial economy to an economy based on information and knowledge. (Drucker, 1999)

However, most Knowledge Management efforts have failed to address this problem and focused on information management instead. Information management is the collection and management of information from one or more sources and the distribution of that information to one or more audiences and much of the literature of KM continues to reflect a techno-centric focus, similar to that of information management, which in essence regards knowledge as an entity that can be captured, manipulated and leveraged. This is a limited perception that disregards the social characteristics of the employees and the realistic understanding of knowledge and its incorporation into the management of organizations, its awareness of a range of views on the concept, including perceptions of knowledge as an entity (and not simply as information), as a resource, as a capacity and as a process.

Therefore, the structure of the present paper is based on the *Concept, Resource, Entity, Process and Capacity View of the KM* and aims to present knowledge as a social creation emerging at the *interface between people* - engaged in communication, knowledge creation, sharing and learning - *and information*. From this operational perspective, KM can be described as the systematic processes by which an organization identifies, creates, captures, acquires, shares and leverages knowledge and is based on the *dintinguishment between the concepts of information and knowledge*.

"Most of the traditional Knowledge Management Systems rely on the assumption that knowledge can be assimilated to objects that can be identified, separated from their initial context, and handled in information systems." (Nabeth et al., 2002)

As knowledge is bound to human beings it is therefore impossible to digitalise. Once it obtaines an explicit form, it becomes information. Information by itself is not useful, as "information (...)

is simply the vehicle by which we attempt to provoke - or evoke - a human response. Information on its own is quite static and lifeless. It simply exists - on multimedia computer screens, in text books, magazines, movies, TV, CDs, reports, letters, emails, faxes, memos and so on - all waiting to be interpreted, all waiting to have meaning attached - by people." (Miller, 2002)

Information becomes useful when it is interpreted by people, what we will refere to as *knowledge workers*. Therefore, KM remains an abstract concept in the absence of understanding what knowledge workers do and how they use information and knowledge to create value, making possible for the issue of knowledge worker productivity to be addressed.

"When it comes to knowledge workers, we pretty much hire smart people and leave them alone. No quality measurements, no Six Sigma, no reengineering. We haven't formally examined the flow of work, we have no benchmarks, and there is no accountability for the cost and time these activities consume." (Davenport, 2003)

Thomas Davenport and Laurence Prusak offer the following pragmatic description of knowledge in organizations:

"Knowledge is a fluid mix of framed experience, values, contextual information, and expert insight that provides a framework for evaluating and incorporating new experiences and information. It originates and is applied in the minds of knowers." (Davenport, Prusak, 1998) The differences between the two concepts are presented in Figure 1.

Figure 1: Distinguishment between Information and Knowledge (Sveiby, 1997, as cited in Miller, 2002)

Information Knowledge Static Dynamic

Independent of the individual Dependent on individuals

Explicit Tacit
Digital Analogue

Easy to Duplicate Must be re-created
Easy to broadcast Face-to-face mainly

No intrinsic meaning Meaning has to be personally assigned

2. Knowledge Management – A Concept developed from Existing Practices

Knowledge Management is a new concept that has grown and developed from existing practices following an integrated approach of the *knowledge-information-knowledge worker sequence*. Many enterprises downsize to adapt to more competitive environments. But unless they have captured the knowledge of their employees, downsizing can result in a loss of critical information. Similarly, as employees leave, organizations are likely to lose access to large quantities of critical knowledge. And as companies expand internationally, geographic barriers can affect knowledge exchange and prevent easy access to information. These kind of contextual situations determine enterprises to explore and develop methods for knowledge management.

Figure 2 - Factors that determined the appearance of KM

Loss of Corporate Memory Global Competition
Closer Relationships to Customers Pace of change

Saving Time on Problem Solving Stimulating Innovation and Creativity

Reducing Duplication of Effort Repetition of Mistakes

Our approach of KM to HRM is based on focussing on the needs of the individual knowledge worker rather than the industrial perspective, which is focussed on organisational goals and defines Knowledge Management as "the attempt by an organization to explicitly manage and control the knowledge of its workforce." (Alvesson and Karreman, 2001). As other authors also noticed, "the fatal flaw in thinking in terms of Knowledge Management is in adopting the perspective of the organization as the relevant beneficiary. Discussions of Knowledge Management start from the premise that the organization is not realizing full value from the knowledge of its employees. While likely true, this fails to address the much more important question from a knowledge worker's perspective of 'what's in it for me?". (McGee, 2003)

Knowledge management can be formally defined as managing knowledge resources, typically by using advanced information technology, "the explicit and systematic management of vital knowledge and its associated processes of creating, gathering, organizing, diffusion, use and exploitation. It requires turning personal knowledge into corporate knowledge that can be widely shared throughout an organization and appropriately applied."

As the discipline, Knowledge Management promotes an integrated approach to identifying, capturing, retrieving, sharing, and evaluating an enterprise's information assets. These information assets may include databases, documents, policies, and procedures as well as tacit expertise and experience resident in individual workers. The resource-based view of the firm suggests that organisations will need to be able combine distinctive, sustainable and superior assets, including sources of knowledge and information, with complementary competencies in leadership and human resource management and development to fully realise the value of their knowledge.

The specific outcomes of KM are: shared intelligence, improved performance, competitive advantage, higher levels of innovation.

3. The Resource View: The growing importance of KM and its implications for HRM. The Knowledge Workers

A term first used by Peter Drucker in his 1959 book, *Landmarks of Tomorrow: A Report on the New «Post-Modern» World*, the knowledge worker includes people working in the information technology fields, such as programmers, systems analysts, technical writers, academic professionals and researchers. In other words, a knowledge worker is anyone who works for a living at the tasks of developing or using knowledge. For example, a knowledge worker might be someone who works at any of the tasks of planning, acquiring, searching, analyzing, organizing, storing, programming, distributing, marketing, or otherwise contributing to the transformation and commerce of information and those who work at using the knowledge so produced.

If in the case of knowledge we encounter a wide range of theoretical acceptations in the specialized literature, *knowledge workers* can be simply defined as those employees whose work is primarily intellectual in nature and involves extensive and regular use of established bodies of formal, codified knowledge. From this perspective, knowledge workers:

- represent an occupational elite;
- are in the vanguard of the knowledge economy;
- their work contributes significantly to the performance of their employer.

The term is also frequently used to include people outside of information technology, such as lawyers, teachers, scientists of all kinds, and also students of all kinds.

- "Knowledge workers appear to be the ideal employee" (Alvesson, 2006), because:
- they find their work intrinsically interesting and fulfilling;
- working patterns represent the norms within the communities they are a part of it;
- they provide the organization with their efforts in return for good pay and working conditions;
- they have the sense of identity as a knowledge worker.

There are some factors that contribute to the *distinctiveness of knowledge workers*:

- high qualification;
- greater importance knowledge and expertise;
- highly tacit and difficult knowledge and skills;

- relatively scarce knowledge and simultaneously highly valued which provides them extensive opportunities to change job;
- distinctive norms and expectations;
- work tasks are highly specialized in nature, as they are focused on the process of knowledge creation, utilization and application.

These aspects determine organizations to consider managing knowledge worker in distinctive ways, motivating and retaining them through HR effective practices.

As it is believed that «without loyalty knowledge is lost», it was given a greater importance to the sense of organizational identity. Alvesson identifies two broad types of loyalty:

a. *instrumental* – *based loyalty*: the workers remain loyal to their employer for as long as they receive specific personal benefits. This kind of loyalty can be developed through pay and working condition.

b. *identification* – *based loyalty*: is based on the workers having a strong sense of identity as being member of the organization, and the workers identifies with the goals and objectives of their organization. There are three strategies for developing identification-based loyalty:

- institutionally based strategy: the organization develops a particular vision or set of values that the workers identifies with it;
- communitarian based strategy: workers develop a strong sense of being part of a cohesive team;
- socially integrative strategy combination of the two strategies.

Implications of KM for HR Development

As KM involves recognising, documenting and distributing knowledge to improve organizational performance, it is of particular significance to HRD in training needs analysis and the planning of training to improve performance and deliver strategic results. KM challenges HR over intellectual property, professional identity and unit boundaries; KM perspectives move HRD's goal away from developing individual capacity to creating, nurturing and renewing organisational resources and interactions. Instead of devising training courses, HRD practitioners may need to identify organised elements that learners can reference as needed, depending on the particular challenges faced.

Implication of KM for HRM sustainability

In today's economy, where so much importance is attributed to the search for sustainable resources and institutions, knowledge-based theory underpins much of the strategic thinking in organisations. In the knowledge-based view, this organisational knowledge is acknowledged as the most valuable organisational asset and the ability to manage knowledge strategically as the most significant source of competitive advantage (Barnes, 2002). Knowledge is both the key resource and a basis for sustainability, but knowledge and associated Knowledge Management practices must also be sustainable. In the wider search for sustainability, issues of context, of culture and appropriateness are of paramount importance. In the realm of context, the focus should be on community as well as on process. In this way, Knowledge Management can enhance the potential for knowledgeable practices that are "envisioned, pursued and disseminated, with other actors encountering these new practices and learning from them to develop their own local knowledge" (Cushman et al, 2002).

Implications of KM for the role of HRM in promoting Innovation and Creativity

Knowledge itself is not of any value to an organization unless these contextual aspects are clearly understood. Much of the knowledge, both tacit and explicit remains largely untapped in most organizations; without a thorough understanding of context, it will not be possible for HRM or KM to support the development of management and leadership capabilities to support innovation and creativity. Much work in HRM has focussed on identifying facilitators and inhibitors of innovation, such as people (e.g. effective leadership behaviours associated with particular innovation phases), structure (e.g. the impact of centralisation, formalisation, complexity, stratification, lateral communications, matrix structures, requisite variety, double-loop learning) and organizational size or resource availability. Other approaches have found that strategic type,

organizational climate and culture, and organizational environment are also important facilitators or inhibitors of innovation. For example, Taylor et al (2000) using a large-scale survey have shown that the significance of inter-firm networking for innovation differs markedly between industry sectors, and that high innovating organizations often seek long-term, secure relationships with employees. Organizations also seem to adopt very different strategies towards staff directly involved in innovation as compared with staff in general, with less use of flexible employment policies for this group. An alternative is to see innovation as more dynamic and fluid, allowing for groups, individuals and collaborative partners to differ in their perceptions and interpretations of events.

4. The Entity View. General Framework for Knowledge Work Analysis

In a long term view, KM represents a convergence of ideas promulgated over the past decade, including core competencies and resource-based theories of the firm, *info-mapping* and *information resource management*, the *balanced scorecard* and *intangible/intellectual assets*, the *learning organization* and communities-of-practice, total quality management and business process re-engineering, the networked organization and *the boundary less firm*.

KM requires a strategic focus on valuable knowledge, concentrating on knowledge that will contribute to the improvement of organizational performance. It involves a holistic view of information, combines internal and external information with coordination of planning and monitoring information and consolidates informal-soft and formal-hard information. KM also requires a strategic focus on valuable knowledge, concentrating on knowledge that will contribute to the improvement of organizational performance.

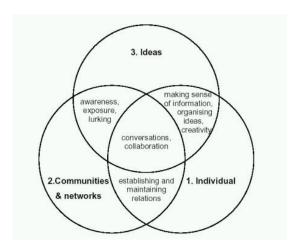

Figure 3: Framework for Knowledge Work Analysis (Efimova, 2004)

From this framework the following processes can be identified: organising personal information; making sense of information (personal); negotiating meaning (social); generating new ideas; establishing and maintaining a personal network; collaborating in communities.

Figure 4 – Knowledge Management and the Business Process Analysis Source: ARES Corporation¹¹

Knowledge creation, learning and renewal

Knowledge Management can be resumed as being a method for gathering information and making it available to others. Knowledge starts as *data* - raw facts and numbers. *Information* is data put into context and is readily captured in documents or in databases. When information is combined with experience and judgment it becomes *knowledge*.

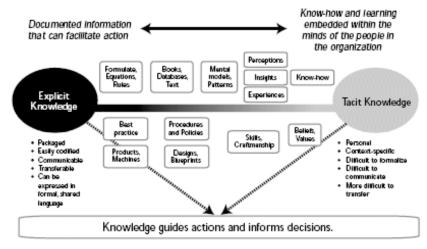

"Most of the traditional Knowledge Management Systems rely on the assumption that knowledge can be assimilated to objects that can be identified, separated from their initial context, and handled in information systems^{5"} (Nabeth et al., 2002)

A wide speed framework for thinking about knowledge proposes two main types of knowledge: *explicit* and *tacit* (as shown in Figure 5). In developing a general framework for understanding KM, we refer to perhaps the most influential framework for knowledge creation developed by Nonaka and Takeuchi (1995) in their studies of knowledge creation and use in Japanese companies. Nonaka and Takeuchi (1995, p.8) distinguish between two types of knowledge, explicit and tacit (Figure 5). Tacit knowledge is basically experiential, whilst explicit knowledge is expressed, and often seen as transferable in one way or another; it includes cognitive and technical elements.

Explicit knowledge is documented information that can facilitate action. It can be expressed in formal, shared language. In an organization, examples of explicit knowledge are strategies, methodologies, processes, patents, products, services, formulas, equations, rules, and best practices. Explicit knowledge is: packaged, easily codified, communicable, and transferable.

Tacit knowledge is know-how and learning embedded within the minds of the people in an organization. It involves perceptions and insights based on past experiences. Examples of tacit knowledge in an organizational context are skills and competencies, experiences, relationships within and outside the organization, individual beliefs and values, and ideas. Tacit knowledge is: personal, context-specific, difficult to formalize, difficult to communicate, more difficult to transfer.

Knowledge originates in individuals, but it is embodied in teams and organizations, as shown in Figure 5.

Source: Copyright 2000, PricewaterhouseCoopers LLP

Figure 5 – Tacit and Explicit Knowledge Source: PWC, 2000

Most business actions require the guidance of both explicit and tacit knowledge. Cognitive elements operate through mental models, working worldviews that develop through the creation and manipulation of mental analogies. Mental models (like schemata, paradigms, perspectives, beliefs and viewpoints), according to Nonaka and Takeuchi, help individuals perceive and define their world. The technical element of tacit knowledge includes concrete know-how, crafts, and skills. Explicit knowledge is about past events or objects "there and then", and is seen to be created sequentially by "digital" activity that is theory progressive. An alternative perspective on the distinction between explicit and tacit knowledge, to be developed later in this paper, is also presented in Figure 1. One difference is that the top row appears to be positivist in its orientation through its adherence to objectivity, whilst the bottom row is critical in nature.

Figure 6: Typology of knowledge (Nonaka and Takeuchi, 1995)

Expression of knowledge type	Explicit Knowledge	Tacit Knowledge
Nonaka and Takeuchi	Objective Rationality (mind) Sequential (there and then) Drawn from theory (digital) Codified, formalty transmittable in systematic language. Relates to past	Subjective Experiential (body) Simultaneous (here and now) Practice retated (analogue) Personal, context specific, hard to formalise and communicate. Cognitive (mental models), technical (concrete know-how), vision of the future, mobilisation process
Alternative	Formal and transferable, deriving in part from context related information established into definable patterns. The context is therefore part of the patterns.	Informal, determined through contextual experience. It will be unique to the viewer having the experience. Not transferable, except through recreating the experiences that engendered the knowledge for others, and then the knowledge gained will be different.

Nonaka and Takeuchi (1995, p.8) offer a SECI model of knowledge creation illustrated in figure 7. At its core are conversion processes between tacit and explicit knowledge that result in a cycle of knowledge creation. Conversion involves four processes: socialisation, externalisation, combination, and internalisation, all of which convert between tacit and/or explicit knowledge. Socialisation is the process by which synthesised knowledge is created through the sharing of experiences between people as they develop shared mental models and technical skills. Since it is fundamentally experiential, it connects people through their tacit knowledge. Externalisation comes next, as tacit knowledge is made explicit. Here, the creation of conceptual knowledge occurs through knowledge articulation in a communication process that uses language in dialogue and collective reflection. The use of expressions of communication is often inadequate, inconsistent, or insufficient. They leave gaps between images and expression, while promoting reflection and interaction. This therefore triggers dialogue. The next process is combination, where explicit knowledge is transformed through its integration by adding, combining and categorising knowledge. This integration of knowledge is also seen as a systemising process. Finally, in the next process explicit knowledge is made tacit by its internalisation. This is a learning process, which occurs through the behavioural development of operational knowledge. It uses explicit knowledge, like manuals or story telling, where appropriate.

From /To **Tacit** Explicit **Tacit** Socialisation Externalisation Creates sympathised knowledge Creates *conceptual* knowledge through through the sharing of experiences, knowledge articulation using language. and the development of mental Dialogue and collective reflection needed. models and technical skills. Language unnecessary. **Explicit** Internalisation Combination Creates operational knowledge Creates systemic knowledge through the through learning by doing. Explicit systemising of ideas. May involve many knowledge like manuals or verbal media, and can lead to new knowledge stories helpful. through adding, combining & categorising.

Figure 7: The SECI cycle of knowledge creation (Nonaka and Takeuchi, 1995)

5. The Process View of Knowledge Management

Traditionally, organizations have rewarded their professionals and employees based on their individual performance and know-how. In many organizations, a major cultural shift would be required to change their employees' attitudes and behavior so that they willingly and consistently share their knowledge and insights. An effective way to motivate knowledge sharing is through the organizational reward and incentive mechanisms. Both McKinsey & Company and Coopers & Lybrand LLP (a management consulting and a professional services firm, respectively) use this mechanism to promote knowledge sharing among their consulting and professional staff. To make information resources productive, organizations should be converted to actionable knowledge, such a process introduces challenges relating to knowledge creation, capture, sharing, and maintenance. (Alavi, Leidner, 1999)

In their studies, Angus and Patel (1998) describe a four-process view of Knowledge Management that we have systematized into the figure 8:

Figure 8 – A Four Process View of the KM

Gathering	Data entry OCR and scanning Voice input	
	Pulling information from various sources	
	Searching for information to include	
Organizing	Cataloging	
	Indexing	
	Filtering	
	Linking	
Refining	ining Contextualizing	
	Collaborating	
	Compacting	
	Projecting	
	Mining	
Disseminating	Flow	
	Sharing	
	Alert	
	Push	

Also, the research made by Yahya and Goh (2002) suggest that a knowledge organisation requires a different management approach than the non-knowledge organisation. In terms of employee development, the focus should be placed on achieving quality, creativity, leadership, and problem solving skill. The design of a compensation and reward system should be on promoting group performance, knowledge sharing, and innovative thinking. The performance appraisal must be the base of evaluation of employee's knowledge management practices, and an input for directing knowledge management efforts.

Knowledge workers interpret information, generate outputs and solve problems according to their internal structures as individuals rather than according to external rules or procedures. By its human nature, each knowledge worker develops his own subjective configuration based on past experiences, the information he has absorbed and the particular context in which he has used his skills and abilities. Neglecting this aspect, corporate software programs aim to level or standardise the differences between individual workers. We suggests that should be provided to knowledge workers tools which enable diversification of individuals' outputs.

6. The Capacity View of Knowledge Management

"The best single lesson I ever learned was to maximize the intellect of the company. You need to gather the knowledge of individuals, share those ideas and celebrate the sharing. That, in the end, is how a company becomes great." (Jack Welch - former Chairman and CEO of General Electric, 1981-2001).

KM initiatives generally take several forms, but they usually involve selection of priority areas for initial effort in the attempt to make formal/explicit knowledge more visible and usable and private/tacit knowledge more explicit, public and useful. The key objective is to convert informal personal contextualized knowledge to formal systematic organizational knowledge, exemplified by creating databases of frequently asked questions (FAQs) searchable by both employees and customers, and lists of past mistakes and success in projects as guidelines for similar future undertakings. In addition to improving the visibility of knowledge, another aim is to develop its intensity, by creating a climate to encourage generation of ideas within workgroups, and generalization to other areas. At the same time, as organizations are concerned about information

overload, a further objective is to achieve a better balance between pushing and pulling it, by giving people just-in-time access to knowledge, allowing the need to know to be determined by the information user (not the owner).

Applications of Knowledge Management can be divided into the three broad categories:

- Knowledge databases and repositories (explicit knowledge) storing information and documents that can be shared and re-used, such as client presentations, competitor intelligence, customer data, marketing materials, meeting minutes, policy documents, price lists, product specifications, project proposals, research reports, training packs;
- Knowledge route maps and directories (tacit and explicit knowledge) containing document collections and datasets that can be consulted, for example, «yellow pages/expert locators» containing Curriculum Vitaes, competency profiles, research interests;
- Knowledge networks and discussions (tacit knowledge) providing opportunities for face-to-face contacts and electronic interaction, for example, establishing chat facilities/'talk rooms', learning groups and holding «best practice» sessions.

Examples can be found in all sectors of business and industry, especially among professional service organizations. The large accountancy and consultancy firms have led the way in launching formal Knowledge Management initiatives, closely followed by IT companies.

Determining effective knowledge strategies suitable for different types of organizations has emerged as an important topic in the knowledge management literature (Hansen, Nohria & Tierney 1999, Zack 1999, Earl 2001). The Hansen *et al.* model was developed from the analysis of consulting firms approaches to knowledge management, given the nature of the business of these organizations and distinguishes between two main KM strategies:

- *The Codification Strategy*, focused on capturing, storing and codification of knowledge in explicit forms so that it can be readily transferred and used by others within the organization and is linked to a business strategy of knowledge re-use. Information technology is used to support the storage of this knowledge. Codification can be viewed as a «people-documents approach». (Hansen *et al.* 1999)
- *The Personalization Strategy*, focused on person to person sharing of tacit knowledge, linked to a business strategy of knowledge creation. Personalization can be viewed as a «people-people approach». (Hansen *et al.* 1999)

7. Inhibitors of Knowledge Management Initiatives

The success of the Knowledge Management initiatives can be inhibited by the lack of willingness among staff from different function to share knowledge, due to a historical culture of interfunctional rivalry; and to the perception that software programs reduce the level of employee' autonomy and lead to greater levels of standardization.

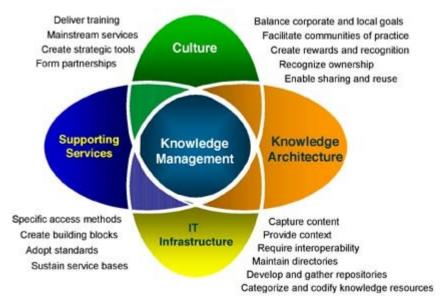

Figure 9 – Knowledge Management Integration Source: NASA¹³

There can be identified some factors that influence the willingness of workers to participate in KM initiatives:

A. Structural factors – which are beyond the control of organizational management:

- a) possession of knowledge significant source of power and status in organization;
- b) the nature of employment relationship results in the interest of workers and management not always being totally compatible;
 - c) potential for inter-personal/group conflict.
- B. Socio-cultural factors which are within the control of management:
- a) the existence of interpersonal trust and good working relations among coworkers;
- b) the existence of trust and good inter-personal relations between workers and their managers;
- c) proper recognition and reward for work efforts and use of individual knowledge.

Workers are most likely to be willing to participate in organizational Knowledge Management initiatives when the general organizational climate/culture is fair and positive. Based on these socio-cultural factors, the most common HRM policy areas that can be developed to support Knowledge Management initiatives are:

- training and development to encourage reflexivity, learning through experimentation and how to conduct critical dialogues with others;
- pay and reward system which recognizes the efforts of workers;
- performance appraisal.

Conclusions

"Today knowledge has power. It controls access to opportunity and advancement."- Peter Drucker

This paper has argued that the increasing importance of knowledge, and knowledge management, (KM), to organizations challenges the nature, role and boundaries of HRM in significant ways, not always as yet recognised by HRM theorists, researchers and practitioners. By presenting a five dimension approach of KM as a Concept, Resource, Entity, Process and Capacity, the present work suggests that tools which enable diversification of individuals' outputs should be

provided to knowledge workers. In addition to discussing the challenges posed to HRM in general, it has also been discussed the ways in which specific functional areas of HRM (employee resourcing, career management, HRD) can respond to these challenges, as well as discussing the implications of the knowledge worker in implementing KM. Tools that have been developed in KM focused on information management and do not support many of the key knowledge work processes. Neglecting the fact that each knowledge worker develops his own subjective configuration based on past experiences, the information he has absorbed and the particular context in which he has used his skills and abilities, corporate software programs aim to level or standardise the differences between individual workers.

QUALITY OF ROMANIAN MEDICAL SERVICES – WAYS TO MANAGING TOWARDS IMPROVEMENT

Barbu Maria-Magdalena

Academy of Economic Studies, Bucharest Faculty of Management Str. Floare Roşie, nr. 7, bl. 51, sc. C, apt. 114, cod postal 062261, sector 6, Bucureşti, România mariamagdalenapnb@gmail.com 0729600325

Health of people means everything since on it depends the well being of persons, families, companies, countries. All medical services should be accessible and offered at a very high level of quality which to allow and ensure future proper health status and people in good condition as active work force. If we do not do so we take the risk that the whole society and economy pay the price by having weak, not healthy work force, able to deliver only poor and medium results. This is the reason for which we should do our best to manage as good as possible for higher quality and continuous improvement. The paper presents Romanian payment and compensation system in comparison with some other countries' systems and ways to improving quality by assuring proper reward of medical personnel who help patients by offering consults, treatments, surgeries and put effort for people's health and overall "state economy's health".

Key words: Quality, Health Services, Motivation, Management, Active Life

The article's JEL code: L89.

Quality of Romanian and other European health systems

In Romania, the patient is paying medical services by the monthly contribution to the health insurance fund (from which the state pays the public physicians), paying other self-willing contributions but also by suffering of some possible in-hospital complications caused by the poor quality of the medical process itself. Into this last case, the patient is paying with his/her own health, and this is the deepest harm possible and the hardest to quantify. The patient is also the one who pays with his time for medical services of poor quality, be it the fact that he/she has to loose the time in order to find out that it's case to address to some other specialists (more competent, more willing/ more attentive), be it he/she has to wait for hours in order to get into the cabinet, even if a scheduling or even appointment has been previously done.

It's in the direction of improving the situation and also in the idea of diminishing such unpleasant cases the fact that the actual strategic planning of Health Ministry contains into the financial part the idea of paying salaries according to the type of individual work contract; paying the residents decently and helping physicians to have a second specialization.

Financing the residents at a higher level would motivate Romanian young physicians that nowadays are more tempted to go to the United Kingdom, Belgium, Italy or some other countries in order to get a decent salary of 1200 -1500 EUR per month and not 400-800 EUR as here.

The young residents are also unsatisfied by the way they are treated "or even totally neglected when it comes to rewards, because otherwise, when it comes about work we are the first to be asked to help but payment is always forgotten of is simply mocking from system side", as declared by Mihaela C., a young resident in Obstetrics-Gynecology within Spitalul Universitar Bucureşti.

What could really matter in the way of increasing the quality of medical services is rewarding personnel according to quantifiable quality criteria. In this idea, physicians and the rest of medical personnel would be motivated to offer not only qualitative medical services in order to obtain big incomes but also are interested for more activity and participation in different events. Using some performance indicators to reflect the quality of the medical interventions can help into this evaluation and should be a priority which could bring a true improvement. The most relevant performance indicators that could be used are: number of solved cases on medical specialties related groups and among them on diagnostic related groups, as reported to the

complexity of the medical intervention; number of nozocomial infections (contacted into the hospital); and time effectively waited by patients.

For sure that smaller rate of nozocomial infections will meet patient's expectations and patients will be glad to wait only some minutes or not wait at all. Successfully managing the quality indicator's aspects will positively influence relationship with patients and will also help in meeting their expectations.

A quality aspect is also the continuous availability of medical services (24 hours a day, 7 days a week). The problem here is that the low level of Romanian physicians' salaries makes it not possible for the moment to have the "non-stop" availability of the physicians belonging to the primary care system but this is desirable for the future. There are also studies analyzing what happens in case of substitution of selected services (example for hypertension and asthma) from secondary to primary care showed this shift to be more cost-effective. In other cases such as depression treatment, shifting from the primary care physicians towards the specialists meant more effective but more costly medical services.

American and Canadian approach

Whether primary care system should be enforced even more or not is a management question. In the medical system of the United States, gate-keeping exercised by primary care preventing direct patient access to specialist care led to patient dissatisfaction. The health insurance system in the United States works fine as long as the person is healthy. Only people who have medical affections have problems since each contributor pays twice as much as people in other wealthy countries and apart of them there are 16 % population (47 million people out of 281,43 million people) without insurance. Americans can go to the doctor, pay directly and then send the bill to the insurance company for reimbursement. In most of the cases, the insurance company sends a form letter rejecting the claim. From this point on, only very ambitious people fight and send back a letter to the insurance companies to ask for clarification and after more steps (physician has to fill in a special form and send it to the insurance company which to confirm to the contributor the ok for the reimbursement or if the respective affection is not covered for reimbursement) get the money back. This is what happens into the private healthcare system. In comparison, with the private insurance, the public Medicare plan has predictable costs and benefits. The person can go basically to any doctor, and Medicare reimburses the doctor directly, protecting him/her from paying upfront and if the claim is denied, the respective doctor is financially liable unless. Nowadays, the lack of transparency means insurance companies can take advantage out of the patients by denying their claims. In exchange, insurers should be forced to disclose the treatments they cover and under what circumstances, as well as their full plan of fees. They should be limited regarding the ability to change the terms of their coverage, and they should be public responsible for the conditions under which they deny claims.

The "pay with your time" aspect is valid in United States and Canada also. Even pregnant women that have scheduling are not taken for consultation right in time. They have to wait several minutes or even hours before entering to the physician's cabinet. The predominant pay model in physician reward system has traditionally been based on obtaining individual productivity. A recently released issue by the "American Center for Studying Health System Change" confirms once more the dominance of incentives based on productivity aspect (7 out of 10 doctors are paid in this way) but also notes an increase in compensation based in part on quality measures (about 24 % of physicians in 2007, raising with 4 percentage points as compared to 2005 level), which is the prove that there is a movement for improving healthcare quality and value.

Although the United States spends more per capita on health care than any other nation, numerous reports highlight deficiencies in the quality of care. Pay for performance is one approach under consideration as a way to garner greater value from the more than \$1.9 trillion spent annually on U.S. health care. A number of health plans and other private payers have initiated P4P programs, and the Centers for Medicare and Medicaid Services (CMS) has several

demonstration projects underway to investigate whether P4P can be incorporated into Medicare. Congress in December 2006 passed Medicare legislation to pay a 1.5 percent bonus to physicians who report on quality measures in 2007. As physician practices contain quality and value into their measurement and reward systems, it is important also that they begin to have a deeper look at compensation in a more strategic approach. The researched done by Minnesota Physician Magazine physicians have been asked to develop and implement better compensation programs which to reinforce their practices' missions, values and key objectives.

A very good aspect is the one that into the western part of the United States, California more precisely health plans offer bonuses for physicians with high scores on preventive care (for example administration of childhood immunizations). The six clinical preventive measures refer to screening for breast cancer, cervical cancer and coronary heart disease; gauge treatment for asthma and diabetes, and monitor the provision of childhood immunizations. The scorecard for payment of physicians taking into account these aspects will also weigh patient satisfaction and use of new information technologies.

Reward and payment processes link together many different parts and persons into the health care industry. Patients, physicians, health plans and insurers are all connected through various financial transactions. Founders of health care include public and private partners such as employers and the state authority into this domain that may offer direct subsidies to certain providers (for example to public hospitals) or for certain services (for example immunizations). Many companies offer into the salary package also health plans or insurances for the employer and his/her family. In some cases, purchasers and providers could also be directly linked through contracting approaches under which employer's contract directly with a provider group to benefit for care. The advantages of having a budgetary approach are that it provides an incentive to control costs and produce care efficiently and can also encourage innovation in cost-reducing technologies, lower-cost and investment in health promotion and disease prevention. The approach can also make costs more predictable for the founder. More than that, it can provide flexibility to providers regarding decision about how to spend the budgeted amount and coordinate care with other providers encompassed by the budget. Disadvantages include the potential for risk selection in order to avoid patients who might be high-cost users of medical care, and the possibility to provide insufficient or reduced quality of services to minimize costs and stay within budget. More than that, there exists also the possibility for conflicting incentives if physicians and hospitals are paid under separate risk pools, which could encourage a physician to admit a patient to the hospital (or refer the patient to a specialist) to reduce his or her own costs. Therefore equilibrium should be kept also between private and public health systems in order to obtain best results out of the system.

Also into the United States, there is possible to have e-mail consults with physicians. It is a preferred way for American people since it saves time (10 minutes to compose and send an email versus an hour or more to drive, wait, enter, consult and drive back); it saves gas and money, it saves physician's visit money; means less money spent from the Insurance funds. The problem appears for the physicians when totalizing revenues because overall, they are smaller. This is because adopting e-mail patient consults really drop physicians' earnings (and especially the primary care sector) if the patient visits are replaced by e-mail communication for more than 11% of the total number of patients. Still, a lot of physicians think that offering e-mail consults is advantageous from the marketing tools point of view, since most Americans with Internet knowledge desire this facility. Benefits that physicians could appreciate are: time saved over reduced phone calls, space gained for patients who really need to see the doctor; reduced revenue losses which would have been for scheduled patients that would finally not show up to the cabinet; and reduced malpractice threat with e-mail consults that are better documented communications than face-to-face visits.

The physician's reward system for this type of consults is charging patients for an upfront annual free for a "Direct Physician e-mail consult service", like the GreenField clinic at Portland, OR

does. Email communication with your physician, with or without a related face-to-face encounter. This is an appropriate way to communicate when you have just a little time, when you prefer written answers, when you want to share information with family. This is limited to 15 email consultations per year, which are defined as in-depth e-mail conversations with the physician, separate from the e-mail related to scheduling appointments, or e-mail conversations with the respective person's health coordinator. Another possibility is for patients to pay for each e-mail online - like Medem System does. The third option is negotiating with the insurance companies for reimbursing e-mail consults. Into the present, only few insurance companies compensate the e-mail consults. Physicians should price them at an adequate level so that it means also saving for patient.

Coming back to our national medical system, we should take into the account the fact that the appearance of the Romanian private medical system offered the patients the possibility to choose between this and the public one even though quality medical services can be offered in both public and private health system. Into the present, Romanian patient's perception is altered when making the comparison between public and private systems due to the fact that people tend to get away from everything that means "past" and public system has been dominant in the past. So be, even if both systems can offer qualitative services, into the mind of lots of people there is the idea that they can receive good medical services only at high prices and therefore only into the private system (clinics or cabinets). Another reason for which certain persons are willing to choose the private system is the fact that their status or image "requires" such a thing, they want to show that they belong to high class. But it is also about the way the two systems are managed. Until 2005, Romanian Health Ministry had only physicians as ministers. In 2005 was elected a person whose studies in management were indeed needed since this is a skill that should not miss for persons into this position. This change could also change, in time, the perception of Romanians regarding the public system. If this will be better managed by a "manager" in specialization than by a physician that has a management position, it will be for sure a gained point in people's mind and not only. In our country we have undertaken health care reforms, with a recent emphasis on decentralization, reform of health insurance schemes, and a more efficient use of health resources.

The main idea is that all medical services should be done at a highly qualitative level and accessible prices so that everything should be done for the best of community, having a social and not commercial goal. Otherwise we risk that the whole society "pays" the price by having work force with poor health status that can offer work at a not very high qualitative level, which cannot have a high productivity and cannot either have notable performances.

Another important idea is that everything has to be thought on a long run and not for short term. This thing is valid for the whole system as well as for each physician and hospital taken separately. On short term patients can choose to receive treatments in clinics or physicians that valuate the financial aspect in the way that they have very high prices for their services (consultations, interventions, treatments). This price level is more likely to be chosen by population interested into "image" as mentioned before, or just simple people that prefer to pay a high price thinking that quality level is directly proportional with price. The problem that appears here is a management one. High prices not sustained by long term strategies, long run plans and quality could mean a single aspect namely the commercial one that is valid only on short term. Because of this bad management, long run could mean that the patient will not come back because he suffered when instead he should have enjoyed the recovery, because the treatment or intervention had no positive effect of simply because maybe there is no one to come back anymore Complications, wrong or unsuccessful treatment or intervention could mean life itself. On the opposite side, long term approach and a good management means that reward of physicians is not only the outcome that they immediately obtain for the services they offered, but also future incomes of the patients that will become real "loyal customers", the health status of the respective patients and also ethic rewards.

As a new way of medical personnel rewarding we could adopt the American idea from the Radford Community Hospital of having in each medical unit a fund of money which to be given to the medical personnel if patients are pleased by the services or to be given to the patients if they are not pleased by the medical and complementary services provided into the respective medical environment. This could motivate the personnel in order to increase the quality of their work by increasing the interest and the dedication knowing that this effort will be highly appreciated.

Moral reward and better managing health system

In many cases the ethic rewards are even more valuable than the money since it means long term thanksgiving coming from patients. This thanksgiving could be direct (many thanks addressed to the physician, appraisals etc.), indirect (praying for health of the physicians that solved their problems) or multiplied (recommending the physician to some other persons, since the respective patient is very satisfied with the health services received from the physician that treated or surged him/her and therefore speaking favorable about the physician). Later on, the fact that also other patients (that heard good things about one physician) go to receive treatment or have a surgery done at the respective physician represents both a moral and material reward.

Sometimes, the quality of medical services cannot reflect the effort of only good willing physicians or of the contributors since the health system of our country cannot totally and in each case return the benefits they are entitled to receive according to the amounts the contributed with to the health fund. Not even compensated medicines or free ones cannot be the way of returning the amounts to the contributors every time because if the monthly maximum fund plan has been eliminated for all pharmacies, now the medicines distributors problem appeared they being unsatisfied by the exchange rate used for calculations and prices when making the expense account with National Health Insurance House, this having as a result stopping the delivery of medicines to the pharmacies and even complete lack of some essential drugs for diabetic affection or some other affections. The result was that two third of the medicines for which physicians have written compensated or free prescriptions have been taken by patients with money, proving once more that the system doesn't work proper. Here, the moral reward can come from the patients from the physician for a successful treatment but will not come from patients to the whole system because is not the case. Future management of the health system should solve this problem in order to allow fluidity and positive trends be something regular into the system and not only happening.

In order to solve the unpleasant and blockage situations similar to the ones mentioned above, National Health Insurance House has elaborated a law project according to which starting 1st of January 2009 physicians to be able to give prescriptions only within a certain amount of money, amount establish on a monthly basis and that cannot be overrun. The system is similar to the one that existed four years ago but this is a risky measure since the patients could be revolted because in this way they will face the situation when not in pharmacies but at physician the funds will be over one day so the maximum limit for compensated medicines other than for the ones comprised into the national health programs will be a floating problem from pharmacies into the cabinets now. Management in this case was thought more oriented on the financial side since physicians are not allowed to prescribe medicines over the maximum limit of the monthly fund per cabinet, not respecting these meaning penalties, but making economies meaning possibility to invest into medical devices for the cabinets. Therefore, changes have been, are done and will be more. They are the engine towards development, this being true also into the medical field. Anyhow, no matter how big is the attention and effort done for having a developed health system and adapted to population needs, there are a lot of controversies and a lot of intentions that sometimes are divergent but the overall idea should be to do everything it takes to assure that the system offers qualitative services both into the public and private medical system and no matter the way the medical personnel is paid or rewarded, be it even for the fact that once upon a time it was a vow

All medical services should have a good management and should be offered at a very high quality level and at very accessible prices (for the private system) or within the insurance plan (for public one) so that everything is done for the best of the whole people community and not according to the commercial interests. If we do not do so we take the risk that the whole society and economy pay the price by having weak and not healthy work force, able to deliver medium quality jobs.

As a conclusion, in order to obtain a system that can appropriately reward quality care, payment methods should provide: the possibility to align financial incentives with the implementation of care processes based on best practices in domain and the achievement of better patient outcomes (important improvements in quality are most likely to be obtained when providers are highly motivated and rewarded for carefully designing and fine-tuning care processes to achieve increasingly higher levels of environmental protection, health safety, effectiveness, patientcentered, timeliness, efficiency, and social equity); reduce fragmentation of care (payment methods should not put barrier to the ability of providers' regarding coordination of the care for patients across settings and along time); fair payment for good clinical management of the types of patients in evidence (physicians should be adequately compensated for taking good care of all types of patients; the risk of random incidence of disease in the population should reside with a larger risk pool, no matter it is about large groups of providers, health plans, or insurance companies); the opportunity for providers to share in the idea of quality improvement (rewards should be located close to the level at which the reengineering and process redesign needed to improve quality are likely to take place); the opportunity for patients to recognize quality differences in health care and direct their decisions accordingly (people need to have good information on quality and the ability to use that information as they see fit to meet their needs, even have access to the physician's grades as appreciated through the performance system).

MANAGEMENT OF MEDICAL SERVICES

Barbu Maria-Magdalena

Academy of Economic Studies, Bucharest Faculty of Management Str. Floare Roşie, nr. 7, bl. 51, sc. C, apt. 114, cod postal 062261, sector 6, Bucureşti, România mariamagdalenapnb@gmail.com 0729600325

The offer of medical services depends on medical personnel and more than this, on the management in the medical field since any resource not managed well or not managed at all is only a lost one, regardless its value. Management is therefore the key, the "how to" method of obtaining the desired result. The same approach can be applied into our study in order to reach more productive medical services which to prove high quality to all patients. We need to use and to squeeze the entire force of management tools in order to reach our goal: accessible high qualitative medical services.

Key words: Quality, Medical Services, Management

The article's JEL code: L89.

First of all, every organization and therefore also a medical one needs a strategy. Moreover, this has to have a quality part. A regional or national hospital quality strategy is a long-term one, namely a program to increase patient and personnel safety and improve hospital quality. There can be specific strategies in each hospital and strategies to improve quality in many hospitals. A quality strategy differs from a quality tool in being an overall approach an organization takes over a period of time, rather than a specific method for a particular purpose. Thus, a program for external inspection of hospitals is a strategy. A particular method for carrying out inspections is referred to by quality specialists as a tool. It is possible to pilot-test a tool, but not a strategy. Benchmarking is both a tool and a strategy. WHO (World Health Organization) will even develop a separate policy synthesis of research into quality tools.

The power of medical management resides in setting a direction for the entire medical organization by having a consistent strategy, ensuring adhesion from personnel side and permanently improving the way their functions are executed.

Generally speaking, the types of strategies encountered during analyzing specialized literature are as following:

- Total quality management and continuous quality improvement: Total quality management is a set of principles and methods applied in many different ways, originating from organization-wide industrial quality programs. This strategy focuses on attention of personnel and on providing the best patient experience and outcomes. Quality tools are used by multidisciplinary teams of workers to make changes, and the approach is generally thought to require strong management leadership. It is based on a view that quality problems are more often due to poor organization than to individual faults. Continuous quality improvement is the same as Total quality management in most literature, although it sometimes refers to a concentration on multidisciplinary project teams analyzing work processes and using repeated cycles of testing small changes.
- Re-engineering: uses some of the Total Quality Management methods, but includes a more radical redesign of "production processes" which normally involves small-scale and incrementally tested changes.
- Increasing resources: increasing the financing, personnel, facilities or equipment used in a medical organization with the aim of treating more patients or treating the same number faster, better and at lower cost-per-person;
- Large-scale reorganization or financial reform: changing the structure of a hospital or health system so as to facilitate better decision-making or use of resources. Changes in financing methods are made as a way of improving quality;

- Strengthening management: improving quality by increasing management responsibilities, authority or competencies. It is sometimes used as part of other types of strategy. It is useful and can be applied only for medical units managed by professional managers in order to be possible to put more charge and work on them. In cases when manager of the medical organization is a physician as well things are more difficult since the persons is overloaded from the very beginning;
- Benchmarking: uses comparative information about quality with additional methods to help providers decide how to improve quality. There are specific methods for identifying, documenting and applying the best practices.

As we can see, more strategies have quality as focus. This is normal and is also a general tendency since competitiveness is higher and higher in medical field also, private medical services having an ascendant trend.

Regarding which strategy is best among the upper described ones, given the lack of evidence it is still considerable discussion about which strategies are or could be effective. One debate concerns "generic" versus "specific" strategies: would more resources carefully allocated do more to raise quality than a specific quality strategy? Many professionals think that increasing personnel, equipment and training is the best strategy. Quality adepts believe that "doing more of the same" can sometimes harm clients which in our case mean patients. They also think that applying quality methods systematically within a strategy is more cost-effective on the long run. This is the most fundamental debate in the field. The debate is especially acute in developing countries, where there is similarly poor and conflicting evidence of the results of different approaches. It is increasingly recognized that quality strategies in these countries supported by donors have not been sustained, exactly the way it happened some time ago into the high-income countries. There is debate about program costs and possible savings or benefits, but no research into the economics of different strategies.

There are more arguments for and against "police, punish and reward" approaches, and "inspire and develop" approaches. Many governments use both, causing problems for the agencies facing both ways: to apply sanctions and at the same time to encourage open sharing of quality performance information. Related to this is the issue of publicizing quality performance data. Critics argue that the data are misleading, easily misinterpreted and subject to falsification by providers and that internal, anonymous distribution are more likely to be effective with professionals. Others argue that public release of data will improve the quality, and that researchers and the state have no right to withhold data about poor quality that the public needs to protect itself and make informed choices.

But is it appropriate to apply "industrial" quality strategies to health care? It is well known that medical services represent a special "field", a sensitive and not very flexible one. Once the acceptance of the methods in healthcare grew, the problem now became how the industrial methods are best translated or adapted for this particular environment. Quality experts think that a strategy has to be tailored to specific circumstances, and debate about the point where adaptation looses the "active ingredient" and results in reduced effectiveness.

Therefore, all medical organizations managers should choose the best fitting strategy and obey to it. This means having plans, programs and actions driven into the strategy's direction. Everything should be done according to it in order to achieve the proposed goal.

In order to achieve the objectives of the strategy, managers of medical organization should keep an eye on performance and strategy adhesion from personnel side.

In recent years, performance monitoring has gained increasing attention as a tool for evaluating the delivery of personal health care services and for examining population-based activities addressing the health of the public. This attention to performance monitoring is related to several factors such as: concerns about ensuring the efficient and effective use of health care funds in providing high-quality care and achieving the best possible health outcomes. Also contributing are a wider recognition that the health of the population depends on many factors beyond medical

care and heightened concern about accountability for use of resources and whether desired results have been achieved.

Performance monitoring means a continuously community-based process of selecting indicators that can be used to measure the process and outcomes of a strategy formulated in order to improve the health of patients by collecting and analyzing data on those indicators, and making the results available to the entire community and especially to those segments of the community engaged in health improvement activities. Performance monitoring should promote health improvement in a context of shared responsibility and accountability for achieving desired outcomes. Many parties within a community share responsibility for health (e.g., consumers, health care providers, businesses, government agencies, public service groups); those with responsibility for accomplishing specific tasks are accountable to the community for their performance

All strategies often include risk management and a wide range of methods from other industries for collecting and analyzing adverse event or near miss reports with a view to prevention.

In all cases management is the key factor that should ensure that every employee follows the strategy settled, the plans and programs established. Medical personnel and administrative one working into medical organizations should be trained regarding the quality methods and the corresponding attitude needed. This attitude should be a real one and not a "theater", a "role playing" one. In this field real quality and positive attitude matters more than can be expressed and counted in words. Management should do everything needed to also stimulate employees in order to accept change at individual, team, organization and systems levels simultaneously, and point out the need for personnel to feel that they, too, as well as patients, benefit from improvements.

Every manager, be it in a public or a private medical unit should continuously seek for best examples in its field and take the parts that can be "borrowed" and match his/her specific context. An ambitious health strategy is that of the United Kingdom National Health System. Since 1998, this has involved generic strategies of restructuring and extra resources. Specific strategies include national guidelines and standards for clinical care, national inspection and public quality performance reporting, a law giving all medical organizations a "legal duty of quality" and requiring them to implement a quality improvement strategy, clinical governance quality management systems, and a national system for reporting and analyzing difficult events. No evidence of results or costs is reported and no research to gather such evidence is planned. Nearly all medical organizations in the United Kingdom have educational programs, local guidelines, improvement groups, and peer assessment methods, most of them using feedback of performance data.

Knowing that health encompasses physical and psychosocial well-being and not simply the absence of disease, management of medical units should know that their task is not an easy one. Because many factors influence health and well-being, understanding the nature and scope of these determining factors is an essential element in developing health improvement strategies and in determining what indicators may be appropriate elements of a performance monitoring effort. The workshop's opening presentation used the framework of the Health Field Model for examining the determinants of health

Quality means rapid access of the patients to the physician, corresponding consultation, proper treatment/intervention, post-treatment/intervention consultation, follow-up medication or diet, investigation on the problem among other family members if it is the case and other similar aspects that patients consider to be very very important. It's all about life after all!

In these conditions management should be all eyes and ears to every move and every action of the personnel. Not from authoritarian reasons but to have a basis for continuous improvement. After setting a direction by having a solid strategy, corresponding plans and programs management should assure that every employee knows this information and acts accordingly. Quality should be a key word in this area not only because it's a word that should characterize the

entire medical services field but because this is also what the managers would need if they would be patients. The same high quality of medical services would need the medical personnel if they were patients. Quality should be assured by management by hiring the best personnel in the field, by investing in best medical devices on the market and have a continuous improvement approach. A big emphasis should managers put on preventive programs. Growing recognition of the importance of addressing social determinants of health is causing a reexamination of the current focus of public health in Western Europe, Canada, Australia, New Zealand as well as the United States. One major task that managers should address is on making sure that their medical organizations invest the same kind of intense resources into keeping people healthier or helping them return to a state of health and low vulnerability as they do to disease care and end of life care.

Quality means also cutting down waiting lists. This is the main desire of the patients but also of the medical personnel at the same time. Waiting lists are no good for anyone. Patients become nervous as delay time increases and physicians feel pressured since they are making consultations "on row", the time is passing and the queue of patients seems endless.....Medical organization managers should ensure all necessary resources (medical stuff, administrative personnel, equipment, consumables, strong relations with stakeholders) and find a way to the best scheduling that can ensure diminishing of patients' waiting lists. This can be done based on the patients' files and on the market demand. Correlating number of patients and frequency of physician visiting with the number of medical personnel per specialties can bring managers in front of the optimum number of physicians needed for each unit. Ensuring consultation on basis of programming is another good thing that can bring more order and productivity for physicians plus patient satisfaction since waiting time will be close to zero. (appearing only when problems appear within some consults and time needed is longer than time scheduled).

Managers of medical institutions should do everything to prevent and minimize the adverse impact of the actual economic "hurricane" which could devastate the social sector, especially the health of people. Worldwide there have already been unhappy cases of suicide because of loss of job determined by the actual economic crisis. Therefore it is very timely that we explore the ways and means of ensuring that the health systems are protected to the greatest degree possible from the impact of this difficult period.

Before the current crisis, many low- and middle-income countries were roughly affected by increases in food and fuel costs, others prospered during the boom in commodity and oil prices. With a fall in demand, prices have fallen, to the advantage of net importers but at the same time to the detriment of those more dependent on export revenues.

In countries that have been affected by an economic recession, total expenditures for health decreased, but not consistently. Some governments have protected health spending or even increased it, but others have done the opposite. The management in this direction is therefore very important. What managers should take into account is that during a recession, private expenditure for medical services paid directly by patients usually tends to decline (in contrast to public spending), especially if same services are available at lower cost into the public system.

Reductions in total expenditure will have an impact on the structure of health expenditures. The tendency is for salaries to be maintained but for infrastructure and equipment to be financed from the savings category that will equal 0 for a period.

With more and more people working abroad, we can even take into discussion the money sent back into the origin country and spent on medical services. Still, how much is spent on health is uncertain, although one survey from Mexico reported that 57% of remitters said that covering health expenses was the primary purpose of the money sent home. In these conditions, a decline in remittance income may not be reflected in levels of population health.

The economies of many low-income and middle-income countries have benefited from the rapid growth of export industries in areas such as ready-made garments, food, flowers and business processing. Since crisis makes the demand decline, job losses will have direct consequences on

family income and therefore inability to pay for health care. Many of the human consequences of recession are often not visible from the very beginning. In this idea, unemployment may erode women's growing economic independence, which will have its own health consequences. Similarly, coping strategies may exacerbate vulnerability (through, for example, increased exposure to HIV). Reduced spending has impacts on health and education, and ultimately on the well-being of families and the development of the community as a whole.

Decreasing health spending, increased costs of treatment and reduced family income and/or insurance coverage will affect use of health services and their quality. The first effect is the decrease of demand addressed to the private care with a consequent transfer of demand to the public sector. Furthermore, if public services are also compromised, they may not be adequately equipped to cope, and overall quality may decline. This problem will affect all countries in which publicly-funded services are under pressure. Changes in utilization rates – broadly following this pattern – were documented during the 1997–1998 Asian financial crisis. A decline in the use of services by the poor people into these countries was obvious.

The current food crisis in particular has been estimated as being responsible for pushing more than 100 million people back into poverty. This will have negative effects for health and nutritional status. Shortages of food and consequent malnutrition predispose individuals to disease and thus act in vicious concert with the economic recession.

The good part is that leaders in developed and developing countries as well as international financial institutions have made strong public, political commitments to health and development. Health is an intrinsic good and an investment to reduce poverty.

In this context, when revenues and income are decreasing, health should not be forgotten at all. Health is an privilege to which people have a fundamental right, as well as making a significant contribution to economic growth, poverty reduction, social development and human security.

Medical organizations' managers should keep a permanent eye on the crisis effects. They should monitor the changes in employment, housing and income (because this is the first cause of illness); changes in behavior relevant to health, including changes in the use of health services (including mental healthcare) and changes in the behaviors of health workers themselves (including patterns of migration); and changes within the health sector, including the cost and availability of treatments.

Managers should also act especially related to causes and not effects. For example, in case of primary health care organizations the focus should be on the reasons that obstruct accessibility, equity and solidarity. The high rate of maternal mortality is a result of many factors including poor access to care, failure to prevent unwanted pregnancy and women's low status in some societies. All these factors should be aimed by managers and can be exacerbated even in recession times.

Primary health care gives direction to work on health systems, reinforcing the idea of solidarity through progress towards the goal of universal coverage. This is very important since the increasing pressures on public services and the need for ways of reducing exclusion. Pooling risk and resources protects people from huge expenditure and it also facilitates greater allocative efficiency and thus more effective resource use. Primary health care highlights the importance of the social, economic and environmental determinants of health, such as the impact of housing, education, employment and nutrition policy; import duties that affect access to essential medicines and technologies; the restriction on the movement of peoples or goods to prevent the spread of epidemics and the major role that clean water, clean air and access to proper sanitation play in protecting health and prevention.

Managers should consider participative approach in decision making since if the public, civil society and parliaments are involved, decisions on how to make health spending more effective are more likely to be rational and accepted than if they are left to bureaucracies alone.

Managers of medical organizations should use all of their knowledge in order to improve the situation but at the same time to take into account the peculiarities of this field. Every step

towards improvement should be taken only after profound analysis of the information collected and correlated with the context. Physicians should do their best and the same should do managers. For sure that management has the power to change the medical organization into the desired better direction but very important is to have a consultative approach in order to be sure that physicians' opinions have been listened and the solution will have personnel commitment on a long run.

The power of managers of medical organizations is bigger then the one of the regular companies but also more difficult to handle since, more than the fact that is a field with emphasis on interpersonal skills as all services are, medical units are responsible for the lives and health of the patients received. Therefore, managers should act by setting a clear direction, ensuring personnel devotion to it, permanently find out patients' opinion about the services they received into the respective medical organization and steer it towards improvement regarding higher quality and productivity. On short: striving to offer better services.

Managers of medical organizations should be the first to think about methods that can prevent injuries related to people's health in these difficult times. They should find ways to turn threats into opportunities, managing in such a manner that makes possible for the medical personnel to offer high quality and productivity to the "customer King", the patient. All these can be done starting from designing a strategy and ensuring adhesion from personnel side to it, meanwhile permanently improving the way the functions are executed and objectives followed and reached. Actual crisis situation should motivate medical organizations' managers to fight even more intense for finding solutions of keeping patients with problems addressing to the medical unit, encouraging preventive approach and the motivation of personnel for ensuring patients as healthier as possible. Management functions should be combined with adequate marketing plans, enhanced communication, public relations, benchmarking and open-mindset in order to be able to adapt and develop the medical organization to the challenges that appear and change everyday.

The conflict in the organizations framework must be considered as the difference between structure and action; think that it must happened and it will happened. The organization being structured in concordats with the predominant culture, all its targets are important, and all its members works together to attain them.

An organization is a complex whole that not only includes simple systems producing goods, but also structures of realizing careers including political systems. In every organization there are different values, conflicts generated by priorities and aims, groups of interests and of influences, rivalries, collations and alliances that must be administrated, so that the conflicts are been solved in a efficiency way for the organization.

Keywords: The conflict, the organization efficiency, the competition for the short resources, the power and the influence between the individuals and the groups, the autonomy tentative, the conflictual cycle, the conflict management

Cod Jel: M14

1. INTRODUCTION

The conflict within the organization must be regarded as the difference between the structure and the action; what would have to happen and what happens. The organization being structured in accordance with the predominant culture, all its targets are important, its members co-operating for the achievement of these.

The information and communicational integration which is based on the antecedent tendencies, is concretized in the creation of the numerous virtual communities, regrouped on the certain fields or sectors, which permit to the user that he identify the products, the systems and the services which respond to the necessities of these. The predominant role in the information and communicational prefiguration belongs to the Internet Protocol (IP), which represents a veritable sector of reorientation and development of the information and communicational technology. It had and he has a big positive impact on the development of the information networks (WAN), of the networks from the enterprises (Intranet), of the networks from the enterprises (Extranet), of the metropolitan networks (MAN), of the local networks (LAN). Concomitantly, IP marks substantially the development of the networks computers, the development of the work stations, of the services for the group work, of the services for the massmedia, of the television networks through the cable and the development of the wireless connection.

The digital technologies have an universal influence, an influence so strong that the changes that they produced were compared with the industrial revolution. They do not increase only the

company productivity, even if this fact represents one of its effects. What is remarkable at the digital technologies is the way in which these change the markets and the peoples work models. The direct and indirect influences of the information technology in the organizations are suggestively rendered in the 1st. figure.

TI favours the increased productivity of the managers, the extension of the control (the employees number on the supervisor) and the reduction of the experts number (because of the experts systems). Related to this, the principal impact is represented by the flattening of the organizational hierarchies, namely, in many organizations, there will be less managerial levels and fewer managers. Also, the flattening of the hierarchies will result from a reduction of the total number of staff, as result of the increased productivity and of the possibility that the staff with the general training execute the activities which need the speciality (for example, using the expert systems).

The use of the information technology determines the shortening of the achievement time of the certain activities, it reduces the development cycle of the products, it makes the communication be faster, in other words it accelerates the rhythm of the companies activities and it increases their capacity to process the information. Also, TI modifies the temporal and spatial limits of the activity. Thus, through the use of the electronical mail and of the video or of the teleconferences, those who work at the project must not be in the same place or work in the same time.

The effects of the use of the information technology previously showed contribute at the rise of the companies flexibility. Basing on the designed and adequately achieved information systems, the organizations can increase their capacity to answer at the clients requirements, to the suppliers requirements and at the requirements of the environment at large.

The organizational flexibility

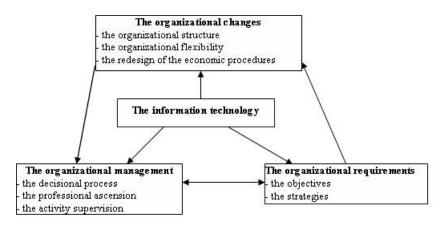

Figure 1 The influences of the information technology within the organization

Through the redesign of the economic processes (Business Process Reenginering - BPR) is obtained a restructuring of the work through the transformation of the activities with the help of the information technology. This redesign is defined as a fundamental rethought and a radical restyle of the activities for the substantial improvements, as well as concerning the cost, the qualitym, the service and the service (Hammer M, 1993). Thus, the redesign regards all the aspects related to the way in which the companies "make businesses", regarding the big changes of this, beyond the simple reduction of the costs or the automation of a process.

The experience demonstrates that TI can sustain both all the efforts of centralization and the efforts of decentralization of the decision process from the organization. The company which wants a centralization of the decision power can opt for a centralized data base, which can be updated from the work stations situated in the different places from the organization and related through the medium of a computers network, for the concentration of the information and for the

keeping of the control of these at the certain levels of management. On the contrary, a company which wants a decentralization of the decision power can appeal to the technology of the distributed systems and to the client/server architecture for offering to the employees situated on the inferior levels of management the necessary help for taking the decisions, permitting thus the supplementary delegation of the decisions¹⁷.

2. THE CAUSES OF THE CONFLICT

The certain reasons which creates a conflictual state in the organization, there are the certain groups with the objectives and with the different ideas, but dependent one of other, when the achievement of the charges depends of the behaviour of the other group. An example is represented by the divergences concerning the organization subdivision between the production compartment and the sales compartment. In the sales department there are concluded the sales contracts with the terms and unreal prices, which put the production compartment in a situation of not respecting the contract data. There can appear the tensions between the production department and the financial department, and between the different production departments. There can also appear the difficulties in the coordination of the disparate activities in the organizations, the coordination managers role being ambiguous, vague, looking for a "scapegoat" for the failures of the organization.

The competition for the short resources can take the form of the disputes between the functional services concerning the investments, the equipments, but they can refer to the position, the promotion career; in fact everything which refers to the person or the group of persons who follow their objectives and their personal dreams. The collective negotiations and the safety of the post-offices are placed in the same context.

The competition between the power and the influence, between the individuals and the groups generates the friction and the restriction of the activity. In the case of the groups the situation is more disastrous.

The autonomy tentatives

When a person is entered in an organization, her competences are established through the post file or through the signed contract. The established charges are usually unclear becoming the misunderstanding subjects between the superior and the subordinate; within the organization the autonomy has a significant factor in the achievement of the performance levels and in the satisfaction offered by the work.

Any change in the post file is greeted by the employee as a territorial violation being greeted with the resistance. Even if the incident at the first sight could be minor this through the organization folklore becomes symbolical as treatment method of the employees by the organization.

The personal problems

Although the majority of the conflicts appears because of the structural causes, we must not ignore the conflict state which has its origins from outside of the organization (the personal anxieties, the aggression, the frustration) and which find their volcano within the organization. In this case it is very difficult for the manager to resolve a such conflict, inclusively its diagnostic being very difficult.

3. THE CONFLICT MANAGEMENT

A study effectuated by the American Management Association reveals the fact that the managers from the superior and middle levels consume almost 2 hours from their time for the solution of the conflictual situations.

More experts consider that the conflict management as being as important as the other functions of the management.

¹⁷ Moldoveanu G-Analiza organizațională-Editura Economică, București 2000, pag153.

We can consider that a conflict is a signal of an inefficient directorate; the disability to know the people or the existent groups from the organization. In this case there must be found a dialogue tone for knowing the dreams of the group, which be in tone with the existent problems within the organization or the flexibilization of these, until their bringing at the same denominator. In the next place, we show some applicable methods within a organization:

- the creation of an atmosphere of collaboration and emulation within the organization;
- the receptivity at the cultural and structural problems;
- the competition control;
- the simulation of the change states for finding the reaction of the groups at the critical conflict situations;
- the application of a change policy in consonance with the external market and with the home market of the organization;
- the formation of a team attached to the managers policy, in which the principal change projects be debated.

The creation of an atmosphere of collaboration and emulation within the organization

In this situation we must start from the idea that in the organization there is a pluralist character, being the interest groups with the different dreams concerning the dominant culture. These conflicts can be regarded as the loyalty lack, the critical commentaries being discouraged in some organizations.

In the pluralist organizations the persons with other opinions will be considered as the partners of discussion and solutions proposals, which resolve the conflictual state, the political underground manoeuvres being discouraged. We mention that the organization is a political system in which the individuals try to obtain the power and the influence; but there is a big difference between the frank discussions and the manoeuvres of side scene. How much functional are the political activities in the achievement of the organization objectives, the personal and ethical problems cannot be avoided. It is considered that within the organization, the information control is "power instrument".

A pleading can be made concerning the necessity the distribution of the information only to the advised staff, which must have it.

The receptivity at the cultural and structural problems

We referred previously at the necessity that the structure and the culture of an organization can answer to the change, pointing some problems which appear when the structure is not adequate to the target and to the organization circumstances:

- the low motivational level, the adoption of the decisions delayed by the bad quality, the conflicts and the coordination lack. All these reflecting in the high administrative costs, the incapacity of answering to the conditions on the modification on the market.

We will examine at large the way how an organization from the sector of the constructions answer at the environment changes¹⁸.

The competition in the rise and the legislative changes bring the major changes in the managers role. In this situation it is necessary the improvement of the management concerning the global and strategical objectives with the impact on the organizational elements (the structures, the employed work force, the styles of managerial work).

The study about a constructions company identified the predominance of a culture of "Power" type, the traditional work in the enterprise and the administration, through the application of some operational procedures of work.

In the table No. 1 there are summarized the susceptible changes to affect the managerial systems in the organization;

4. CONCLUSIONS

The solution of the conflict can be achieved through:

- the fixation of common objectives in the conditions in which a major source of conflicts is represented by the following of the different objectives, the manager must try to propose the objectives equally accepted by the groups found in conflict;
- the improvement of the communication processes the existent communication barriers between the manager and the other members of the organization or between the members of the organization, must be reduced, the communication between the members of the organization must be stimulated through the intensification of the information exchanges between the departments;
- the integrative negotiation the essence of this process is that none of the parts must be obligated to renounce at the aspects that it consider them vital; the people must encouraged to find a creative solution in place of the compromise.

THE USE OF MISSION STATEMENT AND OBJECTIVES IN UNIVERSITIES

Băcanu Bogdan

Transilvania University of Brasov, Faculty of Economic Sciences, str. Eroilor 9, e-mail: b.bacanu@unitbv.ro

The present study is an analysis of the mission statements and the objectives belonging to a significant sample of the Romanian public universities in 2009. The analysis focuses on the formal and main aspects, without aiming at identifying a relationship with the state or the performances of the respective organizations. The information was gathered by means of the official websites.

Key-words: mission statement, objectives, strategic plan, university, university charter

JEL Classification: I23, M19

1. Introduction

After 1990, the number of Romanian universities has increased rapidly, due to the significant changes within the socio-political and economical environment. A part of the existing universities divided on specialization criteria. In parallel, other newly constituted universities appeared, either established on the basis offered by small organizations of higher education which had been in stagnation or extinction before 1990, or founded using no previous basis. After almost two decades, in Romania there are more than 50 public universities and more than 100 certified universities, including publicly and privately-funded organizations.

The explosion in the number of the universities shows certain dramatic changes in the demand and offer of higher education and also significant changes regarding their competitive behavior and managerial mechanisms. The changes in the economic environment have induced an increase in the demand of enlarged university competences, which traditionally have been neglected during the communist period. This phenomenon materialized also in the growth of the number of students who aimed at different types of university degrees and training that had as a result the emergence of a great number of privately funded education institutions besides new public universities and the development of the existing ones. The interest taken within higher education has been enhanced by the reorganization of the Romanian economy and the general economic growth that Romania has experienced in the past two decades. Even in the terms of circumstances favorable to the demand, the rapid increase in the number of universities generated the essential conditions necessary for the development of a competitive environment related to the university offer. The changes associated with the socio-political and economic aspects of the society encouraged the appearance of many regulations which emphasized the competitive character of the offer.

The things that have happened in Romania for the past twenty years reflect a global tendency of increased competition amongst higher education institutions across various academic systems. In these conditions, the universities adopt behaviors similar to the companies which operate on free competitive markets, and apply some of their management tools. From the panoply of the strategic tools that a company uses, universities have chosen the strategic plan, the mission and objectives statement. As these tools, despite their usefulness, have implied also a considerable consumption of resources, a critical evaluation of these processes and their impact on the organizational performance becomes the purpose of this analysis. The evaluation from the point of view related to the effects on performance implies a great number of aspects that are debatable even at the level of the basic theory. As a consequence, the discussion about mission and objectives is focused only of the formal aspects, presuming the accomplishment of certain formal conditions would have positive consequences on the results.

2. Mission and objectives as management tools

The mission statement and the formalization of the strategic objectives related to a certain organization represent an instrumental dyad of management which seemed to gain popularity during the last decades. Even if there is no objective relation that implies the simultaneous and correlated utilization of both elements, the practice shows the managers' preference for such specific use. Due to their nature and role, the formalization of the mission is more transparent than the one dealing with the system of objectives. In general, that is why one can easier appreciate the quality belonging to the mission statement than the one belonging to the manner in which the system of objectives is materialized. One may suppose that, for the public organizations belonging to the university, there is an advanced transparency inclusive of its objectives.

In the case of profit-seeking organizations, the mission statement appears to be utilized by most of the companies surveyed, e.g. 90% of 500 companies surveyed by Bart and Baetz (1998), or 94% from the ones that use strategic tools in a study of Rigby (1994). The certifications related to the management of quality, and also the "democratization" of the companies in the sense of accountability growth referred to an increasing number of stakeholders that create an institutionalized pressure in order to carry out a mission statement.

The numerous studies that deal with the formal aspects related to the mission statements classify and place in hierarchical order the different elements included in the statement. A more reduced number of studies are focused on the relation between performance and mission statement. For instance, Collins and Porras (1995) suggest that the best performing firms have boast clear mission and objectives. On the other hand, there are also studies, as the one belonging to Bart (1997), which offers a different perspective of the topic. "The overall conclusion is that, in any sample of mission statements, the vast majority are not worth the paper they are written on and should not be taken with any degree of seriousness" Bart states after researching the topic in North America. It's obvious that the situation becomes more complex in the case of public organizations, due to issues such as institutional or organizational efficiency.

The use of the objectives in management was theorized by Drucker (1954, 1957) and applied further by Bacanu (2007). Drucker is also at the origin of the set of criteria that define a "well expressed" objective, a set known under the acronym SMART, meaning that objectives need to be specific, measurable, achievable, realistic and time-related). Even if in practice the management by objectives (MBO) diffused rapidly during the sixties and the seventies, certain studies, e.g. Schuster and Kindall (1974), showed that the method is applied correctly and with significant results only in 10 companies from the Top Fortune 500 even if it is estimated that more than 80% of the American companies were using at that moment. Finally, Drucker launches an interesting estimation dealing with the use of objectives in management. During the nineties, he estimates retrospectively that MBO is nothing but a simple tool, along with the others belonging to the panoply of the management techniques, and that its application depends on the existence of certain objectives, or, as the parent of MBO points out, in the most of the cases these objectives do not exist.

Presuming that the formalization of the mission and the accomplishment of certain objectives have positive results related to the organization performances, their use has extended even in the case of public organizations - universities included - especially in the English-speaking area of management within USA and Great Britain. However, there are no consistent studies to relate the use of these instruments to the top positions of the American and British universities.

Accepting that the relation mission-performance works also for the universities on the one hand, and being pressed by the emergence of a competitive environment for the university offer in Romania of 90's, on the other hand, the top officials that managed the policy of the Romanian higher education considered as a necessary measure to introduce certain regulations with direct effects on the discussed topic. Their idea was to motivate the public universities to explain the way they would act, in order to utilize the public resources allocated by the ministry of education.

The explanation presumed a mission statement and the definition of a certain set of objectives which would represent the basic elements of a strategic plan. In these terms, due to a ministry regulation, the public universities, which expected a budget allocation to support the educational process for a part of the students, were pressed to formalize a four to five years plan. On whose basis a so called "institutional contract" was signed between the ministry and the university as a provider of educational services.

This regulation was issued in 1998. It contains general recommendations dealing with the structure of the strategic plan. Between them, there are several elements related to the mission and to the objectives of the organization. For the mission statement a clear formulation is suggested, in order to emphasize the distinct characteristics of the university. The accomplishment of a prediction is discussed for its goals and objectives, dealing with the evolution of certain major components of the activity, with the specialization portfolio included. Detailed explanations dealing with the reason of this class are offered by Bratianu and Lefter (2001). In parallel with the administrative action, there was a series of programs related to the training of the universities top staff, programs developed by the Western partners and supported by PHARE founds.

Together with the accomplishment of these strategic plans the university charters were also updated in the matter of the organization mission. A great number of universities have periodically updated their own charter, but in 2009 it is difficult to clear out, using the methodology of this study, if the mission statement from this official document was updated too. However, several months after the appearance of the ministry disposition, all universities had a formalized strategic plan which took into account the mentioned formal suggestions. Due to the fact that no problems were pointed out in the process of negotiation related to the institutional contracts between the ministry and every public university, one can assume that the strategic plans which supported the negotiation were found acceptable, inclusive to the level of the mission statement and of the objectives.

The effects of the formalization related to the mission and to the objectives of the universities were significantly estimated according to the pattern of the structural studies dealing with the companies. In a different way, one cannot specify the possibility of knowing and assuming the mission and the objectives by the members of the university community, especially by the teaching staff. One cannot state anything about the positive change of the stakeholders' behavior or of the general performances of the university (but what is actually the relevant performance?). The things go the same in the case of more sophisticated elements, as the involvement in the activity of the organization, or the satisfaction of the staff related to the vision was assumed by the organization.

3. Methodology

From the list containing more than 100 of universities certified to provide educational services in Romania, a partial list was detached, containing only the public-funded universities having a civil or non-military character. This first selection is legitimate because for these universities there is an institutional conditioning, associated to the contract of public financing of the educational activity by the ministry of education. The military universities, as the private ones, deal with such institutional arrangements which are associated to certain market structures with monopoly characteristics or with competition characteristics having a poor regulation or being insufficiently matured.

From the first partial list containing more than 50 universities, 33 units were selected from 20 significant cities: Bukarest, Brasov, Ploiesti, Iasi, Cluj-Napoca, Timisoara, Oradea, Constanta, Tirgoviste, Pitesti, Baia-Mare, Galati, Sibiu, Craiova, Tirgu-Mures, Alba-Iulia, Resita, Bacau, Suceava, Arad, that practically cover the whole territory of the country. Even if several important universities were omitted, few small specialized universities, and the unique representatives of certain cities which distinguished themselves as university centers after 1990, there are sufficient

elements which suggest that the overall image offered by this sample can be identified with the overall image of the civil public universities.

The group of the surveyed universities shows relatively balanced characteristics related to the representativeness referred to some basic criteria of classification. From the group of universities, 14 have a universal structure and 19 have a specialized structure, e.g. medical sciences, engineering, economic sciences. A number of 15 universities represent on their own the city they are located in, the rest being a part from certain groups of two or more organizations belonging to a university city.

The research of the mission and of the objectives related to the chosen universities was done by accessing the official websites of universities. No written documents were collected, considering that in this manner a *de facto* evaluation of the transparency is made, related to the presentation of these elements.

The analysis dealing with elements of interest, visible mainly in the content of strategic plans and of the university charter, implied formal and contents elements referred to certain theoretic landmarks well-known in the "nowadays" management and frequently quoted in the Romanian space. In the matter of mission, the works belonging to Abel (1983) and David (1988), and in the matter of objectives the "landmark" is represented by the works of Drucker (1954, 1974).

4. Findings

The study of the mission statement belonging to the universities chosen for the respective sample suggest from the beginning a differentiated perception related to the role of these statements. A certain exposure of the mission on the front page of the official website or the possibility to access it due to a specific link or e-mail show that the respective university assumes that the statement has a marketing role and the straight explanation, in a clear form and using a literate and "commercial" expression represent the first attractive element for the potential students or for other stakeholders. Only 7 universities preferred this specific exposure, the rest bearing their mission "hidden" in their charter and/or in their strategic plan.

Most of the universities placed the mission in their charter in a "legal" form; in other words the form of one or more articles which seem to be wanted to generate certain consequences at the level of constitutive and functional regulation of the organization. The charter can be accessed on the site in the case of almost all the universities, but there are also few situations of "invisibility". A mission statement can be found also in the strategic plans offered. For the period 2007/08 – 2011/12 certain plans may be visualized in 20 cases. By comparing the mission in the plans with the one existing in the charter, one can estimate that more consistent differences appear in 7 cases, but certain slight expression differences appear in other cases. This situation may be the result of a certain "modernization" of expression at the level of the newer document. In several cases, missions are discussed in the same statement, or different missions can be identified for the research activity or for the faculties that compose the university.

The analysis of the conceptual contents, related to the missions statements, show that there is an express concern to declare a specific interest on the research activity. Being aware of the negative financial consequences induced by the ministry in the situation when a certain university declares itself as being interested only on the educational process, the form of declaration represents only an element of protection, without the possibility of reflecting in a realistic manner a state of facts or an intention that may be sustained.

The scientific area which bears a certain interest for the educational and research activity is underlined in the case of the specialized universities, for instance in the case of 15 universities from the whole of the ones that were researched. Even in the case of these universities, a differentiation related to the specialization, where the excellence is searched, doesn't seem as really obvious. For the universal structured universities and also for the polytechnic universities, a preeminence of certain scientific areas is not obvious. In these terms, there is no element of distinction for a medical university or for an agricultural sciences university belonging to the

respective category. The initial ministerial disposition aimed exactly at defining a certain distinctive feature associated to "the product". This distinctive feature becomes less visible when it is related to the geographic area or to characteristics belonging to the students. Only three universities associate their activity to a certain geographic area or to applicants who come from the respective area. The ambiguous expression is almost general, without emphasizing a potential "pole of attraction" for the teaching staff, for partners or for the students. If one reads only the formulation of the mission, it is unlikely to identify the university, excepting the named cases and a small number of other universities having a certain specialization or a unique position in Romania.

A discussion related to the principles or to the values exposed in the mission can be done only by corroborating them with other elements presented in the charter, or with the general objectives exposed in the charter, or in the strategic plan of the respective university. The comparative study of the concepts associated to the same label, as, for instance "the autonomy of the university", "student-centered education" or "academic freedom", shows a strange dispersion of the definitions inherently associated. The university X and the university Y understand a different thing when defining the academic freedom. The identification of values is more difficult when certain concepts are added, using formulations marked by stereotypes that empty the concepts from their meaning. "The development of the personality", "the competitive formation", etc. are discussed, but without revealing the real meaning of these collocations.

From the point of view related to the style of the mission, one can observe that most of the universities prefer a list-type presentation, which translates as avoiding the use of certain predicates with a clarifying role. Another part of the researched sample distinguishes itself due to a style that aims at being concise, but the utterances are abrupt, bombastic and without a logical relation between sentences. Only few exceptions use a "humane" style, which supposes to avoid a stereotype language.

The review of the objectives exposed in the strategic plans and also in several charters show a considerable difference from Drucker's recommendations. There is a relative superficial approach regarding the objectives in several cases, and an ambiguous time reference in others, associated in most of the situations to the term "permanent". So, the reference to the SMART characteristics is gratuitous. The pragmatic consequence is that every process of evaluation becomes useless, because the reference system is missing. In fact, the formulation of the objectives doesn't allow the coherent measurement in order to compare the results, which, as a matter of fact, are not specified.

The display of objectives is centered on collocations built on "the development", "the growth", "the consolidation", "the security", "the modernization", "the improvement", "the achievement", etc., terms having an ambiguous and equivocal character which determines the difficulty of any evaluation, more particularly as any specific quantitative or temporal element is missing. Paradoxically, in various operational plans the objectives do have SMART characteristics, especially in those associated to the investments in the infrastructure. One can infer that the formulation was deliberately chosen, in order to not turn into "negative" elements, neither for the ministry, nor for other stakeholders. Both the ambiguous character and the fact that the verbs suggest certain processes instead of the targets make the used expressions to be rather goals than objectives.

The manner of expressing the objectives and the missions generates significant similarities between them instead of a distinction able to differentiate between the idea and the implementation.

5. Conclusions

One can observe that for the researched universities the exercise of formulating the mission and the objectives is a formal one, induced by an administrative obligation, without a real maturation of a necessity imposed by the market. The formulations are quite similar across universities in the

sample that ahs been studied and they address administrative recommendations. They fail to feedback with suggestions that result from the practice and experience of the companies, or from the theoretic ones offered by contemporary strategic management. The management has only instrumental value and the marketing component becomes insignificant. It's obvious that the process of formulating the objectives and the mission involved only in few occasions the experts in the management theory, and the consultation of other persons interested with this matter was eventually accidental. When comparing the results achieved with the prescriptions of the mission or with what are desired to become the objectives of the organization, one cannot express negative estimations related to the management team.

The number of the public universities omitted by the study is less than the one of the used sample. Due to "the uniformity" observed, one may assume that it stays the same for the omitted organizations. However, their existence offer the advantage of a certain uncertainty related to the quality of the mission statement or the quality of formulating their objectives.

Sanitary organizations function on a market with certain particularities, reason for which the public hospital must strive to elaborate and implement viable management systems, by relating to the private enterprise model. In order to answer the question: "what system to chose best for the hospital?", we have performed a literature review of known lean management system. And since, like any other enterprise that is modernizing, the hospital evolves from an archaic system, to a modern one, we propose to highlight the benefits of the Lean school of enterprise administration, which analyses performance, seen from two perspectives - productivity and quality – through continuous improvement and cutting down losses.

Key words: Lean hospital, value stream map (VSM), standard work, five S, mistake proofing, single minute exchange of die (SMED)

JEL classification: G23, I18, M10, P36

1. Lean – definition and history

The "Lean" enterprise management school is interested in the performance seen under the two aspects of productivity and quality, trying to reach this performance through continuous improvement and cutting down losses (muda in Japanese). Being originally a concept applied to production, "LEAN MANUFACTURING" is the name of the production systems that produces "more with less", also known as "Lean production" or "No waste production", meaning "minimum COSTS production". There are many definition of the concept of Lean manufacturing, such as (Drew, McCallum, & Roggenhofer, 2006):

"A production philosophy that reduces the time interval between the client's order and the product delivery, through minimizing the waste (non adding value work activities)".

"A team approach, meant to identify and eliminate waste, (non-value adding work), through the continuous improvement of the production flow, undertaken at the client's request, aiming towards perfection".

"A way of thinking and involving in view of completely eliminating waste, focused on the customer's success, made possible through the simplification and continuous improvement of all processes and relationships in a climate of mutual trust, respect and involvement of the employees".

Originally applied to "production", the concept of Lean management was invented in the 1970's by Toyota Company. Following the enthusiasm of the Japanese methods of the 70's and 80's, the Americans have later expanded the concept to the assembly of the enterprise, thus conferring it, a coherent theoretical frame. Therefore, the notion of *Lean* was first coined in *James P. Womack's* and *Daniel T. Jones' book The machine that changed the world*, 1990, which, even though sold in 400,000 copies, did not represent, as the authors claimed, but a "wide range of gathered benchmarks in a long journey around the world". The following year, 1991, was depression year in the USA, making a large number of enterprises review their fundamental strategy. As such, "The machine that changed the world" came back on the market with new solutions. What was the result? A growing number of managers started asking themselves: "How could we do likewise?" and "Which are the key principles that should guide our actions?". As a consequence, another book, "Lean Thinking" was edited by the same authors towards the end of

1996, in order to answer to what it was desired to be the five Lean principles: the exact specification of the added value expected by the client; the clear identification of the assembly of value-adding processes; the instauration of a continuous flow between the value-adding processes; ordering the activities, by resorting to the client; the constant improvement power of the previous elements.

The subsequent papers, "Team Toyota" (1996), by *Terry L. Bresser* and "The Toyota Way" (2004), written by *Jeffrey K. Liker* have made possible the clarification of the Lean concepts and practices, the understanding of the cognitive and social fundaments the systems responds to. Therefore, we can distinguish four levels of analysis of Lean thinking:

- 1. A redefinition of the value produced by the enterprise: the added-value of a product must be defined from the client's point of view; the enterprise must ensure an uninterrupted creation of value, all along the production line.
- **2.** A development of a characteristic production scheme: the enterprise produces goods according to the demands and not according to the local production capacities; the production lines are standardized in such a manner that they could facilitate the continuous improvement through eliminating the lines the don't add value; the enterprise maintains a rich partnership with the suppliers and it stimulates them to adopt its own production methods.
- **3.** A development of the original managerial attitudes: the managers and parties involved must find and eliminate the deep causes of the emerging problems; each employee is encouraged to reflect upon and propose the improvement of the productive system, demarche called *Kaisen*; the management must be conducted "on the field", because only the close experience of crisis situations enables the articulation of an efficient diagnosis (in Japanese genchi genbutsn); decisions are necessarily made consensually.
- **4. The formulation of a long term strategy:** the enterprise must favor the long term game, explaining the objective, or, at a global scale, inscribing it in the future, in a sustainable way; the enterprise must constantly seek performance.

Therefore, the *Lean* concept, coined in the autumn of **1996**, has had time to evolve into "*Lean enterprise*" or "*Lean management*". Nowadays, the *Lean school of management* is in an uninterrupted evolution, the interest for Lean rapidly expanding to administrative services - "**Lean Office**", to the outlining of the "**Lean development**" product and even to the informatics development.

2. Implementing the Lean management system in the surgery department

Step 1: examining the current managerial systems in order to identify the value-adding activities, from the patient's perspective. By *value* we define the end user's perception of the product or service provided by the supplier. In other words, *value is given by "what the client is willing to pay in order to satisfy their needs*". And if they were told which is the weight of useless operations reflected in the price, of the waiting time, or of correcting the detected unconformities, they would surely disagree to pay for this additional waste of resources. Value is thus a totally subjective, personal notion, difficult to quantify.

Our recommendation no.1:

(a) The patient regarded as "process" and "activities". The purpose consists in identifying all the critical processes along the "itinerary" of the patient through the section, from the moment he/she arrives at the hospital, is hospitalized, submitted to medical investigations, to surgical interventions, undergoes treatment and gets discharged - and critical processes emerging in identifying the impact this whole itinerary has on the diagnosis, communication and transport procedures, etc. What we are basically proposing is the following patient process for surgical interventions: coming to the hospital; being entrusted to a hospital employee - reception; preliminary consultations; hospitalization decision; filling in the hospitalization papers; bed assignment; receiving hospital clothes; programming the necessary medical exams; meals; programming the exams evaluation; diagnosis; surgical interventions decisions;

programming an intervention; (equipments, personnel, materials, OR); preparing the OR; intervention; anesthesia; post-op or Intensive Care (ICU); moving to a room; treatment; medical analyses; discharge papers; regular monitoring.

- **(b)** Identifying the health problems of the patients or potential patients: classifying the previous processes, according to the constituent activities (for instance classifying the surgical interventions based on sex, age, emergency, frequency, complexity, type of intervention (classic or laparoscopic) criteria).
- (c) The analysis of current processes in the department: the technical succession of the activities currently undertaken by the medical and non-medical staff of the unit; defining the activities in non-technical and technical terms; defining the Lean Hospital particular technique corresponding to each type of surgical intervention: SIPOC Map (Suppliers, Inputs, Process, Outputs, Customers) (S internal suppliers: anesthetist surgeon; I inputs: instruments and documents handed over by the internal suppliers; P process: all the logical activities that make a transformation, a surgical intervention; O outputs: documents, treatment, post-op medical exams; C clients: patients, medical personnel from other departments.
- **Step 2: Transposing the Value stream map (VSM) to the surgery department.** VSM or "Value flow cartography" is a method that makes possible the identification of the adding-value activities and the non-adding value activities in a manufacturing or transformation process, adding information flows (material flows, document flows, personnel flows). (Jones & Womack, 2003). Therefore, we cannot speak of VSM without introducing the notions of value, process and stream (flow).

Wherever there is a **service** provided to a client, there is **value stream**. In order to offer a product or a service, a **production process** is usually undertaken, which includes the *succession of the necessary operations and production activities*. The value stream refers here to the all the subsequent operations and activities that must be carried out in the adequate order in order to create value for the customer.

Our recommendation no. 2:

- (a) Defining, understanding and determining the key information in the VSM vocabulary and their transposition to the surgery department: tak time (the rapport between the patients' demands and the capacities of the section); cycle time (total hospitalization time for each activity according to the types of the interventions; for instance: pre-op stage time assigned for analysis, for evaluation, for diagnosis; etc. the operating stage surgical preparation time personal hygiene, anesthesia time, surgical intervention time, etc; post-op stage: intensive care time, recovery time, medical exams time etc); flow (the flow of patient in the operating block and the waiting time dead time); push (planning the patient flow in the operating block, in view of avoiding errors); changeover time (time designated to preparing the operating block between the surgical interventions).
- **(b)** The measurement and evaluation of the current VSM represent a photograph of the current moment that lets us know what happens, when it happens and why. The purpose consists in the analysis of each type of surgical intervention in terms of time and technical and non-technical activities.
- (c) Identifying the performance indexes on VSM for each type of surgical intervention: Operator cycle time (the total number of individual medical and non-medical activities for each type of surgical interventions); Activity Ratio (the percentage of time in which the medical and non-medical activities are actually carried out); Surgical occurrences a year for each type of interventions; The available number of working hours per year for the medical and non-medical personnel; The necessary medical and non-medical staff, Takt time, cycle time; the number of medical and non-medical accidents; the number of medical and non-medical errors; the number of waiting hours; the level of materials stocks.

(d) Re-projecting VSM (future VSM), taking into consideration the resulting performance indexes.

Step 3: Implementing the Standard Work and 5S in the surgery department.

As **Henry Ford** stated, "Standardizing a method means choosing among the many methods the best one and applying it all the time. Standardizing doesn't mean anything else that standardizing for the better".

The 5S represents a useful instrument in the organization of the working places, its name originating in the five Japanese words that start with the letter S: Seiri, Seiton, Sieso, Seiketsu, and Shitsuke. In other words, 5S is a program structured in order to obtain in a systematic manner organization, cleanness and standardization at the working place, contributing thus to the improvement of productivity and the reduction of quality and work safety related problems. The process of the 5S includes: (Tery, 2003).

- (a) Seiri (Sorting). The first step of the process refers to releasing the space at the work place and eliminating all the unnecessary materials and objects.
- **(b) Seiton** (Orderliness). The second step of the process deals with efficiency and the reduction of the time necessary for getting access to the equipments and for accomplishing the working tasks. This step consists in depositing the handy elements in a pre-established location and in a logical order, so as to facilitate their utilization, to make them easily accessible and brought back to their place as fast as possible.
- (c) Seiso (Cleanliness). The third stage of the 5S process consists in cleaning the working place (floors, machines, lockers), making them "shine". Everyone, from manager to operator, must participate to the cleaning process. All the spaces that constitute a working place must be cleaned, with no exceptions, because any abatement from the order established by the second S may be immediately noticed.
- (d) Seiketsu (Standardization). This fourth step of the process consists in the establishment of the standards (rules, customs and standard procedures) that the personnel must report to in measuring and maintaining the degree of order and cleanliness.
- (e) Shitsuke (Discipline). The last step of the process implies discipline and the respect for the 4 previous Ss. It requires the will of the entire staff to maintain order and to put in practice the first 4 S as a way of working.

Our recommendation no. 3:

- (a) In the surgical line of services, a special importance is held by the demarches regarding: the definition of some precise standards for each task assigned to and performed by the employees from the medical and the administrative-operational sectors; the appropriation of these standards by the employees; attention is also paid to verifying to what extent they know the expected results; another matter of interest is represented by the registering in the procedure and quality protocols of the required changes in the standards plan and by the standardization of the behavioral codes.
- **(b)** The elaboration of the following standardization mechanisms: the guide concerning the surgical protocol; the protocol for preventing the infections of surgical incisions; the specific guide of the linen circuit in the hospital; the protocol for daily cleaning in the hospital, for cleaning the hospital rooms, and other locations (it establishes the concrete work spaces, the time of beginning the actions in every sector, the employed solutions, the work techniques, the work stages, precautions and situational warnings).
- (c) Establishing the protocol for sanitary personnel competences in preventing and controlling nozocomial infections; the protocol used in view of preparing the sterilization of the surgical instruments; the protocol for collecting and weighing wastes.
- (d) Establishing the protocol of aseptic technique in the operating block, which comprises: general principle, the specific dress code in the operating room, walking around in the operating

block, washing the hands, hands antisepsis, wearing gloves, compulsory decontamination, collecting linen, solid waste, the responsibility of doctors, nurses, interns.

Step 4: Implementing Pola Yole (Mistake Proofing) in the surgery department.

Poka Yoke is a **quality ensuring technique** developed by **Shigeo Shingo (the 60's)** in the Japanese companies. The term "**poka yoke**" in Japanese means inadvertent mistakes ("*poka*") prevention ("*yoke*"). Poka Yoke is the path to detect, in a simple, robust and easy way the faults and errors in the company. The essential idea of "Poka Yoke" is process projection, with the helping devices, in such a way that mistakes are impossible to commit or easily detected and corrected. Mistakes are by hundreds in an organization but most of the times they engender the flaws "endured" by the customers.

Our recommendation no. 4:

- (a) Identifying the failed surgeries, classifying them after the type of intervention, after the gender and age: the moment of the intervention, seen from the perspective of the disease evolution degree; the treatment applied prior to hospitalization; the pre-op period (medical exams and the time for results release); establishing priorities in using the OR; the technical equipment of the operating block; the professional training of the surgical team; post-op treatment; bureaucracy; others.
- **(b)** Eliminating the obsolete procedures, the old instruments, of the defective materials and medicines; avoiding human errors through constantly qualifying the staff.

Step 5: Implementing Quick Changeover (SMED - Single Minute Exchange of Die) in the surgery department. SMED = Single Minute Exchange of Die is a concept developed by Toyota Motor Corporation, starting with the 50's, and described by Shigeo Shingo in the book "A Revolution in Manufacturing: the SMED System", 1985, The Productivity Press, USA that was published in a highly competitive industrial univers, in which the Japanese economy has proved its pivotal role in the changes of the series of product and in the global industrial flexibility. The SMED dynamics enables the acceleration of the production, producing anything and anytime. In industry, the SMED method is known under the name of changeover time, meaning: the time spent until finishing the last piece of a lot and producing the first fine piece of the next lot, or the necessary time for a post or work system in order to pass from one type of product to another.

The SMED objectives: reducing the changeover time, minimizing the volume of work necessary to attain an anterior objective, the target being: "no change shall take more than 10 minutes".

Our recommendation no. 5:

- (a) A hospitalization planning: it must set the hospitalization data of the patients for a surgical intervention. The planning horizon is of a few months, depending on the health system had in mind and the treated pathologies.
- **(b)** A construction of the surgical program on a time table noted with T days. We are talking about establishing the surgical interventions that have to be performed during each day on the time table, according to the resources to be employed. Planning the hospitalizations provides the patient a date that risks becoming rather inexact because of the perturbations, which can occur in the operating block (emergencies, annulments, complications, inexact operating time estimations). Consequently, we propose to *adopt a process of hospitalization date confirmation, by constructing the time table of the surgery schedule, for T days*.
- **(c)** Setting the surgery schedule on a daily basis: the objective is to update the previously settled surgery schedule for a T period of time, taking into consideration the various problems that can occur, due to emergencies.

(d) A real time governing of the operating block: this deals with the decisions of the person in charge of the operating block when an incident occurs.

3. Conclusions

Adapting Lean management to the hospital environment brings forth a **flawless methodology** that:

- Enables the description of the institution in the context or providing the means and analysis methods of the environment, of the internal and external opinions.
- Makes possible the description of the main development axis, of the objectives associated with each level of responsibility by using the method of collecting the facts referring to the activity and the means furnished by the list of internal and external opportunities.
- Facilitates the pursuit, on all levels, of the continuous improvement processes, relying on the knowledge and experience of the professionals, which ease the daily tasks.
- Enables the hierarchization of realist objectives, associating them with the objectives of the human resources, and easing the analysis of the costs adherent to these resources.

By proposing a systematic auto-evaluative system, (VSM), Lean Management **introduces an auto-evaluation culture** inscribed in a project of the institution, in a contract based on objectives and means in its internal abatement.

By finally relying on a strong management system, Lean management enables the directing of all energies towards a shared vision of the future.

The conditions for the success of Lean Management can be outlined only in an endeavor to volunteeringly build a system meant to improve the performance of a healthcare institution, oriented not only towards the satisfaction of their patients, but also towards the satisfaction of the entire staff. Not any change is necessarily an improvement, but any improvement is a change. Therefore, we have to clearly explain which the targets are, what we expect and what we can change within the system: this is the responsibility of the of the administrative team, of the managers, and of the people involved.

In the knowledge economy, leadership means more than communicating a vision and mission to the team members. In the knowledge economy there are new type of leaders and new leadership styles. Eco-leaders admit the complexity of human-environment relations and take into consideration social responsibility principles. Eco-leaders take decisions based on the durable development of the society and search for ethical ways for both human and community development. A social responsible company is that company which believes that its strength is based on its ties with suppliers and customers as well as on its commitments to its employees and the local community in which it resides.

Keywords: knowledge economy, leadership, eco-team building, social responsibility

JEL: A13; M12; M14

1. Introduction

Many work papers have been written on the subject of knowledge economy and leadership. In the context of the knowledge economy, leadership is more than having a vision and mission and communicating them to the team. It means also permanent communication, good hiring, proper training and compensation plans that motivate employees and other factors.

Leaders acknowledge that money is not the main motivating factor. The factors that rank higher are recognition, appreciation, respect, enjoyable work environment and the opportunity for professional development. Sometimes it is difficult to find time to address all the issues and the team members examine his or her behavior closely. The leader's behavior determines whether he believes in the things he says, whether he is dedicated to his team's success, whether he desires for them to grow in their jobs and whether he wants them to take on more responsibility and be more accountable. If leaders fail to recognize and demonstrate appreciation for their team members, their leadership is undermined, regardless of the level of desire or skills training.

2. The Approach of the New Leadership and Durable Development

There are a number of different styles of leadership and management that are based on different assumptions and theories. The style that individuals use is based on a combination of their <u>beliefs</u>, <u>values</u> and <u>preferences</u>, as well as the organizational <u>culture</u> and norms. Apart of the well known type of Charismatic Leadership there are several new styles of leadership like <u>Participative Leadership</u>, <u>Situational leadership</u>, <u>Transactional Leadership</u>, <u>Transformational Leadership</u>, <u>Quiet Leadership</u>, <u>Servant Leadership</u> and the last but not the least, the Eco-leader. Charismatic Leadership is the leadership based on the leader's ability to communicate and behave in ways that reach the emotions of the followers, inspire and motivate. For example, more and more followers perceive Barack Obama as an example of charismatic leader.

Participative Leadership is a style of <u>leadership</u> in which the <u>leader</u> involves <u>subordinates</u> in <u>goal setting</u>, <u>problem solving</u>, <u>team building</u> etc., but retains the final <u>decision making authority</u>. means involving the team in making some, but not all, key decisions. There is simply no better way to make people feel valued than to ask them, genuinely, for their advice and delegation is the key means of getting work done through others.

The Situational Leadership model was created by Ken Blanchard and Paul Hersey and is probably the most used formal model of leadership today due to its intuitiveness. The basic premise is that effective leadership requires leadership flexibility since different situations require different leadership approaches and tactics.

Transactional leadership is a term used to classify a group <u>leadership</u> theories that inquire the interactions between leaders and followers. A transactional leader focuses more on a series of "transactions". This person is interested in looking out for oneself, having exchange benefits with their subordinates and clarify a sense of duty with rewards and punishments to reach goals. The core of transactional leadership lies in the notion that the leader, who holds power and control over his or her employees or followers, provides incentives for followers to do what the leader wants. If an employee does not what is desired, a punishment or with holding of the reward will occur.

Transformational leadership is a <u>leadership</u> style that creates voluble and positive change in the followers. A transformational leader focuses on "transforming" others to help each other, to look out for each other, be encouraging, harmonious, and look out for the organization as a whole. The transformational leader enhances the motivation, moral and performance of the followers.

Quiet Leadership is a leadership style that applies modesty, restraint and tenacity to solve particularly difficult problems. Quiet leaders are masters at bringing out the best performance in others by improving the thinking of people around them, literally improving the way their brains process information, without telling anyone what to do. The approach of quiet leaders is the antithesis of the classic charismatic (and often transformational) leaders in that they base their success not on ego and force of character but on their thoughts and actions. Although they are strongly task-focused, they are neither bullies nor unnecessarily unkind and may persuade people through rational argument and a form of benevolent Transactional Leadership.

Servant leadership is one of the most popular leadership models around today. The concept was developed by Robert K. Greenleaf in 1970. The servant leader serves the people he/she leads which implies that they are an end in themselves rather than a means to an organizational purpose or bottom line. Servant leaders **devote themselves to serving the needs of organization members**, focus on meeting the needs of those they lead, develop employees to bring out the best in them, coach others and encourage their self expression, facilitate personal growth in all who work with them and listen and build a sense of community. Servant leaders are felt to be effective because the needs of followers are so looked after that they reach their full potential, hence perform at their best. Such a leadership style is the opposite to domineering leadership and makes those in charge think harder about how to respect, value and motivate people reporting to them.

Finally, Eco-leaders are those leaders who have specific objectives of adapting to the enterprise context the information regarding environment. Eco-leaders are leaders that take decisions of eco-leadership and eco-management regarding the use of the ecological packs, eco-ticketing, production of ecological products and their utilization in production, financing the environment projects, acquiring friendly-environment technologies and development of knowledge of utilization of these technologies. In general, eco-leaders redesign the communication with their followers accordingly with sustainable development.

Eco-leaders are those persons who consider that in today's society, a business must maintain ethical principles in order to be successful. They make programs in order for the employees to feel directly enhanced their benefits given by the corporation, like better health care or a better pension program. Eco-leaders precepts that employees are stakeholders in the business, and there should be taken in consideration the environment within the employees work and the employees families live. Eco-leaders feel that both the employees and the environment are valuable assets for the corporation. When employees feel they are being treated as such, productivity increases. Perhaps the biggest challenge for humanity in this century is to build a sustainable society. In the

knowledge economy context, society is demanding that business and industry behave responsibly, in an ethic manner and contribute to the development of a sustainable society.

People want to make sure that companies adopt and implement ethical codes of conduct, avoid corruption, provide job security, support the needs and concerns of their employees and neighbors, and protect the natural environment. Society expects that companies and organizations generate a variety of stakeholders' benefits. Therefore, a number of companies undertook this challenge and started to change their organizational strategy and vision and developed their business principles incorporating the aspects of sustainability and durable development. A key question on this process is to find out how can societies and companies take the appropriate measures and provide incentives in order to promote responsible leadership within the firm and develop tools to assess sustainability performance within the private sector.

3. Eco – Team Building

Some people define a team as being "a whole that is greater than the sum of its' parts". But this just a feature of *good* teams where members are working well together. Some authors define a team as being the people who report to the same boss. This can be misleading. In a well-designed organisational structure, people reporting to one boss do often form teams but when designing organisational hierarchies there are often compromises made because of pay structures or the need to have traditional reporting lines.

A team is a group of people working together towards a common goal.

Team building is the process of gathering the right people and getting them to work together for the benefit of a project. Getting a group of people together does not make a "team." A team develops products that are the result of the team's collective effort and involves synergy. Synergy is the property where the whole is greater than the sum of its parts and leader is the person who makes assure that the team is in cohesion.

There are three main components in any team's work: the goal, methodology and resources.

- 1. Goal: Result-oriented tasks or content aspect (e.g. team goals and objectives). These are usually developed through interaction with team members;
- 2. Methodology: Process aspect, which includes the team's interactions and how members work together (e.g. leadership, team roles, etc.) Teams, especially technical teams, frequently struggle more with process issues than with task issues;
- 3. Resources: Time, budget, computer facility, educational tools and administrative support.

A team leader has to assign clear tasks to each member, regularly review and monitor progress of work, ensure that the team meets deadlines, discuss and agree on the timetable for major activities with the team, motivate team members and resolve conflicts. He also has to give guidance when needed. He helps members to overcome barriers and regularly assess team performance.

During eco team-building sessions, eco-managers join the team-building activities with echologic activities. The term "Eco –team building" was developed in 2008 by the European Centre for Social Responsibility. The object of eco - team building is to use environmentally safe and friendly adventure based experiences to put in cohesion the human capital structure of an organisation.

4. Social Responsible Companies in the Knowledge Economy

In a global economy, increasingly organizations have a responsibility to facilitate and promote corporate social responsibility. Long-term sustainability demands that organizations redesign their business goals and objectives from solely focusing on making a profit to corporate citizenship and responsible company. Today, the impact of corporate social responsibility is beginning to be seen in the knowledge society.

A social responsible company is that company which believes that its strength is based on its ties with suppliers and customers as well as on its commitments to its employees and the local community in which it resides. Every company that desire to obtain success must have a work philosophy based on ethics and should pay a close attention to the personal and professional

development of employees, to promote safety, to maintain a transparent relationships with business partners, to be actively involved in community life and to minimize or eliminate the impact of operations on the environment.

Until the mid of 2008, a constant growth of international trade and globalization made consumers and society to be more aware to social and environmental needs. Companies must develop several activities of social responsibility like giving a special attention to the employees needs and to safety, a prompt response to clients' complaints or providing quality services with minimum impact for the environment. During the financial crisis, many companies still measure business success using the traditional bottom line, which is profitability. But due to the dynamic changes in economy and society, globalization issues, crisis and climate change, profit is no longer essential for the survival of a maritime company. Businesses must take into consideration other two bottom lines like environment and social capital.

Social responsibility is a relatively new concept that more and more modern organizations try to implement in the structure and practice of the management system. The World Business Council for Sustainable Development defines corporate social responsibility as the business commitment and contribution to the quality of life of employees, their families and the local community and society overall to support sustainable economic development. Social responsibility is characterized by the following specific elements: the establishment of an integrity frame based on a set of corporate values in the relationships with different public categories; the promotion of fundamental rights of people; the induction of social features to products, technologies and activities; the realization of ecological performances; moral integration; the contribution to community development.

Human resources leaders can influence three primary standards of corporate social responsibility: ethics, employment practices and community involvement that relate either directly or indirectly to employees, customers and the local community.

Some of the advantages of a company that develop social responsibility activities is the improvement of the image and reputation, better brand loyalty, increased ability to attract and retain seafarers workers or better work productivity.

One can appreciate that concern for quality, occurring in very old times, were accelerated in the twentieth century, during which there was spectacular actions and evolution of concepts of quality. Services is one of the most dynamic areas of modern economy is. Redefinition of goods in accordance with specific market economy, as who sells and buys, and a fast-field services, not only permits but requires the extension of quality problems in the area of services, and, in regional development. INSURED within a third party can help to assess situations, develop strategies, evaluate programs, measures and actions ex ante, to monitor and support the programs and actions, to evaluate programs and actions ex post to transfer the experience gained in a in a context different.

Key words: regional development, quality, INSURED framework, sustainable development.

The concept of quality in regional development

Quality according to Law¹⁹, is defined by all the explicit and implicit requirements of a product / service to ensure full achievement of the goal was created and marketed.

Quality, in accordance with the International Organization for Standardization, is defined by all the properties and characteristics of a product/service that gives the property to meet the needs expressed and implied.

These definitions of quality can be considered and if a region where we have to ensure that the region through the economic and social development and a cultural standard of living of the inhabitants of the region, so we have the quality of life in the region.

The concept of quality comes from the Latin ,qualis' (way, way to be) and expresses the characteristics of an essential item or service that you are clearly separated from all other similar products or services, which respectively use the same destination.

If we have to regional development, economic, quality is based on a series of principles, as follows:

- according to the requirements
- appropriate for use
- systematic approach to excellence.
- meeting the requirements of society: the protection of life, human health and the environment, proper valuation of natural resources, energy conservation, sustainable development of human life, human health and the environment, proper valuation of natural resources, energy conservation, sustainable development.

Quality in regional development is ultimately defined by man and is close to the project development meeting the requirements and expectations of society, so this is very clearly outlined in the regional.

Since quality is defined by man, may seem to be completely subjective. However, many aspects of quality can be expressed objectively. If you want to get good results in quality management

. .

¹⁹ www.cdep.ro/pls/legis/legis_pck.htp

and regional development, should measure. If you do not collect metrics will be difficult to improve processes through quality management initiatives in the regional development.

One of the purposes of quality management is to detect errors and faults of the project as early as possible, so the regional plan, it is considering a development supported by a regular control in order to achieve the desired results. So, a good quality management process in regional development will require several hours of effort and a higher cost at the outset.

However, the advantages gained will be large, as project development progresses. It is much easier to find problems during the requirements analysis phase, rather than cure works to solve problems at the end of a project.

In business practice, to define quality using a series of terms that we believe that can be used in quality and territorial development:

- quality of design (design quality) is the extent to which certain parts of the region ensure that the beneficiaries and can use.
- quality delivered, representing the effective level of quality at every level and in any area.

As economic and social development, as demand growth and diversification of production, the notion of quality, regardless of how it is viewed, has evolved and diversified, is talking about:

- ,Potential capacity', representing the design as the regional because of the drafting of the development of regions;
- ,Partial quality', representing the ratio between the obtained and quality required;
- The quality achieved, as that resulting from inspections
- ,Quality assured', quality resulting from a program unit containing all the activities of quality control (prevention, measurement and corrective action)
- ,Total quality', which integrates the utility, economy, aesthetics, etc.

For success in developing a region, in terms of quality here believe that we should fulfill the following requirements:

- To satisfy a requirement, a utility or a well-defined purpose.
- To meet people's expectations.
- To comply with standards and specifications.
- Measures to comply with legal and other requirements of society.
- Be competitively priced.
- A cost that brings profit.

General and specific quality of services in regional development

Services is one of the most dynamic areas of modern economy is. Redefinition of goods in accordance with specific market economy, as who sells and buys, and a fast-field services, not only permits but requires the extension of quality problems in the area of services, and, in regional development.

Studying the similarities between products and services can be said that:

- -The means of corresponding needs at least as numerous as the needs for material goods, but with a more complex and heterogeneous.
- -Affirmation of environmental issues highlights elements bearing area with services that are specific to the study and goods.
- -Major and increasing interest for consumer protection has light that services shall, in addition to tangible common goods, and the need to approach particular, very different.
- -Advertising research service functions by anchoring in areas of concern formalities at least as complex as those required in the case of goods.
 - -Service as good, is the result of an anthropic approach, aimed.
 - -Both service and tangible product, are known for certain needs.

Elements of the definition of services in particular states: immaterial nature of services, targeting to a strict benefit first understood as an opportunity for customer satisfaction and secondly, as a profitable activity for the provider.

Regarding the factors that determine and affect the quality of services should be noted that if the products are the material factors that prevail at the service:

- factors aimed at fund-conceptual perceptive of those involved in delivering services and the provider and recipient;
- the specific provision of the service opportunity;
- technical factors involved.

Fund-perceptional concept of providers and recipients is dependent on and defined by specific characteristics anthropic environment, which are: professional competence, education level, availability of the provider to work as stand-by, flexibility and spirit of public relations.

Conditions of opportunity are also a feature of the high quality services in regional development and relate to the adequacy of the service, appropriateness interesând at least 3 ways:

- time:
- space;
- as a way of performance.

To an extent far greater than the products, services that are interested in performance should be achieved in time and place as the most appropriate recipient.

INSURED framework for quality management of regional development

Administration practitioners, political and business tools require understandable, what is based on data available - because the state and estimating the level of development of human capital (social, cultural), produced by humans (economic, technological) and natural (the natural resources) is made difficult, expensive and slow.

The intuitive approach appears when trying to determine how problems are perceived, how to make processes such as book development policies, as innovators and they interact to provide better solutions, how to distinguish the actions of most innovative actions, such integrates innovative actions in policy development.

Also, in an attempt to use the four components of systemic diversity, subsidiary and partnership network use as elements in a decision, you will need to organize both the relations between them and their expression in social interaction that they reflect. As they digest more, the risk to ignore the local and specific cultural and become rigid in thinking.

Regional development policies can not be estimated on the basis of what they are, but depending on the result. Management framework requires an addition in terms of a qualitative approach to specific local factors that may be difficult or impossible to quantify.

The INSURED structure²⁰ is built on the basis of orientation, and growth potential, what components will be explained below.

In terms of orientation, sustainability is an idea with a view to maintaining the many components of time, each component having a value methodology - representing a certain kind of activities and phenomena.

The potential of a region to act appropriately in direction is essential for a sustainable local development and development policies should only improve this potential, not to create.

Sustainable development requires innovation and learning processes. An effective strategy requires a focus on the factors determining this and the key elements of transformation, the dynamic is thus the basic elements of the strategy necessary to enable it to operate.

Although one can imagine various situations - designing a policy to support the government - or estimating program effectiveness within a firm of consulting - or simply at a company that takes an investment decision based on this program - to bring the a common denominator of these types of approaches is a necessary framework for regional management of sustainable

20 The INSURED Project - Final Report, Institut fur Regionale Studien in Europa Schleicher-Tappeser KG, 1999 EURES

development that allows the investigation of these issues and what suggestions can be provided reference to similar decisions in some cases while analyzing the situation from different points of view

INSURED within a third party can help to assess situations, develop strategies, evaluate programs, measures and actions ex ante, to monitor and support the programs and actions, to evaluate programs and actions ex post to transfer the experience gained in a in a context different. **The guidance includes the environment** (which requires the preservation of wealth and potential environment and maintain ecological functioning of the system including additions made by humans) **the economic** (including human needs, improve living standards and efficiency of resource use) **and the Social - cultural** (conservation and development of human potential - habits, customs, culture, institutions - are essential for the proper functioning of society).

The equal distribution of opportunities, **spatial equity** (between regions - for example claimed objective of EU structural funds) **and time equity** (between the generations - in order to increase the total opportunities), **the subsidiary** (all system functions can be fulfilled at the base and the support of its decision to a higher level may occur only if this improves the operation and if it diminishes the autonomy of the basic level - a good example of this is the autonomy in a local body such as the EU superstate), **partnership** (referred to the essentiality of the relations horizontal non-hierarchical - during which you can exchange ideas, information, to organize mutual support - all in a competitive networks - such as flexibility and orientation towards the needs of members are fundamental to the survival characteristics of a network).

Participation is another component of orientation, meaning that all third parties dealing with a problem should have the opportunity of participating in a solution in the sense of seeking suitable alternative solutions and avoid conflicts.

Participation requires time and motivation and strengthens the responsibility, however risky decisions as to contradict the opinion of experts. Perception is part of another group of factors, the potential, and describes the variety of different approaches to the problem, thus improving the adaptability of the opening by third parties and accepting competitive cooperative that facilitates the emergence of new models of governance and autonomy.

Another component **is the self evaluation potential and creativity** (especially in an entrepreneurial culture that emphasizes accountability to the community, which in turn emphasizes the potential regional) and ability to cope with complexity and anticipate change (existence of several alternative support for individuals is essential).

The other points of view and new solutions within the meaning of co-habitation different cultures and mutual learning), discovery (specificity and local knowledge in order to use maximum capacity of people and talent) and fractal distribution of power, given as a strict separation of powers can cause communication problems, compulsive or excessive centralization - noted a system of governance at multiple levels where each level has a particular set of responsibilities - in the sense of addressing each type of problems to a level - but at a different magnitude.

Among the important²¹ aspects of the fractal distribution include: early involvement of the various administrative levels, the ability of simultaneous analysis of the problem at several levels and links to multiple top-down and bottom-up between levels. Responsibility for own development can occur only if it supports decision-making authority - whether in the sense of taking initiative, change the structure and determine a margin of autonomous action at local level. Also includes the potential dependence of resources (which reinforces the identity of its own, eliminate problems and improve the sharing of governance, local - each region had to use the resources and cultural heritage in an independent manner) and taking into account a system of common values - be they environmental, cultural or socio-economic interdependencies - that

²¹ http://europa.eu.int/eur-lex/en/lif/dat/1985/en_385L0374.htm

helps to resolve conflicts and find common goals (a good example being the common interest of communities in protecting the environment).

Another component of the potential is related to local cohesion, trust and mutual support are essential for the dynamics of entrepreneurial risk because of the absorption and facilitate joint action and equal opportunities - including mutual learning, acceptance, autonomy and responsibilities negotiated.

The ability to create common vision and make it part of the potential, at a community that is essential for the coherence and self-seeking and ability to think long term, a multidisciplinary approach and the development of alternative solutions..

Integrating social and technical skills in process innovation can improve the success of innovation and eliminate barriers in the way of their spread. Also, access to information and promoting dialogue and ensuring transparency and control of opportunistic behavior is necessary for ensuring a fair and consistent decision making. Multiplicity of interactions²² - given the diversity and number of opportunities existing in a community, and encouragement of the local initiatives in order of appearance creativity - creating the potential for changing communities.

May contain dynamic and move towards providing quality services to third parties (taking into account the interests, needs and capabilities, through analysis, feedback and transparency, in order to interested in making, to improve and modify the definition of objectives and evaluate the results of the work) and self - the ability of communities to influence one's future and give the margin potential, using the means of internal and external intervention that it is available.

The organizations success of the XXI century depends to a great extent on the existence of imaginative leaders, creative, centered on change, perseverance, attentive in the environment changes and able to encourage and to lead team work, brave, taking their risks and their successes with the team. To influence the others, a leader must have certain basic competences consolidated through experience and learning from mistakes. Among the main features of the leader are: curiosity and desire for information, the ability to communicate, intelligence, clear and strong values, high level of personal energy, ability and desire to constantly develop, vision, good memory, the ingenuity in making the others to feel good.

Keywords: skills, vision, team, assessment, learning, training, strategy.

JEL Classification: M12 Personnel Management; M19 Other

Introduction

"The real leaders impress us. They wake up passions and stimulate all the best in us. If we try to explain why are so efficient, we talk about strategy, vision or tumble ideas. But the reality is at another fundamental level: the real leaders are calling at emotions"²³. Whatever of what the leaders are proposing themselves, to create strategies or to mobilize the teams to actions, their success depends on how they act. If the leaders fail in the task of emotions channeling in the right direction, nothing in what they are doing doesn't work as well as it could have or should have. To influence the others, the leaders need a proper set of competences, which to guide their actions. Although skills are always different from one leader to another, the existence of a basis set from which to develop, the rest increases the chances of success as a leader." These competences may be seen as being the internal instruments to motivate the employees, for targeting systems and of the processes and for business guidance for common purposes, which will make the organization value to grow."²⁴

Trough the research done, studying the works of specialists in the field, making comparisons between different approaches and making case studies to several organizations, SC TRANSGAL SA Galati, SC FAM SA Galati, SC D. NICU SRL Galati, SC BONAROMA SRL Galati, and SC ANCATERRA SRL Bucharest we proposed to find out what are the most important competences that should have or should acquire a manager like, in addition to the formal authority derived form its position in the organization to be an effective leader.

Leadership competencies and their role in organizations

The basic competences are forming the leadership foundation. Through the competences of leadership is separated the leaders by superiors through sedimentation of the knowledge and of the necessary skills for leading the organizations towards top domain in which is working. Without these competences, the leader has an insecure base of startup. The engine of this professional competences is represented by experience and learning from experience. A person can fully master the basic skills and those of leadership, but a medium leader becomes a good

²³ Goleman, D., Boyatzis, R., Mckee, A., 2005, The emotional intelligence in leadership, Ed. Curtea Veche, Bucharest, p. 21

²⁴ Neculau, A., 1996, Leaders in the dynamic of the group, Ed. Science and Encyclopedic, Bucharest, p. 54

leader only trough experimentation and mistake, by deep analysis of these experiences. Each organization needs a different range of professional competences for each management positions in part.

The leadership competencies are listed briefly in the following:

- **1. Leadership skills.** Present those qualities that the people gladly follow. Provide a feeling of confidence. Rounds up the troops and raises the morale in heavy times.
- **2. Vision.** Make the effort to increase the productivity in the areas with acute need of improvement. Creates and sets goals (visions). Feels the environment and uses its personal power to influence the subordinates and the equals. Create a feeling of involvement trough influencing the team in the sense of setting goals and engaging in the process.
- **3.** Creation and leading the teams. Develop competitive teams by creating a spirit of cooperation and of cohesion for achieving the objectives.
- **4. Stimulating of the resolving the conflicts (win - win).** Effectively treats the disagreements and conflicts. Resolve the disputes by focusing on solving problems, without bringing indignity to the individuals. Provide support and expertise to other leaders on issues of human resource management. Evaluate the feasibility of the different mechanisms of resolving the conflicts.
- **5.** Assessing the situations quickly and correctly. It assumes duties when the situation requires it. Make the things to happen correctly and on time.
- **6.** Helping and forming the equals and subordinates. Recognizes that any incident is a chance to learn something (treats the mistakes as an event from which could be learned). Provides a feedback referring to the performances, coaching and professional development for teams and individually, for the purpose of maximizing the chances of success.
- 7. Implementing the strategies of involvement of the employees. Develops a sense of ownership by involving the employees in the decision making processes and of planning. Provides the necessary means for that the employees to have success and to maintain in the same time the welfare of the entire organization. Creates and develops the necessary processes to involve the employees in achieving the organization objectives. It creates to the employees the feeling of authority, giving them the power to perform the tasks efficiently and timely.

Leader abilities

"Good leaders are those taken and those not born. Good leaders are developed trough a continuous process of self-knowledge, education, training, experimentation."²⁵

The leadership skills doesn't come naturally, but are required trough work and permanent study. The best leaders are those who work and studies continuously, to improve their leadership skills.

"The leadership is a complex process by which a person influences the others in the sense of effectuating a mission, a task or objective, and directs the organization so that it becomes more connected and coherent. A person carries out this process trough putting in application the attributes which defines him as a leader (persuasion, values, character, ethics, skills and knowledge)" Regardless of the position of manager, supervisor, coordinator, etc. which gives the necessary authority to fulfill some tasks and objectives in organization, this authority doesn't' create leaders but chiefs. The leader make people want to reach high goals and objectives, while, on the other hand the bosses tell to people to perform a task or an objective.

The base of quality leadership is a impeccable character and work in the interest of the organization. In the eyes of those ruled, "leadership" means everything is done for the organization objectives and their welfare. A respected leader concentrates on what is (beliefs and character), what he knows (job, tasks, nature) and what he does (implements, motivates, orients). The people want to be directed by those that respects them and who haves a sharp sense of direction. To gain respect, they must be correct. The sense of direction it develops trough expressing a clear vision for the future.

²⁵ Nicolescu, O., 2004, The managers and management of human resources, Ed. economic, Bucharest, p. 375

²⁶ Koestenbaum, P., 2006, The leader. Hidden face of excellence, Ed. Curtea Veche, Bucharest, p. 35

A person has the potential to influence others trough the exercise of five types of power²⁷:

- a) coercive power is based on fear. The employees of such a manager aren't involved and they are having the inclination to resist.
- b) reward power presumes obtaining of cooperation trough the ability of distributing rewards that others appreciate them as values.
- c) legitimate power is the one that a person receives as a result of the position that occupies in the formal hierarchy of an organization. According to this position and the responsibilities of the job that the employee is taken, this person haves the right to expect from the employee to respond to certain legitimate requests.
- d) expert power is given by the influence that exercises over others based on experience, skills, education and special knowledge. The expert power is extremely important when it is made in relation to how the employee performs its activity.
- e) the reference power is the influence based on the fact that an individual possesses resources or personal feature interesting , and the people likes the person.

The power doesn't require compatibility regarding the goal attained; on the contrary, it is based on intimidation, while the leadership requires congruence in the sense of a common goal. The power maximizes the importance of lateral and superior influences, while the leadership focuses on the inferior influences. The power focuses on tactics of winning submission, while the leadership follows obtaining of the answers and solutions.

The successful leaders take direct responsibility for training other leaders. "The successful leaders have ideas that they can articulate well, being able to learn other how to transform a firm into an organization that to record successes on the market, how to prepare at their turn other leaders. They have values well structured of the types of behavior that will lead both to the success of the firm and at the personal success. They generate and transmit in deliberate way energy to those who teaches. Also they manifest intelligence and encourage the others to show the ability to face the reality and to take rough decisions." ²⁸

Vision

The quality organizations have a clearly vision on the place that they will be in the future. The leaders must the team to trust in them and to be committed to the vision of the entire collective. Being hones and fair in everything they do, the leaders will be able to win the confidence. to win at their vision, they need energy and of a positive attitude, that is contagious. "The people want a strong vision of the place were they are going. Nobody wants to suffocate in a company in which I like a street that gets nowhere or in a company that goes in the wrong direction. The people want to work alongside a winner. And the team members are those who go to the determined goal."²⁹

The implementation process of a vision follows 6 well determined steps.

1. Creating the vision. The first step in setting the goals and priorities is identifying the way in which the leader wants to show the organization in a certain moment from the future, meaning to establish a vision. The upper echelon leaders are determining the vision for the entire organization, while the other of low level are making just for the team that they have subordinated. Regardless of the leader type, the vision will support the goals of the entire organization. The mission of the organization is crucial in determining the vision, which must coincide with the "complete image". The term "vision" suggests a mental picture of how the organization will look into the future, implying a foremost horizon in time. This temporal horizon tends to be in a moment located at medium or high distance from present, going until 10, 20 or

²⁹ Nicolescu, O., 2004, The managers and management of human resources, Ed. Economic, Bucharest, p. 375

even 50 years. The concept of vision has become a very popular term in the academic environments, politic, of defense and of business, fact that brought very different definitions.

- **2. Establishing the purpose.** The second step is establishing the goal, which is made with active participation of the team. The goals are defined in terms that can't be measured but are more concentrated then the vision; for example "the company must lower the costs of the transport" This second steps determines the vision framework.
- **3. Determining the objectives.** The objectives are developed starting from goals, trough active participation of the team. The objectives are defined in precise terms, measurable, such as "until the second semester the commercial service will realize a study regarding the possibility of shortening of the flow of raw materials, semi finished, pieces and finite products within the company"
- **4. Tasks delegation.** The fourth step is tasks determination that must be completed for achieving the objectives and of the persons that must fulfill them. The tasks are concrete and measurable events that must take place. For example: "The coordinator of the study will determine the detailed costs for each phase of the internal circulation."
- **5. Determining the terms and the priorities of tasks.** Some tasks must be completed before others, so establishing the priorities will help the team to determine the order and terms until they will be fulfilled. For example: "the costs for the internal transport will be obtained until 15 May."
- **6. Follow-up**. The final step is the follow-up which is made by checking if the team does the right thing. The involvement of the leader in this way shows to the others that the determined priorities above worth the effort and demonstrates employing the leader in the direction of performing with success the tasks.

Creativity

The important role of the human resources in the organization is due, among other things, a feature which only holds a human being –creativity. The famous American sociologist, Abraham Maslow, said that "Life is a mixture of routine and personal creativity."

The creativity is necessary whenever must be innovated or introduced a original change in a situation. The need to create can be determined by the existence of a malfunction (exists a real problem), but also the desire to progress.

There are three major families of applications to the creativity: a) creating, invention, innovation; b) solving problems, c) optimizing of what exists. Stimulating of creativity becomes the solving problem of the crisis, by implementing the changes, the response at the remaining behind of some countries over other, some from other companies.

The creativity starts always from the existent knowledge, valuing or criticizing them. At the organization level, the creation work is less of individual type, most often she is performed in groups, circles, collectives proving the superiority over individual creativity in many areas, particularly in the management.,

One of the deployment conditions of a creative activities, effective is the realization of a good communication. A ineffectual communication and superfluous is demobilizing and boring. The efficient innovator is so, trough definition, a first order communicator. The efficient communicator makes appeal without termination at the individual resources of creativity and collective for freeing the energies of all and focusing towards the common success objectives. Before developing a communication strategy is essential the approaching of creativity to explore the expectations, aspirations and representations (mental lists) of the present parties: the management and the staff.

The creativity is part of the objectives of improving the practice and method. To benefit fully from the methods of creativity, there are two conditions: to be creative by nature (in natural way) and to master (to know and to apply) the methods. The leader, as exposed person to the social and economic activities is being differenced by the people around him depending on the nature of

activity that it develops trough concrete situations. True leaders must be creative in any situation within any activity and in order to achieve any objectives.

Creating and leading the teams

- "The leadership is the privilege to improve the lives and performances of others, to form new leaders and to orient them towards a common purpose. An effective leader and which to inspire confidence must consolidate a special relation with the people around him, based on respect and fairness. And the best results can obtain by knowing better the team and its proper capacity of coordination." The leaders mustn't imagine as managers or supervisors but as "team leaders". A team is a group of people who have gathered to work towards attaining a common goal or perform a task for which they are all responsible. A group of people is not a team" A team is a group of people with a high degree of interdependence, group engaged in the process of achieving a goal or to perform a task not just a group that respects the administrative rules. By definition, a group is formed by a number of individuals that something unites them. The team members doesn't just in all matters of common tasks and goals, they share among themselves what traditionally is called "management functions" A team brings thee major benefits to the organization:
- Maximize the human resource of the organization. Each team member is trained, helped and led by the other team members. A success or a failure is felt by all members, not just by an individual. The failures aren't falling on an individual, argument for which is why people find the courage to assume risks. The successes are shared by all the team members, which helps to obtain bigger successes and more important.
- Has net results, whatever the situation will be, and this is due to the effect of synergy of the team a team always exceeds in performance a group of individuals.
- There is a continuous improvement. Nobody knows better that the team the work that must be done, tasks, and goals that must be achieved. When are gathering in team, they aren't afraid to show all that they can do. The personal reasons are forgotten and lets place to the motive of the team comes out to light.

Most teams are formed in situations that require resolving. The leaders are having the duty to bring in the team a few elements that all the members will learn and will demonstrate that these are efficient. These elements are: the common purpose, learning, productive participation of all the members, communication, trusting, sense of belonging, diversity, creativity and assuming the risk, evaluation, compatibility with changing, participative leadership.

The leaders want to have in their team a variety of styles of members: contributors, collaborators, communicators, challengers. The contributors are oriented towards the task to fulfill and they like to bring in team information and technical data. They push the team to establish highest standards. Although are trusted persons, sometimes are getting to much in details and they lose sight of the full image. They are responsible persons, influents, efficient, organized on which you can rely. The collaborators are oriented towards the target that must be achieved, they see the vision, mission and the goal of the team. "They are flexible persons, open to new ideas, willing to knuckle down to work and to do more than writes in the job description" They also, are happy to share with the others members of the team the success. They always see a complete picture of a new situation and sometimes don't give enough attention to the basic tasks of the team or individual needs. They always look forward, going towards goal, are caring, flexible and full of imagination. The communicators are oriented towards the process itself, they know to listen and to facilitate the involvement, resolving conflicts, reaching the consensus, feedback,

creating an informal atmosphere, relaxed. The challengers are always adventurers that always put into question the goals, methods, team ethic. Have the impulse to not be agree with the leader and with its superiors and encourages the team to assume well thought risks. Many persons appreciate the value of honesty and opening this type of teammates, but sometimes they don't realize that they must stop, or becoming stubborn and try to push the team too far. They are honest, sincere, principled and moral.

The people form the inside and the ones out form the team expects from the leaders to coordinate the contacts and the team relations with the rest of the organization.

Conclusions

To influence others, the leaders need some competencies, which to guide the actions, these being the internal instruments for motivating the employees, for directing the systems and the processes and to guide the business towards common purposes, which will make the value of the organization to grow.

The basic competencies form the foundation of the leadership. A person, who masters the basic competencies of the leadership, can become a good leader only by experimentation and mistake, trough deep analysis of these experiences and trough applying the lessons learned from them. Studying the basic competencies that the leaders must have is important for that the managers of the organizations to be able to mobilize the human resources, to create a true team spirit at which they will even be share, to channel the employees energies and to increase their involvement in taking decisions and in effective realization of the objectives, thus becoming effective leaders, not only by the formal power given by the organizational position, but especially, trough the informal given by preparation and by practicing of a effective leadership. In the future, taking into account by the rapid changes that are permanently occurring in the contemporary society, continuous studying of the theme, developed and adapted to new conditions from the ambient environment of the organizations.

Each day, on the territory of the European Union, the citizens are prevented from fully living a professional and social life because of the damages related to discrimination. The economic approach is intended to be integrated, offering at the same time, its own definition of the phenomenon and a specific manner to interpret it. The methods of measurement of discrimination can be of several types and can relate to several levels. Although the purely econometric methods, which have been refined over the years, generally pose problems of positive economy, the auditing methods have more operational ambitions.

Mots-clés: discrimination, discrimination à rebours, méthodes d'audits.

Code JEL: M12, M14, M19

1. L'approche économique de la discrimination

L'approche économique est destinée à être intégré, en proposant dans le même temps, sa propre définition du phénomène et une manière spécifique de l'interpréter.

1.1. Les méthodes de discrimination: la discrimination sur le marché et la pré discrimination

En économie, on parle de la discrimination lorsque certains individus qui ont une caractéristique particulière sont défavorisés, indépendamment de leurs caractéristiques productives. Les études empiriques montrent que, souvent, les travailleurs sont victimes de cette discrimination en raison de l'appartenance ethnique ou du sexe, mais nous pouvons parler de discrimination aussi quand une personne se sent moins bien traitée qu'une autre, qui est égal sur le plan productif, en raison de son origine, son âge, sa religion, ses choix politiques.

La définition économique de la discrimination est établie en termes de conséquences et de résultats et non pas par les intentions. La discrimination implique une matérialité et elle doit avoir des conséquences mesurables sur le marché du travail sous forme de rémunération, de développement de carrière et du niveau de chômage. L'accent mis sur les caractéristiques économiques pour définir la discrimination conduit à une autre distinction: la discrimination avant de pénétrer le marché - la pré discrimination – et la discrimination sur le marché.

La pré discrimination apparaît quand les chances de développement personnel d'un individu ne dépends pas de ses compétences; peut on donc parler de l'inégalité des chances, qui est due à l'environnement social dans lequel chaque individu est formé.

La discrimination sur le marché peut prendre la forme d'une rémunération plus basse, d'un refus d'emploi ou d'une surqualification pour un poste.

Bien sûr, il est difficile de distinguer entre les deux types de discrimination parce qu'il ça peut apparaître des interactions. Par exemple, on peut croire qu'un individu qui prévoit qu'il sera l'objet d'une discrimination sur le marché peut ne pas être motivés à investir dans l'éducation.

Tableau 1. Termes-clés dans la définition de la discrimination

Définition de la discrimination	Précisassions		les types de discrimination
Action	Perspectiveă sur la discrimination	Comme une action avec des objectifs, des moyens, de la motivation	
		Comme simple comportement; Phénomènes de discrimination	
Promotion des inégalités de chance	Niveau de discrimination	Intention, discours ou comportements	
	Mécanisme de discrimination	La diminution des possibilités pour les groupes considérés comme inférieurs	En utilisant les mécanismes de ségrégation, d'exclusion sociale, la sous-évaluation de la main-d'oeuvre, la
		Or, en améliorant les possibilités pour les groupes défavorisés	violation de la dignité La discrimination positive
Associées avec l'appartenance au group	Le critère de discrimination	Caractéristiques de l'état: culturelle: ethnie, race, religion; biologique: sexe, âge, handicap; social: migrant, pauvre;	discrimination ethnique, raciale discrimination religieuse
+		Options culturelles: sexuelle, idéologiques	
Fondée sur les préjugés, les idéologie ou les intérêts	Le fondement de la discrimination	Les stéréotypes et les préjugés Institutions codifiant	
		la discrimination	discrimination institutionnalisée discrimination par la segmentation du marché du travail
Avec des formes spécifiques du domaine de l'interaction sociale	Le domaine de la discrimination		discrimination économique, sociale, politique, résidentielle, etc.

2. Le mesurage la discrimination sur le marché: des méthodes et des procédures

Les méthodes de mesure de la discrimination peuvent être de plusieurs types et peuvent concerner plusieurs niveaux. Bien que les méthodes purement économétriques, qui ont été perfectionnés au fil des années, posent généralement des problèmes d'économie positive, les méthodes d'audit ont des ambitions plus opérationnelles.

Tableau 2. Le paradigme analytique de la discrimination

Description	Les acteurs discrimination	de la	Qui discrimine	Acteur institutionnel/non institutionnel

2.1. Les méthodes économétriques de détection de la discrimination salariale

En Europe, comme aux États-Unis, les femmes sont moins payées que les hommes. Les écarts de salaires varient entre 10 % et 32 %, en France, les mêmes écarts étant de l'ordre de 23 %. L'approche économétrique est une méthode de mesure indirecte de la discrimination salariale qui part de l'analyse des différents déterminants du salaire, en introduisant dans la fonction du salaire, d'une part, des variables explicatives mesurant les caractéristiques individuelles (niveau d'études, expérience professionnelle, ancienneté, etc.) et, d'autre part, des variables indicatrices (le sexe et/ou l'origine ethnique du salarié).

Un coefficient significatif (non significatif) de ces variables indicatrices prouve (infirme) la présence de la discrimination sur le marché du travail. Cependant, la valeur de ce coefficient peut être imputée non seulement à la discrimination mais aussi aux différences observées en termes de caractéristiques individuelles entre les divers groupes.

Afin de purger le coefficient de ce qui est imputable aux caractéristiques individuelles, Alan Blinder a proposé une décomposition de cette différence salariale observée sur le marché du travail. Une première composante est due aux caractéristiques individuelles et une deuxième composante est imputable à la discrimination pure. Plus précisément, on considère deux fonctions de salaire (pour les Noirs: N, et les Blancs: B).

$$Y_{Ni} = \alpha_N + \beta_N X_{Ni} + \varepsilon_{Ni}$$

$$Y_{Bi} = \alpha_B + \beta_B X_{Bi} + \varepsilon_{Bi}$$

En termes de moyenne, on obtient :

$$\overline{Y}_{N} = \widehat{\alpha}_{N} + \widehat{\beta}_{N} \overline{X}_{N}$$

$$\overline{Y}_{B} = \widehat{\alpha}_{B} + \widehat{\beta}_{B} \overline{X}_{B}$$

La différence moyenne, en termes de salaire, entre les Noirs et les Blancs est donnée par :

$$\overline{Y}_{N} - \overline{Y}_{B} = \underbrace{(\widehat{\alpha}_{N} - \widehat{\alpha}_{B})}_{D_{1}} + \underbrace{(\widehat{\beta}_{N} - \widehat{\beta}_{B})\overline{X}_{B}}_{D_{2}} + \underbrace{\widehat{\beta}_{N}(\overline{X}_{N} - \overline{X}_{B})}_{CARACTERISTIQUES_INDIVIDUELLES} = D + C$$

où D_1 indique la contribution du terme constant à la discrimination alors que D_2 indique la contribution des variables explicatives. En effet, si $\widehat{\beta}_N$ est différent de $\widehat{\beta}_B$, cela signifie, par exemple, que le niveau d'études ou le diplôme est rémunéré différemment selon que le salarié est un Noir ou un Blanc.

Frank Jones a montré que la contribution de D_1 et D_2 dans $\overline{Y}_N - \overline{Y}_B$ varie en fonction du choix des variables de référence, des autres variables explicatives (région de résidence, être syndiqué ou pas, le statut juridique de l'entreprise, etc.). Plus récemment, Roland Oaxaca et Michael Ransom ont proposé une nouvelle décomposition de $\overline{Y}_N - \overline{Y}_B$ invariante au choix des variables de référence.

On considère une variable indicatrice R_{sj} , j = 1,2,3,4; s = N,B, caractérisant la région de résidence (Est, Ouest, Nord et Sud) où $\sum_{j=1}^{j=4} \overline{R}_{sj}$, s = N,B. En supposant que la variable de référence est Rs_1 (Est), dans ce cas, la moyenne des salaires des Noirs et des Blancs est de la forme:

$$\begin{split} \overline{Y}_{N} &= \widehat{\alpha}_{N} + \sum_{j=2}^{j=4} \widehat{\lambda}_{Nj} \overline{R}_{Nj} + \widehat{\beta}_{N} \overline{X}_{N} = \sum_{j=1}^{j=4} \widehat{\delta}_{Nj} \overline{R}_{Nj} + \widehat{\beta}_{N} \overline{X}_{N} \\ \overline{Y}_{B} &= \widehat{\alpha}_{B} + \sum_{j=2}^{j=4} \widehat{\lambda}_{Bj} \overline{R}_{Bj} + \widehat{\beta}_{B} \overline{X}_{B} = \sum_{j=1}^{j=4} \widehat{\delta}_{Bj} \overline{R}_{Bj} + \widehat{\beta}_{B} \overline{X}_{B} \end{split}$$

où
$$\widehat{\lambda}_{si} = \widehat{\delta}_{si} - \widehat{\delta}_{s1}$$
 et $\widehat{\alpha}_{s} = \widehat{\delta}_{s1}$; $j = 1,2,3,4$; $s = N, B$.

La nouvelle décomposition de la discrimination de R. Oaxaca et M. Ransom est de la forme:

$$\overline{Y}_{N} - \overline{Y}_{B} = (\widehat{\alpha}_{N} - \widehat{\alpha}_{B}) + \sum_{j=2}^{j=4} (\widehat{\lambda}_{Nj} - \widehat{\lambda}_{Bj}) \overline{R}_{Bj} + (\widehat{\beta}_{N} - \widehat{\beta}_{B}) \overline{X}_{B} + \sum_{j=2}^{j=4} \widehat{\lambda}_{Nj} (\overline{R}_{Nj} - \overline{R}_{Bj}) + \widehat{\beta}_{N} (\overline{X}_{N} - \overline{X}_{B})$$

où

$$\overline{Y}_{N} - \overline{Y}_{B} = \sum_{j=1}^{j=4} (\widehat{\delta}_{Nj} - \widehat{\delta}_{Bj}) \overline{R}_{Bj} + (\widehat{\beta}_{N} - \widehat{\beta}_{B}) \overline{X}_{B} + \sum_{j=2}^{j=4} \widehat{\delta}_{Nj} (\overline{R}_{Nj} - \overline{R}_{Bj}) + \widehat{\beta}_{N} (\overline{X}_{N} - \overline{X}_{B})$$

Cette décomposition présente, en effet, plusieurs avantages. Premièrement, le choix de la variable de référence ainsi que la suppression du terme constant n'affecte pas la décomposition globale de la discrimination. Deuxièmement, la contribution de la variable indicatrice R_{si} à la discrimination

peut être identifiée par
$$(\widehat{\alpha}_N - \widehat{\alpha}_B) + \sum_{i=2}^{j=4} (\widehat{\lambda}_{Nj} - \widehat{\lambda}_{Bj}) \overline{R}_{Bj} = \sum_{i=1}^{j=4} (\widehat{\delta}_{Nj} - \widehat{\delta}_{Bj}) \overline{R}_{Bj}$$
.

En d'autres termes, la contribution du terme constant fait partie de la contribution de la variable R_{sj} . Enfin, la contribution de la variable indicatrice R_{sj} aux caractéristiques individuelles est invariante au choix de la variable de référence.

En fin de compte, il faut souligner que la mise en évidence d'une différence de rémunération ayant la nature d'une discrimination pose toujours un certain nombre d'interrogations. Ainsi l'influence d'une variable significative mais omise dans la régression peut-elle être captée par la race ou le sexe. Par exemple, on risque d'imputer à une discrimination à l'encontre des femmes un écart de salaire qui peut résulter en partie du désir de ces dernières d'opter pour un travail à temps partiel, préférence qui a pu être à l'origine de l'ajustement salarial incriminé. Il en va

de même pour les mesures de l'éducation, celle-ci étant évaluée souvent par le nombre d'années d'études, or il est clair que la variable ne capte pas de façon suffisamment précise l'aspect qualitatif du processus d'enseignement. En omettant cette variable, on peut surestimer la discrimination si les aspects qualitatifs de l'éducation sont corrélés avec le sexe ou la race.

Par voie de conséquence, le caractère aléatoire et non observable de toutes les caractéristiques affectant la productivité ou la performance vient grandement limiter la possibilité d'une mesure précise de la véritable ampleur de la discrimination.

2.2. Les méthodes d'audits

La méthode d'audit est un outil de détection de la discrimination raciale, ethnique et du genre sur le marché du travail. Le principe consiste à former des couples, dits « vérificateurs » (noir et blanc, hispanique et non hispanique, homme et femme) pour un emploi donné. Chaque couple dispose du même *curriculum vitae*. Cette méthode opère en contrôlant, de façon systématique, les différences en termes de caractéristiques individuelles, pour ce faire, elle procède, ensuite, à l'audition des différents couples de vérificateurs pour s'assurer de l'homogénéité du couple et minimiser les différences en termes de compétences.

Une des premières applications de cette méthode a été conduite par Ronald Mincy aux Etats-Unis sur un échantillon d'individus âgés de 19 à 25 ans. Un test de la discrimination raciale a été effectué à Chicago et à Washington, alors que celui de discrimination ethnique a été effectué à Chicago et à San Diego.

La méthode confirme l'existence de la discrimination lorsque l'emploi est proposé à un seul élément du couple, alors que la discrimination est infirmée si les deux personnes obtiennent le poste. De la même manière, une discrimination est détectée si les deux personnes obtiennent le poste du travail mais avec des rémunérations différentes.

Les données suggèrent que les Blancs reçoivent, en moyenne, trois fois plus d'offres de travail que les Noirs, de même, les non Hispaniques ont trois fois plus de chances d'être embauchés que les Hispaniques. Elles indiquent aussi la persistance d'une discrimination salariale de race.

Une des critiques de cette méthode est que toutes les caractéristiques individuelles ayant un effet pertinent ne peuvent être mesurées ou identifiées. Par voie de conséquence, il est presque impossible de former un couple de vérificateurs homogène. En effet, l'apparence du candidat – que le détecteur de la discrimination ne peut contrôler – peut jouer en faveur ou en défaveur du candidat à l'embauche.

Afin de parer aux critiques précédentes, Peter Riach et Judith Rich ont procédé à la détection de la discrimination en effectuant des tests par correspondance au Royaume-Uni. Ces tests consistent à répondre à des offres d'emplois en envoyant des lettres de candidature tout en choisissant des noms particuliers comme signal de l'ethnie du candidat. Les résultats ont montrées que de la part du même employeur, des candidats d'origine indienne ou pakistanaise ont reçu des réponses indiquant que l'offre d'emploi avait déjà été attribuée, alors que, simultanément, les candidats d'origine anglo-saxonne ont reçu des convocations pour une audition. Malgré ces résultats, ces tests par correspondance se limitent à une identification initiale de la discrimination, après l'audition, on ignore si le candidat d'origine anglo-saxonne a reçu l'offre ou pas.

Pour conclure, les méthodes d'audits confirment la persistance des pratiques discriminatoires sur le marché du travail.

SALES STAFF TRAINING – COMPLEX AND PERMANENT ACTIVITY OF SALES OPERATIONAL MANAGEMENT

Brutu Mădălina

University of Piteşti, Faculty of Economic Sciences, 71 Republicii Blvd., zip code 110014, Piteşti, Argeş county, madalinabrutu@yahoo.com 0721.24.23.01

The present article deals with the complexity of the aspects related to sales staff training. Each stage of the sale process requires preparation, training and practice, overcoming the idea according to which sales agents must be sent almost immediately on the field. The article also treats a series of elements influencing the employees' improvement programs in general, including as well the ones of the sale force. These are: the degree of integrating the organization within the business environment, the company's image, the conditions in which it develops its activity, the company's personnel strategy, the human resources planning, the union involvement in the organization and the manager's, employee's and HR specialist's involvement in the training.

Key words: training, sales personnel, training programs, sale

Jel code: M20

Each stage of the sale process requires preparation, training and practice. P.R. Smith speaks of the 7 P in the skills required for sale, namely³⁴:

- **P**rospecting (searching the potential clients).
- Preparation (establishing the objectives, studying the client etc.).
- **P**resentation (demonstration, discussions).
- Possible problems (obstacles size).
- "Please give me the order" (concluding the sale or taking the order).
- **P**en to paper (correct recording of all details).
- Post sales service (constructing a protection wall for the client).

Therefore, personnel training is an essential stage, directly depending on the future productivity of the sales staff and which will directly reflect in the organization profile.

The idea according to which sales agents were sent nearly immediately on the field is outdated. It is correct that training programs require supplementary costs as well as the loss of certain opportunities due to the fact that the personnel is not on the field, but their lack would have serious negative effects.

According to Kotler, the training programs must have several **objectives**³⁵:

- Sales agents must know the organization and they must identify them with it. This is why most of the training programs start with the presentation of company's history and objectives, of the organizational structure, of the financial structure and facilities, of its main products and of the markets it serves.
- Sales agents must know the company's products, and therefore they are shown their manufacture and functioning method.
- Sales agents must know what characterizes their clients and competitors. In this sense, the trainers present the customers features, needs and purchase habits as well as the strategies used by the competitors.
- Sales agents must learn to perform a successful presentation. Therefore, the training courses must cover the basic sale rules and emphasize the reason for each product sale.
- Sales agents must know the work techniques on the field and their corresponding responsibilities. They learn, therefore, to distribute their time between the real and potential

clients, how to use an expense account, how to draw up reports and how to communicate effectively.

The organizational characteristic, such as the organization's degree of integration in the business environment, the company's image, the conditions in which it develops its activity, the company's personnel strategy, the human resources planning, the union involvement in the organization, as well as the manager's, employee's and HR specialist's involvement in training, influence the employees' improvement programs in general, but also of those in the "first line"³⁶.

- The degree of integration in the business environment affects the manner in which the professional training activity is developed. If we speak of a company with an activity strongly integrated, the employees must also know other sectors of activity, services and products within the company. The training taking into consideration other activities can lead to the possibility of moving the human resources to other positions than the ones on which they are hired at the beginning (jobs rotation), in order to manage to comprehend the entire activity.
- The conditions in which the company develops its activity. The business conditions create specific requirements for the employees. For the companies developing their activity in an instable environment (characterized by fusion, acquisition, absorption) the employees' improvement programs can be abandoned, left at managers' discretion, or they can be developed on a shorter period of time than the one programmed.

The employees remaining within a company which underwent a fusion, acquisition or absorption, discover the fact that their positions have now different responsibilities requiring new qualifications, skills.

For the employees in the expanding companies (characterized by an increased demand for products and services) we can find many opportunities for other positions and promotions. These employees are usually thrilled to participate to improvement programs because new positions usually offer increased salaries and more challenging.

During the periods in which the companies try a business revitalization or redirection, profits are often fixed. As a result, less stimulants are available for the professional development: promotions or salary increases. In many cases, the companies reduce their work force in the idea to reduce costs. Employees' improvement in these conditions is performed in order for the employees to be available (trained) to occupy the positions become vacant by pensioning or due to the work force fluctuation. Improvement involves helping the employees to avoid limitation.

- **Company's image.** For the companies with international activity, the improvement programs include employees' training for ample responsibilities, by using temporary and international assignments. Also according to the company's prestige, we shall determine if professional training will be centrally directed and coordinated, from the mother company or it shall be the responsibility of each subsidiary or branch.
- The personnel strategy influences the improvement by: the criteria used for the promotion and designation into decisional positions (designation flow) and the places where the company prefers to obtain human resources in order to complete the vacant positions (supply flow)³⁷. The companies differ, on a scale, according to the manner in which they perform the promotions and nominations in decisional positions, according to the individual or group performance, or based on the business unit performance. Also, they vary according to the degree in which their personnel needs are accomplished by resorting to the employees existing in the company (the internal workforce market) or to the employees in the competitor companies and on the recent entries on the workforce market such as schools graduates (external workforce market).

³⁶Campbell R.J., HR Development Strategies, in Developing Human Resources, Editura K. N. Wexley (Washingtong, DC: BNA Books, 1991), cap. 5.1, 5.34; Berry J. K., Linking Management Development to Business Strategy, Training and Development Journal (August 1990), p. 20 – 22.

Figure (1) presents the two dimensions of the personnel strategy. The interaction between the designation flow and the supply flow consists of four distinct types of companies:

- fortress.
- baseball team,
- clubs.
- academies.

Each type of company lays a different stress on the improvement activities. For example, certain companies such as the medical research ones lay a stress on innovation and creativity. These company types are labeled as "Baseball team", because it can be quite difficult to develop skills related to innovation and creativity. They tend to manipulate personnel needs by keeping the employees away from the competitors, or, by hiring graduates, with specialized skills (professions).

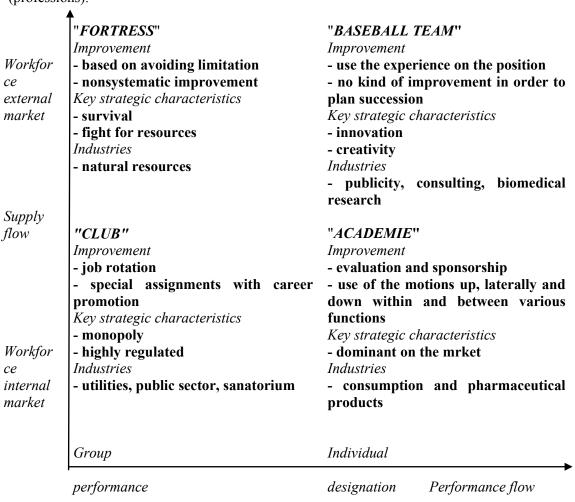

Fig. (1): The implications of the personnel strategy regarding the employees' improvement. (*Source*: Noe R.A., Hollenbeck J.R., Gerthart B., Wright P.M., **Human resource management.** Gaining a competitive advantage, a Time Mirror Higher Education Group, Inc. Company, 1997, p. 386.)

- The human resources planning allows the company to anticipate the motions of the human resources within the company due to jobs rotation, transfers, retirements and promotions. Planning helps to identify the places from the companies where employees with certain abilities are required. The improvement programs can be initiated in order to prepare employees for

certain increased responsibilities, for promotions, movements on the same hierarchic line (lateral), transfers, and opportunities for inferior hierarchic positions which are predicted by the human resources plan.

- **Unionization.** The unions can consider the programs as another attempt to make the employees work harder without sharing none of the productivity gains. The management programs of the Unions assure that all parts (unions, patronages, employees) understand the improvement purposes and are developed to perform the necessary changes so that the company bring profits and that the employees maintain their positions and share any increased profits.
- Involving the manager, the employee ad the HR specialist in the improvement programs development. The employees' efficiency and effectiveness depend on the degree in which the managers, employees and personnel specialized in professional training are involved in the process. The development of the professional training activity for the employees of a company by a personnel specialized in human resources can lead to a wide range of improvement opportunities based on trainings (seminars). If the line managers were aware of what they can obtain by the training activity (such as the reduction of the time for recruiting competent personnel for a vacant position) they would be more eager to get involved in this activity. They will also become interested in the development process if they are remunerated for participation. At Xerox, the performances evaluations are directly correlated to the salary increases³⁸. A part of obtaining managers performances consist in the activities that they undertook in order to promote and develop women and minorities (transferring the women and minorities to polyvalent jobs which can provide them with the experience they need in order to become senior managers).

A present tendency in the professional improvement field is the one in which the employees are the ones who initiate the planning process of the improvement programs. The bigger a company's expectation for a continuous learning philosophy, the more its planning is expected. Companies will support the development activities such as reimbursements of the expenses with courses, seminars, work meetings, granting the employee the freedom to opt for various programs.

In sales, this principle can be successful, because the person who deals with sales knows better the vulnerable aspects that he desires to improve. A company's sales force must be aware therefore that without a thorough and constant training it cannot be competitive on a market with increased competition.

A delicate problem of the human resources management in general and of the preparation and training activity in particular is represented by the **selection of the adequate training method.** In practice two great training possibilities appear: training programs at the workplace (on-the-job training) and training programs outside the workplace normal hours (off – the – job training).

The on-the-job training programs have an informal character and include: training, orientation sessions, coaching, mentorship, job rotations etc.

- *Training*. Is a method for transferring knowledge and skills from an experienced employee to a less experienced one³⁹. Training takes for 4 steps:

Step no. 1: The person training the employee must spend with the latter a "protected" time interval, namely without interruptions. The first assignment is to define the problem or the action to be performed.

Step no. 2: After explaining to the employee which is the situation and why he needs training, the training person must ask him clarifying questions, in order to understand that the respective individual thinks and speaks of the same problem. Is thinking must be encouraged and enlarged by delicate suggestions.

³⁸ Noe R.A., Hollenbeck J.R., Gerthart B., Wright P.M., op. cit., p. 387.

³⁹ CODECS, Open University Business School, BZT654 Competitive Management, vol. 5, Personnel Development and Evaluation, 1997, p. 59.

Step no. 3: The individual must be offered new ideas, at the same time with the encouragements to find his own solution. The person training him must abstain from telling him "I would do like this!", if this is not expressly required. If it is necessary, the problem must be redefined.

Step no. 4: We get to a point in which we must adopt a decision. The employee's trainer must provide him with all information he needs. The discussion is ended, the conclusions are drawn and a summary of what took place is made including the adopted measures. If necessary, we appreciate the advantages obtained or the improvement of the work results, compared to those that the employee would have obtained if he followed his own methods.

- **Jobs rotation** — is a training process in which the participant learns based on the observations and on practice and not based on certain instructions. Rotation means transferring the employees to other departments on different jobs for a given period of time. During the training, the participant is "in the responsibility" of a superior who will occupy with the participant's orientation, training and evaluation.

Jobs rotation is frequently used or training the first management level especially for the new employees. During the training cycle by jobs rotation, the participant expects to learn how each department functions, including the key roles, policies and procedures.

- **Guiding** (coaching). The managers understand that they must have an active and positive role in the employees' performance in order to assure that the objectives are reached. They are not especially paid for what they do, but for what their subordinates perform.

The coaching activity is similar to personnel training, although one of the fundamental differences is that the coach must not be the employee's direct manager. Usually, the mentors chosen to guide the personnel are elder persons or more experienced persons than the one coached. Mentors must offer support, encouragement and development opportunities, acting such as resonance boxes for the employee's ideas.

The stages of such a program is presented as follows:

Table (1)

Stages of a training program

Stages of a trai	Stages of a training program		
Preparation stage	Considers: - establishing the objectives for reaching the desired efficiency; - providing the necessary work equipment and the propitious workplace arrangement.		
Stage I – Preparation	Aims at: - identifying the participant's command degree of the skills necessary for the respective activity; - rousing the employee's interest and desire to learn.		
Stage II – Assimilating knowledge and practical operations	 the employee is theoretically informed related to the operations that must be performed, in this sense the trainer uses the exemplification technique; the employee is motivated in addressing questions in order to clarify the misunderstandings and the general comprehension of the information and operations to be assimilated; the employee is completely patiently trained, with clarity on what he has to do; He exercises insistently until he gets the habit; the trainer makes sure that the employee understood each operation before presenting the following information; at the end of the training, the retention is provided y representing the process in its entirety as operations sum. 		

Stage III – Verifying performances	 - we test theoretically the assignments appropriation manner; - we address questions on what to do; - at a practical level we observe the performance, we correct the errors; - we continue this stage until the effective appropriation of knowledge and habits. 	
Stage IV -	- we verify is the instructions have been complied with;	
Evaluation	- we establish the possible improvements of the training program.	
session		
(follow-up)		

(*Source*: Pânișoară G., Pânișoară I., **Human Resources Management, Practical Guide**, Polirom Publishing House, Bucharest, 2004, p. 98.)

In sales, training is essential, because it is a field in which the changes take place rapidly, and those that do not keep up will be eliminated by the competitors. These activity needs to be granted an increased and continuous attention from both sides (o the management personnel and of the sale force members). Everyone must be aware that there is no point where you can stop, considering that you learned; this point gets farer and farer as you get close to it because nobody will ever detain all knowledge, techniques and skills necessary for the sale!...

This is also the belief of Zig Ziglar, who notices: "If I look behind to my sales agent, sales manager and sales trainer career I have no doubt that the most successful professional continues to have the attitude of a beginner. The sales professional which reaches and remains on top of his job is an "experienced rookie". And this means that if wee consider sales as a continuous learning process, we will ceaselessly learn the "small things" that produce the "big differences" in our career of sales professionals. (We have no profit from a sale ALMOST accomplished)"⁴⁰.

The author lays, consequently, a great stress on the continuous training in sales activity. "We have no profit from a sale ALMOST accomplished." — is perhaps the most realistic phrase ever written about sales. It could be translated with something like ... the national anthem is sung only for the first place... Nevertheless, in order to have the guaranteed success, the sales force must assume the phrase "long life learning" as a fact.

MANAGING SITUATIONS OF CRISIS USING NEGOTIATION OR MEDIATION

Popescu Catalin

Universitatea Petrol-Gaze Din Ploiesti Facultatea De Stiinte Economice, Ploiesti, B. dul Republicii, nr 116 catalin nicolae@yahoo.com 0721-547571

From December, 22nd, 1989, Romania experienced major changes in all fields, but the most important ones are the changes from the political and economical field. In the economical field, our country changed from the centralized economy to the market economy, this having as a result different crisis situation in the last 20 years. Yet, it is the first time after Revolution when Romania is affected by such a powerful international crisis.

This paper tries to explain a few aspects (more theoretical), related to the appearance and managing the crisis situations, what do we have to take into consideration when we negotiate in this kind of situations and the importance of mediation when the negociation fails.

Keywords: crisis, negotiation, mediation, seller, buyer

Cod JEL lucrare: L10, M10, J5, E3

WHAT CAN WE SAY ABOUT THIS CRISIS?

The situation started in USA in 2008. In the begining there were discussions about a major crisis over the ocean, but it was difficult to forecast its consequences all over the world. The economic crisis in USA was first generated by the massive crediting of the real estate and the impossibility of repaying these credits, having as an immediated result the lack of cash in the American banking system due to the fact that the goods that were considered the guarantee for the crediting could not be transformed into liquidities. Thus, in a very short time, the offer of goods on the market was much bigger then the demand, due to the lack of liquidities available on the banking market. The fall of the consumption of the products generated by the psychologycal effect of the world crisis, has as result the unemployment. The bank institutions subsidized by the State by means of the external loans is a short term solution, that on long term can increase the gravity of the crisis when the unemployment goes high and the production goes down the result will be the the impossibility of collecting the taxes owed to the state and the incapacity of respecting the terms and conditions of the external loans contracts. In the same time, the subsidizing by the state of the major American companies is not the most favorable situation when these companies will not have a good marketing strategy so as to transform their products into liquidities. In time, the effects of the crisis spred all over the world and now they have reached the highest peak, being obvious also in Romania, where 2009 becomes a year very much affected by the world crisis. The fact that the entire world is affected by the crisis can be observed if we start form the theoretical definition of crisis (that state of an economical, tecnologycal, social and political process in which this presents, in immediate perspective, impending impossibilities to develop and continue effeciently) and we consider the present situation. The crisis represents a period in the dynamics of a system characterized by gathering more and more difficulties, conflictual bursting of tensions, fact which makes difficult its normal functioning, starting strong pressions to changing. The actors, characters involved in the crisis, are suddenly without any reference point, without their usual basis of decision, information, criteria and references, will not be able to masure and analyse the amount of elements created by the crisis. Against the background of the complexity of the socio-economical and interhuman relations and of the diversity of the common or individual interests that the members of the modern socity have nowadays, against the background of the world crisis it was observed that the classical ways of solving the

differences were not useful anymore and many times they cease to achive their own interests. Thus, during conflict situations in the crisis, people started evaluate their interests more attentivly, reaching to conclusion in the end that what is more important in solving their differences is, first of all, not to lose the position they have in that moment. In this way appeared the idea of accepting compromisis as a solution win-win type, having advantages for both parts, instead of that one in which the right is unproportionally shared and in many situations, with unfavourable consequences for the parts involved.

The first signs that anticipate a crisis request an immediate analysis regarding the following aspects: the causes that led to the crisis or its initiation, the immediate actions that must be taken in order to remove the causes that generated it and to identify the resources (human, material, financial, political) necessary to create the actions which lead to the removal of the generated causes of the crisis.

By finding and foreseeing the immediate effects of the crisis on short, medium and long term, it must be foreseen also the period of coming back to normal and of the level of effeciency of this period. A very important moment in preventing the aggravating effects of the crisis is the moment when the potential or existing situation is identifyed. To ignore the information or forces that announce a possible or iminent crisis means in all cases to aggravate the crisis and to increase its negative effects.

Crisis can be determinde by two groups of factors:

- objective factors;
- subjective factors.

The objective factors are:

- calamities and natural fenomena that can not be prevented and that due to their effects can generate a crisis;
- the market situation indirectly created at a certain moment;
- wars, international conflicts, revolutions, coup;
- technical or environmental accidents.

The subjective factors are:

- to take unfounded decisions
- subordinate the common objectives to the personal ones;
- lack of managerial skills;
- the requests of the job position;
- political errors;
- gouvernamental errors.

HOW CAN THE NEGOTIATIONS BE HANDLED DURING CRISIS?

The main tool of crisis negotiations can be definited as Robert C. Bordone said - Law School, Harvard University "The active listening is the main wapon of any effecient negociation". In praxis, when we have a negotiation in a crisis situation, the main part has the personality of the negotiator, his background, and the personal skills that he has, the language used in negotiation, based on the psychology of persuation during certain moments of the situation. In economy, the crisis can be considered that started in the moment in which the effeciency of the economic activity goes down constantly in a certain period of time, depending on the complexity of the economic process. We can conclude that any economic institution or agent can be at a certain moment in a crisis. In order to lower the effects of the crisis in the economy, a very important part have the commercial negotiations. The competence of the negotiator can be translated by his ability to fulfill his duties at a high standard bringing together hthe necessary skills, attitudes and behaviours. The negotiator must ignore the fact that the negotiations take place during an economical crisis and behave professional. There are many styles of negotiation, as a natural tendancy to adopt differnt kinds of behaviour. The negotiation style is influenced also by the

national culture of the negotiator, so as different negotiators can be described according to the geografical aria or the country they come from.

As Souni Hassan wrote in Manipulation in negotiations, Antet Printhouse, Bucharest, 1998, the negotiation is in the same time an art and a science because is an art that allows those that put it into practice different strategies, technics and tactics that helps having better results and in the same time a science that a lot of people use every day without really studying it.

From the poin of view of the human interaction, the negotiation is the communication process that has as a purpose to come to an agreement between two or more parts that do not share the same opinions. Disputes, conflicts are permanently ended by getting a satisfactory mutual agreement by means of negotiations, mediation or a third part arbitration that decides wether a part was right and the other part was wrong.

The negotiation can be defined as the main communication way, different activities such as contracts, meetings, consultations, talks between two or more partners in order to get an agreement (Mecu, Ghe. – Tehnica negocierii în afaceri, Editura Genicod, Bucuresti, 2001). During this discussion are brought arguments, claims and objections, the concesions and compromisos are made in order to avoid to brake the relations. The negotiation allows to create, mentain and develop a interhuman or social relation, in general as well as a business, working relation. There is no condition that the negotiation leads to an agreement. Often the negotiation take place for their side effects such as: keeping the contract, getting some more time, try to prevent the situation to become a conflict. Except all these, the meeting of the negotiators can be a potential channel of urgent communications in crisis situations.

The negotiation has a a main target getting a willing agreement, of a conses and not a victory. We have partners in negotiation and not oponents. Both partners should finish the negotiation with the feeling that the achived the maximum that they intended. That is why the negotiation should be defined as a wide cooperating process. Because this process is made by people and the people are those who have their own individual and emotional factors. The human behavior had an impact on the negotiation as this process is really made by people. The main characters in an economic negotiationare the seller and the buyer. The seller is associated by the buyer with different negative features: manipulative, exaggerated, promises without keeping his word, cheats etc. On the other side, the seller considers that the buyer has also different negative features such as: puts him to tests, makes pressures, blackmails etc. Both parts creates an interface between their company and the outside world, acting as its representatives.

If the negotiation does not solve the conflict, the mediation will be used.

WHEN THE MEDIATION IS USED?

The parts that are in conflicto usually tend to evaluate their interests as being completly different. In the crisis situations, apart of the nature of crisis, the negotiation can come to a deadlock. As long as the parts succeed to solve their disputes directly, constructivly, is not necessary that someone else to interfere. When the dispute comes to a major deadlock, and the communication is blocked, usually the only solution is a third part to interfere. The intervention of the third parts can be imposed from outside by rules, laws, habits settled inside an organisation, etc. But we should not forget that the interventions that are not accepted by one or both parts, or they are not supported by the experience, friendship or authority of the third part, can determine hostility and even enmity, apart of the motivations or the intentions of the third part. The mediation is a way to interfere in which are promoted the reconciliation or to explain, to make clear the point of view, in order to be correctly understood by both parts. Is in fact, the negotiation of a compromise between point of view, hostile or incompatible needs or attitudes. As a rule, it implys a third part, netral, that has the role to ease the reaching of an agreement. The mediator in this kind of situation has a very difficult job because he has to be in the middle of the demands of the parts. Nevertheless, the power of a mediator is quite limited because he can not give solutions but can emphasis the common ponts of view of the parts, helping them to come to an agreement.

The mediation is an optional way of solving the conflicts amiably, by means of a third part specialized as a mediator, neutral, impartial and confidential. The mediation is based on the trust that the parts have in the mediator, as a person able to ease the negotiations between the parts and to supprt them in order to solve the conflict, by obtaining a mutual, convenient, efficient and long lasting solution.

The mediation helps to keep an important feature of the negotiation: the parts have the control of the solution, which will be very helpful when they want to apply the results.

If the mediation does not solve the conflicto, the arbitration will be used. The arbitration represents the examination and clarifying the conflictual problem by a specialized person or a person named by an authority. The arbitrator acts as a judge and has complete power of decisión. Is the most drastic way of intervention as at this level, the parts acts according to the *all or nothing* policy. In this situation the arbitrator of the conflict has all the power, his decisions being irrevocable. As a result, a part can get everything and the other part can lose everything, so as the parts that are in conflict find other ways of solving the problems. The main difference between them is that in mediation they try to get an agreement involving both parts that will state the solution.

CONCLUSIONS

Managing successfully a crisis situation implys a good organisation and coordination of all those involved, to settle the objectives and the limits that will be followed by the permanet monitoring and control together with the evaluation of the results compared to the established limits and objectives. Assuring the human, financial and material resources that are needed in order to take measures to lower or eliminate the crisis and to evaluate periodically its evolution and effects. In these cases, is necessary to create a very complex structured entity (specialists in technics, economics, law, sociology, architecture, politics) depends on the crisis. The heterogenity of the crisis entity is required by the complexity of the taken decisions that inevitably involve material, financial and human resources. Trying to leave the crisis management in the hands of two people only is not recommanded because is not possible to gather and to ground all the necessary information and in the same time is not possible to have an effecient control and a correct evaluation of the potantial efects of the crisis.

The mechanism of negotiation is based on risk and incertitude, that can not be compleatly reduced, because the behaviour of the parts involved interact among them, creating different consequences. When the behaviours are planned and settled as strategies, objectives or positions of negotiation are never made available to the opposite parts. They are hidden and sometimes changeble. The dynamics of negotiation determines new elements to show up, capable to provoke in any moment, a new aspect of the cause. A more favourable alternative for one of the parts is good enough to stop the negotiation. To negotiate means to accept the risk in order to improve the position. Yet, from different reasons, the crisis development can lead to major changes such as the reorganization or banckrupcy of an economic agent, the changing of the legislation, changing political power or the institutional reorganization. The analisys of solving the conflicts show that there are much more posible common results then those estimated by the parts. Sometimes is too late when the parts realize that is their own interest to choose other alternatives and to lead the negotiations towards compromise or win-win strategies, using mediation or arbitration.

MANAGING STRESS - THE KEY TO ORGANIZATIONAL WELLNESS

Bucurean Mirela

University of Oradea Faculty of Economics University str., no. 1 e-mail: mbucurean@uoradea.ro Tel.: 0259408796, 0745570337

In the 21 cetury, the century of fast changes, business operates faster and with more complexity and uncertainty than ever before. The impact of stress on profitability, whether creative or negative, must be understood, measured and managed in a realistic and thorough way if a company is to successfully navigate today's business environment. Stress has huge implications for company profitability. While there is always a certain degree of strain and tension in our daily lives, the impact and control of stress in organizational life have received increasing attention and concern. The negative, often quite costly, consequences of stress in the workplace are reflected in rising numbers of industrial accidents, heightened turnover and absenteeism rates, escalating health-care cost.

Keywords: stress, cost, managers, investment, knowledge, efforts, profit.

Cod JEL: M

1. Introduction

Stress is a psychological state that develops when an individual is confronted with situations that exhaust or exceed his or her perceived internal and external resources. When the changes appear, for most of people, the stress appears. The change is permanently; this means that the stress is always present. Stress is a feeling that's created when we react to particular events. It's the body's way of rising to a challenge and preparing to meet a tough situation with focus, strength, stamina, and heightened alertness. Controlling stress at its source is a big piece of how we do take care of ourselves to achieve behavioral wellness and the key to controlling stress is meaningful assessment and data-driven Behavioral Wellness Action Planning.

Organization is an open, dynamic system. There are inputs and outputs. Human resources are one of the most important inputs. Organizations mean human resources and in the end depend on them efforts. Companies invest in employees (salary, benefits, training, etc.) in the hope is making a profit on that investment. The most profitable employees should be those in whom there is the greatest investment. If the high investments are in knowledge workers and in managers, supervisors and executives than it would also follow that this investments and the profits that accrue from them are at the grates risk in terms of stress effects on performance.

Stress plays havor with our health, productivity, pocketbooks, and lives, but stress is necessary, even desirable. Exciting or challenging events such as the birth of a child, completion of a major project at work, or moving to a new city generate as much or more stress than tragedy or disaster. Without it, life would be dull.

In normal conditions people must find the balance and answer to the new situation. The stress is not necessary a negative phenomenon and therefore is a mistake to consider just negative and not the positive effects. A middle level of stress can be an important motivational factor. On an individual level, stressful situations may lead to physiological problems, physiological difficulties and adverse behavioral reactions. One of the more significant symptoms from an organizational perspective is employees burnout – deteriorating job performance and decreasing energy levels caused by the cumulative effect of continuous daily pressures.

2. The stressors and the myths

Stress is precipitated by a number of environmental factors, referred to as stressor, the separate effects of which are difficult to isolate and measure. Work-related stressors can occur at several organizational levels:

- intrinsec to the job (role conflict, ambiguity, insufficient control);
- associated with structure and control of the organization (rigid policies, organizational politics)

- related to facets of the reward and feedback system involving concerns about equity and fairness:
- associated with human resources concerns about training, development and career advancement;
- connected with leadership relations.

Stress is a confusing and mysterious problem for most people, to many of those who manage their health care, and to companies that pay ever-mounting health-insurance premiums. Six myths surround stress. Dispelling them is a first step toward understanding stress and how it affects our lives and finances.

Stress is an unknown think to most people; there are a lot of myths and misunderstandings about it.

Myth 1: Stress is the same for everyone.

In fact, stress is different for each of us. What is stressful for one person may not be stressful for another; each of us responds to stress in entirely different ways.

Myth 2: Stress is always bad for you.

According to this view, zero stress makes us happy and healthy. In fact, the only time you have zero stress is when you're dead. Stress can be the kiss of death or the spice of life. The issue, really, is keeping it under control. Controlled stress makes us productive and happy; uncontrolled stress can hurt or even kill you.

Myth 3: Stress is everywhere, so you can't do anything about it.

In fact, you can plan your life so stress doesn't overwhelm you. Effective planning involves setting priorities and working on simple problems first, solving them and going on to the more complex difficulties. When stress gets out of control, it's difficult to prioritize where to devote your energies. All your problems seem to be equal and stress seems to be everywhere.

Myth 4: The most popular techniques for controlling stress are the best ones.

No universally effective stress control technique exists. We are all different; our lives are different; our situations are different; and our reactions are different. Only a comprehensive program tailored to the individual's needs is going to work.

Myth 5: *No symptoms, no stress.*

Absence of symptoms does not mean the absence of stress. In fact, camouflaging symptoms with medication may deprive you of the signals you need for reducing stress-related strain on your physiological and psychological systems.

Myth 6: *Only major symptoms of stress require attention.*

This assumes that the "minor" symptoms, such as headaches or heartburn, may be safely ignored. Wrong again. Minor symptoms of stress are the early warnings that your life is getting out of hand. They indicate that you need to do a better job of managing stress.

3. Personal and corporate behavioral resiliency

Forty-four percent of all adults suffer adverse health effects from stress; 75 to 90 percent of all physician office visits are for stress-related ailments and complaints; stress is linked to the six leading causes of death - heart disease, cancer, lung ailments, accidents, cirrhosis of the liver, and suicide. The Occupational Safety and Health Administration have declared stress a hazard of the workplace.

Stress can have severe consequences for both individuals and work organizations, stress in and of itself is not necessarily harmful. Moderate level of stress can heighten a person's interest, amount of effort expended and ultimately performance, growth and development. People vary significantly in terms of their ability to handle with stress. Something that might be perceived as extremely stressful to one person, might be viewed as irrelevant or even favorable by another.

We can see how behaviorally resilient we are by taking the Behavioral Resiliency test.

We can make our self more stress resilient by improving our health behaviors, modifying our lifestyle, and building up our financial, social, personal & spiritual resources for coping with stress.

Some firms made many stress management efforts; it made some type of campaign for improving the health of their employees – encouraging workers to assess health risks, stop smoking, control blood pressure, screen their cholesterol and modify their diets and exercise. We can see how behaviorally resilient our company is by taking the Corporate Behavioral Resiliency test.

Learn to think of challenges as opportunities and stressors as temporary problems, not disasters. Practice solving problems and asking others for help and guidance rather than complaining and letting stress build. Make goals and keep track of your progress. Make time for relaxation. Be optimistic. Believe in yourself. Be sure to breathe. And let a little stress motivate you into positive action to reach your goals.

A research realized by Center for Creative Leadership about stress at work underline that: 85% managers say that they manage with this phenomenon, 28% say that they belief that the organization do not use enough methods for reduce and eliminate stress and 79% think that in the organization is necessary the presence of same specialists who try to solve this complex problem.

4. Stress cost

Stress is expensive. We all pay a stress tax whether we know it or not. Health-care costs account for more than 13 percent of our Gross Domestic Product, escalating yearly at a dizzying rate. In terms of lost hours due to absenteeism, reduced productivity, and worker's compensation benefits, stress costs American industry more than \$300 billion annually, or \$7,500 per worker per year.

Based upon accepted standards, the Stress Cost Calculator estimates the cost exposures due to stress in several categories:

Top of Form

- Group Health	22% due to stress
- Turnover	40% due to stress
- Absenteeism	50% due to stress
- Presenteeism	50% due to stress
- Workers Compensation	33% due to stress
- Disability	50% due to stress

Bottom of Form

Based upon median direct and indirect costs per category and percent due to stress, the Corporate Stress Costs Calculator estimates annual costs and potential savings in the table below. The Corporate Stress Costs may be higher or lower than estimated relative to the particular costs per category and the level of stress within a company. Savings depend upon the level of stress assessment and intervention. I gave an example for a small business which has 17 workers. I just introduced in the program the number of employees. We can obtain precious information but we must find methods for saving money, finding methods for prevent and reduced stress.

Cost Category	Annual Costs	Median Annual Median Costs Due to Stress	Potential Savings
Group Health	\$79,322	\$17,451	\$873 - \$5,235
Turnover	\$62,781	\$25,112	\$1,256 - \$7,534
Absenteeism	\$13,770	\$6,885	\$344 - \$2,066

Presenteeism	\$55,080	\$27,540	\$1,377 - \$8,262
Workers Comp	\$5,270	\$1,739	\$87 - \$522
Disability	\$8,721	\$4,361	\$218 - \$1,308
Total	\$224,944	\$83,088	\$4,154 - \$24,926

For Romania there is no statistics about stress cost. European Union estimate that the stress affects no less than 40 billions workers from this region and the cost is no less than 20 billions per year.

Stress knowledge promotes behavioral health and saves money in the workplace. Independent studies show effective organizational stress interventions:

- Lower operating costs: for every \$1 spent on stress management there is a \$7 return on investment.
- Increase access to, utilization, and valuation of human capital.
- Promote a company's leadership role in nurturing a productive and healthy work environment in turbulent times.
- Leverage intranet technology investments in support of strategic and workforce initiatives while increasing individual and organizational stress knowledge.
- Reduce health-care costs, worker's compensation claims, disability claims, absenteeism, presenteeism, turnover, and workplace accidents.
- Enhance productivity at all levels of the workforce.

Stress Directions has the metrics and analytics to assess and interpret the behavioral health of work force. Is necessary to develop targeted, data-based programs that:

- Address the overall behavioral health of the company.
- Assist employees in developing coping skills and positive lifestyle behaviors.
- Audit workplace characteristics that affect employee behavioral health and productivity.
- Measurably decrease the negative impacts of stress on the behavioral health of the organization.

Stress knowledge helps reduce corporate liability. Research shows that in the United States:

- Inappropriate anger in the workplace, a symptom of stress and frustration, is a leading cause of firings cited ahead of job incompetence.
- There are nearly two million instances of assault in the workplace per year.
- Homicide was the second leading cause of death in the workplace, after fatal accidents.

For organizations and their employees, the customized services lead to positive action and behavioral changes that reduce stress and promote behavioral health in a consistent, organized manner, and help to maintain a healthy and productive workplace.

The behavioral health of a company depends on the behavioral health of the workforce. Effective stress control is the core of behavioral health in the workforce and in the overall health of a company. Stress Directions helps companies improve their overall behavioral health by reducing stress in the workforce.

5. Conclusion - Keep stress under control

What can you do to deal with stress overload or, better yet, to avoid it in the first place? The most helpful method of dealing with stress is learning how to manage the stress that comes along with any new challenge, good or bad. Stress-management skills work best when they're used regularly, not just when the pressure's on. Knowing how to "de-stress" and doing it when things are relatively calm can help you get through challenging circumstances that may arise. Here are some things that can help keep stress under control.

- Take a stand against over scheduling.
- Be realistic.

- Get a good night's sleep.
- Learn to relax.
- Treat your body well.
- Watch what you're thinking.
- Solve the little problems.

Specific management policies and strategies that can reduce negative stress include:

- increased two-way communication with employees to reduce uncertainty;
- performance appraisal and reward systems that reduce role conflict and role ambiguity;
- increased participation in decision making to provide employees with a sense of greater control over their work;
- job enrichments efforts that develop a sense of meaning and significance in work assignments;
- improved matching of skills, personality and work through carefully constructed career development programs and counseling.

The social-psychological research made in SUA demonstrate that most of people find role of work positive; 4 from 5 persons say that work and colleges are very important for them and they would continue to work even they have enough money. But most of people want to work same where else; that means that stress do not came from work in generally; it came from conditions, social atmosphere at workplace.

The resistance to change is a daily reality with which is confronted the companies managers. This resistance, opposition to change and innovation can be owed by the person, by the company or by the society. The reasons which start the resistance to change, can be grouped in two big categories: individual and collective, which help us to identify the measures which should take to diminish the resistance to change. The researches in this area praise the specifics features of the resistance to change, especially at national level. It can be observe that the key of success at the resistance to change is the communication and collaboration between managers and employees of any hierarchical level.

Key words: the resistance to change, fear, failure, traditional, skeptic, communication absence, adaptation capacity.

Cod JEL lucrare: M10

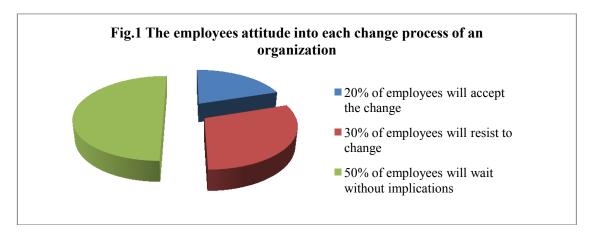

The resistance to change represent opposition up against the change, the new and the innovation which can be owed both the person, like any employee of an organization and the hole organization. For a person, the resistance to change, is a mood, into the human mind which reflect the refuse or indifference at an activity which has the main purpose the change of an present mood. This resistance to change is a normal reaction to routine because inevitable appears the fear of failure, uncertainty and instability. The intensity grade of the resistance to change is different from a person to another, from an organization to another organization and including from a society to another one.

It's considerate that this attitude of the resistance to change like being more meet at low hierarchical level, because the employees at this level have a small capacity to assimilate the new, promoting indirectly the routine; in opposition there are coming another studies which sustain that the persons who keep the resistance to change are TOP Managers and Middle Managers, because they lose more if the change failed, having the obligation to reinvent themselves permanently.

Corresponding to the study made by Sheffield University into each change process of an organization; the employees will be divide in three big *categories*, like:

1

- the employees who will accept the change, will be about 20%;
- the employees who will resist the change, will be about 30%;
- the employees who will wait without implication, will be about 50%.

The research made by Sheffield University has at the base, a fortuitous sample from United Kingdom, which represent that those statistics looking the positions, the employees attitude into change process of organization are the same indifferently of their size, when change is only in the purpose stage. Those percents (Fig.1 The employees attitude into each change process of an organization) will be modified, when will be explain the necessity to make the change and their implications. Those changes has on their base a lot of factors, enumerated lower under individual and collective form.

From the study made by Sheffield University, goes up that the success or failed of making the change will depend of the 50% from employees, who don't have an opinion, who wait to see what will happening, without any action. If we will try to persuade the employees who already resist the change and of its utility, even if it's efficient; we will exhaust our energy, because those employees will give up harder. That's why our force of persuasion must be focused on irresolute employees, demonstrating them how necessary is the change, attracting a highest percent of them, we will succeed to disarm the opponents, who will be open for a dialogue and that's how we will assure the success of change implementation.

With desire to report this research at reactions of the employees from Rumanian companies; we think that the percents becomes to the medium and big enterprises, modifying for microenterprises and small enterprises in the sense of growing up the percent of employees who resist the change and diminishing the percent of employees who wait the change, without involve. Of course those percents are real just for the impact of change, when the employees know about a change in the informal organization. This percents are modified with the information of employees by the managers.

Individual reasons of the resistance to change can be grouped into the following categories:

- The inexistence of change need.
- Sock of the new.
- Selective attention and memory.
- The fear to lose what they won.
- Incertitude.

2

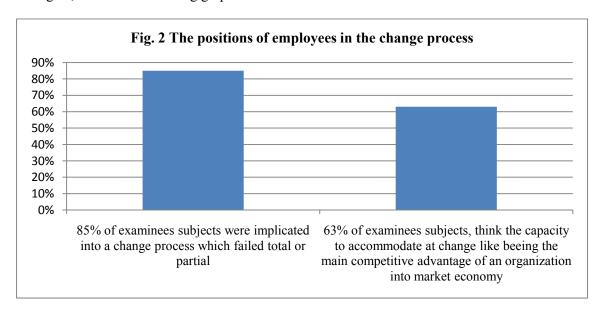

- Dependence.
- Incommodity.
- The fear of unknown.
- Fears at symbolic level.
- The threat of interpersonal relationship.
- The threat at statute and calcification.
- Security need.
- Different opinions.
- The moment of change was bad choose.

- The absence of resources.
- Financial and economic fears.

At individual reasons can be add also **collective reasons of the resistance to change**, like are the following categories:

- Norms and the cohesion of the group.
- The change of power and of influence.
- Organizational structure.
- Organizational culture.
- The immobilization of assets.
- Limited resources
- Agreements between organizations.

At national level was recently made a study by Achieve Global Romania, which illustrate the spirit mood of employees, bounded by the organizational changes, extremely alarming for managers, like in the following graphic:

The sample choose, is format by employees with execution and managing functions, from Romania. Like emerge from the study (Fig. 2 The positions of employees in the change process) 3/4 of examinees subjects were implicated almost in one process of change which failed total or partial, having like results just tiredness, dissatisfaction and even frustration, which drive this

3

category of employees at opposition, resistance and hostile attitude through any purpose of change coming from management, With all of this, more than half of examinated subjects, including those who have negative experience made by change process, think the main competitive advantage is the adaptation capacity at change.

With the research made by Achieve Global Romania which contain only the companies from our country, it was observed the necessity of those to cope with challenges and movements at which are suppose, giving up at the idea to do changes like they think or like the mother-company want in the case of multinationals.

The experts from Achieve Global Romania found behind this research, a change formula as well simple as efficient. From the analyze in which the companies realize meaningful changes and which benefit of success, there result three *elements on which can be based any process*:

- the preparation before change:
- the communication into change process;
- the pursuit and valuation of change.

In contrast with the study made by Sheffield University, the research made by Achieve Global Romania keep out five big typologies which reflect *the employees reactions into change process*:

- the traditional peoples;
- the skeptics peoples;
- the pragmatics peoples;
- the receptive peoples;
- the innovative peoples.

Another side, which arise from the research made by Achieve Global Romania, the same importance, was that the attitude of employees is different, it depends about the type of change. The same person can be traditional or receptive in two different situation. The employees reaction at change is determinate by many individual or collective conjectural factors, being mentioned previous, but almost motivation, interest and implication of many person into change process.

There are some simple approach but efficient, measures which can be take to diminish the employees resistance to change:

- The correct information of staff at the realities activities which determinate the change process and their later instruction.
- Active implication in the change implementation starting with TOP Managers and closing with the employees from the lower hierarchical level.
- The negotiation with employees therefore both sides being winners represent a modality, in which can increase the number of those who sustain the change process.
- Underlining the actual successes and the power points of team. This is the base which can motivate the members of team to mobilize for change.
- Using the energy and enthusiasm of receptive and innovative peoples, of those who want the change and who can be the motor of change.
- Supporting the staff on the whole process is essential, because in the conditions in which they have at their disposition all the necessary means for counteract the fear of unknown or by how to react upon a new situation, the process will be more accepted.
- Serving the mistakes and fails like normal and acceptable results of experimentation (learn from mistakes).

4

- Evaluating and being aware of managers reactions at change, before to communicate to the team, the necessity of implementation the change with its implications.
- The frequent, unswerving and individualized communication with the members of team, cheering up the honest feed-back from their side.
- In the conditions there are employees who don't want to accept the change under any aspect, it can be resort to unwanted methods, like: manipulation and radical decision.

The change must be careful followed and managers must tell the peoples the progress made and offer a prop for surpassing theirs fears. The same attention need to be given to the review of systems, methods, techniques, practices and politics adopted, to follow the must adequate way for touching the purposed objectives.

In conclusion, paraphrasing what said a spokesman of Sheffield University "Change is all about people, people, people!", we are reserving the right to assert that "The resistance to change is all about communication absence". So a tight and open collaborate between managers and employees, will drive at the increase of success chances into the touch of targets which aim an organization.

In recent years the talk increasingly about performance and so were many concepts regarding the definition, classification and highlighting ways of enhancing performance in an organization. Management concepts that dominate modern organizations are value and performance, to measure performance is to assess the value and the known causes of the value "translate as" performance. In this sense performance requires a global vision of interdependency parameters of internal and external, quantitative and qualitative techniques and human, physical and financial indicators of management. An important role is assigned to processes involved in the value creation mechanism, along with production and consumption, and a number of processes in the natural environment and society are critical, because performance is not only within the enterprise or beyond.

Keywords: performance in the public television service, typology of performance, staff performance, economic performance, management performances.

JEL codes: M10, M31

Some authors consider that the performance is a certain level of best results obtained by an organization, which is closely related to the concepts of competitiveness and competitive advantage. A highly performing company should pay special attention to the following factors: the resources of production, work processes, organizational side, the beneficiaries (according to the theory of AD Little). The notion of performance brings to the fore the concepts of efficiency and effectiveness, indicators of their expression being of particular importance in this context. A performance goal set implies convergence in the organization's guidelines, practical performance is not simply finding a result, but it is the comparison between the result and the goal. Profit has lost its role as the basic indicator of performance of the modern organization, lost its position in favor of value, incorporating the benefits of a very important component as: cash flow, time, risk and moral, humanitarian, social, cultural issues. Thus use and management of resources cannot be separated from performance, which is the ultimate goal of their use.

Performance is a result obtained particularly in the management, economic, commercial fields and others alike, which features prints of competitiveness, efficiency and effectiveness of the organization, and its structural components and processes. We can conclude by stating that performance in the public television service is a certain level of best results obtained in a specific context, determined especially by: the set of objectives, competition, expense management, work organization, involving and motivating staff, technical characteristics, specificity of the offer and the management team.

The targets set in order to achieve the performance standards set in public television should cover a number of issues: to be clear and precise, measurable through indicators, easily obtained in the specific context of broadcasting, realistic and tangible.

Competition is an important factor that determines the consequences of the performances of a television, as the market becomes crowded and targeted.

How expenditure is handled is a decisive factor when determining the level of performance of public television, as financial resources are set and achieved and goals meet the public's expectations.

Organization of work must be performed to determine the performance of the tasks of performing the service, to delimit and dimensional accuracy of the process, to ensure correspondence between the objectives of the process and eliminate a number of inherent failures in conducting any activity.

Involving staff in conducting activities to achieve the objectives and requirements arising from the job description of public television have a certain level of performance that relies on quality of the service. The degree of involvement of staff is influenced by political motivation and recognition of merit.

Equipment is a technical requirement to achieve performance and special about this coverage as high-level nationally, resulting in public accessibility to the offer of a public television station. Specific offers are a key to attracting the public to public posts, compared with the commercial offer public television has a number of features derived from its own.

The management team is directly involved in achieving performance, but this is public television called on political criteria - according to the laws in force - and the subject - such institution policy. Thus combining the powers with certain political interests could negatively influence the performance of the institution, in particular by drawing some goals - especially editorial - or by committing certain costs.

Regarding the type of performance, we must consider all the factors which contribute to the smooth running of the business of television, but focused and targeted on achieving performance audiences. Since most of the main objectives of television refer to gaining an audience as large - which implicitly draws revenue from broadcasting advertising - both for commercial television, and for the public - we appreciate that all other elements of performance should be targeted to obtain results in terms of TV station audience and ratings respectively. In this respect, we consider a relevant relational system can be the basis for performance - shown in Figure 1 - which can be considered as a managerial tool in shaping strategies of performance in public television services.

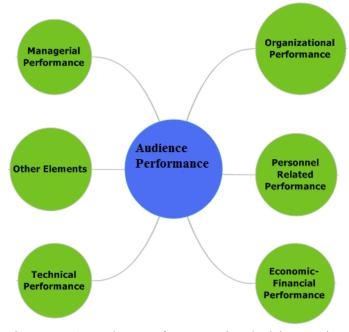

Figure no. 1 Typology performances in television services

Regarding the performance of the audience, there must be regard to the quantitative dimension - the number of subjects pursuing a broadcast TV and the quality - the message. Looking for explanations audience broadcasting a message, through research I found and made determinations outlined extremely diverse, making them a set of factors that generate and influence the audience in general. We also concluded that factors influencing the TV audience are divided into two broad categories: exogenous - extrinsic message - and endogenous - intrinsic message.

The category of exogenous factors that determine significant influence over the performance of the audience, it is notable in particular areas of distribution, promotion and launch schedules, "neighborhoods" and broadcast time, coverage of the channel in question, such as public availability.

Public access is a major issue, and it is favored by the actual time of the broadcast. In time, the maximum audience has come to focus on section19-23 PM, called the prime - time; specialists have also noted an area where the audience is making some increases is 15-17 PM, which they called prime time access.

While launching and / or promotion requires less time compared to determining the distribution hour, it plays a quite important part. Abundance of TV broadcast supply requires TV broadcasters to focus their efforts and practice aggressive marketing trends, both by promoting with the use of their own channels, and by promoting through other media channels. In this context, the ability to determine the key points that distinguishes them so as to offer - and provide the desired audience is extremely important to marketing professionals. Another aspect of the problem is outlined in the design of a promotional message, so that it covers both the public who is constantly seeking a certain TV program, featuring recalling the message as a key element and the capacity to attract new viewers. We must specify that self-promoting messages should be as close to the audience's "horizon of expectations" in order to insure success.

"Neighborhoods" of airtime refer to the broadcast of the channel's own broadcasts succeeding or preceding a certain show, and "Across" are competing channel broadcasts within the same timeframe, both elements generating some influence over the audience. It is recognized and demonstrated - through ratings curves - that when a show is successful, it is also beneficial for program that follows. An important element of the scheduling of broadcasts on the grid is the "locomotive" - the issue of a successful show that attracts large audiences not only to the channel it's aired on, but also to the neighboring broadcasts afterwards. Across sites act exactly opposite, a successful show at a TV channel causes audience to drop on other channels within the same timeframe.

Degree of coverage of the respective channel is also important for the audience, as a network with a national coverage will obviously reach another audience compared to a regional one.

Availability of the public, at a certain time, to receive a TV message is an important factor, but very difficult to evaluate and measure by a station in all its valences, especially because that involves a complex of phenomena which belong to the intricacy of the human being.

Concerning endogenous factors, they are grouped according to the nature of the show. In this respect, specialists have concluded that there are two categories of TV shows: on one hand we have the artistic ones, on the other hand the publishing type, credited with lower potential audience.

Audience of the artistic/show type of broadcasts varies depending on a number of phenomena, such as the accessibility of the message, particularly its simplicity, a phenomenon resulting in greater ratings, often at the cost of reducing the quality of information transmitted, the nature of the theme, the genre that the message features, which in turn may be decisive elements in certain social conditions, conditions in which both the world investigated and universe of issues addressed, becoming factors which promote or inhibit ratings. As for the stars – which should be a magnet on the public - but having taken into account more aspects, for instance how stars can be guests on the show or the actors in a movie, or the presenter or host of the show; moral wear

of the message and even the physical state of the material broadcasted – broadcasting an old film; the combination of value and what is in fashion (a kind of music for example); here, states in the collective are faced, determined by the realities of life, influencing a television channel's ratings. Regarding journalist shows, through their particularities they bring into question a set of specific factors which influence the audience. Among these points the most significant are: the subject as the most important factor, the star / stars, television is the one that stole film its monopoly over creating and launching stars, the live broad cast, which has a very important impact on the audience, the more so as this may be the maximum interest events such as a band or a sports event policy; factors clinging one to a message, including here - the title of the show, the beginning of the show (picture frames, phrases presenter etc..) the point of messages and the broadcast, factors in the case short of publishing schedules which are more important than for artistic shows, here it is necessary to take into account the desirability of the program, which should be based on certain specific principles, as failure in scheduling can significantly reduce a TV station's audience.

Management performances are determined by a number of issues such as: the manager's competency- which determines the quality of decisions and employees - a particular role here being held by the selection process - organizational culture - organizational values, behavior standards, symbols, etc.., Influences exerted by the environment, national and international - social factors, cultural, legal, ecological, political, demographic, economic - the way of solving problems, the quality of instruments used, etc..

Organizational performance refers particularly to the objectives assurance process and the structural-organizational degree of coverage of the work processes involved in achieving objectives.

The degree of assurance process of the targets set for a certain period of time reveals the extent to which the delineation and sizing processes meet the employment objectives categories - basic, level I and II derivatives, specific and individual - recognized by the theory and practice of management science. Such organizational performance can be expressed by the correlation between objectives and the process set out:

- TV station→ fundamental objectives:
- functions \rightarrow grade I derivates;
- actions \rightarrow grade II derivates;
- attributions \rightarrow specific objectives;
- tasks \rightarrow individual objectives.

The degree of structural-organizational coverage of work processes involved in achieving objectives refers to the need for retrievable processes in the work process development, which requires a specific framework. It is very important that each process component has a support structure in order for appropriate organization to be exercised. In general, the process can be retrieved from an organizational point of view as follows:

- TV station→ organizational chart;
- functions \rightarrow department;
- actions \rightarrow compartment;
- attributions → service;
- tasks \rightarrow job.

Staff performance is determined by a number of issues such as: a carefully defined policy with regard to recruitment, selection and hiring of staff - with particular emphasis on transparency and professionalizing benefits and design - application of the principle of continuous training of staff, a consistent and coherent system to motivate staff, training of teams working under the principles of work, initiative and creativity development, providing a favorable climate for communication within and outside the institution, aligning the activities of staff under the organization's culture.

Economic performance - are the consequences of effective financial management and relate to achieving higher levels as compared to targets, competition and the situation in previous years, of

measurable results. In the case of public television, a special position is held by the manner in which financial returns are allocated and committed to carry out other forms of expenditure, because the amounts advanced in large part come from the TV tax and budget allocations.

Performance technical concerns last generation equipment and quality of signal procurement, which depends on other factors unrelated to the television network in question - such as certain weather and reception and transmitting signals by the National Radio Communications Society. Under the **other performances** category, there is especially marketing and communication performance, the ability to organize and to engage in certain special social and humanitarian events.

This paper has as objectives the highlighting of motivation theories applied in real situations and also the tendencies noticed at the workplace. We used as methods comparison between some theories and also between theory and practice and also some statistics got by different institutions. In conclusion, of all the resources available, the human resource is clearly the most significant, but also the most difficult to manage. Excellence can only be achieved through excellent performance of every person, rather than by the high-pitched performance of a few individuals. And motivation is, undoubtedly, the crux.

There is no simple answer to the question of how to motivate people. Can money motivate? Yes, but money alone is not enough, though it does help. The leadership quality is that which leads to the success of a company through team building and motivating its people.

Keywords: motivation, employee, satisfaction, workplace

Theories regarding employee motivation

Management literature is replete with actual case histories of what does and what does not motivate people.

1. 'Stick' or 'carrot' approach?

The traditional Victorian style of strict discipline and punishment has not only failed to deliver the goods, but it has also left a mood of discontent amongst the "working class". Punishment appears to have produced negative rather than positive results and has increased the hostility between 'them' (the management) and 'us' (the workers). In contrast to this, the 'carrot' approach, involving approval, praise and recognition of effort has markedly improved the work atmosphere, leading to more productive work places and giving workers greater job satisfaction.

2. Manager's motivation 'toolkit'

The manager's main task is to develop a productive work place, with and through those he or she is in charge of. The manager should motivate his or her team, both individually and collectively so that a productive work place is maintained and developed and at the same time employees derive satisfaction from their jobs.

This may appear somewhat contradictory, but it seems to work. The main tools in the manager's kitbag for motivating the team are:

- -approval, praise and recognition;
- -trust, respect and high expectations;
- -loyalty, given that it may be received;
- -removing organizational barriers that stand in the way of individual and group performance (smooth business processes, systems, methods and resources see outline team building program);
 - -job enrichment;
 - -good communications;
 - -financial incentives.

These are arranged in order of importance and it is interesting to note that cash is way down the ladder of motivators. Let's look at a couple of examples taken from real life situations. The Swedish shipbuilding company, Kockums, turned a 15 million dollar loss into a 100 million dollar profit in the course of ten years due entirely to a changed perception of the workforce brought about by better motivation. At Western Electric there was a dramatic improvement in output after the supervisors and managers started taking greater interest in their employees.

3. Don't coerce - persuade!

Persuasion is far more powerful than coercion, just as the pen is mightier than the sword. Managers have a much better chance of success if they use persuasion rather than coercion. The former builds morale, initiative and motivation, whilst the latter quite effectively kills such qualities. The three basic components in persuasion are:

suggest;

play on the person's sentiments; and

appeal to logic.

Once convinced, the person is so motivated as to deliver the 'goods'. The manager will have achieved the goal quietly, gently and with the minimum of effort. It is, in effect, an effortless achievement. More contemporary 'persuaders' used by advertising and marketing people include:

faster talk is found to be more effective, since it is remembered better;

brain emits fast beta waves when a person is really interested in a particular presentation; These waves can be detected by an instrument.

subliminal approach using short duration presentation, whereby the message is transmitted below the level of awareness.

Can these findings be used in actual work conditions? AT&T (The American Telephone and Telegraph Co.) recognizing the importance of hidden needs, at one time succeeded in promoting long distance calls by use of the simple phrase: 'Reach out, reach out and touch someone'. Managers will need to adapt this persuasion / motivation technique to their own situation.

4. Job satisfaction - is there a trend?

This is the title of a study carried out by the US Department of Labor among 1500 workers, who were asked to rate the job factors, from a list of 23, which they considered important starting from the most important factor.

and .	C* 1'		• .1	. 11	1 1
Their	findings are	contained	in the	a tahla	pelow.

Job Satisfaction Findings		
White-collar workers	Blue-collar workers	
A. Interesting work	A. Good pay	
B. Opportunities for development	B. Enough help and resources	
C. Enough information	C. Job security	
D. Enough authority	D. Enough information	
E. Enough help and resources	E. Interesting work	
F. Friendly, helpful coworkers	F. Friendly, helpful co-workers	
G. See results of own efforts	G.Clearly defined responsibilities	
H. Competent supervision	H.See results of own work	
I. Clearly defined responsibilities	I. Enough Authority	
J. Good pay	J. Competent supervision	

It is interesting that out of the 23 job factors listed for the survey, yet with the exception of two items (white-collar workers' choice (B) and blue-collar workers' choice (C)) groups selected the same top ten factors, although with different rankings. It is significant that good pay was

considered as the most important factor by the blue-collar workers, but it ranked as the least important for white-collar workers.

5. Individualize motivation policies

It is well known that individual behavior is intensely personal and unique, yet companies seek to use the same policies to motivate everyone. This is mainly for convenience and ease compared to catering for individual oddities. 'Tailoring' the policy to the needs of each individual is difficult but is far more effective and can pay handsome dividends. Fairness, decisiveness, giving praise and constructive criticism can be more effective than money in the matter of motivation.

Leadership is considered synonymous with motivation, and the best form of leadership is designated as SAL, situation adaptable leadership. In this style of leadership, one is never surprised or shocked, leadership must begin with the chief executive and it is more a matter of adaptation than of imparting knowledge. Ultimately, it is the leadership quality which leads to the success of a company through team building and motivating its people.

6. The one-minute manager'

To start with, the manager sets a goal, e.g. one page read in one minute, and it is seen to be achieved by 'one minute' of praising or reprimand as the case may be. But to be effective, these must be given (a) promptly, (b) in specific terms, and the behavior, rather than the person, should be praised or reprimanded.

The concept is basic and it makes sense, although the book seeks to 'dramatize' it. 'One minute' praising is seen to be the motivating force. Everyone is considered a winner, though some people are disguised as losers, and the manager is extolled not to be fooled by such appearances.

7. Lessons from America's Best-run Companies'

Several criteria, including analysis of annual reports and in-depth interviews, were used to pick 14 'model excellent companies' out of an initial sample of 62 companies. As expected, most of the action in high-performing companies revolved around its people, their success being ascribed to:

productivity through people;

extraordinary performance from ordinary employees;

treating people decently.

Personnel function and in particular leadership were considered the most critical components. If the leaders in an organization can create and sustain an environment in which all employees are motivated, the overall performance is bound to be good. The three essentials for creating such an environment are:

fairness; job security; and involvement.

Of all the resources available, the human resource is clearly the most significant, but also the most difficult to manage. Excellence can only be achieved through excellent performance of every person, rather than by the high-pitched performance of a few individuals. And motivation is, undoubtedly, the crux.

There is no simple answer to the question of how to motivate people. Can money motivate? Yes, but money alone is not enough, though it does help. Human resource remains the focal point and leadership the critical component, and motivation has to be 'tailored' to each individual.

REGIONAL CUSTOMS DIRECTORATES MANAGEMENT

Caba Stefan

National Customs Authority Cluj Regional Directorate for Excise and Customs Operations

Căuș Vasile-Aurel

University of Oradea Faculty of Science Department of Informatics and Mathematics vcaus@uoradea.ro

The management of a regional customs directorate is analyzed. A new approach of the managerial system, in the European integration context, is presented.

The customs system is one of the first "doors" to a new economic, social and cultural community. For that, the system must be adapted to European demands in a fast and efficient manner. Obviously, the methods used in management have to be improved. The role of customs system has dramatically changed and, consequently, the coordination of all activities have to change also.

1. Introduction

The adhesion of Romania to the European Union represents a fact with major implications for every citizen. The importance of this fact is, however, differently dimension at personal level. Depending on the possibilities, responsibilities and aspirations of each one of us, the adhesion process and the adhesion itself has been looked upon showing more or less interest. Like every major process, the implications it withholds are of a nature able to bring structural and strategic modifications at all levels.

As of 2007, we are literally part of a cultural, economic and social universe, which includes differences compared to what we have meant as a country to that moment. The efforts made in the pre-adhesion process, as well as those made during the adhesion phase, represent a challenge which cannot be easily faced. To problems automatically generated by the necessity of adaptation to new requirements adds the inertia of a new system that, year after year, has been marked by the sickness of individuality built on non-loyal competition and on structures of relations which very seldom have had bounds to professionalism. These are premises which, among other facts, complicate the alignment of Romanian public institutions to the standards present in most European countries.

The European Union is not purposed as a structure which has as a main purpose helping countries stranded behind development. It is conceived as an inter-state community, in which each country must bring its contribution to assuring an economic-social stability, also maintaining of cultural, ethnical and confession diversity. All this must be achieved by obeying rules, which, for Romania, as a new member, means supplemental efforts. Perhaps the biggest problem is one of mentality, and the rational system of a nation cannot be changed during a short period of time. Therefore, the overlap of a complex gearing, mostly new, over an almost historical mentality, is probably the most difficult aspect of integration.

Begun long ago, the process of reforming public institutions as a part of adhesion efforts has been and is marked by the political handprint of decisional forums. One of the first institutions which have taken important steps toward the accommodation with the European vision was the National Authority of Customs (under its diverse names and organizational structures). Romania is presently a part of the border of the European Union, therefore the customs system must satisfy, at the highest level, the exigencies imposed. With an important role in protecting the European market and also the national market, this system must reach the level where it can fulfill the tasks it is faced with, these being not a few or unimportant.

The structures of the National Customs Authority contribute, directly or by cooperation with other institutions, to the actions of pursuit and collecting of a category of taxes and debts to the national budget, as well as to the prevention and eradication of some contravention phenomena, and so forth. It will not be insisted here on the actions which require the implication of customs entities, but it is obliged to underline some of the aspects which have been modified along with the adhesion of Romania to the European Union.

The statute of border of the European Union imposes to Romania a reorientation regarding the accent posed on different border points. If until 2007, the border points at the western border have mostly represented the central points regarding human and material placements, along with the attainment of the quality of member of the Union, the accent is transposed to the northern, eastern and southwestern borders. Thus, most of the restructuring actions regard the above stated regions. The regional excise and customs operations directorates have been forced to adopt strategies correlated with the national geographical positions in which they are placed. On one hand, some regional directorates have been forced to pay special attention to customs traffic of entrance in the European Union: on the other hand, other regional directorates had to adopt measures to assure the fluidity of traffic inside the Union. These are, obviously, just a part of the tasks to be accomplished at the level of the structures placed under the authority of the National Customs Authority.

References will be hereafter made to some aspects of the activity of a regional directorate of excises and customs operations, and we will present some points of view regarding the management of these entities. Because management is an extensive notion, we will stop upon performance management, as part of that of human resources.

2. The management of performance at the level of regional directorates for excises and customs operations and subordinated structures

The statute of member of the European Union has determined, at the level of the National Customs Authority, the adoption of some strategic policies which are to reflect the modifications imposed by the new status. It must be underlined that, given the nature of the service, the personnel involved in this structure is undertaking some specific pressure, temptation and risk. Furthermore, professional performance, honesty and equity must be appreciated, as they are elements which assure the functionality of the system, and are under careful observation by the competent national and European forums.

The notion of performance management is one frequently used in current language, but which has different meanings in the concept of each one of us. We see ourselves obliged to specify the meaning we give to this notion, in the present study. We will look upon performance management as a part and parcel of the management strategy of human resources, a transpose of department strategies to performance objectives, practical and realistic.

Generally, the purpose of performance management is to monitor, reiterate and reregister the performance of staff, in order to allow access to promotion, to help the planning process and to contribute to the improvement of the management process. A quality management of performance is a condition of a successful strategic management. It can therefore be stated that performance management is the most important function of human resource management, as it allows the establishment of a connection between individual purposes and institutional objectives.

An efficient performance management must allow the quantification of personal achievements in an unbiased manner. Such a system must be built with the purpose of providing an unbiased and correct analysis from those competent and, at the same time, to encourage constructive feedback from those evaluated.

Several components of the system are identified as follows:

- Performance planning.
- A competence-based approach.

- Forming the evaluation collective.
- Providing a permanent feedback.

Performance planning implies the adoption of measures which are to assure an evaluation as correct as can be. Therefore, there is imposed the establishment of performance objectives, adapted to the purposes attributed to each post. It must thus be analyzed whether the employee is able to fulfill the tasks attributed, and afterwards the way he/she has fulfilled them.

The approach based on competences implies firstly the separation of basic competences from functional ones. The purpose of this approach is, on one hand, that of establishing the competences required for occupying a certain position, and, on the other hand, that of analyzing the means by which the tasks have been accomplished, for instance the time necessary for the fulfillment of certain tasks, the quality of their fulfillment etc. These are quantifiable elements, which can contribute to the hierarchy of those evaluated. In other words, the stress is placed not on that which is done, but on how it is done. We can thus compare activities which differ in content, and it is contributed to the identification of common quantification elements.

The evaluation collective is to be formed out of high moral profile, with superior authority, hierarchical and professional position to those evaluated, in order to avoid, among others, the creation of an atmosphere which can bring doubt upon the competence and morality of the evaluators

The assurance of feedback is crucial in performance management. The customs system is in a continuous and dynamic change, both because of modifications generated by the process of European integration, and because of the diversification of the tasks attributed to it. This is why performance standards undergo faster changes than other domains. To apply the same standards on a long term means to deviate from specific realities of each post. It thus becomes impossible to maintain pace with the dynamic of the employees' actions without being in constant contact with them. The feedback function must be assured the more it is indicated that the functions of performance evaluation not be accomplished by personnel immediately superior to that being evaluated.

The application of performance management at the level of units subordinate to the National Customs Authority implies extent knowledge of the system, of specific activities and of employee psychology. The entire system has confronted and confronts the lack of trust from the population regarding the integrity of employed personnel. An exhaustive research on this phenomenon has not been conducted, and the image created is more the result of public exposal that that of a reality. Any institution with broad visibility is undergoing criticism on a larger scale. It is actually a reality which the employees of the customs system and not only them alone, must accept. Furthermore, individual performance which is not the subject of publicity must be pointed out and recompensed in different ways within the system. Some specific elements are thus identified for each component of performance management in the customs system. In the present study, we have looked upon the case *Regional directorates and subordinate entities*, because at this level there meet in a greater measure basic components as well as functional components of competence.

Regarding performance planning, the specific objectives of these entities must be enumerated. Not all of them will be presented, but some of them will be noted:

- Pursuing and collecting of customs taxes
- Pursuing and collecting excises
- Oversight of product producing firms subject to excising
- The assurance of customs control for import products
- The assurance of fluidization of customs traffic, for wares originating from the European Union, as well as for those originating from outside the E.U.
- The cooperation with the institutions implicated in the supervising and diminishment of forbidden product traffic
 - The supervising of product transit and hazardous waste etc.

For each of these activities, as well as for each of those not enumerated, it is imposed the establishment of performance indexes, to measure not necessarily the quantity, but the way in which each employee conducts his/her activity. A conclusive example of this approach is that that a higher level of penalties applied as a result of discovering of illegal activities does not necessarily mean a more efficient activity. On the contrary, a more reduced level can mean a better efficiency of the actions of preventing. Another example: a customs agent who does not register confiscation of wares can be corrupt, or, on the contrary, extremely fair, and therefore avoided by potential felons. In other fields, the hierarchy of performance can be simpler: for example, the productive fields, where, in most cases, performance is measured by directly observing quantity and quality of the products realized by each employee. Therefore, an efficient management of a performance management system differs from one field to another, and is far more complex in the customs system.

The establishment of competence is another element of elevated complexity. A customs agent must possess, even if only intuitively, knowledge regarding psychology and human behavior. These are already elements which can make the difference: those who cannot fulfill their job tasks, those who fulfill them consequentially, and those born for the job they have chosen.

Furthermore, as a consequence to the complexity and diversity of activities which can be tasks of customs agents, the members of evaluation teams must rather be perfectly acquainted to the system than to the personnel to be performance-analyzed. The idea stated earlier is withheld, according to which these evaluations must be made by personnel who is not immediately superior to that evaluated.

In conclusion, it can be stated that a strategic management at the level of the National Customs Authority cannot be successful without the adoption of a performance management system applied at the level of subordinate entities, system for which it is compulsory to adapt to specific factors. Such a system also creates the premises to access to promotions attributed to each employee, the position corresponding to the training, participation and er individual performance.

This article presents some findings of the E-Learning Manager (ELM) Project regarding the skills an elearning manager should possess in order to achieve his/her mission. At this point the project is still in the first stage of it. For the design of the skill card there were identified three domains/units in which an elearning manager should possess skills: pedagogy, technology and management. This article presents some aspects regarding our findings on the management unit.

Keywords: e-learning manager, management, skill set

JEL classification: I20, I21, I29

Introduction

Nowadays, constant innovations and rapid technological changes are commonplace in business. This arises the need for continuous vocational training and the lifelong acquisition of skills and competencies. The use of e-learning to provide vocational training has become an important issue on the European agenda, providing a solution to the question of providing training and assessment on an international scale, regardless of distance, or language.

At the moment, there is no certification in e-learning in Europe being offered. This suggests that there is both: (i) a lack of qualified practitioners, and (ii) individuals who may have experience in e-learning, but lack accreditation. Therefore, a certification in e-learning development would be use not only to those who may work wish to work or already work in the e-learning sector but lack formal accreditation, but also to established individuals already working in the e-learning sector who wish to continue their professional development to keep their skill card up to date.

Research methodology

This paper is based on the **E-L**earning Manager Project (ELM), a Leonardo da Vinci project. Based on the first meeting's findings, held in Cork Ireland, in last November, we conducted a qualitative research, based on an extensive literature review on the managerial abilities or skill an e-learning manager should possess in order to fulfill their mission. The findings of the article we're used in the construction of a questionnaire which intends to validate the theoretical hypotheses.

Description of the project

The ELM project aims to develop a European skill card for a computer-enhanced instructional designer. This skill card will be made available through an integrated European skills acquisition system project: an online system for browsing the skills cards available, performing self-assessment online, collecting evidences, and receiving a formal assessment of the evidences online before being accredited as an e-learning manager.

In the project there are six partners involved: Department of Education Development of the Cork Institute of Technology (DEIS CIT) - Ireland, International Software Quality Institute (ISQI) - Germany, International Software Consulting Network (ISCN) - Austria, Corvinno Technology

Transfer Center Ltd. – Hungary, Babeş-Bolyai University – Romania and Plovdiv University – Bulgaria.

The current stage of the project

At this point the project is still in the first stage of it. For the design of the skill card there were identified three domains/units in which an e-learning manager should possess skills: pedagogy, technology and management. This article presents some aspects regarding our findings on the management unit.

The term management covers a wide range of fields and domains but we should address only those aspects that are interrelated with pedagogy and technology units and also with the skill set sub headings identified: e-learning project management, organizational analysis, knowledge management, change management, standards, evaluation and audit, financial management etc.

Project management

"Project management is the discipline of planning, organizing and managing resources to bring about the successful completion of specific project goals and objectives". "A project is a temporary endeavor undertaken to create a unique product, service, or result." "42"

Effectively controlling projects requires a disciplined approach to project initiation, execution, implementation, and post-implementation. This includes having the right people involved, following standard project management processes, and using a set of project management tools for effective execution.

Organizational analysis and stakeholders

An organization's behavior is in a constant and progressive change "new demands from consumers on an individual level, new demands from companies for training courses, a determination to achieve improved productivity etc. as if some form of technological determinism existed), as is the relationship between society and technology, up to a certain point, it being obvious that social innovation does not occur at the same speed as technological innovation. This twofold change imposes upon service providers a certain number of changes, many of them far-reaching and major." ⁴³

Dealtry R.,⁴⁴ stresses that learning management systems "are too e-learning technology driven, emphasizing the virtual component and neglecting the precursory development of a vibrant and committed formal learning organization culture and infrastructure". He proposes a constructivist methodology when designing and implementing strategic new learning and knowledge-based organization development investments. The author identified several functions and activities that are subject to transformation within an organization in order to enable it to obtain a strategically accepted learning environment.

Knowledge management

"KM is the process through which organizations generate value from their intellectual and knowledge-based assets. Most often, generating value from such assets involves codifying what employees, partners and customers know, and sharing that information among employees, departments and even with other companies in an effort to devise best practices". 45

43 Coulon, A. (2001), Impact of open distance learning on organizations, pg. 3

⁴¹ www.wikipedia.com

⁴² www.pmi.org

⁴⁴ Dealtry, R. (2005), Configuring the structure and administration of learning management, pg. 467

⁴⁵ Levinson, M. (2008), Knowledge Management Definition and Solutions

Bellinger G.,⁴⁶ tried to define 'knowledge' in the context of an organization and the problem of managing the knowledge. Citing Fleming N.,⁴⁷ who stated that "a collection of data is not information, a collection of information is not knowledge, a collection of knowledge is not wisdom, a collection of wisdom is not truth", Bellinger states that: "When a pattern relation exists amidst the data and information, the pattern has the *potential* to represent knowledge. It only becomes knowledge, however, when one is able to realize and understand the patterns and their implications." A pattern "embodies both a consistency and completeness of relations which, to an extent, creates its own context."

Karl-Erik Sveiby cited by Barclay M.O. & Murray P. (1997) identified two "tracks" of knowledge management:

- Management of Information. To researchers in this track: "... knowledge = Objects that can be identified and handled in information systems."
- Management of People. For researchers and practitioners in this field, knowledge consists of "... processes, a complex set of dynamic skills, know-how, etc., that is constantly changing."⁴⁸

Standards

An e-learning manager should be aware, or know the different standards that exist in information technology in order to ensure that the content development is compatible with the delivery system chosen to transmit the content and also to ensure a proper evaluation method and feedback solution. He also has to know the standards or specifications in the field e-learning. But the problem of standardization in e-learning can be a difficult task if we take into consideration the abundance of information technology standards that facilitate the design, deployment and assessment of an e-learning mission.

Singh H. and Reed C. ⁴⁹ state that "strictly speaking, there are no e-learning standards. Instead, there are a series of groups developing specifications". The author argue that as the process of standards or specifications implementations will spread in the e-learning community there will be an increase in specific and significant capabilities like: content portability, granularity, interoperability, e-learning and knowledge management.

Svenson M., ⁵⁰ identifies four major advantages of standard development and use:

- 1. Durability no need for modification as versions of system software change.
- 2. Interoperability operability across a wide variety of hardware, operating systems, web browsers and Learning Management Systems.
- 3. Accessibility indexing and tracking on demand.
- 4. Reusability possible modification and use by many different development tools."

ROI of e-learning

"In finance, rate of return (ROR), also known as return on investment (ROI), rate of profit or sometimes just return, is the ratio of money gained or lost (realized or unrealized) on an investment relative to the amount of money invested. The amount of money gained or lost may be referred to as interest, profit/loss, gain/loss, or net income/loss. The money invested may be referred to as the asset, capital, principal, or the cost basis of the investment" ⁵¹ The problem of quantifying ROI for an e-learning (in higher education institution or in private companies) mission is that it can't be expressed strictly as "the ratio of money gained or lost" because the

⁵⁰ Svenson, M. (2001), e-Learning standards and technical specifications, pg. 4

⁵¹ www.wikipedia.org

outcome of e-learning, the increase in knowledge and skills can be quantified only in qualitative terms even though these qualitative benefits can offer indirect financial benefits for all the stakeholders.

An e-learning manager in order to ensure e-learning is used by learners and embraced the organization, should also have in mind that e-learning:

- -"it's about business and providing a business solution;
- -it's about providing a "return on expectation", not just a return on investment;
- -it's about enabling learning and driving performance, not training;
- -it's about people learners, managers and executives not technology;
- -it's about motivating learners and energizing organizations; and
- -it's about becoming invisible; interwoven into the very fabric of your organization and its culture." 52

Brown D.,⁵³ citing Bielawski and Metcalf ⁵⁴ presents the issues used in training evaluation "identified as being the ROI of training". These issues are: reduced number of training vendors, decreased training travel costs, decreased costs/hr of training, reduced time off task for trainees, increased audience impact, improved response time – meet needs, improved cycle time for training delivery, demonstrated knowledge during training, trainees satisfaction, increased positive management feedback.

The same authors, pertaining to the true value of learning identified the following relevant parameters: increased revenue/sales, decreased cost, improved customer satisfaction, improved quality, improved on-time delivery, increased productivity, improved cycle time, eliminated waste, improved safety record, improved employee satisfaction/morale, reduced employee turnover

Quality management

When it comes to quality and more to quality management most people think instinctively to ISO Standards. These standards are the most used and referred to in various fields. ISO issued o series of standards that settle the frame for a common language and approach regarding e-learning set-up (from a technology perspective ISO/IEC 24751-1/2/3:2008) and also the quality assurance process regarding e-learning (ISO/IEC 19796-1:2005).

ISO/IEC 19796-1:2005 is a framework to describe, compare, analyse, and implement quality management and quality assurance approaches. It will serve to compare different existing approaches and to harmonize these towards a common quality model. The main aspect is the Reference Framework for the Description of Quality Approaches (RFDQ).

Another institution who brought it's contribution to quality assurance and management for elearning is the QAA which released in 2004 the second edition of the *Code of practice for the assurance of academic quality and standards in higher education* which in *Section 2: Collaborative provision and flexible and distributed learning (including e-learning)* states the following: "Recent developments in learning that uses information and communications technologies ('e-learning'), have given rise in some quarters to the belief that this approach requires an entirely separate and distinct form of quality assurance."

In the academic literature Alistair Inglis⁵⁶, covered the problem of quality assurance, quality evaluation and benchmarking in the field of distance education and e-learning. He identifies

⁵⁵ Quality Assurance Agency for Higher Education [QAA] (2004), Code of practice for the assurance of academic quality and standards in higher education

⁵⁶ Inglis, A. (2008), Approaches to the validation of quality frameworks for e-learning

seven published quality frameworks applicable to the field of e-learning: 1. Quality improvement framework (Inglis, Ling and Joosten), 2. Benchmarking framework (McKinnon, Walker and Davis), 3. Benchmarks for success in internet-based distance education (The Institute of Higher Education Policy), 4. Universitas 21 global quality framework, 5. ACODE e-learning benchmarks (Bridgland and Goodacre), 6. Proactive evaluation framework (Sims, Dobbs and Hand), 7. Quality preference framework (Ehlers). The article concludes by considering a range of factors that have the potential to have an impact on the validation process of the frameworks.

Conclusions and further research

From the sub headings discussed in this article we can draw the conclusion presented below.

An e-learning manager has to consider project management as a continuous activity that doesn't stop after the final assessment because e-learning has to be a systematic activity in order to ensure the sustainability of the process and to offer a competitive advantage to the client organization. An e-learning manager has to know the existing project management tool: PRINCE 2, Microsoft Project Manager, and also the standards in the field like those issued by the PMI (pmi.org), and also project control systems to ensure that the project doesn't exceed the time, budget or human resource limitations.

Having in the term knowledge management we can conclude that an e-learning manger should understand and handle the concept of knowledge and it's importance to the client company considering the impact it can have on the mission, objectives, performance and ability to adopt to changes. Also the e-learning manager should be aware of the two approaches to knowledge management system: information and people.

For successfully managing the whole e-learning process or mission an e-learning manager should take into consideration the standards and specifications in the field among which we can list the following: ISO, AICC, IMS, LRN 2.0, Dublin Core, etc.

When it comes to ROI when dealing with the management of a customer organization which intends to implement an e-learning solution an e-learning manager has to "translate" the qualitative benefits into quantitative terms because he or she has to answer the question: how much will this cost us? Or how will our profit increase? addressed by management.

An e-learning manager has to adhere to some of the quality frameworks or standards in order to test his or her e-learning mission against an accepted referential. This is important from at least two perspectives: the recipient of the knowledge transfer and the client organization and the 'image' of the e-learning manager as compliance with quality standards increase the reliability and confidence on the client company.

As mentioned before the domains and sub headings regarding the management skills an elearning manager should have will be tested through three questionnaires available for respondents from the academic and industry area involved, more or less, in the design, implementation, exploitation and improvement of e-learning solutions.

Management is of paramount importance for obtaining economic, medical, commercial performances etc. in the fields conducted. Significant changes are required in this sector of human disciplines, focused on: applying professional management, managerial methodology, promoting strategic management, promoting an organizational culture that favours change, managerial restructuring of all the institutions (organizations) involved in the operation of the healthcare system in Romania, automating, decentralizing health services. The elements that make necessary the design of some modes of achieving strategic objectives are subject to the transition to a society, economy and management based on knowledge.

Keywords: Management, Healthcare, Hospital, Strategy

Success within the healthcare system of Romania

The success of a business depends on the capacity of the managerial team for achieving performance taking into account the opportunities and risks identified in the external environment of the organization, as well as on the strengths and weaknesses known as existing in the internal environment of the organization. In order to develop a business, any member of the managerial team should be involved in the planning, organization, coordination, control and assessment of the achievement of the objectives set up at the organization level. The last decade had witnessed major changes in the healthcare system, modifications of legislation and governmental strategies, which are reflected volens nolens at the level of the hospital as a public or private institution. Notwithstanding the modifications occurred, we should not ignore the two great desiderates of any managerial strategy, namely: the increase in service quality and the decrease in costs. The healthcare system of Romania is passing through a human resource crisis, which has become truly a threat in the recent years and which does not seem to have reached a feasible solution. Success or failure is conditioned to a great extent by the way in which the organization faces future changes. The technological revolution and globalization have changed the competitive

Success or failure is conditioned to a great extent by the way in which the organization faces future changes. The technological revolution and globalization have changed the competitive landscape in all the industrial sectors. The effect of these two forces may be noticed also in the sanitary system, the hospitals trying to enhance their competitive standing focusing on the demands of the market. Among the marketing strategies used most often by hospitals is the identification of and meeting the patients' needs and requirements. The hospitals aim at obtaining competitive advantages through strategic flexibility. Strategic flexibility means the capacity of the organization to respond proactively by changing the competitive conditions, this leading to maintaining or developing strategic advantages. The strategic flexibility involves also the cognitive ability to recognize problems and change direction, when it is imperative. Making decisions is a daily challenge managers are faced with, but one should know that not any decision should be made immediately.

A realistic assessment of the stage in the evolution of the healthcare service sector of Romania towards the knowledge-based economy may not be carried out other than by using international comparative approaches. It is very useful in this case to have the table of assessment indicators established for the Lisbon strategy, structured in five main components:

- innovation and research:
- liberalization and fluidization of the market;

- entrepreneurial and enterprise development;
- the extent the human resources are used and social cohesion:
- sustainable economic development.

The advantages of the implementation of some efficient management methods shall consist of the increase in the capacity of the organization for anticipating and acting efficaciously, for a sustainable and controllable development of the business, and the capacity for reducing or diminishing the risks within the internal and external environment of the organization.

The management generates economic performance at the organization level. Sanitary institutions are not simply professional organizations, but also business organizations of various sizes, which should be conducted so as to be able to stand competition and to meet the patients' needs and requirements at the highest technical and quality standards. A good planning should have a solid implementation basis, given that no one could foresee the future with certainty, but a project is more likely feasible, if based on past and actual accurate data and facts.

The knowledge that managers and contractors possess, besides their number and socioprofessional structure, their age, training level, attitude towards work, motivation degree, capacity for adaptation to changes occurred, the desire and capacity for development are all aspects that define the strategic options in the field. The European and international practices, the volume, complexity and difficulty of the strategic objectives assumed by the heathcare system in Romania recommend as major strategic options the following:

- -developing a national system of further development of specialists
- -ensuring a medical personnel of high professional competence
- -stopping the migration of physicians and other categories of graduate specialists
- -substantial enhancement of designing and conducting the resident physician examination
- -attracting increasingly specialists from other countries in order to fill in the vacancies in the healthcare system.

The factors influencing a strategic management decision are as follows: internal factors (stakeholders, directors, employees, unions; objectives, culture, resources), microeconomic factors (distributors, mediators, competitors, clients) and macroeconomic factors (political, economic, socio-cultural and technological). Stakeholders may exercise a significant influence as regards the priorities and direction of action of the institution, a fact most often reflected by the organization culture and the type of resources available to reach certain objectives. Unlike a private hospital, a state hospital does not have as an objective maximizing profit, but is able to focus only on increasing the medical service quality, depending however on the governmental policy.

At a microeconomic level, strategic alliances shall be favoured, whereas at a macroeconomic level, the strongest influence shall be exercised by technology. Technological development shall influence not only the products and services delivered but also the working process. Technology is changing rapidly and those that are not capable to adapt to these changes shall pay dearly. Medical technology is indispensable to health and life quality. In order to save lives, it may help to cure and contribute to millions of people recovering their vitality and mobility. Medical technology plays a very important role in the sector of medical care, in the prevention, diagnosis, healing and recovery.

The transition from a centralized and monopolist economy, having a tense relation structure (namely some mainly unilateral connections, lacking optional alternatives) to a competitive economy, based on the market mechanisms of the action of the law of demand and offer represents, undoubtedly, one of the most serious challenges of the current period.

Numerous organizations that provide healthcare services both in the public and in the private system have appeared lately also in Romania, a fact leading inevitably to competition in the sector of medical services, and resulting implicitly in the increase in the quality of medical services for the benefit of the consumer.

Overall, as regards the managerial processes of sanitary institutions, the forecast is usually less accurate than in the case of other types of organizations, especially as regards long-term decisions. Among the three forms of making the forecast – prognoses, plans and programs – programs have the highest frequency. Plans are developed most often for a year, but only by a limited number of managers, and prognoses are designed occasionally. Whatever the form of the forecast, this considers almost integrally the requirements of the relevant sanitary institution, not relating closely to the market.

The forecast related decisions are economic in character and refer most often to outcomes, revenues etc. They are based mainly on accounting and marketing information. Frequently, these decisions depend on the managers' talent and intuition, only accidentally the forecast managerial methods and techniques being used. In large sanitary institutions, in order to document certain forecasts, the method of meetings is used, most often in a preponderantly informal setting.

Programs and plans – if drawn up – are based mainly on internal information, completed by certain marketing information. There are rarely information sub-systems providing coherent packages of prospective nature. On the other hand, in order to manage current information, the management of program packages is preponderantly used. Most often, these process and provide information in the accounting, financial and personal domains.

To some extent, these potential deficiencies are counterbalanced by the rapidity with which both forecasts and especially the processes of their implementation reflect the changes in the environment. The hospital manager usually has rapid reactions as far as forecasts are concerned. As a consequence, the forecast process is flexible, continuously adapting to the endogenous and exogenous developments of the organization, especially in the short run, focusing on capitalizing on the existing resources. A significant contribution to forecast flexibility, combining often with a rather limited rigorousness of plans and prognoses, has the less formalized approach it is based on. A significant part of the processes documenting forecasts are preponderantly informal in character.

In general, public healthcare policies aim at promoting a health condition as good as possible and at reducing inequities between various groups of society; one should make sure health aspects are taken into consideration in all the healthcare policies. This involves the creation of the best preliminary conditions for health, minimizing risk factors, designing actions to prevent illnesses and to protect both the individual and the community against health risks. Besides it focuses on the traditional spheres of public health such as controlling infectious diseases, factors of the environment health, risk factors, injuries, healthcare policy

At the same time, the national public health strategy should take into account also the recommendations of the European Union regarding healthcare, within the Union expansion process. Romania as well as the other countries that have recently joined the European union could not participate in the previous programs of the union in the healthcare sector and has a weak institutional capacity, especially due to the fact the transition from the former sanitary system of the socialist type led to an erosion of the public health infrastructures so that we may conclude that that, as regards the public health, too, Romania is a step behind the EU member states. In order to maximize the benefit obtained from participating in the new public healthcare system of the EU, Romania should implement several preliminary measures, of "stage zero", with a view to correspond to the standards required by the new community program of action in the public healthcare sector, actions included in the recommendations of the Sanitary Policy Forum of the EU on 22nd November 2002. Among the recommendations made, we should list the following:

-enhancing the network of surveillance and control of transmittable diseases and improving the information system in the healthcare sector;

-developing a modern concept of public healthcare and public healthcare services, activating public healthcare specialists and strengthening patients' rights;

-involving the civil society in the development of public healthcare policies and in supporting the development of public healthcare infrastructure.

Therefore, one of the major overall objectives of the public healthcare strategy in Romania should be the consolidation of the public healthcare infrastructures for the purpose of ensuring an optimal framework for the implementation of interventions aiming at the improvement of the population health condition and ensuring the optimal participation in the public healthcare programs of the European Union.

According to the strategic plan of the Ministry of Public Health, health is a sector having a major social impact and after the accession to the European Union, it is mandatory to adopt some standards and recommendations resulting in the increase in the efficiency and quality of medical services. For these purposes, the Ministry proposes also to the local public administration authorities to contribute to financing medical services. The accession to the European space leads to the free movement both of patients that may thus make contact with other healthcare systems and modify significantly their requirements and expectations, but also of medical personnel that may migrate to better working and life conditions.

Conclusions:

Most countries, whatever their development level and political system, rethink their healthcare system for the purpose of increasing the quality of the medical services delivered.

The consumer nowadays is overwhelmed by a lot of information, and enjoys a great liberty in choosing its service provider, but at the same time it claims to be an active contributor to its own care. If patients are the ones dictating in the healthcare system, the organizations within the system should model their activities taking into account their requirements and last but not least we should consider that the organizations within the healthcare system provide patients with services the latter hope they will never need.

As regards medical care, the leader's role is crucial. Improvement should be a feasible way to follow and a controlled approach, which does not just "happen". The challenge to the leaders' capacity is especially great within medical care institutions, characterized traditionally by a divided management or dysfunctional barriers between the personnel categories.

The removal of barriers between the functional sectors is necessary in order to change the system effectively. Medical care has a long tradition of sub-optimization of functions, especially if the professions took over the exclusive control over the activities within their own competence.

In market economy, where there is a complex and turbulent competitive environment but at the same time an unstable one, in economic terms, the hospital may survive only if it innovates more (patients react positively to innovative methods), innovates faster (the first on the market to provide new services and high quality services may create its own patient networks before the competition), innovates better (by knowing target patients, the hospital may deliver services adapted to their needs), innovates by the lowest costs (the amelioration of the performance of the economic and managerial instruments being required).

ORGANIZATIONAL CULTURE IN ITS SPECIFIC ISSUES OF A MODERN COMPANY

Ciucescu Nicoleta

In the context of deep economic, political and social changes, in the last few years, the organizational culture plays a special role. The culture represents a basic element, no matter its nature and dimensions, contributing to the organizational success, to the economic and social progress. Changes in values' systems and objectives are important for the creation of a new type of the organizational culture, as an increasing factor in the managerial efficiency. There is not an unique culture for all mankind but a great variety of cultures which correspond to different forms of human existence.

Keywords: manager, organizational culture, modern organizations, types of cultures, characteristics.

Cod JEL: D23, M14

1. The conception of the Romanian organizations on the organizational culture

The organization is a dynamic system following the attaining of some objectives, being influenced by the social features of its members and, also, by the external environment. Each organization is composed by three elements of internal nature between which it may observe a keen synchronizing, on one side, and coordination, on other side.

The first element contains the totality of formal and tangible characteristics, respectively, the structure of the organization. This makes referring to a series of aspects as: official objectives and employed strategies, politics and rules of functioning, hierarch relations and the forms of conducting and of power exercising, the existent resources in the frame of the organization.

The second element is the culture including values, traditions, the beliefs, symbols and the mentalities which are common for a group of individues and sustained by specific, structural arrangements conferring a base for each organization. The culture has, in most cases, a strong influence on the premises of decisions, on behavior and actions of the employees.

The third element refers to individuals, conductors and the personnel of all hierarchical levels, they contributing to creation and modification of the organizational culture.

The organizational culture represents a reunion of rational or irrational, conscious, or unconscious, of groups or individual elements, which are influencing reciprocally and have a strong incidence on functionality and performances of the system. The concept of organizational culture is essential to explain the phenomena intervening in the running of the organizations. Between them may be cited:

- The creation in the frame of values system of a hierarchy influencing the directing the strategically process of the system;
- the determining of the frame of the interhuman relations;
- the configuration of the informational system;
- the establishing of the fundamental attitudes in comparison with the internal and external environment

The culture is themized and, in terms of organizational socialization, is a process of transmission of the culture to the new employees. This process includes:

- procedures, rules, norms;
- knowledges and social habits which contribute to realization of the assumed organizational role, but also of the working charges;

- the knowledges and diverse informations about the teamwork etc.

The organizational systems must fulfill a series of specific exactingnesses, as follows:

- to assure the continuity between past and future;
- to be able to make the analyze as a propre reference system without external marks and to be organized so that to contain the isolated components (cultural vocabulary) as a base to build some complex units;
- to be built so that to reflect the culture from where is part and to be reflected by this.

2. The types of organizational culture

The organizational cultural systems have been classified starting from a series of criteria, as for example: the domain of activity of the organization, the work nature, the feed – back type, the performance system used in the organization, the attitude of risk etc.

Charles Handy realized in 1993 a typology of organizational structure, identifying for types of culture (with the observation that these are not finding the pure reality):

- the culture of "Power type";
- the culture of "Role" type;
- the culture of "Charge" type;
- the culture of "Person" type.

The "Power – type" culture is specific for the small enterprises as, for example, the kind of political organizational structures, trade-unions etc. This culture is met frequently in small organizations, in some commercial and financial companies, and, also, in some trade-unions, political organizations and pressure groups with unic orientation.

Is that culture with a central source of power, said in other way, is structured around of a center of authority which exerces the control through the agency of a person which is very well trained and specially choosed, according to restain number of rules.

The control is let more in the charge of some individual persons and less in the charge of some committees. The functioning of the group depends exclusively on the decisions of the center, which are taken, in great measure, as an effect of the balance of the influences and less on the procedural reason or on pure logic.

A such a structure is the best given graphically under a form of a concentric net at whom can be associated a similar image to a web, where the power source is in the center, the force lines are radial from the central source to the exterior.

The power is concentrated at the level of a single promotor. The organization, which is in such a way structured, has the advantage of the rapid adaptation to the environmental conditions, to the demands of a dynamic market and answers rapidly to the evolution of the events, depending strongly, in the assurance of a continuous, of the decisions coming from the center.

The main characteristics are the communication from up to down, the centralized control, the decision being the expression of the power and not of the procedures. The center of the authority imposes a radial communication in which the decisions are transmitted from the center to the peripherical structures, and the informations are coming from the outskirts to the center. The system is attractive for the individuals desiring the power, the assuming the risk or the control of resources.

The success in an organization adopting this type of culture depends on the agressivity and on the capacity to work in a competitional atmosphere which is oriented on the power and politics, in which are predominant the rituals of humiliation, of differentiating, but to delimit the groups. Because the decisions are adopted at the top, without consulting the employees, the athmosphere is stressant. It is considered that workers have the behaviour as in X theory of Mc Gregor, so control is rigorous and the satisfaction in working is minor.

Therefore it can assert that the atmosphere of this culture may appear hard and severe, the success being accompanied by a low moral and a great fluctuation of labour force, just because of

individual failures or of leaving of this competition frame. Another limit is the fact that there are situations where the abilities of the power center are over solicited.

The values are focused on the individual performances, on the loyalty, on the egocentrism and on the physical and psychical resistance. This type of culture is based on the dicton "the scope excuses the means" because includes a great tolerance in what is concerning the used means to acieve the objectives.

The "Role-type" culture is characteristic for the great companies, for bureaucrat, standardised and formalised organizations; to this culture is associated the image of the "pyramid" or of the "greek temple". The columns of the "temple" are represented by the executive personnel and the roof of the "temple" is represented by the managers. Without "roof", the executive personnel will be in lack of strategical orientation and protection, while without "columns" the managers will be a non-sense. The values and the norms are given off from the "roof" of the "temple", they being clearly expressed in write, with an obvious formal and rigid tendence. In the frame of this model are developed subcultures specialised on departments: production, finances, supply, sales, personnel etc. All these departments form the "columns" on which is propped the temple.

This type of organization is characterized by strong functional or specialized sectors. It is a high degree of formalizing and standardizing, the activity of the functional sectors and the interaction between them being controlled by rules and proceedings, instructions, regulations of internal order, by defining the posts and the authority which are conferred to these posts, by the modality of communication and by regulation of the litigations in the functional sectors.

The hierarchic position is the source of power in this culture. The power is the expression of the influencing by rules and proceedings, that is the power of the position. The organizations centred on the role function well only in the stable, non-competitive environments and are governed by mechanicist bureaucratic formules.

The people are selected in function of the satisfactory achievement of their role, the personal power being not accepted, and the professional power of the expert is tolerated only in his place, the rules and the proceedings represent major methods od influencing. For the individual, the "Role – type" culture offers security and a favorable occasion to obtain a professional specialisation, a slow promotion.

The functioning is assured by the roles attributed to the personnel, to whom is demanding discipline, order, the respect of the rules and proceedings of internal order. For the individuals lacking of dynamism, to whom is not characteristic the creativity, but, also, to whom the stability is like a anchor of the career, the atmosphere is protective.

The communication is formal, ascendent in what is concerned the information, but is descendent in what is concerned the transmitting of the decisions, orders and messages endorcing the coordination of the work. This type of system is heavily receptive at changes and is adapting difficult to these changes.

The rigidity is the main disadvantage of this type of culture in the sense that, usually, the organizations perceive the change very difficulty and act very slowly in what is concerning the outlining of their future. Just for this reason it is possible, at a certain moment, that these organizations to be in one of the following situations:

- are breaking down;
- are failing;
- are changing the conducting team;
- are taken over by another organizations.

The "Role-type" culture is fitted to those managers which are building their success choosing for fulfilling of their role, instead to bring remarkable personal contributions, and in this sense they prefere to perfect the accepted methodology, instead the improve the personal rewsults.

This model of culture is not fitted to the managers who:

- are focused on the power;
- wanting to control the personal realized work;

- are abitious:
- prefering the results instead of the methods.

The organizations adopting this type of culture may survive in a stable environment, and their efficiency depends on the reasonability of the allocation of the working charges and the responsabilities.

The "Charge-type" culture is specific to those matrix organizations and its structure may be reprezented the most sugestive by a rectangular net, in which some threads of the net are thicker or more rezistant than the others, but in knots it may consider that is located the power and the influence.

The "Charge-type" culture is oriented to the professional charge of the employees from the organizations, but the authority is from the capacity of the expertize. It is important the realization of the charges of some specialists by an conjugated effort, thing which is achieveable by the identification of all necessary resources and of the most fitted persons, able to give maximum output, indifferently of the hierarchic level of the organization. This is a culture encouraging the teamwork and the dynamism, non-atributing the fix roles, in the sense that is important the collaboration with the specialists from different zones.

The improvement of the efficiency of this type of culture is influenced in a direct manner by the mobilization of the all team, which has at the basis the identification of the individual with the objectives of the organization. Just for this, it may assert that is a team culture which is characterized by the fact that, before the individual objectives and the most divergent positions and styles, it is situated the result of the whole group.

The decisional influence is based more on the professional power than on the power of the position or that personal, being, also, more dispersed that in other culture.

This culture is not fitted in all the cases, being adapted in the context of the individual liberty, of the current situations concerning the change and the adaptation of the social differences.

If we need to characterize the manager from a "Charge-type" culture, then we can say that this culture must act in a variable atmosphere, but the evaluation of its activity will be made starting from the analyse of the obtained results. It is the type of wanted culture of the most medium level managers; specific is the fact that some members of the team may be more skilled than the manager himself in what is concerning the fulfilling of some aspects of the charges. Also, the results of the group, being very important, then each member of the team is conscious of the frequent possibility of the control of the realized work.

The "Person-type" culture is a relatively new type met culture, existing in few organizations. It is specific of the non-profit organizations, the consulting bureaus, law bureaus, the designing firms, the professional associations having different goals. As presentation form we may say that it is like a "particle swarm" (honey comb), which gravitates around of a central point, represented by an individual. It has the task to serve and to help its members, sustaining and promoting their interests. It may assert that, without doubt, that the power in the frame of the same type of culture is appearing from the quality of those individuals to be very visible professionally, but the formalism, the hierarchy and the standardization are eliminated.

Another characteristic of this culture would be that in the frame of that organization may exist two or more cultures, together with the existing subcultures, helping together to the polivalent development of the organization, which represents a permanent source of surprises, restlesses and frustrations, but, also, opportunities for those living it. The success of each organization may be report, on one side, to the power of the culture, and on other side, to the type of culture which is integrated to it. It is to underline that, however is strong this culture, it will loose the relevance, if is not fitted to the context in which is running the activity of the organization or its structural characteristics.

It may kept in view that all types of cultures advances in time and they are formed and manifest in different forms in the frame of the Romanian organizations. So, it may assert that there is no ideal culture, but only a proper and efficient culture, case in which is to be preffered to take all necessary measures in view to sustain and consolidate it. In the contrary case, if it is ascertained that the culture is inadequately, then it is imposing the descover of those psecific aspects which have to be changed, as: the performance, the quality, the serving the customers, the assumed engagement, the team work and, implicit, the creation and implementation of the change programmes. So, it must to be determined the fundamental values for each case, which presumes the realization of a hierarchy of the priorities from each Romanian organization, that will conduct to the establishing of the directions to be followed.

CONCLUSIONS

In the modern organizations it is trying a joint of many types of organizational culture, but the existence of a certain type of organizational culture is more seldom met., because the organizational culture is not a rigid element, this is in a permanent evolution, which is proportional with the development of the organization, with the fluctuation of the human resources from its frame, and of different internal and external factors of this organization.

The culture is that support absolutelly necessary in the view of taking of the best decisions for the resolving of many problems with which is confronting the modern organizations in the context of the permanent changes of the environment. In this sense, it becomes obvious the necessity of the creation, respectively, of the concepting of those system with which to be found the best solutions, but, also, the adopting of those behaviors, which are able to make face to the influence of the external environment, because the culture has, also, proper dimensions given by those intinsec characteristics of the organization.

The environment market demands constant innovations by the organizations that intend to keep a competitive position. If the organizations want create innovation, they need to develop intern competence and promote a collaborative and propitious environment to generation of new ideas. With the increase of competitiveness, market globalization and customer changing demand, the companies have been encouraged to increase innovation and reduce product time-to-market and all inefficiencies in the organization management. The competence is a set of specific capabilities that compose the organizational strategy to keep your competitively. The objectives of this paper are to identify and characterize the main organizational competences of the organizations that promote the innovation supported by information technologies.

Keywords: competitiveness, management, innovation, ICT, web 2.0

JEL codes: M15, M16, M20

1. Introduction

An especially problem at present is to have in middle relaxation the macroeconomic policy as effect of globalisation by improving the economic competitiveness of both macroeconomic and microeconomic level. In fact the company cannot develop without strong enterprises, which should also improve in a permanent capacity to face international competition.

It appears the competitiveness factor for success as a source of international credibility. Between them there is a steady balance as credibility involves the private sector believes that "intrinsic nature of existing money flexibility will be used to earn production in the short term or to serve a specific". ¹

Credibility problem, her solution has been and is still difficult to consider, what are the general relationships of obtaining value for sustainable development:

$$V = Pn + Ps + Pes + Pedr$$

where:

Pn = direct contribution to the achievement of environmental value,

Ps = economic contribution to support the processes of society,

Pes = potential provided by the companies structure,

Pedr = economic potential of reintroduced circuit economic waste.

At the national level, firms participate to be the potential competitive advantages have become effective, considering that the country is competitive at the international level.

¹ Mugur Isarescu article open "Five lessons to resume growth" presented at National Scientific Symposium: Boosting economic growth in Romania in May 12, Bucharest 2000 in the Academy of Studies Economics, p.16

To expand the global business and competitiveness, the enterprise must intensify the use of Information Communication Technology (ICT) and in particular the utilization of interactive web platform (web 2.0).

2. The pillars of Global Competitiveness

The framework of Global Competitiveness (Figure 1) is built on 12 pillars:

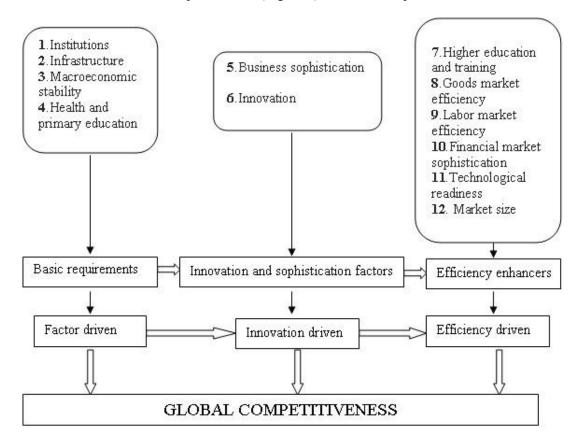

Figure 1. Pillars of global competitiveness (adapted by the authors)

In our opinions the major pillars, in the middle of organization, are "Innovation" and "Business sophistication" that are determined by ICT policy.

2.1 The innovation pillar

The Innovation (and Entrepreneurship) pillar includes the following areas: access to finance, entrepreneurship and innovation culture, innovation and administrative reform, eco-innovation.

The used tools, in this sector are:

- supporting national networks to promote entrepreneurship
- best projects and benchmarking
- twinning between authorities at national and local level
- developing High Growth and Innovative SME Facility (GIF)

Particular attention is shown towards High Growth and Innovative SME Facility (GIF) with two windows: GIF1 and GIF2.

GIF1, shall cover early stage (seed and start up) investments.

GIF2, shall cover expansion stage investments and shall invest in specialised risk capital funds.

2.2 The ICT Pillar

Recent economic history has shown that, as developed countries approach the technological frontier, ICT is crucial for them to continue innovating in their processes and products and to maintain their competitive advantage. ICT provide education and access to business markets and social interactions

In these challenging times of global economic crisis, the extraordinary capacity of ICT to drive growth and innovation should not be overlooked, since it can play a critical role not only in facilitating countries recovery but also in sustaining national competitiveness in the medium to long term.

In the Global Competitiveness Report takes into account the Networked Readiness Index (NRI) that identifies the enabling factors that permit countries to fully benefit from ICT advances, allowing them to follow the progress of their country. The Networked Readiness Index, in the Global Information Technology Report 2008-2009, is the following (Table 1):

Rank	Country	Score
1	Denmark	5.85
2	Sweden	5.84
3	United States	5.68
4	Singapore	5.67
45	Italy	4.16
58	Romania	3.97

Table 1 – Networked Readiness Index (NRI)

(Source: Dutta S., Mia I. "The Global Information Technology Report 2008-2009", World Economic Forum, Geneva, Switzerland, 2009, p. 17)

3. The support of government in the enterprise globalization

For an efficient global company it is important the influence of Public Institutions and the relationship with citizens and enterprises. The competitive capacity of enterprises depends on the quality and responsiveness to business needs and on external infrastructure.

A global company needs:

- an efficient organization of management and therefore good capacities of managers
- infrastructure services which support the globalization and the "real time"
- legal infrastructure / decision-making which reduce transaction costs.

The choice of the global enterprise should take into account three basic variables:

- the internal costs, associated with the territory;
- infrastructure services (high speed, transport, banking, transfer of information, financial system, search and more) regulated by mechanisms of connectivity and portability
- the legal infrastructure to help manager for making business decisions for enterprise

To bring the institutions closer to citizens and enterprises it is important to use ICT technological tools (e-government). In this way Public Institutions can *talk* with citizens and companies by a web portal, an interactive and bi-directional channel.

The Government for supporting this technology must provide large bandwidth, for online access, to citizens/enterprises and promote actively the participation of citizens/enterprises in the public decision with web 2.0 tools (forum, chat, wiki, blog).

Citizens demand better services, better security and more democracy, while business companies demand less bureaucracy and more efficiency. At this stage a greater cooperation between governments and companies is strategic.

The Government itself must stimulate the birth of these virtual communities to increase the communication and collaboration. User exploit web 2.0 tools for both expressing their opinions (Choo et al., 2002) about a service and suggesting solutions for improving it. For the Government it is very important to capitalize users opinions for the improvement of public services.

4. Challenges for global competitiveness

In the global market it is important to have strategic information before competitors (Cha et al., 2006). This information is useful for strategic planning.

An organization is competitive when obtains a sustainable advantage against competitors in terms of the diversity, quality and costs. Competitiveness is in the company's ability to face success as a result of management in open developing strategic models well documented and updated.

The main forms or degrees of competitive advantage are:

- -reduced costs (grade 1)
- -production factors source created by the effort resulted in investment of fixed capital goods and advanced technologies (grade 2)
- -source innovation that provide specialized and adaptable production factors, improving human capital. The global strategy appear, and competition is extending to integrated international production (grade 3)
 - -New Economy (based on welfare) (grade 4)

In a country, the Business Competitiveness Index measures the level of prosperity (GDP) that an economy can sustain the competitiveness of the economy, which is determined by the level of productivity achievable by companies. In the Report 2008-2009 (Table 2) the value of Global Competitiveness Index (GCI), for some countries, is the following:

Country	Rank	Score	Rank
	(CGI 2008- 09)		(CGI 2007-08)
United States	1	5.74	1
Switzerland	2	5.61	2
Denmark	3	5.58	3
Sweden	4	5.53	4
Italy	49	4.35	46
Romania	68	4.10	74

Table 2- Global Competitiveness Index (GCI)

(Source: Porter E. Michael, Klaus Schwab. "The Global Competitiveness Report 2008-2009", World Economic Forum, Geneva, Switzerland, 2008, p. 23)

This report compiled in 2008, placed Romania ranks 68 of 134 countries evaluated having in mind the following variables: macroeconomic environment, technology and innovative capacity of the country, environmental institutional.

Romania can participate in the process of globalisation. At the moment there aren't yet structures and skills necessary to achieve competitive performance in this context. There are still enormous challenges in terms of overcoming obstacles related to initiating and developing a business. The Government, economic environment and civil society are the actors assigned to outline development of effective services of small business who start from considerations of minimum risk and are developed in a self progressive, accessibility and more effective impact. In all these projects it is important to create a knowledge-based business with other countries.

The CGI taking into account 33 economic variables, including: efficient market operation, quality of economic policies and governance, information technology and innovation.

To stimulate competitiveness and improving the business environment following directions are proposed:

-Education and training of entrepreneurs.

General business skills taught at all levels of education. Specific modules of training in business must become an essential component of educational programs at the pre-university and the university level.

-Initiating less expensive and faster business

Should increase access to the registration procedures on-line

-Better legislation and regulations.

Experience through benchmarking exercises should lead to improve current practices in the European Union.

-Strengthening the technological capacity of enterprises.

Technological exchange and cooperation between enterprises of all sizes, especially among European Small Enterprises, development of research programs.

-Using e-business models to ensure a successful and quality assistance for small enterprises.

European Commission and Member States should encourage small enterprises to apply best practices and to adopt efficient business models that enable them to enjoy the real progress in the new economy. -Development of a stronger representation and more effective interests of small enterprises at national and at EU level.

Promote policies to support small and medium enterprises.

5. The competitiveness in Small Medium Enterprise

The evolution of economic systems and the growth of international trade has led to a process of globalization of the economy and markets, encouraging the emergence of integrated production systems in the network, with a concept of extended enterprise that transcends from national boundaries.

With continuous market changing and globalization, the enterprise specializes in a core business and restructures towards more specialized partners that collaborate among themselves and share knowledge. Knowledge is the most important asset of business because generates excellent and innovative products/services, best practices and best relationship with all enterprise stakeholders. It is important sharing this knowledge with all subjects of global extended enterprise.

The production processes of extended enterprise are redesigned with a web-oriented technology that support, internally and externally, the alignment of the information flow in the entire supply chain. This technological context is favourable both small-medium and large companies. As the large company becomes a network of enterprises, in the same manner the SMEs develop a cooperative interconnection.

The Union European must sustain SMEs competitiveness. To this end must formulate specific strategies: creating synergy with EU stakeholders, giving more emphasis to SME clusters, supporting research of new technologies and innovations, facilitating access to global value chain.

It is important that SMEs invest in e-commerce (Marossi, 2006) and e-business:

- -e-commerce: use of web platform, order and pay on line, reduction of transaction costs
- -e-business: integrated web infrastructure, integration supply chain, maximum accessibility to new markets

For the SMEs it is very important the utilization of web platform. An e-marketplace can be described as an online market where companies can exchange information, do business, and

collaborate with each other. The SME, supported by new technologies, becomes an extensive global knowledge economy.

6. Conclusion

We believe that for the competitiveness is needed to identify those steps that cause slowdown or stagnation, such as bottlenecks that cause congestion on the production processes.

In the international market, must be considered that the creation of networks of enterprises produces new problems related to different types of laws, regulations, infrastructure, organizational models and warrantee. It is necessary to uniform the European policy directives.

All directives stipulated in the European Union have as target the goal of competitive advantages.

All directives stipulated in the European Union have as target the goal of competitive advantages of economic agents, with the support of Information Technologies that favour the achievement of Knowledge Society.

EXTREME PROGRAMMING – AGILE METHOD USED IN PROJECT MANAGEMENT

Cruceru Anca

Romanian- American University, Faculty of Management- Marketing, 1B Expozitiei Blvd, Bucharest, cruceruanca@yahoo.com, 0723508894

Fotache Liviu Christian

Economical Studies Academy of Bucharest, 132 Brestei Street, Craiova, liviuchristian@yahoo.com, 0728297207

The main characteristic of the XXI-st century is change, which affects the development of organizations' activities. In this context, the organizations have to adapt their administration methods and systems to the new changes. An efficient administration method can also be project management, which, shall be held by the Agile Project — a project management system. From the multitude of Agile methods, the most important and most frequently used is Extreme Programming. Abiding by the principles and values that represent the basis of this method, the management of one project shall be more efficient in obtaining the desired results.

Keywords: Changing, Project Management, Agile Methods, Extreme Programming (XP)

JEL classification: D3, M15, O3

The organization of the XXI-st century carries out its activity in a dynamic environment, where change is a central element. In the second half of the XX-th century there appeared a "special" way of management, project management. Project management is an essential instrument for all organizations and can be successfully used in this environment in continuous change. The purpose of project management is to prevent as many dangers and problems as possible that could appear and to plan, organize and control the activities, so as the project to be finalized taking in consideration all the existing risks. Along with the appearance of the new changes, in the exterior environment of organizations and also in the internal environment of organizations, new discoveries in the project management are achieved. The most "spectacular" discoveries are in the informatics field, by creating new project management systems to ease the project management activities and to obtain the desired results – Primavera Project, Agile Project Management etc.

1. About Agile...

In the 90s, people became interested in developing software methodologies for the new business environment. As a result, the Agile methods were established, methods which showed the best practices resulted from experience of hi-tech developers and project managers. The purpose was to sustain the work of these successful developers.

In order to contribute at shaping the foundation principles of the Agile software development practices, and also to improve, diversify and increase the efficiency of this software, The Agile Alliance was created (www.agilealliance.org)

The Agile methodologies have in common values and principles.

The Agile Alliance created a manifesto with 4 main enunciations and 12 principles that sustain the manifesto. The manifest is the following:

- "We are uncovering better ways of developing software by doing it and helping others do it. Through this work we have come to value:
- individuals and interactions over processes and tools;
- working software over comprehensive documentation;
- customer collaboration over contract negotiation;
- responding to change over following a plan."[6]

The 12 principles that sustain the manifesto are:

- even late in development are expected and welcomed changing requirements;
- the most important priority is to satisfy the customer needs through early and continuous delivery of valuable software:
- deliver working software varies frequently from a couple of weeks to a couple of months;
- the projects must be build with motivated individuals; you must support and trust them.
- the conversation face-to-face is the most efficient and effective method to give and receive information in a development team;
- daily, in a project, business people and developers must work together;
- to obtain progress you must create working software;
- the agility is enhanced by continuous attention to technical excellence and good design;
- the sustainable development is promoted by agile processes;
- the most essential element is simplicity -the art of maximizing the amount of work not done;
- at some established intervals, the team must reflect on how to become more effective and must adjust its behavior accordingly.
- from the self-organizing teams result the best architectures, requirements, and designs.

The Agile software development practices upgrade the correlation between the business value and the software development. The main values of the Agile development are severed towards productivity and efficiency. A company that adopts an Agile development methodology invests itself in front of the competition even before initiating the competition.

The major Agile methodologies are:

- Dynamic Systems Development Method (DSDM)
- Scrum
- Crystal Methods
- Lean Development (LD)
- Feature Driven Development (FDD)
- Extreme Programming (XP).

2. About Extreme Programming (XP)

The most important methodology is Extreme Programming, which was developed eight years ago, by Kent Beck, Ward Cunningham, and Ron Jeffries. The methodology delivers the software "your customer needs when it is needed" [8]. XP represents a discipline of software development, which has as based values: community, simplicity, feedback and courage. XP emphasizes team work, and also, authorize your developers to answer to changing customer requirements. Managers, customers, and developers (part of a team) pursue to deliver a quality software. Through XP we can experience the view of the cost of change and its emphasis on technical exquisite through refactoring and test-first development. XP tenders a system of dynamic practices. Actually, XP "works by bringing the whole team together in the presence of simple practices, with enough feedback to enable the team to check where they are and to tune the practices to their unique situation".[2]

The principles that embody the values are:

- open, honest communication;
- quality work;
- rapid feedback at all levels;
- assume simplicity;
- embrace change;
- play to win;
- concrete experiments;
- small initial investment:
- incremental change;
- accepted responsibility;
- honest measurement;

- travel light;
- teach learning;
- local adaptation.

3. When and How can we use Extreme Programming?

Extreme Programming can be used to solve problems in areas that need change. Also, it has been set up to address the problems of project risk. XP has been set up for small groups of programmers. The requirements are an extended development team, testability and productivity. XP provides a set of daily practices that, used together with simple rules, have been substantiated to efficiently obtain high quality software.

These practices are:

Whole team- In an XP team: everyone is involved all the time, the team members communicate with one another by talking, everyone is kept fully informed, and everyone works together. The team includes a business representative (the "customer") and some programmers, a coach who keeps the team on track, a manager who allocates resources and removes external impediments, and other specialists.

The Planning Game- We have to take into consideration two aspects:

- Release Planning: the customer articulates the required items, the programmers evaluate the difficulty, and together they establish a preliminary plan (initial order of development, set out what can be accomplished with the available people/money/time).
- Iteration Planning: the required items are broken down into tasks and estimated in more detail, and allocated to programmers. **Customer Tests** these tests address two problems in software development "how do the programmers know when they're finished?", and "how does the team know that everything that was working last iteration is still working this iteration?". For each problem, the XP customer defines one or more automated tests that will show that the feature is working.

Small Releases:

- XP teams try to enhance the system, by adding daily, small features or parts of a feature;
- XP teams liberate tested software that can be displayed to a production environment at the end of every iteration;
- XP teams release to the final end-users as frequently as possible (every iteration for some teams).

Simple Design- XP teams take into consideration the simplest thing that could possibly work, implement it, hoping that the changes that occur are easier to withstand. They try to keep things as simple as possible so as to be easy to understand and to eliminate quarrel.

Pair Programming- The production work in an XP team is achieved by two programmers sitting side-by-side, working on the same machine. Pair programming means converging on the task at hand and diffusing knowledge around the team, especially if you change the pairs regulated.

Test-Driven Development- These tests are designed, implemented and owned by the programmers and they are distinct from the customer tests. These tests are helpful by constraining programmers to center on the "what", the interface itself, before the "how", the implementation and to realize that there are tests for every face of the system.

Design Improvement- Is facilitated by simple design, test-driven development, and pair programming, all these reducing the cost of change (design evolution process called "refactoring").

Continuous Integration- In XP teams it is important to understand that everyone's code works together. XP teams constraint integration as often as they can.

Collective Code Ownership- In an XP team anyone can change anything, anywhere, because XP projects are team activities. This will improve code quality because each piece of code is looked at by many persons.

Coding Standard- The code must be produced by the same person who has to be capable and competent for this purpose.

Sustainable Pace- The XP teams try every day practices that make software development more sustainable and predictable.

Metaphor- In an XP team, the same vocabulary and language has to be used, therefore most time they speak through metaphor- through the mention that the software system is the same as some other system and that they're already colloquial with. This metaphor is useful as it increases the communication compression and also, it can function as an architectural vision.

Other Useful Practices- XP is a discipline that evolves and there exist other practices that are based on the XP principles and that add value for most projects:

Stand-up Meetings- for a good timing, the XP teams have a brief, daily meeting, where the following questions are answered:

- "What have they done since the last meeting?"
- "What do they plan to do before the next meeting?"
- "Do they have any obstacles?"[5]

These meetings are called stand-up meetings because everyone stands up.

Retrospectives- At the end of every iteration, an XP team should have a retrospective, which analyzed what went wrong and what should be improved in the following iteration.

A better way to show how the practices interact, with who they interact, with the purpose to form a development methodology, is to represent an XP Map:

Extreme Programming Project Test Scenarios New User Story User Stories Project Velocity Bugs Requirements Architectural System Metaphor Release Latest Customer Version Acceptance Approval Release Small Plan Iteration Planning 🥷 Tests Spike Releases Uncertain Confident Next Iteration Estimates Spiké Copyright 2000 J. Donyan Wells

Fig. 1 Extreme Programmining Map

Source: www.extremeprogramming.org

As a **conclusion**, we can say that XP is complex, but also agile, in order to adapt to the changes of the XXI-st century. XP's practices are helping in managing the augmentation of the team and its interface to the customer. Actually, in an XP process, the team has the possibility to grow, change and adapt to the opportunities and threats from outside background, that affect the business needs. Also, XP can transform the whole delivery organization, not only the augmentation of the team. We can state that XP is not "the best of the Agile methodologies, just the best known".[5]

THE DASHBOARD AS A MANAGERIAL INSTRUMENT OF MEASURING PERFORMANCE IN MEDICAL-SANITARY INSTITUTIONS

Curpăn Alina Mihaela

The Academy of Economic Studies, The Faculty of Accounting, Informatics and Management Control Bucharest, Strada Piata Romana nr 6, Sector 1, Bucuresti, curpan_alina@yahoo.com, 0722.911.419.

It is a known fact that nowadays, the health institutions are confronted with the existence of resource shortages and with a demand for quality, which, at the same time, raises the issue of performance. The asymmetry of information, the inelasticity of the offer and the rigid price policy in the medical field have encouraged us to rethink the problem of the performance that can no longer be limited to financial elements. Hence, we consider that the dashboard techniques integration in the medical domain through the construction of Balance Scorecard will lead to performance, based on newly imposed economic considerations.

Key words: mission, vision, critical success factors, essential values, strategic objectives.

JEL classification: G23, I18, M10, P36

1. Literature review: definition, history, concept and stages of Balance Scorecard

The concept of Balance Scorecard (BSC) has been coined at the beginning of the 90's by Robert Kaplan, Harvard professor and David Norton, Boston consultant, starting from the following ascertainment: 90% of the enterprises do not manage to put in practice the strategy they have elaborated, identifying four types of obstacles in the implementation an enterprise's strategy: the management; the lack of coherence in resource distribution; the human factor; the absence of a common vision. The BSC developed by Kaplan and Norton appears as a new reference point in enterprise administration, bringing together financial and non-financial indicators, which provide a clear image of a company's the "true" value, a management system that enables the organization to clarify its vision and strategy, and to transform them in concrete actions, offering a feed-back concerning the internal processes and the external results, in view of a continuous improvement of the performances and results from a strategic perspective. In 1996, Kaplan and Norton considered the performance of a company under four aspects: financial, customer, internal processes and innovation/learning, perspectives that respond to the preoccupations of the clients, shareholders, employees and public authorities. Each of the four directions is represented by a game of objectives and measures, the indicators constituting a balance between the external measures for the shareholders and clients and the internal measures of processes and innovation. Practically, the BSC offers the answers to the following questions: What is your vision of your organization and your customers? What kind of strategy corresponds to this vision? What are the key operational variables that enable you to measure whether the strategic objectives have been accomplished or not? The stages of the organizational **BSC** establishment are⁵⁷.

1. The formulation of the mission and of the common vision, of the critical success factors and of the essential values:

The mission of the organization comprises the identity of the organization and indicates the reasons of its existence.

_

⁵⁷ Dr. Hubert K. Rampersard B.S., M.Sc., Ph.D., Total Performance Scorecard Fundamente, Instrument practice de aliniere și îmbunătățire organizațională, Editura Didactică și Pedagpgică, R.A., București, 2005.

The vision of the organization includes the long term dream of the organization and points out the way of the transformations necessary to achieve it.

The essential values are employed to enhance the unity of thinking of the employees and to positively influence their behaviour.

A critical success factor of the organization is a factor the organization needs to excel in so as to survive or a factor of foremost importance for the success of the organization.

- **2.** The formulation of the strategic objectives of the organization. The strategic objectives are measurable results that derive from critical success factors in view of accomplishing the vision of the organization.
- **3.** The definition of the performance indicators. A performance indicator is a measuring point, connected to the critical success factors and to the strategic objectives, through which the functioning of a process can be assessed.
- **4.** The formulation of the organization improvement endeavors. These actions are measures undertaken in order to accomplish the strategic objectives, the ones chosen being the ones that contribute most to the critical success factors.

2. Hospital Scorecard: application for the surgery section

The mission of the surgery section: We are at a surgery section that is safe and reliable for all patients no matter their sex, age or social environment they come from.

The vision of the surgery section: We want to be a professional and well equipped, a section that could become the first choice of any patient. We want to obtain this thing by: (Patient's Perspective):

- 1. The procurement of good financial results by optimizing the expenses for the maximum satisfaction of the patients taking into account the financial constraints tied by the price systems; the procurement of increasing profitability by introducing successfully some new operatory techniques, high tech medical machines with the help of which we could offer to the patients new services (Financial Perspective and Internal processes).
- 2. Offering the patients high quality services regarding the medical, hotel and administrative point of view; offering the patients the right to information, security, confidentiality, trust; to maximize the degree of satisfaction of the patient (Patient Perspective).
- 3. Insuring the solution to all patients' requests in the most propitious period of time (work schedule, waiting hours between processes, the planning of the operator block's resources) with better results than those of the similar sections within other hospitals and the creation of a work climate which encourages the spirit team and open communication (Internal processes Perspective and Knowledge and learning).
- **4.** The continuous training of the medical and auxiliary stuff and the gain of a competitive advantage based upon competence and knowledge (**Knowledge and learning Perspective**).

To be the most reliable surgery section for all the patients, all our activity will focus on achieving a top performance with a motivated medical and auxiliary stuff, who care about the patient's needs (Internal processes Perspective and Knowledge and learning).

The existential values of the surgery section: The surgery section is guided upon the following essential values:

Integrity: We work fair and honest with the patients; when we promise something, we keep our promise.

Passion: We work with a devoted, passionate and decided stuff willing to obtain superior medical performances no matter the type of intervention.

Orientation towards the patient: The patients are the centre of everything we do. We permanently listen to what patients say, we find out their specific needs, we give them individual attention and we offer them those quality medical services they expect from us, to satisfy them constantly.

Respect: We treat our patients as we would like to be treated. We do not accept arrogant and impolite behavior.

Communication: We make time to communicate with the patients and to listen to them. We believe that the information gives humans an impulse.

The other steps can be found in the table below, which represents **BSC** for the surgery section:

		PATIENT	
Critic factors of success	Strategic objectives	Performance indicators	Improved actions
0	1	2	3
The first choice of the patients than need surgical intervention	The improvement of the satisfaction level of the patient regarding the offered medical services	The rate of mortality within hospitals in sections; The proportion of deceased patients 24 h after their hospitalisation per section; The proportion of the deceased patients 48 h after their surgical intervention per section; The rate of nosocomial infections per section; The rate of the re-hospitalized patients (without a previous planning) for 30 days from their discharge; The index of concordance between the diagnosis given at the hospitalisation and that given at the discharge.	The definition of some precise standards for each task realised by the employees of the medical and executor —operational branch; the learning of those standards by the employees and the checking of the degree of their awareness concerning the expected results; The elaboration of the following mechanisms of standardization: the guide regarding the surgical operator protocol; specific guide for the circuit of laundry in the hospital; the protocol for effectuating the daily cleanliness in the hospital; the protocol for the prevention and control of the nosocomial infections; the protocol used to prepare the surgical instruments for sterilisation; the protocol of the aseptic technique in the operator block.
High quality services	Higher degree of trust of the patient regarding the surgical services that we offer	The number of the patients' complaints; Loyalty degree of the patients (coming back for check-up).	A new approach of the relation with the patients in surgical services; The implementation of an improvement plan of the patient's confidence; Benchmarking regarding the patients loyalty.
Image	Improvement of the degree of public cognition	Cognition degree	The creation of the department Public relations; Permanent actualisation of the web page; The strategy of counteraction of negative publicity.

ROMANIAN HUMAN RESOURCES' POLICIES IN THE CONTEXT OF ECONOMIC CRISIS

Deaconu Alecxandrina

ASE, Facultatea Management, Piaţa Romană, nr.6, sect.1, Bucureşti, alex.deaconu@yahoo.com, 0742 062907

Rască Lavinia

IAPAB-ASEBUSS, EXEC-EDU, Calea Griviței, nr. 8-10, Sect.1, București, laviniar@asebuss.ro, 021-319 64 40, 021-319 64 41

Everybody acknowledges today the fact that employees are an essential resource. Unlike other financial, technical and technological resources, the human resource can be acquired, assessed and developed. During the past years, Romania has known an economic dynamic that allowed an increase in the role of human resources within the economic enterprises.

Now, in the new context created by the economic crisis, things are changing...Obviously affected, the enterprises seem to have lost interest in the employees and the human resources policies are not always very coherent. This is the reason why we will go into details, analyzing the specificity of the economic crisis in Romania and its effects on the human resources management team.

Keywords: economic crisis, human resources, work market, unemployment

Cod JEL: M12

1. La crise économique dans le monde

On pourrait croire qu'à l'ère des années 2000, nous sommes immunisés contre la crise économique. Toutefois, il semble bien qu'une récession américaine et peut-être même mondiale veuille se montrer le fin de la tranquillité. Malgré l'opinion très partagés des économistes, la crise économique semble se concrétiser de plus en plus selon les différents médias influents.

Plusieurs facteurs concrets font de cette nouvelle crise économique mondiale une situation de plus en plus inquiétante:

- La guerre en Irak: Cette guerre coûte une fortune aux Américains. Ils font imprimés de l'argent par la banque fédéral comme si c'était du papier ordinaire. Rappelons nous qu'aujourd'hui les billets d'argent sont basés sur la confiance, donc nous ne pouvons les échanger contre des pièces d'or comme autrefois.
- La crise immobilière du subprime: Une des plus grosses crises immobilières de l'histoire des États-Unis. La philosophie dominante a été: "vous voulez investir dans l'immobilier? Eh bien! C'est le bon moment. Vous pourrez y acheter facilement des maisons". Voilà ce qu'a couté aux banques le fait de pousser les consommateurs à dépenser, des faillites personnels de propriétaires rendant impossible les paiements dûs aux prêteurs.
- La montée des prix du pétrol: L'énergie la plus en demande ou si vous préférez l'énergie dont nous sommes la plus dépendante et prisonnière. Cette montée des prix de l'essence touche directement et indirectement tous les consommateurs et entreprises de ce monde.
- La crise alimentaire: Spéculation, désorganisation des filières de production, plusieurs raisons sont à la base de cette crise. Ce sont les produits de première nécessité qui subissent une augmentation exorbitante des prix.

En plus, nous pouvons mentioner aussi d'autre causes de la crise: déficience des régulateurs nationaux; manque de coordination internationale; mauvaise évaluation des risques; opacité des bilans; disparité des normes comptables; absence de surveillance sur certains marchés.

Pour l'instant, ce sont les américains qui sont le plus durement touché. Toutefois, comme les américains sont les plus grands consommateurs dans le monde, les autres pays seront aucun doutes liés à cette crise économique qui les frappe actuellement. Les raisons pour lesquelles la crise nous inquiète sont les suivantes: la plus grande menace actuelle sur la sécurité mondiale car elle risque d'appauvrir des millions de personnes; peut provoquer une radicalisation des

mouvements de protestation; la hausse du chômage et l'effondrement des marches vont faire grimper la pauvreté; cela risque d'alimenter la colère des gens et de provoquer une radicalisation des mouvements sociaux.

2. L'évolution de l'économie roumaine

Pour avoir une idée de l'économie roumaine, nous avons choisi les chiffres. On peut voir, pour l'instant, que du point de vue statistique, la crise n'a pas commencé à laisser des trâces. Pour exemplifier, nous avons analysé le produit interne brut et le volume d'investissement :

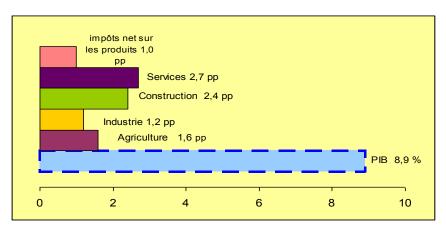

a) le PIB en comparaison avec d'autre pays du monde

Tb.1. Dinamique du PIB 2008 / 2007

					- en	· % -	
	Trim.I	Trim.II	Trim.III		Trim.I	Trim.II	Trim.III
ROUMANIE	8,2	9,3	9,1	Cipre	4,1	3,9	3,5
UE (27)	2,0	2,0	0,9	Lituanie	7,0	5,2	3,1
Belgique	2,0	2,1	1,7	Hongrie	1,7	2,0	0,8
Danemark	-0,9	0,6	-1,2	Hollande	3,3	3,0	1,8
Allemagne	1,9	3,3	1,3	Autriche	2,8	2,2	1,5
Grèce	3,5	3,7	3,3	Pologne	6,2	5,8	5,2
Espagne	2,8	2,0	0,7	Slovaquie	9,3	7,9	7,0
France	1,7	1,5	0,8	Suède	0,9	2,7	0,4

b) la contribution du plusieurs sécteurs d'activité au PIB

Fig. 1 Le niveau et la dynamique du produit intérieur brut (1.I.–30.IX.2008)

En plus, on sait que la contribution de différents sécteurs dans l'augmentation du PIB est: 30,3% - Les services; 40,4% - L' industrie et des constructions; 18,0% - L'agriculture; 31,1% - Les constructions.

c) Les investissements étrangers directes (IED)

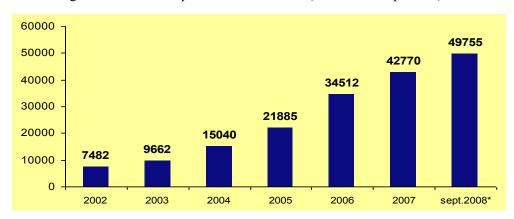

Fig.2 Évolution IED pendant 2002 – 2008 (à la fin de la période)

Pour bien comprendre la situation actuelle, il faut savoir que: les investissements étrangers directes ont haussé pendant 1.I-30.IX 2008 avec 36,0% par rapport à 1.I-30.IX 2007; pendant 1.I - 30.IX 2008 l'investissement étranger a couvert 56,6% du déficit de compte courant.

3. La crise économique en Roumanie

Malgré les chiffres, le monde parle de la crise et ses effets previsibles dans les pays d'Europe centrale et orientale. En tant que dernier pays entré dans l'Union européenne avec la Bulgarie en 2007, la Roumanie risque d'être confronté avec une situation sans précedent. Mais, pour l'instant, les réactions sont contradictoires :

- La presse roumaine traite la crise avec une indifférence qui pourrait surprendre;
- Dans la classe politique se profile un discours sur l'impact de la crise en Roumanie (seulement des débats);
- On assiste à la chute du leu, la monnaie nationale roumaine;
- On assiste à la hausse des taux d'intérêt et à l'effondrement de la bourse;
- On assiste à la hausse des prix pour certains produits:

Les banques roumaines ont augmenté de 0,5 à 2 points leurs taux d'intérêt sur les crédits à la consommation.

Les sécteurs les plus sensibles semblent être:

a) Le marché imobilier: Le secteur immobilier ressent le plus profondément l'actuelle crise économique. Le manque des transactions a déterminé beaucoup d'agences immobilières a disparaître; d'autres ont bloqué leurs projets ou y ont renoncé. Les conditions pour obtenir des crédits sont presque impossibles, et l'argent qu'on emprunte est beaucoup plus ''cher'' quand il doit être retourné; le prix des logements a baissé avec plus de 20%, mais les roumains préfèrent prolonger la décision d'acheter, fait qui a conduit a un blocage en ce qui regard les nouveaux projets.

b)Le marché alimentaire: Les ventes de produits alimentaires ont baissé avec 10-15% pendant le mois de janvier 2009, en comparaison avec l'année dernière ce que va amener à une réduction de la production et du personnel. Les principales secteurs qui vont être affectés sont : l'alcool, les boissons, la viande. Les producteurs de céréales ont resté avec le stock de blés dans l'ensilage, car les prix sont trop bas. Les ventes de céréales ont diminué avec plus de 80%, donc plus de 60% des producteurs et des commerçants vont faire faillite l'année prochaine.

c)Le marché du tourisme : dans ce domaine, la crise se manifeste par : la réduction du pourcentage d'occupation des places dans les hôtels ; la réduction des prix pour le logements ; la réduction du tourisme corporel. Les hôtels de lux vont être les plus

affectés. On préconise une diminution avec plus de 60% du dégrée d'occupation, le tourisme de business va être parmi le plus affecté secteur.

d)Le marché d'automobiles : On observe une réduction de la demande pour les automobiles et les entreprises sont forcées de restreindre leur activité. Pendant le mois de novembre le nombre des voitures enregistrées à connu une réduction avec 50% par comparaison avec l'année passée. Le vrai problème du marché de l'automobile en Roumanie est la production de pièces et sous-ensembles destinés à l'export pour les grands producteurs d'automobiles qui sont gravement affectés par la crise.

e)Le marché des textiles: forte diminution de l'exportation et du volum de production. Le chômage dans le secteur est arrivé à 4% et la majorité des chômeurs résulte de l'industrie qui agit à l'exportation et qui n'a pas reçu des commandes.

f)Le marché de la métalurgiques: En ce qui concerne la métallurgie, les entreprises ont déjà restreint leur activité à cause de la baisse de la demande d'acier. Depuis la fin de l'année 2008, environs 2000 employés du grand sidérurgiste Arcelor-Mittal (de la ville Galați) ont été mis au chômage à cause de la forte baisse de l'activité.

Pour avoir une image des effets de la crise économique sur d'ensemble du pays, nous présentons une charte qui nous indique l'intensité des difficultés avec lesquelles se confrontent l'économie roumaine.

Fig.3 L'intensité de la crise économique en Roumanie

4. Les ressources humaines dans le nouveau contexte économique

Il est évident qu'on peut rattacher à la crise économique aussi des effets d'ordre psychologique, dont il serait rélévant de citer, en grandes lignes:

- l'étonnement, suivi par un état d'inertie commode; cette manque de réaction est principalement due à l'immaturité du comportement des consommateurs roumains; l'habitude de ne pas penser en perspective; la négation de l'évidence, en craignant un retour à la période communiste.
- l'inquiétude, générée par le fait que les salaires ont cessé d'augmenter;
- la prévision sombre que le pouvoir d'achat va baisser;
- la panique, entraînée par le sentiment d'incertitude générale;
- l'anxiété, le stress et le pessimisme, doublés par une perte de confiance en soi entretenus par la réalité du chômage. Aparemment, un quart des personnes embauchées craignent ne pas perdre leurs places de travail, tandis que 20% se préoccupent de la stabilité professionnelle de leur proches.
- dépression. Suite aux études, on a constaté que le nombre de dépressions a augmenté avec un taux inquiétant de 30%, par rapport à l'année 2007. Le profil des personnes touchées: tranche d'âge: jeunes, mais aussi 40-50 ans; occupation: patrons des firmes falimentaires ayant des dettes envers la banque, étudiants n'envisageant de se faire embaucher;

- suicides en 2008, le nombre des suicides a été 3200, plus grand que le nombre des décès causés par les accidents de voitures; ce fléau touche notamment les régions centrales du pays: 32/100 000 personnes;
- troubles de disposition et de la capacité de concentration les managers des compagnies constatent une diminution progressive du rendement des employés au travail;
- appel aux « vices »: malgré la hausse des prix pour l'alchool et les cigarettes, la législation plus stricte vis-à-vis du tabagisme, la population augmente de 10% sa consommation d'alcool, de tabac, de café et de chocolat;
- malentendus au sein des couples, communication fautive: le theme de la crise peut devenir soit sujet tabou, soit une preoccupation obsessive. En 2009, on prévoit un nombre-record de divorces (exemple: vendredi, le 27 février 2009 on a enrégistré 65 demandes de divorce aux instances de Bucarest)

A partir de ce tableau, nous voulons voir que ce passe-t-il dans les organisation. Malgré l'affirmation du caractère stratégique de la fonction des ressources humaines, en dépit de la sophistication croissante des outils qu'elle manipule et du professionnalisme qu'elle exige, cette fonction ne semble pas en mesure aujourd'hui de rivaliser en prestige avec d'autre fonctions de l'entreprise comme le marketing, la finance, ou la production. Les préoccupations sociales dans les entreprises évoluent aussi au rythme de la conjoncture économique et sociale; en période de basse conjoncture économique (ou de crise) et de forte poussé du chômage, le pouvoir de négociation des salariés s'affaiblit et le "social" devient moins prioritaires dans l'entreprise. La mission de la fonction des ressources humaines n'est pas donc très facile aujourd'hui en Roumanie.

L'analyse du chômage, à la fin du mois octobre 2008, nous indique, pour le debut, les difficultés avec lesquelles se confrontent les roumains.

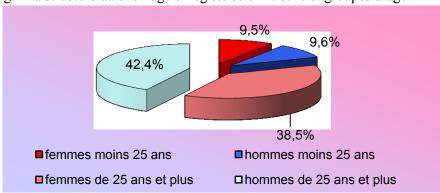

Fig.4 La structure du chomage enregisté selon le sexe et groupes d'âge

Les politiques de ressources humaines dans le domaine de la proccuration, développement et motivation ne sont pas atractives et cohérentes : pas d'embauche, pas de formation, pas de carrière, pas des bonnes remunération... En revanche, souvent des licenciaments. D'un jour à l'autre, la situation s'agrave.

La question prévisible dans une telle situation : quoi faire ?

Pour trouver la bonne reponse, il est peut-être indiqué de regarder autour de nous, à l'Union Éuropéenne .

Parmi les actions déclanchées on retrouve: opposition face au protectionnisme; renforcement de la stratégie d'emploi; garanties gouvernementales pour les crédits bancaires; suppression de l'acompte provisionnel de l'impôt sur le revenu des particuliers; baisse de l'exigence énergétique des bâtiments; encouragement aux exportations; investissements dans la recherche et dans l'infrastructure des transports.

En Roumanie, le plan du Gouvernement, compte 74 mesures orintées en trois directions: le rélancement et la stimulation de la croissance économique; le financement de l'économie et l'augmentation des liquidités; mesures sociales.

Les principaux points du Plan anticrise ont été: investissements en infrastructure; payement des dettes gouvernementales; absorption des fonds communautaires; la non-imposition du profit réinvesti; la compensation de la TVA récupérée avec la TVA à payer; le soutien des PME; le lancement du fond de contra-garantie des crédits pour les PME; l'allocation des fonds pour l'export; l'augmentation du budget général consolidé.

En plus pour se securiser, pour dépasser les effets de la crise et pour éviter autres possibles effets négatifs la Roumanie a signé l'accord avec le Fond Monnétaire International (FMI).On connaît maintenant que: l'accord sera du type stand-by (pour 2 années); l'emprunt sera de 19 milliards d'euros : 12 mld euros du FMI et 7 mld euros de UE.

Il y existe quelques mécontentements pour le "coût" de l'emprunt, c'est-à-dire les conditions trop strictes qui pourraient être imposées par FMI, en ce qui concerne la politique budgétaire et fiscale de Roumaine. En plus, FMI est d'accord avec l'augmentation des salaries de 5% seulement si le gouvernement va finaliser rapidement la loi des salaires uniques dans le système budgétaire . Il demande la restructuration de l'administration publique, c'est-à-dire le licenciement des budgétaires dont la présence ou le salaire ne sont pas justifiés, l'augmentation des impôts et d'autres taxes et un contrôle fiscal très stricte pour les entreprises et pour les citoyens aussi

Les analystes économiques, dans leur majorité, considère que la réalisation d'un accord avec FMI aurait comme résultat plusieurs *bénéfices* pour la Roumanie: une stabilisation de la monnaie nationale devant l'euro ou même une sensible appréciation de celle-ci; les crédits en euro baisseraient leur prix; les évaluations économiques de notre pays pourraient s'améliorer; les investisseurs retrouveraient la confiance dans l'économie locale; la Bourse ressentirait un effet positif.

En conclusions, devant une situation sans précédent, la Roumanie ne trouve pas encore les solutions pour se protéger. Il est vrai que aucun pays ne semble pas avoir la clé pour s'en sortir. Entre temps, les organisations et leurs ressources humaines sont en difficulté. En version optimiste, si le plan anti-crise arrête la dégradation de la situation économique et, indirectement les effets sociaux, la fonction des ressources humaines a toutes les chances de relancer des politiques qui peuvent armoniser la performance économique avec la satisfaction des salariés

Research, development and universities are considered the fundamentals of European competitiveness and therefore require sustained action in partnership with social and economic environment. At European and international level it was discussed about the urgent need to work changes in higher education concerning the role and organizational structure. There is consensus about the need for higher education to substantially contribute to the development of entrepreneurial skills of university graduates who will work in a society that requires frequent changes of occupation, international mobility and a fast adaptation to flexible structures.

Keywords: entrepreneurship concept, entrepreneurial university, triple helix

JEL classification: A23

The entrepreneurship concept

Allan Gibb (2005, p.28) considers that *the entrepreneurial concept* described above will demand: more integration of knowledge (within faculties and departmental areas, between various social science disciplines, between fields in arts and science and between tacit and explicit knowledge); much greater opportunity for experiential learning; greater space for the testing of explicit knowledge in practice (with more time for reflection and learning by re-doing); greater equality of emphasis upon how things are taught with what is taught; innovation in assessment and accreditation procedures; changes in some of the basic philosophies of learning – particularly in the field of management. Mintzberg (2004) and Ghoshal (2005)

Entrepreneurship is associated with major innovation step changes in technology, process, organization or management. Entrepreneurship defined in terms of behaviour, skills and features necessary to meet the demands and opportunities of the social environment aims a larger framework than the economic field and market and makes the difference between the institution defined as "formal and informal ways of doing things" and the organization these practices may be embodied. This approach adds a critically important dimension to the evaluation of the process of market development and indeed other ways of organising exchange. The strength of this conceptual perspective lies in its appropriateness for dealing with organizations of all kinds, not just businesses.

In Gibb's opinion, the list of *entrepreneurial values* are in line with the «ways of doing things» and are associated with organizing things, feeling things, communicating things, understanding and thinking things and learning things.

Fundamental coordinates of the entrepreneurial university

Entrepreneurship University is a concept used by B. Clark as a reaction of the new type of university to changes of the external environment engaging itself, on your own risk, through employment in economic and social development of the region, using existing resources creatively, operating in costs and profit parameters. It puts education on spotlight as a value on the market and can be an extension of large corporations.

Directions of transformation of the university through entrepreneurial efforts, in Clark's opinion are:

- an enhanced decision-making right of the frame consists of administration of the university and the academic departments to ensure efficient and flexible reactions to environmental demands:
- an extended dynamic periphery consists of flexible units that work as interface between the institution and the external environment;
- a diversified funding base through grants and contracts accession, identification of tertiary sources (traders, local authorities, philanthropic foundations), intellectual property valuation, taxes, administration campuses;
- a good core academic well stimulated represented by research departments focused on certain disciplines and interdisciplinary areas of study; this core structure is categorized as providing conduct of most of the academic work;
- an integrated entrepreneurial culture represented by the favourable change in work culture that is based on ideas, principles, culture of the university, institutional identity.

The triple helix of university – industry – government relations

The Triple Helix of university-industry-government relations provides a neo-evolutionary model of the process of innovation that is amenable to measurement. The first dimension of the triple helix model is internal transformation in each of the helices, such as the development of lateral ties among companies through strategic alliances or an assumption of an economic development mission by universities. The seconds the influence of one helix upon another. The third dimensions the creation of a new overlay of trilateral networks and organizations from the interaction among the three helices, formed for the purpose of coming up with new ideas and formats for high-tech development. The triple helix denotes the university-industry-government relationship as one of relatively equal, yet interdependence. (H. Etzkowitz, L. Leydesdorff, Martin Meyer 2000)

The interaction between university and industry has been a classical theme in the agenda of nation states, OECD, EU. It has been discussed that much of the academic knowledge comes out not in the forms of written knowledge, but as tacit knowledge within the individuals (i.e. researchers and graduates). The flow and mobility of these skilled individuals from academy to industry are the most important way for the transition of knowledge from basic research to applied research or innovation. However the flow of knowledge is not an easy matter. The transition of academic knowledge into commercial sector requires several factors, such as an excellent research results, managerial and industrial competence and financial support. Traditionally academic sector is assumed to provide basic research results, but in most of the cases it lacks of commercial skills which is normally found outside academia like in firms.

University-industry relations have become a common and widely accepted phenomenon of the nineties. There is a flourishing of literature and policy programs all around the world. There are several reports of OECD 1998-2000, EU framework Programs, US AUTM Projects, World Bank 1999, UNESCO 1998. By the same token, various scholars have worked on this subject matter based on different concepts and assumptions. Namely, Pavitt, 1997; Steinmuller, 1994; David, Forray and Steinmuller, 1997 have mainly based their theories on the concept of scientific networks. Although all these reports and theoretical discussions aim to understand these diverse relations and mutual benefits of university-industry relations; they still underline how difficult it is to obtain information to uncover these relations, and thus illustrate the role of these settings in the achievement of an interaction between university-industry. Thus this thesis aims to document the university-industry relations further

Companies want universities supply the fundamental research needs, which are generally precompetitive. Apparently both sides are willing and in need of cooperation. The interaction and relations between university and industry need to be institutionalized and regulated in order to eliminate the cultural clashes as well as to endow both sides and society with benefits. Therefore benefits of this interaction for both sides would explain not only the gains of these two settings, but also the implications on the whole innovation systems would be clarified.

Benefits for universities are generally stated as follows: new funding for research, new opportunities for graduates, and new directions for research.

The gains of industries are mainly based on earlier and easier access to: university graduates and faculty members, research results, intellectual property rights.

All these features implicitly reflect that the university-industry interaction provides the innovation system with much more dynamism and efficiency compared to each actor working separately.

However despite this positive picture there are problems and clashes among these actors in not only sharing the results of this cooperation but also in coming together. These conflicts and problems generally emerge due to the differences in culture, contributions and expectations.

The research is a source of strategic value in that it helps to improve system-wide:

- capability (such as qualitative research skills) Knowledge and research skills can be seen as capabilities embodied in researchers and the institutional networks within which they work; scientific knowledge requires a substantial capability on the part of the user both in research and in the application of knowledge, as acknowledged in a recent policy statement from the European Commission:
- variety (the creation of options and diversity) variety is a vital feature of flexible innovation systems. Variety is widely regarded as a desirable attribute in the context of an uncertain future. These themes of capability, variety and capacity outline the main sources of strategic value

provided by public research.

The literature suggests two main approaches to measure these relations through quantitative and qualitative indicators. While the former one consists of amount of measurable intellectual property-Patents, Number of patent licensing agreements; Income derived from licensing, the latter includes level of partnerships between the universities and industries; relationship between university research people and industry engineers (who talks to whom); "«long term» exchange of people.

In order for the benefits of university research to be expressed in the economy, the university research system has to be connected with the economy. The principal channels identified in the literature can be grouped as:

- codification/artefacts: publications, patens, prototypes;
- cooperation: joint ventures, personnel exchanges;
- contacts: meetings and conferences, informal interaction, science parks, industrial liaison offices and funded networks contracts: licences, contact research, consulting.

What has taken in Romania on the construction of university entrepreneurship field?

It can be said that the Romanian higher education trends are: increasing demand for higher education and training in response to the knowledge society; reduction of public financial support; diversifying needs of training and higher education of the adult permanent education; development of information technology with emphasis on the higher education globalization.

Analysis of individual demand for education in Romania highlights some features:

- individual demand for education is centred on diploma, certificates or certifications without being accompanied by a comprehensive assessment of competences, knowledge, values and skills;
- number of highly-qualified and competitive persons that emigrate towards economic developed countries is high;
- Romania is losing highly qualified staff in favour of developed countries, because it doesn't provide minimum guarantees for the performance ones;
- general culture is evaluated against the pragmatic one, using knowledge to solve current problems;

- universities must focus on creation and lifelong learning skills training, on new information technologies and communication usage.

In Romanian context, *entrepreneurial university* is "opposite to the state assisted university". It's a university that takes seriously the competition criteria and financial profitability. It is a "self-governing" university, lead by a "strategic plan" which seeks to alter the competitive balance in its favour. It is a university in which managers are becoming more specialized and in which teachers are involved only in managerial and policy decisions, not the current administration. It is a university which seeks to diversify budgetary resources (it has a policy to increase their revenue) and provides de-concentration of allocated funds. It is an is open and connected university to socio-economic environment, a university in which explicit standards of quality are functioning, and where it is accepted the idea of bankruptcy caused by poor management. (The final report of the R09601PHARE).

Technical assistance in Western Europe chancellors and Romanian experts involved in this process drafted a general scheme of universities reorganization in this regard, substantiated in first instance, the MO no. 5.647/22.12.97 on the new organization of university and Director General Administration job introduction (DGA), and MO no.3334/26.02.98 regarding the post of Administrator Faculty Chief -ASF. Were also launched initiatives to legislative changes to ensure adequate wages of these two new functions (Law no. 154/16.07.1998).

In terms of *entrepreneurship spirit*, even if it's challenged by many traditionalists, it will be dictated by the budget precariousness and more visible competition that will exert future large private universities.

There have been steps taken at the ministry level on the introduction of the strategic plan and institutional contract field, creating in university a culture of strategic management. The results marked a beginning in this field. After 1999, all state universities have adopted strategic plans, negotiated all this year the first contract between the universities and institutional ministry; all actions were based on MO nr.3595/22.04.1998 on developing strategic plan for institutional development university. However, most strategic plans are not the result of policies faculties aggregation, being developed by a group of people and the procedure of negotiation with the ministry concerned is relatively short and shallow as time.

Regarding financial autonomy of universities, established as objective of the PHARE Program, has managed a new financing system called "global finance" meant to increase the responsibility of universities and their economic efficiency. This system is based on "funding follows the student" principle and replaces the one which was the number of posts. This requires universities to effectively make their household resources and to establish staff taking to account the budget and not budget after personnel. Application of several orders of the Minister concerned, governmental ordinances and Education Law amended (no. 85/1999) led to the transition to the new funding mechanism of higher education, and the namely implementation has led universities to reconsider their management and make it anchor in the financial return requirements. However, it remains difficult to accept ideas such as «bankruptcy because of poor lacking management», the idea of the financial losses caused by indiscipline and bad organization, and the idea of financial support of those who are the fault of their deficit. Complementary funding mechanism remained a draft, respectively the funding allocation on competitive criteria, performance in research, and explicit policy of the ministry concerned on budgets deconcentration within universities.

In what concerns the *quality assurance in education*, it has been achieved in recent years, a legislative package that includes: Law no.87/2006 approving the Emergency Ordinance no. 75 of 12.07.2005 on the quality of education, Order no. 3928/21.04.2005 on quality assurance of educational services in higher education institutions, principles and criteria concerning the quality system at the institution of higher education - Annex to the Order no. 3928/21.04.2005 Regulation of organization and functioning of the Romanian Agency for Quality Assurance in Higher Education (ARACIS) and Order No. 4.492/06.07.2005 on promoting professional ethics

in universities. It is important the awareness for all faculty of the importance of practical application of the provisions of Annex Order No. 3.928/2005.

As a conclusion, it must establish a new type of Romanian university synchronized with European and global trends in the field, who rely on an institutional and managerial reform, where the initiative, the innovative behaviour and risk be given priority.

How can the issues of Romanian educational system be solved due to the triple helix?

Improvement of relations between universities and economic environment, administration and non-government organization represents one of the ways to settle issues of the Romanian educational system related to: continuous adjustment of curricula to the society needs, quality of learning, job consulting and orientation, graduates integration on the labour force market.

Universities must become open systems able to meet a high level of integration with the economic, administrative, political and non-profitable environment and to meet efficiently the challenges of knowledge society.

Students, universities and economic agents can all take advantage on the existence of common programmes. It would be useful that the universities to propose yearly a considerable number of subjects for licence /dissertation projects, interesting research subjects of economic environment that should be elaborated made up in collaboration with the economic and social environment. In this way, foreign partners could substantially be involved in the activities of universities such as: students practice, laboratory activities, student's research activities.

It would be useful that master and doctoral programmes should be organized as a result of partnership between university and economic agent, thus determining a better integration of graduates on the labour market. An essential role is that of Job Orientation and Consulting Centres; these should be real liaison between universities, student organizations and business environment by facilitating the employment of students in part-time system, by organizing specialized practice, licence and dissertation works. Business environment should be given the possibility of identifying the suitable students, attracting them by private scholarships, paid practical probation. In collaboration with different student organizations, these centres should carry out different projects (campaign presentations, simulations of interviews, job fairs etc) by which, students can get in touch with the employers and thus they are given the possibility to understand better and earlier the labour force market they are going to integrate in.

The European inspector for education, Jan Figel, has declared that the European universities have an important potential not exploited yet, especially concerning their ability to state connections with the business community.

On the second edition of the universities-enterprises forum, on February 5th-6th, Figel has extolled the universities that allow the industry that allow the industry representatives to attend the reviewing process of curricula to ensure they are pertinent reporting to the labour force market. Many employers have complained that some graduates cannot combine their knowledge and skills. The European Committee has aimed to publish a material concerning cooperation between universities and economic environment in order to state a code of good practices in this field.

The European Social and Economic Committee suggests launching a European process that could be called the Prague Process, related to the Partnership Conference between educational institutions and employers on April 6th and 7th, being initiated by the Czech presidency. This could be embodied in a European framework large enough to allow the operators achieving local and national actions:

- challenge of member states and other public authorities to invest more in education, in general, and specially in these partnerships in order to provide a positive reply to the economic crisis and to the continuous difficulties of the labour force market;
- stimulating enterprises and educational institution to conclude partnerships, by formal and substantial innovations;

- organizing changing of good practices and structures of technical and financial appointments, giving the possibility to test, to evaluate and to disseminate the initiative at a European level;
- drawing up common projects (systems of common reference for degrees, initiative and school networks, improvement of teachers and mediators networks;
- promoting programmes of crossed mobility among teachers, students, schools and employer organizations.

Proposal of the European reporters concerning the partnerships between educational institutions and employers related to the necessity adopting a systematic approach, based on simpler mechanisms (but not so bureaucratic like the European programmes), but also more ambitious, including:

- a global political framework, subject to approval, evaluation and control by the social partners, the European Parliament, the European Council;
- european tools of identifying the markets and sectors looking for qualified persons;
- changes of good practices, including both technical education and permanent training and research;
- mechanisms of European scholarships, financed both by the European Union, the member states, but also by the private and associative sector aiming all types of consignees, especially minorities and young people in difficulty: practical probations, projects of innovation and professional insertion;
- elaboration of common reference systems for degrees and professional titles and networks of local initiatives;
- creation of European mediator networks;
- making up networks of European mediators in order to facilitate the partnerships an adjustment to this objective of the European funds and the existing programmes.

THE DISCOUNT RATE POLICY IN ROMANIA IN THE 20TH CENTURY

Dobrescu M.Emilian

The Romanian Academy, Section of Economic, Law and Sociologie, Bucharest Phone no.: 0744 633 483, e-mail: dobrescu@acad.ro

Pociovălișteanu Diana

Faculty of Economics, University "Constantin Brâncuşi", Tg. Jiu Phone no: 0726 187 718, e-mail: diana@utgjiu.ro

Throughout the 20th century, economists have generally acknowledged the importance of the central bank discount rate as the reference interest rate in a country: by increasing the interest rate during economic booms that forego the busts, the Central Banks help alleviate the consequences of the crises, by deterring entrepreneurship and speculative pressures. Similarly, the discount rate is decreased during recessions, when Central Banks need to stimulate economic activity by providing cheap money and restore the optimistic spirit among entrepreneurs.

This study aims to correlate the macroeconomic evolutions in the 20th century Romanian economy with the variations in the discount rate of the National Bank. It is also meant to reveal to what extent – if any – these evolutions have been influenced by the discount rate policy. By analyzing the discount rate changes during the first half of the 20th century, we can easily notice rather abrupt changes – of about 1-1.5%, both upwards and downwards – in the discount rate. Nowadays, such changes are no longer possible, due to the intricacies and complexity of the economic, financial and banking inter-relations at the European and global level.

The discount rate evolution points out that the Central Bank has provided the cheapest capital throughout the 20th century, at an average rate of 5-6%. The evolution also reveals that the discount rate has been the cause – and not the consequence – of economic policies

Keywords: discount rate, monetary policy, interest rate

JEL classification: E5, E4

Both policy researchers and public authorities are rather divided and subjective when it comes to explaining or grounding various aspects of economic policy. In this respect, the discount rate is one of the most illustrative examples, in that the discount rate policy is subject to fierce debates and controversies. A thorough attempt to research into or to establish correlations regarding the central bank's discount rate will most certainly reveal some very interesting observations⁵⁸.

This paper is meant to establish a possible correlation between the macroeconomic evolutions in the 20^{th} century Romanian economy and the variations in the official discount rate of the National Bank (the interest rate used to lend money to commercial banks for re-financing). It is also meant to reveal to what extent – if any – these evolutions have been influenced by the discount rate policy of the monetary authorities.

Throughout the 20th century, economists have unanimously acknowledged the importance of the discount rate as the primary interest rate within a state or group of states: by means of increasing the interest rate during economic booms that forego the busts, the Central Banks help alleviate the consequences of the crises, thus deterring entrepreneurship and speculative pressures. Similarly, the discount rate is decreased during recessions, when Central Banks need to encourage economic activity by providing cheap money and restore the optimistic spirit among entrepreneurs.

By analyzing the discount rate changes during the first half of the 20th century, we can easily notice rather abrupt variations – of about 1-1.5%, both upwards and downwards – in the discount

-

rate; this reflects rather large changes in the most important economic and banking indicator. At that point, such fluctuations were afforded by the national, European and international economic situation, whereas nowadays, such changes are no longer possible, due to the intricacies and complexity of the economic, financial and banking inter-relations at the European and global level. The evolution of the official discount rate points out a sensible conclusion: the Central Bank has provided the cheapest capital throughout the 20^{th} century, at a discount rate that fluctuated on average between 5-6%. The evolution also reveals that throughout the 20^{th} century, the discount rate has been the cause – and not the consequence – of economic policies. All these aspects are illustrative of the decisive influence that the official discount rate has on the economic developments in Romania.

Before starting an in-depth analysis of the discount rate mechanism, we must mention two general aspects related to the concept:

-The specificity of the concept and its close connection to the banking environment have rendered it less known and rather neglected in the general economic environment; a lot of economists and, at the same time very few bankers have noticed and agreed that the different discount rates can be accounted for by the degree of development and the size of the normal official discount rate

-The utter simplicity of the influence – usually a negative correlation – of the discount rate on economic growth; (here we must note the difficulty of establishing precise mathematical correlations between the two indicators – the discount rate and the economic growth rate – due to the lack of statistical data on economic growth during the first half of the 20th century). In this respect, as early as 1915, M. Musceleanu first noted that: "There exists an inverse relationship between this degree of development (economic and financial – n.n.) and the level of the official discount rate: the more prosperous the economic situation, the lower the official discount rate"

The current conception on the discount rate policy is rooted in the "debates and inquiries that took place during the suspension of the GB pound convertibility (1797-1821), when many economists and bankers realized that a rise in the official discount rate above the market discount rate was susceptible of hindering credit expansion and of triggering deflation, together with its consequences: a decrease in prices and an improvement in the terms of exchange. The immediate conclusion: the consequences are of an economic nature. "Even during the subsequent crises of 1836, 1839, 1847, the Bank of England is believed not to have understood the utility of firmly handling the discount rate policy, because the timid attempts to lift the discount rate could not put an end to the depression"⁵⁹.

Throughout the 20th century, economists have generally acknowledged the importance of the central bank discount rate as the reference interest rate in a country: "By increasing the interest rate during vigorous economic booms that precede an imminent bust, the Central Banks contribute to alleviating the consequences of the crises, by deterring entrepreneurship and speculative pressures, in a time that the economic state requires cautiousness. By increasing the reference rate, deflation occurs. Finally, the discount rate is decreased when its purpose has been achieved or when, during recessions, the Central Bank needs to stimulate economic activity by providing cheap money and thus restore the optimistic spirit among entrepreneurs^{3,60}.

During recent years, the discount rate policy led by the main central banks has been much more effective than 100 years ago.

The main characteristics of the discount rate are:

- a. Its power is relative and it varies from country to country, and across time.
- b. The low level of the reference rate lies at the bottom of the economic, banking and political edifice

180

⁵⁹ Axenciuc, V. (2000) – Evoluția economică a României. Cercetări statistico-istorice, 1859-1947, vol.III, p. 89 60 apud Stoenescu, Radu (1935) – Politica scontului, București, Cartea Românească, p. 23

- c. Sometimes an increase in the reference rate is not sufficient to compensate the risk incurred by the economic uncertainty
- d. A decrease in the reference rate triggers an "extraordinary credit expansion", which, for the most part, generates economic depression, and not economic growth
 - e. A stabilization of the reference rate is possible, but not in the presence of strong opportunistic movements or on a developing capital market
 - f. The diversity of economic life has lead to rigid principles in what regards the reference rate

What actually happens in the economy is a rather simplistic mechanism, if understood by economic and banking authorities: if the reference rate is increased, interest rates will also increase, production costs go up, which in turn, leads to a decrease in profits and investments. "On the contrary, if the official discount rate decreases, there will be a transfer of funds from the monetary to the capital market, where the interest rate is higher, but only for a limited period of time. Production remains constant, profits increase, and the fraction of benefits which is saved will serve either for self-financing, either for a long-term investment, encouraged by the new ascending business cycle... Considered as a means of market regularization, the discount rate policy needs changing and re-orienting from time to time, both in principle and in practice, as the modern economic and financial situations require. It represents though, a classical way of guidance for the national currency, perhaps the only one to have proven its capacity so far, but the only one that the current supporters of the "controlled currency" do not seem to understand" of the current supporters of the "controlled currency" do not seem to understand of the current supporters of the "controlled currency" do not seem to

The principles of the discount rate

- -The official discount rate of the central bank must be lower than the market rate
- -If the production costs do not rise, the discount rate must be left unchanged
- -If the production costs rise, the discount rate must also be increased in order to prevent speculative pressure
 - -Every ascending movement in prices cannot be encumbered by an increase in the discount rate
- -Accidental events, such as wars, crises, reforms, revolutions etc "can provoke a rapid increase in the discount rate in some countries, which can be conveyed to other countries" (Stoenescu 1935)

At the beginning of last century, H. Hornbostel noted that the repercussions of the discount rate fluctuations have become much more complex and that the application of the classical methods has disappointed frequently those who believed more in their efficiency.

The official discount rate is usually motivated by general economic and financial interests, by the monetary circulation and credit expansion requirements. There is no standard formula for an infallible discount rate. It is unanimously accepted that economic stability with no inflation generates ever lower discount rates.

All throughout the 20th century, the discount rate levels – denominated "reference rate" as of 1st January 2002 by the National Bank of Romania – have been as follows:

-The period (1891) – 1901 – 1918 of the gold standard: this period has generally experienced higher discount rates of 6-7% (during the agricultural crisis of 1894); 8% in 1907; 6% between 1914-1918; this points out that periods of economic upheaval usually generated higher discount rates than periods of normal activity. In this respect, dr.Radu Stoenescu (1935) observes that "Between 1901-1914, the National Bank continued to help economic development through ever larger productive investments... The

_

⁶¹ idem, p. 67

official discount rate was reduced to 8,7,6 and even 5% (14th August 1902), as the economic situation improved and remained at this level up to 1907 when, due to the international monetary crisis and the national social-agricultural crisis, the rate had to be raised to 8% again (27th October 1907). When the crisis ended, the discount rate turned back to its previous 5% level February 1908), a level maintained until 19th October 1912, when it was again (28^{th}) 6%. It was during 1912 that the age of prosperity and economic progress came to an end and gave way to an endless period of economic and political crises, which still goes on today... In 1914, the National Bank considerably enhanced its discount operations, in order to help eliminate the previous crises. The variations in the discount rate fluctuated between 5.5 - 7%economic activity determined a sensible decrease in the National ... and the stagnation of the Bank operations

-The period 1919 – 1928: the average level of the discount rate was 6%: an official discount rate as low and stable as possible, in order to help reconstruct the national economy, by providing a cheap commercial credit... Maintaining too low a discount rate seems to have fuelled the speculative activity which was going on. Indeed, it was a most profitable business for large banks to borrow money by refinancing at the National Bank at a 6% discount rate, and then lend it to smaller banks or to other private entities at 20-25% interest rate. Not only did this hamper economic development, but it also contributed to an aggravation of the national currency depreciation, by encouraging the ascending tendency of prices

-The period 1929-1934, of the economic crisis: the discount rate varied between 8-9.5%; the 7% discount rate, although well grounded in the monetary situation, seemed too high from an economic point of view, if we take into account the low profitability of enterprises and the conventional interest rate established by law in March 1931 – at 5 percentage points above the official discount rate. Therefore, the National Bank turned back to the 6% interest rate on April 5th 1933... On December 14th 1934, the National Bank proceeded to a new decrease in the official rate, from 6% to a mere 4.5%... In this way the National Bank proved once again not only a considerable comprehension, but also its effective support, as the issuing entity, to the development of our national economy

-The period 1935-1946, the discount rate varied between 3-4%. This interval comprises both the pre-war period and World War II, with its economic and financial peculiarities

-The period 1947-1989 (the communist period) – during this age, the official discount rate varied by 1-2% from year to year up to 1955-1960; then as the centralized plans pinned down most economic evolutions and variables, the NBR official discount rate leveled off at 1%.

By analyzing the discount rate changes during the first half of the 20th century, we can easily notice rather abrupt variations – of about 1-1.5%, both upwards and downwards – in the discount rate; this reflects rather large changes in the most important economic and banking indicator. At that point, such fluctuations were afforded by the national, European and international economic situation, whereas nowadays, such changes are no longer possible, due to the intricacies and complexity of the economic, financial and banking inter-relations at the European and global level. The evolution of the official discount rate points out a sensible conclusion: the Central Bank has provided the cheapest capital throughout the 20th century, at a discount rate that fluctuated on average between 5-6%. The evolution also reveals that throughout the 20th century, the discount rate has been the cause – and not the consequence – of economic policies. All these aspects are illustrative of the decisive influence that the official discount rate has on the economic developments in Romania.

THE NATIONAL BANK OF ROMANIA – PRESS RELEASE – January, 30th 2002

- The National Bank is Going to Replace the Official Discount Rate with the Reference Rate -

The macroeconomic context in Romania during recent years has been characterized by structural liquidity surplus in the banking system, triggered mainly by the relative acceleration of capital inflows. The commercial banks enjoyed alternate financing sources, which led to a progressive reduction in re-financing operations, and forced the National Bank to sterilize the economy in order to prevent the inflationary pressures of the excess liquidity. Romania's case is not unique, in fact sterilization operations are a common feature for most Central and Eastern European countries acceding to the EU.

Since operations such as refinancing and discounting have gradually lost their relevance, in that they are not a particular feature of the current monetary policy orientation, the replacement of the discount rate with a rate of reference for the central bank operations seems like the natural thing, deriving from the evolution of monetary circumstances. The necessity for such a change is reassured by the fact that, for at least the next three years, the sterilization shall continue to play a predominant role among NBR operations, which is also reflected in the National Economic Development Strategy for the Medium Term, conceived in March 2000 and submitted to the European Commission.

A restoration of the discount rate is rather unlikely since, in light of the European accession process, the National Bank of Romania seeks to align its procedures to those of the European Central Bank, whose analytical kit – as that of many modern central banks – does not include the discount rate concept.

In this context, the discount rate will be replaced with the NBR reference rate and will be calculated as to reflect the prevalent conditions on the monetary market. For the forthcoming period, the new interest rate will be calculated as an arithmetic average weighted with the level of transactions, of the interest rates for deposits and reverse repo operations of the previous month. The reference interest rate will be made public through press releases of the National Bank on the first working day on a monthly basis. This information will also be published in the monthly bulletins of the central bank as well as on its website (www.bnro.ro).

The reference rate will enter into force on February 1st 2002, by regulation of the National Bank of Romania which will repeal NBR Regulation no.11/1998 and will establish the level of the reference rate for February 2002.

We must observe that the shift from the discount rate to the reference rate will not produce any shocks, the two indicators having comparable levels at present.

COMMUNICATIONAL APPROACH IN THE ORGANIZATIONAL CHANGE MANAGEMENT

Dragos Constantin Vasile

The Academy of Economic Studies, Faculty of Commerce Piata Romana, nr. 1-3, sector 1, Bucuresti dragoscv@gmail.com, 0722251367

The need for information and communication increases when organizations experience organizational changes. The paper examines the need of communication in terms of the professor Tichy's theory of the technical, political and cultural systems of organizations. The change agents must operate at these levels. Starting from this imperative the question is whether communication can help with implementing change from both technical, cultural, and political perspectives. From technical point of view the management responsibilities are to make knowable the organization's world. The political perspective addresses the issues of power, interests and alliance games in organizations. The cultural change accompanying a new and revolutionary vision of the future requires a period of time for the staff to become familiar with it and instructing is the type of communication that seems the most adequate for this end.

Keywords: change, communication, information, organizational politics, organizational culture

JEL Codes:

The major role of information is to reduce uncertainty due to an imperfect knowledge of a reality. The need for information and communication is not a problem for organizations as long as their external environment is characterized through stability and they run smoothly based on well-known practices and well defined and stable relationships. But the external environment has generally lost the confort of the stability that has been replaced by the turbulence caused by the dynamism of changes and increased complexity. Besides that, organizations in change move from a known current state to an unknown future state. In other terms, uncertainty grows.

1. The need of communication in organizational change management

The need of information and communication within organizations that run in turbulent environments and initiate change programs substantially increases. The current procedures and processes remain important, but they cease to be a solid support for designing and implementing changes. The exchange of information get a vital role to play for coordinating the efforts of the organization members. People aspire to a deeper knowledge of their role, their managers' expectations, and how their contribution and efforts articulate in the programs that triggered changes. People have to understand what it happens or it is to happen around, the events they live. But the knowledge of each individual is not enough, all members of the organization have to share their knowledge, which is achieved through an intense communication. It results that a deeper need of communication follows the need for coordination and the modifications of the collective knowledge of the organization in change.

Besides that, each step of the change process requires communication. For example, designing change is not possible without documenting its necessity, exchanging information about the organization capacity to change and the likely obstacles and resistance, or sharing understanding so that stakeholders should embrace the plans. Communication is probably the most important skill that people need to have in order to be effective change agents. In situations of instability, or ambiguity, communication becomes an essential ingredient. Poor communication around change issues can destroy commitment to an organization, irrevocably damage employee morale, generate huge resistance and hostility to change, encourage later performance problems.

The change situations are very different and they give birth to a lot of problems. Closed problems are generally less complex and easier to be defined and delineated from the context. Although cultural and political aspects does not lack at all in this instance, they can be tackled especially through means of technical instruments and tools. On the contrary, when opend problems prevail organizational culture amd

politics become significant dimensions of the change. Communication also has to be in accordance with the characteristics of different change situations.

We can describe several types of managerial communication:

- *Informing*. The communicator gives people information they need so that they can make better dicisions and achieve adequately their tasks at the required standard. The information may take the forms of facts, opinions, interpretations and judgements based on facts, feelings about the facts and their interpretation, or, generally a mixture of the above. In giving the information the communicator is interested that it should be taken into consideration, although the relevance of the decisions and actions taken in consequence can not be an important issue.
- Seeking information. The reverse of informing is seeking information when the communicator attempts to get people to tell him or her. The communicator does this by asking questions, actively listening, giving information of his or her own, or by reading documents and reports.
- *Instructing*. Instructing subordinates is a more complex form of communication than informing. Communicators want people's behaviour to change as a result and people to act otherwise than before being instructed.
- *Influencing*. Communication always has effects on the recepients of the message, but sometimes influencing the recepient's attitude, behaviour and actions is the main purpose of the communicator, such as when motivating or encouraging. Influencing makes use of suggesting, persuading and other elements (ex: manipulating the components of the situation); power is also a relevant issue. A process in which mutual influence of the communicators is negotiation, based on clarifying the parties' interestes and needs, and trying to find mutually satisfactory compromise.

Sometimes, informing can remove misunderstandings and reservations about the change. Other times, the interests of the stakeholders are affected by the planned change and informing has to be complemented by influencing. Certain large changes affecting organizational culture need time to be implemented and instructing the people in the organization.

2. Communication in the perspective of Tichy's organization systems theory

We examine further the link between change and communication in terms of the professor Tichy's "TCP" theory. Tichy sees the organization as a system with three components (fig.1):

- -*Technical* including activities and elements that serve to production operations and solving the associated problems.
- Cultural concerning the components of the organizational culture and the dominant ideology.
- Political encompassing practices and activities aiming to sharing power in the organization.

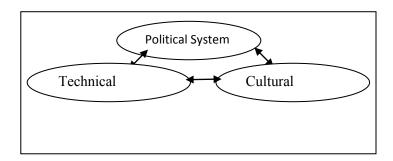

Figure 1 – The organizational systems

The three systems of the organization are tightly connected and their alignment is a condition of a sound organization. Hence managers must distinguish between technical, cultural and political aspects of a change situation and must intervene in a balanced manner following a holistic

approach. Addressing technical, cultural and political aspects of the organizational change may require the use of different types of communication or a mixture of them.

3. Communication and the technical perspective on change: informing

From technical point of view, communication is primarily linked to the effort of making knowable the organization's world. Making decisions requires relevant and timely information, hence change agents are interested to collect, analyse, process and store valuable data and infomation. Besides that, people in the organization aspire to be extensively informed about what is happening within the organization. So, informing the stakeholders about the change is needed not only for ensuring good decisions, but also for other two reasons: (1) coordinating the efforts of the people angaged in planning and implementing the change, and (2) motivating the people to engage in the change process and to cooperate each other in commun endeavours.

Collecting and circulating relevant information raise a problem due to the fact that it is dispersed within the whole organization and is refering to a changing reality. The problem of the information needed for planning changes, coordinating the change efforts and motivating people can be approached into two manners:

- *In a centralized way*, by transmitting information from an resource allocation center. The key element is that transmiting center should be able to ensure information with a high degree of accuracy, in due time and at a reasonable cost.
- *In a descentrized way*, by transmitting much less information from the central point and letting the economic calculus and making decisions to more local levels, where information already exists. The key element in this instance is that the decisions should result in coordinated and coherent actions.

The information problem has similarity to the problem of initiating and leading the change processes. Centralized (top-down) change is initiated and lead from the top; directions of action, indications and measures are decided by the senior management and they must be implemented and observed throughout the organization. A weak of centralized change is that valuable information residing at inferior levels where people have direct contacts with the organization's external partners (e.g. saleforce) does not reach the deciders at the top of the organization, generally due to the high cost of collecting and circulating it. As a result certain opportunities of initiating changes are lost. Another weak is that instructions from the top are sometimes difficult to be adjusted to particular cases in different areas of the organization. The risk of infringement of the plans designed from the top is quite high at the levels where people lack the privilege of comprehensive information.

Descentralized (down-top) change has certain advantages. Based on genuine direct information, change agents may initiate interventions in reponse to external and internal preassures, and they have not to wait until their information is transmitted to the top and plans are received down. So the organization is able to react faster to external forces. Also, staff empowerment for taking change initiatives introduces a strong motivational element in the process. However, down-top approach gives birth to a problem, because too many change initiated locally may have adverse effects on the stability and direction of the organization. On the other side, there are ample projects and plans that envisage the whole organization or significant processes, systems and parts of the organization and they are result of inspiration, vision and efforts of leadership.

Combining "top-down" and "down-top" interventions seems to be the most effective approach (Clark, 1994). It is a way to take advantage of the strength of the descentralized change with its genuine valuable information leading to ideas for local improvements of the activity and the strength of the centrilized change in terms of providing control and resources to the process. That's why any kind of change needs the implication of top managers who can become "onwers" or at least "sponsors" of the change, even if it has been initiated from local area of the organization. The members of the superior management acting as "sponsors" or "owners" are responsible for providing direction and resources.

At the same time an effort must be made for finding solutions that the valuable information collected at the bottom could be conveyed at the top of the organization in due time and with affordable costs. The improvements of the informing mechanisms and channels is an essential factor of developping the capacity of the organization to change.

4. Communication and the political perspective of the change: influencing

A more general and very controversial issue of the change theory is the game of the interests in the organization. The undestanding of the issue depends on the managers' perspective on organization and on ideology based on it. A unitary perspective on organization tends to ignore the individual interests of the managers and employees and focuses on the general commun interests of the organization as a whole, generally based on strong organizational culture and paternalistic management. A different perspective means a recognition that in almost every organization there are varying interests and there are also clusters of interests. The change agents need to diagnose the political landscape and figure out what the relevant interests are, and what important political subdivisions characterize the organization. They do not assume that everyone necessarily is going to be their friends, or agree with them (Pfeffer, 1993).

From unitary perspective, change is a mostly a technical process, and the contraints that have to be controlled result mainly from resources, planning competences or process leadership. The change may easily be designed and implemented from the top by virtue of the leaders' authority to lead. In this context the issue of resistence to change is pointless as long as any divergent interests cannot apear. The senior management plans the change for meeting the organization's needs and people accept it because their needs are also met by implementing the plans. The crucial point is that the plans should be designed adequately and enough resources should be available to implement them. On the other side, the pluralist perspective on change involves participation of people in organization to designing and carrying out changes. The plans must take into consideration the interests of different stakeholders, and the change agents have to play a role of a coordinator of the political subdivisions within the organization, and deal with the conflicts caused by cognitive or material divergences.

Persons and groups within the organization attemp to promote their interests and in this respect they try to strengthen their power and influence. Power represents the capacity to influence situations, events, people and ourselves, for example managers can influence employees to become more performant. From unitary perspective the main source of the power is hierarchical authority, i.e.the formal and legitimate authority. From pluralist point of view the sources of power are diversified, the hierarchical authority co-exists with other forms such as expert power, dependence power, personal power a.s.o. Power and influence within the organization constitute the area of organizational politics, which are an important function of the change management. Organizational politics can support the change processes if an effort is made of creating favourable alliances.

Dealing with political issues, such as the creation of alliances in favour of the planned change requires an effort of intense communication that can help with clarifying and sharing different views and with making satisfactory compromises. One function of negotiation, as a form of communication, is the introduction of change into organizations (Faure, 1991). Negotiation is an adequate instrument when change involves cognitive and material divergences among stakeholders, or when some people or groups are affected by the planned change and lose something, such as the convenience of a familiar job or practices, a more intense work, or the necessity of aquiring new competences. Such losses have normally to be compensated. Negotiation represents a type of communicational interaction where the influence has a major role to play.

5. Communication and the cultural perspective on change: instructing

From a cultural perspective communication helps with carrying out more subtle processes of the change implementation, especially those involving the organizational culture that emerges from the collective experience of its members. According to Schein (1985), the culture of an organization helps it deal with essential problems. Firstly, organizational culture is important for the organization's external adaptation, through developing shared understandings of its mission and strategy, goals, standards, or the corrective actions needed to improve goal accomplishment. Secondly, it contributes to the internal integration through building a sense of membership, through developing a commun language, establishing an ideology that gives meaning to unexplainable events, creating consensus on membership criteria, or standards for intimacy and friendship (*apud* Schermerhorn, Hunt şi Osborn, 1991).

Implementing profound changes into the organization involves very often the challange of making changes of the organization's culture. Miner (1988) argues that the organizational culture cannot be managed and intentionally changed, based on reasons such as:

- cultures are spontaneous, elusive and hidden, hence they cannot be acurately diagnosed;
- the organization's culture requires considerable experience and deep personal insight so that the efort of understanding could make cultural management infeasible in most instances;
- cultures provide organization members with continuity and stability, therefore members are likely to resist even modest efforts at cultural change because of concerns about discontinuity and instability (*apud* Wagner and Hollenbeck, 1992).

However the Minor's arguments have to be regarded in our opinion as reflecting the difficulties of cultural change endeavours, rather than the impossibility of changing the organizational cultures.

Communication is a way of helping with shaping and ensuring continuity of the organizational culture for example through the infusion of shared set of perception and meanings into their work of the organization's members. As McQuail (1997) puts it, the organization and the way people understand it are mostly the result of communication, at least in terms of its organizational culture. On the other side, communication has an important role in creating mutations in the organization's culture (Boneu, 1998).

Changing culture requires complex and subtle communicational efforts. Modifying the visible aspects of culture such as language, stories, rites and sagas is easier to be accomplished through management's proposal of interpreting situations in new ways and adjusting the meanings attached to important events. But it is much more difficult reshaping values and common assumptions of the people, which requires more drastic and radical action. Informing communication is not enough. Change agents have to produce a change in the current cultural paradigm, which needs efforts and time. They must help people to understand and live with the new paradigm and an adequate way to do it is by instructing. For example training programs can be created to help people understand the desired new state of the company, or to change their attitudes and aquire new skills and competences.

6.Conclusions

Major changes cannot be successful without the implication and participation of the organization's members in designing and perfoming different interventions and actions during its implementation. People's commitment and initiatives are ingredients of a successful change and they can be enforced through adequate communication within the organization. Communication becomes an important value of a company, especially when changes occur, which means an effort at creating a communication culture within the company. Such a communication culture may facilitate the main change processes such as creating an overall awareness of the need for change, reducing or removing people's resitence to planned changes, enforcing a sense of "ownership" of the designed interventions a.s.o. However specific change situations require specific communicational approaches. There instances when informing may be the main

instrument of communication, but generally, in case of complex and profound changes, other types of communication are necessary to be used, such as influencing and instructing.

Considered to be the engine of the economy, the SMEs sector has a well defined identity in the configuration of any modern economy. SMEs are one of the most important new job generators and they are acting in a dynamic and complex environment. Thus, SMEs have relied on human resources as a source of competitive advantage and more and more entrepreneurs are becoming aware that the recruitment and selection processes play a major role in obtaining adequate staff. This paper is aiming to point out some aspects regarding the specificity of the recruitment and selection processes in SMEs active in Bucharest. The conclusions of the paper are based on a field empirical research on 25 SMEs. The results showed that the recruitment and selection processes have some significant particularities in the researched SMEs.

Key words: SMEs, recruitment process, selection process, human resources

JEL Classification: M12

Introduction

Personnel are the most valuable resource of an organization. An adequate human resource management ensures the success of an enterprise, regardless of its size. An efficient human resource management starts with efficient recruitment and selection processes. These processes can be considered the most important stages of the human resource management because the success of an enterprise directly depends on its staff's quality. This paper was written because of a vast interest in human resource management in SMEs. Based on a field empirical research on 25 SMEs active in Bucharest, the paper aims to present a series of features of the recruitment and selection processes in researched SMEs. The paper is structured into three parts. The first one explains the main concepts used in this paper. The second part points out the main steps of the research methodology and the third focuses on the main findings of the research.

Recruitment and selection processes in SMEs – concepts' content

Small and medium enterprises: According to Law no. 346/2004 on stimulating the creation and development of small and medium enterprises with the subsequent modifications and additions, legal definition for SMEs in Romania established that SMEs are classified into 3 classes of enterprises: micro, small and medium enterprises. Micro enterprises are those enterprises that have up to 9 employees and create an annual net turnover or total assets of up to 2 million Euros, equivalent in Lei⁶². Small enterprises are those which have between 10 and 49 employees and achieved an annual net turnover or total assets of up to 10 million Euros, equivalent in Lei. Medium-sized enterprises are enterprises that have between 50 and 249 employees and achieved

62 Leu (plural – Lei) is the currency of Romania.

an annual net turnover up to 50 million Euros, equivalent in Lei, or which have total assets of up to 43 million Euros, equivalent in Lei.

Recruitment: "Recruiting is the work of human resource management, which identifies sources of qualified candidates to fill a post and it determines the candidates to apply for employment of new or vacant positions within an organization" Recruitment can be done inside the organization and/or outside it. Recruiting from internal sources is possible especially if the organization was engaged in a sustained recruitment process in a previous period of time. Usually, internal recruitment is known as a form of promotion or transfer within the organization. The most frequently used method for the internal recruitment is the employment ad. External recruitment is common especially for fast developing enterprises and for those hunted by higher educated and qualified candidates. There are different methods used in external recruitment such as advertising ads, recruitment agencies, online recruitment agencies, recruitment in educational institutions or search in applications for employment published in press.

Selection: "Selection is the activity of human resource management which consists in choosing, according to certain criteria, the candidate whose psycho-socio-professional profile best matches the characteristics of a particular job"⁶⁴. Selection refers to the final stage of the decision in the recruitment process. Selection must provide two essential features: to identify, from a lot of employees, the adequate person for the free job and to be effective (the resources used for designing and conducting the selection process have to be justified by the quality of new employees)⁶⁵. The selection's purpose is to provide candidates who will have the best results in the job for which selection takes place. During the selection process different criteria are used, such as the study of background information provided by the curriculum vitae and letter of motivation.

Personnel recruitment and selection in SMEs - Research methodology

In the preliminary phase of the research, the *research question* was defined: What are the main particularities of the recruitment and selection processes in SMEs? After this phase, the *purpose* of the research was established: identifying recruitment and selection processes' features in researched SMEs. Further on, the *objectives and hypotheses* were set as shown in table 1.

Table 1 - The Objectives and hypotheses of the research

-			
Objectives	Hypotheses		
Determining the importance of the human	Most entrepreneurs consider the human factor		
factor in researched SMEs.	important for their business.		
Identifying the main recruitment and selection	Most entrepreneurs prefer informal sources of		
methods used into the panel of SMEs.	recruitment.		

The design stage of the research had as initial step - the selection of the sources of information. For this research, primary sources of information have been used, namely entrepreneurs-managers of 25 SMEs in Bucharest, randomly chosen. The method chosen for collecting the information was the undisguised survey based on a questionnaire. As a structure, the questionnaire contained 7 closed and 3 open questions. The first 2 questions were used to obtain information in order to classify enterprises in the panel according to several variables, and the last 8 to obtain basic information for the research. During the research accomplishment phase, information collection was performed by administering the questionnaire to a sample of 25

entrepreneurs-managers of SMEs in Bucharest. The high share of SMEs in Bucharest in SMEs in Romania (*e.g.*, in 2007, approximately 24% of local SMEs active in industry, construction, trade and other services were in Bucharest⁶⁶) led to the solution of choosing the capital of Romania as an area of administration of the questionnaire. *Information processing* was done in Microsoft Excel by quantifying the information obtained and by using the ranking method. *The analysis and interpretation of the results* was based on the information obtained in the previous stage. The last stage of the research - the *conclusions* provides some specific features of the recruitment and selection processes in researched SMEs.

Data analysis and interpretation

Depending on their size, SMEs in which the questionnaire was administered were grouped, as shown in table 2.

Table 2 - The type of SMEs in which the questionnaire was administrated

The type of SMEs	Frequency	%
Micro	12	48
Small	8	32
Medium	5	20
Total	25	100

Source: data processing

The questionnaire was administered in 25 SMEs active in Bucharest. Of those, only 5 (20%) are medium-sized enterprises and 8 (32%) are small enterprises. Almost half (48%) of the 25 SMEs are micro enterprises. The large share of the micro enterprises in the total SMEs in which the questionnaire was administered is explained by the large share of the micro enterprises in our country and also in Bucharest (*e.g.*, in 2007 in Bucharest, 88% of local SMEs active in industry, construction, trade and other services were micro⁶⁷).

Depending on the field of activity of the SMEs in which the questionnaire was administered were grouped as seen in table 3.

Table 3 - SMEs grouping by field of activity

Tuete 5 SIMES 8. oupling by flette	of activity	
Field of activity	Frequency	%
Commerce	8	32
Services	6	24
Industry	2	8
IT	4	16
Constructions	5	20
Others	0	0
Total	25	100

Source: data processing

Most SMEs (32%) in which the questionnaire was administered operate in the trading field. 6 (24%) of the 25 SMEs provide various services, 5 (20%) operate in the construction field, 4 (16%) in the IT field and only 2 (8%) in industry, specifically the textile industry. Of the 8 commercial SMEs, 7 (88%) are micro enterprises and only one (12%) is small. Of the 6 service providers, 3 (50%) are micro, 2 (33%) are small and only one (17%) is medium. The 2 enterprises in the textile industry are one small and one medium. Of the enterprises which operate

⁶⁶ Institutul National de Statistica, Anuarul Statistic al Romaniei editia 2008, pp. 700, 702.

⁶⁷ Ibid., p. 702.

in the IT field 2 (50%) are micro, one (25%) is small and one is (25%) medium. 3 (60%) of businesses that operate in the construction field are small and 2 (40%) are medium.

Regarding the existence of a human resources department, it is noted that only 8 (32%) of the SMEs in which the questionnaire was administered have such a department. Of these, 4 (50%) are small and operate in the trading field (1), IT (1) and services (2) and 4 (50%) are medium and operate in the construction field (2), IT (1) and services (1). The remaining 17 SMEs (68%) do not have a department of human resources. Of these 12 (71%) are micro enterprises operating in commercial areas (7), IT (2) and services (3), 4 (23%) are small enterprises operating in the construction (3) and textile industry (1) and only one (6%) is medium and it operates in the textile industry. It is noted that the micro enterprises do not have a department of human resources. Thus, the entrepreneur plays also the role of human resources manager. There is a part of small and medium enterprises which have a department of human resources. This shows increasing concern for the human factor, as the size of enterprises is also rising.

Perception of the importance of human resources in undertaking their business has allowed the grouping of entrepreneurs as shown in table 4.

Table 4 - Entrepreneurs grouping by the importance of the human factor in their SME

The importance of the human factor in SME	Frequency	%
Very important	8	32
Important	14	56
Less important	3	12
Least important	0	0
Total	25	100

Source: data processing

It is noted that more than half (56%) of the respondents consider the human factor important for their business, 8 (32%) consider it very important and only 3 (12%) consider it less important. The 8 respondents who consider human resources very important for their business are the entrepreneurs of the 8 SMEs that have a human resources department. The 3 respondents for whom the human factor is less important are the entrepreneurs of a trade micro enterprise, a small enterprise from the textile industry and a small enterprise that operates in the construction field. It is observed that in enterprises active in areas where unskilled labor overbears, human resources are considered to be less important for the enterprise success.

Regarding the entrepreneurs' preferences on the sources of recruitment, it can be observed that none of the respondents prefer internal sources of recruitment exclusively, while more than half (68%) prefer only external sources of recruitment. Only 8 (32%) prefer both sources of recruitment. These 8 are the entrepreneurs who have a human resources department in their enterprise and who consider the human factor very important for their success.

The entrepreneurs' preferences on the methods of personnel recruitment have allowed a top of the preferred methods of recruitment, as shown in table 5.

Table 5 - Respondents' preferences on the recruitment methods

Method of recruitment	1 st	2 nd	3 rd	4 th	5 th	6 th	Total
	place	place	place	place	place	place	
Advertisements published in the press, broadcasted on radio or television	3	8	10	3	1	0	25
Recruitment agencies	8	3	0	3	6	5	25
Online recruitment agencies	11	5	5	2	1	1	25

Recruitment from educational	0	3	3	1	10	8	25
institutions							
Search in applications for employment published in the press by persons in job search		2	3	7	4	9	25
Recruitment from informal sources (friends, family, relatives and others)	3	4	4	9	3	2	25
Total	25	25	25	25	25	25	25

Source: data processing

It is noted that recruitment agencies were placed first among preferences for methods of recruitment by 8 of the respondents while 5 have located them in the last place. Of those 8, 7 are entrepreneurs who have a human resources department in their enterprise. It can also be noted that 11 respondents located in the first place the online recruitment agencies. Of these 9, 5 are the entrepreneurs in micro enterprises in commerce, services (2) and IT (2). Thus a high demand for online recruitment can be identified among micro enterprises. The evolution of technology led to the evolution of recruitment methods, online recruitment becoming increasingly used, even by the entrepreneurs of micro enterprises. Thus, ever more modern methods of recruitment replaced the old ones; only 3 respondents placed the recruitment through informal channels first (friends, relatives, family and others). Classical recruitment advertisements published in the press were located in the first place as the most used method of recruitment only by 3 respondents (2 entrepreneurs from small business in the textile and construction industries, and one entrepreneur of a medium enterprise in the textile industry). Therefore, it is noted that in areas of activity where unskilled labor overbears, the recruitment advertisements published in the press remained preferred. To determine the top of the preferred methods of recruitment, the ranking method was used. Thus, a "grade" was assigned, as follows: the 1st place received 6, the 2nd place 5, the 3rd place 4, the 4th place 3, the 5th place 2 and the 6th place received 1. After that, the sum of the multiplications between the grade assigned to each place and the number of respondents related to each place was calculated. After that, the amount obtained was divided by the total amount of respondents, 25 respectively. The scores obtained revealed that the most preferred recruitment method is online recruiting (score 4.80). Ranked second among the respondents' preferences on methods of recruitment are recruitment ads published in the press with a score of 4.36. Ranked third with a score of 3.64 is recruiting through informal channels, and ranked next, with a score of 3.56 is recruitment agencies. Last 2 places of the deck are occupied by searching applications for employment published in the press with a score of 2.40 and the recruitment from educational institutions with a score of 2.32.

Regarding the preferred selection methods, in 22 SMEs the selection process consists in analyzing the information provided by the CVs and letters of motivation followed by an interview. Of the 22 SMEs, only 11 also chose testing as method of selection. The 3 SMEs that have not chosen any method of selection are those that chose the recruitment from informal sources as the main method of recruitment. The other SMEs who have not chosen testing as a method of selection are those that have awarded the 1st or 2nd place to the recruitment advertisements published in the media.

Conclusions

The research confirmed the hypothesis about the importance of the human factor. It was found that most entrepreneurs of researched SMEs consider the human factor important for their business. It may be inferred that, acting in a dynamic and complex environment, SMEs have become aware that human resources can be an important factor that can ensure their survival or success on the market. The hypothesis regarding the entrepreneurs' preference for informal sources of recruitment has not been confirmed. Thus, the research showed that most entrepreneurs of the micro enterprises prefer online recruitment.

Less than half of the SMEs in which the questionnaire was administered have a human resources department, which was predictable, since nearly half of SMEs are micro enterprises, and the existence of a human resources department in such firms is not justified. According to the gathered data, more than half of small and medium enterprises have a human resource department which leads to the conclusion that as companies grow, their concern for personnel increases. Along with the enterprise size, the field of activity is another factor influencing the existence of a human resource department. Thus, the research revealed that a medium enterprise from the textile industry does not have a human resources department. Thus, enterprises operating in areas where unskilled labor overbears do not put great emphasis on human resources.

More than half of the respondents consider the human factor important for their business. Although they do not have a human resources department in their micro enterprises, the entrepreneurs do not deny the importance of the human factor for their success. They are aware of the strong competition existing on the market they operate on and they consider human resources as a source of competitive advantage.

More than half of the respondents prefer external recruitment only, the rest preferring both internal and external sources of recruitment. External sources are largely preferred by micro entrepreneurs. As companies grow, entrepreneurs prefer both internal and external sources of recruitment. Since the internal recruitment (commonly known as promotion) is an important means of motivation, and concern for the human resources increases with increasing business, entrepreneurs of small and medium businesses often use this source of recruitment.

Nearly one third of respondents ranked recruitment agencies as the preferred method of recruitment. However, almost half of the respondents placed the online recruitment service in the first place, part of them entrepreneurs of micro enterprises in commerce, services and IT. The evolution in technology led to the evolution of recruitment methods. Thus, online recruitment became increasingly used even by the entrepreneurs of micro enterprises who consider it a way of rapid and cheap access to millions of potential candidates. Thus, ever more modern methods of recruitment replaced the old ones; only a minority of the respondents placed the recruitment through informal channels first (friends, relatives, family, and others). This method of recruitment, which assumes prior knowledge of future employees, is generally used by entrepreneurs of micro enterprises. Classical recruitment advertisements published in the press were placed in the first place as the most used method of recruitment only by very few respondents, the entrepreneurs of business in textile and construction industries. Therefore, it is noted that in the areas of activity where unskilled labor overbears, recruitment through the media was preferred. Considering the top of the entrepreneurs' preferences regarding the methods of recruitment it can be observed that the 1st place is taken by the online recruitment agencies. The 2nd place belongs to recruitment ads in the press, the 3rd one to recruitment through informal channels, the 4th place is held by recruitment agencies, the 5th place is held by searching for applications published in media and the last place belongs to recruitment from education institutions.

In most SMEs in which the questionnaire was administered, the selection process consists of analyzing the information provided by CVs or letters of motivation of the candidates followed by an interview. Few SMEs use tests as a method of selection.

The present paper revealed some specific features of the recruitment and selection processes in a panel of 25 SMEs. In order to validate these findings for the whole Romanian SMEs sector, further researches are required.

AUDIT – GUARANTOR OF ETHICS IN THE MANAGEMENT OF PUBLIC INSTITUTIONS

Dumitrescu Adelina

National School of Political Studies and Public Administration Faculty of Public Administration 6, Povernei Street, Bucharest, Sector 1, Romania E-mail: adelinadumitrescu02@yahoo.com Phone: 0740 604 251

Nowadays we can hear more and more references to conflicts of interests, corruption, traffic of influence, and so on. The Romanian Press has literally shouted over the last few years about such cases, diminishing the already doubtful prestige of the Romanian Public Administration. Despite of visible efforts of the Government to solve these problems, efforts concentrating on founding of organisms and institutions powerful enough to fight against such phenomena, they still persist.

To apply a medical principle, one must first fight the cause of a disease and only then the effect; and let's be honest – corruption in the Public Administration is a severe disease.

As remedy for this disease and its causes we must take the internal audit into consideration, which can generate reports about infringements of the public servant at all hierarchical levels to the ethical and deontological norms of conduit.

Kevwords:

Internal audit, Ethics, Infringement, Public servant, Management

1. Introduction

Ethics and ethical behavior have always been a key player in setting up procedural standards in any field of activity. The first codes of ethics were introduced in ancient days within the military and medicine. The Hippocratic Oath can be considered the first attempt to establish a set of rules and guidelines for behavior in a field of activity. Codes of ethics come to complete legal regulations, infringements to these not necessarily putting the offender on the "wrong side" of the law.

Nowadays every métier has established a code of ethics, which is enforced by professional organizations, and every person who wants to be part of that organization, has to follow these rules in every aspect of his activity. Furthermore these organizations enforce their codes of ethics by granting the right to exercise ones profession only by being a certified member of these organizations. We can mention here for Romania: the Order of Architects (OAR), The College of Doctors, the Bar, The Body of Expert and Licensed Accountants of Romania (CECCAR), the Chamber of Auditors, and so on.

Ethics play a significant role also within the public administration. The public service is an activity meant to help all citizens of a nation, equally, without discrimination of any kind. The behavior of the public servant must be flawless at any level, starting from the management and ending with the last levels of the organization of public institutions. By obeying ethics within the public administration, an objective basis for the decision and the procedures within the public sector is being set up. Especially in the public sector, where money from contributors has to be spent in such manner that these contributors are given the basis for a normal, decent life, infringements to ethics are most dangerous and have to be avoided on a systematic level. In this regard, the Public Internal Audit has the means, the power and the responsibility of enforcing an ethical behavior within public institutions and avoiding infringements within the public service. Infringements in the public service are to be considered any action, decision procedure or conflict of interests based on subjective criteria whose results can be considered an abuse of power, a

68 Friedberg, A.: "The Role of State and Public Audit in Safeguarding Ethics in the Public Service: Whose Ethics? What Ethics?", EBSCO Publishing, 2002, pag. 123 – 125.

fraud or any situation of inequitable behavior against one or more contributors⁶⁸. Furthermore, this definition raises the problem of the moral integrity and personality of the public servant.

This paper tries to define the institutional framework for the Public Internal Audit as guarantor of ethics in the management of public institutions and within the public service itself. Two issues have to be clarified:

- What is the place taken by the Public Internal Audit within the public institution?
- What are its interest fields and its limits?

One thing is sure: the Public Internal Audit cannot force the moral conduit in the institution in which it is done. This remains one of the duties of the management, still the audit can pull the right "strings" where infringements to ethical norms have been committed.

2. Ethics in the public sector

What do we understand under ethics in the public sector? Leaving a scholar approach aside for a few moments, and trying to give a more plastic definition, one can say that, ethics in the public service are the first weapon in assuring that public service is done for the benefit of the contributor.

There are some principal differences between the activity of a public and a private entity⁶⁹. The public service is done for all contributors alike, regardless of the differences in wealth, social status, religion and so on, whilst private service is done for those who can afford it. This paper isn't meant to be a lecture for human rights, but there must be said that the public service must respect these human rights in its daily business.

Public service is all about helping the members of a society in their everyday problems. From healthcare, over daily travel to and from work and ending with culture, public service is present in every aspect of our lives, and influences us more or less, depending of the quality with which the public service is done. Therefore, the public servant must be, regardless of his rank and status within the organization, a keeper and defender of human rights, and his attitude must reflect the above mentioned quality and the desire to help every kind.

We cannot separate the moral integrity of the public servant from the moral integrity of the public manager, because the manager is the first person in the public institution who has to enforce ethics. Ethics starts from the top of the command chain of the public sector and is enforced downwards, so infringements have to be avoided from the top. In this regard, the High Court of Justice of The State of Israel had ruled: "The political appointment is a breach of trust of the executive branch against the public. It can influence the public's confidence in the public service; it influences the equality of rights; it influences the professional standards of public officials, who are not demanded to prove, by tender, that they are the best. It can bring about a phenomenon characterized by preferring connections to qualifications; and politics in its narrow meaning turns out to be the major factor in the appointment. It can lead to the false organizing of a system, enabling the absorption of close political 'relatives' to speed up their advancement and to create unneeded jobs. It can corrupt the public moral integrity, unbalancing the stability and decreasing professionalism. It can harm the public servant's morale, influence the quality of the public service and hurt its image. In conclusion, the political appointment harms the basic principles of our judiciary system, our concept of values, our understanding of the essence of public service and of the social covenant, which is without a doubt the basis of our existence as human society."⁷⁰

⁶⁹ Androniceanu A.: "Noutăți în managementul public", 3rd edition, Ed. Universitară, Bucharest 2008, p. 19-21.

⁷⁰ High Court of Justice 145/98, the New Labor Federation and the federation of Academics in Social Sciences and Humanities v. The State of Israel, the. Minister of Construction and Housing and Shimon Einstein, Director of the Department for Rural Building, 5998, Para. 10.

There are seven criteria which define the moral conduit of a public servant and a manager as well⁷¹:

- Probity, meaning the correctness of the public servant/manager in fulfilling his duties;
- Dignity: under a material aspect, the public servant/manager is being paid to fulfill his function, and under a moral aspect, the servant has necessary authority, and is denied the right to degrade himself or his function;
- Interdiction of cumulus: the public servant may not have contrary interests to the administration he serves;
- Impartiality: for some public servants, like magistrates, policemen or military it is not permitted to be members of political parties. Because of the very late adoption of The Statute of The Public Servant⁷², political patronage of public institutions was possible;
- Subordination: public servants have the obligation to obey orders and instructions received from hierarchical superiors;
- Fidelity: the public servant must fulfill his duties to and for the interest of the Institution that employs him;
- Respect towards the function: the public servant must not surpass his function.

Even though the problem of the moral conduit it regulated by the Code of Ethics and The Statute of The Public Servant, we are confronted almost on a daily basis with infringements to these codes. The guarantor of ethics should be the management of the public institution itself, but it is exactly here where we find a conflict of interests: the manager is subject to the same infringements as the public servants. The need for an "independent external control" of the moral aspects of the public service is under these circumstances obvious, and enters the field of the internal public audit. The need for an independent external control of the internal public audit.

Another issue of the moral behavior of public institutions are local cultural aspects. Starter of the research in this field is considered Geert Hofstede, who has established a series of five criteria to define the cultural aspects of a society⁷⁵, getting even more dangerous, if the society has an open attitude towards risk taking. Also what morality and ethics are concerned, a link to these criteria can be found. For example, it is a known fact, that cultures showing a large distance to power tend more to corruption than cultures with a short distance to power. Although Mr. Hofstede did not measure these criteria other authors too have studied local aspects of organizational culture⁷⁶. For example, Romanian public servants consider that there is a high degree of inequality in Romanian public institutions, due to strong hierarchies and military-like leadership.

3. How can the Public Internal Audit guarantee the upholding of ethical and moral laws?

The main issues which appear in the case of the Public Internal Audit are the following three:

What kind of audit should we consider for the issues of ethics?

How can we guarantee the authority of the internal audit infront of the manager of the public institution?

What are the limitations of the internal public audit?

71 Profiroiu M., Parlagi A., Crai E.: "Etică și corupție în administrația publică", Editura Economică, Bucharest 1999, p. 18-20.

⁷² Law no. 188/1999 republished in Monitorul Oficial nr. 365 / 2007 regarding the statute of the public servants.

⁷³ As the German like to say: "Vertrauen ist gut, Kontrolle ist besser". (It is OK to have confidence, but it is better to control).

⁷⁴ An explanation has to be made at this point regarding the link made between the terms of internal audit and external control: the designator "external" refers here to the object of activity of the public institution. According to its definition, the audit is an independent activity within an entity, which is unrelated to the object of activity of that entity. The word "external" has to be read strictly as not being part of the main activity of the institution. Also, it must be mentioned, that there is a significant difference between audit and control. This paper, as it is structured, relates to internal audit, and not to internal control. That is why, the term of internal control is written between citation marks.

75 www.geert-hofstede.com.

⁷⁶ Androniceanu A.: "Noutăți în managementul public",3rd edition, Ed. Universitară, Bucharest 2008, p. 302-313.

At a first glance, the answer to the first question is obvious: the best suited audit to evaluate ethics within public institutions is the performance audit⁷⁷. Still, we have to ask, what are the role of the other two types of audit (regularity and system audit) in fighting infringements? In this regard we will raise the following question: how does nepotism affect the image of public institutions and their efficiency, efficacy and economic aspects?

Answers like the one of the High Court of Justice of the State of Israel are to be given in each case of infringement of the moral and professional rules of conduit. That is why, every type of audit can give information about infringements or can foresee situations where the public servant/manager can be tempted to break these rules. The audit as a whole has a regulating role within any entity and having to ensure the adaptability of the institution to every situation 78 and the weight of each of the three audit types in solving morality issues depends on the problem itself, yet has to obey the same Three "E" Principle.

What the authority of the public auditor in front of the management of the public institution is concerned, the problem is a bit more complicated. Nobody can deny the necessity of exerting authority over the object of audit. We are talking about the object of audit and not the subject of audit, because the audit is by nature an objective and not a subjective activity⁷⁹. That is why a audit repost makes reference only to institutions and not to persons. It often so happens that the manager mistakes the object of audit with the subject, giving birth to unnecessary conflicts sprung out of personal vanities or fears of any nature. Thus the problem has two different aspects:

- A psychological one, referring to the auditors personality;
- An institutional one, referring to the subordination relationship of the auditor to the manager.

The personality of the auditor on one side, and on the other, the accumulation of issues that appear to be infringements to moral integrity can lead to cardinal changes in the way the auditor approaches such phenomena. The problem of political appointments which has strongly contributed to the corruption of the public system, is in this case a very good example. The personality of the auditor, situated on a scale between active and passive, his horizons and his character have a huge influence on his decisions regarding to problems of audit, generally to public entities that have been audited in the past and particularly to issues of moral integrity⁸⁰.

From the point of view of the institutionalization of the internal public audit, it must be said that the internal auditor has to have the same independence as an external one or a controller in order for his activity to have a sense and to give good results^{81,82}. In this regard the guarantor of authority of the internal auditor is the statute of the internal public auditor, as stated in the Charta of the Public Internal Audit and in the Law of the Internal Public Audit⁸³.

A third guarantor of authority for the internal auditor is the irreproachable moral and ethical conduit of the auditor itself. It is utterly unconceivable that an auditor whose conduit is less than spotless can make statements about ethics in public affairs of an institution. Although the Central Harmonization Unit for Public Internal Audit (U.C.A.A.P.I.) has the role to ensure the good conditions of the Public Internal Audit in public institutions in all aspects that are involved

⁷⁷ Ghiță, M., Popescu, M.; "Auditul intern al instituțiilor publice: teorie și practică"; Ed. Ceccar, București, 2006, pag. 101

⁷⁸ Dumitrescu A, "The Role of the audit in Optimizing The Spending of Public Funds" IESC 2009 Conference Proceeding, Sibiu 2009.

⁷⁹ Law 672/2002; Monitorul Oficial, Nr. 953 din 24.12.2002 regarding the internal public audit.

⁸⁰ Friedberg, A.; "The Role of State and Public Audit in Safeguarding Ethics in the Public Service: Whose Ethics? What Ethics?"; EBSCO Publishing, 2002, pag. 123 – 125.

⁸¹ Morariu A., Suciu Gh., Stoian F., "Audit intern și guvernanță corporativă", ed. Universitară, Bucharest 2008, p. 148-150.

⁸² At least at a theoretical level. In practice this requirement proves itself very difficult to uphold because the internal auditor obeys the public manager.

⁸³ Law 672/2002; Monitorul Oficial, Nr. 953 din 24.12.2002.

including the ethical-deontological one, we feel that the proper moral conduit of the auditor must not spring out of the fear of consequences, but out of one's own moral convictions and attitude.

The main issue in determining the field of interest of the auditor concerning the manager's behavioral study is determining those actions of facts that represent or will lead in the future to infringements to conduit rules of the public administration. Here we must take out of differentiate socially immoral or amoral behaviors from legally unethical behaviors, because it is not the duty of an auditor to examine morality aspects of the character of public servants/managers but the conformity of actions, decisions procedures and systems to ensure the objectivity of undertaken analysis and of the reported conclusions. On the other hand, when we spoke earlier about the moral behavior of the auditor as guarantor of his authority we meant the professional and the moral behavior as well. These issues play an important role in the quality of the audit⁸⁴.

Jaques Renard⁸⁵ clearly distinguishes between the audit of management and management audit, meaning that the audit must not question the decisions of the public management nor mus he intervene in either way in the decision making process, but he must analyze the decisions, procedures and methods and evaluate risks ant consequences and to point them out to the management. The role au audit what ethics are concerned relies thus in determining infringements to deontological norms, where such infringements have already taken place, and determining facts and decisions that could in the future lead to such infringements, and in bringing them and their consequences to the attention of the public management.

It is in this authors opinion that the auditor must know very well the mechanisms that work within the public institution, and furthermore to ensure that the management understands itself these mechanisms and that his actions⁸⁶ are compliant to these mechanisms but also with the ethical norms that rule his activity.

4. Conclusions

Infringements to deontological norms that are valid in public institutions are unavoidable. We do not necessarily believe that all infringements are premeditated, but more they come from misunderstanding an ambiguous and permissive legal framework. The consequences of such infringements are nevertheless in most cases extremely serious, for the public, seeing that the trust of the contributors in the administration is very low, and for the public servant breaking these rules as well.

It is of the duty of the management to impose the rules of deontological conduit and to ensure that these rules are followed by all public servants. Managers must themselves be guarantors of these rules within the institution they manage and the audit must pull on the emergency signals for possible infringements. This is why we consider that the Public Internal Audit must ensure the compliance of current activities—of the institution without questioning the decisions of the management or interfering with daily business of public institutions. The audit cannot impose the moral conduit on public servants.

The auditor himself must be a model of personal morality and professional conduit in order to exert authority in issues of ethics within the public institution and to fulfill his mission in compliance with the demands for quality that are set to him.

Safeguarding ethics is by no means the only field of interest of the internal public audit, but it is one of the most important. It interferes with other issues at more levels than one and it is difficult to say if one problem is only of an ethical nature or if it concerns more aspects. However,

⁸⁴ Deis D. R. jr., Giroux G., "Determinants of Audit Quality in The Public Sector", The Accounting Review, vol. 67, no. 3, 1992, p. 462 – 463.

especially in Romania, it is especially demanding, also because of the demands of the European Union to fight corruption and other infringements to ethical behavior.

HUMAN RESOURCE STRATEGIES WITHIN THE BANKING SYSTEM IN ECONOMIC RECESSION SITUATIONS

With increasing levels of export intensity, firms begin to face new demands. The first set of resources brought to bear on the issues, and those resources are most quickly mobilized, are the employees. Indeed, higher levels of exporting require activating relatively less mobile resources through the building of organisational structures and mechanisms for managing repositories of knowledge (particularly organizational specialization and selectively hiring appropriately skilled staff).

This article presents human resource strategies within the banking system in economic crisis situations. Solutions are put forward that enable companies to survive during this period of economic decline. One of the best strategies that a company may apply is the assimilation of knowledge through efficient training.

Keywords: human resources, training, performance, efficiency, banking system

Cod JEL: J28, O15.

Human resources (HR) have been proposed as one of the most important sources of competitive advantage in the global environment (Barney 1991).

Specific HR practices could be used to enhance the human capital of employees. Indeed, such practices are indicators of a firm's investment in HR (Snell & Dean 1992). With the increasing focus on the management of knowledge, as a source of competitive advantage, the human capital approach provides the opportunity for emphasising the intellectual aspects of capital (Petty & Guthrie 2000).

To increase productivity through human capital, the firm needs to harness the potential contribution of the employees. This human capital must then be developed and managed as a core competency of the firm, and a potential source of competitive advantage (Barney 1991). A key mechanism for harnessing the human capital is by using appropriate HR practices (Youndt, Snell, Dean & Lepak 1996).

Organisations can put in place the internal systems to encourage and enhance the accumulation of knowledge. Empirical evidence has demonstrated that human capital-enhancing HR practices are important as a mechanism for enhancing the accumulation of knowledge (Snell & Dean 1992, Youndt et al. 1996).

A key mechanism for harnessing the human capital is by using appropriate HRM practices (Youndt et al. 1996). Similarly, human capital-enhancing HR practices have been found to be positively correlated with the adoption of advanced manufacturing technologies (Snell & Dean 1992). The use of HR to develop and harness knowledge is consistent with the human capital theoretical approach, which argues the skills, knowledge, and abilities possessed by the HR would provide economic value to organisations (Schultz 1961, Parnes 1984). Proponents of human capital theories argue that when complemented by the adoption of HR practices, there is a positive relationship between firm investment in human capital and performance (Youndt et al. 1996).

Within the manufacturing management literature, manufacturing strategy has been described as the match between employee competencies and the extent of competitiveness in the market (Orr 1999). This notion of a match between HR and a firm's internal and external structures is consistent with the literature on strategic HRM (Schuler, Dowling & De Cieri 1993). The emphasis for exporters is on the effectiveness of strategic HR practices and human capital-enhancing HR practices to manage the knowledge required to conduct export activities (Andersen 1993). The level of knowledge acquired would, in part, rely on the types of HR practices used to enhance learning. Therefore, it is expected that organisations will adopt more human capital-enhancing HR practices as the level of export intensity increases.

In a society based on technical and scientific progress, which experiences permanent changes, the individual faces the need to acquire new competences, to renew his or her knowledge and skills at least once every 2-3 years by participating in professional training programmes.

Investment in human resources, which make up the most valuable asset of a company, proves to be intelligent and durable, even if it involves certain costs and the results are not noticed right away. The application of the "3L" principle - "lifelong learning," generates benefits both in favour of companies, as well as in favour of employees by creating new better qualified labour, by increasing competitiveness, output and personal development.

Romania will have to modernise its education system and to adjust its programmes according to the requirements of the labour market.

Professional training for adults in Romania has been a national priority for a long time. Today, when Romania is a Member State of the European Union, the latter should provide support to the European mobility of persons, which is a key element of the European policy.

The quality of employees and their improvement through training and education are the most important factors in establishing a long-term profitability. If one employs and maintains good employees, investing in the improvement of their skills in order to increase their output makes up a good policy.

Research has shown which are the specific benefits that may be obtained through staff training and improvement, namely:

- Output increase.
- Decrease of the rate according to which employees are substituted.
- Efficiency increase, which results in increased financial gains.
- Decrease of the need for supervision.

In a developing technical universe, where adjustability is called for, we are deeply convinced of the indispensable and irreplaceable role of professional training in increasing competitiveness.

Professional training must be a priority of national policies. The application of the lifelong learning concept will be beneficial to both the society, as well as to persons, following the increase of competitiveness thereof, the professional development and the employment potential.

Although it does not rank among the first countries that invest in this field, Romania has taken a few important steps in programming the professional employment and training policies. The main element of a strategy in connection with lifelong improvement is a strong partnership with the parties interested in the education phenomenon and the involvement of social partners and the development of customised training programmes must respond to personal and to company options and interests.

Professional training and improvement within the banking system involves:

- The determination of the needs for professional formation, training and development
- The elaboration of training and improvement programmes and the follow-up of their application
- The organisation of training and improvement courses relying on own bank staff or based on collaboration with other specialised companies
- The guarantee of participation conditions with respect to employees' participation in these programmes

- The assessment of training and improvement actions
- The follow-up of efficiency of pursued programmes

Staff promotion within the banking system:

- The elaboration of promotion criteria for all professional categories
- The elaboration of a promotion plan
- The organisation of promotion contests
- Career plans

The professional and personal training and development within the banking system aims at achieving the strategic objectives of the bank.

Obligated to act within a legislative framework that is marked by significant discrepancies compared to the international system (except for the last years), the financial and banking companies had to "fight" for the problems corresponding to gaining market shares, but especially for the problems caused by the capitalisation on human resources (given that the human resource capital does not have a high level of education, stability and it is fluctuant).

Regarding the purpose of courses attended within the Transilvania BANK, one may come to the conclusion that these allowed its staff:

- -to improve their personal performance, which allowed them to be better appreciated by the superiors and respected by the colleagues;
- -to correctly carry out their tasks distributed based on the position occupied, thus enhancing the trust in themselves;
- -to be promoted to a higher category or within the position occupied, which contributed on the one hand to enhancing the personal reputation, to increasing the income yielded, and on other hand to improving working conditions.

The companies on the local market, especially those in the financial field or those that provide support services take into consideration the professional retraining of the employees as an alternative to restructuring. The solution is to move the employees from the unproductive department to productive ones.

Companies are now willing to do whatever it takes in order to prevent the closing of their business. For example: staff rotation, unpaid leave, decrease of salaries – either the salaries of all the employees or, with their consent, the salaries of the managers.

Professional retraining is a solution that is easily implemented, especially in the case of less specialised jobs that require a shorter training period. Generally jobs that require a month or two months at the most to learn the specific features of the work involved are concerned.

Companies have to opt for one of two types of strategies:

- -either to keep the already existing staff and not to perform any kind of salary increase
- -or to dismiss part of the employees and to keep the ones with the highest performance.

Companies in the second category manage this way to keep some of the benefits and even to perform salary increases. Less than 10% of the companies on the local market have foreseen salary increases of less than 5% for the next period.

A well prepared training offers to trainees the possibility to acquire practical knowledge according to specific fields within a very short time, it offers them the possibility to interact and socialise and constitutes a framework where they can test and practice their skills.

On the other hand, irrespective of the profession, training is one of the instruments that may help employees overcome periods of crisis. Among the useful training courses are the training in finance, project management or negotiation techniques.

For example, the training in the finance fields is meant for employees who have decision-making roles or influence roles within a company and who lack the economic training. Thus they may better understand the way in which a budget is constituted, the financial indicators, the control of costs and they may come up with relevant proposals using the financiers' language.

Moreover, regarding project management, the training helps better manage resources, whether it is about material resources or human resources, so that the losses caused by delays or blockages in various moments are reduced.

Another very useful training is the one that concerns the problem solving techniques and the creative thinking, which helps stimulating the "problem-solver" approach through which any employee may contribute to finding solutions to problems entailed by recession.

The advanced negotiation techniques, especially for the purchase field, help decreasing the costs incurred by negotiations with partners on higher positions, especially when major contracts are concerned, where every percentage received or given and every clause is significant.

The change management training is useful for both efficient communication of changes within the organisation, as well as for the assessment of costs corresponding to the decisions made.

We may conclude that the importance of training to the sales force and the activity of debt recovery within the financial and banking companies is a major component of the employees' success with respect to the sales process, to the career management and to the positioning of the company among the top employers on the market.

Those who work in the training field face a continuous challenge, a combination between personal development and passion, between intuition and have the chance to offer transforming experiences to others.

DIE EXTERNALISIERUNG DER HUMAN RESSOURCEN

The outsourcing of human resources is an instrument that optimizes the structure of an organization. In Romania it is used especially by international companies. But during the current economical crisis, beside the multinational companies, even more national companies have wanted to externalize their human resources. The advantages of outsourcing during crisis are: the decrease of wage costs, the reduction of secondary costs, lower future investments, flexibility etc. Beside the reduction of costs that are obtained with outsourcing, there appears another advantage through the transfer of the responsibilities and professional competences to another company.

Schlüsselwörter: Externalisierung, Outsourcing, Kriseperiode, Human Ressourcen.

Die JEL Kode des Artikels: M12, M50

Einführung

Der Begriff Outsourcing kommt aus der amerikanischen Terminologie – outside resourcing – und bedeutet: von Außen etwas zu nehmen oder zu kaufen. Dieser Begriff wurde danach in der ökonomischen Sprache benutzt, um zu zeigen dass, die externen Quellen benutzt werden können, um die Unternehmensaktivitäten zu entwickeln; Aktivitäten die traditionell mit Hilfe vom internen Ressourcen durchgeführt wurden.

1. Definitionen. Klassifizierung des Outsourcings

1.1. Definitionen des Outsourcings

Die Externalisierung ist ein allgemeiner Begriff und beschreibt verschiedene Outsourcingaktivitäten: vom Mittagessen anbieten oder Dienst der internen Post bis zur Prozesse wie Informationstechnologie, Verwaltung und Logistik; die von einem Lieferanten durchgeführt werden, weil dieser Qualität und Ergebnisse anbietet.

Gleichzeitig, ist das Outsourcing ein Managementinstrument, das im Bereich der Informationstechnologie gegründet wurde, aber jetzt wird auch in Bereichen wie: Human Ressourcen, Finanzbereich, Verwaltung, Marketing/Verkauf u.a benutzt. Die Externalisierung ist ein Optimierungsinstrument der Unternehmensstruktur.

Das Outsourcing bedeutet auch bestimmte Dienstleistungen des Unternehmens vom speziellen Dienstleistungsunternehmen übernommen zu werden. Das bedeutet, dass das Unternehmen keine Mitarbeiter mehr braucht um diese Dienstleistungen durchzuführen⁸⁷.

Die Schriftsteller B. Quélin und A. Duhamel sagen dass das Outsourcing sehr oft begleitet wird, vom materiellen und menschlichen Ressourcentransfer, in der Richtung des gewählten Anbieters. Dieser hat die Pflicht die internen Dienstleistungen, die externalisiert wurden, für eine mittelfristige oder lange Frist zu ersetzen⁸⁸.

Also, anhand aller Definition kann man sagen, dass das Outsourcing eine Lieferung, von den bestimmten internen Dienstleistungen, zu einem spezialisierten externen Unternehmen ist. Dieses Unternehmen hat als Pflicht diese Dienstleistungen anhand des Vertrages eine lange Periode durchzuführen.

87 A.Ivanovic, P.H. Collin, Dictionar de resurse umane si managementul personalului: englez – roman, Editura Technica, 2001, p. 439

88 B. Quélin, A. Duhamel, Bringing Together Strategic Outsourcing and Corporate Strategy: outsourcing Motives and Risks, European Management Journal, Vol 21 No. 5, 2003, p. 8

1.2. Klassifizierung des Outsourcings

Abhängig von der Auswirkung auf die Unternehmensaktivitäten, ist:

- strategisches Outsourcing determiniert die qualitative Veränderungen zwischen "Ressourcen-Kompetenzen- Kenntnissen", die neue, zukünftige Entwicklungsmöglichkeiten für das Unternehmen erstellt haben und/oder verarbeitet relevante, strategische Aktivitäten, die benutzt werden für die Behaltung des wettbewerblichen Vorteils;
- operatives Outsourcing ist nur eine neue Konfiguration der Aktivitätsgrenzen des Unternehmens und/oder eine effiziente Benutzung der existierenden, operativen Kapazitäten. Abhängig von der festgelegten Beziehung der Partnerschaft, ist:
- traditionelles Outsourcing bedeutet eine kurzfristige Partnerschaft zwischen dem Empfangsunternehmen und dem Lieferanten, die mehrere geteilte Transaktionen beinhaltet;
- relationales Outsourcing bedeutet eine langfristige Partnerschaft und auswertet das Potential und die Ziele des Empfangsunternehmens und der Lieferanten. Die Transaktionen sind komplexe Aktivitäten des Empfangsunternehmens um spezifische Relationen mit dem Lieferanten durchzuführen und synergetische Ressourcen, Kenntnisse und komplementäre Kompetenzen zu nehmen und zu kombinieren.

Abhängig von dem Bereich/ die Aktivität die externalisiert wird, existiert Externalisierung im Bereichen wie: Informationstechnologie, Produktion, Logistik, Finanzbereich, Human Ressourcen, Verwaltung, Marketing und Verkauf, Entwicklungsbereich, Buchhaltung, IT, Reinigung, Wach und Sicherheitsdienst etc. Alle Bereiche können im Unterbereiche/ Unteraktivitäten dividiert werden.

2. Externalisierung der Aktivität im Bereich Human Ressourcen

Sehr viele Dienstleistungen, im Bereich der Human Ressourcen, die vor ein paar Jahren Verantwortung des Unternehmens waren, werden jetzt vom externen Lieferanten übernommen, also sie werden externalisiert.

Das Outsourcing der Human Ressourcen bedeutet die Externalisierung von bestimmten Aktivitäten, die zur Funktion der Human Ressourcen eines Unternehmens gehören. Anhand der Unternehmensgröße oder wie kontrollierbar die Funktion der Human Ressourcen ist, existiert die Möglichkeit eine oder mehrere Aktivitäten zu externalisieren.

Die Externalisierung der Human Ressourcen ist das Ergebnis einer Entscheidung und ist abhängig von der mittelfristige oder langfristige Strategie des Unternehmens im Bereich von Human Ressourcen. Der Verwaltungsrat und der Direktor der Human Ressourcen müssen die verschiedene Outsourcingmodelle analysieren um danach zu entscheiden welche Lösung die Beste für das Unternehmen ist.

Die wichtigsten Aktivitäten die man externalisieren kann sind folgende⁸⁹:

- Ausbildung und Schulung der Mitarbeiter;
- Rekrutierung;

- icki utici ulig

- Überwachung und Beratung für die Systeme der Sicherheit für Arbeit und Gesundheit;
- Sozialschutz der Arbeitnehmer- und Beratungstätigkeiten;
- Kinderkrippe und Kindergärten für die Kinder der Arbeitnehmer;
- Verwaltung des Gehaltes;
- spezialisierte juristische Beratungsdienstleistungen;
- arbeitsmedizinischen Dienste und die Erhaltung des körperlichen Zustandes.

Es ist möglich fast alle Aktivitäten im Bereich der Human Ressourcen zu externalisieren. Kleine Unternehmen, oder die Unternehmen die unzureichende, interne Ressourcen besitzen externalisieren interne Aktivitäten. Die am meisten externalisierte Aktivitäten im Bereich der Human Ressourcen sind: Berechnung und Verwaltung des Gehaltes (Payroll services) oder Personalleasing.

⁸⁹ M. Amstrong, Managementul resurselor umane, Manual de practica, Editura Codecs, București, 2003, p. 73

Die Payroll Dienstleistungen werden vom spezialisierten Unternehmen durchgeführt. Dieses Unternehmen ist eigentlich ein externen Payroll Department das sich mit Berechnung und Verwaltung des Gehaltes für die Arbeitnehmer des Kundenunternehmens sich beschäftigt.

Die Personalleasingdienstleistungen sind Dienstleistungen die vom bestimmten, spezialisierten Unternehmen durchgeführt werden. Das Dienstleistungsunternehmen beschäftigt sich mit Verarbeitung der Arbeitsverträge, Berechnung und Bezahlung des Gehaltes für das Personal, aber auch mit anderen Aktivitäten, die sehr viel Ressourcen und Zeit benötigen wie: die Durchführung der medizinischen Kontrollen vor Anfang der Arbeit sowie die regelmäßige Kontrollen für jeden Mitarbeiter, die Durchführung des Trainings für die Arbeitssicherheit, Verteilung des Essen – Tickets für die Mitarbeiter etc.

Die Fälle indem man die Personalleasingdienstleistungen benutzen soll sind:

- nicht genügende Angestellte im Unternehmen;
- Einschränkung der Anzahl der Angestellten, dank der internen Politik über die maximale Anzahl der Angestellten;
- die zu lange Dauerzeit bis eine Stelle genehmigt wird: kann bis 6 Monaten dauern;
- Budgetbeschränkungen: diese werden benutzt mehr für das Gehaltbudget und nicht für das Budget für die Outsourcing Dienstleistungen;
- das Mangel einer legalen Entität im Rumänien: entweder existiert die Entscheidung um keine juristische Entität im Rumänien zu gründen, oder es dauert zu viel um eine zu eröffnen;
- die interne Ressourcen sind unzureichend oder ungeeignet: entweder fehlt das Human Ressourcen Department, oder die Ressourcen die angewiesen wurden sind unzureichend;
- die Anstellung in der Probezeit: ist eine Möglichkeit die Fertigkeiten und die Kompetenzen einer zukünftigen Angestellten zu prüfen, um danach ihm anzustellen.

2.1. Gründe der Externalisierung der Human Ressourcen

1. Vielfältige Kompetenzen

Man braucht ein Team mit einem verschiedenen Kompetenzniveau um den ganzen Gebrauch von Kompetenzen, dass das Unternehmen braucht im Bereich der Human Ressourcen, zu decken. Aber ein spezialisiertes Unternehmen wird das ganze Team im Bereich Human Ressourcen benutzen.

2. Die Human Ressourcen konsumieren andere interne Ressourcen

Die Kosten mit einem Angestellten bestehen nicht nur aus seinem Gehalt: alles beginnt mit der Rekrutierung, danach mit dem ersten Spezialisierung und geht weiter mit Steuern und Gebühren die neben dem Gehalt bezahlt werden müssen. Es existiert auch das ständige Bedürfnis der Spezialisierung. Diese sind die Bemühungen die man durchführen muss um einen produktiven Angestellten zu haben. Und nachdem alles durchgeführt wurde, passiert die Situation indem man wieder rekrutieren muss, weil der Angestellte einen anderen Job gefunden hat. Der Dienstleistungslieferant im Bereich Human Ressourcen kann viel effizienter alles verwalten.

3. Die Disponibilität ist der Schlüssel zum Erfolg

Wenn im Unternehmen das eigene Human Ressourcen Department existiert, es wird nicht rentabel sein, mehrere Personen mit derselben Spezialisierung zu haben; die bezahlt werden müssen auch wenn sie in Stand-by sind. Aber wenn diese Ressourcen nicht existieren, dann blockiert sich die Aktivität ständig. Der Dienstleistungslieferant im Bereich Human Ressourcen macht sich keine Sorgen mit dem Ausfällen, weil er mehrere Ressourcen hat, und wenn Probleme austauchen es wird sicher eine Person sein die sie lösen kann.

4. Der Kunde ist viel anspruchsvoller als der Arbeitgeber

Es ist viel einfacher die Anforderungen und die Verpflichtungen einem Lieferanten im Vergleich mit einem Angestellten zu steuern. Und wenn das Unternehmen nicht mit dem Ergebnis der Anforderungen zufrieden ist, dann ist viel einfacher ein Vertrag mit einem Lieferanten zu beenden, als einen Angestellten zu feuern, weil er nicht mit dem Arbeitsplatz passt.

5. Die Effizienz der Kosten

Die Kosten für die Human Ressourcen werden kleiner, weil die Dienstleistungen billiger sind und man kann die Größe der Funktion reduzieren.

6. Die Konzentration der Mühe im Bereich der Human Ressourcen

Die Mietglieder der Human Ressourcen Funktion sind nicht mehr abgelenkt und fokussieren sich auf die wichtigen Aufgaben, die Wert bringen.

7. Gründung vom spezifischen Kompetenzen

Das Unternehmen kann das Know-how und die Erfahrung die es nicht besitzt kaufen.

2.2. Vorteile der Externalisierung der Human Ressourcen

- 1. Die Möglichkeit des Unternehmens sich auf die wichtigsten Aktivitäten des Unternehmens zu konzentrieren.
- 2. Die Möglichkeit viel einfacher die Kosten zu beobachten.
- 3. Die Reduzierung der Risiken die mit der richtigen Benutzung der legislativen Veränderungen tauchen
- 4. Investitionen für Programme, im Bereich der Berechnung des Gehaltes, die man auch aktualisieren soll, sind nicht mehr brauchbar.
- 5. Es erscheint ein Wachstum der Produktivität und Vereinfachung des Verwaltungsprozesses der Arbeitnehmer.
- 6. Es wird Zeit und Geld gespart.
- 7. Es gibt eine Sicherheit über die gesamte Daten und Informationsschutz.
- 8. Es gibt eine konstante Flexibilität je nach Anforderungen der Kunde durch Gründung vom Berichten in einer Form die von den beiden Seiten festgelegt wurde.

2.3. Probleme der Externalisierung der Human Ressourcen

Sehr viele Unternehmen, die die Externalisierung benutzt haben wurden nicht mit den Ergebnissen zufrieden. Das größte Problem war, als die Externalisierung durchgeführt wurde, um die Kosten und das Effektiv der Arbeitnehmer sehr schnell zu sinken. Das Problem tauchte, weil einige Unternehmen grundlegende Tätigkeiten externalisiert haben, ohne eine aufmerksame Analyse der Folgen durchzuführen und ohne über die nächsten zukünftigen Situationen nachzudenken. Die Idee war: schnell und kurzfristig einen Vorteil zu bekommen.

3. Die Externalisierung der Human Ressourcen in der Kriseperiode

Eine der einfachsten Lösung die man benutzen kann in der Kriseperiode ist die Externasisierung der Unterstützungsaktivitäten in der Richtung der spezialisierten Unternehmen oder Personen. Die meisten Aktivitäten die externalisiert werden auch in der Kriseperiode, sind: Buchhaltung, Human Ressourcen, juristische Abteilung, IT, Transport Marketing und Werbung etc.

Richtig benutzt, die Externalisierung kann ein Unternehmen retten.

In Rumänien wurde das Modell der Exteralisierung von den multinationalen Unternehmen übernommen. Aber neben die Externalisierung, die diese Unternehmen benutzen, in der Krisezeit stieg die Nachfrage der Externalisierung auch für keine Unternehmen.

Die Externalisierung ist aber nicht eine Lösung für alle Unternehmen. Es kommt zu einem Zeitpunkt, indem die Unternehmen nachdenken sollten ob sie externalisieren sollen oder nicht; um fixe Kosten zu reduzieren und Flexibilität zu haben. In Rumänien ist aber nicht die Rede über riesigen Kostenreduktionen, denn es existiert nicht ein sehr teueres Markt das externalisiert in der Richtung eines sehr billigeren Marktes.

Also: die wichtigsten Vorteile in der Kriseperiode sind:

Die Reduzierung der Gehaltkosten. Die Reduzierung der Kosten für das Personal ist eine der wichtigsten Strategie in der Kriseperiode und realisiert sich durch:

- Restrukturierung der Arbeitsplätze um die Zufriedenheit und die Effizienz des Angestellten zu vergrößern. Diese Restrukturierung realisiert sich entweder durch Addierung von ähnlichen Aufgaben (horizontal) oder durch den Transfer der Aufgaben auf einem höheren Niveau (vertikal);

- die organisatorische Restrukturierung bedeutet die Reorganisierung der Operationen aus dem Unternehmen und bedeutet die Konzentrierung der wichtigsten Aktivitäten und die Externalisierung der peripheren Aktivitäten:
- die Vorruhestand der Personen die schon ein Alter haben oder diese unterbrechen für eine Weile die Aktivität, wenn es notwendig ist;
- die Reduzierung der Löhne, wenn man Arbeitskraft benötigt wird, aber die Ressourcen nicht mehr reichen;
- Kündigung.

Die Externalisierung der Dienstleistungen befindet sich zwischen den Strategien die benutzt werden um die Kosten des Unternehmens, in Rumänien, zu reduzieren, aber die wichtigste Methode die benutzt wird ist die Verkleinerung des Gehaltes.

Die Reduzierung der Nebenkosten. Das Nutzunternehmen muss nicht mehr dem Angebotsunternehmen: Dienstauto, Kraftstoff, Möbel, Gebäude, Schulungen u.a. anbieten.

Geringere zukünftige Investitionen. Nach der Externalisierung muss man nicht mehr die freigegebene Aktiven ersetzen.

Das Bekommen vom zusätzlichen Geldmitteln nach dem Verkauf des freigegebenen Aktiven nach der Externalisierung (Pkw, Anlagen und Maschinen, Möbel etc.).

Dienstleistungen die einen qualitativen Wert haben. Sehr oft ist schwer, qualifizierte Angestellte für die Unterstützungsaktivitäten zu finden. Die spezialisierten Unternehmen besitzen solches Personal.

Flexibilität. Abhängig von der Notwendigkeit des Empfängers, der Vertrag kann modifiziert werden.

Die Nachteile der Externalisierung der Human Ressourcen:

- Feuerung der Angestellten;
- man verliert die Kontrolle über bestimmte Aktivitäten des Unternehmens;
- man verliert das Geld für die Investitionen die durchgeführt wurden im Bereich der Schulung, Training und Zertifizierung;
- es beginnen Kommunikationsprobleme zwischen das Angebotunternehmen und die Angestellten des Untzunternehmens zu erscheinen.

Aber sehr oft wird in Rumänien eine falsche Richtung benutzt. Die Unternehmen beginnen produktive Mitarbeiter zu feuern, wenn sie Probleme haben. Aber die Mitarbeiter aus den Büros bleiben genau so viele wie sie waren. Eine solche Herangehensweise vergrößert nur der Rückgang des Unternehmens, weil die Ressourcen benutzt werden, ohne das diese Mitarbeiter aus dem Büros etwas produzieren werden.

4. Schlussfolgerungen

Die externalisierungsnachfrage der Human Ressourcen stiegen im ersten Monat 2009, weil die Externalisierung der Unternehmen eine Reduktion der Kosten mit 25-30% brachte.

Es ist trotzdem sehr schwer zu sagen, ob die Unternehmen alle diese Vorteile der Externalisierung bemerken, oder diese Möglichkeit benutzen nur als eine Lösung die ihnen zur Verfügung steht. Die Unternehmen, die bemerkt haben, dass die Externalisierung eine interessante Methode ist um Kosten zu reduzieren, befinden sich im Bereich: Datenverarbeitung, Administrierung der Webseiten, Transport, Handel, aber auch Managementberatung. Die Externalisierung hat neben der Reduktion der Kosten noch einen Vorteil: die Verantwortung und die professionelle Kompetenz werden transferiert. Aber die Reduktion der Kosten in der Externalisierung befindet sich nicht in der Differenz zwischen den direkten Kosten und Gehalt, sondern in der Optimierung zwischen der finanziellen und steuerlichen Kosten.

MANAGEMENT, KNOWLEDGE AND VALUE WITHIN THE ROMANIAN RESEARCH INSTITUTES FOR THE PAST 20 YEARS

Fotache Liviu Christian

Economical Studies Academy of Bucharest, 132 Brestei Street, Craiova, liviuchristian@yahoo.com, 0728297207

Cruceru Anca

Romanian- American University, Faculty of Management- Marketing, 1B Expozitiei Blvd, Bucharest, cruceruanca@yahoo.com, 0723508894

Our action is intended towards emphasizing some of the most important issues in Romanian research area, especially with reference to the technical and agricultural research and this because it is important to understand how our research area has evolved in the past 20 years in order to know what has to be done in the present to achieve a reliable research industry in the coming future. Before reaching any benefit from our research system we should understand what drives the people involved and what makes it so difficult to manage and so important for the society.

Keywords: research – development institutes, management of the research – development organizations, knowledge-based management

JEL classification: D8, O3

1. An objective "radiography" of the evolution of the organizations assigned to the research – development domain

The research – development institutes have crossed a "golden period" at the end of the 60s and at the beginning of the 70s, simultaneously with the efforts made by the then form of government to obtain a certain industrial, and, implicitly, scientific independence. The collaborations with similar organizations from France, particularly, and also from the former USSR, and from the States, in spite of all the existing bottlenecks, have allowed the birth of a fecund scientific environment. At a given moment, Romania even benefitted by a rather numerous and well trained researcher group and by the necessary resources, and pretty surprisingly, Romania also benefited by at least an extensive material support, although not directly related to the latest technologies. The Romania of 1990 found meant research institutes for almost all the industrial domains, to be

The Romania of 1990 found meant research institutes for almost all the industrial domains, to be located in the most important towns of the country, research institutes to be organized around the universities from Bucharest, Iasi, Cluj, Timisoara, Sibiu, Constanta, Craiova, to name only some. The attraction and pressure forces from the free market instantaneously made their presence obvious in the research – development domain, as well, "knocking down" a domain with a practically inexistent "immunity" system. The management of the vast research – development domain was not oriented either towards increase, or towards survival.

"The wave" of request and offer struck, at the peak of its force, like a cold shower, the system, which resulted in the decrease of the management of this one to the level of reality; the mentioned cold shower included:

- the migration of the experienced technical personnel reached very high levels;
- for the great majority of the ones who chose to remain in Romania, the excessive politicizing of the institutes that were still under the state's subordination made it rather impossible for them to have access to high positions that would thus motivate their real implication;
- the fundamental research remained, to a great extent, the responsibility of "idealists" who have not had the capacity to cross beyond the theoretical discovery and proceed with patenting and putting to good value their ideas, not to mention that the bureaucratic, development and capitalization body was, mostly, made up of less adequately educated persons who has no interest or attraction to that domain, or who were simply unfit.

Unfortunately, this was not the only bottleneck the national research – development system was faced with after the 90s. During the first year after the revolution, the research institutes remained in the state's patrimony, and the allocated budget for this domain was scarce for years on end, sometimes just covering the disproportionately small salaries if related to the Romanian researchers' high education and professional qualities, and also some maintenance expenses, as well. The investments in new equipment and modern research techniques were quasi inexistent.

Needless to say that, at the end of the 90s, the Romanian research institutes' material foundation was obsolete from the technological point of view.

However, this is not the end of the problems that the national research system was faced with, at least not yet. The initiation of the privatization process represented only to a small extent the relaunching of an organization as a research institute.

As concerns the years that have passed between the former form of government and to the present date, it is much to our regret that we can list here only few positive aspects. Nevertheless, the location of the institutes next to university centers helped the institutes acquire qualified youngsters who would thus become future researchers.

In spite of an obsolete material foundation, in spite of less educated researchers, in spite of having an extremely precarious position on the European and international research – development market, the research institutes from Romania still try not to recover the former famous status, but to survive in a rather difficult context.

2. Assessments on the management applied by the research – development organizations. Consequences of this management

Thus, it is more than obvious that, based on the above "picture", we shall not be able to assume that the research-related management could be called "a success". Although it was not the same policy that was applied to the management of all the institutes, there are outstanding joint characteristics and we consider that it might be interesting to have a look both at the management decisions and also at the market pressures.

Plus and minus approaches related to the research – development management of the Romanian institutes

The management officers of the research institutes have proven little interest in a careful administration of the resources they benefited by. We do not refer here mainly to the tangible patrimony in spite of the fact that the poor administration of this one has not allowed a capitalization of the patrimony to be consistent with the potential, not to mention that it has also triggered an overwhelming increase of the additional expenses, as well. The overhead and maintenance expenses of the physical patrimony have become disproportionate if related to the number of active researchers and to the volume of the continuously decreasing purely scientific activities.

The applied management has ignored the possibility to externalize the dedicated activities – accounting, legal, maintenance, while the bureaucratic unit kept the same positions in parallel with a dramatic decrease of the researchers' number. The institutes preserved a wide range of activities, besides the administrative ones, while putting into practice an inefficient technique to assign the resources to too many domains.

The insufficient funds have hindered the institutes from participating in the main scientific events to be organized all over Europe, have hindered the institutes from benefiting by the computer-based information process, from setting contacts and initiating partnerships; needless to say that it was such partnerships that would have benefited by the expertise and knowledge of the Romanian researchers.

Previous to the 2000s, the research institutes have nor managed to develop a knowledge marketing policy as the so-called "brain export" process has not brought back to the institute any kind of value. Such a situation should be also understood from the point of view of the fact that before the "90s the institutes did not have to deploy any effort in view of the capitalization, on

the dedicated market, of the research results as these ones were included in a centralized material at the economic units from Romania or from the former Soviet block.

This way, for more than 15 years, the Romanian research activity, the owner of an impressive range of innovative technical solutions out of which some have already been patented at the national and international levels, allowed "dust" and time to cover them, and even worse than this, some of these solutions significantly lost some of their assigned value when the initiative arose to launch them on the market.

It is to a great extent that the management of these organizations was based on financing from the state budget, which led to a reduced interest towards marketing and towards development by means of a project-based management.

The valuation of the attitude towards the organization, towards its values and towards the environment in which the organization operated is absolutely necessary to be able to better understand the extent to which the research – development environment from Romania shall be able to meet the opportunities and challenges that lie ahead for the period between 2008 and 2013.

3. Analysis of the major involved aspects

Major aspects of the research – development domain:

- the dedicated personnel and the related knowledge make up the most important resource of the organization that operates in the research development domain;
- the research activity at the European level develops, to the greatest extent, further to the support provided by national and European research programs, thus setting up the knowledge and partnership networks;
- the specific nature of the research development domain and of the scientific knowledge market imposes the use of state of the art technologies, the updating of the endowment, of the work technologies and of the managerial methods;
- the active attendance at the domain-related events organized on a regular basis at the European and international levels is a compulsory condition.

These four aspects stand for the main columns of the research – development domain; they are the axes around which the research – development domain develops. It shall take huge efforts, really much time and determination to be able to go beyond this handicap that has not been inherited, but that has been induced by indifference, by the lack of initiative and by the incapacity to understand the depth of this domain and the seriousness of the actors who perform in this context.

However, we take into account another aspect, that has brought its major contribution to the present situation. The stakeholders' priorities have been either neglected, or exacerbated, and the passage from one extreme position to the other was obvious. Our intention is to point to the fact that the stakeholders' carelessness has led to serious lack of balance for the system since the system balance is granted by the very correlation between, on the one hand, their interests, and, on the other hand, the requests placed by the market and the pressures made by the domain market.

4. Proposals to improve the management of the research – development organizations

To be able to be successfully involved as active actors on the European research – development market, the organizations shall have to apply a management that is based on knowledge that is real, adaptable and flexible and depends on signals from the environment.

The specialization of the activities seems to be now more necessary than ever, and we do not refer here exclusively to the scientific, research activities. The specialization of the bureaucratic, financial – accounting and legal activities is compulsory to be able to integrate the organizations into the pan-European research networks / consortiums. It is already common knowledge for

everybody that the European financing, in general, and the European financing for the research – development domain have become the subject matter of an excessive bureaucratic pressure.

It is our deep wish to make an inventory, for the pages to come, with a brief list of the obvious measures that should be taken in view of turning the management of the research – development organizations into an efficient one:

- 1. to render efficient the management of the bureaucratic processes:
- to set up a legal department that is specialized in making-up the documentation that is related to the projects with European or national financing / to hire a consultancy company that is specialized in the administration of the bureaucratic processes (to check contracts, to organize public tenders procedures, etc);
- to set up a financial accounting department that would take over the correct and efficient administration of the cash inputs and outputs that have been generated by the project all through its implementation (the existence of such a department is justified in case of those organizations that simultaneously participate in several projects, where the activity volume is high, and the projects share multiple similar characteristics) / to hire a consultancy company that is specialized in the administration of the bureaucratic processes (to check contracts, to organize public tenders procedures, etc);
- to standardize the bureaucratic modules within the projects, including aspects related to the organization and launching of public tenders, press releases and publicity, non-scientific reports, presented in quasi similar forms, easy to adapt and that are replicable;
- 2. to specialize, at the highest possible level, the developed scientific activities the outsourcing of the non-specific activities shall be completed simultaneously with an increase, to the maximum, of the personnel specialization level and with the improvement of the methods to acquire information that has value and knowledge potential;
- 3. to direct the research development activities to the market requests. The research, and particularly the industrial research, shall give proof of realism and pragmatism as concerns the applied approach methods, and we must understand that, pretty often, a product that cannot be sold is a product that lacks importance, at least for the time being, at least with reference to the environment we are living in;
- 4. to organize valuation campaigns in order to decide which are the traditional clients' needs, and to understand the level of satisfaction of these ones;
- 5. to implement market study programs that would render obvious the requests, needs, new standards and expectations the dedicated market has so that the research development organizations be able to set their targets, and even try to provide, in due time, the solutions that would be adequate to the innovation requests, to the research and development requests for new products and services.

Nevertheless one of the most important decisions that should be taken in order to really improve research is to decrease the bureaucratic dimension of the Framework Program that sustains research all over the European Union. It is a very important and difficult task but it definitely is a must if research and researchers are to be considered a reliable economical driving force.

Management in the healthcare system is a new notion in Romania. When we think about a hospital, we tend to think about the medical practice in the system and not about the hospital as an institution that should be managed so as to become profitable. Management is one of the most important factors generating economic performance at the institution level. Its functionality, efficiency and efficaciousness depend to a great extent on the quality, efficiency and efficaciousness of management. The hospital does not represent any longer only a medical institution, but also a business organization, sometimes a very large one, and exactly this is the reason why it should be managed by directors that have the required background to be able to integrate and understand the economic, social and professional factors influencing the development of the organization.

Keywords: Management, Healthcare, European Union, Healthcare Management. JEL classification: A12; I 11.

Management in healthcare institutions

Management in the healthcare system is a new notion in Romania. When we think of a hospital, we tend to think of the medical practice within the hospital and not of the hospital as an institution that should be managed so that to become profitable.

The new law 95/2006 on the reform in the health sector contains the notion of hospital manager (article 178 paragraph 1: "The public hospital is managed by a manager, an individual or a legal entity."), and the same law sets forth the type of qualifications that the hospital manager should possess, it not being required to have medical training, but its specific managerial training being of the first importance; this the reason why a new career tends to develop, namely that of hospital manager (the law 95/2006, article 178 paragraph 2: "The individual manager or the representative designated by the legal entity - manager should be a graduate from a higher learning institution and of some management or healthcare management development courses approved by the Ministry of Public Health and set forth by order of the minister of public health.").

The first education institution that understood and created programs meeting these requirements was set up in the United States of America – the American College of Hospital Administrators, which still exists under the name of the American College of Healthcare Executives. The number of university programs for hospital managers has increased over time and is still increasing in order to provide quality health services. Most countries, whatever their development level and political system, rethink their health system for the purpose of increasing the quality of the medical services delivered. The consumer nowadays is overwhelmed by a lot of information, and enjoys a great liberty in choosing its service provider, but at the same time it claims to be an active contributor to its own healthcare. If patients are the ones dictating in the health system, the organizations within the system should model their activities taking into account their requirements and, last but not least, we should consider that the organizations within the health system provide patients with services the latter hope they will never need. Over time, the environment in which the hospital managers carry out their activity and even the hospital as an institution have changed; hospitals have become larger, more complex, the technology used has advanced, science has evolved, the financing means has been modified.

The manager tends to be in charge especially as regards the financial issues related to the hospital and for maintaining the moral and social order within the institution, in a continuously changing environment.

The transition from a centralized and monopolist economy, having a tense relation structure (namely some mainly unilateral connections, lacking optional alternatives) to a competitive economy, based on the market mechanisms of the action of the law of demand and offer represents, undoubtedly, one of the most serious challenges of the current period. Complex processes such as privatization, restructuring, liberalization of prices and elimination of subsidies, accompanying the economic reform, as well as the institutional and legislative transformations, the substantial modifications of the coordination mechanisms at various levels, at the same time with the tendency to access a new economic space by the intention of integration in the European structures are content changes, significant and wide mutations characterizing the Romanian environment.

Among the organizational changes, we should mention as important the following:

the intellectualization of working processes, naturally, not of all of them to the same extent, but substantial as regards every function;

transformation of knowledge in input, an essential "raw material" for almost all the activities of the institution;

the increase in the creative dimension of the working processes within every function and activity;

the increase in the efficiency of working processes, in productivity, a fact that reflects, clearly, superior performances of institutions by comparison with the previous period, in the conditions of maintaining the same sizes or even decreasing them;

the externalization of certain specific activities as regards the value vector, which is, within the knowledge-based institution, the vector of strategic knowledge, which generates competitive advantages to the firm, at the same time with the internalization of some other activities, in the context in which the incorporated knowledge falls into the vector of the institution value;

focusing activities on creating, sharing, using and capitalizing on the key knowledge as regards the profile and objectives of the institution;

changing the emphasis onto the working processes as a consequence of focusing first on knowledge, on using and capitalizing on it and not on formal discipline, which predominated in the classical institution.

The result of these changes is the superior functionality in carrying out the activities within the institution, of the process dynamics of institutions.

In 1987, the International Health Organization defined health in medical institutions as "an approach that should allow and guarantee to every patient the harmonization of diagnosis and therapeutic acts, ensuring the best outcome in health conditions, in accordance with the current stage in the development of medical sciences, for the most profitable cost of the same outcome, involving the lowest risk, to the great satisfaction of patients, under the procedure conditions, outcomes and human contracts within the healthcare system".

There are three fundamental principles specific to sanitary institutions providing medical services:

- 1. Social responsibility. The sanitary institution that provides medical services should take into account its place and role in society.
- 2. Result-oriented. The financial results (looking for efficiency), satisfying patients and stakeholders, should be considered in the quality management of the sanitary institution providing medical services.
- 3. Reaction and execution speed. The medical institution providing medical services should apply mechanisms of reaction and adaptation to internal results and external influences.

Quality improvement in the healthcare system

Quality improvement means improving processes. The need to improve processes results from: the analysis of the management; internal audits; external audits of secondary party or third party; audits monitoring the certification body and/or the validation body; patients' complaints; enquiries regarding patients' satisfaction; modifications to laws and/or regulations regarding the relevant processes.

Quality may be improved by achieving a better efficiency than the existing one. In order to apply a quality improvement program, one should differentiate chronic problems from sporadic problems. The chronic problems are the ones responsible for an unsatisfactory quality, whereas the sporadic ones are the ones affecting negatively the results, sometimes representing more than defects, failures, errors, being inherent to the process itself.

The improvement actions are: analyzing and assessing the current situation in order to identify the areas to be improved; setting the improvement objectives; looking for potential solutions to achieve the objectives; assessing and selecting those solutions; implementing the selected solutions; measuring, checking, analyzing and evaluating the results of implementation in order to determine whether the objectives had been reached; making the modifications official.

The intellectualization and dematerializing economic processes is the most important transformation taking place in the health service sector. Given that we referred in detail to the content of these processes in the previous paragraphs of this chapter, we consider that it is no longer necessary to explain them. Our specification refers to the manifestation, intellectualization and dematerialization within the structural profile of the sector.

Firstly, one finds that, to the extent a knowledge-based economy develops within the health service sector, the intellectualization of processes generates more and more efficient knowledge, more and more added value, at the same time with the increase in its becoming operational in all the domains. Naturally, the intellectualization and materialization of processes varies within a wide range from a domain to another. These processes are the strongest in education, information technology, communications, consulting.

Secondly, the intellectualization and dematerialization of processes results in the attenuation of differences between the economic processes carried out in various domains of health services. On this basis, relations witness more fluidity, rapidity, harmonization, having multiple benefic effects as regards the generation and more efficacious use of knowledge.

Another consequence of the intellectualization and dematerialization of processes is the appearance of virtual forms of economy, in which the intangible, qualitative elements play a more and more important role, having multiple positive effects. The changes in the nature and content of economic processes are reflected also in the modification of the structure of investments and expenses in the economy, those related to the intellectual capital – the support of new processes – increasing substantially.

The well-known British specialist Charles Handy recommends the new mode of action to achieve an efficient management in the conditions of the new economy:

- 1. Acting fast, taking into consideration that bureaucracy blocks decisions;
- 2., Basing decisions and actions on good people even if their number is less than necessary
 - 3. Practicing transparency and openness to novelty, benefic for the institution
- 4. Observing discipline, the standards and rules are key elements for the institution achieving efficiency
- 5. Carrying out strong and comprehensive communication processes, given that employees and the other stakeholders need to know what happens within the institution;
- 6. Focusing management on essential elements, given that 80% of the information existing in a firm is not necessary
 - 7. Focusing on clients, treating each of them as an individual
 - 8. Considering as a priority the treatment of knowledge and especially its sharing

9. Practicing leadership based on personal example, which had proved to be the most efficacious.

We should say that the increase in the quality of medical services so as to reach European standards may be achieved by:

increasing the motivation of the medical-sanitary personnel and of the institutions where this activates;

ameliorating the financing of sanitary institutions (from the state budget, the sole health insurance fund, etc);

ameliorating the health infrastructure (investments in new hospitals, modernizing the existing ones, in equipping them with modern medical apparatuses, in training specialists to use them etc)

training the medical-sanitary personnel to be neutral as regards their attitude to the patient, whatever the situation the latter is in as regards the health insurance, state or private

a new attitude to less favoured categories, lacking any support (CAP pensioners, rural population with very low income, etc)

The decentralization of the health system is a constitutive part of the reform process in the sanitary domain. By the introduction of the health social insurance system, the patient may choose its provider of medical services, a fact leading to the migration of patients to large centers, with a view to be provided with high quality medical services and to have access to the state-of-the-arts technological means. The national programs that are a part of the strategic plan of the ministry try to equip all the medical institutions across the country that have specialists competent to use efficient technologies, so that high quality medical services be available anywhere to patients, without being necessary for them to move to some other places.

Although the financial-economic crisis has just started and Romania has not be began to feel its effects very strongly, during the following period the Ministry of Health shall have to homogenize the sanitary policy with the one of the European Union and, at the same time, retain the specialists that seem to accept no longer the conditions within the system.

The quality of medical services in the medical institutions of Romania shall reach high standards to the extent the medical personnel is motivated to carry out a high quality medical act, both by its income and, most important, by the environment in which it carries out its activity, and by the materials – apparatuses that it uses in its daily activity. If this economical-financial crisis has repercussions also on the budget of the Ministry of Health , it being reduced, the current investments and expenses in hospitals shall decrease, a fact that is not in favour of the patients who need high quality medical services.

More than any time before, hospital managers shall have to redesign their managerial programs for unfavorable situations but at the same time to retain their specialists, able to keep pace with the most recent discoveries in the field, for the purpose of maintaining the health condition of population as good as possible.

Conclusions

When changes are expected, a powerful culture may become a handicap instead of being an advantage. It is true that there are many things to preserve and the leader shall have the obligation to identify them and maybe to consolidate them; but it shall have, at the same time, to specify by all the communication means what things to change and to prove it is the first to act accordingly. The managerial culture is strongly oriented towards achieving the objectives the managers are in charge with. It acts as a mechanism modeling the influences of exogenous variables and endogenous ones affecting the institution, from the point of view of the characteristics of the managerial work and the managers from every institution. Therefore, the organizational culture refers to the value system, the beliefs, aspirations, expectations and behaviour of managers within an institution, reflected in the management types and styles practiced within the institution,

strongly marking the content of the organizational culture of every company and its performances.

The functionality and general and specific managerial performances depend decisively on the quality of the methodologies and the competence of those using them (managers, specialists). Obviously, if managerial performances are witnessed, favorable premises are created for achieving economic performances in the domain managed.

THE EVALUATION OF HUMAN RESOURCES PERFORMANCE AT S.C. ELECTRICA S.A., BAIA MARE

Gavrilescu Liviu

Instituția Prefectului – Județul Maramureș, Str. Gh. Şincai, nr. 46, 430311 Baia Mare, Romania, tel. +40 262 215001

The North University of Baia Mare, The Faculty of Sciences, Str. Victoriei, nr. 76, 430122 Baia Mare, Romania, tel. +40 262 276059, liviugavrilescu@yahoo.com

The evaluation of the personnel performance is an important element of the performance management system, as a way towards better overall results. The system ensures the convergence of the individual purposes and objectives with those of the company, through the evaluation of the personnel according to the priorly set objectives. The author makes a brief review of the main methods and techniques of performance evaluation, paying a special attention to the possible evaluation errors. The paper presents a case study regarding the performance evaluation of the human resources of S.C. Electrica S.A., Baia Mare.

Keywords: management, evaluation, human resources, performance

JEL code: M12

THE PERFORMANCE MANAGEMENT

The performance management is a way to obtain much better individual and organizational results, by understanding and managing the performance in the general framework of business, and in the particular framework of previously established objectives and standards.

The evaluation of the performances has a central role and is an important element of the performance management system, and, also, is the mean by which the organizational objectives become individual objectives. The potential problems to be considered in the approach of the performance evaluation are the following:

- the necessity of creating a culture of performance, to prevent the risk of encouraging individual performances, in spite of the organizational ones;
- the involvement of top managers in the process of evaluation, in order to be satisfied both individual, and organizational necessities;
- the proper functioning of feed-back, that means that the strategic goals of the organization, and their implications at the individual level, may be influenced and changed.

THE EVALUATION OF THE PERFORMANCE

The evaluation of the performances is the basic activity of the human resources management and represents a complex and systematic process which renders analyses and estimations on the work behavior and performances of the employees, as well as their development potential.

The evaluation of the performances must be:

- positive, rather then negative:
- constructive, rather then destructive;
- a look towards the future, rather then a look in the past.

METHODS AND TECHNIQUES OF PERFORMANCE EVALUATION

The increasing quality of the evaluation of the employees' performances depends in goo measure on the quality of the evaluation methods or systems, which means:

- the validity of the results;
- the fidelity of the determinations;
- the convergence of the results produced by different evaluators;
- the internal homogeneity:
- the sensitivity of the instruments used.

There are many methods of estimation, based on different evaluation procedures, but none can be considered perfect. Each of them has their own advantages and disadvantages, being appropriate for an objective, or another.

Among the most used, there are the evaluation scales. The evaluation scales are among the most popular systems of estimation of people and of evaluation their performances. This method is used to estimate the degree in which an individual possesses or not a certain quality.

The basic principle of this method consists of evaluating the subjects in every aspect of a set of characteristics, specific to a certain profession. For example, such a set may contain: the work quantity, the work quality, the organization of the work, the discipline, the team behavior, etc. No matter their form, the evaluation scales are based on the assignment of qualifications, according to some external standards. In this respect, each individual will be appreciated independently and not related to a group.

According to literature of specialty, about 62% of small organizations and 51% of large organizations use evaluation scales.

EVALUATION ERRORS

Concerning the evaluation techniques, the deficiencies belong to the evaluation tools, as well as the evaluators. By itself, the evaluation system can present a series of design imperfections, grouped in what is known as psychometric errors (statistically identifiable marking errors), and simple conceptual errors (due to the individual / educational particularities of the evaluators).

The evaluation errors can be grouped in three major categories:

- a) Errors pertaining to the person of the evaluator and which reflects the evaluation distortions due to oneself:
- the halo effect the tendency of an evaluator to be impressed by a certain feature of a person, and not to take into consideration other characteristics;
- the error of indulgence / severity the tendency of an evaluator or manager to evaluate all individuals too high or too low;
- the central tendency error the tendency of the evaluator to avoid the extreme values of the scale and to give mostly average marks;
- b) Errors caused by psychometrical deficiencies of the evaluation tool
- c) Errors of the precision of the measurement.

CASE STUDY REGARDING THE PERFORMANCE EVALUATION OF THE HUMAN RESOURCES OF S.C. ELECTRICA S.A., BAIA MARE

S.C. ELECTRICA S.A. uses as evaluation method the multiple steps evaluation scale. These evaluation scales consist of a list of aspects, qualities, or professional dimensions, each detailed in degrees or levels of performance, usually 5 to 10.

According to the particularities of the work-places, specific aspects, qualities, or professional dimensions can be grouped. The evaluator's task is to mark, for each aspect, the best corresponding level to the behavior of the evaluated person.

The evaluation scales with multiple steps are widely used in the industrial environment, due to the fact that they offer an analytical image of whatever is most appreciated. The scale gives a succinct description of the evaluated quality, as well as the levels on which the evaluation is done. The evaluator simply compares the items described in behavioral terms to the behavioral manifestations of the evaluated person.

CONCLUSIONS

The necessity of evaluation of the personnel from the industrial and other domains was achieved through the use of numerous methods and techniques. The correct choice of the most adequate and objective evaluation systems was very important for the specific of the activities.

The evaluation of the personnel based on completing fiches by the department chiefs needs a lot of responsibility, as the efficiency, the progress, and the future of the company depends on it. The methodology of evaluation of the human factor gives the possibility of:

- the highlighting of the positive aspects of the personnel; the negative ones will be revealed to make possible the adjustment and improvement of the employees, wherever this might be possible;
- the convergence of the individual purposes and objectives with those of the company, through the evaluation of the personnel according to the priorly set objectives;
- the establishment of a system of rewards and promotions, based on each employee's performance;
- ensuring the possibility of the re-orientation of the employees, according to each capacities and skills.

The evaluation fiches are completed, with no excessive indulgence, nor severity, for the benefit of the company, as well as the benefit of the employees. In this way, the employee can be directed towards a good performance and professional satisfaction.

The fishes are completed at the end of the year, or whenever the evaluation of an individual employee is needed. A copy of the evaluation is handed to the employee.

AN ANALYSIS OF THE INTER-HUMAN RELATIONS AT S.C. ROMTELECOM S.A., BAIA MARE

Gavrilescu Liviu

Instituția Prefectului – Județul Maramureș, Str. Gh. Şincai, nr. 46, 430311 Baia Mare, Romania, tel. +40 262 215001

The North University of Baia Mare, The Faculty of Sciences, Str. Victoriei, nr. 76, 430122 Baia Mare, Romania, tel. +40 262 276059, liviugavrilescu@yahoo.com

Good inter-human relations within groups of an organization can ensure the well-functioning of the team, an increased competitiveness, and better decisions, more creative and productive. On the other hand, the opposite situation can have disastrous consequences. Sociometric studies can reveal the real situation within the group, and can give valuable solutions of problems. The paper presents an analysis of the social relations existing between members of a quite young group belonging to S.C. Romtelecom S.A. The purpose of the study is to determine the formal and informal leaders of the group, and the degree of attractions and rejections between the members of the group, using sociometric instruments, such as the sociometric matrix, and the sociogramm.

Keywords: inter-human relations, sociometric test, informal leader, behavior,

JEL code: M12

THE ANALYSYS METHOD

Men occupy a certain position inside a group. They possess a status and they want others to respect and approve it. Every individual positions and all considerations and feelings about each other give as a result the strength or the weakness of the group.

The application of a sociometric test can determine the quality of a group, resulting the real attractions and rejections, also the perceived attractions and rejections among the members of the group.

The sociometric test was applied to a group of employees of the Financial-Accounting Department of S.C. "Romtelecom" S.A.

The study concerning the inter-human relations intends to determine the informal and formal leaders of the group, also the measure of the attractions and rejections between its members. It was also determined the cohesion of the group and the way it influences the work efficiency.

The test consisted of applying to the group the following questionnaire:

Name:

Length of experience in the group:

1. In case of forming a special team in order to achieve a highly appreciated objective, whom of the present group colleagues would you like to work with?

me present group co	wengines we much you mile to we
a) first place	4;
b) second place	3;
c) third place	2;
d) fourth place	1.
2. Whom you would i	not like to work with?
a) first place	<i>4;</i>
b) second place	3;
c) third place	2;
d) fourth place	1.
3. Who do you think	would like to work with you?
a) first place	4;
b) second place	3;
c) third place	2;

d) fourth place

4. Who do you think would reject you?

a) first place 4: b) second place 3: c) third place 2: d) fourth place 1.

The subjects were asked not to communicate with one another and to answer to all questions, without the intervention of the interviewer, for an increased relevance of the result. The absenters were not taken into account with the sociometric test.

After collecting the completed questionnaires, the effective analysis of the data was conducted, using the sociometric matrix and the sociogramm.

THE GROUP ANALYSIS

The Financial-Accounting Department of S.C. "Romtelecom" S.A. group has 9 members.

The sociogramm resulting after the completion of the questionnaires is presented in Table 1. The employees from the group are:

- Cristi, Dragos, Mircea, Dana, Anca, Nicoleta accountants;
- Silviu chief accountant.

The meaning of the numbers is:

- +3 the first choice
- +2 the 2nd choice
- +1 the 3rd choice
- −3 the first rejection
- -2 the 2nd rejection -1 the 3rd rejection

The numbers between the brackets is what the individual belives, that he is chosen or rejected, from the behavior of his colleagues.

	Cristi	Dragoş	Mircea	Silviu	Dana	Anca	Nicoleta
Cristi	X	+1(+1)	-3(+3)	+3(-3)	-2(-2)	+2(-1)	-1(+2)
Dragoş	+1(+3)	X	-3(-3)	+3(+2)	+2(-1)	-2(-2)	-1(+1)
Mircea	-1(-1)	-3(+1)	X	+3(+3)	-2(-3)	+2(-2)	+1(+2)
Silviu	+3(+2)	+2(+3)	-1(-3)	X	+1(+1)	-3(-2)	-2(-1)
Dana	+2(-1)	-3(-3)	+1(+2)	+3(+3)	X	-2(-2)	-1(+1)
Anca	-2(+2)	+2(+3)	+1(-2)	+3(+1)	-3(-3)	X	-1(-1)
Nicoleta	+2(-1)	+1(+2)	-3(-3)	+3(+3)	-2(-2)	-1(+1)	X

perceived			11 4 571				

Table 1. The sociogramm

The calculation of the sociometric indicators:

The index of the real preferential status of each member of the group:

$$I_{sp}real = \frac{R_p - R_n}{N - 1}$$

where:

 R_p – positive real reciprocities;

 R_n - negative real reciprocities;

N – the number of subjects in the group.

$$I_{sp}$$
C = 0.33

$$I_{sp}$$
D = 0.33

$$I_{sp}$$
M = -0.33

$$I_{sp}$$
S = 1

$$I_{sp}$$
D = -0.33

$$I_{sp}A = -0.33$$

$$I_{sp}$$
N = -0.66

The limit values of the index of the real preferential status in the group are -0.66 and 1.

The index of the perceived preferential status of each member of the group:

$$I_{sp}perceived = \frac{R_p - R_n}{N - 1}$$

where:

 R_p – positive perceived reciprocities;

 R_n - negative perceived reciprocities;

N – the number of subjects in the group.

$$I_{sp}C = 0$$

$$I_{sp}$$
D = 0.83

$$I_{sp}$$
M = -0.33

$$I_{sp}^{S}$$
S = 0.66

$$I_{sp}$$
D = -0.66

$$I_{sp}A = -0.66$$

$$I_{sp}$$
N = 0.33

The limit values of the index of the perceived preferential status in the group are -0.66 and 0.83.

The group cohesion index:

$$I_c = \frac{\sum_{c} c}{\frac{N(N-1)}{2}}$$

c – reciprocal choices

N – the number of subjects in the group.

$$I_c = \frac{\sum c}{\frac{N(N-1)}{2}} = \frac{5}{\frac{7(7-1)}{2}} = 0.24$$

The index shows that the group is weakly cohesive.

The preferential power index:

The preferential power index of the group is used to determine the intensity of the force of the inter-group preferential attraction (I_{pG}). It is calculated by considering the concrete values of the power indexes of the group members..

$$I_{pG} = \frac{\sum FI_p}{N}$$

where:

F – the frequency

 I_p – the individual preferential power index N – the number of subjects in the group

$$I_p G = \frac{\sum FI_p}{N} = \frac{3x1 + 4x(-1)}{9} = \frac{3 - 4}{9} = -0.11$$

The-0.11 value of the preferential power index highlights a negative situation inside the group. The number of those with a negative preferential status exceeds the number of those with a positive preferential status, the situation needing to be immediately corrected.

The index of preferential stability of the group

This index highlights the interpersonal balance achieved within the group, or between the its members being in reciprocal relations. Its calculation formula is:

$$I_{spG} = \frac{R_p - R_n}{N}$$

where:

 R_p – positive reciprocities;

 R_n – negative reciprocities;

N – the number of subjects in the group

$$I_{sp}G = \frac{R_p - R_n}{N} = \frac{5 - 5}{7} = 0$$

The preferential stability of the group is low, because the number of reciprocal preferences equals the number of reciprocal rejections.

In this respect, it should be taken measures of augmentation of the positive reciprocities, as they have a lower probability to brake apart. The equality between the positive and the negative reciprocities leads to a critical situation.

DATA INTERPRETATION

With the help of the preferential status index, there can be established the place occupied by each member in the preferences of the other members. Also, the informal leader of the group can be deduced.

The analysis of the sociomatrix and the real preferential status index indicates the following repartition of the group members:

Number of preferences	Number of subjects ith the same number of preferences	Isp real	Psychosocial value of preferential type
6	1	1	Very popular
2	2	0.33	Popular
-2	3	-0.33	Rejected
-4	1	-0.66	Rejected

Table 2. The repartition of the group members, function of $I_{sp real}$

As shown above, Silviu is the most popular member of the group, with 6 choices and no rejection. He has the position of chief-accountant, being at the same time formal and informal leader, which is the ideal situation.

Number of preferences	Number of subjects ith the same number of preferences	Isp perceived	Psychosocial value of preferential type
4	2	0.66	Very popular
2	1	0.33	Popular
0	1	0	Indifferent
-2	-2		Rejected
-4	2	-0.66	Rejected

Table 3. The repartition of the group members, function of Isp perceived

As shown above, Silviu and Dragoş perceive themselves as very popular, believing to be chosen by 4 colleagues out of the 6, and Nicoleta perceives herself rejected, also feeling very isolated.

At individual level, considering the preferential status, one can determine the position of each member within the group.

Two extreme positions can be detached:

- members with all positive preferential statuses Silviu, the chief accountant;
- members with all negative preferential statuses, only rejections from the other members no such cases

The other members have mixed statuses, containing in different proportions choices and rejections. The negative statuses show the fact that their owners are rejected, disliked (Mircea, Dana, Anca, and Nicoleta).

A first step to increase the cohesion of the group would be: transparency, open communication between the group members, especially with the rejected members.

The sociometric analysis of the group shows that the formal leader of the group is also the informal leader, occupying the position of "very popular", being part of 3 reciprocal choices and no rejection.

The group leader (formal and informal) could be more close with the isolated members (Mircea, Anca şi Nicoleta, whom he rejects, but who accept him), and the group will become more cohesive.

For example, Mircea accepts Silviu, but Silviu rejects Mircea, thinking to be rejected by him, which is false. If Silviu would be told that, in fact, Mircea accepts him, he could change his attitude, helping in a substantial way Mircea's integration in the group.

The important thing is that the members with a positive preferential status should be more communicative, more open, to give those with a negative preferential status the chance to feel accepted by their colleagues.

CONCLUSIONS AND SUGGESTIONS

The team is a group of individuals who work together in order to accomplish a task. When a team starts its activity, the cohesion between its members is little, and there is no understanding of the way this group will act to accomplish the task. The team from S.C. "Romtelecom" S.A. is young, in process of formation. As the members work together, a synergy is developed.

During a group's life, the unsolved problems will appear again ad the group may adopt unproductive behavior, so it is very important that the problems are well understood.

What is necessary for the team work to be carried on with best results:

- the preparations for the team work;
- the organization for action;
- establishment of a climate;
- clarification of the task;
- establishment of the resources:
- the work and the reflection upon it.

The productivity of a team is largely determined by the efficiency in solving the problems. To be more efficient, teams should recognize and treat problems connected to both tasks and

interpersonal issues. Any type of problem can block the productivity of the group, when ignored, or insufficient treated.

Teams are valuable because the individuals that form them are different. Experience has shown that a team that works well, in which the members contribute with different points of view, will take more productive and creative decisions than several individuals working separately and then gather their results.

In the group observed in this study, the formal leaders are also informal ones, which is very good for the performance of the group. As the leader helps the group to increase its cohesion, the growth of competence and the degree of involvement will be noticed.

The leader should focus more on support and relationship within the group, than on exactness and on the task. They should stimulate creativity in the group, and try to understand problems, to be open to new ideas, to be able to tolerate different values, beliefs, and points of view.

In order to increase competitiveness, the team from the study should:

- communicate clearly the objectives (a very important role of the leader);
- improve internal relations;
- have high standards of quality;
- reduce the number of complaints;
- reduce he conflicts within the group;
- increase the level of motivation:
- establish an efficient communication;
- increase the participation of the group members
- reduce the centralized control

Everything starts from the dual condition of the human being: creator (of goods, technologies, values, behaviour, ideas, beauty and even amazing things, etc) and destroyer (of goods, technologies, values, behaviour, ideas, beauty and even himself). In this paper, the authors debate the opportunity and possibility of designing and implementing a sustainable development, taking in consideration the intrinsic way of being of human factor.

key words: world population, resources, sustainable development, fads, conspiracy theory

JEL classification: J

Introduction

Our world is changing, everybody knows it. Our economical world is changing, too. Lately, we all have been discussing about a globalized world and about the collapse of time and space, meaning that geographical boundaries and distances are no longer as relevant or important as inhibitors of trade and communication. More commonly, the phrase *the world is getting smaller* is used to describe the tendency towards globalization (Heery and Noon, 2001). This globalization determines a small chaos helpful for some, not so advantageous for others.

Demographical issue

We all are more than 6.7 billions of habitants of this World, if we take into consideration the study made by German Foundation for World Population (DSW) in 2007. It was showen there that the world population had to surpass that edge until the end of 2007, being also noticed the fact that the demographical grow for the same year was supposed to be around 80 millions of people. And again, it was also emphasized one more time that the phenomenon is more visible in the poorer countries (www.scienceline.ro şi www.agenda.ro).

Generally speaking, it can be said that the obvious fast grow of the population after 1800 was practically a normal result of the qualitative evolution from the agriculture, health and higiene system. On the other hand, there were also some economic and social changes that substantially increased life level, especially in Europe and North America.

But even if the evident qualitative jump cannot be denied at a global escale, analizing the way that this wealth is spread reveals the fact that only 2% of the World population owns more than half of the world fortunes. That statement is part of the last study regarding the wealth spread and made by World Institute for Development Economics Research of the United Nations University (UNU-WIDER)⁹⁰ (www.wider.unu.edu) in 2000 and being the first one of this kind. It took into consideration both annual revenues and all kind of goods possessed, starting with stocks and finishing with lands and all other kind of goods.

The same investigation emphasized also an even bigger gape between the goods possessed by people from highly economic developed countries and those from poor countries. It was not given any political advise; it was only stated that a developed banking system able to financially

_

⁹⁰ World Institute for Development Economics Research of the United Nations University (UNU-WIDER) is the first research and training centre of the United Nations University (UNU), established in Helsinki, Finland in 1984. It undertakes applied research and policy analysis on global development and poverty issues

sustain business environment could be an important factor for incomes and goods grow. The difference became huge when the analysis was made on the level of annual income obtained The suggestion was made even if the analysis reveled consistent differences between incomes and goods possessed and level of debts. Thus, it became obvious that many countries having a low level of revenues achieve a higher level of fortune (due to the low level of indebtedness). By contrast, countries having a considerable level of consum bring into discution fortunes that are even smaller (due to the taken loans). (www.wall-street.ro).

As a first conclusion, world population seems to grow extremly fast, each second bringing with it three more lives. In an optimistic scenario, ONU estimates that by the end of year 2050 our world will count not less than 9,2 billions of human beings, meaning 2,5 billions more than during the current period. Facing such of foresight, on the 11 of july, 2008, celebrating the World Population Day, ONU asked for an increase of investment in family planning. At this time, discussting only about the necessities of the developing countries, the annual cost is around UD dollars 1,2 billions and only half of this amount is spent on the main goal.

Further more, taking in consideration the new demographical values to which our population goes, it become very demanding the assurance of certain level of life conditions for no less than 9 billions of people for the next decades (an increasing need of food, water, fuel and so on). United Nations considers that this kind of growing rithm is difficult to be sustained, espeacially within the current situation faced with a continuously destroy of the plough land and also a decrease of water ressources (www.romanialibera.ro). Studies made by some specialists ⁹¹ show that if every green plant growing on this planet would be used as food for human beings, everything sustained only 15 billions of habitants. It can be disscused here about the concept of carrying capacity, defining the entire number of citizens living together in the same time on Terra. Its maximum value assumes that all the Earth ressources should be used with the unique goal of assuring population existence (as a result, it cannot be anymore about having parcs or natural reservations and, also, it implies the consumption of every possible food ressource only for human beings need - which is an unrealistic approach). (www.yuppy.ro).

A similar but more radical position is sustained by Eric Pianka⁹². He recommands an American and European version of the Chineese low limiting at one the number of existent children within a family (simple reproduction). He also states that, in order to really preserve the environment, there is a need for trimming the Earth population by 90%; his suggestion was the use of a simple mutation of Ebola viruse, thinking that the world itself is a huge biomass sustaining the perfect sublayer for killer bacteries.

In these conditions, there is still a hope in the confirmation of the demographical evolution theory ⁹³ that has the following stages:

- at the beginning, both mortality rate and birth rate were high comparing them with the lower level of population increase (closed to zero);
- the second phase of the evolution brought in the same time a high birth rate and a low mortality rate (due to the public health system development, the technological advance and so on). The result was a considerable increase of the population;
- during the third phase, birth rate goes towards a decrease following the social changes led by women emancipation (choosing the career instead of a family) -, it is reduced as much as possible the mortality rate (discouraging also numerous families, in an indirect manner), and it is increased the number of families using family planning etc. Thus, hopefully the population increasing rate will be decreasing again towards zero. There is still a main problem: this

-

⁹¹ Lotka-Volterra, Donella Meadows, Richard Dawkins, Paul R. Ehrlich

⁹² Eric R. Pianka is an American, best known for his contributions to herpetology and evolutionary ecology. He is nicknamed "The Lizard Man".

⁹³ Bolovan, S., Bolovan, I., Stefan Pascu și demografia istorică în România", Universitatea Babeș-Bolyai, Cluj, 2003

judgement does not take care about the each region taken apart, not being relevant even at a global level (due to the great economic gapes).

After all, we all are several billions of habitants; we all are different as look as well as attitudes, values and believes. We have different cultural backgrounds, lives different presents and go towards different futures. Still none of us miss, one way or another, the fighting spirit, power and wealth desire, as well as creative and innovative spirit. It has been mentioned that these are confirmed at the individual level. Fire, knife, wheel, roman engineering, than bulb, telephone, gramophone, peniciline, flying machines, computer, the Internet and so on, everything had as a ground the individual geniality and the pleasure of compeating with himself. A problem arise only when it is realized that a positive collective result (similar with the collective intelligence situation), does not consist in a sum of positive individual results.

Sustainable development

Everything previously mentioned imposed an interesting concept called: "sustainable development", meaning nothing else than that kind of development following current needs satisfaction without compromising future generations posibility of satisfaying their own needs". This is the most used definition included also in "Our common future" report (so called Brundtland report), by the World Commision for Environment and Development (WCED) in 1986. Other words, on the one hand, it has to be not forgotten the collective needs satisfaction of contemporanne generations as well as the followings', on the other hand, it has not to be given to one of them an extrem importance in the other's detriment.

Leaving apart that if a development is thought on the long run it has to be sustainable, the concept brings into discussion a human reality more and more obvious and pressing: our environment destroiment due to the own activities, fact that can destroy even the world future.

Even if at its early stage sustainable development was thought as a solution to the ecological crisis established by the intensive industrial use of the ressources and to the continuu shading of the environment, setting as main objective the deffend of environment quality, nowadays its content expaneded on the life quality in its complexity (economic and social aspects). Thus, another strategic goal of the sustainable development is justice maintaining between states and, nevertheless, between generations.

At a certain point, it became obvious that society oppinion is an important factor in partnership promotion and sustainable development implementation. But the development of a certain attitude and behavior based on respect for nature, people, resistant values and so on, became obviously a great challenge as well.

Everybody agrees the idea that each individual, conscious or not, can help the sustainable development implementation. Still, in fact, even if it does not take much to sort plastic and glass wastes, to recycle paper or to wisely use garbage, it takes longer to transform all these actions into unconditioned reflexes. *Sustainable development* is a *young* concept and beyond a well-organized frame, the decision of keeping the environment wealthy or not belongs to everyone. This is also one of the reasons explaining the tendency of depletion of natural ressources, row materials and food, of the regenerable ressources consumption much faster than their potential of regeneration, next to the water, air and land pollution. (Lester, R.B, 2006). "A sustainable society", says Lester R.Brown, "is that who is able to model its economic and social system in a such manner that natural ressources and supporting systems to be maintained ". On the other hand, it has to be not forgoten that collective interest is not given by the sum of individuals interestes; the human himself cannot handle larger temporal dimension (this leads to his lack of worry regarding something appearing eternal to him); an individual can difficultly step outside his limited temporal perception due to his irrelevant period of his consciousness faced to the universal existence.

Leaving appart the difficulty of developing a certain behavior and attitude of the population, it can be also said that either the politic environment does not do bigger steps (more meatings less practical actions). Thus, even European Union set sustainable development as being the comprehensive principle of every European politics (Lisbone strategy), the reality prove that economic competitivity lead political agenda. And even if previously everybody agreed with an extension of the sustainable development concept to the care for nature, resources, different nationalities and individuals apart under the current and future aspects, now it seems to restrain everything again only to the respect for nature. The explanation brings into discussion the need for economical grow in order to be able to implement any kind of strategies and politics for environment and social protection (shows the imposibility of thinking on the long run)

An observation can be made: there are too many different problems under the sustainable development concept umbrela. In this way, with or without intention, the attention can be taken away; this can be also a reason for the a circular and not climbing spiral? way of acting within this field. One thing is still sure: the stated goal of the sustainable development (continuous improvement of the life quality of the present and future generations), cannot be achieved but only within communities able to use ressources rationally and efficiently and to discover the ecological potential of the economy. In this way, the final result will be not only prosperity, but also environment protection and social cohesion.

In the absence of this base, sustainable development is only an emergency doctrine that shows, contradicting with its own stated mission, that the care for environment and humans, on the one hand, and economic development, on the other, are nothing else but opposite processes. More than that, facing the current financial crisis, the concept seems to not be taken anymore into consideration when it is about running a business (or the public life) and it is in danger of being label as fads⁹⁴ (Skyrme, D.J., 1997).

A more insight look brings an even more contradictory association: sustainable development and globalisation. Globalisation, could it be a closed road unable to offer a continuous development possibility? Paradoxally, no matter the answer is, the importance of the "return at roots", at the simplest, even fundamental, things, is obvios; it can assure the human and his activity pereniality and that means, basically, a real sustainable development process:

"One of the life truisms is that crisis periods could happen. Still, a crisis is basic things left and the most certain way of dealing with it is the appropriate return at fundamental things" (Zig Zaglar, 2002).

"All we need is a major crisis and all nations will accept the New World Order", was saying David Rockefeller at the begining of the last century. This remark has a very well-known scintific explanation: every edge situation breaks the resistance at change⁹⁵ in the same way that a crisis or a war are followed by a new begining, a new economical starting-up. Can it be here about the human creativity (strategies and economical distraction creation) and power desire, too? Again, no matter the answer is, everybody agrees that a financial crisis is almost more moral than a war or, at least, harder to be blamed. Speaking about sustainable development, it is also interesting the way that calling nations to solidarity become a vital subject at the very that moment when some make the snowball and orient it towards others; these *others* have to understand and help at "recovery".

⁹⁴ Every several years, business strategies analysers develop new concepts of informational technologies and/or management philosophy. It can be mentioned here Total Quality Management, Business Process Reengineering, Knowledge Management, e-Business.

⁹⁵ Kurt Zadek Lewin (September 9, 1890 - February 12, 1947), a German-born psychologist, is one of the modern pioneers of social, organizational and applied psychology. He developed an early model of change describing change as a three-stage process: unfreeze, change and refreeze again.

It sounds like a conspiracy theory⁹⁶. John Perkins is one of the latest sustainers of it through the New York Times best-seller: "Confessions of an economic hit-man". He focuses on the ultimate goals of those exalting globalization process (who have exalted it, at least). How randomly are certain quakes? Is there any logic in periodically rising and falling of some nations? Behind the asserted and applauded well-intended actions, is there or not a grand cheeseboard? ⁹⁷

John Perkins brings into discussion the possible global reason which, even if not avowed, it is a part of the individual belief (believing in God is a form of universal logic belive): "Economic hit men (EHMs), he says, are highly paid professionals who cheat countries around the globe out of trillions of dollars. They funnel money from the World Bank, U.S.Agency for International Development (USAID) and other foreign "aid" organizations into the coffers of huge corporations and the pockets of a few wealthy families who control the planet's natural resources. Their tools include fraudulent financial reports, rigged elections, payoffs, extortion, sex and murder. They play a game as old as empire, but one that has taken on new and terrifying dimensions during this time of globalization."

Conclusion

Advoiding to set a general truth, it is still impossible to not notice the way that advertising controls our daily lives (even if everybody seems to look for a communication improvement that paradoxaly goes to a communication decrease between humans).

Only during the latest period, mass-media spread 18.038.139 ads⁹⁹. As a daily mean, Romanians were fired on with no less than 7.060 ads. The biggest investors in tv advertising campaignes were multinationals (like Procter&Gamble and Unilever ordering 517.076 and respectively 398.590 tv ads (www.razboiulnevazut.com)

Aparently, the advertising storm has been intensified because of the economic grow and life level. Speculatively, advertising does not mean anything else than a mass manipulation way. We all are ads prisoners, even if we like it or not. We enter in hipermarket or drudstore and choose, as being hypnotized, just the yougurt or medicine whose ad we generally ignore. From this point of view, motivational theories, neurolingvistic programming nor subliminal messages ¹⁰⁰ do

function pro individual.

According to literature by Silent Sounds, Inc., it is now possible, using supercomputers, to analyze human emotional EEG patterns and replicate them, then store these "emotion signature clusters" on another computer and, at will, "silently induce and change the emotional state in a human being". Far from necessarily being used as a weapon against a person, the system does have limitless positive applications. However, the fact that the sounds are subliminal makes them virtually undetectable and possibly dangerous to the general public 101

On the other hand, if few years ago our parents did not use to have more than some aspirins at home, nowadays there are a lot of very agressive ads emphasizing the need for drug at the same level as the need for food. Aparently, again, it is only a care for the individual health. Yet, paradoxaly, when some dreaded diseases were eradicated, we start die because of flue; when we

⁹⁶ According to Wikipedia, a conspiracy theory is a term that has come to refer to any tentative theory which explains a historical or current event as the result of a secret plot by usually powerful Machiavellian conspirators, such as a "secret team" or "shadow government"

⁹⁷ Brzezinski Z., 2000, "Marea tabla de sah", Ed. Universul Enciclopedic, ISBN 973-9436-24-2

⁹⁸ John Perkins, 2007, Confesiunile unui asasin economic, Editura Litera International

⁹⁹ In conformity with observation of the Romanian maeket made by Alfa Cont Mediawatch during 2000 – 2007.

¹⁰⁰ The mind-altering mechanism is based on a subliminal carrier technology: the Silent Sound Spread Spectrum (SSSS), sometimes called "S-quad" or "Squad". It was developed by Dr Oliver Lowery of Norcross, Georgia, and is described in US Patent #5,159,703, "Silent Subliminal Presentation System", dated October 27, 1992.

¹⁰¹ Miller, R.A, 2001, Synthetic Telepathy and the Early Mind Wars, Presented at the Consciousness Technologies Conference, July 19-21, 2001, in Sisters

speak about an increase of expectation of life level, even more young people die because of stress, exhaustion or despair; when we talk about more medical secrets revealed, we also understand that no medicine is more efficient but only more bought.

As a final conclusion, no matter if the conspiracy theory or the necesity of a sustainable development is accepeted, the reality catches its creators: "If you do not help and elevate those who are less lucky than you, it will come the day when, because of the quantitative difference, the less lucky will draw you down." (Ziglar, Z., 2002).

INFORMATION SYSTEM DEVELOPMENT: ARE MANAGERS AVOIDING THE "TRAPS"?

Gorski Hortensia

Romanian-German University of Sibiu Economic and Computer Science Faculty Calea Dumbravii, no. 28-32, Sibiu Email: tenzig11@yahoo.com Telephone: 0269 233568; 0744 475361

The present paper aims to outline some of the "traps" that might appear during the development and implementation of an information system. Managers, as promoters of change generated by the implementation of new information technologies, should know these traps, in order to be able to take quality decisions and to undertake timely the adequate measures when there are problems that might affect the quality of the information systems. In practice, these traps might come from different area: the feasibility study; the risks' analysis; the users' demands; the cooperation with the stakeholders.

Key Words: Information System, Feasibility Study, Risk, Manager, Stakeholder.

Cod JEL lucrare: M10, M15, M19

Introduction

Under the circumstances generated by the transition from the industrial society to the information society, the development and implementation of a competitive information system – based on the new instruments provided by the information technology – may represent an important step for obtaining competitive advantage over the business rivals. Relying on the opportunities provided by the information technology, organizations may bring on the market more diversified, more qualitative products and services and in a shorter period of time.

As a results, there can be higher sales and profit increases. However, many voices claim that the development process of an information system has a number of "traps" that must be had in view both by the IT specialists and by managers, as promoters of change which is based on the new information technology, in order to be able to take the necessary measures in due time (it increases the probability of overcoming the problems).

The objective of this paper is to present some of the "traps" related to the information system development. Based both, on theoretical research and on long-term practice experience (as expert in information systems development), we can underline that these "traps" might come from the following areas: the feasibility study; the risks' analysis; the systems ability to meet the users' demands; the cooperation with stakeholders.

The information systems feasibility study

The development of an information system may cost – according to its complexity – from a few thousands of euro to hundreds of euro. As a consequence, it is necessary that managers do not start such a wide-spreading project until they have made some serious feasibility studies.

The feasibility study has as purpose to demonstrate whether a new project should or should not be started or whether an already-started project should or should not be continued. An operation system's feasibility study is made by a team which includes both specialists in the technical field and economists and experienced persons from the organization implementing this system. Moreover, to

make the most rigorous analysis, the team must have managers and representatives of the information system's final users.

To get the anticipated performances, before developing an information system, a proper attention should be given to the feasibility study. The feasibility studies related to the information system are various: organizational feasibility; technical feasibility; economic feasibility; exploitation feasibility or operational feasibility.

Organizational feasibility. The organizational feasibility examines how well the proposed information system supports the organization's objectives as a whole. Even from the beginning the systems that do not facilitate reaching the organizational objectives, which do not support the organization's mission and which do not comply with the established strategy, should be rejected. Technical feasibility. The technical feasibility refers to the abilities related to hardware and software and to the system's ability to provide the users quality information. Can the managers get valuable information to support their decisions? Can the employees get the information they need to accomplish the tasks assigned to the job? Is this information available when is needed? If the answer to these questions is negative it means that the information system is not properly planned / designed / implemented. Other important questions are related to the existence of IT and necessary human resources: Can the information system be created, implemented and exploited using the existing IT in the company or should there be made any purchases? Can the hardware and software instruments support the established objectives? Does the company have the human resources capable of developing, implementing and using, with the desired performances, the information system? If it does not have these persons, the organization should - totally or partially - resort to external consultants and/or to specialized companies, therefore outsourcing the system.

Economic feasibility. Regarding the economic feasibility and Cost/Benefits Analysis there are some questions: Is the project possible, taking into account the resource constraints? What are the tangible and intangible benefits related to the information system? Are the benefits worth the costs? What are the tangible and intangible savings that will be obtain from the system? What are the development and operational costs? What are the hidden costs of ownership?

From the point of view of the economic feasibility there are two problems: whether the costs justify themselves (financial, human, material, time resources consumption); whether the organization has the necessary finances for the information system's development.

From the financial point of view, investing in an information system implies a very big capital expense (invested capital). This expense has to be compensated, in the future, by the positive cash flows, generated by the new information system. The investment's opportunity is established based on the initial expenses with the investment – called negative cash flow or cash outflow – and on payments and income that occur at regular periods (annual) as a result of the information system's exploitation.

Concerning the future cash flows' estimation, a delicate problem appears: while the initial expenses are relatively simple to be estimated – based on the general estimate – the future cash flow estimation is relatively difficult to be realized because of the following reasons: there always is an estimations' uncertainty; It is difficult to separate the information system's effective contribution to the organization's future total cash flows.

It is always necessary to check, before starting the effective design of an information system, if the expected benefits will exceed the anticipated costs. The information systems for which benefits - quantifiable and non-quantifiable – do not exceed initial costs, and operating costs, must not be approved unless there are other reasons (such as, for example, legal regulations).

In practice, managers have to decide whether or not, economically speaking, the development of an information system is feasible. Sometimes they have to choose between various information system projects. For solving these aspects, managers have various methods of capital allocation, respectively of investments' choice; Payback Period – PBP; Net Present Value – NPV; Internal Rate of Return - IRR; Modified Internal Rate of Return – MIRR.

Operational feasibility. The operational feasibility or the exploitation feasibility focuses on the behavior, knowledge and ability of all those involved in operating and using the information system. To get the anticipated performances, it is important that the ones involved support the information system's development at all stages: from proposal to effective implementation and exploitation. Even from the beginning it is necessary to establish the stakeholders – persons/groups that are interested in the information system's development and utilization. If the relevant stakeholders – managers, employees, clients, suppliers – do not support the system's usage, it is very likely that it will fail. For example, if the system is too difficult to be used by the employees, they will avoid it, reject it or even sabotage it or will resort to other methods to do their tasks.

Moreover, the negative consequences will spread and affect the ones situated along the informational circuit. Every employee, in his/her job, is an information receiver and sender. If somewhere along the track an employee refuses to use the implemented information system, his/her decision may affect everyone who should get information from him/her. As a consequence, opportunities may be lost or problems may occur due to the fact that information is not at all received, is received too late and/or is of poor quality.

Risk analysis in information system development

In the new era, information systems and their operation medium become more and more complex. Consequently, the projects for these information systems' development also become more and more difficult to control. Under this context, it is important that anyone involved in the development of an information system be aware of the risks that might occur.

Risk management encompasses three processes: risk assessment, risk mitigation, and evaluation and assessment. Risk management is the process that allows IT managers to balance the operational and economic costs of protective measures and achieve gains in mission capability by protecting the IT systems and data that support their organizations' missions ¹⁰²

In practice, any investment in an information system or information technology system is risky. Unfortunately, however, risk management is frequently ignored, although it should represent an essential step in the development process of an information system or of the informational technology implementation. The absence of such a study may seriously affect the results and may have as an effect the project's failure. The failure of an adequate risk management leaves the effects of a software project into the hands of luck or irrelevant optimism. The systematic risk management offers the frame, the perspective and the necessary techniques for replacing luck with engineering discipline.

The first step in the risk management is to identify and analyze risks, and the second is to establish the strategies to overcome these risks. The risk analysis was the subject for studies made by various specialists, who tried to identify a list of the most common risk factors ¹⁰³. Based on the specialists' experience in information systems, the list containing the risk factors and their analysis may be a highly important guidebook for the project managers. It would be interesting and at the same time useful to have such a research in Romania as well. To collect the risk factors one may use the Delphi method, and for establishing the panel project management, experts may be used. The study might emphasize the risk factors mentioned by the experts and it might realize a comparison of these factors with others got from theory or from researches in other countries.

Investments in projects concerning the information systems always raise difficult problems. The investment decision is, within its nature, risky and uncertain; it is based on a number of

¹⁰² Stoneburner, G., Goguen, A., Feringa, A. (2002), Risk Management Guide for Information Technology Systems, National Institute of Standards and Technology Special Publication 800-30, available at: http://csrc.nist.gov/publications/nistpubs/800-30/sp800-30.pdf Accessed: (2008/11/29).

predictions and these may or may not accomplish. Under this circumstances, it is necessary that project risks are always properly evaluated and their analysis be based on quality information.

The information systems ability to meet the end-users' demands

Another aspect that the specialists should have in view when they get involved in the design of information systems is related to their ability to meet the end-users' demands. The information systems' investigation, analysis and design processes may be time-consuming and very expensive. Often, time and costs generate pressures upon designers and make them resort to "shortcuts", which may lead to the development of less qualitative information systems, full of "cracks" and which do not meet the users' demands. Failure in meeting the users' needs and demands may also occur because users do not always properly describe what they want from the informational point of view. This issue may be aggravated when information system experts have little or at all experience in this matter. Therefore, the situation when the designed information system can not handle the users' needs and demands may occur. Another possible problem might be generated by the fact that, as users become more familiar to the system, their needs and demands may grow, change. Therefore, the designed system must be flexible, adaptable and this change possibility – even from the beginning be foreseen.

Another aspect that the senior managers, the project managers and the information systems' specialists should have in view is the resistance to change. This situation often occurs when, for different reasons, end-users fear that: (a) the new information system, based on new IT, might make certain jobs useless; (b) they will not be able to learn how to handle the IT, and how to use the new IS; (c) they will lose the position, power, status within the company. Generally, the resistance towards using the new information system is higher when the end-users are excluded from its design. Excluding the users from the information system's design may lead not only to an incomplete and incorrect analysis and an incomplete IS project, but it may also generate resentments towards the new information system.

Cooperation with stakeholders

Knowing, understanding and fulfilling, as possible, the interested parts' needs, expectations and demands is of vital importance for the success of any investment, especially the ones related to information technology and information system. Under these circumstances, it is very important to identify all interested parts, known as stakeholders.

For the success of an information system it is important that network era managers understand the importance of having collaboration relationships with all the people or groups that might affect or be affected by the projects regarding the information system. It is essential for companies to build long-term relationships – based on trust and mutual respect – with the stakeholders: managers, shareholders, employees, clients, suppliers etc¹⁰⁴. To facilitate the successful introduction of new IT applications, issues of project risk must be addressed, and the expectations of multiple stakeholders must be managed appropriately¹⁰⁵.

Organisations and their managers should understand that information system specialists, no matter how professional they are, can not insure the success of an investment in information technology or information system. They must be team players, communicate and cooperate with the other interested parts: managers and users.

In many cases, the managers' and other stakeholders' expectations from the information technology or other types of implemented information systems are too high. Some authors capture the importance of reaching the expectations of the parts interested in the success of an

information system¹⁰⁶. They claim that an information system's failure is actually a gap between the interested parts' expectations, expressed through an ideal or a standard and the real performances.

Conclusions

In practice, during an information system's development, a series of risks may occur, which might have negative consequences on the subsequent implementation and usage of the information system and, implicitly, on its performances and success.

Managers, as new-information-technology change promoters, must know these risks, in order to take the necessary measures in time (it increases the probability of avoiding/overcoming them). In practice the information system's development traps might occur from the following fields: the feasibility study; the risks' analysis; the system's ability to meet the users' demands; the cooperation with stakeholders.

Often, the information technology is regarded as a "saviour" for the organization, although, in practice, in many cases, the results have been far beyond the ones expected. In reality, not the information technology is the key problem. After all, its success or failure is independent of the way in which the organization, the specialists, the managers and the employees know to comply with the information technology's abilities, to the organization's strategy and to the users' and organizations' real needs.

THE USE OF FUZZY LOGIC IN THAT THE DECISION-MAKING PROCESS

Grădinaru Dorulet

University of Pitesti Faculty of Economic Sciences gradinary dorulet@yahoo.com 0752458187

The present study is a short introduction in the theory of the fuzzy sets. It also presents some aspects of the application of the fuzzy logics in founding the decision-making process related to the firm's management. In the end there are presented some average operators that express the idea of compromise in making a decision.

Keywords: fuzzy logic, decision-making process, classical theory of the crowd.

JEL Code:L23, C02, C44.

1. Introduction

Crowds' fuzzy theory was developed from years 60, in response to poor consistency rules Deterministic type "YES" or "NO", trying the formalization of judgments such as "More or less. In classical logic, sentences can be true or false, no possibility of intermediate values. In the case of models approach concrete, real world, there was some tricky situations: not all are clear and real Deterministic (as such cannot be described accurately on the basis of classical logic), and a full description of the system requires a real range of information not known or fully supplied, and often are not understood exactly.

This came as a necessity to use fuzzy logic and resulting from the use of fuzzy instead crowds classic crisp.

2. Fuzzy crowd

Definition 1: Let X a lot nevoid. A lot fuzzy (vague) A is characterized by its membership function

$$\mu_A: X \rightarrow [0,1]$$

Where $\mu A(x)$ is interpreted as the degree of membership of element x in A fuzzy crowd, for any $x \in X$.

It is clear that A is completely determined by the crowd tupelos $A = \{(x, \mu A(x)) \mid x \in X\}$ and therefore we will write A(x) instead of μ A(x). Family crowds all fuzzy in X us note F(x). If A = (x1... xn) is a finite lot X, we use notation

$$A = \mu_I/x_I + ... + \mu_n/x_n$$

Where the term $\mu i / xi i = 1... N$ implies that μi is the degree of membership of xi in A, and is the plus sign.

Suppose that a person wants to buy a car cheap. "Cheap" can be a lot like the fuzzy world prices. For example (see fig. 1) "cheap" can interpret:

- Under \$ 3000 cars can be considered cheap, and prices are not too differentiated eye purchaser;
- Between \$ 3000 and \$ 4500, a change in price induces a slight preference (poor) to cheaper car;
- \$ 6000 beyond the costs are too high (not interested).

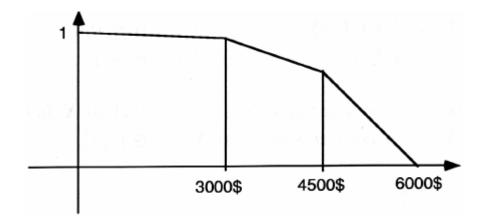

Fig.1: Discrete membership function for cheap

Definition 2: A fuzzy number A is called triangular fuzzy number with peak (center) a, left width of> 0 and right width of> 0 if its membership function has the following form:

A (t) =
$$\begin{cases} 1 - \frac{a - t}{\alpha}, & \text{if } a - \alpha \le t \le a \\ 1 - \frac{t - a}{\beta}, & \text{if } a \le t \le a + \beta \\ 0, & \text{otherwise} \end{cases}$$
And notes A= (a,\alpha,\beta).

1 and a and

Fig.2: Triangular fuzzy number

A triangular fuzzy number with center can be seen as vague and quantity: "x is approximately equal to a".

Definition 3: A fuzzy number A is said trapezoidal fuzzy number with the tolerance [a,b] width to the left and right width, 8 if its membership function has the following form

$$A(t) = \begin{cases} 1 - \frac{a - t}{\alpha}, & \text{if } a - \alpha \le t \le a \\ 1, & \text{if } a \le t \le b \\ 1 - \frac{t - a}{\beta}, & \text{if } a \le t \le a + \beta \end{cases}$$

$$0, & \text{otherwise}$$

A trapezoidal fuzzy number can be seen as the vague "x is approximately in the range [a, b].

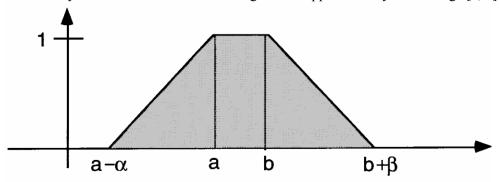

Fig. 3: Trapezoidal fuzzy number

3. Operations with fuzzy crowd

In this section expand the operations of the classical theory of the crowd. To note that all operations that are extensions of crisp concepts are reduced to their usual meaning when they under the crowds have fuzzy degrees of membership in the crowd {0.1}. Therefore, when expanding operations in fuzzy variety, use the same symbols as in theory crowds crisp. In what follows, A and B are two fuzzy under-lots same lot of classical X.

Definition 4: Say that A is a under-lots of B if A (t) \leq B (t), whatever the t ε X. **Definition 5:** The crossing of A and B is defined as $(A \cap B)(t) = min\{A(t), B(t)\} = A(t) \wedge B(t)$, for all t ε X.

 $A \cap B$ can be construed as "x is close to x and is close to b".

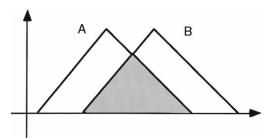

Fig. 4: Intersection of two triangular fuzzy numbers

Definition 6: The meeting of A and B is defined as (AUB) (t) = max (A (t), B (t)) = A (t) \vee B(t) for all t \in X.

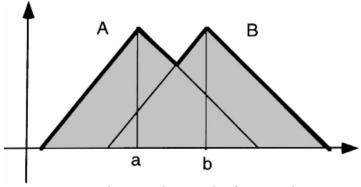

Fig. 5: Meeting the second triangular fuzzy numbers

Definition 7: A complementary fuzzy set is defined as $(\neg A)(t) = 1 - A(t)$ for all $t \in X$. It can be construed as "x is close to", and $\neg A$ can be read as "x is not close to" or "x is far from".

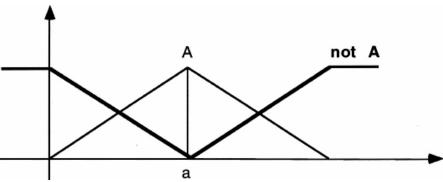

Fig. 6: Crowds vague A and A

Definition 8: A fuzzy under-lot and B are equal say, A = B, if $A \subset B$ and $B \subset A$ if A(t) = B(t) for any $t \in X$.

An under-lot fuzzy blank of X is defined as $\phi: X \to [0, 1], \phi(t) = 0$, for any t εX .

I can see that $\phi \subset A$ for any vague under-lot A of X.

Universal fuzzy under-lot of X is defined as $l_x: X \to [0.1]$, lx(t) = 1, ε t to X.

It is noted that the l_x is most vague under-lot of X, $A \subset l_x$ for any vague under-lot A of X.

Moreover, $l_x = \phi$ and $\phi = l_x$. However, unlike the classical theory of the crowd, and the third non-compliance and the third excluded are not satisfied, meaning $A \wedge A \neq \phi$, and $A \vee A \neq l_x$.

De Morgan's laws are satisfied by the fuzzy under-lot X, meaning

$$(A \wedge B) = A \vee B$$

 $(A \vee B) = A \wedge B$

4. That the fuzzy logic and decision-making process

Crowds fuzzy theory was developed by L. Zadeh [Zad75], who noted that the mathematical models and various classical methods in that the present flawed decision-making process and are difficult to apply the complex reality of economical factors .As increasing complexity as an economic process can reach a critical point, the accuracy and significance of claims about the incompatibility incompatible. The incompatibility process are defined by Zadeh, converge to vague statements (fuzzy) and fuzzy logic tries to establish a formalism for uncertainty and ambiguity specific natural language. And this new language, to shape the natural language, created a new type of mathematical model. Reporting on fuzzy logic is always time for a decision-making process; values are associated with membership in the [0,1]. Adoption and complex decisions based education becomes possible through the various methods and techniques that facilitate decision-making choice optimal variant, each of which is falling in a given decision-making model. Depending on volume, structure and quality of information they receive may be making Models: Deterministic, centered on information with high precision, complete indeterminists and probabilistic. Using these methods and techniques result in a decision to increase the degree of rigor and, implicitly, the effectiveness of decisions, varied in relation to the typology of decision-making situations involved. Correspondence between the quality of information - as expressed by the parameters of accuracy and completeness - and decision-making models (economic or economic-mathematical) was suggestive graphic stressed by some experts as Fig. 7:

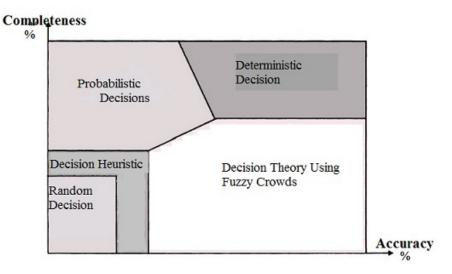

Fig. 7: Completeness and accuracy in decision-making models

The examination of the graph that the two characteristics of information (and not only them) determining one or other methods of decision theory that management put them in practice disposal economy. Thus, if a low degree of accuracy and completeness corresponds Heuristic and random decisions based on intuition, reasoning and decision-experience, as information is more complete and more precise, the possibility of using methods and techniques focused on algorithmic procedures, which allow adoption of decisions with high background.

Models based on theory crowds vague (fuzzy), the information transmitted for the substantiation of the decisions are highly completeness, but least accurate, probabilistic models used in the existence of accurate information, but less complete, and Deterministic models are in our opinion, the most significant.

Besides these there are many methods and techniques, among which we mention methods of operational research, provided by mathematical programming, inventory theory, graphs theory, theory of firms' waiting game theory, simulation decision theory equipment that can be used with successful business practice.

Methods and techniques to group decision making, depending on the type of decision-making situations involved in 3 categories:

- Methods and techniques to optimize decisions, conditions certainty: Electric, the global utility, the additive, Deutch's algorithm-Martin, decision table, decision simulation;
- Methods and techniques for optimizing decisions under uncertainty: technical optimistic, pessimistic technique (A. Wald), the technique optimum (C. Hurwicz), the technique of proportionality (Bayes-Laplace) technique to minimize regrets (L. Savage);
- Methods and techniques for optimizing decisions in conditions of risk : decision tree, the mathematical expectancy.

Techniques for optimizing decisions under uncertainty, which included those related to fuzzy crowds through their Heuristic generates obtain different optimal choices. Emphasize that some experts in management recommended that the use of one or another of these techniques to consider the habit decision to operate with a technical manager and psychology and, especially, the economic-financial company. The firm has an economic and financial situation better, so it is possible to assume risks higher, so much more optimistic view on the probability of obtaining superior results for resources is that there is compensation in case of failure.

5. Average operators

In a decision process, the idea of compromise corresponds to an overall view assessment as an action between the worst and the best evaluation. This occurs in the presence of conflicting objectives, where compensation is allowed between proper compatibility. Operators' average achieved compromise between objectives, allowing a positive compensation between their assessments.

Definition 9: An average operator M is a function

$$M: [0, 1] \times [0, 1] \rightarrow [0, 1]$$

Satisfying the following properties:

M1. M(x, x) = x, x [0.1].

(Idempotență)

M2. M(x, y) = M(y, x) x [0.1].

(Switching)

M3. M(0.0) = 0, M(1.1) = 1

(Extreme conditions)

 $M4. M(x, y) \le M(x', y') \text{ if } x \le x' \le y \text{ and } y' \text{ (Sameness)}$

M5. M is continuous.

If M is a mean operator, then

 $\min(x, y) \le M(x, y) \le \max(x, y), x \in [0.1]$

In fact, the monotony idempotenta and that of M

 $\min(x, y) = M(\min(x, y), \min(x, y)) \le M(x, y)$ and

 $M(x, y) \le M(\max(x, y), \max(x, y)) = \max(x, y)$

An important family of operators is the average time to the quasi-arithmetic:

M (a₁, a2... an) =
$$f^{-1}\left(\frac{1}{n}\sum_{i=1}^{n}f(a_i)\right)$$

Kolmogorov characterized this family as all the class average and decomposable.

Examples: quasi-arithmetic average of a1 and a2 is defined as: $M(a_1, a_2) = f^{-1} \left(\frac{f(a_1) + f(a_2)}{2} \right)$

$$M(a_1, a_2) = f^{-1}\left(\frac{f(a_1)+f(a_2)}{2}\right)$$

The uses of average operators are:

- Media harmonic: $\frac{2xy}{x+y}$

- Geometric Average: \sqrt{xy}

- Media arithmetic: $\frac{x+y}{2}$

- Duala geometric average: $1-\sqrt{(1-x)(1-y)}$ - Duala average harmonic: $\frac{x+y-2xy}{2-x-y}$ - Median: $med(x,y,\alpha) = \alpha$, if $x \le \alpha \le y$ x, if $\alpha \le x \le y$

- P-average general: $[(x^p+y^p)/2]^{1/p}$

The aggregation of information occurs in many applications related to the development of intelligent systems: neural networks, fuzzy logic controllers with, vision systems, expert systems, multi-criteria decisions, etc.

APPROACHES OF THE ENVIRONMENTAL MANAGEMENT OF INDUSTRIAL PRODUCTION

Grădinaru Dorulet

University of Pitesti Faculty of Economic Sciences gradinary dorulet@yahoo.com 0752458187

The article treats the environmental management of industrial production, which aims the management of the environment as a concern both for the economic operators, the public administration and national or international institutions. In the presented conception, the environmental management of industrial production or the "green" management of production is a part of the production management, ensuring that the progress and the development of the production to be without negative consequences on the environment. Starting from the fact that the company is organized and managed so as to achieve, at any cost, his purpose, namely to obtain profit, which may represent a threat to the environment, in the need to constrain this organization through a series of laws and regulations, the paper presents a form of audit of the evaluation of the strategy of transformation in terms of performance security / environment.

Keywords: environmental management, industrial production, strategy.

JEL Code: L23, Q57.

1. Environmental management of industrial production: content, development, approaches

Management of environmental is a science with an interdisciplinary character and integrity, having as object of study and research environment as a public good and auto-reproduction based system, taking into account the close relationship of interdependence that the economic environment. It aims to achieve a rational management of resources, to assess damages and costs related to the environment, establish economic instruments of environmental policy, repercussions micro and macro-economic measures and means of environmental protection etc. Environmental management must assume a major role in decisions that the efficient management of the environment by man, it must be in the position of partner nature, are held and work in accordance with the laws of nature.

Environmental management of industrial production and managing "green" production is part of production management, ensuring that the pursuit and development of production, means that the production management, to do without negative environmental consequences. He is to study, so, environmental industries.

In Western Europe, while, three steps are outlined in the Heads of businesses and staff education, in relation to the environment, namely:

- Rationalized denial:
- Therapeutic shy:
- The management responsibility.
- a) *Denial rationalized* was a dominant attitude of those responsible for businesses in Western Europe until the early 70s. They argued on the basis of demonstrations supported by industry figures that do not pollute and services. In very rare cases, they showed that the phenomenon existed, but the balance is very positive, including the environment and are not cause for concern. Also responsible businesses claimed that any industrial process is under control, except for a few unforeseen accidents.

In Eastern Europe, until before 1990, the environment was considered as an acceptable price to be paid to improving the living of the population.

b) Therapeutic shy appeared in major industrial groups in the early 70s.

Due to public pressure and legislation increasingly sensitive to it and aware of their responsibility to their immediate managers of the industrial and services are even more equipped with technical means to fight against pollution. At the same time, they invent more effective ways to combat environmental degradation. The so-called *risk management* began to develop at least the heavily polluting enterprises or high-risk environment.

Currently, the concept of negative therapeutic shy of fighting against pollution and substituted the concept of a positive *policy environment*. In parallel, experimental methods are developed to put in the work of such a policy, devansand of the limited technical and technological issues relating to the environment.

It points out however that these methods are now confidential, closed to both having the size necessary to invest. They are, however, ignored the small and medium enterprises, although they also need methods.

c) The management responsibility, in the sense of a coherent environmental policies and responsibility dates from the 80s.

Method legal environmental audit came from the need to follow, to understand and apply the increasingly numerous, complex and often contradictory to the laws and regulations require.

Ensemble methods and policies for environmental management have been summarized in a green strategy by the heads of enterprises, the need to ensure a certain consistency in policy to promote the environment.

For each area of activity of the answer to the question: What should I know a director of production, marketing, human resources, research, etc.. About environmental issues?

The next activities (functions) are analyzed: trade, the production, the administrative, legal and financial activities of human resources, research-development activity in the general direction.

The production or processing. This is the most profound implications on the environment and for these reasons, the question stăpânirii processes processing or processing strategy and green feature is directly related to the economic sector analysis.

The need to measure and optimize the processes of transformation from upstream during the phases of processing or manufacturing and execution, and downstream activities.

Diagnosis of "green" of the transformation process are the:

- Supply strategy;
- Transformation strategy;
- Strategy development studies and methods;
- Strategy of finished goods and services after sale.

There is a close link between the promotion of an enterprise-wide green and functions related to the production and quality control and assurance of security and organization, so that in some companies, a single service that manages the three activities: security service-quality environment.

Transformation processes or processing, and other economic activities can have a strong negativ impact on the environment, a framework biogeologic such as nuclear activities, mining and processing of minerals (gold, zinc, aluminum, copper, etc..) construction of dams, the extension of airports, motorways etc existence. It is necessary to ensure a balance biogeologic in any situation in which industry and services have their role, not only neutral (no influence), but positive (improving). Be measured by, for, example, infiltration of zinc and aluminum in soil, groundwater contamination of water and water flowing.

It is estimated that the model based methods and tools of management and business planning are not adapted to take account of environmental responsibilities, which should be the concern of any manager.

Maladjustment mentioned is because the methods and tools for management and planning are based on postulated traditional consumption, which is undertaking a coherent set of individuals and groups, having a single identity, namely that of their enterprise, and one end all the enterprise.

That enterprise is organized and managed so as to achieve at any cost making its purpose, namely obtaining a profit, can represent a threat to the environment. For these reasons, in all countries with advanced economy, it was necessary to hold this organization through a series of

regulations and laws to reduce the destructive capacity in relation to the environment.

2. The concept of sustainable development

Omission of the costs and negative effects to environment and health human economic activities have led some consequences to be borne by the whole society. Imposed rethinking and redesign the organization and how to conduct economic activities and achieve the transition to a new behavior and way of life and admitted under controlled environmental and human aspect.

The last decade of the century XX century brought to the fore, the problem of sustainable development, a concept which is more comprehensive compared to the ecological development. An essential factor of the rapid spread of this concept is linked to the end of the Cold War and the installation of the democratic system in the countries of Central and Eastern Europe.

At present, the international community is unanimous agreement to consider that we live in a "global risk society" (Risk Society World - WRS), because the challenge of risk as a result of human actions, in a limited space and time, spreads globally.

Perception state of WRS is in three areas: global society itself becomes an object of study, admission risk on a global scale will lead collaboration within the international community, the need for urgent measures perception of risk is determined on a global scale will impose pressure on political factors to reduce risks industrial activity, which may lead to a collapse of society, without achieving sustainable development.

The concept of sustainable development (SD) with guidelines for the future was launched at the presentation of the report entitled "Our Common Future "(known as " The BRUNTLAND Report") in the work of the World Environment and Development, is defined as" type development ensure that the needs of present without compromising the ability of future generations to meet their own requirements."

This concept has been accepted and supported by the scientific, political and economic world, and being taken by the Conference in Rio de Janeiro in 1992.

In general, the concept of sustainable development involves ensuring performance on three coordinates:

- 1. *In economic*: increased resource recovery and removal losses of non-renewable resources;
- 2. On the ecological: avoiding environmental degradation:
- 3. *On the socio-cultural*: ensuring living conditions and human achievement.

As a general objective of sustainable development, shall be a finding optimal interaction of four systems: *economic, human, environmental and technological*, are in a dynamic and flexible working to meet targets. Under these conditions achievement of SD requires major change in economic policies and environment, leading to reduced resource inputs per unit of useful effect.

For the World Commission for Environment and Development, SD is defined as the transformation process in which the exploitation of resources, targeting of investments and targeting techniques and institutional changes taking place in harmoniously.

Achieving sustainable development involves meeting several requirements, namely: resizing economic growth based on a more equitable distribution of resources and a stronger emphasis on the qualitative side of production; eliminate poverty with basic needs relating to employment, housing, food, energy, water and health; population growth to ensure an acceptable level in order to brake the uncontrolled population growth; conservation and enhancement of natural resources, monitoring the impact of economic development on the environment, technology shift and control risks arising from it; decentralization forms of governance and increased participation in decision making; unification decisions on the environment and economy; maintaining and broadening the diversity of ecosystems.

Sustainable development is a model of economic growth in which is placed restrictions related to the necessary balance between the economic system (created by humans) and natural, which created the man.

To achieve sustainable business must take into account in determining the value in equal measure, economic, ecological and socio-cultural, based on applying the concept of balance.

Currently, the classical approach tends to business, that the main objective is to maximize profits through a fierce competition on the market, to be replaced by a holistic approach and pursuing other goals: that all those involved, environmental protection, social responsibility, etc.. It follows therefore that a business relationship with the company includes positioning its products or in relation to environmental dimensions.

Ultimately, sustainable development involves stimulating firms to design and put into service production systems "friendly to the environment."

As was mentioned in connection with sustainable development have emerged many new definitions of activities, processes and business results, such "green competitiveness", "green productivity", "green marketing", "green technology", etc. All of these approaches was based on the importance of sustainable development impact in the socio-cultural.

3. Environmental externalities (external costs) and internalize costs of environmental protection

The activity of producing goods economic effect on two plans:

- Recover higher material factors, natural and human;
- May cause a degradation of the natural environment, due to the use failure of these factors.

A shortcoming of the financial management in market economies is that prices for a base purchase decisions and guide resource allocation rarely reflect the true costs of environmental degradation.

In a market economy, the pursuit of obtaining a higher profit leads to accelerated environmental degradation, a fact illustrated by a rich literature in the field.

Externalities are defined as any gain or loss is sustained (sustained) from outside, as a result of action initiated by producers or consumers and not paid any compensation.

A creative activity of economic assets which depends on externalities can be described using the following relations:

 $P= f(A_1, A_2... A_n, E)$, in which:

P is Profit Company;

A1, A2, ..., An - business activities that depend on profits

E - business-to influence other companies, called externality.

Externalities E is not compensated in any way and it appears if there is an interdependence between the activities of at least two firms, but lack any form of mutual reward of any kind.

Therefore, one can say that externalities occur where an economic activity is not determined exclusively by the variables that he controls, but also the external variables of his decision.

In the analysis externităților, intervening two categories of costs, as social cost (SC) and the cost of private (CP), called the corresponding marginal costs.

Social cost (SC) consists of all costs incurred by community members as a result of an organization, being composed of the private cost of achieving product (CP) and the cost of pollution or, more generally, external costs (EC) that is: SC = CP + EC.

It was assumed that a manufacturer who produce a quantity of products Q and pollute the environment, in which case the demand curve for its products is C, and the private marginal cost of product completion is CP. Marginal social cost (CS) and the realization of related pollution (EC), obviously, is higher than HP, this results in Fig. 14.2.

In Fig. 14.2 are given these types of costs.

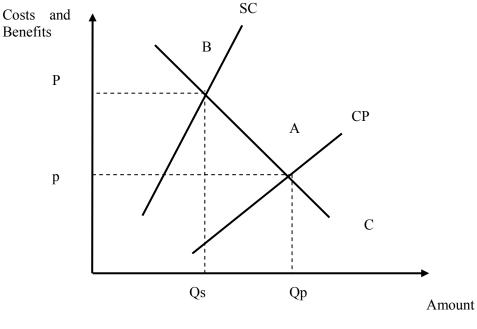

Fig. 14.2

If the manufacturer is not obliged to take measures against pollution, he will seek equilibrium point A, which corresponds to the price p and quantity Qp, acting at the same time to maximize profits related quantity Qp. This behavior is not beneficial to society because it does not bear the negative consequences of pollution.

If it is taken into account the costs of pollution, the efficient production of QS is obviously smaller than Qp.

Behavior corresponding to point A firm and level of production Qp characterized by the following: the company achieved a production quantity Qp greater than the optimal level of production qs corresponding to point B, when taking into consideration the costs of pollution, the firm emit additional pollution environment at the situation depicted is effective B; product price rise of pollution is lower compared with the situation taking into account the cost of pollution (p<P) company is stimulated to reduce pollution as long as it does not bear the costs of pollution; Whereas it is cheaper to pollute the environment, implementation of effective measures to eliminate pollution is discouraged.

Resource allocation through the free market is distorted is the existence of externalities. In order to correct the distortion allocation and to internalize externalities (external costs), was created polluter pays principle (Polluter Pays Principle) = PPP, which has two important functions:

- a) establishes liability for the pollution produced:
- b) determines the setting of prices for environmental resources, so that producers take account of their importance in the production.

To ensure an effective use of the real factors of production, the emphasis on the impact of human activities on natural environment, the only viable solution is to include expenses for environmental protection in production costs.

Need internalize external costs in market economy is necessary for the following reasons:

- External costs are part of the total cost of production which has the effect of environmental negative and are therefore cost effective;
- Whereas prophylaxis reduces or eliminates the therapy is important to consider since phase studies on economic and technical investments, the setting of targets and their realization antipoluante, while running with the entire investment;
- To establish the total cost must be taken into account the economic efficiency of the technique new dependent care expenses on the manufacturer to make them assimilate them in order to avoid degradation of the natural environment. For these reasons, should be excluded from consumption goods, works, services and technologies that have a social cost (or damage caused to society) beyond individual benefits. The current re-restructuring and economic branches are the new guidelines in the field of technical progress to ensure the restructuring of energy and polluting industries.

4. Economic and financial instruments and administrative costs relating to the internalization environment and natural resources

Rational management of natural resources, as noted, must be based on a coherent set of tools, methods and strategies, which are known and applied by managers.

Integration of environmental protection in economic and management practices and market mechanism presupposes the existence of tools consisting of:

- a) standards;
- b) permits, licenses and other authorizations;
- c) economic and financial tools and specific administrative:

Arsenal of these tools should consider the ability and breeding regeneration of resources for environmental and market requirements of goods and production inputs (machines, plant, machinery, equipment).

- a)Standards are technical regulations are standards that define the environment and determine the permitted level or concentration of substances (particles released in water, air, soil or existing products). They differ most categories of standards related to environmental protection, as environmental standards, emission standards in the tributaries, technological standards and performance standards, product standards, process standards.
- b) *Permits, licenses or other authorizations covers* assigned based on compliance certain rules and standards, along with fulfilling other specific conditions conducive to minimizing the negative effects of human activities on the environment. Such tools include mandatory environmental controls and may be withdrawn or suspended in relation to the environment.
- c) Economic and financial instruments relate primarily to various charges for land use or emission of polluting waste. Thus, "land use fee for state property for purposes other than agriculture and forestry", nr.69 regulated by law since 1993, was introduced to avoid removal from circulation of some important economic agricultural area. It is awarded annually by the autonomous, companies and other legal entities for state-owned land under administration or use them with other destinations than agriculture or forestry. Tax on the emission of polluting waste is designed to fit all economic agents that cause pollution in the maximum allowable. The fee for the use of state-owned roads is determined according to the situation existing at the first land in January of each year, based on the declaration made by the payer.

It is emphasized that the widespread application of the concept of sustainable economic development, to internalize social costs and accurate assessment of the effect of global production and consumption is a prerequisite for maintaining a healthy environment that is transferable to future generations.

THE LASTING EXCELLENCE OF THE INDUSTRIAL ENTERPRISES

Grădinaru Puiu

University of Pitesti, Faculty of Economic Sciences, 71 Republicii Boulevard, gradinarupuiu@yahoo.com, 0745902875

The excellent companies are considered to be those that, by proper strategies, owning an outstanding leadership, an organizational culture and a valuable tradition, have a higher profit than the competitors. We can make out the excellence as the successful combination between resources, the way of organization and the efficiency of the managerial process. By its nature, the excellence involves a join and an inspired and efficient use of the existing resources or of those attracted by the company. The analysis of the role of synergy appears as imperative in obtaining the excellence. The effort to maintain the excellence, for lastingness, is provided by the process for the engendering of the synergies resulted from the harmonization between strategy – organizational culture.

Keywords: lasting development, lasting excellence, attributes of excellence, productivity by people, synergetics

JEL Code: L25, L29

1. The concept of lasting excellence

The excellence of the companies and the lasting development are subjects in vogue. Debated on a large scale, both by the ordinary public, and in the academical field, the two collocations receive a content and a meaning based on the context and on the subjective interpretation of those who approach this theme.

In order to avoid the possible misunderstandings that might subsequently appear, we will demarcate the ordinary meaning, the colloquial, from the one that it is used in the present paper.

The Dictionary of Neologisms of the Romanian Academy /5/ defines the word **excellence** as a title whereby some persons are honored, either a high degree of perfection: the quality of being **excellent**, very good, out of the ordinary, high, wonderful. Thus, the word has the significance of a special appraisal, a form to accentuate the success.

Lasting means the quality to persist for an extended period of time (lastingness), to resist – durabilitas in Latin – indicating the durability. Associated with the term of development, we obtain the term of **lasting development**, a collocation which indicates the maintenance of the system – in the general environment – in an uncontaminated state, without degradation.

The meaning of the collocation **lasting development of the enterprise** can be larger, then it can regard the entire life of the accounted organization, not only its interests regarding the presentation of the environment. In an identical manner, the lasting development of the national economy and of the world economy implies multiple aspects, not only the environmental ones.

In the present paper, we will use the term **excellence** to appoint the enterprises, the companies, that have recorded or which can record an outstanding, worthy of imitation success. These companies represent a model that is worthy to be followed by other companies in the industry field, of the entire economy of a country, a goal that can be reached by perseverance, readiness, truthfulness and qualification.

We will use the collocation **lasting excellence** to refer to a company which maintains in worthy of imitation situation – success, profit – a long period of time and which it adjusts correctly and in an efficient manner to the exigencies of the social-economic environment.

2. The excellence of the industrial companies

The evolution of the thinking in the business field, especially of the strategical thinking regarding the business company, the industrial firm or company, is a process of gradual settlement of the

accumulated knowledge and less a process of exclusion of some old ideas. This evolution is marked out by two main trends of thought that appeared at the middle of the 60s.

The two paradigms are:

- The paradigm of the strategic rationality.
- The paradigm of the strategic conduct.

Our interest is focused on the latter one, whose representatives (Lindblom, Peters, Waterman) put their efforts in a field rather opposed to the schools of strategic rationality.

Tom Peters and Robert Waterman, in the paper "**Lokking for Excellence**" (1982), a bestseller of that period, spread in the academic and business environment the term of culture of enterprise or organizational culture. The term of excellence has been frequently used since then to characterize the successful companies (the excellent companies, according to the authors).

They plead that the excellent companies accomplish better than the competitors a number of eight important actions. Tom Peters and Robert Waterman showed that, the eight attributes of the excellence, applied by the successful companies, have positive results because they have a theoretical ground tested for a long time in practice. This, even it was ignored by the majority of the managers, passed the test of time and its application is attractive for the endorsed ones.

The excellent companies led to the appearance of the champions of the productivity, group of individuals who strongly believe in their ideas, which blots out the bureaucracy and promote their projects within the system and outside it, to the clients. These champions represent a permanent source of innovation; the knowledge and initiative are their favourite weapons.

The **eight attributes of excellence** are:

- The predisposition for action: the preference to do something, instead of convey an idea on endless cycles of analysis and at the reporting committees;
- To remain close to the client: to find out the preferences of the clients and to fulfill them;
- Independence and entrepreneurship: to divide the corporation into small companies and to encourage them to think independently and in a competitive manner;
- Productivity by people: to create in all the employees the conscience that their efforts are essential and they will enjoy themselves of the reward of the success recorded by the company;
- The company must be run by values: to insist for the managers to keep focused on the essential business of the company and to promote a strong culture;
- Maintaining within the base business: to remain within the business that is better known by the company (to decide which is the essential speciality of the company and to fight for its development);
- Simple organization, the allocation of the exact staff that is necessary: to maintain a minimum number of hierarchical levels, with a small number of employees at the superior levels; a sole structural dimension must take precedence (the product, the function, the geographic area);
- Keeping of the flexibility and firmness: to stimulate a climax of high devotion to the essential values of the company, correlated with the preferences if the employees who accept the fundamental values (a paradoxical combination of the directing from the center with the individual autonomy).

From the eight attributes if the excellence, the comlpex and tight connection is revealed in a transparent way, which denotes in fact the harmonization between the strategy of the company and its organizational culture.

The achievement of the excellence within an enterprise implies policies which should mobilize the staff for their performance. Thus, for example, some enterprises included in the project for the achievement of the excellence the implementation of the method regarding "the multiple zero" in the enterprise, according to which the activity must performed with zero flow, zero stocks, zero delays, zero paper, zero troubles, zero accidents and zero conflicts.

The internal effects of the application of the method mentioned above are: cost cut, flexibility, better information, reliability and efficiency, improved conditions of labor, and, from the external

effects we can mention: the image of the products in point of quality and prices, feedback in point of the competitive environment, reacting, reliability of the couple product-system, a favourable social image.

In the paper "In Search of Excellence" (1994) Robert Waterman launches a new solution for the achievement of excellence: "the self-directed work team". The message, presented right in the subtitle of the book is that we must learn from the companies that give the right of way to the use of human potential. The author advises us to learn from the best as long as they head and continue to gain on. Even the best are not always as good as they seem to be. A lot of companies hid their weaknesses behind the gigantic dimensions. A new type of excellent companies is asserting: they are flexible, fast in reactions, daring. Their characteristic feature is the permanent improvement and change.

A decade and half later, in Europe, Robert Heller continues, completes and updates the studies of Peters şi Waterman. In the paper "In Search of European Excellence" (1998), Heller analyzes the main ten strategies, implemented by the European companies to achieve excellence.

He believes that the **rebirth of the European companies** is pursued by ten ways:

- 1. the conveyance of the authority (a profound delegation of it) without involve the loss of the control or of the final decision;
- 2. the conversion of the enterprise structure in the secret to gaining a long term success;
- 3. the start of some radical changes, in the entire system of the corporation and not only in a division which proves to be in the red;
- 4. the division of a company in order to reach success, by keeping or gaining the advantages which marks the small sized firms, while the company remains or becomes bigger;
- 5. the use of the organization's potential by new ways to approach the leadership of a company;
- 6. the maintaining of the company at the head of the competition, in a world in which the old ways to win have started to work;
- 7. the achievement of a constant renewal, the avoidance of the contamination of success with the virus of decadence;
- 8. the leadership of those who motivate of the managers in order for the employees to motivate themselves;
- 9. to make the work teams to perform successful actions becomes a needful ability to reach excellence;
- 10. the achievement of the total quality management by the better administration of all the activities

From the more cautious analysis of the work of Robert Heller issues that the companies do not apply a sole method in an absolute manner. Indeed, confronting the valuable ideas of R. Heller with a European reality on the whole, the managers are noticed to prove creativity, where there is no necessary need or it is indesirable.

We believe to be excellent the companies which, by adequate strategies, having an outstanding leadership, an organizational culture and a value tradition, succeed in recording profit regard the competitors, facing with success the adversity of the economic environment, improving with high efficiency its opportunities.

An important role in the achievement of excellence could belong to the application of the method OPT (Optimized Production Technology). According to this method, the goal of an enterprise to achieve excellence in business is to increase the sales and to diminish the stocks and the operating costs, proving that a rise of the net pay off, of the capitalization and of the treasury can be obtained in this manner. The implementation of this method imposes the observance of two basic rules, supporting in this way the idea that the sum of the local optima is not the optimum of the global system. Thus, at the level of an enterprise, to be efficient means to deliver quality products, in short time and at competitive prices. At the level of a workshop (department), to be efficient means quality products and a production as big as possible, in a unique preparation-closing time.

Therefore, we can conceive the excellence as the successful combination between resources, the way of organization and the efficiency of the managerial process. By its essence, the excellence implies a combination and an inspired use of the existing resources or of those attracted by a company. The analysis of the role of synergy in reaching excellence appears to be imperative. The systematic generation and the maintaining of the positive synergies, on long term, seem to be the essence of the lasting development of a company.

3. The integration of excellence with lastingness in the case of the industrial companies. The accumulation of the synergies of a company

There are three pillars of the lasting development, accepted by the specialists.

- The economic development: the generation of wealthiness especially for the poor ones in ways that are consistent with the other two pillars;
- The environmental protection: the avoidance of the negative impact on the natural and social systems (pollution, depopulation etc.);
- The social inclusion: the avoidance of the too large inequalities of fortune, health, chances for life.

The fact that the business can be lasting is a disputed one. The difficulties in the application of the principles of lasting development at the level of the enterprises result from the following grounds:

- The lasting is a property of the systems (for example, economy) rather than of the components, such as the enterprises. Nevertheless, the majority of the companies are relatively complex systems;
- The nature and the importance of the lasting varies a lot in accordance with the industrial branch
- The concept of lasting is still a disputed one, both because of the lack of some statistics, and because of the social and cultural frictions.

Another problem that can be discussed is that of the type of lastingness. The defenders of the hardline type of lasting development tend to se the environmental protection and the social inclusion as being utterly and they do not want to make any compromise in favour of the economic development. The partisans of the lasting development of a weak / moderate type accept to negotiate to foster the economic development. The lasting development that endorses the environment and that regarding the lasting of the development of business, of the enterprise are more and more taken into discussion. Forward, we will focus on the durability of a business.

A lasting business has a few of important objectives outside the profit. These result right from the essence of the lasting development, as a principle: the environmental protection, which consists in the maintaining and even the extension of the value of the natural capital; the social inclusion, which consists in the improvement and the enhancement of the existing values of the authorised capital.

As the economic development has been largely reckons upon **knowledge and human competence**, we can add another objective of the durability of an enterprise or of a business, that of **the increase of the human capital** by education, training and other ways. The **role of the investment in knowledge** has become increasingly important.

The strategy of the business company must be focused not only on the objectives mentioned above, no matter how important they are. The strategy must create a shared vision, a common one, for the direction where the enterprise turns to. Only a strategy that is accepted by the entire staff is likely to be implemented with success, to be flexible and lasting.

This depends on the understanding of the essence of strategy, by the attractivity carried out by this on every employee. From this reason, the strategy is desired to be achived up, to be inspired by the realities of each job. In this way, the strategy of the company will present vitality and it will be harmonized with the organizational culture.

By the persistent propagation of the binomial strategy – organizational culture is made up and the main source of positive synergies which propel the company to excellence and provide its lastingness. The harmonization between strategy and organizational culture represents in this way the essence and the guarantee of the lasting excellence.

The companies that rejoice a high level of harmonization strategy-culture have an increased flexibility (which develops even the flexibility of the technological processes and of the equipment in the manufacturing halls. This flexibility allows the faster adjustment of the company to the needs of the economic environment.

In the periods of economic recession, the company will successfully survive, and if the opportunities appear, the unit will be able to see and to improve them, assuring a stable prosperity. At a high level of the harmonization between strategy and organizational culture, the company will be able to build gradually its own ways to weather the deadlock, even if the momentary opportunities are absent.

The excellence of the company is followed by an organizational culture at the same level. The goal of the companies is to serve their clients, because they are the ultimate masters. The clients are not "treated" with untested technologies or with products with needless additions. The clients receive durable products and services delivered in the right time. The high quality and the out of hand service invariably represent the hallmark of excellence.

In order to be obtained, the co-operation of all is necessary, not only the power and the effort of the leadership. The excellent companies need, claim and obtain extraordinary performances from the usual people, the ordinary ones. The carefulness, the strong decision and the permanent stimulation of the ordinary person, named "**productivity by people**", is required.

The leadership induces the process, and, subsequently, it has an active role, to settle and to maintain the initial impulse. The effort to maintain the excellence, for durability, is provided by the process of the generation of synergies resulted from the harmonization strategy – organizational culture.

Professor Herman Haken, from the University of Stuttgart, defines the **synergetics** in this manner: the science of the auto-organization and of the auto-structuring of the systems, independent on their nature, on the ground of collaboration, of the organic co-operation, of the pieces and composing subsystems. The influx of energies or information, due to the previous accumulations, produces the passing to a state of equilibrium, characterized at microscale by a chaotic movement, by a new dynamic equilibrium, with a clear superior efficiency. Thus, the order appears from chaos. This effect is peculiar to the processes of auto-organization of the open systems and it is accentuated by synergetics.

Synergetics represents a field which, properly, attracts in a larger percentage the heed of the experienced managers who are determined to get a competitive advantage for the enterprise they run, to improve their strategic effort.

The symbol equation of synergy "2+2 =5", denotes the fact that the business portfolio of the company means more than the partly business, stand-alone. Thus, the synergy provides a rational support to the interest of managers for **the diversidification and the permanent improvement** of a business.

The synergy represents a measure of the effects of **complementarity** between two or more activities that, once as they are grouped in a convenient way, produce an effect that is clearly superior to the algebraic sum of the effects obtained in an individual way. The null synergy could be represented by the formula "2+2=4", a situation in which we have a simple arithmetic addition, the grouping of the elements having no effect to increase the technological, commercial, financial, innovation or motivation possibilities, but only an acculmulation of elements which, sometimes, can generate complications in the processes of communication, co-ordination or control.

The negative synergies, symbolized by the equation: "2+2 =3" show that the grouping of the elements produces an effect which is low grade to the sum of the individual arithmetic sums. This

kind of situations in which the negative synergy manifests can be found in the case of the overplus of staff at an employment or in a certain technological area, to the agglomeration of the SDVs or AMCs within a manufacturing department etc.

The managers use the possibility to acquire positive synergies, in order to improve the efficiency of their own strategy by the correlation of this with the elements which they do not include directly in the strategy, but which are the subjects of the strategic action (the improvement of the location, of the way in which the human resources react etc.). Thus, the increased performances of a multidisciplinary group, especially in the situations in which an intense creative effort is necessary, requiring for multiple skills, represent an example of positice synergies accumulated and put into action. The pooling of the business of two or more companies – what justifies and recommends the strategic alliances – is another example of synergies put into action.

The concept of synergy allows to the strategic analysis to mark out the connections between various strategic activities of a company, to designate **the characteristic power**.

Two or more strategic activities that are related by synergy have an important part of shared costs, of know-hows and or skills, of values of the organizational culture and of objectives grouped together, in order to reach success, to get **the lasting competitive advantage** in regard to the competitors.

CONSIDERATIONS ON THE DECISION PROCESS WITHIN THE ENTERPRISES

Grădinaru Puiu

University of Pitesti, Faculty of Economic Sciences, 71 Republicii Boulevard, gradinarupuiu@yahoo.com 0745902875

The process of taking decisions is focused on the increase of the competitiveness of a company, namely of its maintenance on a market of competition and evolutive, in conditions of profitability. The quality of a decision is essentially influenced by the available information, by its relevancy and credibility and the ability of the person who takes a decision to use them. An important role in taking decisions is represented by the classical and probabilistic logical reasoning, useful tools and the assessment regarding the stability of the economic measures. The performance rate of the internal environment and of the external environment specific to a company have priority in substantiation of the decisions.

Keywords: optimality criteria, reasoning, dashboard, performance rates, coefficient of variation. JEL Code: M10. M19

1. Considerations on the decisions

In the theory of decision, the so-called optimality and satisfaction criteria are encountered. The optimality can be mathematical and logical. The mathematical optimality is defined by the maximum and minimum values of the commensurable indexes. Examples:

- the rate of the economic efficiency of an investment → maximum value
- cost → minimum value

The logical optimality is also named the paretian optimality (Vilfredo Pareto) and it represents the social consensus: "the achievements of a person must not affect in a negative manner those of any other person". In the case of two companies that cooperate, both of them must win in order for the issue to be solved in an optimal way.

The satisfaction criterion (sufficiency) is necessary because, even if a version to include optimality can be achieved, in some cases this might not be satisfactory.

The concept of decision is used in a large scope of senses:

- from the time of a simple reaction to the economic decisions;
- from the elementary psychic acts to the complex processes of deliberation and choice (the conduct of the consumer);
- from the individual activity to that of the collectivities (the group decision).

The process of taking decisions is a process of mental elaboration, of processing the information that is received, followed by a selection between more versions from which one is chosen. There is no process of taking decisions without information.

From the perspective of the business management, the decisions are divided in two categories, based on the stage of a business:

- The decisions to draft a new business. It refers to the way of conception and the building of a business and mainly contains: the choice of a field, the establishment of the objectives, the establishment of the organizational structure, the establishment of the necessary resources and of the main indexes of earning capacity.
- The decisions regarding the operation of an existing business that contain the main stages of the strategic, tactical and operational management.

The establishment of the typology of decisions involves two different aspects:

- the typology of decisions per se, done based on certain criteria assigned beforehand;
- the typology of the persons who take decisions based on certain individual peculiarities expressed in that respective process.

In conclusion, the process of taking decision is a mix between the logical types for classification of the decisions and the psychological peculiarities of the persons who take decisions.

The process of taking decisions is focused on the development of the competitiveness of a company, namely of its maintenance on a market of competition and evolutive, in conditions of profitability.

The quality of a decision is essentially induced by the available information, by its relevancy and credibility and the ability of the person who takes decisions to use them.

From the point of view of the process of taking decisions, the essential problem is represented by the selection at each level of decision of the relevant information, in which absentia a lot of decisions are wrong.

In the selection of the relevant information, an increased attention must be given to the usefulness in direct connection with the importance and credibility, according to the relation: usefulness = importance x credit.

An information of maximum credibility and of zero importance has a zero usefulness in taking a decision, and one of huge importance but wrong has also a zero usefulness.

2. Concepts regarding the types of reasoning in process of taking decisions

The classical logical reasoning operates only with two "truth values":

true – is shown using the figure 1

fals – is shown using the figure 0

On this ground, all the assertions are included in two categories. There is a third category of assertions: those who are not entirely true or false, whereon the classic logical reasoning has no answer.

The probabilistic logical reasoning. The probabilistic logic takes into account the assertions from which none is entirely false and neither entirely true. The assertions are ordered in relation to their degree of truth, stating how much or how less one is plausible compared to another. The probabilistic logic is not limited only to two truth values (0 and 1) but uses an infinity of values expressed by figures between 0 and 1. The main characteristic of the probabilistic logic is that it provides the best type of answer regard the available information.

The probabilistic logic provides the degree of trust that we are entitled to give to an assertion.

Example: Question: How will the turnover of a company for the n year reach? (question asked on October of the year n-1)

Answer:

Classical logic: The turnover will reach ROL 85 billion

Probabilistic logic: The turnover will reach ROL 85 billion with a degree of trust of 0.9.

Let us consider an experiment that can lead to N various events. Let us presume that from the N events we consider $n \rightarrow$ favorable, respectively the appearance of any of these events is that we are interested in.

The objective probability P(E) of the event E is defined by the relation:

$$P(E) = \frac{n}{N}$$

If E appears in all of the N possible events, then $P(E)=1 \rightarrow$ certainty. If E does not appear in any of the N events, then n=0 and $P(E)=0 \rightarrow$ impossibility.

Let us start from the structure of the Romanian economic agents, according to the table presented below:

Table 1.1

Number of employees	Share from the total
0 - 50	97,16
over 51	2,84
Total	100,00

In this experiment, N = the total number of companies.

In terms of probability, if we consider an urn with N balls, corresponding to the N economic agents, with two colors suiting to the companies with more than 51 employees (black) and less than 50 employees (white), we can say that if we take out at a venture a ball from this urn, the probability to have a white ball is 97,16% and the probability to take out a black ball is 2,84%.

The result of any experiment regarding the N elements is subjected to the basic relation

$$N = \frac{n}{N} + \frac{(N-n)}{N}$$
, where $\frac{n}{N}$ = the share of the positive results = p (probability of success) and

$$\frac{(N-n)}{N}$$
 = the share of the unfavorable results = q (probability of failure).

The basic relation that results is: p + q = 1

3. Useful tool in the process of taking decisions Dashboard

The dashboard is an ensemble of relevant information regarding the results obtained in the field that is administrated, presented in a synthetic manner, preset and conveyed in an effective way to the beneficiaries. For each level of decision, the dashboard that gathers the relevant information represents the support of the processes of taking decisions.

The dashboards are peculiar:

- to the strategic level of an enterprise (General Manager);
- to the particular functions of an enterprise (managers on fields).

The most important dashboard is that referring to the strategic level of a company that always contains three sections corresponding to the three environments of an enterprise:

- the general external environment that refers to: the factors related to the intervention of state, factors related to the economic conjuncture, technological factors, social factors, judicial settlement;
- the particular external environment, that includes the structure of the competition, the commercial structure of the markets and technological structure;
- the internal environment, with analysis on the directions: marketing, human resources, technology, financial and exploitation.

The ability to select the relevant information for the strategic dashboard is an attribute of the management of performance (the table 1.3).

The typology of the information related to the environments of an enterprise

		1 abel 1.3
No.	Environments of the	Types of information
crt.	enterprises	
1.	The general external environment	 The inflation rate The average monthly salary The unemployment rate Strikes at the main suppliers The rate of exchange RON/ EUR The monthly rate of the interest of loans Changes in the prices of utilities Changes of charges and taxes Funds for the development of the enterprises provided by EU
		 The evolution of the market share regard that of the competitors The rate of the general profit of the main

2.	The particular	competitors				
	external environment	• The back payments of the main				
		competitors				
		• The result of exploitation of the main competitors				
		• The financial expenses of the main				
		competitors				
		• The labor productivity at the main				
		competitors				
		• The share of the salary expenses in the				
		added value at the main competitors The geographical group of interest of the				
		• The geographical areas of interest of the main competitors				
		• The debts of the main competitors				
		• The rate of the exploitation result				
		(Exploitation result/Turnover, %)				
		• The rate of the salary expenses (Salary				
		expenses/Net added value, %)				
		• The rate of the back payments (Back payments/Turnover,%)				
		• The rate of the financial expenses				
		(Financial expenses/Turnover,%)				
		The ratio between back payments and debts				
		• The rate of general profit (Gross				
		result/Turnover, %) • The rate of indebtment (Total debts/Total				
		assets,%)				
3.	Th. :	• The labor productivity (The net added				
	The internal environment	value/number of employees) in				
	Chvii onincit	comparative prices				
		• The rate of self-financing capacity				
		(Capacity of self-financing/Turnover,%) • The level of wages of the staff in				
		comparative prices				
		The bank account (RON and currency)				
		• The period for the recovery of debts				
		(Debts/Turnover x 365days)				
		• The dynamics of the turnover in comparative prices				
		The intensity of export (Revenues from				
		export/Turnover,%)				
		• The degree of defrayal with cash of the				
		monthly expenses of exploitation,%				
		• The energetic efficiency (Energetic				
		expenses/Net added value,%)				

The selection of the information must be correlated with its periodicity: at the appearance, day, week, month, quarter, year.

The first five rates from the **internal environment** assessed in a dynamic manner define in a percentage of over 80% the performance of any company, irrespective of its field of activity. Therefore, we appreciate these rates as being of high priority in taking decisions.

We appreciate some of the rates that were presented as having alarm thresholds, for example: the rate of the back payments $PR/CA \ge 50$ % or the rate of the financial expenses $ChF/CA \ge 25$ % that represent alarm thresholds referring to the inability of payment; the rate of the salary expenses ChST/Va net = 80%, at a bigger value, the company recording losses in exploitation; the degree of defrayal with cash of the exploitation monthly results Ga < 80 %, that represents the financial safety of a company; the rate of indebtment DT/AT = 60%, that represents the measure of the degree of defrayal of the debts by the total asset of a company.

On the ground of the afferent data of the **particular external environment**, the manager makes a dynamic assessment of the fixed market, induces its degree of concentration, makes the static and dynamic diagnosis per each company, determines the trend and takes the right decisions in the establisment of the company's strategy to act on the actual and potential markets. The competitive management converts the economic agent from an entity prevailing **introvert** (inclined to himself, to his internal problems), to an extravertit entity (open to the global environment, with fast feedback and adaptive).

4. Minimal statistical abstract for the assessment of the stability of the economic measures The simple sequence of statistical data is a sequence of numerical data which measure the value of a characteristic quantity of the phenomenon that is analyzed.

Example: A company whom is measured the value of the turnover of every year. The statistical sequence is the following: $y_1, y_2, \dots y_n$, where y_i the turnover in the year "i" and n – the number of years.

The basic indexes of a static sequence are:

The arithmetical mean:
$$\bar{x} = \frac{\sum_{i=1}^{n} x_i}{n}$$
 The standard deviation: $S = \sqrt{\frac{\sum (x_i - \bar{x})^2}{n-1}}$

The coefficient of variation is defined as the percentage rate between the standard deviation and

the mean
$$V = \frac{S}{m} \times 100$$

The coefficient of variation takes values between 0 and 100%.

If V = 0, it means the lack of variation

If $V \rightarrow 0$, the variation of the characteristic is small

If $V \rightarrow 100\%$, the variation of the characteristic is big

No description of a social – economic phenomenon is complete in the absence of the computation of the mean, of the standard deviation and of the coefficient of variation.

The most important error in the assessment of the economic and social events is the exclusive use of the mean as an index of estimation.

Example:

Levels of monthly wages (ROL):

a. 2.000.000 2.500.000 3.000.000 3.500.000 4.000.000
$$\overline{X} = 3.000.000 \quad S = 790.569 \quad V = 790.569 / 3.000.000 \times 100 = 26.4\%$$
 b. 1.000.000 2.000.000 3.000.000 4.000.000 5.000.000
$$\overline{X} = 3.000.000 \quad S = 1.581.139 \quad V = 1.581.139 / 3.000.000 \times 100 = 52,7\%$$

c.
$$1.000.000$$
 $1.500.000$ $2.500.000$ $4.000.000$ $6.000.000$ $\overline{X} = 3.000.000$ $S = 2.031.009$ $V = 2.031.009/3.000.000$ x $100 = 67,7\%$

In the three cases, the mean \overline{X} is the same, but the wage policies are very different. The measure of the difference is given by the coefficient of variation V, % = S/mx100.

The most important index of the impact of the disturbing factors is represented by the coefficient of variation V. On the whole, irrespective of the number of the terms, a coefficient V that is bigger indicates an increase of the influence of the perturbing factors.

The increase of the coefficient of variation represents the greatest danger, because the large variations hide the causes.

The leading indicators of business performance cannot be found in financial data alone. Quality, customer satisfaction, innovation, market share- metrics like these often reflect a company's economic condition and growth prospects better than its reported earning do.

More and more managers are changing their company's performance measurement systems to track non-financial measures and reinforce new competitive strategies. The purpose of the paper is to present the most important performance indicators that can be used by organizations. The paper is designed to provide details on how to measure organizational performance.

Keywords: performance indicators, business process, performance measurement, management

JEL Code: L25, M10.

1. Introduction

In today's business environment, every conceivable advantage is being pursued by companies. They have implemented improvement tools and techniques, such as Total-Quality-Management (TQM), Just in Time Manufacturing (JIT), benchmarking, time-based competition, outsourcing, partnering, and reengineering and change management.

Companies have tried different organizational structures, changing reporting structures, upsizing, downsizing, contracting out, and empowering teams in an attempt to manage better their business and to obtain high values of performance. However, the majority of companies have not been able to effectively measure performance. The single largest contributing factors to this have been the lack of a proper understanding of the management functions and the development of measurement and control systems for organizational performance.

2. Performance Measures

Performance measures have been misunderstood and misused in most companies today. Performance indicators are just that, an indicator of performance. They are not to be used to show someone is not doing their job in the company and how, now that they are exposed, they can be dismissed. Performance indicators are also not to be used for "ego gratification" that is, to be used for comparison with another company to show how much better one company is than another. Nor are performance measures to be used to show "we are just as good as everyone else in our market, so we don't need to change". 107

Properly utilized, performance indicators should highlight opportunities for improvement within companies today. Performance measures should be used to highlight a soft spot in a company and then be further analyzed to find the problem that is causing the indicator to be low. Ultimately, they can point to a solution to the problem.

107 T. Wireman, "Developing Performance Indicators for managing maintenance" 2nd edition, ed. Industrial Press, USA, 2005, p. 9.

This implies that there should be multi-level indicators. One layer of indicators is at a corporate strategic level. A supporting level is the financial performance indicator for a particular department or process. A third level is an efficiency and effectiveness indicator that highlights what impacts the financial indicator. A forth level is a tactical level indicator that highlights the department functions that contribute to the efficiency and effectiveness of the department. The fifth level of indicator is the measurement of the actual function itself. Figure 1 shows this tiered approach to performance indicators.

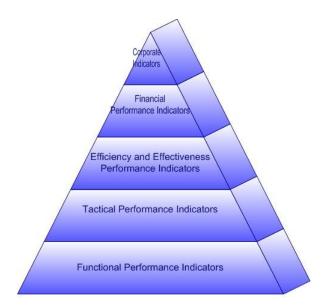

Figure 1: The Hierarchical Performance Indicators 108

While the pyramid provides the hierarchical relationship of the performance indicators, it should be noted that the indicators are determined, not from the bottom up, but from the top down. The corporate indicators are measuring what is important to senior management to achieve the corporate vision. Corporate level indicators will require the entire organization to focus their efforts on achieving the corporate vision.

The corporate indicators will vary from company to company, depending on their current market condition, business life cycle, and corporate financial standing. Even different parts of the corporation may be measured with different indicators. For example, in energy exploitation and production, a particular field will be measured based on where it is in its life cycle. A new field will tend to have higher spending levels for operations and maintenance; whereas a field that is nearing the end of its life cycle tends to have lower operating and maintenance expenses.

Because corporate indicators focus on achieving the long-term vision, all subsequent indicators must focus the organizational levels on supporting the corporate direction. If the indicators are not connected, the overall organizational effort is sub-optimized, endangering the corporation's survival when faced with competitors who have grater focus.

3. Objectives of Performance Indicators

Performance indicators should be integrated and interdependent in order to provide an overall perspective on the company's goals, business strategies, and specific objectives.

During the process of developing performance indicators, the following should be considered:

¹⁰⁸ T. Wireman, "Developing Performance Indicators for managing maintenance" 2nd edition, ed. Industrial Press, USA, 2005, p. 10 (Introduction).

- 1. Make strategic objectives clear, in order to focus and bring together the total organization. Senior manager must clearly communicate the company vision.
- 2. Tie the core business processes to the objectives. Maintenance is a core business function if you have assets or equipment.
- 3. Focus on critical success factors for each of the processes, recognizing there will be variables.
- 4. Use the indicators to track performance trends and to highlight progress and potential problems.
- 5. Identify possible solutions to the problems.

Many companies need a performance indicator system that truly pulls together all parts of the organization in a strategic model. This model allows for optimum return on the investment in the business, thus constantly attracting investors. Keeping the five points above in mind will assist in assuring development of a good performance indicator system.

4. Examples of Performance Indicators

The correct way to develop performance indicators is to work from the top or corporate level, and then develop indicators at each subsequent level to allow the indicators to be connected. If the indicators are selected at the bottom and then built upward, they may be conflicting rather than supportive.

4.1. Corporate Indicators

These indicators are the long-term strategic indicators that upper management utilizes for business planning. The window of planning is typically for the three-to-five-year strategic plan.

Table 1: Examples of Corporate Indicators ¹⁰⁹

Corporate Indicators	Observations				
Total Cost to Produce	This indicator compiles all the costs needed to produce a product. It				
(Manufacture)	is used to calculate the profit margin because the difference				
	between this cost and the sales revenue is profit.				
Total Cost of Occupancy	This facility measure compiles all the costs needed to occupy a				
	facility.				
Return on Net Assets	This indicator measures the profit earned compared to the net value				
(RONA)	of the company assets.				
Return on Fixed Assets	This indicator compares the profit earned to the net value of the				
(ROFA)	fixed company assets.				

4.2. Financial Indicators

These indicators are used to insure that the departments in a company are meeting the financial goals set in the strategic plan. These indicators are monitored annually. If the annual figures are not in compliance with the forecast then the analysis would start at the next level in the hierarchy. No organization will use all of these indicators, but will choose the ones that support the selected corporate indicators.

¹⁰⁹ T. Wireman, "Developing Performance Indicators for managing maintenance" 2nd edition, ed. Industrial Press, USA, 2005, p. 207

Table 2: Examples of Financial Indicators used by Maintenance Management 110

Table 2. Examples	of Financial Indicators used by Maintenance Management
Financial Indicators	Observations
Maintenance Cost per Estimated Replacement Value of the Plant or Facility Assets	This indicator is becoming standard. It is an accurate measure for plants and facilities because the cost is usually fixed. This aspect also makes the indicator easy to use to trend any increases over time.
Stores Investment as a Percentage of Estimated Replacement Value	This indicator is also becoming standard for measuring stores investment. The indicator is easy to use to trend any increases over time. If the percentage of stores costs increases, then the efficiency and effectiveness indicators should show what maintenance or stores function caused the increase.
Value of Asset Maintained per Employee	This indicator is another measure for plants and facilities because the asset cost is usually fixed.
Maintenance Cost per Unit Processed, Produced, or Manufactured	This indicator, which is the maintenance costs divided by the volume of production, is a common measure of maintenance performance, although it is not necessarily one of the best. The production volumes vary for reasons not under the control of the maintenance department. If the maintenance department is held accountable for this indicator, then poor decisions will he made related to the maintenance strategies. The organization will be upsized, downsized and otherwise impacted due to the fluctuations of the indicator. This indicator is good for a broad, trending indicator, but should never be used as a sole performance indicator.

4.3. Efficiency and Effectiveness Performance Indicators

Effectiveness emphasizes how well **a** department or function meets its goals or company needs. It is often discussed in terms of the quality of the service provided, viewed from the customer's perspective. Efficiency is acting or producing with a minimum of waste, expense, or unnecessary effort. Efficiency compares the quantity of service provided to the resources expended: Is the service provided at a reasonable cost? Efficiency measures concentrates on how well a task is being performed, not whether the task itself is correct. Effectiveness concentrates on the correctness of the process and whether the process produces the required result.

A common problem in efficiency and effectiveness performance measurement is the reporting of process measures (workload) or input measures instead of output measures (e.g., effectiveness and efficiency).

¹¹⁰ T. Wireman, "Developing Performance Indicators for managing maintenance" 2nd edition, ed. Industrial Press, USA, 2005, p. 209.

Table 3: Examples of Financial Indicators used by Maintenance Management 111

Efficiency and Effectiveness Performance	Observations				
Indicators					
Work Order Systems	This indicator can be calculated as percentage				
	of work distribution by type of work order				
Technical and Interpersonal Training	This indicator can be calculated as estimated				
	lost time due to lack of knowledge or skills on				
	total worked time				
Operational Involvement	This indicator ca be calculated as current				
	maintenance costs on maintenance costs prior				
	to predictive program.				

4.4. Tactical Performance indicators

The tactical performance indicators monitor the function indicators in a longer-term window of a quarterly or 90-day timeframe. This window allows time for trends to develop. By monitoring the tactical indicators, companies can identify required changes highlighted by pyramiding of the functional indicators. Changes can then be made to all processes before the efficiency and effectiveness of the organization is impacted to the degree that the annual financial performance indicator targets are missed.

Tactical indicators focus on the individual processes. However, optimizing one process may have a negative impact on other processes. Therefore, the efficiency and effectiveness indicators are important; they *evaluate* the overall organization whereas the tactical indicators evaluate only specific processes.

The following list of tactical indicators can be used by different organization. No organization will use all of these indicators, but will choose the ones that support the selected efficiency and effectiveness indicators

Table 4: Examples of Financial Indicators used by Maintenance Management

Tuble 1. Examples of I maneral materials asea by maintenance management					
Tactical Indicators					
Preventive maintenance tasks completed/Preventive maintenance tasks scheduled					
Total number of orders not filled/ Total number of orders requested					
Hours of maintanance activities performed by operators/Total hours in time period					

4.5. Functional Maintenance Indicators

Functional indicators derive their name from the word function. Simply put, the indicators show how one of the five management-specific functions is performing. The following list reviews the specific functions required of or expected of a organization.

- Preventive Maintenance.
- Stores and Procurement.
- Asset Management Systems (EAM).
- Work Flow Systems.
- Operational Involvement.
- Predictive Maintenance.
- Technical and Interpersonal Training.
- Continuous Improvement.
- Statistical Financial Optimization.
- ETC.

111 Idem, p 212.

The functional indicators mentioned previously in this book show how well the parts of the function are doing in supporting the tactical issues. No organization will use all of these indicators, but will choose the ones that support the selected tactical indicators.

5. Conclusions

The corporate mandate is to keep the costs low while insuring the long-term viability of the company assets. Each company function that contributes to production costs must be as efficient and effective as possible. The tactical focus is one of insuring optimization of the overall costs on a quarterly basis. The functional support focus on optimizing each component of the business processes.

This paper tried to offer a larger image on what performance indicators could be used by companies in order to measure their viability. In summary, the performance indicators are the key to the continuous improvement process. As a future area of research we would recommend finding other indicators which could be included in one of the five main categories: corporate, financial, efficiency and effectiveness, tactical and functional performance indicators.

Contemporary trends in global competition, rapid technological developments and increased use of management information systems and the Internet, developments in planning and control and management thinking, and changing demographics are putting pressures on profit and nonprofit organizations. As a consequence, companies are having more and more difficulty in achieving sustained performance. They are forced to look for new management methods and to develop cutting-edge processes to deal with existing trends and developments.

The paper focuses on describing how strategic performance management supports organizations in their pursuit of better performance.

Keywords: strategy, performance management, strategic objectives, management.

JEL Code: M12, L25, L10

1. Introduction

Performance management is important because it plays a pivotal role in any organization's human resource framework. There are clear benefits from managing individual and team performance to achieve organizational objectives. Similarly, compensation in the form of pay, bonuses, stock options and other benefits can be linked to the achievements of particular goals. But such links do not necessarily produce extended results. This is a problematic and complex area in which common-sense solutions do not work.

A well-designed performance management process stimulates managers to develop high-quality strategic plans, set ambitious targets, and track performance closely-all activities which help to achieve strategic objectives and consequently sustained value creation¹¹².

The purpose of this paper is:

- to underline ideas and developments in the field of performance management which will help managers to improve the performance management process in their organization.
- to investigate how performance management can be used to reinforce an organization's human resource strategies;
- to consider whether or not performance management really encourages desirable work behavior:

Performance management processes have come to the fore in the recent years as means of providing a more integrated and continuous approach to the management of performance than was provided by previous isolated and often inadequate merit rating or performance appraisal schemes. Performance management is based on the principle of management by agreement or contract rather than management by command. It emphasizes the integration of individual and corporate objectives as well as the initiation of self managed learning development plans. It can play a major role in providing for an integrated and coherent range of human resource

112 C. Lobo, D. Cochran, J. Duda, "Using axiomatic design to support the development of balance scorecard" In Performance Measurement Past, present and future, ed. A Neely, p.347-357, 2000.

management processes that are mutually supportive and contribute as a whole to improving organizational effectiveness.

Performance management can be defined as a strategic and integrated approach to delivering sustained success to organizations by improving the performance of the people who work in them and by developing the capabilities of teams and individual contributors¹¹³.

Performance management is strategic in the sense that is concerned with the broader issues facing the business if it is to function effectively in its environment, and with the general direction in which it intends to go to achieve longer-term goals.

2. Purpose of performance management

Performance management strategy aims to provide the means through which better results can be obtained from the organization, teams and individuals by understanding and managing performance within an agreed framework of planned goals, standards and competence requirements. It involves the development of processes for establishing shared understanding about what is to be achieved, and an approach to managing and developing people in a way that increase the probability that it will be achieved in the short and longer term. Evaluating periodically the human resource inside the organization can increase the motivation and commitment of employees and enable individuals to develop their abilities, increase their job satisfaction and achieve their full potential to their own benefit and that of the organization as a whole. Unfortunately not all organizations provide opportunities for personnel evaluation.

An example: Personnel evaluation in Latin America and Spain. 114

A study by Bumeran, a HR technology company owned by Terra Lycos, focused on personnel evaluation in Latin America and Spanish companies. The study looked at the issue from both company and employee perspectives. The online survey received a total of 3500 responses from all countries combined. This represented 450 companies.

Results from the employee perspective included: 35% of responses stated that they never received evaluations from their employees, 53% of Brazilian responses said that they were never evaluated, and 49% of Spanish respondents said that they received annual evaluation.

From the company side: 50% of Brazilian companies stated that they never evaluate their employees, 50% of the companies from Spain said that they conduct annual evaluation of their personnel, and in Brazil, Mexico and Spain a similar percentage of both employers and employees indicated that they know the internal procedures and evaluation methods, and when evaluations are done, they are clear and understandable.

Results varied considerably in Argentina, Chile and Venezuela but this may be due to the high level of unemployed respondents. Obviously the unemployed group does not receive any kind of evaluations

3. The process of performance management

Performance management strategy has to focus on developing a continuous and flexible process that involves managers and those whom they manage acting as partners within a framework. This should set out how they can best work together to achieve the required results. It focuses on future performance planning and improvement rather than on retrospective performance appraisal. It provides the basis for regular and frequent dialogues between managers and individuals or teams about performance and development needs. Performance management is mainly concerned with individual performance and development but it can also be applied by teams.

¹¹³ M. Armstrong, "Strategic Human Resource Management", 3rd edition, ed. Kogan Page, London, p. 142, 2006.

¹¹⁴ Source: HRM Guide.com (www.hrmguide.com), 20 June 2002

Performance management measures outputs in the shape of delivered performance compared with expectations expressed as objectives. In this respect, it is concerned with targets, standards and performance measures or indicators. But it also deals with inputs- the knowledge, skills and competencies required to produce the expected results. It is by defining these input requirements and assessing the extent to which the expected levels of performance have been achieved by using skills and competencies effectively that developmental needs are indentified.

4. Components of the strategic performance management process

Strategic performance management is defined as: the process where steering of the organization takes place through the systematic definition of mission, strategy and objectives of the organization, making these measurable through critical success factors and key performance indicators, in order to be able to take corrective actions to keep the organization on track¹¹⁵.

The strategic performance management process consists of various sub-processes: strategy development, budgeting/target setting, forecasting, performance measurement, performance review and incentive compensation. These integrated sub-processes create the performance-driven behavior of employees that is needed to become and stay world-class.

4.1. Strategic development

The strategy development process results in clear strategic objectives and action plans for measurable performance improvement. These are based on a through understanding of the key value drivers that are aimed at achieving a competitive advantage. Business issues that drive organizations to improve the strategy development process are the lack of focus of the strategic plans and the low quality of the strategic targets. The strategy development process often focuses too much on meticulously calculating future financial results instead of planning for value creation. Strategic plans tend to look inward, resulting in unrealistic long-term views that do not take environmental developments into account and that focus insufficiently on competitive advantage and true differentiation.

4.2. Budgeting/target setting

The budget/target setting process results in clear operational action plans for improving the key value drivers, for committing resources, and for setting financial targets for the coming year. Business issues that drive organizations to improve the budgeting/target setting process are the low reliability of the budget data and the too high level of detail of the budget. Because of the volatility of the business environment and the organization itself and the early start of the budgeting process in the year, the targets in the budget tend to be out of date the moment it is set. In addition, the budget tends to be detailed with too many parameters on all management levels, and therefore takes too much time to prepare.

4.3. Forecasting

During the forecasting process organizational members execute the activities that have to lead to the desired results. Regular forecasts are made to predict whether the organization is still on track or whether corrective and/or predictive actions are needed to solve current or predicted problems.

4.4. Performance measurement

The performance measurement process collects, processes (including consolidation), and distributes data and to allow an effective execution of the other sub-processes. The information is represented in the form of critical success factors (CSFs) performance indicators (KPIs). A business issue that drives organizations to improve the performance measurement process is the low quality of management information and management reports. Often management information does not fully satisfy management's needs and does not stimulate proactive behavior because the reports lack non-financial information, are not sufficiently exception-based, do not include

¹¹⁵ A. Wall, "Power of performance management: How leading companies create sustained value", ed. Wiley, New York, 2001

corrective and preventive actions, and are incomplete because data collection is very time-consuming.

4.5. Performance review

The performance review process periodically reviews actual performance, targets, and forecasts in order to ensure that timely preventive and corrective action is taken to keep the company on track. Business issues that drive organizations to improve the performance review process are the low quality of forecasts and bad timing of performance reviews. The added value of forecasts is relatively low because their accuracy is often insufficient, they are usually too financially oriented, they do not provide enough explanatory information about future issues, and it takes too much time to prepare them. Performance review meetings generally take place on a regular basis rather than as an exception when there really is a problem. As a result the performance reviews take up too much time when there are no problems in the organization and when there are real performances issues and problems the reviews are either not held or held too late.

4.6. Incentive compensation

This process links strategic and operational actions for key value drivers, in a balanced way with compensation and benefits policies. The main business issue that drives organizations to improve the incentive compensation sub-process is that this process is not sufficiently aligned with the other sub-processes; therefore it does not reward the right performance-driven behavior of organizational members.

5. Conclusions

In conclusion it must be emphasized that strategic performance management is not about establishing a top-down, backward-looking form of appraising people. Neither is it just a method of generating information for pay decisions. Performance management is a strategic process because it is forward-looking and development. It provides a framework in which managers can support their team members rather than dictate to them, and its impact on results will be much more significant if it is regarded as a transformational rather than as an appraisal process.

To be successful in the long run, an organization strives for organizational fitness, which is defined as an organization's ability to adapt and survive in the ever-changing business environment.

Organizations that have implemented a performance management system, and are using it, perform both financially and non-financially better than organizations that are less performance management driven.

Initiating and developing a business involves a considerable risk and a sustained effort in order to defeat the inertia against what is new. The person initiating a business, assuming the responsibility and risk of its development and benefiting from the results of this work is the entrepreneur. In the context of economical development, the number of entrepreneur-women has increased significantly in comparison with the past periods. The spectacular modification of family life and professional activity made that more and more women got involved in businesses. The entrepreneur-women differentiate from the other women by the fact that they are more inclined to assume the risk, they are much more determined and firm and have a greater wish to control their own destiny.

Keywords: entrepreneurship, female entrepreneurship, profit, businesses

M: Business Administration and Business Economics; Marketing; Accounting

1. Dimensions and evolutions of the entrepreneurial phenomenon

Ever since the notion of "entrepreneur-woman" was elaborated by specialists in entrepreneurship and small enterprises in the mid '70s (Catley şi Hamilton, 1998), the research among entrepreneur-women has extended and developed considerably (Carter et all, 2001). Nevertheless, there are some little studied areas in the research about entrepreneur-women, linked mostly to the way in which the social environment is built and how it affects the entrepreneurship (Ahl, 2002:168, Driga, O., Lafuente, E. – Female entrepreneurship in Romania: Personal characteristics and the effect of socio-cultural variables. Centre for Entrepreneurship & Business Research. CEBR working paper series, WP 02/2007, page 3).

Following is the diagnosis for Maramureş County from the small and medium entreprises point of view

Table 1. Evolution of the number of small and medium enterprises in Maramureş County, on size categories, in the period 2000-2007.

-in absolute size-

	2000	2001	2002	2003	2004	2005	2006	2007
Total	6157	6725	7553	8944	9705	10402	12150	12628
Microenterprises	5200	5740	6529	7868	8596	9232	10957	11345
Small enterprises	825	839	845	878	902	924	935	993
Medium enterprises	132	146	179	198	207	246	258	290

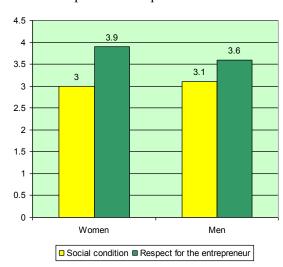

Source: County Direction of Statistics Maramures, 2008.

The companies led by women in Romania, benefit from an increase of 39%, much faster than those led by men, with a development percentage of only 31%. Although relatively small, the difference is significant, is shown in a study of CEBR (Centre for Entrepreneurship & Business

Research), company of consultancy and research in businesses. There is not any relevant study yet, regarding the possibility of delimiting in Maramureş County, as exact as possible how many companies are led only by women, in order to establish an evolution of this situation or the percentage of entrepreneur-women in total companies led by men.

2. Stimulating factors

The decision of a woman-person, to get involved in entrepreneurship by setting up and managing a business, can be affected by a series of perception variables, which refer to the perceptions regarding the way in which the society "regards" entrepreneurship and success, as the case, failure in their businesses. Thus, in the societies where entrepreneurship represents an admired activity (due for example, to the independence and courage that often associate with the entrepreneurs), the entrepreneur persons can realize that getting involved in such activities, will bring them, besides economical benefits, also a certain social statute, admired by the other members of the society. In such conditions, this factor, can therefore act as a stimulus to become an entrepreneur-woman.

Graphic 1. Perception variables

Adaptation after source: Otilia Driga (CEBR), Esteban M. Lafuente González (CEBR) Working Paper Series, 02-2007- Female entrepreneurship in Romania: personal characteristics and effect of sociocultural variables, August, 2007, page 6.

In Maramureş County, the stimulating factors of entrepreneurship, are linked to business opportunities, like: maintaining services, activities regarding wood processing, crafts based on traditions, unique in the country and in the world, tourism and mainly rural tourism, confections, constructions, food industry

(http://www.infofirme.ro/oportunitati+de+afaceri Maramures simpla.html).

Other stimulating factors, are linked to the existence of the Business Incubator from Maramureş County, of organizing, annually, by the Chamber of Commerce, the top of companies in Maramureş County, after different performance criteria, of exhibitions and fairs, like Fair Rivulus Dominarum, Tourism fair, Traditions and Culture, Fair of educational offers, Fairs of health-nutrition, Fairs of Furniture (http://www.ccimm.ro/search/events_list.php?reset=1&menu_id=15, page 1). Will be organized also by the Chamber of commerce, in the period 16-18 May 2009, first European week of small and medium enterprises, a campaign of promoting entrepreneurship in Europe and of informing the entrepreneurs from the county, about the help they could benefit from at European, national and local level. This event puts at the disposition of small and medium enterprises from

Maramureş, a large variety of information, advice, support and ideas, in order to develop their activity. The most important Informative Bulletin of the Chamber of commerce is Hermes Contact Maramureş, in which there appear all the press communicates, monthly, regarding entrepreneurship in the county, and also a Catalogue with the exporters from Maramures.

3. Disparities of gender in the female entrepreneurial field

The annual statistic data, state substantial differences between the situation of women and men, and data comparison in time, reveals the fact that the differences on economic plan between the situation of women and men, have an increasing tendency. The data from the last 50 years show that in the assembly of population, the percentage of women was situated in average, at over 50%. If at the end of 1999, the women represented 46.2% from the total busy population, fact that reveals the tendency of diminishing the differences, other data come to complete and nuance this image. The salaries from the sector in which the proportion of women is the majority among the employees, are lower than those of men who detain the weight. The salaries from the budgetary sectors, in which over 2/3 from the personnel are women, are situated under the average level on economy (Coica, Liliana, Conțescu Valentina, Dimitriu Doina, Ilinca Cristina, Negruțiu Florentina – National report regarding the equality of chances between men and women, Bucharest, 2002, page 4).

The women work mainly in the following fields of the national economy: health and social assistance (78.8%); financial, banking activities and insurances (71,3%); education (69,5%); hotels and restaurants (66%); commerce (55,4%); post and telecommunications (53,9%); agriculture (50,4%). As along years the above percentages suffered **insignificant** modifications, we can state that traditionally in these fields of activity work majority women (National report regarding the equality of chances between men and women, Bucharest, 2002, page 5). Housewives occupy a percentage of 50%. 40% from the women in rural environment are interested in the rights on the work market, and 20% in initiating a business. Most women from the rural environment have incomes under 500 lei, they take care of the house, get informed from television, go to vote, but get little involved in taking decisions, according to a study of the National agency for equality of chances between women and men made public in March 2008.

The National agency for equality of chances between women and men (ANES) developed in the period January - February 2008, an analysis at national level regarding the situation of women in rural environment. Concerning the professional situation, the study shows that the women in rural environment address mainly to fields like public administration, health, agriculture, social assistance or education. Women are interested in the fair of work places, in proportion of 56%, according to this study.

4. Particularities of female entrepreneurship

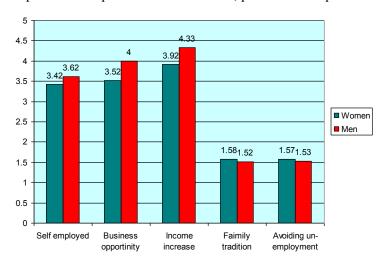

The number of entrepreneur women has seriously increased in comparison with the past periods. The modification of family life and professional activity, made more and more women get involved into businesses. The entrepreneur women are different from the other women by the fact that they are more inclined to assume the risk, they are much more determined and firm and they have a greater wish to control their own destiny. **The particularities of female entrepreneurship** can be mentioned by means of the analysis of differences between entrepreneur men and women in Maramures County.

Differences between entrepreneur men and women

Although the characteristic features of entrepreneur men and women are generally very much alike, the entrepreneur women differ from men under the following aspects: motivation, reasons, financing sources, instruction, personality characteristics, environment conditions, support groups, business field.

Regarding the reasons to create a new business (graphic 2): the main motivation seems to be that of increasing the income by developing your own business. This reason seems to have a greater

importance in the case of men, thus confirming an idea postulated in the specialty studies, according to which, women are less interested in financial award, they aiming through businesses to reach other purposes like, gaining a plus of independence or completing the family life with the working one.

Graphic 2. Entrepreneurial motivations, potential entrepreneurs

Adaptation after source: Otilia Driga (CEBR), Esteban M. Lafuente González (CEBR) Working Paper Series, 02-2007- Female entrepreneurship in Romania: personal characteristics and effect of sociocultural variables, August, 2007, page 4.

Motivation. Women tend to be more motivated by the need of achievement resulted from the frustration at the working place caused by the lack of promotion possibilities and manifestation of talent. Reasons. Both men and women have similar reasons to get involved into businesses. Both of them generally have a strong interest and a rich experience in the business field in which they want to get into. Women often leave the former working place with a deep feeling of frustration and a special enthusiasm for a new business, without taking experience too much into account, making transition more difficult in a way. Financing sources. Women generally rely on personal premises and savings. This is because women obtain loans more difficult than men from banking institutions. Instruction. Most women have an administration experience, limited to average levels of management, mainly in services field. Personality characteristics. Most personality characteristics are similar both to entrepreneur men and women. Both men and women are energetic, independent, sociable. Yet men are often more self-confident and less flexible and tolerant than women, fact that can lead to the existence of some very different management. **Environment conditions**. Most women are a bit older than men when they start businesses (35-40 years old, compared to 25-30 years old). Support groups. Women ask first for husband's advice, then their close friends' and only after that the specialists'. Also women ask for the support of different commercial associations and feminist groups. **Business field**. The nature of businesses made by men and women differs too. Women tend to start businesses especially in the field of services and retail commerce. Consequently, businesses owned by women are often smaller and lower income than those of men. Yet, business opportunities for women have an increasing tendency without precedent as the field of services registers a strong tendency of development.

Difficulties faced by entrepreneur women

Women face a series of difficulties that men do not usually have. Banks and other financial institutions are more conservative in giving loans to entrepreneur women. An explanation is the fact that some banks see characteristics of successful entrepreneurs mainly in men. In

Maramureş County, women get into business mainly in the field of services and retail commerce.

Entrepreneur women face an additional difficulty also by the fact that they have to deal with family problems too. Some researches reveal the fact that there is a direct connection between satisfaction in business and family happiness. Moreover, entrepreneur women have a greater satisfaction in work than those who are managers, satisfaction generated by the possibility of controlling their own destiny. In the following table, we present the results of a study regarding the main difficulties that entrepreneur women face both in initiating businesses and during their development.

Table 2. Difficulties faced by entrepreneur women in Maramureş County

PATRIARCHY IN THE SCHOOL: COVARIATES OF GENDER TRADITIONALISM IN ADOLESCENCE

Hatos Adrian

Universitatea din Oradea Facultatea de Științe Socio-Umane ahatos@gmail.com 0744-262126

Gender traditionalism is one of the cultural traits of contemporary Romania which has severe consequences on the effectiveness of human resource allocation. How is this cultural framework produced and reproduced in time is a major question for any attempt at promoting gender equality. My research investigates the covariates of attitudes regarding gender equality of 2485 teenage students enrolled in high schools in Oradea surveyed in 2007. The results show that gender traditionalism correlates strongly with gender itself, religious membership, socio-economic status and educational achievement. Consequences for policies and further research are discussed.

Keywords: gender, traditionalism, attitudes, regression

JEL code: Z13

Introduction

Equal access to entitlements, including jobs or public offices between man and woman is not only a benchmark of modernity and a political and cultural objective but an issue of effectively making use of one's country's human resources. Romania is, obviously, one of the most patriarchal societies in the European Union. Pasti & Miroiu referred to gender relations, metaphorically, as being the "last inequality" in Romania (Pasti & Miroiu, 2003). In a more nuanced description one says that the socio-politic landscape of today's Romania is `an original overlapping of traditional patriarchy on a modern patriarchy assorted with equalitarianism in the public sphere` (Dascal, 2005, p. 108)¹¹⁶. International comparisons of value surveys are placing Romania constantly among the nations least available to offer equal opportunities to men and women (Voicu, 2007).

The school itself plays, according to Arenas, Rus & Rus (2005, p. 4) a crucial role in transmitting gender stereotypes, inclusively through noticeable hidden agenda mechanisms to be found, for example, in textbooks (Grunberg, 1996). In the IEA civic education survey of 1999, Romanian teenagers recorded among the worst in acceptance of gender equality among the 29 participant countries, better only than the subjects from Bulgarian and Lithuania (Torney-Purta, Lehmann, Oswald, & Schulz, 2001).

Theoretical background and aims of the study

My study aims to contribute to the understanding of the construction of representation of the relations between men and women in adolescence.

Assessing the equity of the distribution of authority among men and women reflect a certain culture of gender relations. The patriarchal, or traditional culture is widespread even in most modern societies (Brownson & Gilbert, 2002; Paterna & Martínez, 2006). This differentiated perception dims within more modern conceptions which have, among their core rules, gender equality. Therefore, searching for the covariates of intolerance towards gender equality means, in a good measure, to identify the factors associated with traditionalism.

Gender itself has to be one of the important predictors of attitudes referring to gender relations. The sexist conception is part of gender role internalized by boys following various socializing influences, regardless of social or economic position. This hypothesis is sustained by previously obtained results at international level (Petterson, 2003). Significant differences have been recorded, thus, among boys and girls in all 28 nations participating in the IEA survey on civic education (Kerr, Lines, Blenkinshop, & Schlagen, 2002).

116 In Romanian in the original text. Translated by the author.

Moral traditionalism is correlated with religious belonging and some religious denominations – the neo-protestant in Romania – are promoting a conservative attitude towards gender relations. North-American studies have systematically shown a link between the membership in fundamentalist religious groups and conservative attitudes concerning gender relations (Brinkerhoff & MacKie, 1984; Hoffmann & Miller, 1997). This is why I consider membership in neo-protestant movements an important factor behind gender attitudes.

The traditionalism of male priority should be associated with appartenance to deprived socio-economic categories. One's position in the social stratification is generating gender attitudes through interactional mechanisms within the families or the peer-group. Recent international comparisons show that teenagers from poor countries have more traditionalist gender attitudes than those from more developed countries (Gibbon & Stiles, 2004). Using IEA data, Petterson proves that accepting gender equality is stimulated by the index of socio-economic status of the parents (Petterson, 2003) which is best indicated by the parents' educational and occupational status. We expect that teenagers coming from families with low educational capital or those with parents with low status occupations to display sexist attitudes.

Another expected indicator of traditionalism is urban/rural residence. In Romania is almost a truism that rural population is attitudinally more conservative that the urban one. I expect students with a rural background to hold significantly less tolerant attitudes toward gender equality than those with an urban background.

Moreover, it is likely that family structure, more exactly the absence of one of the parents, to affect significantly the attitudes towards gender relations. Since in families in which one or both parents are absent is less probable the unfolding of interactions prone to transmit gender role prescriptions, it is plausible to expect significantly different distribution of gender attitudes in families with a non-intact structure.

It is important, at this level, to discern long term from short term effects. The absence of one the parents can be definitive, temporary or just recent. We have several indicators of the situation of temporary or recent absence of parents: divorce occurred in the previous year and migration for work of one or other of parents. I will try to ascertain the impact of these variables upon gender attitudes, contrasting them with the effects of more general measures of mother's and/or father's absence.

Since we associate one's position towards gender relations with the position on the traditionalism vs. modernity axis, we can attribute part of the variation in the dependent variable to cognitive sophistication, or to the presence/absence of cognitive constraints, beyond the influence of background educational resources. Similar theories make a link between moral conservatorism or modernism and more or less modern attitudinal structures and the older distinction from social psychology, between persons with open thinking, as opposed to those with a close, dogmatic thinking (see Stes & Leik, 1993). These statements receive a support in Petterson's study (2003) where the covariates of educational results (and of socio-economic status as well) like exposure to media news and school climate resulted to be in positive relationship with the acceptance of women in public life. If we admit that one's cognitive potential is reflected in a certain measure in school results and in the type of educational institution in which is enrolled, it is plausible to suppose that all these variables significantly influence attitudes towards the equality between men and women. Due to the same reason we expect that one of the predictors of this variable is age: learning that comes together with age brings about a more complex and autonomous understanding of social relations.

Data and method

I have built a causal model of attitude towards gender equality of teenage students using the data collected in the 2007 survey of the research project `Adolescents – future citizens. Longitudinal study of processes of social exclusion suffered by teenage students`. I have used a random sample of 2961 students from grades 8-12 from high schools and vocational schools of Oradea, Bihor

county, Romania. The survey has included a set o items designed for the measurement of attitudes concerning gender equality adapted from the IEA survey questionnaire. In the technical report of the 1999 international survey, they were called simply "attitudes towards women" (Schultz & Sibberns, 2004).

Table 1. Distribution of answers to the tolerance items (%)

		Totally against	Partially against	Rather agree	Totally agree	DK/NA
1.	Women should run for public office and take part in the government just as men do	7,6	15,2	25,5	37,6	14,1
2.	Women should have the same rights as men in every way	3,1	8,8	24,2	54,3	9,6
3.	Women should stay out of politics	30,4	24,6	17,0	13,7	14,3
4.	When jobs are scarce, men should have more right to a job than women	28,2	26,4	16,8	12,1	16,4
5.	Men and women should get equal pay when they are in the same jobs	4,1	7,1	19,6	57,2	12,0
6.	Men are better qualified to be political leaders than women	15,9	17,4	23,3	23,3	20,2

Confirmatory factor analyzes underpin the face validity of the scales, extracting a sole component that corresponds, evidently, to attitudes towards women's. The sole inconsistencies concern the inverted items. In order to preserve the consistency of the scale measuring the attitudes towards the rights of the women, in comparison with the scale that had been used in the IEA survey, I have dropped two items (3 and 4), thus computing the subject score using items 1, 2, 5 and 6. The scale has an alpha greater than 0,7. The index of attitudes towards gender equality constitutes the dependent variable in my study. It has a minimum of 4 and a maximum of 16. The larger the score, the more tolerant is the subject vis-à-vis gender equality.

In the successive models I have built in order to test the theoretical propositions I have used the following independent variables.

- -Gender (dummy, 1=male)
- -Age (numeric)
- -Urban/ rural provenience (dummy, 1= rural)
- -Measures of socio-economic status
- -Mother's education (one dummy for mother holding a less than high school certificate, and a dummy for mother with higher education)
- -Mother's occupation (one dummy for worker or housekeeping)
- -Index of material endowment of household (number of household appliances at the home from a list of 7)
- -Index of cultural endowment of household (number of cultural items at the home from a list of three)
- -Measures of family structure
- -Number of siblings
- -Absence of parents (one dummy for the absence of mother and one for the absence of father)
- -Parents' migration for work (one dummy for mother's migration and one for father's migration)
- -Parents divorced within the last year (dummy)
- -Religious membership (dummy, 1=neoprotestant)
- -Measures of cognitive sophistication
- -GPA in previous half year
- -The type of high school attended (dummy, 1=theoretical lyceum)

The hypothetical statements detailed in the previous sections have been tested first using ordinary least squares regression. Starting from the results of the linear regression I have deepened the hypotheses testing and the construction of the causal model using path analysis.

Results

Attitudes concerning gender equality

The relatively large number of missing values prevented me from imputing some values – computed through regression for example, or simply some indicators of central tendency – for the subjects which chose the DK/NA answers to the attitude items. Computing the score of attitude towards the women was possible on a subsample of 2488 cases, while 477 cases have at least one missing values per scale. While the index of attitude concerning gender equality has a minimum of 4 and a maximum of 16 the average for the 2485 teenagers used in the analysis is 11. Student collectivities seem to display a certain homogeneity concerning the distribution of the focus variable. ANOVA tests applied on classes and schools reveal, at both levels significant interspecific differences. They could indicate some biases generated by the conditions in which the data were collected.

OLS model of gender ideology

Multiple ordinary least square regression model in table 2 allows several interesting conclusions concerning the genesis of attitudes about gender equality.

Table 2. OLS regression of attitude concerning gender equality $(R^2=0.25)$

Urban rural background (small town=1)					
Urban/rural background (rural=1)					
Mother absent					
Mother migrated for work in the previous					
year					
Parents have divorced during the previous					
year					
Father absent					

Based on the standardized coefficient, the most important determinant of gender attitudes is gender itself. It accounts for approximately 15% of the variance of gender attitudes¹¹⁷. Boys have measures of tolerance regarding gender equality with almost half standard deviation smaller then girls while controlling for the variation of the other variables, the non-standardized effect being of almost two and a half points using the metric of the dependent variable. The strong effect of gender is proof of the fact that boys, regardless of socio-economic context, acquire strong sexist attitudes, in contrast with girls which display more tolerant views. We can talk easily of a macho culture that transcends all social boundaries and makes boys hostile to attempts of equalization of social chances of men and women.

According to the model, the background socio-economic status has a significant impact on the dependent variable but only through the educational resources of mothers. The model suggests that the more educated are the model the more likely are the teenagers to acquire the modern ideology of gender equality. However, parents' occupational status or the economic capital of the family does not influence the considered attitudes. The model suggests that mother's authority in the family, as well as the predominant family model acquired by the children, depends mostly on the mother's educational capital than on other measures of status.

The hypothesis that more educated women are more able to negotiate a fair distribution of authority in the family is plausible, but my data lack appropriate measurements needed to test the conjecture. The fact that the number of siblings correlates negatively with the acceptance of gender equality suggests again the importance of family roles, if we accept that a large number of children correlates with a precarious status of women, not only on the labor market but similarly in the family since caring for a sizeable family supposes the acceptance of dependency on a male or on extended family. It is certain that teenagers raised in families with many children tend to express patriarchal attitudes regarding the relations between men and women.

According to our expectations, membership in a neo-protestant church constitutes a predictor of conservative beliefs even after controlling for measures of social status. The causal mechanism may not be as clearly weberian as it may look after a superficial consideration. The strong relationship between the measures of socio-economic status and membership in neo-protestant denominations can be bases of a situation in which religion is a mere mediator. More robust methodologies (structural equations and/or longitudinal analysis) might bring clarifications in this matter.

Variables that measure the structure of the family and its eventual defects have a surprising behavior relative to gender attitudes. While most of the indicators of temporary or long term absence of one or both parents do not have a significant effect, the migration for work of father during the previous year produces an important decrease in the dependent variable. This merely suggests that, on one hand, absence of any parent does not influence children's gender attitudes while, on the other hand, father's migration for work is occurring more likely in patriarchal families in which is at work a traditional perspective on the relationships between women and men. Even this single significant parameter in the OLS model may indicate the mediation of a causal relationship, considering the circumstance that international migration for work is more probable in families with low socio-economic status Pong & Ju, 2000; Toth & Toth, 2007).

My data contradict the hypothesis of rural or provincial traditionalism. Holding social and economic conditions equal, teenager raised in villages or in small towns have similar gender attitudes with their colleagues from larger, and presumably more modern, Oradea. However, we can suspect here a selection bias – opting for learning at one of the schools in Oradea can be indicator of modern attitudes and of availability for ascendant social mobility, at least at the level of aspirations, if we consider parents' aspirations or their answers to their children's socio-professional aspirations.

¹¹⁷ Computed comparing R2 of model with gender with R2 of model without gender.

On the other hand, the effect of cognitive constraints appears to be significant according to the regression model. Both school results and the type of school have a positive effect on the dependent variable. Students with higher GPAs and those from the more academically oriented theoretical lyceums perform better in accepting equality between men and women. Since these results are obtained after controlling for the effect of measures of socio-economic status and of educational and cultural resources in the family – which are all correlates of school achievements – one can say that accepting equality between women and men supposes a certain degree of cognitive complexity, which may be necessary to overcome the sexist prejudices and the patriarchal worldview that dominates traditional culture.

Conclusions

My article aimed at explaining the variation in attitudes of teenager students from Oradea about the equality between men and women. Multivariate analyzes of data from a random sample of students in grades from 8 to 12 in Oradea, show that attitudes about equality between women and men have a complex determination.

The most important cause can be identified in the large difference in attitude between boys and girls which is evidence of a generalized patriarchal culture. It is transmitted, through various socialization mechanisms, mainly to boys. This difference between boys and girls in the way they see gender equality attests potentially great difficulties in any attempt of promoting a culture of gender equality. Socio-economic status explains, as well, the more or less tradition attitudes of teenagers from Oradea. The paths through which teenagers of low status families become having patriarchal gender attitudes can be: 1) through membership in a neo-protestant religious movement, which involves a serious degree of moral conservatism besides a socio-economic status that lower than that of the majority; 2) through less successful educational careers, indicated by educational underachievement or by the type of school followed. My research suggests, however, that gender traditionalism is not reproduced intergenerationally in a simple manner but only in contexts that have a class meaning. Finally, gender attitudes depend, as my analyzes show, directly upon the degree of cognitive openness of the concerned teenager. The older ones, those with better educational achievement or those who are following an academic track are ready to accept women holding social positions similar to those of men.

On the other hand, the intactness of the family seems not be having an influence on the dependent variable, showing that the effect of interactions within the family require a more nuanced treatment.

Longitudinal models can clarify in future research the relationship between my dependent variable and other psychosociological measurements which, for reasons of methodological caution I have not used in the models in the present article.

ROMANIAN HIGHER EDUCATION FINANCING IN A EUROPEAN CONTEXT

In the category of many difficulties facing today Romanian higher education, an important financial issue is taken by financial issue, providing the necessary funds necessary to the activity development, that being, as a rule, at the origin of many other imbalances manifested in the organization and functioning of the educational system.

Although funding of research results is a viable alternative to sustain the system of higher education, there is found out that in most countries in the European Union, the state continues to be the principal financier of education. We must have in view as investments in human capital are investments with positive and long-term, both at individual level and at macroeconomic one.

Therefore, we consider that the largest share in the financial resources allocated to higher education must be at the part of the additional funding over.

Keywords: higher education, financing sources, investment, scientific research

JEL classification: A23, I22

1. Evolution of financing public higher education in Romania

Until 1990, the main financing source of the Romanian public higher education was represented by the budget allocation destined for such purpose. Due to the changes occurred at the level of the higher education system, during the period of time between 1990 -1996, certain changes were brought also within its financing principles, which are similar to the changes at the level of the OECD countries, as follows:

- a system of budget funds allocation, corroborated with the increase of the universities' financial autonomy;
- the diversification of the financing sources by distributing the costs for education also to its beneficiaries and to the economic agents introducing for this purpose the schooling fees;
- a clearer distinction between the funds for education and those for research.

Even in such conditions, the budget allocations continue to represent the most important financing source for the Romanian public higher education.

An important stage in the reform process was represented by the replacement of the budget financing with the university global financing based on an institutional contract with the Ministry of Education and Research. This change represented a method to obtain better performances in education and in research by a better financial resources management. Thus, the level of financing a public university was mainly determined by performance and by efficiency criteria.

Starting with 1999, the forms for financing higher education were modified again, passing to a methodology of distributing the budget allocations based on a formula (*quantitative component*) in compliance with the fundamental principle "resources follow students". Since 2002, the methodology is completed as well by a qualitative component, permanently updated during the period between 2003-2007.

The evolution of the basic financing during the period 1998-2007 is shown in the table no. 1.

Table no.1

	1999	2000	2001	2001	2003	2004	2005	2006	2007
Basic financing (mil.Euro)	106	133	145	149	164	205	263	327	439
GDP (mil. Euro)	33388	40346	44904	44402	52613	60842	79551	97118	99993
%FB in GDP	0,32%	0,34%	0,32%	0,31%	0,31%	0,34%	0,33%	0,34%	0,38%
Euro exchange rate (annual average)	1,630	1,996	2,603	3,126	3,756	4,053	3,623	3,540	3,35

acc. to CNFIS, June 2008

Except the budget resources, the universities can mobilize supplementary income sources, according to the legal stipulations. The funds coming from the state budget represent approximately 50-70% of the total budget. The rest are funds coming from taxes, research contracts, services and other types of activities.

The comparative analysis with the main countries in the EU shows that in Romania a very low level of expenses for education is recorded, as a percentage of the Gross Domestic Product, even tough the allocations increased significantly during 2006. This situation is presented in table no.2

Table no 2

^{*} Statistics Report no.3 – 2008 (* estimated)

Another important component of the higher education financing system in Romania is represented by the complementary financing, meant to cover the complementary expenses for the direct expenses, determined by the didactic process, which are important both for sustaining the development in optimal conditions and for the development of education (such as: allocations for laboratories equipment, capital repairs, investments and research), as well as for performing other university objectives or services (research, micro-production, administrative services for students etc). In this field as well, the income sources for the complementary activities are made up of public incomes (amounts allotted from the state budget) and own incomes (donations, sponsorships and taxes got, according to the law, from individual and legal entities, be Romanian or foreign ones, and from other sources), which can have a greater importance depending on the involvement of universities in activities generating income.

Regarding the topic related to equipment and investments, the proposals of the National Authority for Scientific Research (ANCS) take into account the distinction between investments such as constructions, consolidations and the independent equipment, but also the necessity of financing with priority the construction of educational and social premises. Regarding the distribution per universities of the funds approved for capital repairs for buildings and constructions, the real technical condition of the buildings and constructions for which are required funds for capital repairs is kept in mind.

The university scientific research represents another field for the higher education financing, and the distribution per universities of such funds is performed on competitive bases, by means of

evaluation, monitoring and financing procedures issued by CNFIS through which the budget allocations were increased for the research grants which fit in the strategic directions on a European level and in the priority domains on a national level for research, development and innovation programs.

In order to render more effective the use of the complementary financing, CNFIS intends that the complementary financing for the scientific research be performed also for sustaining the universities, to increase the visibility of the research activity and of its results (financing for establishing famous publishing houses/publications; the elaboration of annals, scientific publications, conferences organized in the country, publications subscriptions, access to on-line databases and scientific articles etc.). Also, a complementary financing fund was initiated in order to support students, aiming at the financial support for student mobility (Erasmus complementary), financing programs for master's degree, doctor's degree and post-doctoral degree.

The education financing systems are in a continuous improvement. In this sense, we consider that an effective solution for the financing problems related to education in Romania is the financing of study programs and not of equivalent students. The State will compare the costs of a study program running at various universities (which propose such programs) and it will then establish an average cost/program/student. The State will cover then from the public budget only this average cost, and the public universities shall then be forced to ask for study fees at the level of their own costs for a smaller number of students, in order to cover partially the costs of a greater number. The universities which will have real costs under the average cost shall have an advantage, receiving the amounts according to the average costs and not to the number of students or to their own costs.

Another improving directions of financing the education and the professional training, which must have the attention of the Ministry of Education and Research and that of the universities are: diversification of the public financing funds for sustaining the differentiation of the system and the focusing of the resources according to quality; multi-annual financing, per cycles of study; encouragement of universities to get funds for research from private companies; introduction of a correct system of evaluation of the universities responsibilities in managing public funds, so that the autonomy increase associates strictly with the increase of public responsibility.

2. Scientific Research – an Important Financing Resource for Education

Although certain measures for education financing development were applied, at present the Romanian university environment is characterized by an excessive homogenization of resource distribution. We refer here to the fact that the present financing system is not based on a hierarchy of universities according to the quality of the education they provide and of the scientific research results. Related to the level of graduate knowledge, we can note that a medical university, for example, with a graduation percentage at the residency examination of 70%, receives the same amount per student equivalent as another medical university with a percentage of 30% of residency graduates. A law faculty, which provides 30-50% of the students admitted at the National Institute of Judiciary, receives the same financing per student equivalent as any other law faculty having no graduate admitted in such institute.

Regarding the scientific research, taking into account the more and more important role that higher education institutions have in performing the national programs which are and will be initiated in this field, we consider that one of the university financing criteria should be the results obtained in the research activity. We take into account especially that the improvement of the didactic process is strictly connected to the proper scientific research. As a result, we should stimulate first the universities which have, at the same time, an education and a research profile. Such an orientation would radically change for both the financing sources and level, as well as the budget financing system for higher education.

The doctoral schools, which along with the doctor's degree leaders and the research groups from universities might take over projects from the national programs for scientific research, should have a decisive role in this orientation. We also mention that in this aspect positive results are already noticed after the implementation of the present organization system for the university scientific research, materialized in national grants offered by CNCSIS and by the government and in international grants financed by the EU funds. The deficiency of this system consists in the fact that, because of the reduced available contracts, it does not allow the complete valorisation of the entire research potential in education. The same situation can be found in the business environment offer, where the small and medium enterprises, which represent more than 98% from the entire number of enterprises, do not have available funds for research-development.

In the most high performance education systems, the differentiation and the concentration appeared as a result of a natural evolution. In the USA, for example, from the 4000 higher education institutions, only 3% are considered *research-intensive*, only 550 (13%) grant doctor's degrees and 50 of them offer more than 50% of the doctor's degrees. In Canada, only 109 universities grant doctor's degrees, and five of them cover more than 50% of the accredited doctor's degree programs.

On the other hand, where the differentiation and the concentration did not appear as a result of natural evolution, substantial efforts are made in order to quickly implement them. Germany launched the "excellence initiative" in order to identify the elite universities, *research-intensive* universities for which a supplementary financing of 2 billions euro will be allotted. France has similar initiatives of concentration and differentiation for the system, and at the European level important steps were made such as the establishment of the European Institute for Science and Technology.

In average, in Europe, approximately 82.8% of the resources allotted to the higher education institutions come from the public sector and only 5.1% from the non-profit organizations and from enterprises. In Hungary, Netherlands, Sweden, Great Britain, Croatia and USA, more than 10% of the higher education institutions funds come from the non-profit organizations and enterprises. These finance, in general, the research-development activity. The amounts paid by students and their families for covering the expenses related to education itself or to other adjacent are very different form country to country. These expenses represent less than 5% in Denmark, Greece, Malta, Finland, Sweden, Island and Norway, while in Spain, Cyprus, Latvia, Poland, Bulgaria, Japan and USA they exceed 20% of the total.

3. The Experience of Developed Countries in Financing Education

The analysis of the present situation and of the trends shows that the European Union suffers from an insufficient investment in the development of human resources. In average, the European Union member states spend a little more than 5% of the GDP for education and training (financed from public funds), but with substantial differences from one country to another. According to the information provided by the Ministry of Education and Research, in the Report concerning the state of the national education system for 2006, the average recorded by the European Union member states in 2002 was of 5.2%. As indicated in table no. 3, at present, the percentage of the GDP allotted for education is very high as compared to the European Union average, precisely in the countries with a higher quality of life level.

Public expenses for education (% of GDP)

Table no. 3						
	2003	2004	2005	2006	2007	
Denmark	8,33	8,43	8,28	8,3	8,4	
Norway	7,54	7,47	7,02	7,9	7,8	
Great Britain	5,34	5,25	5,45	6,0	6,2	
Germany	4,7	4,59	4,53	5,2	5,2	
France	5,88	5,79	5,65	5,6	6,3	

From this perspective, the convergence of the Romanian education with those of the main countries belonging to the European Union can only be assured on a long term, requiring investments for the development of the two great categories of infrastructures, of physical and human type. The granting of a percentage of 6% from the GDP for education might make available such resources.

The consolidation of a development pattern on these two directions, under the terms of insuring the coherence and complementarities with the already existent strategic-programmatic instruments (The National Plan for Development 2007-2013, the National Program for Reforms 2007-2010, The National Strategic Reference Frame 2007-2013, The Durable Development Strategy 2025, the Governing Programme 2004-2008, the Convergence Program 2007-2010, the National Strategic Report on the Social Welfare and Social Inclusion 2006-2008) reflect the strategic hierarchy of Romania's development objectives, the priority being imposed by the limited character of the available resources.

In the countries where the individuals contribute significantly to the financing of their own education, the governments offer them a considerable support by providing the financial subvention granted for students. These countries have at their disposal various financing schemes for the higher education, either through directly financing the education, or through indirect financing, by supporting students living costs or schooling expenses, or by combining both systems.

The public authorities from the Czech Republic, Greece, Spain, France, Poland, Portugal and Switzerland grant more than 90% of the total public expenses for higher education directly to the education institutions.

The transition from the education system to the labour market is an important factor in evaluating the human resources quality. The long term unemployment, the professional declassification are factors that lead to the depreciation of knowledge, abilities and capacities acquired during the schooling period, namely to the depreciation of the human capital. Romania has, at present, an unemployment rate quite low (5.3%) comparatively to the other European Union member states (9.2%), but also an increased part of the population involved in agriculture (27.41% as compared to 5% in the EU) and industry – namely the fields of activity where the level of qualification required is also reduced. The lack of educational and professional training or its reduced level will render quite difficult for the future the integration of high performance technologies necessary, for increasing productivity.

Conclusions

In our study, we have tried to underline the idea that investment in education, and especially in higher education, is a profitable investment which guarantees positive long-term effects, both upon the individual as well as upon the social-economic progress of the entire society.

The financing of public universities in Romania has started to improve since 2006. However, in order to reach the "Lisbon goals" by Romania (established by the European Committee, having the deadline 2010), which dovetail with the deadline for the foundation of the European Framework for Higher Education, we should have our government financing us with at least 2% of the GDP by 2010 in point of higher education only.

But, at present, the financial level in Romania is even much lower. Between 1999-2005, it represented 0,45%-0,46% of GDP for public outlay (besides research and repayable loans), 0,69%-0,78% for total outlay in point of higher education. Thus, as experts state, investment in education would be one of a best efficiency. It is true that once the level of education has increased, the income would also raise much above the average. The advantages are more obvious as regards the developed countries. Let's take into consideration the USA, for instance – the difference in average income between university graduates and high school graduates was between 40-50% at the beginning of the '60's and has continuously grown since then.

The economic analysis can underline the reason why in the course of the history there were countries which experienced an extended and continuous growth of the income per individual. Thus, countries such is the USA and Japan have experienced a continuous growth in individual income for over 100 years or even longer than that period. The explanation relies in the expansion of the scientific and technical knowledge, which helps production and labor productivity grow.

The systematic application of scientific knowledge in the production of goods has enormously increased the value of education, especially of the technical one. It is obvious that there is a positive relationship between investment in education and technological progress, the latest having a great influence upon all the fields of the social-economic life.

As a conclusion, one can finally say that education, information and knowledge actually stand for power.

Analysis of human resources activity, also called control, appraisal, or evaluation, is viewed by human resources as feedback. Multi-source feedback methods are the new wave in human resources appraisal. We have chosen to give several details about the most used multi-source feedback method: 360 degree feedback.

Before presenting an example on how it is used in a Romanian company, with the main strengths and weaknesses in usage, we present the method, according to several authors. The second chapter of this paper contains the example – the use of 360 degree feedback inside a Romanian organization. The last chapter is dedicated to conclusions regarding the use of the method for the future. Some of the mistakes made in using 360 degree feedback in the example are identified and final conclusions are presented.

Key words: human resources, appraisal, feedback, multi-source

The article's JEL code: M12

1. Introduction

The 360-degree feedback process taps the collective wisdom of those who work most closely with the employee: supervisor, colleagues (peers), direct reports (subordinates), and possibly internal and often external customers. The goal of this paper is to present this new method as it was applied in a Romanian company by us and to analyze whether 360-degree feedback is an alternative for traditional appraisals used by the old-school.

Inside the first chapter we analyze the theories regarding human resources appraisal, human resources performance management, human resources development. The opinions differ from author to author. An important part of this chapter is dedicated to the presentation of the 360-degree feedback from theory, insisting on defining the method and its principles.

The second chapter is a 360-degrees usage example. We have used the method for a big Romanian service company. All details regarding to these example are presented in the second chapter. Conclusions regarding the example and the possible usage of the method are in the final part of the paper.

2. Human resources performance management and appraisal

Performance management has been defined as a strategic and integrated approach to delivering sustained success to organizations by improving the performance of the people who work in them and by developing the capabilities of teams and individual contributors (Edenborough and Kogan: 2005, p.2).

There are many **types of appraisals** and many sources for evaluating human resources performance. London identifies the types of performance and the sources (London: 2003, p.67-70):

Contextual performance comprises behaviors that show: job dedication (job-task conscientiousness), organization dedication (organizational citizenship performance), and interpersonal facilitation (interpersonal citizenship performance);

Task performance consists of activities that directly transform raw materials into the goods and services produced by the organization or maintain the technical core of the enterprise by replenishing supplies, distributing products, and providing planning, coordination, supervision, and staff functions that allow for efficient functioning,

Adaptive performance, or learning, a third element of performance, can be construed as separate from task and contextual performance. It is the proficiency with which employees change their behavior to meet changing situational demands.

Jobs vary in the extent to which each of these categories of performance are relevant. Supervisors should understand the relative importance of these different job elements to the particular job they are evaluating. This also implies that supervisors should vary the type of support they provide for employees to help them perform well.

Feedback is the information people receive about their performance. It conveys an evaluation about the quality of their performance behaviors. Giving feedback is "the activity of providing information to staff members about their performance on job expectations". Feedback is an important part of the education process. People at work give feedback to reinforce others' good behavior and correct their poor behavior. The recipient of feedback judges its value and determines whether to accept and act on the feedback, reject it, or ignore it. It helps newcomers learn the ropes, midcareer employees to improve performance and consider opportunities for development, and late career employees to maintain their productivity. Managers are an important source of feedback because they establish performance objectives and provide rewards for attaining those objectives. Other sources of feedback are coworkers, subordinates, and customers (London: 2003, p.11).

Taking into account the types of performance which could be evaluated, we have identified two different **types of performance evaluation methods** – the classical one and the multi-source feedback.

The **typical performance appraisal** becomes just another dreaded experience that must be repeated at least once a year (Garber: 2004, p.7). Classical performance feedback is in the form of an annual evaluation in which your performance is measured against pre-established criteria. A standard form or format is usually followed with checklist-type criteria measuring the individual's performance against the organization standards.

Garber identified ten common pitfalls of classical performance feedback systems (Garber: 2004, p.7-15): performance feedback in the organization is given only during annual performance evaluations, performance appraisals are based on a single evaluator's feedback, feedback is presented only by the supervisor, performance evaluations are more of an argument built to support the overall performance rating that is being given, performance feedback is negatively based, performance feedback addresses only the formal aspects of job performance, performance feedback is not specific enough about the person's performance, formal performance reviews are full of surprises, the design of many performance appraisal systems results in making 80 percent of those affected by them mad.

Multi-source resources measurement systems

In each of the previous levels of performance feedback, there has been at least one common factor: The supervisor has been the source of the performance feedback. Even though in most circumstances the supervisor would likely seek input from others in the organization, he or she is still the focal point for providing this information to the individual (Garber: 2004, p.80).

Multiple-source performance feedback provides an individual a number of different perspectives about how others in the organization see him or her. This can be particularly valuable feedback for the individual because it eliminates many of the inherent problems of single-source feedback

discussed earlier. For instance, biases that one might perceive their supervisor has against them can distract from any feedback received from their boss. Multi-source feedback refers to ratings that can come from subordinates, peers, supervisors, internal customers, external customers, or others (London: 2003, p.84-86). This main feature in comparison to classical feedback is exposed in the next figure. When feedback comes from all the locations around a person (boss, subordinates, suppliers, customers) it is also called "360-degree" feedback. Usually, multi-source feedback is collected for managers or supervisors, but it could be collected for any employee, with the raters depending on the employee's role in the organization.

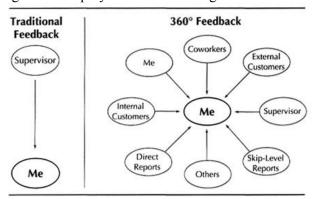

Figure 1. 360-degree feedback versus traditional feedback, Edwards and Ewen: 1996, p.8

The 360-degree feedback model differs substantially from the traditional single-source assessment completed by the supervisor. Supervisor-only appraisal typically occurs once a year with the express purpose of providing employees with an assessment of their work performance and management with information it needs for decisions on pay and promotions.

As the name implies, a person receives feedback from the "full circle" of other people who work around him or her. Feedback is provided by others from every direction including peers, subordinates, supervisors, and even the individual him- or herself.

360-Degree feedback systems provide the individuals with feedback from a variety of levels in the organization. In a traditional supervisor-subordinate performance evaluation, the supervisor looks at a person's performance from an evaluative viewpoint. In 360-degree reviews, the purpose of the information is more from a feedback viewpoint. This is a very important distinction: The focus is on feedback rather than evaluation, taking this information out of the organization's formal evaluation process with all its implications on the person's career and future.

360-Degree feedback processes involve a standardized questionnaire that looks at a number of dimensions of an individual's job performance. Typically, forms are sent to a person's supervisor(s), peers, and direct reports, creating the full circle of feedback. There is also a form that the individual completes about his or her self-perceptions. Once sent in, the completed forms are summarized by the company who developed the feedback tool, and a confidential summary report is sent to the individual. How are people typically viewed by those from various perspectives at work? Are their peers and direct reports more or less critical than their supervisor? How do people see themselves compared to these others? Of course, there are many different ways this data will result depending on the people involved.

Again, the greatest advantage of this type of performance feedback (and team and self-directed feedback, to be discussed later) is that they typically are used as a developmental not evaluative tool. They are most effective when they are used on a non-consequential basis. In other words, a person should not feel that their future or career is "on the line" as a result of the feedback they receive. 360-Degree feedback is presented in a confidential manner, and the information is shared only if the person chooses to do so as part of their developmental plan.

Multiple-source feedback systems such as this also take into account the fact that we interact differently with different people. An individual might be a very effective supervisor, but might not be as good at being a subordinate, or vice versa. 360-Degree feedback gives a more accurate description of the person's total skill and performance capabilities. By better understanding how others see us, we can identify opportunities to continue to grow and improve our job performance.

Most commonly, 360-degree feedback serves as a supplement to, not a replacement for, supervisory review. It blends the multi-source feedback on behaviors or competencies with the supervisor's assessment of results. Individuals are evaluated both on how they do the job that is, their behaviors and what they do their results or outcomes (.The 360-degree feedback process offers extensive and diverse **benefits to key stakeholders** in the organization and the organization too:

Customers – the process gives customers a chance to strengthen the customer-supplier relationship. The 360-degree feedback captures the relevant and motivating information from internal and external customers while giving them a voice in the assessment process.

Team members – the only option for identifying team and individual members' effectiveness is 360-degree feedback. Failing feedback from multiple sources, team members lack the information necessary for effective individual development

We can't say that there are no disadvantages. It depends very much on how you use this method. A final conclusion regarding this method is that it is a very cultural sensitive method – it depends very much on the organizational culture how you implement it and how you can use the results.

3. The use of 360 degree feedback in practice – example

We have used the method in December 2008 to evaluate the shifts chiefs from a big Romanian company, which we shall further call Romgroup.

Name of the evaluated group: shifts chiefs of Romgroup

Date of the evaluation: 2.3.4.5 December 2008

Number of the interviewed persons: 197 (including superiors and subordinates)

Number of the usable questionnaires: 180 360-degree feedback method had consisted in:

Each participant performed a self-evaluation, each participant has been evaluated by the direct supervisor, and each participant has been evaluated by hers / his colleagues, the persons which have management positions have been also evaluated by subordinates.

Main goals of the process were to build a coherent framework, a 360-degree view regarding each person's individual competencies and to identify high-flyers and drag-feet employees.

The evaluation instrument. Based on the discussions with Romgroup management team, a questionnaire has been developed with low difficulty level, considering the level of knowledge of operational workers:

Circle the number corresponding to the affirmation which best fits the evaluated person (including you):

Quantity of work: (1)He/she solves very few of the received tasks; (2)He/she solves few of the received tasks; (3)The number of solved tasks is acceptable; (4)He/she solves most of the received tasks; (5)He/she solves all of the received tasks;

Quality of work: (1) He/she never performs the work with accuracy; (2) He/she rarely performs the work with accuracy; (3) Most of the times he/she performs the work with accuracy; (4) He/she almost always performs the work with accuracy; (5) He/she always performs the work with accuracy;

Complying with the term: (1) He/she never finishes the tasks in time; (2)He/she rarely finishes the tasks in time; (3) Most of the times he/she performs the tasks in time; (4)He/she almost always finishes the tasks in time; (5) He/she always finishes the tasks in time;

Work knowledge: (1)He/she doesn't have the knowledge for the performed work; (2)He/she has poor knowledge for the performed work; (3) He/she has acceptable knowledge for the performed work; (4) He/she has good poor knowledge for the performed work; (5) He/she has very good knowledge for the performed work;

Team working: (1)He/she works very hard in a team; (2)He/she works hard in a team; (3)He/she works acceptable in a team; (4)He/she works well in a team; (5)He/she works very well in a team; **Complying to the discipline rules:** (1) He/she doesn't comply at all with the disciplines rules; (2)He/she doesn't breaks often the disciplines rules; (3)He/she complies mostly to the disciplines rules; (4)He/she complies almost always to the disciplines rules; (5)He/she complies always to the disciplines rules;

Initiative: (1)He/she makes never any suggestions for activity improving; (2)He/she makes rarely suggestions for activity improving; (3)He/she makes from time to time suggestions for activity improving; (4)He/she makes seldom suggestions for activity improving; (5)He/she makes very often suggestions for activity improving;

Leading capacity: (1)I would not trust him or her if he/she were my chief; (2)I would have few trust him or her if he/she were my chief; (3)I think he/she would be an acceptable chief; (4)I would trust him or her if he/she were my chief; (5)I would have maximum trust if he/she were my chief.

4. Conclusions Results centralization

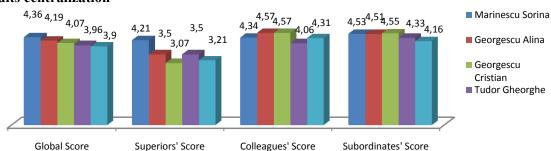

Figure 2. Score of evaluated persons per sources

From this figure we see that the worse scores were given by the superiors, thing which is abnormal at this kind of evaluation, at least at international level. Colleagues' and subordinates' scores are above 4 for all persons, which could mean that there is no true feedback culture inside Romgroup organization.

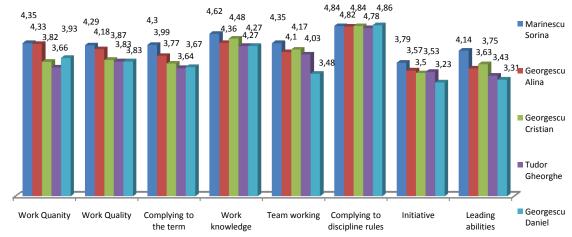

Figure 3. Score of evaluated persons per sources

We can see that the worse score is for initiative, probably influenced by superiors' opinion. The question is whether there is a leadership style which permits such initiative to appear. It is clear from the evaluation that all the persons involved are trustful and willing to perform a good job. There are not very clearly high-flyers and draw-feet, at least these is not an evaluation which performs to drive out such a conclusion, given the fact that the differentiation was made mostly on supervisor's opinion. We think that there should be created on long term a feedback culture which will permit for the future better results at such evaluations, more accurate and more trustful.

Problems related the example

There are several issues in the performed study which did not take into account the theories related to 360-degree feedback construction in the evaluation we have performed at Romgroup:

The elements which were measured did not take into account which factors contribute to attaining firms' objectives, the method was applied more as an evaluative method – one goal was for the firm the dismissal of the person with the worse score.

The focus should be in developing these persons / the report should contain recommendations regarding what abilities, competencies should be improve at organizational level and for each evaluated person individually;

Only the supervisors realized the importance of the evaluation, while the others considered the evaluated persons just some friends which need help.

Considering these problems, we consider for our next studies several ways for improvement in usage:

- -The most productive way to introduce the method is to use it *first for development alone*. Then, after employees become used to the technique and the resulting data, and receiving feedback becomes routine, the organization can begin to incorporate it into administrative decision making. -In any case, all raters and those rated should be clear about the purpose of the process.
- -Generally, managers tend to be more accepting of multi-source feedback when the organization provides training to help managers improve on the performance dimensions rated;
- -Multi-source feedback surveys usually should have some space for open-ended comments. Managers often say that this qualitative information is the most useful, and they tend to rate them heavily in determining areas for improvement. They do not require digesting numbers and comparing scores. Recipients may feel that the evaluators wrote comments about areas that were of most importance to them, and that they thus deserve attention. Also, because the raters took the time to formulate and type in specific comments, the recipients will feel obligated to take them seriously.

Companies could gain cost advantage using their logistics area of the business. Warehouse management is a possible source of cost improvements from logistics that companies could use during this economic crisis. The goal of this article is to expose a few best practices used in warehouse performance measurement which lead to performance improvements. Warehouse performance measurement refers to the measurement of: optimal use of storage space, customer relations activity, quality level, assets usage and costs. What are the warehouse performance indicators? How are they calculated and how are they interpreted? How can a manager use them in order to improve the warehouse performance? This paper will answer all these questions and will also present the way in which using performance indicators in a warehouse belonging to a company from Romania, S.C. TUDOR S.R.L., can lead to specific solutions.

Keywords: performance measurement, performance indicators, logistics, warehouse management The article's JEL code: M19

1. INTRODUCTION

The purpose of companies is to gain competitive advantage. One way to achieve this is by lowering logistics costs. The reduction of logistics costs diminishes the total cost of goods sold and therefore it helps companies have a higher profit margin or a cost advantage in comparison with their competitors. The present article brings solutions regarding one side of logistics: warehousing.

In 2008, there were a few reports around the world regarding logistics costs, respectively warehousing costs. The first one, done by *Establish Incorporation*, emphasised costs as the strongest force in driving decisions in logistics. The warehousing costs decreased due to rationalisation of locations. In 2008, warehousing costs were about 20% of the total logistics costs in North America. The same study suggests that in Europe warehousing costs were higher. *The European Logistics Report* 2008 considered the reduction of costs essential in warehousing. In the Central and Eastern Europe there was a strong construction activity last year, but despite this fact, the direct investment in warehousing property decreased by 38%. Warehouse construction increased in Romania because of low cost, a growing consumer market and the growing activity around the Constanta port. *The European Distribution Report* (2008: 5) revealed the rent for warehousing purposes, the land price and the building costs in major cities from Romania. These studies emphasise the importance of logistics and warehousing costs at international level. That is why we consider improving management best practices regarding logistics, in general, and warehousing, in particular, a must for Romanian managers.

The structure of the article is as follows: the first part is a literature review for warehousing performance management (the goal is to present several indicators used at international level), then we try to solve the problems related to a warehouse from Romania, belonging to S.C. TUDOR S.R.L.

2. LITERATURE REVIEW

Performance refers to the way in which work is done. There can be a good performance or a poor one. But what is **performance measurement?** Neely et al. (1995: 86 - 146) defined it as the

process of quantifying the efficiency and effectiveness of an action or activity. The purpose of performance measurement is to find out whether things are going the right way and, if not, to find what were the causes that generated a poor performance. After this step, there have to be found solutions for improving performance. There are several reasons for measuring performance: for improving performance, for avoiding inconveniences before it's too late, for monitoring customer relations, for process and cost control and for maintaining quality (Ackerman, 2003: 1). The main instruments for assessing performance are performance indicators, also named key performance indicators. They are specific characteristics of the process which are measured in order to describe if the process is realised according to pre-established standards. The best way to use indicators is to compare process values with normal, standard values. If there are poor results, poor performance, in reality, improvements for the process have to be made. Indicators are used basically for comparison with expected values. They are the control system of the studied process. In our case, setting an indicator system for warehousing activity is the key for performance improvements, as it shall be presented in our example. We present here some key *indicators that are used around the world to measure warehouse performance*:

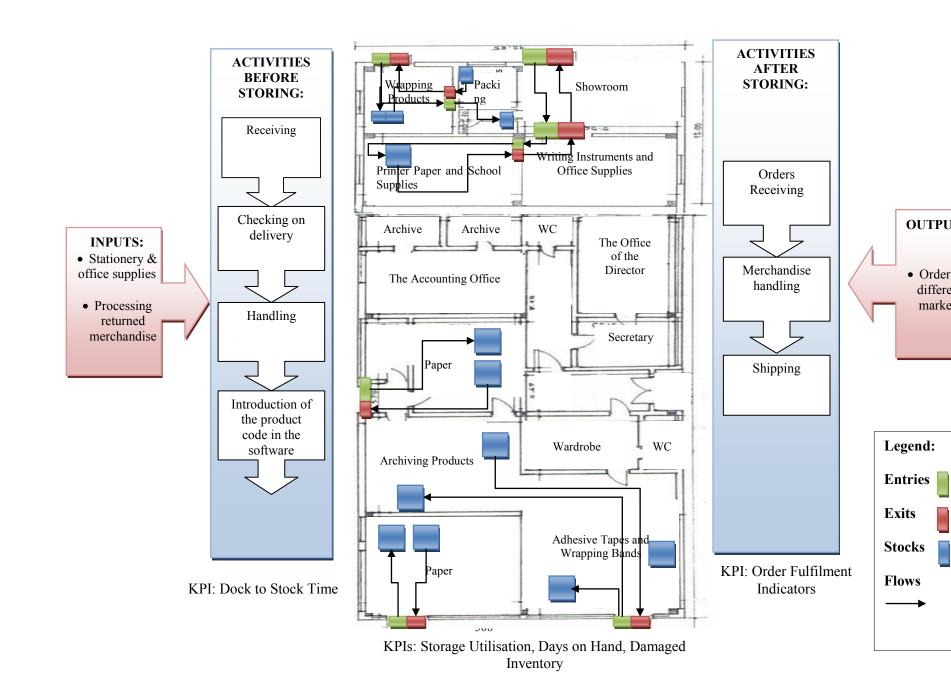

- Colson and Dorigo (2004: 332-349) present a software tool which allows selecting public warehouses according to the following criteria: storage surface and volume; dangerous items; possibility for temperature control; separation of storage areas; geographical distance to highway connection, train, waterways; certification; opening hours; assistance with customs; use of technology; handling equipment; number and characteristics of docks etc;
- Krauth et al. (2005: 5-6) classify around 130 indicators used for assessing warehouse performance, such as storage surface, storage volume, storage racks, number and characteristics of docks, pallets per hour, pallets per square meter, opening hours, and assistance with customs;
- Last but not least, John M. Hill (2007: 20-23) uses three types of indicators: order fulfilment, inventory management and warehouse performance. Some of the indicators proposed by John M. Hill are relevant for S.C. TUDOR S.R.L. activity, so we have decided to use them.

3. CASE STUDY

3.1. SHORT PRESENTATION OF THE COMPANY

S.C. TUDOR S.R.L. was opened in Bistriţa in 1992 as a family company with three associates. Until 1997, the firm functioned sporadically, producing and selling knitwear. In 1997, the firm changed its field of activity into wholesale and retail of stationery, office supplies, consumables and wrapping products. Nowadays, the company has three shops and two warehouses – one rented and one owned by the enterprise. S.C. TUDOR S.R.L. has 30 suppliers and about 500 customers. In 2008, the firm had a turnover of 4.850.710 lei, being the leading firm selling stationery and office supplies from Bistrita-Năsăud district in the last four years.

The warehouse owned by the company is located in Bistriţa and was acquired in 2003. The location of the warehouse was chosen for the following reasons: it is placed near the trucks route, there is an easy access to the facility, and it has a parking area for the cars of the firm.

The building has 467 square meters; it has few rooms for storing the products (on shelves or on pallets), and offices for the whole firm.

3.2. WAREHOUSE DESCRIPTION

For describing the warehouse we have performed a process mapping. It is a useful way for depicting all operations that take place in the warehouse. On the bottom of the map, we also provide the indicators to show at what operations of warehousing they refer. The warehouse has three zones: the first one (the bottom of the map) has three rooms for storing products: one for adhesive tapes and wrapping bands, one for paper and one for archiving products; a toilet and a wardrobe; the central zone of the warehouse - a room for storing paper, a delivery area, the offices, two archives and a toilet; the last zone (the upper part of the map) - a room for printer paper and school supplies, one for writing instruments and office supplies, two for wrapping materials, and a showroom. The warehouse stores about 1700 different types of products. You can check the process map in the figure above.

3.3. USING PERFORMANCE INDICATORS

We shall use for performance improvement the performance indicators we have described above in the literature review area. The purpose is to identify the poor performance inside the warehouse. As we mentioned above, we are using John M. Hill's indicators to assess the performance of the warehouse, grouped into three categories: "Inventory Management", "Warehouse Performance" and "Order Fulfilment" (2007: 20-22). The values written in green indicate that the operation is going smoothly and red means that there are problems. The indicators followed by "min." should be as small as possible and the ones with "max." should have values as high as possible.

Table 1. Inventory Management

MEASURE	CALCULATION	VALUE
Damaged Inventory (min.)	Total Damage (lei) / Inventory Value	0.4 %
Days on Hand (min.)	Avg. Month Inventory (lei) / Avg. Daily	41 days
	Sales/Month	
Storage Utilisation (max.)	Avg. Occupied Sq. m. / Total Storage	80 %
	Capacity	
Dock to Stock Time (min.)	Total Dock to Stock Hrs. / Total Receipts	0.75 hours (45 minutes)

Table 2. Warehouse Performance Indicators

MEASURE	CALCULATION	VALUE
Orders per Hour (max.)	Orders Picked or Packed / Total Warehouse Labour	
F ()	Hrs	4 orders/hour
Items per Hour (max.)	Items Picked/Packed / Total Warehouse Labour Hrs	
		80 – 100 items/hour
Cost Ondon (min.)	Total Warehouse Cost / Total Orders Shipped	
Cost per Order (min.)		5.042 %
Cast as 0/ afficient (min.)	Total Warehouse Cost / Overall Sales	
Cost as % of Sales (min.)		2.08 %

Table 3. Order Fulfilment Indicators

MEASURE	CALCULATION	VALUE
On-Time Delivery (max.)	Orders On-Time / Total Orders Shipped	98 % on-time deliveries
Order Fill Rate (max.)	Orders Filled Complete / Total Orders Shipped	98 % complete deliveries
Order Accuracy (max.)	Error-Free Orders / Total Orders Shipped	98 % deliveries are error-free
Order Cycle Time (min.)	Actual Ship Date – Customer Order Date	1 – 48 hours
Perfect Order Completion (max.)	Perfect Deliveries / Total Orders Shipped	99.8 % of the orders are perfect

3.4. PROBLEMS AND CAUSES

Taking into account the red values from performance indicators and also the warehouse process map, we have identified several problems regarding warehousing, related to space usage (based mostly on process map), inventory management, warehouse performance and order fulfilment (performance indicators), that are presented in the next table:

Table 4. Problems and Causes

CATEGORY	PROBLEMS	CAUSES
1. SPACE	- only 59.83% of the surface allocated to the	- the building had a different use before (it was a
	storing of goods;	bakery facility).
	- excessive division of the space.	- the building had a different use before (it was a
		bakery facility).
2. INVENTORY MANAGEMENT	- a too high value of Days in Hand (41 days);	- the contracts with the suppliers aren't negotiated; the costs with the immobilisation of inventories aren't evaluated.
	- a too high value of Dock to Stock Time (0.75	- the firm doesn't use barcode readers and a

		hours).	barcode software.
3. W PERFORMANCE	VAREHOUSE	- a too small value of Orders per Hour;	- the excessive division of space; the firm doesn't use barcode readers and a barcode software.
		- a too small value of Items per Hour.	- the excessive division of space; the firm doesn't use barcode readers and a barcode software.
4. ORDER FULFILM	ENT	- the superior limit of Order Cycle Time is too high.	- the goods arrive late from the suppliers; the firm doesn't use barcode readers and a barcode software.

3.5. SOLUTIONS

3.5.1. Space

The main problem of the warehouse is the poor utilisation of space. It can be solved by breaking some walls so that to have only a room for storing the merchandise. One of the archives, the two halls and one of the toilets should be eliminated. The offices of the firm should be moved on one side of the warehouse, so that access to goods be direct. The current Office of the Director should be divided in two halves: one used by the director and the other by the accountant and moved on the left side of the warehouse. These modifications would result in a gain of 55.83 sq.m. There should be two main docks in the warehouse: one for receiving the products and one for delivering them. They should be situated on opposite sides of the warehouse. In this way, there will be a better access to all the products. Before making these modifications, the opinion of a construction engineer should be taken into account. Another solution is related to the fact that there are multiple flows which intersect each other. One solution which would improve space utilisation is a new design of flows inside the warehouse – it looks like possible to establish one different entry and one different exit for each stored product category.

3.5.2. Inventory Management

"Dock to Stock Time" can be reduced by introducing portable barcode readers and a barcode software. The time for entering the products or for preparing them for delivery will be shortened also by solving the problem related to space. "Days on Hand" indicator will have a lower value if contracts with suppliers are renegotiated and if are kept only the ones who are able to deliver products fast. The firm should also use an ABC analysis in order to know what products to place near the exit dock.

3.5.3. Warehouse Performance

The problems related to warehouse performance can be solved by improving the space utilisation and by introducing portable barcode readers. We recommend a performance indicators continuous monitoring, in order to observe the improvements while they appear.

3.5.4. Order Fulfilment

Delivery problems can be solved by collaborating with suppliers that have the possibility to deliver merchandise fast or by investing in cars, and all that results from this investment (hiring a driver).

These solutions could be implemented, in our opinion, in about 3 months, and this is because the whole architecture of the building has to be changed. These solutions support the short and long-term objectives of S.C. TUDOR S.R.L.

4. CONCLUSIONS

The main solutions we propose in this article regarding warehouse management are performance indicators and process mapping. These two solutions complete each other. It is easier to establish key performance indicators for a warehouse after a process map was drawn, considering also other indicators used at international level. The process map is the helicopter view needed for establishing relevant performance indicators.

Performance indicators are useful for identifying the problems – red or abnormal values of the indicators are as a control system for a warehouse.

In order to solve the problems, we have used a very simple methodology: identify the causes of the problems and then try to diminish their impact or just eliminate the causes. It is a cause-effect approach, easy to be applied by any manager.

Warehouse performance measurement means, in our opinion, discovering the problems of the warehouse and solve them before is too late. It is a way to reduce costs by improving operations that take place in a warehouse, and having low costs is an essential feature of differentiating logistics firms. We applied the key performance indicators to a small company, but they can be calculated also for large firms. Even on a small scale, they helped us discover a lot of problems, out of which the poor utilisation of space was the essential one.

PERSPECTIVE AND STRATEGIES IN AUTOMOTIVE INDUSTRY

Isac Nicoleta

University of Pitesti, Faculty of Economic Sciences Blv. Republicii no. 71, postal code 110014, Piteşti, Argeş nicoleta isac2004@yahoo.com 0722.25.34.33

Bucharest Academy of Economic Studies Faculty of AgroFood and Environmental Economics victormanole@eam.ase.com 0722.32.97.33

In 2008, all that has changed. The momentum of optimism has been checked: companies are now confronted with a world gone into reverse, where growth is highly uncertain and where prices and financial conditions are highly volatile. This change is visible in many areas. It is visible in lower expectations for revenues and profitability, higher expectations of bankruptcy, and more pessimism on the speed at which the industry can adapt to challenging conditions. More companies expect overcapacity to emerge in key regions, and that sales and production growth will fall in emerging markets in particular.

Key words: quality, management, automotive industry, crisis

Cod Jel: L 16, L 62

According to the Economist Intelligence Unit (EIU), global passenger car sales are expected to rise at an annual average of 4.0 percent during 2008 – 12 (reaching approximately 67 million units in 2012), a slight improvement on the 3.4 percent rate recorded during 2003 – 07. The increase will be driven by demand in China and India. However, automobile sales in the developed world will remain disap-pointing.2 According to a global automotive outlook survey conducted by Dykema in 2008, approximately 98 percent of participants suggested that in 2008, pas-senger vehicle sales will drop below 16 million units in the US.3 According to Carlos Gomes of Scotiabank Group, approximately 13.7 million passenger cars will be sold in the US during 2008.4 Figure 2 presents the forecast for passenger car sales across geographies in 2012 and the compound annual growth rate (CAGR) for the period 2007 – 12.

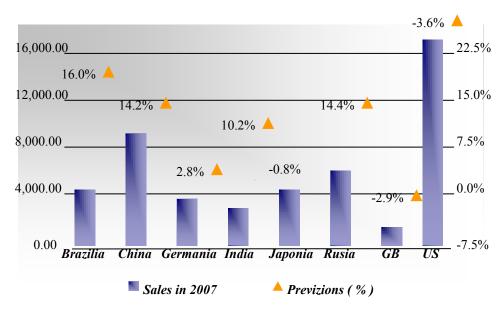

Figure 1: Forecast for passenger vehicle sales in 2012 and the CAGR for 2007 – 12 Source: World Data, The Economist Intelligence Unit, 2008

It is clear that the near future is going to be very tough for the automotive industry, also shows that long-term many companies are well aware of the concerns have not greatly changed but on long-term trends, opportunities and challenges, companies continue to say they retain a long-term focus on innovation and technology – particularly fuel technologies.

The 2009 Survey suggests that innovation and technology are likely to be at the heart of industry efforts to recapture profitability in the coming months and years. For example, innovation – especially process innovation – is still seen by companies as the best way to cut costs, rather than attacking direct overheads. Companies also believe that product innovation will be key to rebuilding sales: it is notable that despite the fall in energy costs during the last few months, expectations of sales of hybrid and other fuel-efficient vehicles continue to rise sharply compared with previous years.

Still, the mood of the world's auto industry has reversed: after the relative optimism of 2007 with its expectations of a gradual return to stability and prosperity, expectations in 2008 have changed for the worse.

The most important issues for the industry overall – the question that reveals the relative weight of long-term concerns – in 2008, the deterioration of the global economy rose to second place (from fourth place in 2007). While traditional long-term concerns hold their place in the rankings of overall issues (product quality remains the most cited issue, for example) companies have been consistently forecasting a deterioration of overall global growth for the last four years, with concerns about the global economy rising year on year from 2005. However, the number of companies citing labor relations as important has fallen in 2008: just under half of companies rate labor relations as unimportant in 2008, compared with 59 percent in 2007. The number of companies rating labor relations as unimportant has also risen sharply from 9 percent in 2007 to 16 percent in 2008. This is consistent with the deterioration of confidence in other areas in 2008: while last year companies remained concerned about labor shortages – especially in the fastest expanding markets – in 2008, they appear to expect their key labor markets to loosen.

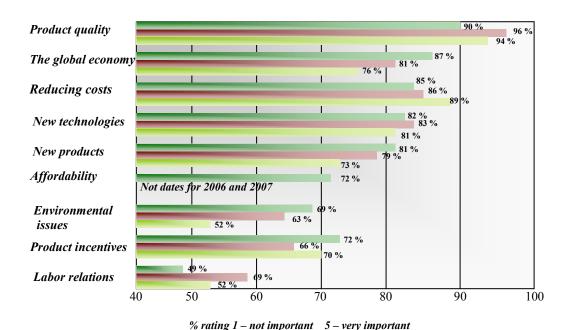

Figure 2. Haw important is each of the following issues to the current state of the auto industry Source: KPMG Global Auto Executive Survey 2009

When Companies were asked: which of these is the main business growth strategy for your company over the next five years? report that their growth strategies are more concentrated on winning new customers and new business in existing markets than on entering new markets. However, in interviews, companies stress that in many cases they are already active in new markets, and therefore count.

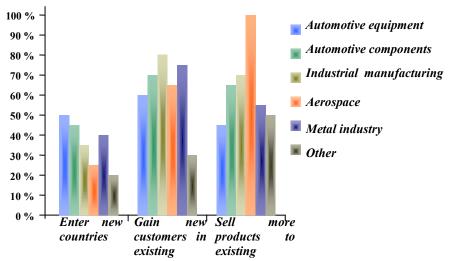

Figure 3. The main business growth strategy for company over the next five years Source: KPMG International 2008

Two issues dominate corporate concerns regarding sourcing from or manufacturing in low cost economies: cost and quality. Some companies surveyed also voice concerns about the challenges of managing through joint-venture approaches, but these are in the minority as most companies report that the manufacturing that they consider critical is almost always accomplished through wholly owned subsidiaries.

Many companies surveyed remained concerned about the achievement of quality in emerging market locations. However, companies with manufacturing operations in intermediate cost locations – such as economies on the European periphery – frequently report very positive results on both cost and quality. "We have more quality issues in high-cost countries than in low-cost countries," says one European industrial machinery maker. "We make all our critical components in places such as the Czech Republic and Portugal: we have low cost and the highest quality." And this company adds: "achieving quality from low-cost markets is entirely dependent on how long you have had to manage the issue".

Manufacturing in low-cost east Asia – especially China – is more problematic, although several companies argue that quality failings are often the fault of the manufacturer rather than the location. The CFO of one large east Asian auto components maker says that his company remains reluctant to commit to manufacturing in China on quality grounds: "quality is very important to a manufacturer in our business. We make things like brakes – these are critical components that lives depend on. We would do a lot more manufacturing in low-cost locations if we could be sure of the quality".

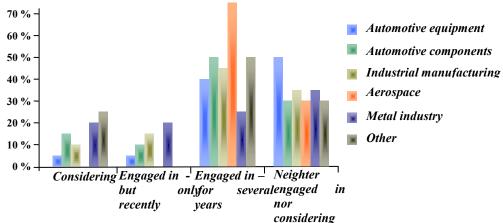

Figure 4. The importance of low-cost country sourcing for production

Source: KPMG International 2008

A large Indian auto parts maker with global auto customers adds that "on quality, we consider India to be as good as it can be. China is not so good, but training and investment will push that quality up. There is no doubt that quality is the biggest challenge in low-cost country sourcing, and getting and keeping the right skills is the next most difficult issue".

Almost without exception, companies report that productivity rather than direct labor cost is the key to profitable manufacturing operations in new markets. "Labor costs are not increasing," says a large Indian auto components maker with global customers. "The cost per person is increasing, but so is productivity – so overall there is no cost increase.

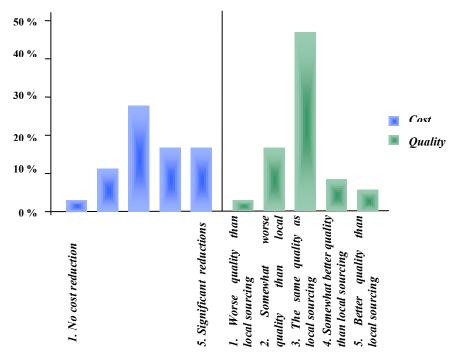

Figure 5. Significant low-cost country sourcing was in terms of cost and quality on a scale of 1 - 5 *Source:* KPMG International 2008

Conclusions:

The automotive sales outlook for key markets in 2008 is gloomy. In addition, with increasing commoditization of vehicles and very little to differentiate among them, the emphasis shifts towards a better retail strategy. In most of the major automo-tive markets, vehicles are sold mainly through franchised dealers. There has been a shift towards multi-brand dealerships in almost all the key automotive markets, which allows customers to test and compare various vehicles at the same loca-tion. Another major trend seen in the automotive retail industry is the consolidation of automotive dealerships. However, despite consolidation, global automotive markets remain fragmented with scope for further consolidation.

The automotive industry is cleary facing an unprecedend crisis, a crisis that companies fully expect will reshape the industry. But even amid crisis conditions, the long – term concerns of automotive companies remain strikingly stable: developing and leveraging technology in an era of gradual but inexorable shift away from oil dependence. One of the lessons of the 2009 survey ist hat companies thet manage that shift successfully are likely to be the industry leaders of the future.

CLUSTERS - BENEFITS AND RISKS ROMANIA'S CASE

Jeleriu Daniela - Claudia

Romanian American University, Faculty of Internal and International Commercial and Financial-Banking Relations, 1B Expozitiei Blvd., Sector 1, Bucharest, e-mail: jeleriu daniela @yahoo.com, phone: 0724.269.966

A cluster is a geographical concentration of related and supportive industries which compete and cooperate with each other. A famous example of cluster is Silicon Valley in the USA, which concentrates a great part of the cybernetic industry in the USA. The cluster is made up of competitive firms in an industry, plus the supplying and the beneficiary firms, which make up the competitive environment in which the company functions and which benefit from the local infrastructure.

In what way does the existence of the cluster influence the competitiveness of the firm?

First of all, the related or supportive industries which make up the cluster stimulate the creation of the factors or the specialized mechanism of those which contribute to the improvement of the firm's competitiveness.

A concentration of domestic competitors encourages the creation of the new factors – local labour.

Keywords: cluster, competiveness, economic development.

JEL: M13,M16

Context marked by the intensification of interactions between nations, with direct implications on increasing competition, resulted in increased interest of the economic environment on ways of obtaining success in the market. Globalization has forced companies to be competitive, innovative and dynamic in order to pass the market test

Romania, country reminiscent of communism, difficult to overcome, adapts pretty ponderous to the new requirements of global markets, as in Western firms, the practice of capitalism is more easily applied. Getting forms without substance remains the approach of our country. The problems and solutions to increase the degree of competitiveness are valid on the whole Romanian economy

Competitiveness is applied not only on firms, as one might think, but also on nations, or newer regions. Just as competition between companies increases, all the same happens between nations and regions. Thus, creating a competitive environment will also depend on firms operating in that environment and the rules established by the state. On one companies struggle to gain market share as well, and therefore a higher profit, developing strategies and policies as appropriate which differentiate them from competition. On the other hand, the regions or nations have to struggle to get the competitive advantage to attract on their territory as many investments. The reasons why some nations or regions are more attractive to firms than other economic and fiscal policies of these countries are: the existence of adequate infrastructure and the low level of bureaucracy.

Romania must submit further effort to become a business environment attractive to investors. Moreover, our country must develop a well articulated strategy by which to achieve the final goal: getting a real competitive advantage based on innovation and without artificial support.

Clusters theory

Regional specialization and the tendency of firms with the same activity profile to crowd in a particular geographical area has been held by economists for a long time. The notion of national and regional specialization, which leads to higher productivity has been stated since the nineteenth century by David Ricardo. A century later, Alfred Marshall presents the causes leading to a higher productivity of industries, such as geographical proximity of firms, labor market specialization, the effects of propagating the knowledge or specialized suppliers.

Many current theories have introduced the concept of "market forces" which tends to focus investments in areas where they offer infrastructure, better access to market specific human capital, and lower risks.

Theory locating economic activities, known as the theory of clusters, launched by Michael E. Porter¹¹⁸, refers to the ways and the contributing factors of increasing "competitiveness at the local, national, regional and global market" and is, finally, a way in which a country may face fierce competition of the capitalist economy. This theory justifies the importance of locating, while factors of the development relating to climate and natural conditions, the fertile soil, proximity to geographical location help to the development of the cluster.

Porter's success with theory clusters is largely due to this theory's pragmatism, which is not only a purely theoretical debate, but is also conceived as a useful method for managers, governments, and economic development policy in today's stiff competition. Unlike similar theories, launched by geography, Porter's theory is like a "business strategy, focusing on the idea of productivity, competitiveness and performance. Porter's cluster comes as a solution for companies, but also for savings.

118 Michael E. Porter - Clusters and the New Economics of Competition Harvard Business Review, November-December 1998.

The word custer means to "gather in one place, the group after certain criteria" to get its definition of 'initiator' concept¹¹⁹ namely, cluster is "a geographical concentration of companies that compete but also cooperate, suppliers of goods and services and institutions which are associated with them."

The definition may seem a little unclear and too general, being criticized in this respect by specialists in geography, such as Ron Martin - Professor at the University of Cambridge and Peter Sunley University of Edinburgh. According to their idea of cluster, this is not just an invention of Porter's, but is a redescovery of Marshall's idea of the importance of geographical location in the business. This vague definition of the generic term is used intentionally, to cover a wide spectrum of groups and industrial specializations Cluster is, indeed, a theory approached by Marshall, but Porter's contribution is quite substantial. The concept itself means much more than theory agglomerations. As for the generality of the definition, it is due to existing diversity of clusters. Industrial clusters are agglomerations of companies with similar and interdependent activities, located in a geographic area, operating on a common market and having the same needs, technology and specialization of labor. Firms within clusters develop their comparative advantage in the immediate neighbourhood competitors using the skilled labour, specialized suppliers and, ultimately, the exchange of information between firms These agglomerations combine development needs of local / regional business with internationalization through Foreign Direct Investment - FDI, putting the value in local resources, know-how, labour force, traditional products and practices, information and network Public and Private Partnership (PPP).

This means to cluster firms in a given region, which results in further exchanges between them, favouring and improving communication and trust aiming to achieve efficiency and flexibility.

Clusters, in essence, assume the existence of interdependent firms whose collaboration is an important factor of competition and the necessary infrastructure and research centres to generate specific innovation in the field.

The latter produces infusion of money, which translates into the development of regional and national economy. Optional, clusters may include government institutions, NGO's or educational institutions.

The purpose of the cluster, besides reducing costs of the immediate neighbourhood companies involved, is to create competitive advantage for that specific location, employees, suppliers, infrastructure, research potential and innovation

Opinions on the factors that determine the performance of firms in industrial clusters are different. Most opinions support geographical proximity and intense networking between firms as essential elements in increasing performance. Firms present in competitive agglomerations are considered members of a collectivity which facilitates the diffusion of innovation (Abrahmson and Rosenkopf, 1993, and St. Pouder. John, 1996The effects of spillovers generated by firms most developed, leading to the emergence of a process of mimicry and imitation (mimetic isomorphism) of the cluster competitors (DiMaggio and Powell, 1983) and, consequently, enhance competitiveness.

Recently, however, a number of studies have brought to the scene a different opinion on the factors that decide innovation in a cluster. According to the authors of these studies, geographical proximity is not essential in determining innovation. Rather than this, the companies are part of an "elite society" formed in a selective process that has strengthened the position of certain companies to the detriment of others. According to these authors, there is a relationship between the intensity of interactions within small businesses and the higher degree of innovation of the first firm.

Benefits and risks of clusters

Main benefits identified after adoption of the model clusters are in organizational productivity, regional specificity and increased mobility of information.

Productivity, along with increasing wage levels of employees, are considered the main causes for which there is increased interest for the formation of clusters. Opinions on the subject of "clusters" vary. Productivity achieved by firms within a cluster can only be verified through empirical study of each case. One such project, so difficult to achieve, is now run by Harvard Institute - Cluster Mapping.

Increased mobility of information published online, represents the third main benefit of clustering. It is well known that technology and innovation does not develop in isolated companies but in open environments, where interaction between individuals of different competent organizations appears. The latter, leads to constructive interaction asimilating existing knowledge and generating ideas, products and processes of production. Studies show that the exchange of ideas happens frequently, either directly through the association of member firms, for the purpose of research (Cooke 2004) or indirectly due to labor mobility between firms (Power and Lundmark 2004).

A region may become vulnerable if cluster owned portfolio is too concentrated. Moreover, the cluster can often be not only the answer to increasing the competitiveness of a region, bur also the source can come from elsewhere. Opinions on the ad-hoc formation of clusters, following the deliberate intervention of external forces (eg. local government), are controversial. The reason is that investment risk is high and the result is not predictable.

-

¹¹⁹ Michael E. Porter - Clusters and the New Economics of Competition Harvard Business Review, November-December 1998.

Cluster structure can also be the source of unfortunate events. For example, a cluster made up of small firms may be vulnerable to market disturbances, as clusters of platform anchor on the first firm like a hub and spoke. They may become vulnerable if the first firm goes bankrupt.

Clusters in Romania

A feature of developing economies is the tendency of concentrating economic activity around the capital or cities with great political influence. This happens either on purely objective grounds, or because of government intervention, aiming to concentrate competition around the capital.

Implementation of a "cluster policy" could be regarded as less feasible for countries in developing countries. Generally, clusters in transition economies are less powerful, often lacking FDI support and competition between companies is poor Among the differences between transition economies and developed countries, there is the transition from planned economy to a market economy, which means lack of experience in competition, lack of collaboration among institutions and lack of trust in government initiatives.

At this time, our economy is in the phase of comparative advantages such as those arising from the production of consumer goods from cheap labor and the less processed natural resources. These benefits are not only temporary and questionable, but they also have devastating consequences, in some cases.

If we view the development stages, according to Dunning and Narula, Romania is located somewhere in the stage two of development, which is dominated, on one hand, by the stage of easy production of goods, with processing that needs cheap labor, and, on the other hand, by the export of raw materials needed for processing standardized goods, of course in search of lower costs and increased efficiency.

In Central and Eastern Europe, according to OECD statistics in 2004, Romania is situated on the lowest level in terms of technological potential. This awareness has made between 2001 and 2004, industrial policy discourse to present clear concepts, in which competitiveness is the key word: "Under the new concept, the European industrial policy of the governments should have as fundamental objectives the increasing of competitiveness." Therefore, Romania should create competitive advantages with the positive effect of duration.

Nowadays, cluster formation in Romania is still poor. They are mostly only at the level of proto-clusters, lacking the mature clusters. Low potential competitive dynamics in the Romanian economy is reflected most directly in the connections between the competitive firms - the debut of clusters - which are found in the first stages of the production process or in final stages. Usually, the final stages, by their nature, need not to generate very large horizontal land vertical links, and do not propagate effects (spillover effects).

On one hand, the Romanian state has tried to promote the agglomeration of firms by public policies, giving rise to "public" clusters, which by law, have the status of industrial, scientific and technological parks. On the other hand, the clusters can be identified by means of statistical and quantitative analysis. Various studies and research projects have been identified several potential clusters in Romania.

The Applied Economics Group¹²⁰, in their study on the emerging clusters in our country, talk about clusters, such as IT in Bucharest, textile clusters in Timisoara or ceramic clusters in Alba Iulia. They have used different methods of study, which is why results have not coincided, and clusters identified were numerous and diverse.

Therefore, the issue of clusters in Romania remains, for now, an open one. Time will show which of these emerging clusters crosses the road to a mature cluster, present in developed countries. In my opinion, the transformation of proto-clusters into mature clusters can be achieved through mutual support and cooperation among the public, private and academic media.

Managerial communication is a subdivision of interpersonal communication, a leadership tool with the help of which the manager exerts his specific attributions: planning, training, organization, coordination, control, evaluation. Due to the fact that the manager's attributions are varied and complex managerial communication becomes a real force, occupying a central place in the activity of any manager. Time management and managerial communication are correlated.

Time management can refer to all of the practices that individuals follow to make better use of their time. In conclusion, modern management places a special emphasis on communication and time management, as a vital component of the managerial system of any organization, either in the private sector (under the jurisdiction of private management) or in the public sector (private management).

Keywords: communication, management, time, system, organization;

Managerial communication is a subdivision of interhuman communication, a leadership tool with the help of which the manager exerts his specific attributions: planning, training, organization, coordination, control, evaluation¹²¹. As part of the leadership process (Henry Fayol added communication to planning, prevision, organization and command as one of the fundamental elements of management)¹²², through which the manager understands subordinates making himself understood to them, managerial communication is oriented not only towards the transmission of messages, but also towards changing mentalities and their psychological adaptation to the institution's objectives. Managerial communication represents an auxiliary to management, placing in circulation information about decision results, which return to the decision centre, thus making possible the action comming to terms with objectives and results with planning. The importance of communication in organizations is owed also to the complex character that this process has at this level. Thus, in every organizational framework there are numerous communication networks, that is groups of communication channels in specific configurations which all form the communicational system. That is why communications have a big role in the decisional frame, of amplifying relationships between group components, of consolidating their cohesion.

It is compulsory that every manager develops and promotes a policy based on communication which permits him the permanent adjustment of the structure and organizational system to the changing conditions inside and outside the organization. Moreover, through his role of negotiator, of promoter of the organizational policy and its transmitter, the manager has to put together and maintain an entire network of contacts with the organization's partners, for the realization of external policies and an informational network useful for the maintenance of internal politics. In conclusion, modern management places a special emphasis on communication, as a vital component of the managerial system of any organization, either in the private sector (under the jurisdiction of private management) or in the public sector (private management).

One of the important components of management is represented by the exchange of informations and messages between the manager of the organization and subordinates, as well as between employees with the same hierarchical level, with no management attributions. The particularities of managerial communication in comparison with the other existent communication types are generated by the aim, objectives and roles of this communication, by the frame and structure of organizations as well as by the context of the organizational culture. Similarly, managerial communication in any type of organization is subject to certain ethical norms which are part in the organizational culture, in the organizational policies and obviously, in the individual ethics of the manager. Sometimes communication is deficient because of a rigid system of communication. It has to be conceived as a

Sometimes communication is deficient because of a rigid system of communication. It has to be conceived as a dynamic organism, capable at any time to adapt to the information needs of employees. Managerial communication in any organization must inform correctly and efficiently vertically and horizontally. For this, in the managerial communication process there are certain communicational needs of any employee that need to be fulfiled:

- need to know professional knowledge necessary for accomplishing tasks or even the position;
- need to understand it is not enough to know how to do a certain thing, but also to know why it has to be done
- need to express themselves to bring your opinion to the knowledge of those in hierarchically superior positions Communication between manager and subordinate represents a key point in the vertical ascendent or descendent communication in organizations. This should also allow subordinates to ask questions about the roles of their work

_

¹²¹ HINTEA, Calin, Management strategic in administratia publica, Ed. Gewalt, Cluj-Napoca, 2000.

¹²² FAYOL, Henry, General and industrial management.

and to come up with suggestions about improvement. There are always communicational barriers in this communication, the most frequent being the status of the position and organizational stress.

The effect of the status is that the managers lays too little price on communication with their subordinates, because it creates the tendency to communicate to people with similar positions.

As a social and psychological element, especially an element of group psychology, there is a direct relation between the image that the collective staff and each of its members create about the manager and the degree to which they accept his authority. Subordinates want to feel their manager sensitive to their expectations and feelings, to their ideas and suggestions, to inspire trust and respect through his attitude and behavior.

Managerial communication has to focus on the realization of permanent managerial objectives, which have to be correlated with the functions of management: planning, organization, coordination, training, evaluation-control.

For understanding the place and role of communication at the level of each function, we must know the significance of these functions at a managerial level. This helps in deciphering the structural mechanisms of any organization.

- a) At the level of general management, planning or prevision function consists of work processes through which the main objectives of the company are determined, as well as the resources and main means necessary for their achievement. The role of this function is to establish what has to be accomplished, how, by what means, in what conditions and time. These objectives are realized through planning according to the criteria: detailiation, obligativity and horizon, prognosis, plans and programes. It is obvious that the base for making up these prognosis, plans and programs consists of a large process of data collection, documentation and processing information, a communicational process, actually. In a nutshell, communication represents an essential component of the planning function, without which this could not be applicable. At an internal as much as external level it is unconceivable to exert the planning function without a real communicational support. This is because only through communication plans and action policies can be done, information can be transmitted at hierarchical levels, and employees can be trained in decision-making, by encouraging to take part in this process within meetings and discussions.
- b) The second function, organization, designates the management processes through which physical and intellectual work processes and their components (movements, time, operations, work, sessions) are established and delimited, as well as their grouping in jobs, work formations, compartiments and their assignment to personnel, according to certain managerial, economic, technical and social criteria, with the aim of better realizing the objectives. The role of the organizing function is to accomplish objectives previously established by efficiently combining human, material, informational and financial resources, by a correct occupation of jobs, at the level of compartments and of the whole organization. We observe the double valence of the organizing function: we speak of organizing of the whole institution as well as of each department, direction, office, service. At the same time, the organizing function means communication, means building formal relationships of the internal and extarenal informational system, means receiving, soliciting and using feedback.
- c) The coordination function at the level of general management consists of "the work processes through which the decisions and actions of the staff and its subsystems are harmonized within the previsions and the organizatoric system previously established"¹²³. In the specialty literature, coordination is appreciated as being "a dynamic organization" thanks to the fact that:
- -the economic agent and the environment are undergoing continuous change which is impossible to reflect fully in foreseeings and in the organizatoric system;
- staff reactions demand a permanent feedback.

In organizations, coordination function focuses on the collaboration of activities and optimally allocated resources with the aim of realizing objectives. In order to ensure a good coordination it is essential to have an adequate communication at every level of management in an organization. This communication has to focus mainly the transmission of information, the whole perception of the message. In its turn, for communication to be efficient, it depends on a series of factors like:

- the quality of management (leadership style; the realism of objectives proposed through specific policies, the experience of managers, the concordance between their experience and the requirements of their positions);
- quality of the excutive apparatus (their experience, aptitudes, interest for problem solving, receptivity degree).

At the management level in an organization the coordination function takes two shapes according to the criteria of communication making:

- bilateral coordination based on communication of a linear type, realized between manager and subordinate for obtaining a feedback; this is time consuming;
- -Multilateral communication based on a communication of a network type, implying a large number of subordinates exchanging information with the manager; it is usually done in meetings.

Certain qualities are needed in order to be a good manager. Not all the people are made for this profession. The skills and qualities required are depending on managerial competence, which refers to the manager's capacity to

¹²³ NICOLAE, Tudorel, Comunicare organizationala si managementul situatiilor de criza, Ed. Ministerului Administratiei si Internelor, Bucuresti, 2006.

perform in his activities, not just do them. A competent manager must possess 3 types of skills: technical, conceptual and human. They refer to the manager's qualities to work with people and consist of being aware of one own's actions, perceptions and opinions, of seeing the utility and limits of one's own attitudes, emotions and feelings. There is a set of skills necessary for being named a good manager: double professionalization – reflected by the knowledge and qualities which emphasize the capacity to lead; the capacity of developing an efficient system of relationships, through which a positive favorable work climate is built; modelling one's own behaviour which would influence the subordinates' behaviour also and orient it towards performances; formal authority; creativity – necessary for delaing successfully with technological, social changes; resistance to pressing solicitations – decisional stress, deadlines, responsibility.

Some conclusions can be designed therefore: the manager is a professional, behavioural and attitudinal model for subordinates and partners; he develops his own leading style, in accordance with his personality, experience and preparation and with the precise situation in which he has to take action; the manager must never forget that he takes action on people and the results obtained are not only his, but of the entire team; by his behaviour, he has to encourage change and creativity¹²⁴.

We can affirm that in an organization, internal communication is influenced by a series of factors:

- a) organizational structure;
- b) the type of communication implemented;
- c) communicational barriers;
- d) the importance of informal communication;
- e) the manager-subordinate relationship;
- f) the climate of communication.
- g) time management

We live and work together, that is why we have to know our needs and interests mutually. Mutual knowledge is the base of our existence. Any professional group has a leader, any institutions, irrespective of its profile and mission, has a certain structure. The entire activity of an organization is developed by people, employed according to specific principles, work criteria, with certain professional roles, have a status and a statute. And precisely because it is developed by people, any organization is founded primarily and inevitably on the principle of communication, in all directions and in all the senses possible.

Time management is an esential component in the art of communication. If you want to be a good manager you have to know how to manage your time.

Time management is commonly defined as the management of time in order to make the most out of it. The management of our own activities, to make sure that they are accomplished within the available or allocated time, which is an unmanageable continuous resource"

You can't manage time, it just is. So "time management" is a mislabeled problem, which has little chance of being an effective approach. What you really manage is your activity during time, and defining outcomes and physical actions required is the core process required to manage what you do.

Time management can refer to all of the practices that individuals follow to make better use of their time, but such a definition could range over such diverse areas as the selection and use of personal electronic devices, time and motion study,[3] self-awareness, and indeed a great deal of self-help. As narrowly defined, it refers to principles and systems that individuals use to make conscious decisions about the activities that occupy their time.

Time management strategies are often associated with the recommendation to set goals. These goals are recorded and may be broken down into a project, an action plan, or a simple task list. For individual tasks or for goals, an importance rating may be established, deadlines may be set, and priorities assigned. This process results in a plan with a task list or a schedule or calendar of activities. Authors may recommend a daily, weekly, monthly or other planning periods, usually fixed, but sometimes variable. Different planning periods may be associated with different scope of planning or review. Authors may or may not emphasize reviews of performance against plan. Routine and recurring tasks may or may not be integrated into the time management plan and, if integrated, the integration can be accomplished in various ways. It is always good to write what you want to do. It increases your productivity manifolds. Further you never miss any important task. Remember " Even faintest ink is stronger than the strongest memory"

task list (also to-do list) is a list of tasks to be completed, such as chores or steps toward completing a project. It is an inventory tool that serves as an alternative to memory.

Task lists are used in self-management, grocery lists, business management, project management, and software development. It may involve more than one list.

Some people study in different ways so you are to find out how you are able to study and put that into action. Some people are able to understand their work if they can see it. Some need to touch and feel whatever is being spoken

_

¹²⁴ TRIPON Ciprian, Human Resources Management, suport de curs.

about in the book. Some people need to see what they are studying in order to understand what is coming out of the book.

Techniques for setting priorities

A technique that has been used in business management for a long time is the categorization of large data into groups. These groups are often marked A, B, and C—hence the name. Activities that are perceived as having highest priority are assigned an A, those with lowest priority are labeled C. ABC analysis can incorporate more than three groups. **POSEC METHOD**

POSEC is an acronym for Prioritize by Organizing, Streamlining, Economizing and Contributing.

The method dictates a template which emphasises an average individual's immediate sense of emotional and monetary security. It suggests that by attending to one's personal responsibilities first, an individual is better positioned to shoulder collective responsibilities.

Inherent in the acronym is a hierarchy of self-realization which mirrors Abraham Maslow's "Hierarchy of needs".

- 1. **Prioritize-**Your time and define your life by goals.
- 2. **Organizing-**Things you have to accomplish regularly to be successful. (Family and Finances)
- 3. **Streamlining-**Things you may not like to do, but must do. (Work and Chores)
- 4. **Economizing-**Things you should do or may even like to do, but they're not pressingly urgent. (Past-times and Socializing)
- 5. **Contributing-**By paying attention to the few remaining things that make a difference. (Social Obligations) Time management becomes a real force, occupying a central place in the activity of any manager. It is compulsory that every manager develops and promotes a policy based on communication which permits him the permanent adjustment of the structure and organizational system to the changing conditions inside and outside the organization.

International specialized literature speaks about motivational strategies, about methods of increasing the employees' satisfaction at work and of obtaining the best results by increasing work motivation. But what does motivation really represent? Which are the most modern motivational theories? How do HR specialists choose to evaluate work satisfaction and the motivation degree of the employees? The purpose of the article is to make radiography of the main traditional motivational theories, but also the modern approaches related to motivation, sometimes contrary to the traditional opinions and evaluation techniques of employees' satisfaction at work applied in the EU.

Keywords: employees' motivation, evaluation of work satisfaction, The European Employee Index, human resource management.

JEL article code: M54: Labor Management.

Foreword

Certainly, motivation is one of the main factors that determine the work performance of employees. But what does motivation really represent? We may say that a person, man or woman, is motivated when he or she wants to do something. The reason does not represent the same thing as the stimulus. While a person could be enthusiastic about a stimulus, her main reason for achieving something could be the fear of failure, the desire to distinguish herself from the others, the wish of acquiring knowledge, etc. The motivation of a person covers all the reasons for which he choses to act in a certain manner (Adair, 2006).

Professor Frederick Herzberg dichotomized, suggesting that the factors which make people experience satisfaction in their work situations are not the opposite of the factors inducing work dissatisfaction. The dissatisfaction is determined by deficiencies in the work environment and the context of the job; work satisfaction depends of the content of the work and the career opportunities, the accomplishments, the recognition and the personal growth.

International motivation theories

The most influent theory in the specialized literature is the theory of **Maslow's Hierarchy of Needs**. Maslow published in 1954 a volume of articles and papers made during 13 years of research, under the name "Motivation and personality". "A theory of motivation" appears in chapter 5 and classifies people needs in 5 well-known categories: physiological needs, needs of security and safety, social needs (sense of belonging), needs of self-esteem and the needs of self-actualization.

Through this theory, Maslow mentioned that, when an inferior rank need is satisfied (for example, assuring food, clothing, the need of breathing, etc), the next level need becomes dominant, and the attention of the person is dedicated to the accomplishment of this higher rank need. The need of self-actualization can never be satisfied; Maslow mentions in this sense that "man is a perpetually wanting animal" and only an unsatisfied need can motivate the behaviour, the dominant need being the primary factor for behaviour motivation. During the evolution of needs towards the top of the hierarchy of needs, there is also a psychological evolution, but it doesn't happen necessarily as a direct progression. The inferior rank needs continue to exist, even if temporarily in a latency state as motivation factors, and people constantly come back to previously satisfied needs.

Maslow's theory has had a great influence over the organizations, but it was also very criticized, especially for its rigidity, because people are different and have different priorities. Even Maslow mentioned that it is hard to accept that people's needs advance progressively and constantly towards the top of the pyramid, in a very orderly manner. Another motivation theory is **Frederick Herzberg's Two Factors Theory**. He made an investigation about the sources of professional satisfaction and dissatisfaction for accountants and engineers. Hertzberg ascertained that their statements about the good periods were mostly related to content elements of the professional activity, especially professional acknowledgement, achievements, promotions, responsibilities and the nature of work itself.

The frustrations of the interviewees were frequently related to the context of their work: the company policy, the management, the surveillance system, the salary, the work conditions.

Hertzberg considers that motivation and the increase of work performance can be only obtained through the action of the motivational factors, which directly reflect the content of the executed work by the employee on his position. The contextual factors represent only the conditions necessary for the execution of work processes.

This theory was often criticized, especially because it does not make any evaluation of the relation between satisfaction and performance. Many critics also suggested that Hertzberg drew deductive conclusions, with general incidence, unjustified by the utilization of significant interviewees.

Douglas McGregor developed one of the best known motivational theories, **Theory X and Theory Y**. In the process of work, McGregor separate employees in two categories. Employees that align to the X theory are predisposed to negligence, by avoiding work as much as possible, by lacking ambition and avoiding responsibilities. Considered a medium level person, the X employee is indifferent to the needs of the company that he belongs to, and has certain inertia towards change, by resisting it. In consequence, at the workplace, the X employee must be forced, threatened with punishments, permanently controlled and penalized in order to be determined to make the efforts necessary to attain the company objectives. According to the Y theory, the employees consider it normal to make physical and intellectual efforts at work, by voluntarily taking upon themselves different assignments and responsibilities and by being motivated by the associated rewards. The Y employee must not be forced by different means to obtain performance, because he is motivated by the content of his work. McGregor's view can, of course, be considered simplistic, because external and internal factors can often decisively influence his work performance.

Along with those three content theories, there are also different process theories. If in the content theories the accent is on the specific factors that motivate the employees regarding certain necessities and aspirations, in the process theories the accent is laid on the processes, on the psychological forces that have an effect on motivation. They start from the premise that motivation begins with the wish of doing something, generating expectations. The process or cognitive theories are more useful to the managers than the content theories because they offer more realistic principles regarding the motivation techniques. The best known process theories are: the expectancy theory, the goal setting theory and the equity theory.

The expectancy theory, also named the VIE theory was initially elaborated by **Vroom** (1964) and then developed by **Porter and Lawler** (1968). This theory establishes a connection between the employees' motivation and the certitude of their expectancies. The motivation is possible only when there is a clear relation between the work performance and its results and the results are means to satisfy a certain need.

The goal setting theory, developed by Lotham and Locke (1979) states that the level of motivation and performance is higher when the individual has specific objectives established and when these objectives, even with a high level of difficulty, are accepted and are offered a performance feedback. The human resources specialists have an important role to play in establishing organisational objectives. The employees must participate in the process of goal setting in order to obtain their approval when setting higher and higher targets and the human resources people can help them to understand the consequences of these targets over their entire activity. Feedback is also vital to maintain employees motivation, especially when targeting even higher objectives.

The equity theory speaks about the people perceptions regarding the way they are treated in comparison with others. Actually, the theory states that the people are higher motivated when they are fairly treated and less motivated when there is no equity between employees. This theory only explains one of the features of the motivational process, but an important one at an ethic and moral level.

The theory of group personality and group needs is a recently debated theory. In the last years the team work and the project based work developed rapidly across worldwide organisations. Their advantages are definitely known and were proved in the business practice. Though, we must ask ourselves which are the actions that motivates the entire team and not only some of the individuals in the team.

Adair (2006) brings some new issues in the theory of group personality and group need. He developed the idea that working groups resemble individuals in that although they are always unique, developing its own group personality, yet they share, as do individuals, certain common needs. There were identified three areas of needs present in such groups. Two of these are the properties of the group as a whole, namely: the need to accomplish the common tasks and the need to be maintained as a cohesive social unity, called by Adair "the team maintenance need". The third area of needs is constituted by the sum of the individual needs of group members: physical needs, social needs, intellectual and spiritual needs, which can be accomplished or not by participating to group activities.

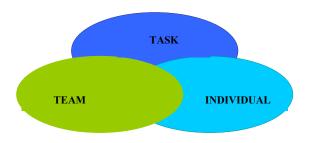

Figure 1. Interaction of needs (Adair, 2006)

As we can observe in the upper figure, that the three types of needs interact and influence one another inside the group. For example, if a group fails to achieve a specific goal, this will intensify the disintegrative tendencies present in the group and produce a diminished satisfaction for its individual members. Though, if there is a lack of harmonious relationships in the group this will affect performance on the job and also individual needs. On the other side, the achievements of the team build a sense of group identity and close the psychological gaps between team members, automatically rising their morale. An individual whose needs are recognised and who feels that he or she can make a significant and worthwhile contribution both to the task and the group will tend to perform in both these areas.

Adair (2006) developed a **new theory of motivation** also named **The Fifty – Fifty Rule.** Its fundament is the intersection of the three circles. Adair took into consideration the Pareto Principle and suggested that a similar principle is at work in the field of motivation. Its theory does not claim to identify the exactly fifty proportions in the equation. It only says that a substantial part of motivation lies within a person while a substantial part lies outside and beyond its control.

From many perspectives this theory is contrary to the general theories developed by Maslow and Herzberg. They put into light only the intrinsic and extrinsic motivation of an individual. The Fifty – Fifty rule enlarges the motivation understanding and suggests that 50 per cent of our motivation lies without us. Of course, this does not mean that it is pointless to study the very much known theories. The two researchers contribution lies in the fact that they map out the internal needs and motivations of an individual, many times accomplished through work. Maslow's sketchmap is more general and more original. Herzberg continued and applied Maslow's theory into practice. He dichotomized the human needs into satisfiers and dissatisfiers, or motivational and hygiene factors. The Fifty – Fifty rule covers both perspectives: the internal perspective of an individual and its inner motivational factors and also the external perspective, when the employee motivation is influenced by others and the instant circumstances. "When someone is motivating you, he or she is consciously or unconsciously seeking to change the strength and the direction of your motive energy" (Adair, 2006).

The European Employee Index

The European Employee Index was developed by some human resources specialists in the northern European countries (Sweden, Denmark, Norway). The research and the developing of the model were based on annual questionnaires conducted in more than 20 countries which offered the best international benchmark. Accordingly to this model, the employees' motivation, their job satisfaction and sense of loyalty are the result of a large number of factors directly related to the employees' perception of job and work environment. In the European Employee Index, these factors were gathered into seven dimensions, levers that the company and the individual manager can pull in order to improve motivation.

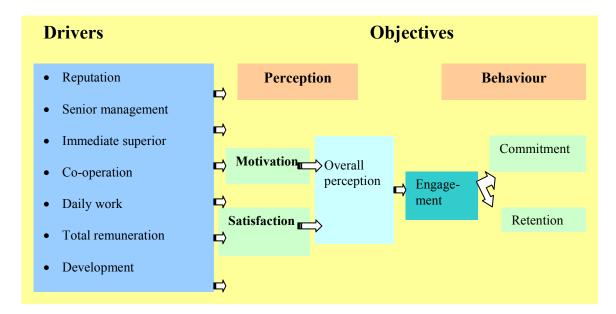

Figure 2. The European Employee Index Model¹²⁵

Reputation is the employees' perception of the general knowledge of the organisation and how this is perceived externally, both as a workplace, as a player in society and in relation to the products that the organisation delivers. Senior management is the perception of the general direction of the organisation and the people in charge.

Immediate superior is the quality of the management and support offered by formal immediate superiors as perceived by the individual employee in the daily work and which is reflected in an assessment of the qualifications of these superiors.

Cooperation is the quality of the interaction between people in the organisation – in relation to the performance of a specific task, the general sense of community and atmosphere as well as the social interaction with colleagues both in and outside the workplace.

Daily work is the employees' general perception of the specific content of their daily activities in the workplace and the working conditions related to the performance of these activities.

Total remuneration is the employees' perception of all the elements involved in the compensation that they receive for performing their job.

Development is the employees' perception of the individual acquisition of competences (both professional and personal) which takes place in connection with the employment in the company. Competences can be acquired in connection with formal education, courses, on-the-job training, everyday challenges and feedback from managers.

The last study conducted in 2008 shows no change in the top two countries that have the highest motivation and satisfaction: Denmark and India, two very different countries. For every country, a different driver was found to be the most important, definitely influenced by the cultural features. For instance, senior management is especially important for employees in Ireland, the United States and Japan. Immediate superior is important in United Kingdom and Japan, while co-operation means a lot for the employees in Netherlands. In the Czech Republic and Russia remuneration plays the most important role. The study also brings into light the fact that, no matter the country, the development of human resources and the daily activity are very important factors for increasing employees' satisfaction.

It is very important to know the needed features of a successful salesman in order to recruit and select the most suitable persons for such a job. If the native talents are imperative in a view of getting high performance, then qualification, experience and knowledge also have an important role. They are an intensifier of individual talents in order to develop them and convert them in competence. In this paper we intend to refer to the employment of a salesman that belongs to the commercial domain. The present paper tries to identify the needed features of a salesman for accomplishing high performance.

Keywords: talent, competence, high performance, salesman

The article's JEL code: M50

1. Salesman: the multiple facets of an employment

According to an old saying, "every one earns his existence selling something". If we take into consideration the fact that most of us are employed, earning a salary and at a certain time we were in the position of being a salesman of our own abilities, the above approach doesn't seem to exaggerate.

In order to be able to delineate the area of the present issue, we started from the definitions and the descriptions of this occupation, which shows us which are the attributions and the responsibilities that are required, and then we focused to the necessary talents and competences for being able to practice successfully in such position.

A concise definition of a salesman is given in Wikipedia Encyclopedia, according which a salesperson is a person employed to sale different products or services. 126

According to Robert N. McMurry, the salesman term covers a wide range of functions, where there are more differences than similarities. Thus, a salesman can belong to one of these categories:

- Supplier, having as a main responsibility the delivery of products.
- Receptor, with the responsibility of taking over the orders for products.
- Missionary, when the salesman visits the clients to consolidate the company reputation that he represents.
- Engineer, a position that emphasizes the salesman's technical knowledge.
- *Demand creator*, position that requires presentation in a creative way of tangible and intangible products, in order to market them. ¹²⁷

This list encompasses positions from the sales department, requiring often different creativity degrees, starting from lower levels to higher ones. The first ones require the employees to offer services to the clients and to take over their new orders, while the latter ones pretend that the potential clients should be searched and influenced to buy.

According to the employment standard of a salesman, developed by COSA (Council of Occupational Standards and Certification), his responsibilities are the market prospectation to be able to identify the main sales opportunities, the negotiation of the sale conditions with potential buyers, creating the sale conditions and the exposition of sale object, monitoring the clients and their satisfaction, and also ensuring service and merchandising activities. ¹²⁸

In order to accomplish successfully the activity, the salesman must have some competences such as interactive communication, team-working, daily individual activities planning, promoting firm image, professional development, selling specific products, merchandising, negotiation and others.

Although there is a wide opinion, according to which everyone can be a salesman anywhere, the practice reveals that it is totally unrealistic.

Not every person is able to sell because the constant success in salesman career requires some born talents.

2. Sales myths

¹²⁶ http://ro.wikipedia.org/wiki/Agent-de-vânzări

¹²⁷ McMurry, R., The Mystique of Super – Salesmanship, Harvard Business Review, după Kotler, Ph., Managementul marketingului, Editura Teora, București, p. 873.

¹²⁸ http://cnfpa.ro

There are some prejudgments about the sales efficiency. They are wrong beliefs regarding the determinants of the success, like the following myths.

The educational and the experience myth promote the idea that graduated courses and experience years influence miraculously the performance in the sales field. Even if their important role can't be denied, the Gallup's researches have emphasized that not the postgraduate degrees and longevity on the job make the difference between an excellent salesman and a medium one, but talents developed in a proper job.

The "good salesman can sell everything" myth leads us to the aggressive sales. The sale doesn't consist only in the drawing on customers and determining them to buy something they are not interested in. It is a process that a salesman develops for the client or with the client in order to discover their needs and desires. ¹²⁹ This myth may also have another interpretation. We can see that if a salesman was efficient in a company selling some products, he will have the same success in another company, selling other products. In reality, there are considerable differences regarding style and the necessary abilities for a real estate salesman and a pharmaceutics products salesman.

The money myth asserts the idea that the salesmen's main motivation is to get important earnings. But the researches show that different salesmen have different motivations. Some of them are often animated by their desire of being important or their competition spirit; others have a feeling of accomplishment when they succeed to save a company in difficult financial situation.

People need certain skills in order to be successful in a profession. In the sales field, these refer to the ability of solving clients' problems, of establishing lucrative social relationships, of having influence on others, the ability of planning the job in order to keep engagements to the clients.

3. The required talents of salesmen

The dictionary of psychology defines the talent as being a special ability in a field, like engineering, science, art and so on. Relying on some natural maximal dispositions of the organism, the talent is an aptitude, a natural or gained superiority of doing something. The talent emerges early, develops mostly up to 20 and often has longevity. ¹³⁰

To define the talent in the sales field is ineffable because this talent doesn't exist as such. More precisely, there isn't just one talent in this field. The native talents of the great salesmen may be totally different from person to person.

In a developed research relying on thousands interviews of sales department representatives, the Gallup organization's goal was to identify the features and the talents of the greatest salesmen of different companies in order to help them to hire only the individuals who could become "stars".

The Gallup researchers found out that these talents may be grouped in zones, that we called *themes*. A theme is a grouping of features and talents that together become an individual's strength establishing a certain approach of his work.

After a fine analysis of the data base, thirty-four themes have been selected and widely described in a Benson Smith and Tony Rutigliano's book. 131

These talent zones are presented using examples of specific features and behaviors as following:

Activator. He is anxious to action; doesn't need all information at once; believe that action is the best way to learn; always brings new ideas; has no patience with long meetings.

Adaptability. Although has plans, he shows availability for solving present problems; a very flexible person, which can be efficient when he is called on different actions at once.

Analytical. He considers himself as an objective and impartial person; has many information for making decisions; deeply researches until he find the determinant cause of a problem. A logical and compelling person.

Competition. He is naturally aware of others' competences; makes comparisons between him and others; likes the competitions where he can get the first place.

Communication. He likes to explain, describe, to be a host, to speak in public, to write; is able to animate with images and metaphors the simplest idea; wants the information sent by him to be retained.

Leadership. He likes to take control and impose his point of view; isn't afraid of confrontations, but, on the contrary, considers it as the first step of solving a problem; feels that he must present the facts and the truth no matter how disagreeable are; makes the others to take risks as soon as a goal was established, he will be restless until everyone around him will be mobilized.

Discipline. Because he likes everything around to be organized and planned, he establishes naturally rules and a structure for the surrounding environment. He focuses on scheduled activities and deadlines. He doesn't like surprises and is impatient with mistakes.

_

¹²⁹ http://www.wall-street.ro/articol/Management/6234/Mituri-despre-vânzări

¹³⁰ Șchiopu, U., Dicționar de psihologie, Editura Babel, București, 1997, p. 682.

¹³¹ Smith, B., Rutigliano, T, quoted paper.

Empathy. He can feel the others' emotions like his own feelings. He doesn't necessary agree with the others' opinions, but he understands them. When other people cannot express themselves, he easily finds the right words and tone.

Organizing. When he faces a complex situation that involves a lot of factors, he likes to analyze again and again, aligning and realigning until he is sure they are the most efficiently hierarchical distributed. He is able to assume the responsibility of some big projects and to simplify them.

Accomplisher. The individual feels that everyday, until the end of the day, must accomplish something tangible in a view of feeling well. In his soul is burning a flame that makes him to aim always more. It is the energy source for working all day without feeling tired.

Responsibility. This individual needs to recognize "the psychological paternity" for any action where is involved and, no matter important or not important, he feels obliged to accomplish the task. He has a strong consciousness and is guide by unimpeachable ethical values.

All the thirty-four themes of the above research were found at the interviewed salesmen, but none of them had the same talents. Most people have some themes, not many, which are more intense than others'. These are the definitive themes or the ruling talent zones. But, consequently everyone has themes with medium intensity and hardly observable themes.

For salesmen, being aware of the definitive themes means the ability of finding the best approach of their jobs. This kind of knowledge can help them to improve a sales style, where they can use constantly their natural talents.

4. A generic model of competence for the sales personnel

Even if the presence of a talent to an individual may predict his success in a certain field, he will not reach a high efficiency until he will be competent. Being competent is more than having a natural talent, but undeveloped. In order to become competent in a field, besides talent, education and experience are required.

The competence represents knowledge, personal abilities and features required in a view of accomplishing an activity, and the applying way of these attributes.¹³² Abilities and knowledge are just potential competences until they are proved by carrying in to effect through behavior. They will be put to account depending on the individual's motivations, values and self-image.

To be competent in an occupation requires: to apply technical knowledge; to analyze and to make decisions; to use creativity; to work as a team member; to efficiently communicate; to adapt to the environment, where the job takes place; to cope unforeseen situations. 133

Distinctive competences of the salesmen, who achieve high performances, vary with order-sending cycle's length and complexity (interactions number and the time between first client contact and sale accomplishment), product features and consumer type. ¹³⁴ The features of sales positions with short, medium and long order-sending cycle are presented in table 2.

Table no. 1 The features of sales positions varying with order-sending cycle's length 135

Short	Medium	Long	
Retail	Some retails, more industrial sales	Complex and industrial sales	
One buyer	Usually one buyer or a small group.	Many buying influences	
Personal impact	Low or medium impact on business	Strong impact on client business	
Short interactions, usually, once	Short interactions, but recurrent	Complex and long relations; deep involvement in client decisions	
A great many clients	Many clients	A few clients	
Small sales income per sale	Medium sales income per sale	Great sales income per sale	
Frequent denials	The denial number varies	Rare denials	
Varied products, easy assembly	Other sellers offer similar products	Technical complex products, which can be customized; assisted assembly.	

330

¹³² Adkin, E, Jones, G., Leighton, P., Resurse umane – ghid propus de The Economist Books, Editura Nemira, București, 1999, p. 53.

¹³³ http://cnfpa.ro

¹³⁴ Spencer, L.M., Spencer, S.M., Competence at Work, John Whiley& Sons Inc., New York, 1993, p. 171.

¹³⁵ Idem, pg. 112.

Starting from the present models reanalysis and combining the results of a research, that included representatives from over 200 job types, L.M. Spencer and S.M. Spencer have developed a generic model of competence for the sales personnel, widely described alongside other competence types, in "Competence at Work". 136

The model presented in table no. 3 includes some competences that tell the high performance salesmen from the mediocre ones.

Table no. 2 Generic model of competence for salesmen¹³⁷

Relative importance	Competence
x x x x x x x x x x x	Impact and influence
xxxx	Orientation to accomplishment
x x x x x	Initiative
x x x	Interpersonal skill
x x x	Orientation to the client's requirements
x x x	Self confidence
x x	Building relationships
x x	Analytical thinking
x x	Conceptual thinking
x x	Information search
x x	Organizational conscience
Basic requirement	Technical expertise

The number of "x" symbols from the table shows the importance of the respective competence.

Impact and influence. Influencing others in a view of buying products needs most of the salesmen time. It is very important when the selling takes place in an intercultural environment. The salesman addresses to the client understanding the most important needs and problems. The "impact and influence" competence is more important in long sales cycles than in the medium and short ones. In the case of industrial buying, the salesman will thoroughly prepare the presentation offering a lot of technical data and emphasizing the product's advantages.

Orientation to accomplishment. Even less frequently mentioned than "impact and influence", the orientation to accomplishment may be more important for high performance. The researches emphasize the important role of accomplishment need for sales personnel.

The orientation to accomplishment starts with a great self-management: choosing provocative goals, but achievable, using efficiently the time and "enjoying" the competition.

The orientation to accomplishment, which had the highest frequencies in the medium sales cycles, requires personal efficiency, improving the operations for clients, cost-benefit analysis and, sometimes, assuming calculated risks.

The initiative often takes the shape of tenacity and perseverance to the salesmen: they try again and again, in different ways, working many hours and not giving up in front of denial.

In the long and medium sales cycles, the initiative includes identifying opportunities, immediate action, facing the competition threats and, altogether, doing more than the job requires.

Interpersonal skill is the ability of understanding others' skills, interests, needs and perspectives and translating non-verbal behavior. Interpersonal understanding is used in order to explain or specify someone behavior, to influence or to better meet the clients' requirements.

In the long sales cycles, a high performing salesman needs sometime to coordinate the effort of some persons (technical experts, finance person) working in a team. In this case, what distinguishes the high performing salesman is his ability of accommodating the colleagues to the clients, using his sensitivity both for colleagues' style and the client one.

Orientation to the client serving varies from prompt and courteous attend to the assuming his consulting role in important decisions. The essence of the orientation to the client serving is the allocation of the necessary time for finding out the consumer real needs and their adjustment to the offered products and services, making an extra effort for satisfying consumers' needs.

A high performing salesman often is the client's confident consultant. As a consequence he must be very familiar both the product's characteristics and the client's business.

Self confidence, expressed by a confident attitude to challenging situations, is the dominant personality feature of the salesmen. It seems that it is the main feature in the models where the technical expertise is less important.

-

¹³⁶ Spencer L.M., Spencer S.M. – quoted paper.

¹³⁷ ibidem.

In the short sales cycles, where there are many denials, the high performing salesman doesn't feel sorry for denials and most often attributes the failure to external causes or doesn't explain it at all. On the contrary, the medium performer usually looks for possible reasons why he lost the sale.

Building relationships is usually considered an important part of the sale activity. This is true for some product types selling, especially the daily-use products. The selling of high technology products and the selling consulting depend less on building relationships and more on technical expertise and post-selling services.

Analytical thinking. In long sales cycles and financial transactions, the analytical thinking may require problems solving, technical processes or improving processes for the consumer. Otherwise, the competence content refers to how to understand and influence the client. Analytical thinking of sales personnel has in general a medium level of complexity.

Conceptual thinking. This competence was most often found as basic to moderate level at salesmen. Nevertheless, some top executives have build theories and strategies very complex in order to influence the client-organization. Searching information about products, clients, potential consumers, their needs and competition is a constitutive part of every sales model.

<u>Technical expertise</u>. In the retail trade, technical expertise is assimilated by the search for superior knowledge about products. In intermediate sales, the technical knowledge wasn't mentioned as distinct competence of high performers. A certain level of expertise is still required for keeping the job, but the additional knowledge doesn't differentiate a high performing salesman from a mediocre one. In long sales cycles, the technical expertise is an essential requirement.

Conclusions

Regarding the accomplishing of high performances, the salesman needs:

- to identify his own talents, the specific features that could become strengths if they are properly developed;
- proper specialty training;
- experience in that field for consolidating the strengths and developing a selling style where he can use invariably his naturally talents;
- to apply efficiently the acquired knowledge and experience, adapting him to the work environment, using his creativity and the ability of making decisions in order to face unforeseen situations.

PROTONEGOCIATIONS - SALES FORECAST AND COMPETITIVE ENVIRONMENT ANALYSIS METHOD

Lupu Adrian Gelu

ASE Bucureşti, Facultatea de Management Ploiesti, Str. Grigore Alexandrescu nr.1, 0721227256, adrian lupu06@yahoo.com

Abstract:

Protonegotiation management, as part of successful negotiations of the organizations, is an issue for analysis extremely important for today's managers in the confrontations generated by the changes of the environments in the period of transition to market economy and the economic crisis we are going through. Marketing researches have identified many techniques and method of analysis of clients preferences correlated with the attributes of the products and services and the positioning or repositioning of new products on the market. This article will try to prove the importance of protonegotiations in the business system, it will point out the fact that protonegotiation may lead to a sales forecast for the offered product or service. The results of the protonegotiations in different moments of their development can also be used as method of analysis of the competitive environment that competition carries out its activity in.

Keywords: protonegocitions, sales forecast, competitive advantage

Jel classification: M19, M20

1. Considerations about protonegotiations

Apart the proper negotiations that suppose a meeting between authorized representatives of the parties, having an order of the day and a commonly-established procedure in order to reach an objective under the form of a written agreement, there is between the parties a constant activity of tacit accommodation and harmonization of attitudes¹³⁸. All negotiations suppose an activity significantly oriented towards the other¹³⁹. The absence of a formal and organized framework does not allow us to call this kind of activity 'negotiations'. The fact that they have the basic features of negotiations suggests the introduction of the term 'protonegotiations'. Protonegotiations consist in a unilateral action that is taken as signal by the interested parties, it is decoded, interpreted and commented by the party that feels targeted.

We are, under these circumstances, able to define the situation of *simple protonegotiation* as the purchase reaction of the end user to the stimuli of promotion of the product-service offered by the seller in the conditions known or indicated in the message of promotion of the offered product-service. As a matter of fact, simple protonegotiation is an exception with regard to the other protonegotiations due to the fact that it is the only transaction situation that ends without a concrete negotiation, provider-beneficiary, client-buyer to mark the agreement. The consumer of promoted product accepts the product sales conditions without other negotiations regarding the product purchasing conditions. In case of major transactions with complex aspects that are going to be negotiated protonegotiation is still very important but it will have a completely different dimension.

Communication is only one of the conditions of negotiation ¹⁴⁰.

In these situations, the activities of communication with potential partners will be part of a major campaign of promotion of the targeted interested to the potential segment of partners, as much as possible to the targeted partner. In this case, the protonegotiation activity cannot replace the effort of formal negotiations subject to a complex of principles and by their initiation they express an affirmation of the common will to reach a result.

We can say that the protonegotiation that is not limited to the mere promotion of product-service but is part of evolved campaigns of communication and promotion that do not conclude the proper transaction without the need of other negotiations between partners in order to reach the purchase agreement, irrespective of the nature of the agreement, is a *complex protonegotiation*. Unlike the situations of simple protonegotiation, where the agreement is concluded between the parties without the need for a meeting between the parties and which can be approached as a distinct process with its own objective, complex protonegotiation is only a separate activity within a larger process that shall ideally end up with the conclusion of the agreement, after passing through all the intermediate stages of common negotiations. Also, in the context of complex protonegotiation, the proper activity represents a easing of the way that the negotiator team must go in the phases of the negotiation process. A well-defined protonegotiation campaign, prepared in detail that reaches its objectives, bringing the negotiator teams together and making them decode the issued signals correctly, can mean in the economy of a negotiation more than the sum of the efforts that a company must make in order to prepare a team of experimented and trained negotiators¹⁴¹. Depending on the ability of its use, the degree of knowledge of negotiation and sales techniques, the

protonegotiation activity can be directed for the resolution of other intermediate objectives followed by the negotiator team.

2. Protonegotiations – a sales forecast method

In the light of the idea according to which protonegotiations are simple and complex, naturally the analysis of protonegotiations as a sales forecast method must be made in two dimensions. In each of these two situations protonegotiations materialize through different negotiation methods, techniques and tooling.

In the case of simple protonegotiations, where the transaction is concretized without holding actual negotiations, the traceability of the interlocutor must be ensured by an expansion of the product promotion. The most adequate form that simple protonegotiation can have so that sales forecast can be quantified is product questionnaire, an actual opinion poll.

Questionnaires are a flexible research tool that allows primary data collection through questions structured with well-defined principles so that they arouse interest and involve the subjects so that they answer as sincerely and clearly as possible to the questions addressed to them through the questionnaires. Relevant and objective, questionnaires or opinion polling through questionnaires have advantages and, of course, disadvantages.

The advantages of an opinion poll based on a form with questions are that in a short period of time information can be obtained from many people and the appreciation is possible in a short time interval as well. Some of the advantages of its use in market research are the following: thematic richness of the data that can be collected through it, accessible handling and processing, possibility to repeatedly pass it on to the same different subjects; also, in the panel-type longitudinal market researches the questionnaire is able to collect from the bearers of the application both quantitative and qualitative information.

The disadvantages are the limitation of the possibilities to answer the question, problems regarding data interpreting and possible technical appreciation means. The latter are inevitable, if the objective is the analysis of the relations between questions or the inter-relation of certain questions. Although with regard to the necessary costs it is not the cheapest research tool, it is used mainly for the collection of the necessary data on the most varied issues. Thus, it can be used in both selective researches performed among economic agents (industrial survey) and for the investigation of clients with regard to many aspects.

Philip Kotler believes that for the collection of the data necessary for marketing research, 'two categories of tools can be used: questionnaires and specialized devices'. Considering the opinion of other marketing specialists as well, the instruments considered to be most frequently used during marketing research are the following: interviews and questionnaires.

In the specialized literature and practice of marketing researches questionnaires are the most important and most frequently used tool for the collection of the necessary information for market research. In this sense, a reputed professor of the University of London, the English specialist C. A. Moser stated in his works that: '...an investigation cannot be better than his questionnaire', pointing out this way the central position of this tool in the methodology of social investigations.

But in order to adopt the form of protonegotiation, to be more precise, simple protonegotiation, apart from the opinion polling function, the questionnaire must contain a message that stimulates the respondent's interest and decision to purchase the indicated product or service. The questionnaire – protonegotiation must ensure a communication of the interests of the part that generates the negotiation. The questionnaire must also promote the product or service so that the answer to the questionnaire can really express the buyer's decision to purchase the promoted product or service. Only now in this situation can we say that the questionnaire represent a simple protonegotiative method meant to forecast sales.

Forecast can be performed over sales in case of simple protonegotiations, it is based on comparative methods regarding the evolution of sales in the intervals of time without protonegotiative monitoring and the one in which the organization management adopts the study of promotion of sales through simple protonegotiations. Following the analysis of the sales situations performed in the two sales intervals, the one with application of sales forecast protonegotiative method and the one in which no method is applied, the first important quantifiable conclusion regards the modification of the sales volume following the application of that method. In the past people used to believe that the sales force had to sell, sell and sell again. Of course, the ideal sales case from the point of view of the economic efficiency of the sale is when with loc sales promotion costs major transactions as volume, values, etc. can be performed. The practice of the last period in which sales operations do not only consist in proper sales but also in services associated to sales, such as: servicing or technical assistance sales placed at the clients' disposal that accompany the traditional form of selling through sales agents or other specially arranged location proves that the efforts made by the sellers are greater every time.

Another application of this method consists in the fact that by proportional multiplication of the capital allocated to the promotion of sales and their forecast by protonegotiative methods sales can be taken to the desired level of

¹⁴² Kotler Philip, Managementul Marketingului, Ed.IV, Editura Teora, 2005.

volumes and profit. Also, applying the protonegotiative method the future sales levels can be guessed and at the same time following the analysis of the sales forecasts the position of the offered product or service can be seen by the curb of the lifecycle of that particular product or service.

In case of complex protonegotiation, the questionnaire can play a forecast role, with the observation that in this case negotiations must be held in order to conclude the transaction. The questionnaire in this case only plays the role of stimulus to dialogue and initiation of the negotiation. It is obvious that in the case of complex protonegotiative situations, any form of indirect communication used in protonegotiation can be used as a sales forecast tool.

The sales forecast using this method is performed after quantifying the interest showed by the people that responded to protonegotiative actions, the assessment and forecast of the sale of that particular good or product depending on their answer.

As compared to the sales forecast, in the case of application of the method based on complex protonegotiation, the sum of conclusions that can be drawn by analysis is much higher. In this case, elaborate buyer behaviour studies can be carried out, as well as forecasts regarding the product lifecycle, sales forecasts, studies regarding the investments necessary in the product production process or in the modification of the organization's management itself

As stated above, citing C. A. Moser: '... an investigation cannot be better than his questionnaire', the quality and quantity of the information obtained after the application of the forecast methods based on the application of protonegotiative models is directly proportional with the quality of the transmitted messages, the quality of the interpretation of the received messages, the level of training of the negotiation team and quantity of financial resources that can be attracted in these activities.

The main issue at the manager's discretion is the type of protonegotiative forecast that needs to be approached. The resolution of this issue lays mainly in the strategic objectives established for the product or organization or the medium and short-term objectives considered during the application of the protonegotiative models for the desired forecasts.

3. Protonegotiations – a method of analysis of the competitive environment

Marketing researches have identified numerous techniques and methods of analysis of clients' preferences correlated with the attributes of the products and services and the positioning or repositioning of new products on the market, such as for example: the multi-dimensional scale, BCG analysis, price analysis in correlation with product attributes, etc. Starting from the idea according to which the efficiency of a company depends on the class, quality and cost of the offered products, the management system must be conceived so that it is capable of keeping up with the strategic evolutions and innovation on world market. In Ridderstrale and Nordstrom's opinion¹⁴³, these strategies consist in: combining operation and creation, using markets and human beings; imposing the innovation of supply and demand, rational and emotional monitoring of imperfections. McKinsey¹⁴⁴ points out the fact that innovation refers to the reconfiguration of the company, rearrangement of the 'value chain', change of the rules of the game so it is necessary for the company to capitalize distinct competences and create barriers in order to protect the created advantage. According to Prahalad and Hamel, innovation is all-embracing and defies stereotypes¹⁴⁵.

After the launch of the protonegotiative messages, through the received signals, the analysis of the steps taken by rival companies, a synthesis image of the profile of the existing or new rivals in the competitive context and their strategic intentions can be obtained and strategic counter-measures can definitively be elaborated in order to take the own product, service to the preferences of the targeted clients and, why not, obstruct rival products or services.

The analysis of the feed-back of messages of protonegotiative nature is the base of the analysis of the competitors on the targeted market segment. The competitor analysis is meant to:

- foresee rivals' future strategies;
- foresee reactions to the company's strategic initiatives;
- determine rivals' behaviour so that it can be influenced into company's favour.

These are all referred to the knowledge and understanding of the rivals, strategies, tactics and reactions to market movements. The analysis requires the intelligence of the competitor (of the competing company). Competitor's intelligence implies continuous information, a systematic collection of data and analysis of the publications about all rivals, and not only.

In order to analyze and understand rivals' behaviour, the competitor analysis model¹⁴⁶ can be used, which supposes five analysis and forecast directions, briefly presented in chart 1:

¹⁴³ Ridderstrale Jonas, Kjell Nordstrom, Karaoke Capitalism, Management pentru omenire, Ed. Publica București, 2007, pg. 300.

¹⁴⁴ McKinsey, New thinking for a new financial order, Harvard Business Review, September 01, 2008, pag54.

¹⁴⁵ Prahalad C. K., Gary Hamel, Competiția pentru viitor, Ed Meteor Press, București, 2008, pg. 154

¹⁴⁶ Grant R.M., Contemporary Strategy Analysis, Blackwell Business, Oxford, UK, 1998, p.217-232.

- 1) Identification of the current strategy, observing what the rival does and says. Mintzberg (1988) points out the difference between the *intended strategy* and *performed strategy*. The intended strategy is presented in the annual balance report and the performed strategy consists in the actions performed and decisions made.
- 2) The identification of the objectives implies the analysis of the rivals' performances, prices and profit.
- 3) The assumptions of the rivals of the industry regarding the perception about the industry, the business in general, stability in time.
- 4) Foreseeing the rivals' behaviour using any possible information.
- 5) Identification of the rivals' capabilities, with reference to the potential for change, for a quick adaptation to the constraints of the environment.

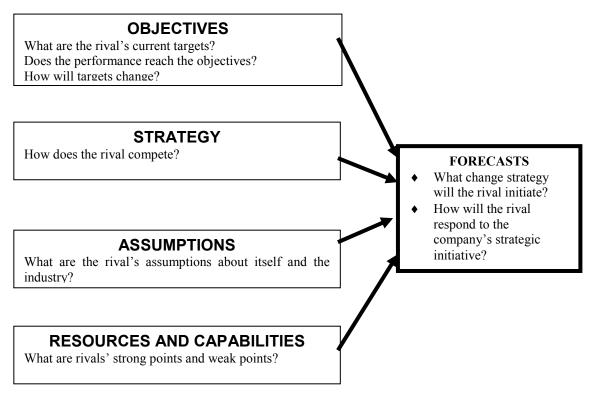

Chart 1: Competitor analysis model

The main objective of this analysis is to identify the threats that the company may be exposed to. In order to find the adequate means and strategies in order to be successful in competition with other companies, it is necessary to know in detail the advantages of the company, plastically speaking, the 'war arsenal'. The knowledge of the position, competition structure, competitive structure and competitive advantage lead to the elaboration of the competitive strategy of a set of alternative strategies. In Grant's vision 147 competitive advantage represents the company's ability to have a performance higher to its competitors with regard to the basic purpose of existence. namely profitability. If the adopted strategy is not efficient or if the competitive environment imposes the adaptation of the company to new environmental conditions, to new requirements, change is adopted.

Theoretically there are no limits for a company in offering to its clients and consumers a wide range of opportunities associated as a matter of fact to the characteristics of the products and services.

Another strategy applicable in the competitive environment of the company that can be applied after the analysis of the results of the protonegotiative messages is differentiation. Differentiation in the competitive environment¹⁴⁸ refers to the promotion of what is 'unique', except for the practicing of a lower price. Differentiation as a strategy does not mean the promotion of 'oneness' only to be 'unique', but to create value by understanding the products and services, understanding the clients and consumers and identification of the unique opportunities and their creative use.

There are many models of creation of the differentiation, the most frequent being the following: the offer's market route (to the clients and consumers) by examining the resources and capabilities the oneness and route of the demand on the market can be created, by examining the consumers' needs and preferences.

Analyzing the answers obtained from the messages of protonegotiative nature launched by the organization, the information referring to the analysis of the competitors in the targeted segment can be used, corroborated with the strategy applicable in order to promote the differentiation of the organization in the competitive environment for

¹⁴⁷ Grant R.M., Contemporary Strategy Analysis, Blackwell Business, Oxford, UK, 1998, p.217

¹⁴⁸ Grant R.M., Contemporary Strategy Analysis, Blackwell Business, Oxford, UK, 1998, p.217

the identification of the organization's success factors. Except for the aforementioned situations, the results of the protonegotiative forecast of sales analysis can be applied successfully in the analysis of the competitive advantage, analysis of the competition context that the future activity is targeted in, harmonization of the product lifecycle with the product and activity portfolio, elaboration of managerial strategies in the competitive environment, strategy monitoring and assessment of the strategies of the competitive environment, change of the managerial strategies and of course, the spectrum of applications can be extended.

In order to survive and become prosperous in a certain industry, a company must comply with the two criteria proposed by Grant ¹⁴⁹ namely it must offer what the clients and consumers want to buy and must fight and survive the competition. In order to cope with the second criterion, the company must therefore analyze the context and identify its success factors. The information generated for the company by the protonegotiative methods of analysis of the competitive environment completes the image of strong points necessary for decision-making and the substantiation, establishment and implementation of the strategy necessary to the organization.

Conclusions

Far from being exhaustive, the study is trying to prove both the importance of protonegotiations as sales method and the importance pf protonegotiation as method of analysis of the competitive environment.

The novelty of this study consists in the introduction of the method of analysis of the competitive environment with the help of protonegotiative practices. It is obvious that the use in the analysis of the competitive environment of this innovation and the efficient balancing of its component parts could generate special savings of financial resource, time and last but not least special efficacy. As any real information used at the right moment, in organization management, in the elaboration of managerial strategies, as essential part of the strategic management applied in a competitive environment, the information generated by the protonegotiative methods of sales analysis can be used in different analysis, studies, forecasts etc.

The applicative dimensions of these methods are going to be practically and analyzed comparatively with the already recognized analysis models. The study represents an improvable, efficient analysis that can be, I hope, handy to successful managers to whom it can directly or indirectly a competitive advantage.

ANALYSIS OF THE ALTERNATIVE INVESTMENTS AS BASES FOR THE BUSINESS DECISION MAKING

Lupu Felicia Adriana

ASE București, Facultatea de Management Ploiesti, Str. Grigore Alexandrescu nr.1, 0722 156 506, felilupu@yahoo.com

Abstract

In the process of investment decision making it is not only the question if some investment has to be made, but it has frequently appear the problem of selection the best investments between two or more alternatives. For selection of investments that compete to be implemented in an enterprise it is necessary to estimate those investments represent alternatives.

The aim of this article is to understand the concept "time value of money" which is used in the evaluation of investments projects expected to provided benefits over a number of year and to develop a theoretical basis refering to the adequate models and methods, to find out which are the dynamic indicators used for evaluation the efficiency of investments.

Key words: investment decision, economic indicators, net present value

Jel classification: D 61, M19

Introduction

An important characteristic of investments that is usually linked with the investment process is uncertainty of expected benefits. As longer is investment period, as higher is uncertainty of future effects.

If the leading principal investment goal is profitability, in the case when we have at disposal mutually exclusive investment projects, the investor would tend to invest available financial resources into economically most profitable solution. In the process of selection between possible investment project alternatives, the decision will be made in favour of the alternative with highest profitability degree, with greatest amount of profit in an enterprise. It is necessary to emphasize that it is started from preposition that management team makes choice between two possible investment alternatives economically justified in an absolute sense with given calculative interest rate. That is why the solving of this problem is in making choice of those investment projects which could be more profitable for the investor.

If management team has at disposal amount of financial resources sufficient for implementation of only one of possible two alternative investments, then profitability level of chosen investment alternative should not be lower than minimal profitability level investor would like to achieve in the process of investment into enterprise. In that case the investor limits itself into the project that promises the highest level of economic effectiveness. In that way there have been adjusted amounts of available financial resources with investment possibilities in an enterprise.

The concept "time value of money" is used in the evaluation of investments projects expected to provide benefits over a number of years. Money can be thought of a having a time value. In others words, an amount of money received today is worth more than the same Ron amount if it were received a year from now.

Because of the fact that the processes and the phenomena from the investment field are influenced by the implications of the time factor, it is necessary to valuate dynamically the parameters of the investment projects (the investment value, the project incomes and costs, the profit or the net cash flow etc.).

The dynamic valuation of the effort and effect indicators within the analysis of the economic efficiency provided by the investment projects has a significant relevance, when the value indicators defining the investment activity involve an unfolding, an evolution in time and consists in recalculation of the investment parameters, their presentation depending on the reference chosen moment, an operation that requires the use of the up-dating procedures. So, the up-dating is a specific method for the dynamic valuation of the investments economic efficiency, giving the possibility to calculate certain adequate dynamic indicators that allow expressing and estimating the economic efficiency of the investments.

1. Methods and Models for evaluation the efficiency of investments

Static models¹⁵² - Only one period is being analysed while applying a static model. It is a particular period of exploitation that should be considered as an essential period of exploitation, or, in hypothetical terms, it is a medium period. In such a case, all the data from the planned period are received, which characterize the relative medium period. The question arises if it is justified to rely on one objective function or it is possible to ignore relations between other areas of enterprise activities in the process of decision making. Moreover, the problem of static model should be assessed critically¹⁵³.

¹⁵⁰ Moyer, C., & McGuigan, J., & Rao, R., Fundamentals of Contemporary Financial Management, Second Editions, Mason: Thomson, 2007, pg. 161

¹⁵¹ Bradu, M., Statistical-Financial Valuation Methods of the Investment projects, Theoretical and Applied Economics Review, 508, 2007, pp.49-52.

¹⁵² Perridon L., Steiner M., Financial economy of the enterprise, 10 Edition, Munich, 1999.

¹⁵³ Blohm, H., Lüder, K., Weak establishments in the field of industrial investments and ways of their elimination, 7 Edition, Munich, 1991.

Dynamic models¹⁵⁴- Investment projects are described by instalments and payoffs, which should be paid while realizing the projects in the particular period of time. The assumption is usually related with this, that major influence of alternatives is limited by definite specified instalments and payoffs. Their values can be determined in terms of time intervals. Instalments and payoffs accounting as well as the analysis of dynamic indices in the particular periods is an essential feature differentiating the dynamic models from the statistical ones. It should be noted, that the dynamic evaluation of utility model in comparison with the static model is closer to reality, because, in this case, several periods are analysed. Therefore, even though the application of the dynamic model requires more time, it is more efficient compared with the static model.

When we have to evaluate the efficiency of investment projects with a number of objective functions we use:

- 1. Methods based on quantitative measurements consists in methods within multicriteria utility theory¹⁵⁵.
- 2. Methods based on initial qualitative assessments, the results of which later take a quantitative form. This group consists of analytic hierarchy method 156.
- 3. Methods based on quantitative measurements but using a few indices to compare the alternatives (comparison preference method). This group consists of comparison preference methods ¹⁵⁷.
- 4. Methods based on qualitative data not using a shift to quantitative variables. This group comprises verbal decision analysis (VDA) methods¹⁵⁸.

It is possible to use methods from different groups of the classification above to analyze the effectiveness of investment policies. However, one should take into account peculiarities of individual investment problems.

A major goal of research is to develop a theoretical basis for creating a decision support system aimed to increase efficiency by applying multiattribute decision making approaches and mathematical modelling.

2. Dynamic indicators used in estimating the economic efficiency of the investments

The capital commitment (engaged capital/ up-dated total costs)

The capital commitment indicator expresses the initial total costs of the investments for building the projected production capacities and the ulterior costs for commissioning, for their operation minus the redemption expressed in the present value for a certain reference moment, usually, at the moment of beginning the investment works (t_0) .

The time horizont for calculation of the engaged capital is (d+D), namely the duration of executing the investments works (d) and the duration of efficient operation for the investment objective (D). Therefore, the capital commitment is calculated according to the relationship¹⁵⁹:

$$K_{t}^{up} = I_{t}^{up} + C_{t}^{up} = \sum_{t=1}^{d+D} \frac{I_{t} + C_{t}}{(1+r)}$$
 (1)

where:

 K_t^{up} – the total capital commitment up-dated at the moment t_0 ;

 I_{t}^{up} – the total investments up-dated at the moment t_{0} ;

 C_{t}^{up} – total operation costs up-dated at the moment t;

I, – annual investments;

 C_t – annual operation costs;

r – up-dating rate.

It is aimed to minimize the capital commitment at a given level of the storage capacity, total incomes and total economic advantages.

The Payback Period (PP)

The payback period of the investments is a segment of the useful life concerning the operation of the capacities provided through investments. The payback period of the investment represents the period of time that begins at the moment of commissioning the storage capacities, when the cumulated sum of the provided economic advantages equals the volume of the investments allocated in the project. In a dynamic approach one calculates the updated term of the investment payback, starting from the equality:

$$\sum_{t=1}^{d} \frac{I_t}{(1+r)^t} = \sum_{t=d+1}^{d+T} \frac{P_t}{(1+r)^t}$$
 (2)

¹⁵⁴ Heinhold M., The preliminary estimate and the account of profits and losses in examples, Schäfer-Poeschel publishing house, Stuttgart, 1997

¹⁵⁶ Saaty T. L., Fundamentals of Decision Making and Priority Theory with the AHP, RWS Publications, Pittsburgh, PA, USA, 1994

¹⁵⁷ Roy B., Multicriteria Methodology for Decision Aiding, Kluwer Academic Publishers, Dortrecht, 1996, 293 p.

¹⁵⁸ Larichev O. L, Olson D. L., Qualitative methods of decision making, Kluwer Academic Publishers, 2001.

¹⁵⁹ Stoian M., Ene Nedea, Practica gestiunii investițiilor, Ed. ASE, 2002, pg.92.

This one is the variant when the calculations are done from the beginning of the investment works on the assumption that the annual profits Pt are generated only after commissioning the objective. Therefore, during the execution period are partially put in exploitation certain storage capacities that will generate certain advantages. If the calculations are done at the moment of putting the objective into operation, then we have:

 $\sum_{t=1}^{d} I_{t} (1+r)^{d-t+1} = \sum_{t=1}^{T} \frac{P_{t}}{(1+r)^{t}}$ (3)

where T – term of payback the investments.

If more variants of the investments projects are compared, then is preferrable the project providing a minimum payback period.

The use of the payback term analysis in the economic and financial valuation of the investment decision is considered as a way to take into account the risk of the projected investments. By giving the priority to the more advantageous projects, characterized by short payback periods, it is accepted the conclusion that the future incomes and economic advantages will not be affected by incertitude and risk at the same scale as in case of variants with larger payback periods.

Another argument in the favor of this method is represented by the fact that the companies confronted with a cash shortage will give more importance to the rapid recovering of the invested funds and, respectively, to the possibility to satisfy other necessities.

The net present value (VAN)

This indicator, being a fundamental criterion for the economic and financial valuation of the investment projects, characterizes, as absolute value, the advantage gain of an investment project, the investor's gain for the invested capital expressed as cash-flow in present value.

Defined in comparison with the cash-flow, the VAN provided the scale of comparison between the total present cash-flow generated during the life of the project (CF up) and the total investment effort provided by that project, expressed in present value $(I_t^{up})^{160}$.

VAN is an integral indicator of investment efficiency and strikes off the register the total surplus of cash-flow in comparison with the investment cost. The reference moment for the NPV calculation is that of the works start ¹⁶¹:

VAN = CF^{up} - I_t^{up} =
$$\sum_{t=1}^{d+D} \frac{CF_t}{(1+r)^t} - \sum_{t=1}^{d} \frac{I_t}{(1+r)^t}$$
 (6)

Defined by means of the net value, NPV expresses the algebraic sum of the present net value upon the horizon of time (d+D). By annual net value VN it is understood the difference between the annual volume of incomes (receipts) generated during the all operating period of time Vt and the volume of the total annual costs (investments and operation in the year t (Kt=It+Ct).

According to the criterion VAN, must be accepted the projects and the project variants for which VAN > 0. This fact means that the corresponding project has the capacity to reimburse during the economic life (D) the invested capital or, in other words, has the capacity to generate an income flow in excess, providing a certain volume of net value.

A project with VAN < 0 has to be rejected because its rentability will be smaller than the updating rate. VAN remains one of the best criteria for selecting the investment projects. But, in order to exclude the risk of certain incorrect decisions it is recommended the analysis of this indicator together with other ones, namely the profitability index, the internal rate of return, the updated term of the investment collection.

The profitability index (PI)

During the calculation and the analysis of the investment project one uses this index when the investment projects or the projects variants are differentiated between them through the necessary investment effort, because this index takes into account the size of the investments, the necessary investment costs, element that is not provided when we use the VAN indicator. The profitability index is calculated according to the relationship 162:

¹⁶⁰ Stancu I., Finante, Ed. Economică, București, 1997, pg.291.

¹⁶¹ Cistelean L., Economia, Eficiența și Finanțarea Investițiilor, Ed. Economică, București, 2002, pg.319.

¹⁶²Cistelean L., Economia, Eficiența și Finanțarea Investițiilor, Ed. Economică, București, 2002, pg.333.

$$PI = \frac{CF^{up}}{I^{up}} = \frac{\sum_{t=d+1}^{d+D} \frac{CF_t}{(1+r)^t}}{\sum_{t=1}^{d} \frac{I_t}{(1+r)^t}}$$
(7)

An independent investment project must be accepted only if PI > I and has to be rejected if PI < I. The project having PI = I (same as when VAN = 0) will provide the recovering of the investment expenditure only, without generating some profit. The more PI is the more profitable are the projects.

The internal rate of return (IRR)

This is defined as the updating rate that provided equality between the updated value of the net cash-flow incomes and the updated value of the investment costs. It results that *RIR* represents that discounting rate for which the *VAN* value is equal with zero.

The internal rate of return is one of the most significant indicators for the efficiency of the investments project, because it expresses the investment capacity to generate profit during the all operating period of the objective by fixing its economic power.

The \widetilde{RIR} value can be calculated through the *interpolating method*¹⁶³. The application of this method implies to find such two updating rates that for a rate r_{min} results an updated positive net value (VAN+), and for r_{max} an updated negative net value (VAN-). The values of the VAN level for these two updating rates are placed within a rectangular system of coordinates, expressing on X-axis various updating rates, and on Y-axis the progress of the updated net value.

The difference between rmax and rmin must not exceed 5 percentage points. Otherwise, by using a larger distance an error will be generated. RIR will be larger than the real value. Given the fact that the differences between r_{max}

and r_{min} are small enough, we can take into consideration the existence of a linear dependence between VAN and the updating rate (r). Therefore, for finding with exactness the RIR one uses the relationship:

$$RIR = r_{\min} + (r_{\max} - r_{\min}) * \frac{VAN(+)}{VAN(+) + VAN(-)}$$
(8)

When we compare alternatives of investment projects or project variants, characterized through *VAN* close values the priority is given to the project (variant) having a maxim RIR.

Conclusion

A complex analysis of methods and techniques currently used by the researchers of various countries to determine the efficiency of investments was made.

In the analysis of the economic efficiency concerning the investment projects, a significant importance has the number of the analyzed projects, either a sole project or a set of investment portfolio when there are independent projects and projects that exclude themselves reciprocally is in discussion. The analysis of a sole project is a particular case of a portfolio of investment projects when the criteria *VAN,RIR* and *PI* leads to the same conclusion concerning the acceptation or the rejection of the investment project. This happens because between these indicators there are relationships of interdependence.

Selection between two alternative investments can be also done on the basis of the rate of effective invested capital compounding, i.e. on the basis of their internal rates of return. An investment is economically more effective if its internal rate of return is higher than determined calculative interest rate. In other words, for investor one investment is more favorable if the rate of effective invested capital compounding is higher than required degree of minimal compounding (determined by level of calculative interest rate).

In the case of selection between two alternative investments, we could conclude that for investor the more favorable investment is the one which enables higher rate of effective invested capital compounding. Similarly as in the case of net present value method utilization, procedure of economic effectiveness comparison between two alternative investments on the basis of their internal rate of return depends on the fact if analyzed investments represent full alternatives, or they differ in investment amounts, or expected utilization period. In the cases when those two parameters (investment amount and utilization period) are the same in two investments, criterion for selection of economically more effective investment alternative is the following: Investment I is economically more effective than Investment II if it has higher internal rate of return.

If they have equal projected investment values, equal period of exploitation and equal annual cash flows by particular years, then we can conclude those investments represent full alternatives. In that case, decision on selection could be made on the basis of the model for comparison of economic indicators for particular alternatives. For one model it is important to be given starting suppositions concerning type and conditions of financing into

_

¹⁶³ Stoian, M., & Ene N., Practica gestiunii investițiilor, Ed. ASE, București, 2002.

particular alternatives. Then, it is necessary to be defined the business goal and appropriate constraints. It is evident that establishment of an investment model is aiming at achievement of the basic economic goal- maximal degree of invested capital compounding.

Abstract

Efficient planning and management of investments have become not only an important problem but also a complicated problem in the dynamically changing environment.

The goal of this article is to develop a theoretical basis for creating a decision support system for distribution for food products companies. To achieve the goal, the following problems have to be solved: determination of the characteristics of merchandise distribution companies, determination of the adequate methods, and identification of the recommended values of dynamic indicators for the determination the eligibility of the investments.

Keywords: investment decision, economic indicators, present value, future value, distribution companies

Jel classification:D39, M19

1. Characterisc of distribution

The term *distribution*, in Patriche's vision¹⁶⁴, designates the complex of means and operations ensuring the placement at the users' or final consumers' disposal of goods and services provided by manufacturing enterprises. Or, in other words, distribution represents the process by which the goods and services are placed at intermediate or final consumers' disposal, providing them with the facilities of location, time, size, etc.

The term *distribution* designates the complex of means and operations ensuring the placement at the users' or final consumers' disposal of goods and services provided by manufacturing enterprises. Or, in other words, distribution represents the process by which the goods and services are placed at intermediate or final consumers' disposal, providing them with the facilities of location, time, size, etc., according to the requirements they express on the market¹⁶⁵.

Clients appreciate the immediate availability of the merchandise, being ready to pay an additional amount for this facility. As a result of this decision, the distributor now supplies in a profitable way the market at the national level, whereas manufacturers benefit from a uniform demand. The distributors that feel that they are in a partnership relation with their suppliers can influence their clients to purchase a certain product. Briefly, distributors can achieve the differentiation of the product.

The means and operations designated by the term *distribution* are classified into two big categories that can be designated by the notions *commercial distribution and physical distribution*. The commercial distribution consists in the transfer of the ownership title over the product from the manufacturer to the consumer. That distribution can be ensured by distribution agents. They can be individual, such as the sales agents of an enterprise, or wholesale enterprises, companies whose object of activity are mail order selling or retail trade etc. Physical distribution, in its turn, consists in placing from the material point of view the goods and services at consumers' disposal, with the help of the means of transport and stocking. The physical distribution can also be found in the specialized literature as commercial logistics.

In a society based on knowledge, distribution exceeds the limits of a mere transmission of merchandise, adding or associating to it a constantly-increasing range of services, as well as an active influence of production, based on the detailed knowledge of the consumers¹⁶⁶.

Distribution is meant to regularize the circulation of goods and services between production and consumption and satisfy consumers' needs, providing them with a series of services, giving them the possibility to choose from a wide range the goods and services that better correspond to their needs and exigencies etc.

Among the main function of the distribution, the specialized literature mentions the following:

- change of the ownership over the product, namely the performance of the successive transfer of the ownership right from the manufacturer to the consumer via sale-purchase agreements;
- displacement of the products from the manufacturer to the consumer through activities of transport, stocking, conditioning, handling, dismounting or assembling, packaging, exposure for sale, sale etc.;
- information, consultancy and provision of after-sale servicing in order to ensure a good information of the clients about the possibilities to satisfy various needs, facilitate the operations of choice of the necessary products and assistance in the process of maintenance and use of the different purchased goods¹⁶⁷;

¹⁶⁴ Patriche D., Economie Comercială, Ed.Institutul National Virgil Madgearu, Bucucurești, 1993, p 35.

¹⁶⁵ Dayan A., Manuel de la distribution, Les Editions d'Organisation, Paris, 1987, p.23.

¹⁶⁶Gnetta J., A chaque type de client, un marché specialisé, Rev. "Le nouvel economiste" nr.932/1999, Franța.

- financing of commercial operations, a function that considers the existence of cases in which distribution agents finance manufacturing enterprises in the product purchase and stocking process in intervals in which the merchandise is produced and not sold to the client immediately.

The enumerated functions point out the fact that distribution plays a multiple and beneficial role for both the manufacturer and the consumer.

With regard to the manufacturer, distribution operates a regularization of the manufacturing activity, allowing the manufacturer to break down production all over the management year by advance orders and stocking, operations that annihilate the effects of the seasonal or circumstantial oscillations of the demand, the distribution participating in the financial efforts of the manufacturers, paying for the goods stocked without having the certainty of their sale. By its functions, distribution also allows the manufacturer to orient its production and send its products everywhere, by the participation in the organization and performance of promotional actions meant to ensure a better sale of its products or services.

With regard to the consumer, distribution also plays an essential role. It places at the consumer's disposal, wherever it is and whenever it wants, the necessary goods in the requested quantities. By such facilities, distribution spares the consumer of long trips, efforts to perform big purchases and immobilizations of amounts that, made available this way, can be used for other purposes.

Contemporary economy, by the complexity of the phenomena it generates, makes distribution methods evolve constantly. In such a context, new forms of wholesale and retail sale as well as new retail distribution systems appear¹⁶⁸.

Manufacturing companies, from the perspective of the distribution companies, are at both ends of the chain, as both receiver of raw materials and components and product offerors. The thinking style of commerce business is based on the improvement of the relation between sales and purchases and as the sum between efficacy and efficiency by a constant reconciliation between standardization (avoidance of the renunciation to a commercialized product) and flexibility (introduction of a new product in sales) and by the monitoring of the performance indicators for cost/price, quality and delivery time. Productivity is extremely important when we are talking about market share and even competitiveness level. The factors influencing the productivity level in distribution companies are the following: supplier management and 'best practices' conception, company losses, competition monitoring and constant improvement of the client relation. In synthesis, the distribution business process is as follows: suppliers, logistics, storing, sale, clients.

2. Investment decisions

Investments have a determining role in the development of a business, as any mistake in this domain endangers the life of the organization, investments representing in fact a certain expense for a future full of uncertainty¹⁶⁹. Generally speaking, *the notion investment comprises all expenses or funds an allocation from which future income is expected*. The investment process supposes the allocation at a given moment of a quantity of currency to a direction that may produce income in several successive periods of time.

In their restricted meaning, investments represent expenses performed to obtained fixed assets, namely for the construction, reconstruction, expansion, modernization and purchase of fixed assets such as machines, equipment, means of transport, etc.. By the investment process in restricted meaning, currency is turned into fixed assets, we are therefore talking about the allocation of funds for activities of replacement or expansion of working tools.

The investment decision must be based on complex and exact information referring to the necessity, opportunity, volume of the expenses and financial resources, fund receipts and disbursements during the whole period of operation of the fixed assets, provision of profitability and liquidity, recovery of invested capitals, duration of execution and operation of the investments, etc.

The investment decision corresponds to the top management of the enterprise, as it engages in general wide-span actions involving major consumption of capital.

When a project is started, the management team naturally becomes aware in a certain extent of the probabilities not to achieve the proposed objective. It I therefore necessary to know the risk and uncertainty and select the action measures meant to prevent or diminish those risk factors.

At the same time, successful companies are periodically performing critical reassessments of the allocation of the resources in investments in order to see whether the current performances and estimations for the business products, services or segments are still in the same line with the organization's global strategic position. Should an attentive analysis reveal economic results or estimations about a certain market or activity below expectations, then the disinvestment, seen as diametrically opposed to investment, becomes a decision-making option. The activities with weak result are responsible for the destruction of the business value. The sale of the assets afferent to these activities or the sale of the operational units in block, using the principle of the continuation of the activity, allows

¹⁶⁷ Montgomery St. L.: Profitable Pricing Strategies, Mc Graw-Hill Book Company, New York, 1988, p. 151-160.

¹⁶⁹ Vasilescu I, "Pregătirea, Evaluarea și Auditul Proiectelor Economice", Eficon Press, 2006, pg. 89.

the recovery of the invested funds and their reallocation for other activities in a more advantageous way, by making new investments, reducing indebt ness or redemption of own shares from the market. Also, the sale of fixed assets and their replacement by new ones create by their sale, financing sources for the new acquisitions.

The references necessary for the selection of the investments or disinvestments are general economic performance criteria. They are based on cash flows, measuring the influences of the option between the fund invested at present and the cash flows expected in the future from operational activities and residual values of the investments performed. The financial measure tools based on cash flows are the following: the net present value - VAN, the internal rate of return - RIR, the profitability index - PI.

On the other hand, the usual references used to measure the existing investments are generally based on the data and relations of the accounting of the companies. Indicators such as profitability of the invested capital, profitability of the net assets and profitability of the operation assets link the data existing in the accounting balance and the ones of the profit and loss statement.

According to Cocriş and Işan¹⁷⁰, no matter the decision-making situation (certainty, uncertainty or risk), the investment decision has three dimensions: the strategic dimension, investment dimension and financial dimension.

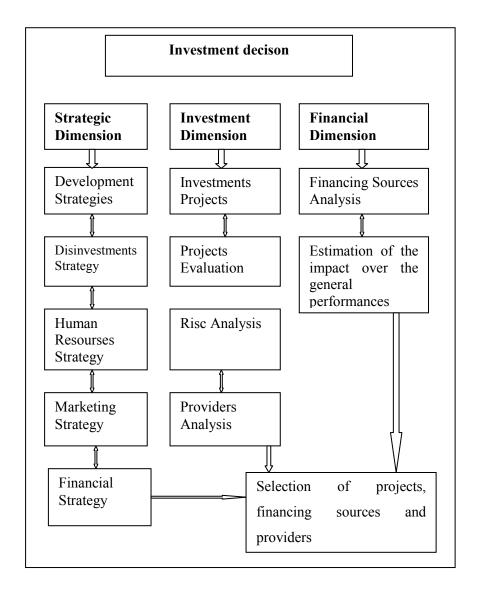

Table 1 – Dimensions of the investment decision

Investments of the food distriburion companies represent acquisitions(or constructions under own contracting) of real estate properties, mobile assets, commercial investments and human resources investments.

The investments in mobile assets of the merchandise distribution companies consisted especially in means of transport and stock.

Investments in human resources of merchandise distribution companies basically represent the key of success of these companies, the distribution activity implying a direct contact between people. No matter how good the client

¹⁷⁰ Cocriș V., Işan V., "Economia Afacerilor", Editura Graphix, Iași., 1995, pg. 114-118.

service strategy, people will be the ones to apply it, and client' perception over the provided services will lead to the failure or success of the organization. The penetration of the strategic human resources management concept as well as the models practiced by international companies require a sustained training programme, career development, motivation, delegation, performance assessment and employee satisfaction measurement. Investments in the human capital give value to an organization to the same extent as any type of investment.

Românu and Vasilescu¹⁷¹ believe that all investments are defined by four characteristics: the individualized concrete content of resources, the time factor, the efficiency or future effect of the use of the resources at present and the investment risk.

In the restricted meaning, in the studied situation of merchandise distribution investments represent expenses made in order to obtain fixed assets, namely for the construction, reconstruction, expansion, refurbishment and purchase of fixed assets such as deposits, means of transport for sales agents, means of transport for merchandise, PCs and online communication systems, etc. Other expenses are assimilated to investments, such as: expenses referring to design works, training of the staff necessary for objectives under construction, etc. By the investment process in its restricted meaning, currency is turned into fixed assets, so that we witness the allocation of funds for activities or replacement or expansion of working tools.

For the manager of the organization, investment is first of all a decision to immobilize a capital in order to obtain good profitability. His/her main role is to find the financing sources necessary for the investment assess and obtain an adequate profitability. From the financial point of view, an investment characterizes by very high expenses by fund receipts during all its operation intervals.

3. Dynamic indicators used in estimating the economic efficiency of the investments in distribution for food products companies

Construction of the alternative investments' models in a distribution companies is based on determination of inputoutput indicators and relations. In analysis of alternative investments in an enterprise we could get answers on the following questions:

- What investment alternative in enterprise is the most profitable one?
- Determination of choice between alternative investment possibilities.

In the process of finding out the answers on above-mentioned or similar questions, it is necessary to define the investment goal. If the leading principal is profitability, in the case when we have at disposal mutually exclusive investment projects, the investor would tend to invest available financial resources into economically most profitable solution. In the process of selection between possible investment project alternatives, the decision will be made in favour of the alternative with highest profitability degree, with greatest amount of profit in an enterprise. It is necessary to emphasize that it is started from preposition that management team makes choice between two possible investment alternatives economically justified in an absolute sense with given calculative interest rate. That is why the solving of this problem is in making choice of those investment projects which could be more profitable for the investor.

If management team has at disposal amount of financial resources sufficient for implementation of only one of possible two alternative investments, then profitability level of chosen investment alternative should not be lower than minimal profitability level investor would like to achieve in the process of investment into enterprise. In that case the investor limits itself into the project that promises the highest level of economic effectiveness. In that way there have been adjusted amounts of available financial resources with investment possibilities in an enterprise.

The concept "time value of money" is used in the evaluation of investments projects expected to provide benefits over a number of years. Money can be thought of a having a time value. In others words, an amount of money received today is worth more than the same Ron amount if it were received a year from now.

Because of the fact that the processes and the phenomena from the investment field are influenced by the implications of the time factor, it is necessary to valuate dynamically the parameters of the investment projects (the investment value, the project incomes and costs, the profit or the net cash flow etc.).

The dynamic valuation of the effort and effect indicators within the analysis of the economic efficiency provided by the investment projects has a significant relevance, when the value indicators defining the investment activity involve an unfolding, an evolution in time and consists in recalculation of the investment parameters, their presentation depending on the reference chosen moment, an operation that requires the use of the up-dating procedures. So, the up-dating is a specific method for the dynamic valuation of the investments economic efficiency, giving the possibility to calculate certain adequate dynamic indicators(engaged capital/ up-dated total costs, the Payback Period - PP, the net present value - VAN, the profitability index - PI, the internal rate of return - RIR) that allow to express and estimate the economic efficiency of the investments.

¹⁷¹ Românu I., Vasilescu I. (coord.), "Managementul investițiilor", Ed. Mărgăritar, București, 1997, pg.15.

¹⁷² Moyer Charles, J.McGuigan, Ramesh P. Rao, Fundamentals of Contemporary Financial Management, Second Editions, Ed.Thomson, Mason, USA, 2007, pg.161.

Conclusion

In distribution companies, it is aimed to minimize the capital commitment at a given level of the storage capacity, total incomes and total economic advantages.

According to the criterion VAN, must be accepted the projects and the project variants for which VAN > 0. If more variants of the investments projects are compared, then is preferable the project providing a minimum payback period. A project with VAN < 0 has to be rejected because its rentability will be smaller than the updating rate.

An independent investment project must be accepted only if PI > I and has to be rejected if PI < I. The project having PI = I(same as when VAN = 0) will provide the recovering of the investment expenditure only, without generating some profit. The more PI is the more profitable are the projects.

When we compare alternatives of investment projects or project variants, characterized through *VAN* close values the priority is given to the project (variant) having a maxim RIR.

This project propose a strategy focused on the realization of some measurable, well definited objectives, and on a series of strategically options, supported by actions with clear dead-lines and with direct implications on the entire system of Romanian penitentiaries.

In order to determine the essentials elements of the strategy, we took into consideration the aim of this institution and the necessity to adopt a development strategy, in the context of lining-up the penitentiaries from Romania to conditions enforced of the FII

Through the strategic objectives and the suggested actions for the system of Romanian penitentiaries, we followed as the suggested strategy for insuring a competitive durable advantage and to offers the funds required of the development.

Key Words: management of penitentiaries, development strategy, strategic objectives, risks analyse Jel Code: K

Introduction

Aspects of execution of penal punishments are largely unknown to the public because of lack of transparency that the administration of the prison showed at 1948 until 1990.

There are relatively few works in the world - and also romanian specialized bibliography - on the work performed in detention and management organizations in the prisons, although the issue has an extreme actuality through its social implications.

The prison management issues is addressed in scientific publications devoted to particular subsequent periods in which the negative events of prisons become public or after extensive protests or strikes caused the detainees or even the guardians.

The implementation of penitentiary system reform in Romania is ongoing, from the month of October 2006 when has entered into force the new law of penal punishment (Law no. 275/04.07.2006). So, I consider that aims to present work is presentation a management study in a special type of organization from environment of deprivation of liberty – for improving and adapting the work of these organizations to the new realities of the Romanian society. At present, in Romania, from a herd of more than 36.000 prisoners, operating a number of productive 9.600, in direct coordination and supervision of more than 2000 employees of the National Administration of Prisons (ANP). Their work is conducted in a number of 48 units subordinated ANP and 5 branches of the autonomous institution specialized in work with this category of staff - Multiproduct RA.

1. Assessing the external environment of the penitentiaries system

After a diagnostic analysis of the prison, I concluded that the evaluation of the influence of external environment on the prison system presents a particular interest, as long as it is a open socio-economic system, in which entries in the system are material, human and information resources, but particular the prisoners which are in middle of the transformations. This transformation held at social, educational and psychological behavior taking place in order to obtain results (output) to meet the society, that is concerned for the provision of safe conditions of detention and the preparation of social return of prisoners.

2. Evaluation responses to the environmental constraints

In assessing of the prison system responses to environmental constraints, I considered necessary to obtain additional information from the prison employees, from prisoners and of civil society represented by the main partner NGOs.

2.1. Resultats of polls at level of the prisons employees

Considering the staff from prison as the main catalyst for reform of professional standards and mentality in the prisons system, I appreciate that their views can help to assessment of the effectiveness of the system in relation to his mision and internal factors that determine responses to the penitentiaries system of environmental constraints. Through Compartiment Research and Studies from National Administration of Prisons, have been distributed questionnaires to a number of 399 persons. To build the sample was used on quota sampling method combined with the random and is considered representative for the research, with a margin of error of the study is \pm 5% and a confidence level of 99%.

The study was descriptive in nature and main objectives were:

- Identifying the opinions of employees of units subordinated to the National Administration of Prison on the institutional and informal relationships at work;
- Identification perception prison employees on the prisoners;
- Identifying prison employees perception of the quality of vocational training and working conditions;
- Identifying prison employees opinions on the mission prison system.

Following the study were obtained the following results:

A. The appreciation of the role of the prisons

It was noted that a proportion of 42.3% of the sample of employees of the penitentiary system, consider that the main role of the prisons is social reintegration. 17.6% of the respondents consider that can not split the role of social reintegration of the custody, while less than one quarter of prison officials see in their work only important custodial role. 17.2% have not reponse to question.

B. Assessment of the management of the institution

The assessment on a scale of 1 to 10 the care shown by the leadership of the institution from achieving the objectives of management of the ANP, and to the employees ANP has generated an overall average of perception with regard to the care shown by the leadership of ANP from the tasks is of 8.56, while care for subordinates is perceived by study subjects as less - 6.60. Thus, employees consider that the level of decision-making act, directors of prisons are concerned more tasks than the subordinates. I wanted also to know what is, in the opinion of respondents, the degree of involvement of management staff in process of decision-making at the prison. In general, workers in the penal system are not considered to consult before making a decision, 63% stating that they are rarely consulted or very rarely. Even if the decision is taken without being seen and subordinates in nearly 50% of these cases the decision is not even explained, it is a simple order that a large proportion of staff (third) do not understand the meaning. Where employees are, however, consulted by senior decision-making, most of them stated that their opinions are rarely or very rarely taken into account. Specifically, only 15% of prison employees feel that they are seen and believe that personal matter and is taken into account in decision-making.

C. Evaluation sectors of activity

Respondents appreciated, by providing notes from 1 to 10, the quality of activity for each sector of activity. Almost all sectors whose work does not involve working directly with the prisoners, have over 8 note, as proof that their work is appreciated positively in the prison system. It should note the modest appreciation of activity for Social Reintegration Service (instead of 8 in quality rankings activity) which indicates a major dissatisfaction on the competence and efficiency of this sector, or dissatisfaction of the security sector employees who claim that often are not supported their work by specialists other services that work with prisoners. The biggest complaints is about the quality of medical assistance activities.

D. Vision of the overall needs of the organization

At the request to mention what would change in their unit, if they have this possibility, 32.3% of those interviewed have not given any response. The fact that one third of respondents hesitate to answer such a question, although employees are clearly dissatisfied many aspects of activity in the penal system, may have different reasons: fear, carelessness, lack of imagination.

Of those who responded to this question, most responses (15.1% of the sample, and 22.2% of quantifiable responses) were referred to the desire to change the mentality of staff. Ranks second (8.2%) is intended to supplement the staff with new employees. 6.5% of the interviewed would change the relationship work, and 6.1% would create conditions and an atmosphere of more pleasant. 5% of respondents would invest in new facilities, 3.6% would make organizational changes or would change the division of tasks by sector, the same percentage of employees would insist on motivational factors and 3.6% would change the style of work management. Only 3% of respondents would dismissal (1.1% would dismiss the leadership, and 1.8% would dismiss staff in other sectors).

2.2. Resultats of polls at level of the prisoners

Considering that the prison system performance is reflected by the degree to which people deprived of freedom can return into community as citizens capable of living and is claimed by its own forces, in compliance with the laws and moral norms accepted, I appreciate that their views can help us to evaluate the effectiveness of the system in relation to its social mission.

Information obtained from a total of 681 prisoners, which is considered a representative sample for the research, with a margin of error of research \pm 5%. reveals the following perception indices on the quality of life of detention:

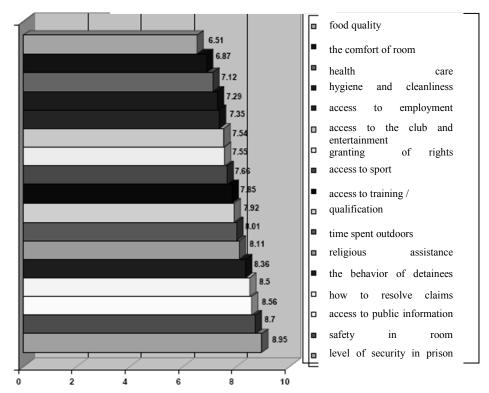

Figure 2. Notes granted to indicators regarding the quality of life in detention

Identifying the degree of satisfaction of prisoners on the quality of life in detention, was maked through the notes from 1 to 10 (10 being the maximum grade) for 17 indicators of quality of life in prison.

Results on the perception indicators for quality of life in detention shows that is an obvious displeasure of prisoners in particular towards the quality of food (the smallest average - 6.51), from the comfort of the room holding (in circumstances the index of overcrowded exceeds 150% in some prisons), compared to the quality of care and conditions of hygiene and cleanliness. The prisoners have appreciated the level of security in prison (the highest average - 8.95), and a good appreciation obtained access to public information(8.56).

Unfortunately, some of the most important issues for social reintegration effort of prisoners, namely access to work and access to education activities and training, have received little or mediocre note, compared with other indicators of life detention.

3. Proposals for the mission, vision and values for penitentiaries system

We appreciate that the formulation of a clear vision on the future development of the penitentiary system has a major importance because:

- provide guidance on the overall interests of all stakeholder;
- provides general information on the future allocation of available resources;
- provide information on the future orientation of the penitentiaries system, allowing the formulation of general goals, which can be easily measured and controlled.

Considering the issues specified above, I propose the following **strategic vision** on the penitentiaries system from Romania at the horizon 2012: Penitentiary Service will become a partner for social community, recognized as essential for ensuring public safety due to high level of social reinsertion of offenders.

We consider that the mission must made such a way as to reflect the particular interests of citizens, because they are directly or indirectly present in multiple categories of stakeholder, either as an individual (person convicted), as a group of individuals (family of convicted person), and the whole society needs public security which is provides from penitentiaries system.

Also, based on strategic vision, it is recommended formulation of a mission with a character provocative, to represent a real engine for development of the penitentiary system in our country. Therefore, we propose the following **mission**:

Penitentiary Service, as part of the judiciary services, has the mission to ensure respect for fundamental rights of the individual in the execution of punishment and measures involving deprivation of liberty, to ensure the education of prisoners in order to return and their social status and contribute to improving the safety of the community by creating and maintaining a secure environment custodial and transparent.

Through the proposed mission consider that we have a clear definition of the fundamental objectives of the penitentiary system, namely, ensuring a secure detention and transparent to ensure the reintegration into society of persons convicted and respect their rights.

In this regard, the penal system should create conditions enabling for every prisoner to have access to education, vocational training, retraining programs and social reintegration.

In order to achieve its mission, the penitentiaries system promotes the following main values:

- professionalism and integrity of personnel;
- transparency in the institution;
- the efficiency and effectiveness in achieving the objectives;
- assuming the responsibility of its social role;
- respect for individual rights and human dignity;
- respect for social values;
- appreciation potential for rehabilitation of persons deprived of liberty;
- the need to reduce the negative effects of deprivation of liberty.

4. Setting strategic objectives for penitentiaries system

In order to develop a global strategy I appreciate necessary a systemic approach of the priority directions for establishing strategic objectives and options.

It may set the following examples of strategic objectives included in the priority directions of action:

Developing educational function of the prison service

- a) psycho-social intervention programs will be available for at least X% of inmates with serious problems (alcohol, drugs, violence, etc.). at the appropriate level of quality standards assumed;
- b) It will provide a degree of inclusion minimum Y% of those who want to participate in literacy programs at the appropriate level of quality standards assumed;
- c) The share of education activities will increase by Z\% in daily program by 2010 at the quality standards;

Improving conditions at the prison

The global index of capacity of accommodation will be a value below the threshold of 100%;

The accepted value of the accomodation index will be the maximum X%;

The transport of the prison service will increase with Y% by 2010;

Providing an optimal level of resources for the operation of the penitentiary service

- a) Z% increase in the level of investments reported at the detention unit;
- b) Establishment of minimum X new places having regard to current standards by the end of 2010;
- c) Modernization for Y places having regard to current standards by the end of 2010;
- <u>Providing a positive image of the prison service to society</u> a) Until the end of 2008 will ensure total transparency, responding to all requests from the legal media and civil society:
- b) Number of active partnerships and actions taken to the local community will increase by Z% by 2012;

Increasing security for penitentiaries system

- a) Number of escaped prisoners will not exceed annual Y;
- b) The degree of modernization of access and surveillance units in prisons will increase to z% up to 2010;
- c) The acts of aggression on staff will decrease with X% up to 2010;
- d) The acts of aggression between private freedom will decrease to Y% up to 2010;

Improving health care service in prison

- a) The annual rate of deaths recorded in the system will be under Z to 10.000 people;
- b) Medical service charge (No cases / physician) to fall by X% by 2010;

Development of human resources policy

Establish at least and new posts by the end of 2012;

State of functions at the prison service will reach with Z% in X years;

c) The percentage of personnel involved in training activities or specialized exceed X% annually and over Y% at the end of 2011;

Improving service management in prison

- a) At the end of 2008, will be placed on management agreements in the X% of subordinated units;
- b) The degree of fulfillment of the objectives will be at minimum Y%;
- c) Up to 2010, the standards will exceed Z% for the prison service functions.

Improving conditions at the prison

- a) The total employment will be a value below the threshold of 100%;
- b) the accepted face value of the index of employment change will be the max. X%;
- c) The transport of the prison service will increase with Y% up to 2010;

- Providing an optimal level of resources for the operation of the penitentiary service
- a) z% increase in the level of investments reported at the unit of detention;
- b) Establishment of minimum X new places having regard to current standards by the end of 2010;

Ensure a positive image of the prison service to society

- a) Until the end of 2008 will ensure total transparency, responding to all requests from the legal media and civil society;
- b) Number of active partnerships and actions taken to the local community will increase with Z% up to 2012;

THE AUDIT OF RECRUITMENT, SELECTION AND INTEGRATION OF THE HUMAN RESOURCES

Manolescu Aurel Ase Bucharest Marin Irinel

ASE Bucharest

The most well known category and also the most important is the one referring to the recruitment and selection of staff. Here, a lot of issues of legal nature may occur within the organization. This part refers to obtaining and assessing the qualified candidates for positions within the organization, from internal sources as well as external.

Content:

- 1. Overview The Role and Importance of the Human Resources Audit;
- 2. The Audit of Recruitment, Selection and Human Resources Integration
- 2.1. Practical hand book of the methodological-procedural system in approaching the audited field.
- 2.2. Norms and national and international reference standards of reporting the recruitment, selection and human resources integration audit.

1. Overview-The role and Importance of the Human Resources Audit

What does the human resources audit represent?/ How does organizations help and what kind of implications involve performing such an audit?/ What is the optimum moment of performing the human resources audit, so that to generate efficiency and effectiveness for the future activities of organizations?

Therefore, here are some of the questions that frequently occur in the international specialized literature, that led to the appearance and development of this relatively new field: the human resources audit.

As there is not a definition unanimous accepted and reckogned in the specialized literature regarding the human resources audit, each of them having as background the author's conception, the culture and the personal criterion of approach, one will try to present several **definitions** given by experts in this field.

The human resources audit is a periodic expertise performed within the administration of the human resources, which includes monitoring and collecting the information, its analysis and assessment on this basis of the efficiency on which the organization uses the human resources, with the purpose of improving continuously the performances and the work satisfaction of the employees ¹⁷³.

În 2000, the French author **Ingalens** suggests that ,, the human resources audit represents a **judgement** on the quality of the human resources of an organization"¹⁷⁴.

The American specialist in this field, **Bill Coy** argues that ,, the human resources audit represents a process of politics,procedures,documentations, system and research practices regarding the functions of the human resources within an organization ¹⁷⁵".

Therefore, through **the human resources audit** one can understand a complex of activities of monitoring and collecting information, that ensures the manager that the activities developed in the human resources field are running according to the plan, measuring the progress in the direction of the established objectives and detecting this way the deviations from the plan in order to take corrective measures. Derived from the monitoring activity of the results of the human resources, the human resources audit evolved in time and became a ground rule of the human resources management .

Except the fact that it succeeds in pointing out the real dimensions of the human resources activities, the audit helps the manager within all phases of the managing process, the decisions resulted from the information provided by the audit being well fundamented ¹⁷⁶.

The fundamental question addressed by the human resources audit- to the management audit is: Which should be the organization form of the staff administration system? Which is the number and the necessary qualification for the organization, in order to lead to an efficient achievement of the company' startegy based on the lowest costs?

Being a managing instrument, **the human resources audit** allows a global understanding of the human behaviour at the work place and its role in the management process. Therefore, it is an essential instrument for the

¹⁷⁷ Dubuis Maryline, Rotigliano Laura, Vergeseres Szlvie; professeur: M. Rousson, asistante: V. Turansky – "L'audit En Ressources Humaines", seminaire: Changement et Intervention dans l'Organisation, mai 2002, p.6

manager who is often submitted to the pressure of decision making in promoting, offering licence, dismissal, adjusting/readjusting the work place or whatever any other element belonging to the sphere of the human resources. In conclusion, it is extremely important that the audit performers as well as the managers, to be interested in the presentation of reliable images of the real situations within the human resources department, as making decisions based on real information is favourable to the organization on long term .

Within the activity of managing the human resources function within the organization, all aspects and the corresponding behaviours of this one, must be periodically audited and assessed. The audits must be performed with the purpose of determining if different elements of the subsystem are efficient for achieving the objectives established by the management of the organization.

The complexity of the economic process determines in the immediate perspective an increase of the audit role up to turning it into a profession and officialising this type of consultancy in the human resources management. The audit does not signify a "disguised" control under a more modern form; its role is to represent a correction factor to the requirements imposed by the market evolution, so that the organizational economic efficiency to be ensured.

A human resources audit can identify the results and recommend sollutions on the basis of the feed-back between the staff and the manager, combined with the author's observations. Moreover, the human resources audit implies a systematic examination of the practices and the politics regarding the human resources from an organization. This one points out the differences between "what is done" and "what needs to be done". Eliminating the mentioned differences, the organization can ensure itself an efficient leading of the processes, by identifying the weak and strength points of the organization and of the filed in which improvements can be made. As it can be noticed, the human resources administration system requires detailed researches.

2. The Audit of recruitment, selection and integration of the human resources

2.1. Practical hand book of the methodolgical-procedural system in approaching the audited field

The purpose diversity of the human resources audit and of the work relations within an organization allow the approach of this procedure as a complex process, which should be studied individually.

The content of auditing the recruitment, selection and human resources integration will comprise the assessment of the methods and procedures used for the staff recruitment; the recruitment costs; the efficiency of the recruitment through filling in the vacant positions; filling in the possible future positions; the efficiency of the selection and integration procedures of the new employees within the organization.

In order to gather the most complete information, in order to perform an efficient audit, the necessary set of questions which is required will be used . Here are several of them:

- Who is the responsible person with the employment requests and authorization of new employments? (to be filled in: the responsible person with the requests of new employment and its position; the responsible person with the authorization of new employment and its position)
- Is the existence of a job description necessary when the staff employment is being authorized? (Yes/No)
- Is the existence of some predefined performance standards necessary when the staff employment is being authorized?(Yes /No)
- Is the internal staff employment favoured versus the external staff one? (Yes / No)
- Does the organization have a program regarding the occupancy of the vacant positions? (Yes / No) If the answer to this question is a positive one, it can be speculated in order to obtain additional data regarding the details of this program.
- Is there a promotion policy that applies within the organization? (Yes / No);
- Who determines the techniques and the employment methods? (the responsible and the position is to be filled in)
- Which of the following specifications appear in the employment announcements? (one or more of the following categories is to be marked: the name of the organization, the name of the position, the location, the phone nr., the salary, the bonuses, the requirements, the contact person's name, the confidentiality of the information, the modality of replying of the organization, others, the organization does not make public the vacancies)
- Is there a minimum nr of candidates interviewed for a certain position? (Yes / No);
- Who is in charge with the candidates' selection? (the responsible and its position, to be filled in)
- What kind of sources are used in order to obtain external candidates? (to mark one or more of the following categories: internet, head-hunting agencies, the Agency for Employment of work force, schools, consultants, newspapers adds, job events, employment placement firms, staff reconversion, internal publications, others)
- Is there a program of recommending the candidates? (Yes /No).

In the case when the answer is positive, a series of additional questions can be generated, which could bring to the listener a plus of knowledge. This way, one can ask further questions regarding the responsible persons with the special phases of a selection and the methods used, the trainings programs performed by these ones, the employment rules, the modalities of storing the information, the requirements linked to the drugs tests, psychological tests, physic tests.

Finally, one can make an option for the questions with graded levels, referring to the employee's opinion.

2.2. National and International norms and standards of reporting the recruitment, selection and human resources integration audit

The reference system used within the human resources audit is created in order to offer to any auditor or to any interested user a benchmarking, referring to the criterion the audit is being performed on. In what the **general reference points** of the human resources audit concerns, one can consider the following:

- The audit is being performed by a person or persons that own an adequate technical preparation and professional experience as revisor/inspector
- In all activities that refer to tasks, the revisor/inspector or revisors/inspectors maintain the independance within the mental behaviour
- The concern is being manifested through performing the audit and preparing the report;
- The procedures of certifying the social auditors (according to ISO standards 9002) started being applied in 1994.

In 1941, **The Institute of Internal Auditors** (I.I.A.) was founded in the United Staes of America. The Anglo-Saxon institute gained trust and international interest. This one has an important activity regarding the level of professional experience and research, publishing writings and having its own magazine.

Starting from the "Responsibilities Declaration", one has currently reached to establishing some professional norms of internal audit which: define the ground principles, provide a background, establish appreciation criterion representing a factor of improving the auditors activity.

In order to reach these objectives, the **French Institute of Audit,** elaborated a programmatic document consisting in:

- The Deontological Code
- Qualification norms (according to the international standard series 1000) that states what are the characteristics that the audit services and the people that belong to these ones, should have
- The functionning norms(series 2000) that describe the audit activities and that define the quality criterion;
- The implementation norms (series 1000 or 2000, accompanied by an enclosed letter) which reject the precedent ones in the case of specific missions.

The Recruitment and the Selection can be compared to reference points and reported to different laws as ::

- -All recruitment requests of the positions are to be based on very clear descriptions of positions;
- -Use of adequate channels in order to inform the candidates for each position, including agencies, recruitment firms, head hunters, external networks and internal vacancy channels;
- -Each recruitment source must be measured in order for the opportunity to be determined;
- -All potential employees are tested for integrity;
- -All potential employees are interviewed by at least 2 members of the management;
- -All employees are submitted to the medical analysis
- -Order nr.761 from 30th of October 2001 of the Ministry of Health and Family for approaching the methodology regarding the medical examination at employment, the medical examination of adaptation, the periodic medical examination and the medical examination for work restarting;
- -The techniques for psychological analysis are to be used when necessary;
- -The stipulations referring to the testing of work period are included in all labour contracts
- -Government Decision nr .759/2002 for approving the National Plan of action for the occupancy of work force _ Official Monitor nr. 637/29.08.2002;
- -Government Decision nr.829/2002 regarding the approval of the NATIONAL Plan against poverty and promotion of the social inclusions Official Monitor nr. 662/06.09.2002;
- -Government Decision nr. 1156/2002 for approving the Memorandum of agreement between the Romanian Government and the Labour International Organization regarding the elimination of the child's labour, signed at Geneva on the 18th of June 2002 Official Monitor nr.792/30.10.2002;
- -The staff has been entirely informed on all important regulations of their employment
- -The Government Decision nr..261/22.02.2001 regarding the criterion and the methodology of placing the position in special work conditions Official Monitor nr.114/06.03.2001;
- -The Government Decision nr.676/2001 for modifying and completing the Government Decision nr.261/2001 Official Monitor nr.424/30.07.2001;
- -The Government Decision nr. 1337/2001 for modifying and completing the Government Decision nr. 261/2000 Official Monitor nr. 36/21.01.2002;
- -The norms from 07.05.2001 of applying the Government Decision nr .261/2001 Official Monitor nr.300/07.06.2001.

TRAINING AND DEVELOPMENT OF HUMAN RESOURCE AUDIT

Marin Costel - Irinel

ASE Bucuresti Bucuresti, b-dul. Decebal, nr. 17, bl. S16, sc.3, et. 5, ap. 57, sect. 3 Telefon: 0723 907915 E-mail: irmarin@ase.ro

Education, training and development refer to giving the opportunity to all employees to enrich their knowledge, to follow training programs for abilities and performances, to develop their careers by using both internal and external resources.

Keywords: Training, development, human resource, audit

JEL Classification codes: Management

Content:

- 1. Overview The Role and Importance of the Human Resources Audit;
- 2. Training and development of human resources audit;
- 2.1. A practical guide regarding the methodological and practical system for approaching the audited domain;
- 2.2. National and international reference audit reporting norms and standards regarding the development of human resources

1. Overview-The role and Importance of the Human Resources Audit

What does the human resources audit represent?/ How does organizations help and what kind of implications involve performing such an audit?/ What is the optimum moment of performing the human resources audit, so that to generate efficiency and effectiveness for the future activities of organizations?

Therefore, here are some of the questions that frequently occur in the international specialized literature, that led to the appearance and development of this relatively new field: the human resources audit.

As there is not a definition unanimous accepted and reckogned in the specialized literature regarding the human resources audit, each of them having as background the author's conception, the culture and the personal criterion of approach, one will try to present several **definitions** given by experts in this field.

The human resources audit is a periodic expertise performed within the administration of the human resources, which includes monitoring and collecting the information, its analysis and assessment on this basis of the efficiency on which the organization uses the human resources, with the purpose of improving continuously the performances and the work satisfaction of the employees ¹⁷⁸.

În 2000, the French author **Ingalens** suggests that ,, the human resources audit represents a **judgement** on the quality of the human resources of an organization"¹⁷⁹.

The American specialist in this field, **Bill Coy** argues that ,, the human resources audit represents a process of politics,procedures,documentations, system and research practices regarding the functions of the human resources within an organization ¹⁸⁰,.

Therefore, through **the human resources audit** one can understand a complex of activities of monitoring and collecting information, that ensures the manager that the activities developed in the human resources field are running according to the plan, measuring the progress in the direction of the established objectives and detecting this way the deviations from the plan in order to take corrective measures. Derived from the monitoring activity of the results of the human resources, the human resources audit evolved in time and became a ground rule of the human resources management.

Except the fact that it succeeds in pointing out the real dimensions of the human resources activities, the audit helps the manager within all phases of the managing process, the decisions resulted from the information provided by the audit being well fundamented¹⁸¹.

The fundamental question addressed by the human resources audit- to the management audit is: Which should be the organization form of the staff administration system? Which is the number and the necessary qualification for the organization, in order to lead to an efficient achievement of the company' startegy based on the lowest costs?

¹⁷⁸ I.G. Odegov, T.V. Niconova – "The Staff Audit", Ed. Examen, Moscova, 2004

¹⁷⁹ Jacques Ingalens – "Audit des Ressources Humaines", Editions Liaisons, 3e edition, p.91

¹⁸⁰ Prepared by Bill Coy, Senior Associate for HR Consultation L Piana Associates, Inc. - "Introduction to theHuman Resources Audit", 2002, p.162

¹⁸¹ Marin, I. – The Human Resources Audit" – Main Function of the Human Resources Management" _ Administration and Public Management" Magazine , nr.2, Ed. ASE, 2002

Being a managing instrument, **the human resources audit** allows a global understanding of the human behaviour at the work place and its role in the management process. Therefore, it is an essential instrument for the manager who is often submitted to the pressure of decision making in promoting, offering licence, dismissal, adjusting/readjusting the work place or whatever any other element belonging to the sphere of the human resources. In conclusion, it is extremely important that the audit performers as well as the managers, to be interested in the presentation of reliable images of the real situations within the human resources department, as making decisions based on real information is favourable to the organization on long term.

Within the activity of managing the human resources function within the organization, all aspects and the corresponding behaviours of this one, must be periodically audited and assessed. The audits must be performed with the purpose of determining if different elements of the subsystem are efficient for achieving the objectives established by the management of the organization.

The complexity of the economic process determines in the immediate perspective an increase of the audit role up to turning it into a profession and officialising this type of consultancy in the human resources management. The audit does not signify a "disguised" control under a more modern form; its role is to represent a correction factor to the requirements imposed by the market evolution, so that the organizational economic efficiency to be ensured A human resources audit can identify the results and recommend sollutions on the basis of the feed-back between the staff and the manager, combined with the author's observations. Moreover, the human resources audit implies a systematic examination of the practices and the politics regarding the human resources from an organization. This one points out the differences between "what is done" and "what needs to be done". Eliminating the mentioned differences, the organization can ensure itself an efficient leading of the processes, by identifying the weak and strength points of the organization and of the filed in which improvements can be made.

As it can be noticed, the human resources administration system requires detailed researches.

2. The Audit of recruitment, selection and integration of the human resources

2.1. Practical hand book of the methodolgical-procedural system in approaching the audited field

The purpose diversity of the human resources audit and of the work relations within an organization allow the approach of this procedure as a complex process, which should be studied individually.

In order to do this, they will always ask **questions** as:

- -Is there anybody in your company responsible with education, training and development of human resources? (Yes /No);
- -Who bring forward a training request? (choose between the following categories: employees / supervisors / supervising managers / department managers / human resources manager responsible with training program / an external consultant / others);
 - -Are there training programs for teaching the personnel other jobs within the company? (Yes / No);
 - -Do all training programs have pre-established behavior objectives? (Yes / No);
 - -Do the training programs have their results assessed? (Yes / No);
- -Who set the training domains necessary for the employees? (mention the names of the persons responsible and their positions);
- -How is the necessity of training identified? (choose between the following categories: position performance standards and objectives / performance level / changes of position's content / program of evaluation / promotion / employees' individual objective in order to develop / others);
- -How are the training programs procured? (choose between the following categories: from external sources / developed internally by training experts / developed internally by each department / developed externally by consultants / developed by schools or professional associations /others);
 - -Who perform the training programs? (name the responsible and position);
- -What type of training it is used? (group training / self training / computer assisted self training / Internet or Web self training / duty rotation).

One can use the following scheme containing several entrepreneurial training methods. Many of these versions can be applied for the human resources department too and can be successfully brought together in order to obtained as performing results as possible.

- -Must the training responsible persons have specific aptitudes? (Yes /No);
- -Are classes and seminaries considered training methods? (Yes / No);
- -Are the training costs for each program calculated regularly? (Yes / No);
- -Is the training cost carried out by the department where the trained person comes from? (Yes / No);
- -Is there any specialized catalog presenting methods and training techniques? (Yes / No).

Details will be obtained regarding this catalog if we have an affirmative answer.

_

¹⁸² Dubuis Maryline, Rotigliano Laura, Vergeseres Szlvie; professeur: M. Rousson, asistante: V. Turansky – "L'audit En Ressources Humaines", seminaire: Changement et Intervention dans l'Organisation, mai 2002, p.6

- -Is the organization paying the training programs or it is the possibility of a sponsorship? (one can choose between categories);
- -Is there a person responsible with employees' guidance towards fulfilling their future plans of development? (Yes / No);
- -Is the organization giving the possibility to discount the expenses for the training? (Yes No);
 - -Is the discount available on a special level? (Yes / No).

It is concluded with the open questions assessed on a 1 to 9 scale, representing the levels of very low or very high. The diversity of audit's goals for human resources and work relations within an organization allow the approach of this procedure as a complex process which has to be studied individually.

The content of recruitment, selection and integration audit for human resources will include the evaluation of methods and procedures which are used in order to recruit personnel; the recruitment costs; the recruitment efficiency by filling up the free jobs, filling up the jobs in the future; the efficiency of the selection and integration within the organization for the new employees methods.

The most influential and thus important category is the category related to **personnel recruitment and selection**. Here we can have the majority of juridical problems for an organization. This part can allude obtaining and evaluating the candidates qualified for jobs inside the company both from internal or external sources.

In order to gather information as complete as we can in order to have an efficient audit, one can ask as many questions as necessary. Some of the questions can be the following ones:

- -Who's the person responsible for request and certification of new employment? (fill in: a person responsible with demands of new employment and it's position; a person responsible with certifying new employment and it's position)
 - -Is there necessary a job description when certifying personnel employment? (Yes / No)
- -Are there necessary some standards of performance when certifying personnel employment? (Yes / No)
 - -Is it encouraged hiring personnel within the company against outsiders? (Yes / No)
 - -Is the organization having a program which enables job occupancy? (Yes / No)

One can try to get more information regarding the details of this program if the answer is affirmative.

- -Is there any promotion politics applicable within the organization? (Yes / No);
- -Who determine the techniques and methods of hiring? (name the person and position);
- -Which of the following specifications occur in the employment announcements? (check one or more of the following categories: name of the organization, job, location, phone number, salary, benefits, demands, name of the contact, confidentiality of information, organization's response modality, others, organization does not make the jobs public).:
 - -Is there a minimum number of interviewed candidates for a job? (Yes / No);
 - -Who perform their sorting? (name of responsible and position);
- -What type of sources is used in order to bring external candidates within the organization? (check one or more of the following categories: internet, head-hunting companies, Agency of Employment and Occupancy, schools, consultants, paper announcements, professional associations, employees' recommendations, job markets, employment companies, personnel changing, internal publications, others);
 - -Is there any candidate recommendation program? (Yes / No).

One can generate a series of adjacent questions if the answer is affirmative in order to bring to the auditor additional knowledge. Thus, as follows there are going to asked questions regarding the persons who are responsible with the selection stages and what methods do they use, the training programs performed by these ones, employment rules, ways of data storage, demands regarding the drug test requests, psychiatrical and physical tests etc.

Finally one can choose between the questions with gradual response regarding the employee's opinion

2.2. National and international reference audit reporting norms and standards regarding the training development of human resources

Education, training and development can pertain as guide marks as:

- -for all jobs were identified the necessary abilities;
- -the complex of abilities for each employee was identified and compared with the job it has in order to identify the training needs;
 - -proper training tactics were identified for the training needs of each employee;
 - -in time it is drawn up a training and development plan for all employees;
 - -the manager together with the employee set clearly and accept the objectives before each class;
- -a individual evaluation takes place after each class in order to observe if the objectives were and the level and in order to identify the necessary remedy;
 - -the abilities of each and every employee are periodically analyzed;

- -the expected performance standards which were analyzed and correspond to the employer;
- -management's periodical performances against the standard provisions;
- -the remedy process it is set together with each employee when performance deficiency;
- -the organization can contractually act if unsatisfactory performance.

Emphasizing the main particularities of the recruitment and selection process in the Romanian companies is more necessary in the present economic, social and political environment, the main challenge in the human resources field being the management of talents. In fact, we are talking about a more and more obvious problem which not just the Romanian companies are facing on, in the context of the globalization process extension, respectively how the companies are identifying, localizing, attracting and retaining the talents on long term. For the human resources specialists, knowing the main issues of the human resources recruitment and selection process could be a way to understand the complexity of this activity and especially, a way to identify new methods, opportunities to attract and retain in their companies the best people, the most competent employees from the labor market.

Key words: human resources recruitment and selection; recruitment and selection methods; human resources management; multinational companies; competence, performance.

JEL classification: M12, M50

Introduction

The data and the opinions presented in this paper are underlying the results of a study about the human resources management in the Romanian companies. There were 150 companies involved in this research. The study was based on a questionnaire (40 items) and it was addressed to the human resources specialists which act in companies from different branches. The main aim of this study was to achieve relevant data about the main human resource management activities (human resource strategies and policies, job design and analysis, human resources planning, recruitment and selection, human resource development, performance evaluation, reward management and work relations). All the 150 selected responders, human resources specialists, were actively involved in the research and they filled in the questionnaire. 26.58% of the responders are human resource managers and 73.42% of them are performers (execution job holders).

The 150 companies are from all four branches of the national economy: agriculture (3.8%), industry (20.25%), construction (6.33%) and services (69.62%).

The structure of the studied sample of companies reflects the contribution of each branch on the Gross Domestic Product. In 2007, the contribution of each branch on the Gross Domestic Product was the following: services – 60.8%, industry – 23.46%, constructions – 9.11%, agriculture – 6.63%.

The sample of the companies was structured: small and medium enterprises - 24.05%, public institutions - 21.52 %, big companies (Romanian capital) - 16.46% and multinationals - 16.46%.

Particularities of the human resources recruitment in the Romanian companies

The short time orientation that characterized the managerial activity is underlined by the fact that the most part of the Romanian organizations are guided, in the employment process, on the evolution of their day by day activity. Although it may be surprisingly, in the Romanian companies, the spontaneous needs of human resources are the main tool used in the process of the human resources planning. 57% of the companies are using this criterion to plan their human resources necessary, while 43% of them have human resources plans.

The Romanian companies are recruiting their human resources from where? What methods and tools are they using to recruit their personnel? These are two major questions that we are trying to answer. The results of the study about the human resource management in the Romanian companies, underline the preference of the employers for the external sources to recruit their human resources. The proportion between the external sources and the internal sources is 57% to 43% (table 1). This trend is available for the entire sample of the studied companies but, certainly, there are some differences between different types of companies. Although in the public institutions, the recruitment from the external sources is dominating, though they are using it on a low level than in the other organizations: small and medium enterprises (57.21%), large companies (56.15%) and multinationals (57.2%) (Table 1).

Table 1 Methods and sources of human resources recruitment used in the Romanian companies, by type of companies and personnel (performers and managers)

Head-hunting	2,40	2,17	2,10	2,15	2,57	2,40	2,43	2,44	2,48	2,04	
References	1,91	1,96	1,56	1,56	1,57	1,60	2,56	2,57	1,86	1,96	

The Internet is the most used external recruitment method of human resources, both for the performers (1.76) and for the managers (1.68). It has a higher frequency than the other external recruitment methods, mainly for the managers (table 1). But we must underline that the Romanian companies are using the Internet as an external recruitment method, mostly for the low and middle managers. The advertising and the references are used very often by the companies to recruit their personnel from external sources.

The external recruitment from the educational institutions and from the National Agency for Occupancy and Labor is used rarely. The main reason for this situation is that there is no partnership between the business environment and the educational institutions. Also, the offer of the National Agency for Occupancy and Labor is very poor. Companies do not use this external recruitment source because of the lack of the personnel competencies. Companies want to recruit people with a higher level of education and experience, but the National Agency for Occupancy and Labor doesn't offer them this kind of personnel. The Romanian companies are using head-hunting to recruit managers from the external sources. This recruitment method is used mainly to recruit the top managers. In the small and medium enterprises, the references are used very often to recruit from internal sources both, the performers (1.94) and managers (1.91). In the small and medium enterprises the references, the Internet and the advertising are the main methods used to recruit the personnel from the labor market. The managers are recruited from the external sources using the Internet (1.33) and the advertising (1.45), these two external recruitment methods being the most important. The performers are recruited from the external sources using the references (1.56) and the Internet (1.57). The small and medium enterprises are rarely cooperating with the National Agency for Occupancy and Labor, to recruit the performers (2.92) and the managers (3.00) (table 1).

In the public institutions, job posting is the most used internal recruitment method, both for the performers (1.59) and for the managers (1.82). The references (1.57) are used more frequently than the other external recruitment methods, like: the advertising (2.00), the Internet (2.00) and the spontaneous nominees (2.00). Recruiting from the educational institutions (2.78) and from the recruitment agencies (2.75) are rarely used to attract the performers. In the public institutions, the managers are recruited using the external recruitment methods like: references (1.60), the Internet and the spontaneous nominees (1.8) and the advertising (1.92). Just like the other organizations, the public institutions are rarely cooperating with the educational institutions and with the National Agency for Occupancy and Labor to recruit their managers (2.67).

The large companies recruit their human resources from internal sources using the references mostly for the performers (1.92) than for the managers (2.13) (table 1). The advertising is used as an external recruitment method both for the performers (1.75) and for the managers (1.56). The Internet offers important advantages for recruiting the performers (2.22) and the managers (2.29)

Unlike large companies, multinationals are using frequently the job posting to recruit the human resources from internal sources, both for the performers (1.78) and for the managers (1.87). In multinationals, to attract the performers, the main external recruitment methods are: the Internet (1.64), the advertising and the references (1.86). This trend is available in the case of the managers (table 1). For a better recruitment of the managers, multinationals are cooperating with the temporary work agencies (2.04) and with the specialized recruitment agencies (2.08). Unlike other organizations, multinationals are using frequently the head hunting to recruit their managers.

Particularities of the human resources selection in the Romanian companies

Which are the main selection criteria used in the Romanian companies? What is important: knowledge or experience? And how much does it matter? What methods are the Romanian companies using to select their personnel? These are other major questions and we are trying to answer by using the results of the study about the human resource management in the Romanian companies.

The most important four selection criteria used in the Romanian companies are: the individual attributes, abilities and capacities (2.00), the studies (2.04), the professional knowledge (2.30) and the professional experience (2.35) (table 2). This classification of the selection criteria shows that the employers are using many criteria to select their future employees.

The "individual attributes, abilities and capacities" criterion is used very often in all the organizations to select their future employees, unlike the public institutions which are using seldom this criterion (table 2). In multinationals, this criterion has a big importance (1.83).

The "studies" criterion is used very often in public institutions to recruit and select the new employees. Otherwise this criterion is used in all the Romanian organizations, but in the public institutions it has the biggest weight in the final employment decision, because of the employment legislation of the public servants, which states that in the public institution "the studies" criterion is the main recruitment and selection criterion (table 2).

The "professional knowledge" (2.30) and the "professional experience" (2.35) criteria have almost the same importance in the employees' recruitment and selection process (table2).

Table 2 The selection criteria used in the Romanian organizations

Criteria	SME's	Public institutions	Large companies	Multinationals	Average
Individual attributes, abilities and capacities	1,94	2,41	1,92	1,83	2,00
Studies	2,06	1,59	2,00	2,31	2,04
Professional knowledge	2,33	2,24	2,25	2,33	2,30
Professional experience	2,17	2,71	1,92	2,43	2,35
References	3,24	3,13	3,08	3,00	3,10
Age	3,00	3,87	2,73	3,31	3,26
Physique	3,56	3,93	3,27	3,73	3,66
Personal relations (friendships)	3,44	4,19	3,00	4,04	3,76
Sex	3,75	4,20	4,20	4,28	4,12
Nationality	4,40	4,31	4,00	4,16	4,23
Zodiac	4,63	4,33	4,60	4,24	4,41

Note: $1 - \overline{\text{very important}}$, $2 - \overline{\text{important}}$, $3 - \overline{\text{no matter}}$, $4 - \overline{\text{few important}}$, $5 - \overline{\text{very few important}}$

Although the "personal relations (friendships)" criterion has a low importance in selecting the new employees (3.76), we must underline that there is a big risk to appear the effect of nepotism in many Romanian organizations, mainly in the large companies (3.00) and in the small and medium enterprises (3.44). The main cause of this situation is that many Romanian organizations are applying the "entrepreneurship for my family" model of management [2, 3]. This model of management is not the best way of action, because working for the owner's family and employing the owner's cousins generate some compromises and it represents negative signs for the external employees. In many cases, the external employees are afraid for their status because they have three choices: to be a part of the "owner's family", to work for the "owner's family" or to leave the organization. Many organizations are forbidding the employment of the internal employee's cousins. In the public institutions, we are afraid that the "personal relations (friendships)" criterion is more important than the results of the study showed us (table 2). The criteria "sex", "nationality" and "zodiac" are rarely used in the Romanian organizations.

The "professional experience" criterion (61.32%) has a major importance in the recruitment and selection process of the new employees, than the "studies" criterion (38.68%).

In the large companies, multinationals and small and medium enterprises, the "professional experience" criterion has the major weight in the final employment decision of the new employees (table 3).

Table 3 The importance of the "studies" and "professional experience" criteria in the Romanian organizations

Criteria	SME's	Public institutions	Large companies	Multinationals
Studies	36,95 %	53,61%	29,13%	35,31%
Professional experience	63,05%	46,39%	70,87%	64,69%

The analysis of the data from table 3 underlines the major trend that characterizes the recruitment and selection process in the Romanian companies. Overall, the Romanian companies recruit and select their employees using the "workable competencies" criterion. This trend reflects the influences of the British, German and American systems of management, which are standing on the technical and workable competencies of their employees.

In the Romanian companies, the selection methods are customized on the different types of employees. The CVs and the cover letters (1.29) and the employment interview are used mainly to select the performers (table 4).

Table 4 The selection methods used in the Romanian companies

Selection methods	Types of	personnel
	Performers	Managers
CV and the cover letter	1,29	1,82
Employment interview (classic interview)	1,37	1,37
Behavioral interview	1,96	2,13
Tests of skills	1,95	1,30
Tests of knowledge	1,87	2,10
Tests of personality	2,11	1,86
Tests of practice	1,92	2,18
Simulations	2,30	1,82

Note: 1 - always, 2 - frequently, 3 - seldom

The differences between the selection methods of the performers are more obviously on types of organizations. In the small and medium enterprises, large companies and multinationals, the CV's, the cover letters and the employment interview (classic interview) are mainly the most used selection methods for the performers.

The simulations are seldom used to select the performers (2.30) (table 4). This trend is valid for all types of the Romanian organizations: small and medium enterprises (2.45), large companies (2.50) and multinationals (2.21). The tests of personality are rarely used in the public institutions to select their new employees.

In the Romanian organizations, the tests of skills (1.30), the employment interview (1.37), the CV's and the cover letters (1.82) and the simulations (1.82) are mainly used to select the managers. The CV's and the cover letters (1.56) are frequently used in the public institutions to select their managers. In the small and medium enterprises the tests of skills and the employment interview (1.20) are very often used to select the managers. In the large companies, the employment interview (1.21) and the tests of skills (1.33) are frequently used to select the managers. The tests of practice (2.18) and the behavioral interview (2.13) are very rarely used to select the managers.

Conclusions

The ratio between the external recruitment sources and the internal recruitment sources is over one. The employment strategy of the Romanian companies bases on the external recruitment sources. The main aim of the employment strategy is to attract and get the talents from the labor market. Hereby, the Romanian companies are trying to cancel the planning difficulties that they are facing on. Some organizations do not have enough competent employees to face on the increasing complexity of the activities. Besides it is cheaper and easier to get and to employ trained people from the labor market, than to train them. But it must be underlined that this kind of people need more time for accommodations and they are not so much trusty as the internal employees.

Though the professional experience of the candidates is very important for the employers, this situation could have some negative consequences on the behavior of the candidates, especially for the candidates that spent very much time in the training programs and they are well trained, but they didn't work during the training stages. Some candidates worked during their professional stage and they achieved some professional experience. The last ones have many chances to get a job than the other ones. The candidates that didn't work during their professional stage could be frustrated because they don't get the recognition that they are expecting from the companies. Even for the employers it could be frustrating because they couldn't benefit from the knowledge of the employees.

THE COMPETITIVENESS OF THE ROMANIAN TOURISM – A GHOST OR SUSTAINABLE REALITY?

The integration of Romanian tourism into the European Union means making the economic activity more efficient in concordance with the natural and social environment. The tourism has the chance to develop freely without constraint from the limits imposed by the decision factors, as it happened in the cases of the agriculture and industry. The reduced competitiveness of the Romanian tourism in comparison with the member states of the European Union, even the new integrated states, can be improved through the adoption of a strategy which could establish very clearly the priorities towards which they would direct the financial resources allotted by the EU or by the state budget for the period 2007-2013.

Keywords: competitiveness, tourism, destination, economy, project, globalisation, sustainable. JEL: L83, O10, Q01

INTRODUCTION

The context of today's world, marked by the globalisation of phenomena and the acknowledgement of the interdependencies, has imposed new rules of the game: the prosperity of the nations meaning competitiveness on the international markets, and the companies integrated into the world chain of values. As a consequence, the problem of competitiveness has become a hot subject at the level of each actor on the economy scene, from the one of the economic regions to the one of each organisation. At the same time we can notice an evolution of the concept of competitiveness, that is the change from the static competitiveness where the advantage was given by the endowment with the technical factors, to the dynamic competitiveness whose factors are: the technical progress, the rise of the salaries and the modern methods of management, which have created the advantage to outrun the economic dimension: the growth of financial power and of the productive power of the country, the education, the security, the quality of life being all the components of the concept.

Being defined as the "degree to which a nation, in conditions of the free and honest market, can produce goods and services which can pass the trials of the international markets, managing at the same time to maintain and increase the real income of its citizens (Ph. Kotler, The Marketing of Places, Teora Publishing House, Bucharest, 2001, pg. 232): the competitiveness is thus a challenge which applies not only in the case of the nations but also in the case of all the regions and the cities/resorts in the world.

The competitiveness of a nation is influenced by the level of competitiveness realized at the level of each of the actors on the national economy scene. In other words, all the sectors of the national economy, and implicitly all the branches of national economy, all the organizations within each of the branches, contribute to the achievement of the competitiveness of a nation.

Thus, the productive sectors of the national economy contribute, through the increase of their competitiveness, to the increase of GP, of the VAT, while other branches contribute, through the enrolled activity, to the increase of the quality of life (health, tourism, culture, social assistance), to the formation of qualified work force (education), to the assurance of the efficient function of the justice, to the protection of the private property and of the citizen's safety.

In 2007, there were 760 millions tourists. In fifteen years there will be 1 billiard 760 millions. By generating considerable public incomes, tourism is one of the most important sectors and with the most rapid development in the national economy. But tourism is a special product.

The branch of tourism identifies with the accommodations: the national and international hotel chains as well as a lot of small companies, the majority being family businesses. The small and medium sized companies represent over 90% of the European tourism companies. The industry of tourism contains, as well, the destinations with their offers and their natural and cultural wealth, as well as professional tourist operators.

Globalisation, the promotion of a new destination, new technologies have changed the competitive environment of the European countries. Nowadays the most powerful instrument in the tourist promotion is the image of a country or of a region or of a tourist product. If we concentrate on the international dimension, the strategies for building an image or for the tourist promotion are:

- the creation of a new tourist image;
- the re-positioning of a traditional tourist destination;
- the creation of a degree of awareness within the competitive frame;
- the process of creation of the brand (which covers the regional/national level).

In the case of well-known destinations, the tourist promotion is planned and financed through the collaboration and the partnership between the public sector and the private one. This thing brings, first of all, more resources for promotion, which can be allotted using a strategy on a long term and from the perspective of marketing and communication, where the objectives and the targets are very well defined. The public-private partnership for the tourist promotion is a very important problem, because the majority of tourism companies are small and have the tendency to set for themselves shorter time horizons and to take individual decisions, while the objective should be to consider tourism within the bigger picture. This is a very important point in the involvement in activities of promotion and in the strengthening of the collaboration between the diverse actors in order to assure the participation of all the parties in this process.

The undertaken short analysis emphasizes the importance of the investment in the public relations through communication strategies which can contribute to the tourism development. The partnership and the promotion in the tourism industry must deal with the complex reality. On the one hand, the professionals/the specialists in promotion and partnership collaborates with the Coordination Institute (which represents the political, economic and productive forces) which has been established for the strategy of promotion, setting the main directions of communication, and on the other hand must take into consideration the many actors and a fragmentation of the companies: the achievement of the objectives of the strategic plan is not an easy task.

If there is not a development strategy for the implementation of a quality tourism, based on the sustained development, including a selective and planned construction of accommodation units and the reconstruction and the improvement of the already existent ones, the staged development of a supplementary offer (culture, sports, wealth, entertainment, recreation etc.), the development of family tourism, of the organisational and business tourism, activating the potentials of the whole territory, then successful results will not exist: the tourist sector must adopt a proactive attitude. And how can a tourism strategy promote the interests of all its participants on the basis of mutual advantages, how can it afford the challenges of globalisation, how can it plan new and successful strategies for the small and medium sized companies in tourism? How should a project be finalized by the promotion of the image of a country, of the Danube Bend, of the seaside, of some centres of recreation or some mountainous areas?

In the following, I will try to offer some solutions, which, in my opinion, are beneficial in such an attempt:

- 1. A project of promotion and of partnership must take into consideration all the interested entities (stakeholders) from the tourist branch. What are they? The accommodations, the tourist associations, the professional associations, the unions, the municipality, the local travel agencies, which work for the public departments, the Ministry and/or the National Committee for Tourism, the National Agencies for Tourism,
- the European Union (the Difficulties of adjustment to the external shocks at the global level, like the terrorism acts, prove to us one more time how important peace and the political stability are for tourism.). Without being aware of the relations between entrepreneurs, institutions and the public, it is impossible to initiate the planning of an efficient communication strategy
- 2. The market research is the essential tool which brings specific information, which not only offers a clear image of the actual state, but also offers the possibility of turning to quantity and quality researches of the tourist sector in discussion and of the trends in tourism in general. The SWOT analysis cannot miss from the promotion plan for tourism. It is advisable, in case there is not any, to create an observation point for the collection and the monitoring of the statistical data.
- 3. The strategic plan: the tourist sector, as a dynamic community, which consolidates the destination brand through Communication and public relations.

The first step, the internal communication: in order to complete this plan there is a fundamental condition: the consolidation of the partnership culture, the actors' information about the strategic plan and about its objectives as well as the indication of the positive aspects for the participants.

The second step: the use of promotion tools, starting with the relations with the media through press tours, and even study tours for the travel agencies, the collaboration with the National Council for Tourism, the promotion of the conferences about tourism, the organisation of meetings and events, especially at the most important holiday and tourism fairs, the participation in the promotion activities along with the tourist operators, the support for the advertising campaigns for the tourist image, in general, and for the specific products. The promotion of some quality and ecologic labels in order to increase the responsibility of businesses and of the consumers (tourism is an economic activity where there is a close relation between the suppliers of services and the consumers).

4. Last, but not least, there is the creation of a system of monitoring and evaluation with the purpose of checking the performances and the objectives achievement.

"Everything little is beautiful" says a very beautiful sentence, but in order to be and remain competitive, the small and medium sized tourist companies must connect to a bigger network. The collaboration and the partnership lead in a professional manner are the key elements for success.

The recent and the beneficial cooperation at the level of the European Union is relevant if it brings a plus of value. There have been identified three domains in which the actions of the European Union can bring a plus of value to the states member, including Romania. These are:

- 1. The improvement of the common statistical data bases in order to offer correct information regarding the tourism industry – represents a precondition for the comparative analysis, for the exchange of ideas and experience and it addresses especially to the strategic problems from the tourist sector. One of the things already accomplished in this matter is the registration of the 10 destinations from Romania. which there is the one we coordinated within the Pilot Project: "Drobeta – the Danube Bend - Ponoare", a tourist triangle of excellence, won through competition, cofinanced by the European Commission and the Ministry of Small and Medium Sized Companies, Commerce, Tourism Government of Romania through the the General Direction for Development and International Relations (Dec. 2007 - June and Professions – 2008), obtaining the Diploma of Excellence, as a result of the selection within the Project "European destinations of Excellence" with the topic "Tourism and the untouchable local heritage". Following the project, the destination benefited from the free promotion within tourism event from the country and from the ones organised at the European level. where there have been presented the elements of tourist interest of the destination, that is Mehedinti County.
- 2. The focus on the comparative analysis in order to know in detail the tourist activities from the member countries and in this way to develop the quality of the definitions and of the indicators, by formulating a vision of the sustainable tourism.
- 3. The consolidation of the tourism policy integration within the other policies with which it has a connection. Tourism is a sector with a transversal nature and it is affected by numerous policies of the European Union, and numerous common efforts should often be focused on the horizontal nature problems. The economic growth from the following years should come from the implementation of the structural reforms and from the improvement of the conditions within the general frame for the citizens as well as for the companies in the European Union.

The last point on this list is situated at the centre of the discussions which take place at the level of the European Union. The problem is that if tourism had an own horizontal policy or if tourism were considered within the EU Treaty as one of the support domains, which could play a complementary role in the European Union for the member states.

Another example of cooperation at the European level is represented by the care for the protection against the commercial effects, which leads to the bankruptcy of the tour-operators, and they represent a great part of the tourist sector.

Even if there are national protection plans for consumers, hotel companies and their suppliers, the danger still exists and a mechanism must be implemented at the European level in order to respond to the special conditions, like the time differences, the distances and the various practices in doing business.

A number of factors are expected to have a major impact on the tourist transportation and on the competitiveness in Europe in the future: the diversity of the means of transportation plays an important role in the growth of the European and international tourism – the car being the most common means of transportation, followed by the air transport and the train.

We live in a world in which the economic growth has stimulated the demand for transportation – there is a great part of the population who travels, the journeys being shorter though, but more frequent. The transportation cost will always remain a decisive part of the global cost of the tourist product, the transportation being judged correctly by the terms of quality, profitability and safety. In many cases the preference for a means of transportation conditions the type of vacation and the destinations chosen by the tourists. The traffic jams and/or the delays may make them think twice before taking a decision.

The use of information technologies in the tourism sector may modernise and improve the efficiency of the tourist infrastructure and can promote an intelligent transportation. Also, the mobility can increase.

One of the most serious problems of European tourism is whether there should be a unitary promotion or not. This is not a political problem or an administrative one, in the sense that the only thing that politicians have to do is to put together the old plans with the new ones, to work together with other professional researchers and stakeholders and decide, from one case to another, if it is more useful/more efficient to promote the entire Europe, only certain parts from the continent or to offer governments the possibility and the support to achieve the promotion locally. In the last case, it is interesting to notice if the local governments are capable to promote the cultural or the natural resources common to more regions, or the realities of isolated regions. In one word, if they have the ability to act beyond their own competences.

Thus, the implications of the adhesion to the European Union which aims directly to the tourism in Romania are already visible:

- The tourist destinations competitiveness. Because there is not only one offer of services for the satisfaction of the tourist's needs, the competitiveness of a destination depends at a great extent on the quality of the different facilities which this one has to offer. As long as there are more tourist activities practised by the public institutions, the competitiveness of a destination depends on the good function of the partnership between the public and the private. The destination is as well the best level for the creation of cooperation networks between different offers of tourist products. Moreover, the Community supports a

number of actions which emphasise first of all the quality aspects; such actions include pilot projects for the preservation of the architectural heritage, the restoration of the European monuments and of the historic objectives (for example the European City of Culture, the case of Sibiu, declared European capital in 2008, fact that attracted many appreciated merits, the European cultural month and the Kaleidoscope project) in order to encourage cultural events and the activities with a European dimension involving participants form at least three member states.

- The number of foreign tourists from EU which visit Romania is possible to grow. Still this growth is unlikely to be spectacular and it must be seen as within the general tendency of tourism growth at a European level, but also in the context of promoting Romania within the member states manifested through the growth of the interest for a new country in the EU. We must take into account that in 2004 there was a great extension with 10 new member states, many of these are veritable tourist destinations Cyprus, Malta, the Check Republic, Hungary or Poland.
- The competition growth at the level of destination as well as at the level of the tourism operators. As a holiday destination Romania will enter the competition with the new member states which entered EU in 2004. The tourism operators on the Romanian market will compete with any similar company from the unique European market.

The monitoring of the degree of Romania's tourist competitiveness is based on the data offered by the World Travel and Tourism Council (WTTC) within the so-called "Monitor of Competitiveness" elaborated in partnership with Christel de Hann Tourism and Travel Research Institute from the University of Nottingham – Great Britain. This Monitor of competitiveness is in fact an analytical framing which:

- offers a record of the policy indicators and of the evolutions which have an impact on the industry; tourism
 - compares the national statistics, the policies, the governmental engagements for 2009;
- indicates the efficiency of the national policies in order to attract direct foreign investments and the expenses of tourists on a competitive market;
- shows the importance of the strategic planning and the need for the tourism and travels industry to be included in the policies and the governmental decisions.

The competitiveness analysis in tourism is based on a series of 8 indexes – the index of price competitiveness, the index Human Tourism, the index of the infrastructure, the index of the environment, the index of technology, the index of human resources, the index of the opening, the social index – whose value on a scale from 0 to 100 shows the performance of each country in comparison to other countries. The 0 value represents the smallest value of the index, and the 100 value is the greatest. The data sources for these indicators are represented at a great extent by the development indicators elaborated by the World Bank, but also by the UNO and the WTTC reports.

Within the competitiveness analysis in tourism 8 countries close to Romania have been chosen as reference countries, considered competitor countries in tourism: Bulgaria, Croatia, Serbia and Montenegro, Hungary, the Check Republic, Slovakia, Poland and Ukraine.

If we calculate a simple average of the indexes value, supposing that all these have the same importance, we obtain a so-called "competitiveness environment index". In conformity with this, Romania is clearly outrun in the competitiveness in tourism domain by countries like Hungary (78.44) and the Check Republic (74.47), but also by Bulgaria (68.57), Croatia (68.04), Poland (66.03) and Slovakia (62.84).

Romania is more competitive than some of the competitors in the domains of prices, of the environment, of the openness towards commerce and tourism and in the social domain, but less competitive in the technology domain, the human resources and the infrastructure:

- In comparison with Bulgaria, Romania is more competitive regarding the prices domain (the tariffs per room in hotels, in 2007; the parity index of the purchasing power; at the level of the taxes on tourism), infrastructure (only the roads and the railways with superior indexes than Bulgaria), environment (fewer carbon dioxide emissions than Bulgaria, but a greater population density), technology (the high-tech exports), social (the newspapers and television sets indexes).
- In comparison with Croatia, Romania is more competitive regarding the prices domain (the taxes on tourism), environment (fewer carbon dioxide emissions than Croatia, but a greater population density), international openness (the taxes on the international commerce) and the social domain (the newspapers and television sets indexes). We must also mention that the analysis is incomplete because of the lack of data for the infrastructure and human tourism fields.
- In comparison with Serbia and Montenegro, the analysis of competitiveness is limited to two fields because of the lack of data: the technology field (Romania having a larger number of INTERNET users) and the international openness (visas and the taxes on international commerce).
- In comparison with Hungary, Romania is more competitive only regarding the prices field (the tariffs per room in hotels in 2004 and the taxes on tourism) and the social field (the television sets index).
- In comparison with Slovakia, Romania is more competitive only regarding the prices field (the tariffs per room in hotels in 2007), human tourism (the involvement of people in tourism), environment, technology

(the high-tech exports), the international openness (visas) and the social field (the newspapers and television sets indexes).

- In comparison with the Check Republic, Romania is more competitive only regarding the prices field (the tariffs per room in hotels in 2007 and the taxes on tourism) and the social field (the newspapers and television sets indexes).
- In comparison with Poland, Romania is more competitive only regarding the prices field (the tariffs per room in hotels in 2007 and the taxes on tourism), human tourism (the economic impact of tourism), technology (the high-tech exports), the international openness (the openness towards tourism index and the openness towards commerce index) and the social field (the television sets index).
- In comparison with Ukraine, Romania is more competitive regarding the prices domain (the tariffs per room in hotels, in 2007; the parity index of the purchase power; at the level of the taxes on tourism), human tourism (the population involvement in tourism), environment (fewer carbon dioxide emissions than Ukraine, but a greater population density), technology (the high-tech exports, the number of INTERNET users, the mobile phones), the international openness (visas, the taxes on the international commerce) and social (the newspapers and television sets indexes, the computers index, the human development index).
- The quality of the tourist product will become a decisive factor in order to respond the best to the tourists' needs and to cope with the competition.
- The tourists will be aware of their rights as consumers, the result of the European legislation regarding the conditions of the increase of tourist exigency towards the services offered.
- The protection of the environment and the sustainable development will condition the development of tourism. This is an imperative around which any new tourist assembly will gravitate.
- A great accent is set on the tourism development at a regional level in the context of the decentralising/regionalising tendency of the competences in the tourism field as an economic activity.
- The intensification of the cooperation between different tourism operators at the level of a tourism destination as a result of the creation of a partnership between the public and the private which is necessary for the access to the European finances as well as for offering a better competitiveness of the destination.
- The tourist marketing must constitute a priority at the level of the central authority (the National Authority for Tourism) as well as at the level of tourist destination and even at the level of each tourism operator. Image plays a very important role in the decision of choosing a holiday destination. Many of the European tourists still know very little about Romania, certain prejudices about our country still existing. The reasons for the holiday are very closely connected to images. People choose their holiday destinations if these match their reasons. The potential tourists from the member states must be convinced that their reasons to travel are satisfied in Romania, and in these conditions it is time for a strong marketing.
- The transparent access to the finances offered by the European Union will facilitate the tourism development and that of the infrastructure in the areas with tourism potential from Romania. Of course, this depends on Romania's capacity of "completing viable projects" for tourism, and the human resources play a very important part here.

On a short term the impact on tourism is not relevant. There is no guarantee that foreign tourists will be more interested in Romania once it has adhered to the EU, but only a chance that must be revaluated through the aggressive promotion in the member states markets, doubled by the offer of quality services. We must take into account the inadequate infrastructure in many regions of the country, the poor quality of the tourist services and, last but not least, the existing prejudices that the Occident has regarding our country.

On a medium and long term, if it knows how to use the opportunities offered by the quality of EU member, Romania could become a veritable tourist destination not only exclusively for the old member states, but also for the member states or not from the Central and Eastern Europe. It would be ideal to transform the GHOST into a sustainable reality, with professionalism and especially with tourist potential, even an exceptional one, and acknowledgement at the highest forums of the European and world tourism field.

Under the conditions of the rapid evolution of technical progress, when the renewal of products and the moral depreciation of equipment, respectively of the work installations are particularly accelerated, the leasing operations prove to be advantageous for obtaining some costly pieces of equipment, goods and installations, necessary to expand and modernize the production.

Key words: leasing, financing, location, user, financer.

JEL Code: M16

Leasing is an expression of modern contracting techniques in this field and it has proven very effective both in national and international transactions. Leasing is from all points of view a product of the global market economy; it is an economic business that is clinched on a certain period of time and under certain conditions included in the lease contract - which is the legal support of the action.

Thus, leasing can be considered:

- a form of commerce, because it involves a commercial contractual operation to which usually taking part the supplier of goods, in order to be leased, the owner of the goods bought that are to be the subject of the lease and their beneficiary, the person who uses the assets and who pays for them under special conditions;
- a form of financing on medium and long term by specialized financial companies, financial institutions or direct producers that offer goods under rental conditions to customers, who do not have sufficient resources to purchase them and who prefer the right to use them for a specified period of time;
- an accessible privatization form that enables some people who do not have sufficient capital to settle companies to use a leased material base within some leasing transactions.

Leasing presents some distinct characteristics, compared with other economic affairs, especially compared to the purchase-sales transaction:

- -the dissociation of the ownership right from that of possession, through leasing only the right of use (possession) is remised and the right to property is preserved;
- -the main risk is not one of production, but one of ownership of goods;
- -the leasing company that preserves its right to ownership supports the user's activity (maintenance, repairs, service);
- leasing gives its potential users the choice of goods and suppliers;
- -the triple option that the user can express at the expiration of the lease contract;
- -the leasing companies exert a significant influence on the market, especially when they are specialized in certain types of goods or on a particular market segment;

Leasing appears in economic business as a relatively new, promising formula of economic business, in which the partners are: the manufacturer, financer and the user.

The analysis of the leasing market in Romania during 2006-2008

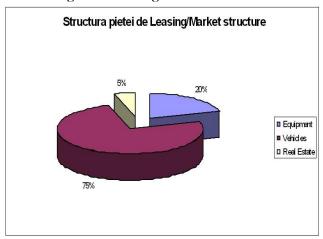

Due to the development of the market economy in Romania, leasing enjoyed a progress and an unprecedented development.

The leasing market in 2006

The economic growth in 2006, of over 7% was also advertised on the leasing market, which has developed significantly, confirming the status of the lease of financial product complementary to other banking products and accessible to a large number of economic agents, representing over 3% of the GDP, as shown in a press release of the Association of Leasing Companies and Financial Non-banking Services - ALB and of the Association of Leasing Companies from Romania – ASLR (ALCR).

In this sense, it can be argued that leasing has become a source of financing for medium-term investments able to support the development of various sectors of the national economy at competitive financing costs.

Figure 1 Leasing market structure

Source: Association of Leasing Companies and Financial Non-banking Services - ALB Romania, www.alb-leasing.ro

In 2006, financial leasing has continued to represent the main direction of development of leasing contracts, reaching a rate of 98% of the total of financed assets, the remaining of 2% being represented by the operational leasing.

The largest market share is registered by the sector of the banks' subsidiary companies with 75% of the total, followed by the sector of independent companies with 17.5% and by the sector of captive companies with 7.5%. In the dynamic the pace of growth between the total of the market from 31 December 2005 and that from the same period of 2006 is 57%. ¹⁸³

The operations of external financial leasing represented externally in 2006, a 3.6% share of the total of goods contracted by members of ASLR (ALCR), registering an increase of approximately 72% compared to 2005. The value of assets for the lease of legal entities represented 70.9% of the total market, 7.86% being represented by the public sector and NGOs, the difference of 21.24% being represented by individuals or natural persons and PFA (ANP-Authorized Natural Person). Of the total of 47,965 contracts signed in 2006 and in operation at the end of the year, approximately 56.5% are contracts with foreign suppliers and 43% represent leasing with domestic suppliers.

The leasing market in 2007

The value of goods financed on the Romanian leasing market has advanced by 51.59% to 4.94 billion euros in 2007, mainly owing to the entry of new companies, thus exceeding the initial estimates by almost 650 million euros, said the secretary general of ALB, Adriana Ahciarliu.

The initial estimates of the Association of Leasing and Financial Non-banking Services (ALB) on the local leasing market were worth 4.3 billion euros in 2007, going up by 32% compared to 2006, when there were goods financed worth the value of over 3,26 billion euros.

Figure 2 The leasing market in Romania during 2003-2007

Source: Association of Leasing Companies and Financial Non-banking Services - ALB Romania, www.alb-leasing.ro

-

¹⁸³www.ghişeulbancar.ro.

In the rankings of the volume lease financing at European level, Romania was ranked fourth. According to the European Association of Leasing, the greatest increase in the financed volume has been registered in Russia (102%), followed by Bosnia and Herzegovina (80%), Serbia and Montenegro (70%), Romania and Bulgaria, with 60%. On the opposite side there were the mature markets from Western Europe with a tradition for decades in financing through leasing. Thus, in Germany, the advance was of 6.35%, in the UK of 3.5%, and in Italy of 1.5%.

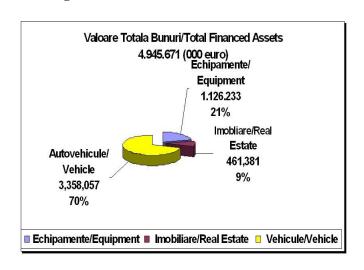

Figure 3 The Total Value of Assets in 2007

Source: Association of Leasing Companies and Financial Non-banking Services - ALB Romania, www.alb-leasing.ro

In 2007, the segment of real estate has almost doubled its share, from 5% to almost 9%, the share of equipment has increased from 20 to 21%, while the auto share remained at 70%.³

In terms of duration of the lease contract, the most common period is that of 4-5 years (31%), followed by the 3-4 years (26%), over 5 years (13%), 2-3 years (22%), 1-2 years (6%) and 1 year (2%).

The first year in which Romania was a member of the European Union appears to have been one favourable for the leasing companies, if we consider only the figures caught in the budget executions on 31 December 2007.

The leasing market in 2008

The Romanian leasing market fell in 2008 by 2.6%, until 4,817 billion euros, as a consequence of the negative impact of the introduction of the pollution tax on motor vehicles and of the difficult economic context of the last part of the year, shows the data published by ALB. The auto leasing segment, the main business of the companies on the market, advanced only by 1% in 2008 up to 3,384 billion euros, compared to 3,36 billion euros in 2007.

ALB states that the real estate leasing market has been affected significantly since July 2008. "A factor added to the international one is represented by the local one, through the high degree of taxation and notarial taxing, as well as through the non-acceptance of an accelerated depreciation during the lease contract."

Estimates for 2009

Still fewer companies will use this year firms specialized in leasing to equip themselves with cars or with various equipment because of economic evolution, but also because of the difficult situation on international markets. The leasing companies are not optimistic and it is expected to have a decrease in the market, on the whole, with 20-30% up to 3,37-3,85 billion euros in 2009 compared to last year, according to the Association of Financial Companies - ALB Romania. This, in the situation in which cars represent 71% of the total of assets financed through leasing. The forecast for reduction comes after the fact that last year the market registered a decrease of 2.6% compared to 2007, to 4,817 billion euros.

The representatives of ALB blame the auto pollution tax, but also the financial crisis, which have made their effects become obvious particularly in the last quarter of 2008 through a decrease by 60% of financing.

For 2009, ALB estimates that **car or auto leasing** will have a share of 75% of the total market, while funding for equipment will be 21%, and real estate leasing will have a rate of 4% of the total market.

² Amembal S.P. – Winning with leasing, Amembal&Associates, SUA, 2006.

³ www.wall-street.ro.

⁴ www.standard.ro.

The leasing market from Romania is a very active one and, concerning the financing of certain market segments, it is comparable to major markets across Europe. But, in some areas, such as financing vehicles, the market is somewhat more limited, innovation and sophistication being lower than in other European countries which have more experience.

Conclusion

Given the current economic and financial context from Romania, the use of leasing as a financial instrument, has become a rapid and efficient alternative of financing for the development of the companies from the private sector. The judicious use of resources, of fees management, reducing the financial effort on imports, the flexibility of the payment system, the speed and affordability make the balance tilt in favour of using leasing in the detriment of using other financing systems.

The professional formation of employee is a systematic process, intentional, for the development of specific skills and for the influence of behaviour of organization members, such as the resulting behaviour contributes to organizational effectiveness. Formation can be called also as any attempt to improve employee's performance in a currently occupied job or related to it. This usually means changes in knowledge, skills, attitudes, or specific behaviour in the interest of the employer, for whose fulfilment need to be made continuous financial investments. However, continuous formation of employees must be seen as a tool for sustainable development of the organization and increase of its competitiveness.

Keywords: human resources, competitiveness, continuous formation

Jel classification: M54

Human resources – element of competitiveness

Define mechanism, competitiveness is seen as a means of ensuring the survival of organizations. There are companies and even countries that speak about competitiveness to survive to the violent attacks of globalization, new entrants and lower profit margins. In this sense, competitiveness as a means of survival is a reactive response to the business environment. Competitiveness may increase or decrease based on the environment in which the company is found. Competitiveness as a proactive measure looks beyond the uncertainties and risks that the business environment presents and discovers hidden opportunities.

Business responds to the challenges and opportunities that the environment offers. The answer of the company depends on perception, understanding and action of the people from different levels of the company. Company responses to the changes of the environment are visible through the decisions made and emphasized priorities. These decisions create the desired benefits by the company.

Traditional way of thinking about gaining the competitive advantage focuses on the financial, strategic and technological capabilities of the company. But to be competitive in price through financial capacity, or product quality and innovation, high performance companies are committed in an explicit competition for the most capable employees. This competition goes beyond the simple employment of the best people. Organizational capacity refers to hiring and retaining the competent employees and development of those skills through actual practice of human resources.

During the industrial period, the company's physical assets - such as machinery, plants, and even land - determined how powerful they could compete on the market. After experts from Harvard, in the current era of knowledge, intellectual capital is what defines the company's competitive advantage. Human capital is the only source of knowledge and abilities that have the working force of the company. The essence of each organization is the human effort, and its efficiency and effectiveness are influenced, in a large extent, by the behaviour of people within the organization.

After Manolescu A. 187 human resources are the only resources capable of producing and reproducing all other resources available to an organization. People are active resources of the organization, because their potential, experience and passion of people, their initiatives and development contributes actively to the increase of organizational efficiency and effectiveness. Without actual presence of human is simply impossible for an organization to attain its objectives. Today's successful businesses gain through innovative ideas and top products and services - all having the origin in the knowledge and skills of employees.

According to Waterman, "which makes the best companies the best cannot be attributed to such things as technology, a bright idea, an artistic strategy, use of an instrument, or the generous followings of the guidelines outlined in the book such as *In Search of excellence* ... (The best companies) are better organized to meet the needs of its *people*, so attracting people better than their competitors and their people are more motivated to do a superior job, whatever it is." ¹⁸⁸

187 Manolescu, A., Lefter, V., Deaconu, A., Managementul resurselor umane, Editura Economică, București, 2007, pag. 18.

¹⁸⁸ Dreher, T., Dougherty, G., Human Resources Strategy, The McGraw-Hill Companies, Columbus, 2001, pg. 5.

Role of human resources formation

The companies of high performance show a great commitment to formation and skills development. This practice is a key strategy of human resource management. However the acquisition of knowledge and skills will not lead to improvement of company's performance if employees are allowed and encouraged to use the knowledge and skills related to work during the program. Thus, companies must be careful to select people with the ability and willingness to learn and develop, and they must establish pay practices that encourage employees to participate in training activities.

The formation program is a systematic process, intentional, for the development of specific skills and behaviour influence of the organization members, such as the resulting behaviour that contributes to organizational effectiveness. ¹⁸⁹ Formation can be called also as any attempt to improve employee's performances in a current job or related to it. This usually means changes in knowledge, skills, attitudes, or specific behaviour. To be effective, the formation program must involve a learning experience, to be an organizational planned activity, and be designed to fulfil the purpose of the organization while simultaneously fulfilling the individual goals of employees. The formation program should be directed to the achievement of organizational objectives, such as more efficient production methods, enhanced quality of products and services, or reducing of operational costs. ¹⁹⁰ This means that an organization must commit resources only in those formation activities that can best help to achieve its objectives, with the final goal the profit.

Why is formation necessary?

- To allow work to be done well.
- To maintain the quality.
- To maintain the quantity.
- To meet legal requirements.
- To develop a member of the company.
- To give management flexibility.
- To give someone a boost increasing morale and motivation.
- To prepare someone for the future changes in job structures.

Exits a concept supported by specialists from Harvard that training skills is a mutually beneficial arrangement: the companies that provide formation programs for effective skills, gain the benefits of employees who are experienced in the present standards and employees will retain the "occupation" and, sometimes, advance to higher levels. Thus, many companies consider the development of employees a good investment. Employees become richer in knowledge and effective, which, in turn, make your customers happier. Other companies, on the contrary, doubt the value of employees' development during the present situation of high mobility of labour. The question is when will be recover the high costs for formation in conditions that are forced to give up to these employees or they are going

This concept raises some problems, because there are sectors that have great need of employees' continuous formation, such as the technology field and engineers, whose skills are obsolete in time. The idea is hiring the right people and negotiating specific contract that includes forecasts in this respect.

to another job? The conclusion is that it may incur large costs to form the future employees of the competition.

Formation programs can be formal or non-formal. Non-formal formation is generally cheaper than formal formation methods, and it does not remove the employees from work. Formation through formal methods is more structured, is held in special rooms or held electronically. It is more expensive, because it involves the movement from the work, hiring of experienced trainers, and depends on the materials available to be developed and maintained.

Formation through formal methods is generally governed by state, but at the same time adapted to the needs of companies. In U.S.A. this is organized by "corporate universities", reaching 1700 American companies. These companies are popular because they align the formation of employees to the company's strategy and ensure continuous updating of knowledge.

Employee must follow the formation program he needs and that fits to him. Need for formation is a shortfall in performance that the formation program can correct. Amos J.A. advises to discuss with employees and see what they feel that they have a lack of skills, knowledge and experience. According to Nicolescu O. 193, the methods and techniques of formation and improvement of human resources that can be used by organizations should be interesting, attractive and effective.

Most companies use evaluated data to determine the need of staff for formation or development. Hundreds of companies, including Microsoft, IBM, and Merck, now use information from several sources (eg, subordinates, colleagues, customers etc.) in order to assess the supervisors or managers. ¹⁹⁴ The results are shared with each manager with suggestions for a specific program of formation and development (if needed). Honeywell ¹⁹⁵, for example, has specific training modules based on assessment rates for certain jobs.

Human resources formation in Romania as EU country

Currently, all Member States try to lead to the fulfilment of the strategic objective Lisbon: European Union to become by 2010 "the most competitive and dynamic economy based on knowledge from the world, capable of a sustainable economic growth, with better jobs and more and greater social cohesion". ¹⁹⁶ In this context, lifelong learning must be approached as a necessary objective imposed by the transition to an economy and society based on knowledge.

Orientation towards a knowledge-based society involves investment in human resources development to encourage employees to acquire new skills and accept occupational mobility. At the same time, it is important to promote the quality of formation offer and to ensure its relevance in relation to skills, knowledge and individual needs.

Following the creation of legal and institutional framework for continuing vocational formation, in January 2004 began the process of approval of providers of formation for adults. The legal framework for approving formation programs in Romania are regulated by the Government Ordinance no. 129/2000 regarding adults' formation, with amendments. The methodology is implemented by the National Council of Adult Formation (CNFPA) under coordination of the Ministry of Labour, Family and Social Protection and Ministry of Education and Research.

Authorization is required by those training providers who wish to organize formation programs finalised with certificates of graduation or qualification with national recognition. Approval of training providers is made, based on the assessment criteria, for a period of 4 years, for each formation program, organized for a qualification, occupation, and group of competences or a key competence.

Reducing the tax of authorisation from three net average wages in the economy to two minimum crude wages, in October 2004 had as result the increase of the number of authorized training providers. Also, an extremely important role in the authorization of organizations have had and still has the European program PHARE and the Regional Operational Program and Sectoral Operational Program for Development of Human Resources that substantially foster organizations through the financing funds allocated (www.inforegio.ro, www.fseromania.ro). The largest number of licensed providers are in the municipality of Bucharest (22%), followed by the county of Cluj and Constanta (both with a rate of 4%).

According to data provided by the CNFPA, in the period 2004-2008 were authorized for the organization of formation programs for a number of over 3,000 suppliers of training, for 10,105 formation programs, of which 6543 qualification programs, 798 initiation programs, 1834 improving programs and 905 specialisation programs.

In Romania, professional formation is based on occupational standards, the legislation providing the obligatoriness for development of formation programs subject of authorization on this basis. Insufficient number of occupational standards and that the complex task of their elaboration returns currently to training providers and other interested organizations, is an impediment to the authorization of training providers for more occupations, limiting, in some areas, the professional formation offer.

Training providers are, generally, small institutions, non-specialized, which adapts quickly their formation offer to the immediate needs of the market. In general, they offer programs for Level 2 of qualification, initiating programs for the use of computers or for acquiring language skills. There is a reduced supply of programs for skills that require significant investment by providers of training.

Offer of authorized formation programs reflects only partially the formation needs of the job. The most effective way to link the formation content to the needs of the labour market is realised when formation takes place at the request of economic agents, and the practice is conducted in real conditions of work or training providers work closely with operators from certain sectors. Formation at the workplace is the most common way of formation, being, on the one hand, inexpensive, and, on the other hand, inevitable, required by the development of work itself. Formation offer tends to focus on programs for complete qualifications or on programs for development of general competences. Also, the formation offer is still very fragmented, because it addressed more to people and not to companies, targeting the point requests of the labour market.

The system is focused mainly on the provision of certificates and less on developing the skills necessary for employment. Long duration of the continuous formation programs, make them unsuitable for employed persons. According to data provided by the European Commission Romania is on the last place in the participation of

¹⁹⁴ Bernardin, J., Human Resources Management: An Experiential Approach, Third Edition, The McGraw-Hill Companies, Columbus, 2003, pg.144.

¹⁹⁵ www.honeywell.com.

¹⁹⁶ European Commsion, www.ec.europa.eu.

population in education and training programs (1.3% of total population aged 25-64 years), placing well below the average of 10% at EU level.

Another important factor that acts as a brake on the current system of continuous formation is the fact that current legislation does not permit certification of partial qualifications, although the formation demand for labour market is often focused on narrow skills.

For many employers, especially in industries with low added value, where there is a large supply of labour and workers' wages are low, investment in continuing vocational formation is not considered a necessity.

As long as in the Romanian economy will prevail jobs with low wages that focus on industries with low added value, where education and training bring little benefit, it is possible that this situation and perception to continue.

Development of branches with high added value will help to change employers' attitudes and mentality towards investment in education and professional formation.

Low individual income and relatively high costs of the formation programs are the main obstacles to access the formation, while the formation offer has the tendency to focus on longer programs for complete qualifications. Economic units and individuals manifest a greater demand for modular courses of short duration, targeted to the acquirement of certain skills.

Employers prefer to hire a staff that is already prepared. Therefore, people who have invested in their formation are in a better situation than young school graduates, workers with no experience and those returning to the labour market after a period of unemployment.

Professional formation is seen as a cost, that must be minimized, and not as an investment. Employers' investment in human resources development is low and expenditure generated by professional formation is covered by individuals.

Conclusions

EU wants to become the most competitive and dynamic knowledge-based economy in the world, reason for which are imposed investments in human resources development to encourage the employees to acquire new skills and accept occupational mobility. Romanian State regulated legal framework for continuing vocational formation, giving the possibility to companies and employees to access formation programs that provides them modern and updated opportunities to improve their skills, knowledge and practices, and also their recognition at national and European level. Here intervenes the EU law amended by Directive 2005/36/EC, which lays the foundation for recognition of qualifications at European level, fact that should motivate and drive employees and employers to participate and to develop continuous formation programs.

However these programs are regarded as additional costs, sometimes considered too big and unnecessary for the organization, using them due to the legal work code but also as "weapon" of employees' retention for a longer period of time. As noted, implementation of these investments is quite difficult, either because of lack of employer's interest, or lack of financial sources for the persons concerned.

AGILE SOFTWARE DEVELOPMENT METHODOLOGIES: AN OVERVIEW OF THE CURRENT STATE OF RESEARCH

Năftănăilă Ionel

University of Economic Studies (ASE) Bucharest Faculty of Management Piaţa Romană 6, Bucharest, Romania ionel@naftanaila.ro +40213191900

Under the current economic conditions many organizations strive to continue the trend towards adopting agile processes, in order to take advantage of the numerous benefits that these can offer. Those benefits include quicker return on investment, better software quality, and higher customer satisfaction. To date, however, there is no structured body of research that can guide organizations in adopting agile practices. To address this situation, the current paper identifies and structures the main theoretical contributions to the field of Agile Methodologies research, by presenting Agile Methodologies, by analyzing the main papers on social implications of using Agile, by presenting the main studies on implementation of Agile and by synthesizing the research with regard to communication in Agile projects.

Keywords: Agile Software Development, Scrum, Project Management Methodologies, eXtreme Programming

JEL code:M10

Introduction and motivation

Since the beginning of the current world financial crisis many technology-driven companies have suffered the effects, being forced to lay off people or drastically diminish costs (Wauter, 2009). The survival of the company itself becomes dependant of the time-to-market, deliver on time to the customer and minimize costs. The scientific literature abounds of examples in which the success of projects drive the success of companies, or, the other way around, the failure of a project puts the company out of business (Charette, 2005), (Voas & Whittaker, 2002), (Jones, 1995). As a consequence, minimizing risk and approaching projects in a structured manner become critical success factors. Over the past few years software development organizations have learned about the benefits of Agile Methodologies, such as Scrum and XP. The scientific literature and business journals present numerous success stories highlighting the benefits of organizations which successfully adopted agile practices. As a result, many organizations are now aspiring to adopt agile practices.

Overview of Agile Methodologies

Agile represents a group of software engineering methodologies which promise to deliver increased productivity, quality and project success rate overall in software development projects. Such methodologies are SCRUM (Schwaber & Beedle, Agile Software Development with Scrum, 2001), XP (Beck & Andres, Extreme Programming Explained: Embrace Change, 2004), or the lesser-known Crystal (Cockburn, 2001). The outline of Agile Methodologies was laid down by the Agile Manifesto, published by a group of software practitioners (Beck et. al., 2001).

Scientific literature on the subject (Highsmith, 2002) suggests that the differences between traditional methodologies and Agile Methodologies relies on two main assumptions: First, traditional methodologies assume that customers do not know their requirements, hence they need guidance from the developers, but Agile Methodologies assume that both customers and developers do not have full understanding of requirements when the project starts. Therefore, in traditional software development environments, developers want a detailed specification, whereas in Agile Methodologies customers and developers learn together about the system requirements as the development process evolves. Second, traditional methodologies assume that customers' ability to foresee their future requirements is limited, and as such developers have to build in extra functionalities to meet these future needs, often leading to overdesigned system. On the other hand, Agile Methodologies emphasize simplicity.

Research on social implications of using Agile Methodologies

All Agile Methodologies have in common a certain emphasize on social aspects of software development, taking in consideration a series of explicit values, such as communication (Schwaber & Beedle, Agile Software Development with Scrum, 2001), or courage (Beck & Andres, Extreme Programming Explained: Embrace Change, 2004). Also, these methodologies involve a set of best practices such as pair programming, continuous integration or daily deployments (Beck & Andres, Extreme Programming Explained: Embrace Change, 2004).

It is found in the literature that usually the mature agile teams have a better social and technical cohesion, as close communication is crucial to success (MacKenzie & Monk, 2004). Code writing is often performed by pairs of developers, while the traditional roles in software development (analyst, tester, and architect) disappear (Năftănăilă, 2008).

While the traditional waterfall methodologies rely on a large number of documents and artefacts, SCRUM and the rest of Agile Methodologies use a minimum of documentation, just sufficient for the project to run under good

conditions. Two of these artefacts are the story cards and the wall (Sharp, Robinson, & Petre, The role of physical artefacts in agile software development: Two complementary perspectives, 2009), which bear two main purposes: enable the capturing of requirements and support the development process. It has been shown, though, that different teams use slightly different conventions for these artefacts, in terms of card layout, card colour and organising principles for the wall. There are, however, some common traits. For example, most teams' user stories follow are written in natural language, and use the widely known template proposed by XP (Beck & Fowler, Planning Extreme Programming, 2000), following the pattern "As a <<rol>
 role>> I want <
behaviour>> so that <
ceptenefit>>". Each card usually gets through a general life-cycle such as: story is written on the card, card is prioritized by the customer, card is estimated by the team, card is assigned to an iteration, implemented by developers, and accepted as "done" (Schwaber, SCRUM Development Process, 1995).

The wall is usually a whiteboard (in SCRUM) where team members display the user stories, and which they use as a visual "control panel" of the project. Beside the user stories, the wall usually holds other items, such as the burndown chart (measure of project's evolution). Daily stand-up meetings involved by the Agile Methodologies take place around the wall.

The study of (Sharp, Robinson, & Petre, The role of physical artefacts in agile software development: Two complementary perspectives, 2009) aims to shed light over using these rather simple artefacts in Agile Methodologies (and implicitly in Scrum) by analyzing the notational and social perspectives of using the story cards and the wall. The authors find that, besides the fact that both the users stories and the wall have their own separate meanings, they have strong *combined* meanings (meanings that occur only when they are used together). Therefore, from a notational perspective authors find that using the story cards and the wall leads to: closeness of mapping between the users' minds and what they are trying to express, appropriate level of abstraction, providing means of secondary notation (ex. by using colours, layout and labels), bringing consistency in the project, reduce diffuseness of meaning, show hidden dependencies, and improve overall visibility in the project. From a social perspective, authors infer that notation does not exist in isolation, it has to be situated in the reality of a social setting. For instance, the authors show that in relation to the story cards, the teams have developed great care and respect (especially when handling them physically, in situations like moving them on the wall, or annotating them). Authorship becomes meaningful, while handwriting and initials become a form of a secondary notation. In the same time, the wall becomes centric for the social life of the team – mediates and manages the life of developers. The position of the card on the wall becomes highly significant – when a card is moved to the "done" area, developers feel professional satisfaction and achievement.

The implications of their article, especially when implementing Agile Methodologies, are that using software tools to manage Agile teams can be done, but only after a social context and meaning has been created. There are reports of situations when teams have two means of storing the artefacts: physically for collocated team members, and in a software tool, for remote team members. However, in order to maintain the physical significance of artefacts, the teams have backed-up the software tool with phone conversation and even photos of the wall at critical development stages (Sharp, Customer collaboration in distributed agile teams, 2008).

Research on implementation of Agile Methodologies

In terms of *implementation* of Agile Methodologies, the literature is rather scarce. We can identify the study of (Nerur, Mahapatra, & Mangalaraj, 2005) who show that migrating to Agile Methodologies involve issues regarding management, people, technology and process.

In terms of acceptance of Agile Methodologies, we can identify the significant study of (Chan & Thong, 2009) which attempts to address what can be done to overcome the challenge to Agile Methodologies acceptance. They provide a critical review of the extant literature on the acceptance of traditional SDMs and Agile Methodologies, and develop a conceptual framework for Agile Methodologies acceptance based on a knowledge management perspective.

Based on previous work on Agile Methodologies (mostly case studies) in papers such as (Ceschi, Sillitti, Succi, & Panfilis, 2005), or (Cohn & Ford, 2003) they propose a conceptual framework regarding the acceptance of Agile Methodologies. They propose that a series of factors, such as (a) Ability-related factors (Self efficacy, Experience, Training, External Support), (b) Motivation-related factors (Career consequences, Top Management support, Voluntariness, Subjective norm, Organizational culture), (c) Opportunity-related factors (Teamwork, Communication, Shared understanding, Arduous relationship) influence Knowledge Management Outcomes (Knowledge Creation, Retention and Transfer). Knowledge Management Outcomes, on the other hand, along with Agile Methodology characteristics (Perceived usefulness, Perceived ease of use, Perceived compatibility, Perceived demonstrability, Perceived maturity) lead to Acceptance.

While this framework is yet to be empirically proved solid, it can be considered significant because it brings knowledge management as another perspective in examining acceptance of software development methodologies, on one hand, and because it synthesizes and critically analyses the previous literature on this subject.

Another paper proposing a framework for implementing and improving Agile Methodologies in practice is the one of (Qumer & Henderson-Sellers, 2008). The authors depart from the hypothesis that in practice, few organizations

are able to take on an agile development approach immediately and adopt them successfully over a short period of time – in many cases, a full implementation requires years. The authors present and explain the Agile Software Solution Framework (ASSF). While testing the model proposed, the authors prove (although this is a collateral finding of their study) that SCRUM presents the highest degree of agility 197 in terms of practice. The Agile Software Solution Framework (ASSF) proposed by them can be used to create, modify or tailor situation-specific agile software by using a situational method engineering approach, feedback and a standard meta-model. The authors have embedded a number of new models and processes in ASSF, such as an agility measurement model and process, an agile adoption and improvement model and process, an agile software solution framework knowledge-base engineering and management process, an agile workspace and an Agile Toolkit.

Studies on communication in Agile Projects

In previous literature on software project management it has been shown that communication is an important success factor (Stelzer & Mellis, 1998), and that communication is considered to make software development more efficient in companies (Paasivaara & Lassenius, 2003). The main problem seems to emerge from the fact that all the players in the software development process (users, customers, team, maintenance team, management) view and communicate regarding the same product from different perspectives: users require the product to have a large degree of usability, customers seek reliability and low maintenance costs, as well as fast time-to-market, managers seek minimizing costs, maintenance teams seek documentation and reliability, while the development team seeks technical challenges and moving to the next project (Boehm & Ross, 1989).

Communication, on the other hand, is not very well covered with regard to Agile Methods in general, and with SCRUM in particular. The paper of (Pikkarainen, Haikara, Salo, Abrahamsson, & Still, 2008) aims to increase the understanding of communication in the context of agile software development: internally among the developers and project leaders and in the interface between the development team and stakeholders.

Their study (under the reserve of being a qualitative research, based on two case studies carried in the same organization) shows a few interesting conclusions in terms of communication in projects. For instance, SCRUM puts a great emphasis on the daily stand-up meetings, which are in general perceived as being helpful in reducing the confusion about what should be developed (Mann & Maurer, 2005). On the other hand the authors, referencing the work of (Murru, Deias, & Mugheddue, 2003), suggest that the sprint planning meetings might cause the risk that the most demanding customers get what they want and are favoured by this approach, but the decisions are not always analysed in enough detail from a technical perspective, leading implicitly to a negative impact on the overall project goal. Another example refers to the open space concept: although generally the open-space environment is perceived as increasing productivity in software development, the authors have found evidence of situations when open-space setting was perceived as being distractive. Also, when it comes to the communication between the project team and the project stakeholders (customer, management, etc), the conclusions of (Turner, 2003) with regard to the fact that limited formal and informal

communication mechanisms can hinder communication between pilot project teams in

the context of agile software development have been confirmed by the authors. The work of (Rising & Janoff, 2000) is also confirmed by (Pikkarainen, Haikara, Salo, Abrahamsson, & Still, 2008), supporting the hypothesis according to which short time-boxed iterations in agile software development are key reason for improving communication in software development teams.

Empirical studies regarding Agile Methodologies

It has been argued that the current research has only a few case studies on agile software

Development (Layman, Williams, & Cunningham, 2006). While this is true, there are a few papers which empirically study Agile Methods, such as Scrum or XP. For instance, the paper of (Salo & Abrahamsson, 2008) brings a series of interesting findings from an empirical study of Scrum and XP in European embedded software development organizations; for instance, the authors show that 77% of the respondents who have used Scrum have reported positive experiences, while 27% of the respondents claim to use Scrum systematically or mostly through the project. However, the number of empirical studies remains low, and further research must to be conducted in this area.

Conclusions and further research

Agile Methodologies are more and more used in software development companies; even large companies, such as Microsoft, have started to use it – which shows increasing importance as well as increasing recognition of this group of methodologies.

The paper analyses the current state of research with regard to Agile Methodologies. Although many articles and papers have been published, only a few represent significant empirical papers, most of them being case studies and anecdotic evidence. Therefore, there is a strong need for more empirical studies in this field; from this perspective,

¹⁹⁷ Determined using their Agility Calculator known as the 4-DAT which measures the key attributes of agility: flexibility, speed, leanness, learning and responsiveness.

the current paper can constitute the departure point, as it synthesizes and structures the most significant body of research to-date. From a practitioner's perspective, the current paper can be used as a departure point in implementing Agile Methodologies, by providing a comprehensive synthesis of the most significant sources of practical knowledge.

While one of the conclusions that can be drawn from the above analysis is that without doubt using Agile Methodologies brings substantial benefits to the companies, the current paper also shows that the current state of research lack of studies which analyses use and implementation of agile practices in teams and organizations.

The economic and social importance of the small and medium enterprise (SME) sector is well recognized in academic and policy literature. It is also recognized that these actors in the economy may be underserved, especially in terms of finance. This has led to significant debate on the best methods to serve this sector. There have been numerous schemes and programs in markedly different economic environments. However, there are a number of distinctive recurring approaches to SME finance. This paper present the current situation in Romania, based on a comprehensive quantitative research.

Key words: Romania, SMEs, financing, competitiveness

JEL classification: D8, L2, M1

1. General perspective

In terms of SMEs financing, the outcome of our research¹⁹⁸ reveals that: **71.26% of the enterprises used their own resources for financing their activity**, **49.52%** contracted **bank loans**, **25.88%** used **leasing** as a financing source, 5.57% contracted non-reimbursable funds and 3.82% of the SMEs contracted loans from financial institutions.

We notice that 1.43% of SMEs appealed to factoring, 0.88% used guarantees from the Romanian SMEs Guarantee Fund, 0.40% of companies accomplished share emission on capital market and only 0.24% used other financing forms (credits from providers, associates/ shareholders and other natural persons, sponsors etc.)

This situation highlights the average capacity of some enterprise to finance their activity by themselves, the decrease of the amount of bank loans and leasing compared to previous years and a reduced use of other financing modalities for the majority of small and medium companies in Romania. See figure 1.

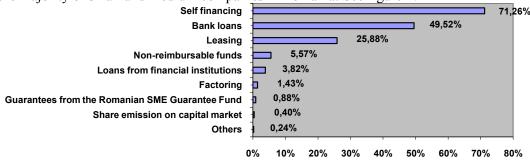

Figure 1.

SMEs financing

Analysis of financing modalities depending on SMEs regional status reveals the following important aspects:

- SMEs within the South Eastern region register a higher percentage of companies that used leasing as a financing source (35.00%) and non-reimbursable funds (8.75%);
- economic units in South West register the highest proportion of SMEs that used their own resources for financing their activity (75.79%) and the lowest weight of firms that used factoring (1.05%);
- companies from the Center used in higher degree bank loans (60.87%), factoring (4.35%) and the Romanian SMEs Guarantee (2.90%);

¹⁹⁸ The research has been conducted on a sample of 1256 SMEs – micro, small and medium sized enterprises – operating in all economic sectors, covering every age category and each of the eight development regions, being considered as representative for the goals of the research and for the Romanian SMEs' situation

- companies in South West, North West and Center distinguish themselves by the absence of SMEs that accomplished share emissions on capital market, enterprises in South East and West didn't contracted loans from financial institutions, companies from West and North West didn't used factoring, SMEs from South West and West didn't access the FNGCIMM.

See table 1 for further details.

SMEs financing by development regions

Table 1

		1		winding »J	are vero printers	8								
No	Financing sources				Developme	nt regions								
		North East	South East	South	South West	West	North West	Center	Bucharest					
1.	Own resources	74.81%	61.88%	69.57%	75.79%	70.31%	67.14%	57.97%	75.38%					
1.	Bank loans	57.89%	51.25%	58.70%	46.32%	26.56%	48.57%	60.87%	42.64%					
2.	Leasing	25.56%	35.00%	26.81%	28.42%	31.25%	21.43%	30.43%	20.56%					
2.	Share emission on capital market	0.38%	0.63%	0.72%	0.00%	1.56%	0.00%	0.00%	0.25%					
3.	Non-reimbursable funds	5.26%	8.75%	8.70%	5.26%	3.13%	5.71%	5.80%	3.81%					
3.	Loans from financial institutions	3.01%	0.00%	3.62%	4.21%	0.00%	7.14%	1.45%	6.35%					
1.	Factoring	1.13%	1.25%	2.17%	1.05%	0.00%	0.00%	4.35%	1.52%					
4.	Guarantees from the Romanian SME Guarantee Fund	0.75%	1.25%	0.72%	0.00%	0.00%	1.43%	2.90%	0.76%					

Analyzing SMEs by **size classes** (see table 2), we noticed that:

- the weight of SMEs using bank loans, leasing, share emission on capital market, non-reimbursable funds, factoring and guarantees from the Romanian SME Guarantee Fund increase as the size of the enterprises increases, due to the enhancement of activities and economic potential;
- the percentage of enterprises that used their own resources for financing is higher among micro enterprises (73.00%) and the small sized enterprises are the most numerous that used loans from financial institutions (4.24%).

Table 2

SMEs financing by size classes

		Size classes					
No	Financing sources	Micro enterprises	Small enterprises	Medium enterprises			
1.	Own resources	73.00%	66.97%	71.43%			
2.	Bank loans	42.88%	61.21%	62.18%			
3.	Leasing	19.25%	35.45%	43.70%			
4.	Share emission on capital market	0.25%	0.30%	1.68%			
5.	Non-reimbursable funds	3.38%	8.48%	12.61%			
6.	Loans from financial institutions	3.75%	4.24%	3.36%			
7.	Factoring	1.00%	1.82%	3.36%			
8.	Guarantees from the Romanian SME Guarantee Fund	0.50%	0.91%	3.36%			

SMEs analysis by **fields of activity** (table 3), highlights the following aspects:

- companies within services hold the lowest weight of SMEs that used bank loans (42.06%), but a higher percentage of firms that used their own resources for financing (75.70%);
- among companies from the industrial field one can record the most of the enterprises that accessed non-reimbursable funds (11.11%) or guarantees from the Romanian SME Guarantee Fund (3.11%);
- SMEs within constructions register the highest weight of companies that contracted bank loans (64.52%), leasing (58.06%), share emission on capital market (3.23%), factoring (12.90%) and obtained more frequently loans from financial institutions (6.45%);
- companies that carry out their activity in trade business, tourism and constructions distinguish themselves through the absence of SMEs that accessed guarantees from the Romanian SME Guarantee Fund;
- commercial companies from tourism did not use the factoring and enterprises within the industrial field did not use share emission on capital market.

SMEs financing by fields of activity

No	Financing sources			Fields	of activity		
110	rmancing sources	Industry	Constructions	Trade	Tourism	Transportation	Services
1.	Own resources	72.00%	64.52%	64.38%	68.42%	69.52%	75.70%
2.	Bank loans	60.00%	64.52%	48.75%	60.53%	49.73%	42.06%
3.	Leasing	32.00%	58.06%	25.63%	15.79%	26.74%	20.56%
4.	Share emission on capital market	0.00%	3.23%	0.00%	0.00%	0.53%	0.47%
5.	Non-reimbursable funds	11.11%	6.45%	5.00%	10.53%	2.41%	5.14%
6.	Loans from financial institutions	0.89%	6.45%	3.75%	2.63%	3.48%	5.61%
7.	Factoring	1.33%	12.90%	3.13%	0.00%	0.80%	0.70%
8.	Guarantees from the Romanian SME Guarantee Fund	3.11%	0.00%	0.00%	0.00%	0.80%	0.23%

2. Quality of banking services

The outcome of our research shows that, according to the entrepreneurs, the banks providing the best services for SMEs are (figure 2): **ROMANIAN COMMERCIAL BANK** (indicated by 43.97% of companies), **BRD-GROUPE SOCIÉTÉ GÉNÉRALE** (35.68%), **TRANSILVANIA BANK** (24.49%), RAIFFEISEN BANK (19.96%), OTP BANK (16.01%), BANCPOST (13.31%), LIBRA BANK (12.05%), ING BANK (11.38%), UNICREDIT TIRIAC BANK (10.99%), and ABN AMRO ROMANIA (3.95%).

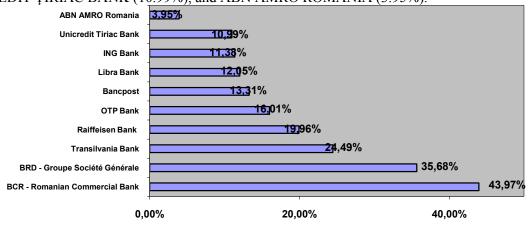

Figure 2

Quality of banking services

The entrepreneurs/ managers mentioned most frequently the following banks as having a low quality regarding the banking services: **BANCPOST** (indicated in 21.57% of the firms), **BRD-GROUPE SOCIÉTÉ GÉNÉRALE** (17.78%), **TRANSILVANIA BANK (14.29%)**, RAIFFEISEN BANK (13.70%), COMMERCIAL ROMANIAN BANK (de 13.41%), UNICREDIT ȚIRIAC BANK (9.33%), OTP BANK (7.79%), ING BANK (6.41%), LIBRA BANK (4.08%), and ABN AMRO ROMÂNIA (3.50%). See figure 3.

One can observe that **the subjects' opinions regarding the quality of the banking services are very different,** the banks evaluated more often holding positions both in the top for best quality services and in the top of worst quality services. We must underline the fact that the banks have been perceived in a positive manner more frequently than in a negative one (except for BANCPOST), which reveals **an ascending evolution regarding the quality of the banking field in Romania.** We will therefore refer only to the positive appreciations recorded by SMEs:

Analysis of banking preferences depending on **SMEs regional distribution** reveals that:

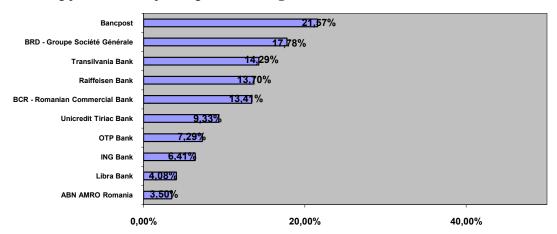

Figure 3. Low quality of banking services

- BCR maintains its first position in top in South East, South, South West and Bucharest;
- BRD is favorably appreciated in a higher number of companies in West (55.56%) and in a lower number of SMEs in the North Western region (14.75%);
- TRANSILVANIA BANK is frequently preferred in North West (59.02%) and Center (46%). See table

Quality of banking services by development regions

Table 4

	C		•						
		Development regions							
No	Bank	North East	South East	South	South West	West	North West	Center	Bucharest
1.	BCR - ROMANIAN COMMERCIAL BANK	20.59%	58.33%	57.94%	63.77%	37.78%	22.95%	46.00%	50.61%
2.	BRD - GROUPE SOCIÉTÉ GÉNÉRALE	19.75%	44.17%	37.30%	39.13%	55.56%	14.75%	36.00%	43.90%
3.	TRANSILVANIA BANK	19.75%	35.83%	25.40%	14.49%	24.44%	59.02%	46.00%	15.85%
4.	RAIFFEISEN BANK	20.59%	16.67%	37.30%	26.09%	20.00%	13.11%	18.00%	14.33%
5.	OTP BANK	25.21%	7.50%	22.22%	2.90%	0.00%	14.75%	2.00%	7.62%
6.	BANCPOST	11.76%	10.83%	17.46%	26.09%	0.00%	11.48%	8.00%	14.02%
7.	LIBRA BANK	18.91%	8.33%	4.76%	1.45%	2.22%	4.92%	0.00%	5.79%
8.	ING BANK	5.04%	3.33%	1.59%	5.80%	22.22%	6.56%	4.00%	24.39%
9.	UNICREDIT TIRIAC BANK	14.71%	10.00%	3.97%	5.80%	8.89%	3.28%	12.00%	14.02%
10.	ABN AMRO ROMANIA	2.52%	0.83%	0.79%	4.35%	15.56%	1.64%	4.00%	6.10%

Taking into account the impact of **companies' size classes** on the perception of the quality of banking services (see table 5), we remark that:

- ROMANIAN COMMERCIAL BANK maintains its position in SMEs preference top, irrespectively of their size;
- BCR and TRANSILVANIA BANK are most frequently favorably appreciated within small sized enterprises (45.39%, respective 25.89%), and BRD GROUPE SOCIÉTÉ GÉNÉRALE is preferred more often by micro enterprises (37.50%);
- the percentages by which RAIFFEISEN BANK, OTP BANK, LIBRA BANK and ABN AMRO ROMANIA are favorably appreciated increase together with the enterprises' size.

Quality of banking services by size classes

Table 5

		, v	Size classes	
No	Bank	Micro enterprises	Small enterprises	Medium
				enterprises
1.	BCR - ROMANIAN COMMERCIAL BANK	43.45%	45.39%	43.43%
2.	BRD - GROUPE SOCIÉTÉ GÉNÉRALE	37.50%	33.33%	30.30%
3.	TRANSILVANIA BANK	24.09%	25.89%	23.23%
4.	RAIFFEISEN BANK	17.68%	21.63%	30.30%
5.	OTP BANK	13.26%	17.38%	30.30%
6.	BANCPOST	11.89%	17.73%	10.10%
7.	LIBRA BANK	11.28%	12.77%	15.15%
8.	ING BANK	14.18%	4.96%	11.11%
9.	UNICREDIT TIRIAC BANK	10.06%	13.12%	11.11%
10.	ABN AMRO ROMANIA	4.73%	1.42%	6.06%

Considering the appreciation of bank services by **SMEs fields of activity**, we remark that:

- BCR is best quoted by transport companies (51.27%) and less frequently preferred by companies within constructions (29.17%);
- BRD GROUPE SOCIÉTÉ GÉNÉRALE is more frequently favorably perceived by the enterprises from transport companies (38.85%) and less frequently by those within tourism (25.81%). BRD GROUPE SOCIÉTÉ GÉNÉRALE and OTP BANK hold together the first position in the evaluation top of the construction field (33.33%);
- TRANSILVANIA BANK registers the most numerous positive appreciations among enterprises from tourism (32.26%) and registers the least preferences within constructions (16.67%). See table 6 for further details.

Quality of banking services by fields of activity

	_	•	8	Fields	of activity				
No	Bank	Industry	Constructions	Trade	Tourism	Transportation	Services		
1.	BCR - ROMANIAN COMMERCIAL BANK	48.15%	29.17%	37.30%	35.48%	51.27%	39.38%		
2.	BRD - GROUPE SOCIÉTÉ GÉNÉRALE	35.98%	33.33%	28.57%	25.81%	38.85%	36.26%

10.	ABN AMRO ROMANIA	2.65%	0.00%	3.17%	0.00%	4.14%	5.38%		

3. Conclusions

- More than 70% of SMEs subject to our research finance their economic activities from own sources.
- 49.52% of the enterprises contract bank loans to finance their activities.
- 25.88% of SMEs use leasing, 5.57% obtained non-reimbursable funds, 3.82% borrowed from financial specialized institutions, 1.43% financed through factoring, 0.88% used guarantees from the Romanian SME Guarantee Fund and 0.40% used share emisions on the capital markets.
- Higher levels of self-financing are recorded for SMEs with less than 5 years of experience (73.71%), SMEs from the South Western region (75.79%), micro-enterprises (73%), Joint Stock Companies (73.58%) and economic agents within the services field (75.70%).
- The frequency of bank loans is higher for SMEs with more than 15 years of experience (58.97%), companies from Center (60.87%), medium companies (62.18%), Limited Liability Companies (49.65%), enterprises within the constructions field (64.52%) and economic units with superior performances (52.30%).
- ROMANIAN COMMERCIAL BANK (43.97%), BRD-GROUPE SOCIÉTÉ GÉNÉRALE (35.68%) and TRANSILVANIA BANK (24.49%) have banking services highly appreciated by SMEs.
- RAIFFEISEN BANK (19.96%), OTP BANK (16.01%) and BANCPOST (13.31%) represent the second sample in the top of small and medium companies regarding the quality of banking services.

Given to the fact that organizations' functionality and efficiency are strictly dependent on their capacity to anticipate and set up future plans, highlighting planning/foresight activities developed within small and medium enterprises in our country has an essential significance in creating a general image. This paper presents several important issues regarding how Romanian set up strategies, policies and acquire competitive advantage.

Key words: SMEs, strategies, policies, competitive advantage

JEL classification: D8, L2, M1

1. SMEs plans, policies and strategies

Research results reveal that annual plans and policies are issued in 45.24% of the total number of companies, strategies on 3-5 years are issued in 11.94% of SMEs and no planning activities* are undertaken in 44.55% of enterprises (figure 1). If we consider that – according to an exhaustive study on small and medium enterprises in EU member countries – within one European SME out of six, strategies are issued and operated, we notice that from the point of view of strategic approach frequency, small and medium companies in our country are close to their homologues from developed countries, in spite of the big difference as competitiveness is concerned. The explanation is that many entrepreneurs, managers and specialists from Romanian SMEs are used to planning activities imposed by centralized economy in communist regime.

We must emphasize that researches carried out in the last years by the European Union revealed that more and more SMEs experience the necessity to issue formal entrepreneurial strategies. Also the quickly and intense processes of activity internationalization, especially economic activities, substantially intensify the necessity to elaborate and implement strategies in an international perspective for each category of companies.

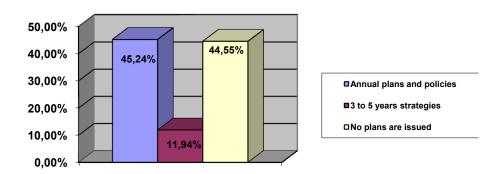

Figure 1 SMEs foresight activities

Analyzing small **and medium enterprises depending on size**, (table 1), we reach the conclusion that the weight of companies in which plans, policies and strategies are issued increases in a direct proportion with the increase of size, because once the size is increased and implicitly the activities are increased, the necessity of developing planning activities and issuing and implementing strategies becomes a stringent matter.

^{*}The amount of SMEs percentages where annual plans /policies are issued and strategies don't have to be 100%, because there are companies in which annual plans /policies and strategies are issued. Surprisingly, only a little part of business men/ managers indicated they issue both, although plans and policies represent the basis for strategies.

Table 2

SMEs' plans, policies and strategies – classified by size classes

		Size classes	Size classes						
No	SMEs draw up:	Micro enterprises	Small enterprises	Medium enterprises					
1.	Annual plans and policies	38.02%	54.72%	67.27%					
2.	3 to 5 years strategies	10.28%	12.38%	21.82%					
3.	No plans are being drawn up	53.04%	33.55%	18.18%					

If we classify SMEs enterprises by **fields of activity**, we remark the following aspects:

- SMEs within industry field register the highest percentage of companies in which strategies are being worked out (15.38%) because the activity profile imposes an anticipative vision on business development;
- trade business companies hold the highest weight of enterprises where activities are not planned (52.82%) and the lowest percentage of SMEs where annual plans and policies are drown up (37.32%);
- companies within constructions stand out both by the highest weight of SMEs in which annual plans are being worked out (68.97%) and by the lowest percentages of enterprises that think out 3 to 5 years strategies (3.45%) and in which planning activities are not drawn up (27.59%). See table 2 for further details.

SMEs' plans, policies and strategies – classified by fields of activity

	NI	CME	Fields of activity							
2.	No	SMEs draw up:	Industry	Constructions	Trade	Tourism	Transportation	Services		
	1.	Annual plans and policies	53.37%	68.97%	37.32%	47.37%	43.15%	43.69%		
	2.	3 to 5 years strategies	15.38%	3.45%	11.27%	13.16%	9.33%	13.13%		
	3.	No plans are being drawn up	35.58%	27.59%	52.82%	42.11%	47.81%	44.95%		

SMEs main objectives

As far as the Romanian SMEs objectives for the next two years are concerned, research results reveal that in the **majority of companies (63.26%) the moderate business expansion was established as an objective**, in 20.93% of enterprises the main objective is to maintain business at the existent size, in 13.30% of the firms a fast business extension is wanted, while 1.40% of business men intend to close the business and 1.12% wish to sell the business. This situation is graphically presented in figure 2.

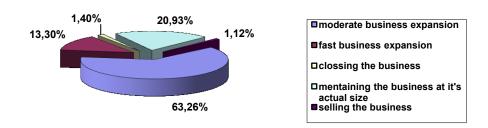

Figure 2 SMEs main objectives for the next two years

Considering SMEs' size classes (table 3), one can notice the following aspects:

- maintaining the current dimensions of the business and closing the business are reported in an inverse proportion to the firms' size
- business moderate expansion is recorded in a higher proportion by medium sized enterprises (71.43%) and fast business expansion is more frequently reported among medium sized enterprises (16.19%)
- enterprises with a view to sell the business hold a higher weight among micro enterprises (1.33%)
- no medium sized enterprises intend to close the business.

Table 3

CMF	main	objectives	hy ciza	classas
DIVIDS	шаш	objectives	DV SIZE	ciasses

SWIES main objectives by size classes					
No	SMEs objective	Size classes			

		Micro enterprises	Small enterprises	Medium enterprises
1.	Maintain the current dimensions of the business	25.00%	14.98%	11.43%
2.	Business moderate expansion	58.58%	71.42%	71.43%
3.	Business fast expansion	13.17%	12.20%	16.19%
4.	Business selling	1.33%	0.70%	0.95%
5.	Business closing	1.92%	0.70%	0.00%

Analyzing **SMEs** by their field of activity highlights the following aspects:

- enterprises within transportation field hold higher percentages of SMEs with an objective to maintain the current dimensions of the business (25.24%) and selling the business (1.94%), but they also register the lowest weight of enterprises with a view for moderate expansion (58.90%);
- SMEs within constructions register the highest weight of companies aiming for business moderate expansion (72.41%) and the lowest percentage of firms with a view for business fast expansion (10.34%); selling and closing the business is not wanted by the enterprises operating in this specific field;
- companies within trade business and tourism are up to fast business expansion in a higher weight (15.79%); among SMEs within tourism there is no intention to sell the business. See table 4.

SMEs main objectives by fields of activity

Table 4

		Fields of activity					
No	SMEs objective	Industry	Construction	Trade	Tourism	Transportation	Services
			S				
1.	Maintain the current	15.34%	17.24%	16.54%	21.05%	25.24%	22.02%
	dimensions of the business						
2.	Business moderate expansion	70.90%	72.41%	63.91%	60.53%	58.90%	62.33%
3.	Business fast expansion	12.17%	10.34%	15.79%	15.79%	11.65%	14.32%
4.	Business selling	0.53%	0.00%	0.75%	0.00%	1.94%	1.06%
5.	Business closing	1.06%	0.00%	3.01%	2.63%	2.27%	0.27%

3. SMEs competitive advantages

Taking into account the fact that the competitive advantage that companies create reported to the economic market decisively conditions their performances and functionality, highlighting the **main competitive advantages** that SMEs decision factors consider to have against the competitors is extremely important. According to analysis results, **56.29%** of the entrepreneurs/ managers indicated as a competitive advantage the **quality of provided products/ services**, 43.07% - **price-quality balance**, 28.90% - **low price for the provided products/ services**, 9.79% - **used distribution channels**, 7.72% - **innovative capacity**, 6.21% - **post-sales services provided to customers**, 5.97% - **company's reputation**, 3.74% - **quality management**, 3.58% - **high qualified personnel**, and 1.91% - **networking** - **with political and economical environment**. We notice that most of SMEs are oriented towards differentiation through the quality of provided products/ services and/ or through their commercialization at prices reasonable for customers. See figure 3.

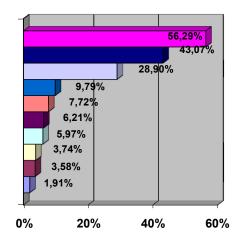

Figure 3 SMEs main competitive advantages

The analysis of SMEs competitive advantages by their size classes highlights the following important aspects:

- the weight of SMEs that have as a competitive advantage the quality of provided products/ services, quality management and firm's reputation increases together with the companies' size;

- proportion in which companies are more competitive as a result of the innovation capacity decreases together with the companies' size;
- the competitive advantages generated by the price-quality balance, used channels for distribution, post-sales services provided for customers, high quality personnel, networking with the political and economic environment are more frequent for small companies

See table 5 for further details.

Table 5

Table 6

SMEs competitive advantages by size classes

No	Commentation advantage		Size classes		
	Competitive advantage	Micro enterprises	Small enterprises	Medium enterprises	
9.	Low price of provided products/services	31.75%	23.33%	25.42%	
10.	Quality of provided products/services	53.75%	56.67%	71.19%	
11.	Price-quality balance	39.88%	48.18%	47.46%	
12.	Distribution channels	8.88%	12.42%	7.63%	
13.	Post-sale services	5.75%	7.58%	5.93%	
14.	Innovation capacity	8.25%	7.27%	4.24%	
15.	High qualified personnel	3.50%	4.55%	1.69%	
16.	Networking	1.50%	2.73%	2.54%	
17.	Quality management	3.63%	3.94%	4.24%	
18.	Firm's reputation	5.00%	6.36%	11.02%	

Classifying **SMEs by fields of activity**, (see table 6) we notice the following:

- taking into consideration the quality of provided products/ services the highest weight is recorded by small and medium companies within tourism (71.05%) and the lowest by SMEs within trade business (45.63%);
- as for the price-quality balance for provided products/ services, the highest proportion is recorded by companies within constructions (54.84%) and the lowest by companies within services field (38.08%);
- if we consider the competitive advantage generated by the low price of products/ services we notice that the highest proportion was recorded by companies within transportation (35.03%) and the lowest by SMEs within constructions (19.35%);
- competitiveness generated by used distribution channels was noticed in the highest proportion for companies within transportation (14.17%) and it wasn't registered at all by enterprises from constructions;
- taking into consideration the innovation capacity, we notice that SMEs within construction field hold the highest percentage (16.13%) and companies that activate within transportation record the lowest proportion (4.01%);
- the highest percentage regarding the competitive advantage represented by post-sales services is recorded for economic agents within transport field (7.75%) and the lowest for companies within tourism field (4.38%);
- in terms of the company's reputation, a higher proportion is noticed for enterprises in constructions (12.90%) and a lower one for companies within tourism (2.63%).
- if we consider the quality management and networking with economical and political environment, the highest percentages are registered among companies within tourism, and companies within constructions have no record of such advantages;
- a high quality personnel was registered in a higher weight among enterprises in services (5.61%) and in a lower one among those from transportation (2.14%).

SMEs competitive advantages by fields of activity

4. Conclusions

- In 45.24% of the SMEs subject to our research draw up annual plans and policies, 44.55% of them have no planning activities and 11.94% draw up 3 to 5 years strategies.
- The weight of SMEs drawing up plans, policies and strategies amplifies as the size of the enterprise increases.
- Frequency of enterprises where no planning activities are developed is higher for startup companies, economic agents from the South Easter region, micro enterprises with other juridical status, companies within the trade business and those with inferior performances.
- In most of the SMEs (63.26%) moderate expansion of business was established as an objective, in 20.93% of companies the major target is to maintain business at the actual size, 13.30% of entrepreneurs think out for a fast expansion of their business, 1.40% intend to close the business and 1.12% intend to sell business.
- Companies with a view for a fast business expansion registers higher percentage within SMEs with less than 5 years experience (16.95%), those from the North Western region (21.21%), companies of medium size (16.19%), firms with other juridical status (14.75%), and companies within trade business and tourism (15.79%).
- The most important competitive advantages that entrepreneurs consider to have compared to their competitors are quality of offered products/ services, indicated by 56.29% of enterprises, price-quality ratio (in 43.07% of SMEs), low price of provided products/ services (28.90%), used distribution channel (9.79%), innovation capacity (7.72%), post-sales services provided to clients (6.21%), company's reputation (5.97%,), quality management (3.74%), high quality personnel (3.58%) and networking with the political/ economical environment (1.91%).
- The competitive advantage given by the products/services quality is registered in higher weights at the enterprises with more than 15 years of experience (61.54%), from the North Western region (68.57%), medium sized enterprises (71.19%), Joint Stock Companies (62.26%) and SMEs from tourism (71.05%).

Maritime competitive companies are the ones that provide qualitative transport services at a lower price than competitors. High professional seafarers are the key success for competitiveness in maritime field. Professional and competitive seafarers are not the ones that accept a low wage but the ones that are well trained and responsible with their work and with the environment. In order to be competitive and responsible, maritime companies and seafarers must acknowledge and implement a management of safety at the board of the ship. Commitment of leadership, continuous communication, crew's involvement and responsible attitudes towards safety are the determinants of a proper implementation of safety management – key criteria in acquiring and maintaining competitiveness in the business.

Keywords: competitiveness, maritime human resources, safety management

Coduri JEL: 015, J28, J24

1. Competitiveness in the maritime business

Competitiveness in maritime business is a relative term that can be measured in terms of price, unit production cost or labor productivity relative to competitors. According to Organization for Economic Cooperation and Development (OECD, 2002) competitiveness of a nation can be defined as "the capacity of a state, which is in an international competition, to generate a high level of incomes and placement for the labor force on a sustainable basis". The concept of competitiveness is at the core of the success of nations and companies (Toma, Marinescu, Ianole, 2008). A competitive maritime company is the one that clearly states a mission reflecting a serious commitment to international transport activities; has the ability to identify and adjust rapidly to clients needs and opportunities and has the ability to provide high-quality, competitive navigation services. The following elements are determinants for a firm's international competitiveness: specific assets and core competences that can be exploited to their competitive advantage, reputation, continous innovation in ship building, ship design or ship services, shown in particular in passenger cruises, a firm's architecture which describes the culture of the company. The firm's architecture can be observed in the company's recruitment and promotion practices, the rate of staff turnover — a major issue for a maritime company, the number of client complaints, the company's relationships with stakeholders, suppliers and other external organizations. (Radu, Catanet, 2007).

In the maritime business, competitive firms are the ones that provide qualitative transport services at a lower price than competitors. We consider that qualitative transport services are the ones made with qualitative ships ran by professional seafarers, paid with a lower wage than other maritime companies. Some maritime companies, in general the small ones new to the market, sign employment contracts with less-than-good maritime seafarers, that accept to go on long voyages of four, six, or more than six months for less money. Maritime companies with long tradition in this business avoid such hiring, even if they are in condition of personnel shortage.

The growth and diversification of maritime activities has lead to an increase and an evolution of threats; this new situation requires the consideration of individual threats (navigation, accidents, terrorism, immigration, illicit traffic and pollution) and environmental threats (natural resources and disasters). In such environment, competitive seafarers are the ones who are well trained, accept a low level of risk and are responsible with their work and with the marine environment. In Romania, like in other countries, competitive maritime companies are the ones that hire seafarers after they passed a technical computer exam in English and a very well structured interview. Competitiveness is acquired when seafarers act as professionals in every action they make at the board of the ship or o land. Employment conditions for seafarers should be at least comparable with those found in other industries – particularly in view of the obvious impact that the quality of the shipping industry's workforce has on safety at sea and protection of the marine environment. Applying a professional way of thinking, not only in their job, but in life in general, brings satisfaction. A professional learns every aspect of the job while an amateur skips the learning process whenever possible. A professional seafarer carefully discovers what is needed and wanted while an amateur quickly assumes what others need and want. A professional seafarer looks, speaks and dresses like a professional while an amateur has a lack of attitude and is negligent in appearance and speech. A professional seafarer keeps his or her work area clean and orderly while an amateur has a messy, confused or dirty work area. A professional seafarer is focused and clear-headed while an amateur is confused and distracted. A professional seafarer analyze his or her mistakes, learn from them and share their earn knowledge with others while an amateur ignores or hides mistakes. A professional seafarer jumps into difficult assignments while an amateur tries to get out

of difficult work. A professional completes tasks and job as soon as possible, while an amateur complains about received tasks and looks for excuses for unfinished work. A professional seafarer with the attitude of a leader remains level-headed and optimistic when facing problems and try to solve other people's upsets and problems while an amateur gets upset and assumes the worst, avoiding others' problems. A professional seafarer uses higher emotional tones like enthusiasm, cheerfulness, interest, contentment and avoids anger, hostility, resentment or fear. A professional persists until the objective is achieved and don't give up at the first opportunity, producing even more than expected. This are the reasons for which professionals earns high pay while non-professionals earns low pay and feels it's unfair.

Competitiveness means professionalism and high productivity. At the level of maritime company, it means cost efficiency and cost effectiveness. But competitive companies don't cut costs with training systems for seafarers and invest in sending employees to international conferences and seminars on safety issues and safety management.

Safety is the state of being "safe" and protected against all types or consequences of failure, damage, error, accidents, harm or any other event which could be considered non-desirable. International Maritime Organisation (IMO) – the United Nations specialised agency with responsibility for the safety and security of shipping and the prevention of marine pollution by ships – places considerations of the human element at the centre of its work. Issues of concern to seafarers such as stress, fatigue, workloads, training standards, safety, security and environmental protection are affecting the competitiveness of a maritime company. Ship owners admit the benefits from employing seafarers who are not only properly qualified but who also display the professional standards and technical competence needed to manage today's ships safely and efficiently. That is why seafarers can obtain seafaring certificates only after they demonstrate their knowledge on IMO's International Conventions on Standards of Training, Certification and Watchkeeping for Seafarers (STCW), *Safety of Life at Sea* (SOLAS) or International Safety Management (ISM) Code.

The STCW Convention, which underwent a complete revision in 1995 and has been updated with amendments since then, focuses on the demonstration of competence, not just the acquisition of knowledge. The implications of this have been significant for improving safety and environmental protection record for international shipping. Some of this improvement can be attributed to improved technology but, statistically, 80 per cent of accidents are caused by human error or lack of competence.

International Safety Management (ISM) Code is a mandatory code that deals with management and, in particular, the responsibility of management to play a full and active part in building a safety culture onboard ship and within the company, to the benefit of all stakeholders. The ISM Code entered into force on July 1998 for passenger ships, including passenger high-speed crafts, oil tankers, chemical tankers, gas carriers, bulk carriers and cargo high-speed crafts of 500 gross tonnage and above. According to this code, if something goes wrong with the ship at sea, the Master of the ship is not solely responsible but the issue is taken as far as the boardroom.

Competitiveness in shipping relies heavily on the initiatives, co-operation and constant vigilance of seafarers to help prevent breaches of maritime safety and security. Maritime safety and security sectors have become ultrasensitive faced with the growing need for the protection of goods and persons against multiple threats coming from the sea. Every year, many seafarers are either injured or lose their lives in maritime accidents caused by poor designed or equipped ships or operated and manned to poor standards (Cockroft, 2005). In order to be competitive, efficient and for safety reasons, seafarers need special time to relax and recover between voyages before they take their ships out to sea.

2. Implementation of safety management in maritime companies

Maritime safety and security sectors have become ultra-sensitive faced with the growing need for the protection of goods and persons against multiple threats coming from the sea. The growth and diversification of maritime activities has lead to an increase and an evolution of threats; this new situation requires the consideration of individual threats (navigation, accidents, terrorism, immigration, illicit traffic and pollution) and environmental threats (natural resources and disasters).

The objectives of safety management code are to ensure safety at sea, prevention of human injury or loss of life, and avoidance of damage to the environment, in particular, to the marine environment, and to property. By enabling safety management objectives, seafarers should provide safe practices in ship operation and a safe working environment. They establish safeguards against all identified risks; and continuously improve safety management skills of ashore and aboard ships, including preparing for emergencies related both to safety and environmental protection. The owner of the ship or any other organization or person such as the manager, or the bareboat charterer, who has assumed the responsibility for operation of the ship from the shipowner and who, on assuming such responsibility, has agreed to take over all duties and responsibility imposed by IMO's ISM Code, should develop, implement and maintain a safety management system which includes safety and environmental protection policy; instructions and procedures to ensure safe operation of ships and protection of the environment; defined levels of authority and lines of communication between, and amongst, shore and shipboard personnel; procedures for reporting accidents and non-conformities with the provisions of ISM Code; procedures to prepare for and respond to emergency situations and procedures for internal audits and management reviews.

A competitive maritime company should establish a safety and environmental protection policy and should ensure that the policy is implemented and maintained at all levels of the organization both ship based as well as shore based. The maritime company should define and document the responsibility, authority and interrelation of all personnel who manage, perform and verify work relating to and affecting safety and pollution prevention.

To ensure the safe operation of each ship and to provide a link between the company and those on board, every maritime company should designate a least a person ashore having direct access to the highest level of management. The responsibility and authority of the designated person or persons should include monitoring the safety and pollution prevention aspects of the operation of each ship and to ensure that adequate resources and shore based support are applied, as required.

From the perspective of resources and personnel, the maritime company should ensure that the master is properly qualified for command. The maritime company should clearly define the Master's responsibility with regard to implementing the safety and environmental protection policy of the company, motivating the crew in the observation of the policy, issuing appropriate orders and instructions in a clear and simple manner, verifying that specified requirements are observed and reviewing the safety management system and reporting its deficiencies to the shore based management. The Master or Captain of a merchant vessel is a licensed mariner in ultimate in command of the vessel. (Aragon, Messer, Tuuli, 2001). A Ship's Captain, also called Shipmaster, is responsible for its safe and efficient operation, including cargo operations, navigation, crew management and ensuring that the vessel complies with local and international laws, as well as company and flag state policies and therefore, a candidate for an unlimited master's licenses requires several years of seagoing experience as third mate, second mate, and chief mate. A ship's Master commands and manages all ship's personnel, and is in charge of the ship's accounting, payrolls and inventories.

The <u>Master</u> is responsible for compliance with <u>immigration</u> and <u>customs</u> regulations, maintaining the ship's certificates and documentation, compliance with the vessel's security plan, as mandated by the <u>International Maritime Organization</u>. He is also responsible for responding to and reporting in case of accidents and incidents, and in case of injuries and illness among the ship's crew and passengers. A <u>Ship's Captain</u> must have a <u>Master Mariner's</u> license, issued by the ship's <u>flag state</u>. A <u>Shipmaster</u> at sea, during the navigation, represent some official authorities like the public notary, police, and has the official power to use, in some particular case, like mutiny and pirates assault, the dead force addressed to defence the interests of: flag state, owner, environment, cargo owners, crew, passengers and the safe navigation activities and laws. No other official autorities on board, during the navigation, are in power to override the Captain from his important office. All persons aboard, crew and passengers, conforming the nautical and navigation laws, must remain under command and under the authority of the Master.

A competitive maritime company should ensure that each ship is manned with qualified, certificated and medically fit seafarers in accordance with national and international requirements. New personnel and personnel transferred to new assignments related to safety and protection of the environment must be given proper familiarization with their duties. The company should ensure that all personnel involved in the company's safety management system have an adequate understanding of relevant rules, regulations, codes and guidelines.

The company should establish and maintain procedures for identifying any training which may be required in support of the safety management system and ensure that such training is provided for all personnel concerned. Also, procedures by which the ship's personnel receive relevant information on the safety management system in a working language or languages understood by them should be assured.

The company should establish procedures to identify describe and respond to potential emergency shipboard situations. Programs for drills and exercises to prepare for emergency actions should be established. The safety management system should include procedures ensuring that non-conformities, accidents and hazardous situations are reported to the Company, investigated and analyzed with the objective of improving safety and pollution prevention. Procedures for the implementation of corrective action should be assured. The company should establish procedures to ensure that the ship is maintained in conformity with the provisions of the relevant rules and regulations, that inspections are held at appropriate intervals, any non-conformity is reported with its possible cause, if known, appropriate corrective action is taken and records of these activities are maintained. The company should establish and maintain procedures to control all documents and data which are relevant to the safety management system. Documentation should be kept in a form that the company considers most effective and each ship should carry on board all documentation relevant to that ship. The company should carry out internal safety audits to verify whether safety and pollution prevention activities comply with the safety management system and the audits and possible corrective actions should be carried out in accordance with documented procedures. The results of the audits and reviews should be brought to the attention of all personnel having responsibility in the area involved. The management personnel responsible for the area involved should take timely corrective action on deficiencies found.

3. Aspects of competitiveness analysis and implementation of safety management

A competitive analysis establishes the skills necessary to succeed in maritime business and define a company distinct competitive advantage. Therefore, it's essential for new businesses in maritime sector to complete a

competitive analysis during the business planning stage, but competitive intelligence can also be useful for marketing, pricing, managing and other strategic planning. Before a company can know it's competitive edge, should know its competitor: where is the competitor located, what are the competitor's strengths and weaknesses, how can the transport services be compared in terms of quality, appearance and any other criteria.

An analysis of competitive benchmarking can be used for comparing the maritime organization's operations against those of the competitor's. In making specific comparisons within maritime industry, organization gains information about common marketing practices, available seafarers and stakeholders. In order to benefit from this research, a company should take as many weaknesses of the competitors as possible and turn them into potential strengths for the business.

An analysis of competitiveness and safety management implementation at the board of the ship presents a number of disadvantages related to excessive retraining costs, management time consumption, increase paperwork and formalities, demands unrealistic employee commitment levels, and emphasizes process over results. Failure in implementation may be caused by lack of understanding and coping with the organizational culture, inadequate training, lack of management leadership, financial commitments, and cooperation (Pun, Yam, Lewis, 2003). From the experiences of the safety management system certified companies in Hong Kong and Singapore (Yeung, 1997), the most difficult problems associated with the registration are: resistance to change, lack of human resources, insufficient knowledge of procedures or lack of inter-departmental communication. Many shore-based staff and crews are resistant to change when introducing new procedures and instructions in accordance with the ISM Code. Preparing safety management manuals and writing procedures require human effort and time that are beyond the capability of current staff. The requirements of ISM Code are new to many managers, port and ship captains, and engineering superintendents and conflicts always occur among departments, especially between the operation department and the technical department. Level of education is another weakness accepted by a large number of companies that employ lower educated crews from developing countries. This reduces operating costs but also creates a lot of problems with competitiveness standards from the service quality point of view. communications and frequent staff turnover is another issue that many maritime companies have to face. Most crews are recruited on a contract basis (normally in four to 12 months). This adds to the difficulties of introducing change or any new policies and practices on board. Many ship operating companies rush to complete safety management system registration in nine to 12 months time and this imposes enormous pressure on the management and staff involved to achieve it.

Conclusions

In order to acquire competitiveness by implementing the safety management system in maritime transport business, the management of the maritime company should state a clear vision and mission so that the crew members can understand the expectations of management. There should be established a safety management panel to monitor the implementation of the system and a least one person should be designated ashore to provide communication between the company and crew regarding safety operations and any problems that may appear. Nevertheless, the company should finance leadership and safety management training programs and seminars.

The implementation of safety management in maritime transport companies must be consistently analyzed and reviewed. Competitive maritime companies with tradition are the ones hiring seafarers after passing both a high level exam and a very well structured interview. In order to be competitive and responsible, maritime companies and seafarers must acknowledge and implement a management of safety at the board of the ship. "Just getting by" is an attitude uncompetitive seafarers or maritime companies may accept, but this is the attitude of amateurs with no professional standards.

THE ESTIMATION OF BANKING SERVICES QUALITY BY USING THE MYSTERY SHOPPING METHOD

Nistor Razvan Liviu

Babes-Bolyai University Cluj-Napoca Faculty of Economics and Buusiness Administration razvan.nistor@econ.ubbcluj.ro, 0264418654

Zagan Zelter Diana

Babes-Bolyai University Cluj-Napoca Faculty of Economics and Business Administration diana.zelter @econ.ubbcluj.ro, 0264418654

The continous increase in consummers' expectations as well as fierce competition, is turning quality into a necessary condition for being successful. On long run, the quality of a company services is the most important factor influencing the profit and the surest way of increasing the turnover and the market share, because it allows "attracting new customers, a higher business volume with the existing ones and losing as few clients as possible" The general aim of this study is to offer a practical perspective on the quality of services in order to reinforce certain concepts such as: typology (technical quality versus functional quality), the dimensions and the evaluation of quality. By analyzing the dimensions of quality, the measurement modalities and their improvement, the present research offers instruments for understanding the significance of this "irreprochable service".

Keywords: quality, evaluation, banking services, the mystery client Cod JEL:M, M10

1. INTRODUCTION

The Romanian society has undergone serious changes for the last 20 years. Not only did it move from a centralised economy to the market economy, but also from oppression to free expression and manifestation, or from isolation to unlimited access to information. We are experiencing a new social order or, at a better look, a new "social disorder", where there are no clear value systems.

Philip Kotler used to say: "All companies are service companies. You are not a chemical products company, but a company for serving chemical products." In other words "everybody serves somebody", we are all service providers. In the economic environment, this situation demonstrates the necessity of being different from the competition through a different service which exceeds the expectations through superior quality. In the banking environment, which is already characterized by strictness and exigency, this situation demonstrates the necessity of providing an irreprochable service.

2. THE NATURE AND CLASSIFICATION OF SERVICES

K.J. Blois considers that "the service represents any activity that offers benefits without necessarily assuming an exchange of tangible goods". ¹⁹⁹Philip Kotler defines the term "service" in the following way: " a service is any action or operation that one party can offfer to another party and which is essentially intangible and it does not have for a result getting possession of a thing. Its production may or may not be related to an existing product in physical shape" ²⁰⁰. Thus we can retain the following defining elements for services: "benefit-generating activity" and "intangibility". To these we can add the "personal" character, determined by the inseparability between the activity provided, its provider and its beneficiary. Thus, the services become "personal and immaterial performances" ²⁰¹. Consequently, the banking services can be understood as activities or range of activities (the banking activities) that offer benefits, satisfying the consumers' needs. The service provider is, in this case, the banking institution, and the service beneficiary, the bank client, the consummer of banking products and services. The banking services are placed among those with reduced possibilities of personalization (through the very nature of the products and services). However, the degree in which the contact provider-client ensures personalization is very high. One distinction can be made between: quality as a consequence of the service chracteristics and quality as a consequence of the lack of flaws ²⁰². Another distinction is made between the technical quality and the functional quality²⁰³ of services. While technical quality expresses the result of the performance (what the client stays with after the interaction with the provider), the functional quality refers to the way in which the service is provided.

3. CASE STUDY – THE ANALYSIS OF THE QUALITY OF THE BANKING SERVICE "THE CREDIT FOR STUDIES"

3.1.GENERAL PRESENTATION OF THE CASE STUDY

¹⁹⁹ Olteanu V., Marketing financiar – bancar, Editura Ecomar, București, 2003, p.38.

²⁰⁰ Kotler P., Managementul marketingului, Editura Teora, București, 1997, p.580.

²⁰¹ Lendrevie J., Lindon D., Mercator, Editura Dalloz, 2000, p.667.

²⁰² Kotler P., Bowen J., Makens J., Marketing for Hospitality & Tourism, Prentice-Hall, 1996, p.354.

²⁰³ Kotler P., Bowen J., Makens J., op. cit., p.355.

Starting from an external method for quality evaluation ("mystery shopping"), we can evaluate the technical and functional quality of the service "the credit for studies", which is present in 5 versions on the banking services market from Romania, eventually identifying adequate improvement strategies. The 5 services analysed are: "Academic Extra/Super" — credit BCR, "The credit for studies"—BANCA TRANSILVANIA, "The credit for studies"—BANCPOST, "The credit for studies"—UniCredit Tiriac Bank and "Student Plus" credit —BRD-Groupe Société Générale.

The need that is to be found for the analysed service is covering the costs generated by study improvement: tuition, living expenses, transport expenses, expenses for purchasing study materials. The beneficiaries of the credit are often young people admitted in the study programme of certain Romanian or foreign universities.

In the case of the "Academic Extra/Super" credit $-BCR^{204}$, the destination allowed is the payment of the tuition fee, living expenses, expenses for purchasing study material, transport expenses and other expenses related to studying. The credit can be granted in RON, EUROS or US dollars.

studying. The credit can be granted in RON, EUROS or US dollars. "The credit for studies" – BANCA TRANSILVANIA²⁰⁵ is granted to all Romanian citizens, residing in Romania, students or graduates of high education. The object of the credit is covering the tuition fee or other expenses such as: transport, accommodation, taxes, food, (in the case of studying abroad). The crediting period is between 1 and 5 years, being correlated with the study period.

"The credit for studies" - BANCPOST²⁰⁶ is granted for paying the tuition fees of a certain educational form or professional training, for the borrower or a member of their family. The eligibility conditions that the borrower should fulfill are: to be a Romanian citizen with permanent residence in Romania; to be of age, to prove that they have an income; to present the required collaterals; not to have debits or other unpaid obligations to the bank at deadline when they apply for the credit; to achieve the minimum score imposed by the risk evaluation system - Credit Scoring.

"The credit for studies" – UniCredit Tiriac Bank²⁰⁷ can be granted in RON, US dollars or EUROS, having a minimum value of 3000 EUR. The crediting period is between 1 and 10 years. For sums up to 10.000 EUR inclusively, the maximum crediting period is 5 years.

The "Student Plus" credit- BRD-Groupe Société Générale²⁰⁸ is granted to persons between 21 and 40 years old, admitted in a post-graduate study programme of a Romanian university approved by BRD. The destination of the credit is financing post-graduate studies (master, PhD) in Romania.

3.2. THE DESCRIPTION OF THE EVALUATION METHODOLOGY

For measuring the quality of the services above, the chosen technique is "mystery shopping". Concentrating on the interactions between employees and clients, that is on the so-called "truth moments", the applied technique will evaluate the functional quality of services. Because of practical impediments, there are however differences between the theoretical version of the method and the way in which this is applied. Firstly, from the theoretical point of view, the method involves buying the tested services, "the mystery client" being allocated a budget for this purpose. In this study we tested just the "pre-shopping"stage. Secondly, the method implies making repeated tests in the same bank with more "fictitious clients". In the present study, we tested services belonging to different banks (one for each), with just one "fictitious client".

For applying the method the next stages were followed:

Choosing the services to be tested;

Identifying and defining the dimensions of the functional quality which is to be evaluated; the ellaboration of the assessment paper for functional quality;

Establishing an assessement scale for the identified dimensions;

Planning the application process (setting up the testing schedule and the routine to be Centralising and interpreting the data . followed);

The limits of the study:

- a considerable limit is subjectivity: its first form of manifestation is linked to the process of defining the quality of a service that greatly depends on personal experience and the exigency degree that characterizes the "researcher"; another form of manifestation for subjectivity is linked to the service perception. "The mystery client" is subjective, filtering the service through their own personality and comparing it to previous experience;
- another limit is the circumstantial character of testing, the results obtained after the simulation of the purchasing acts depend on the place, the hour, the employee and the service which is the object of testing, the generalization possibilities being reduced;

^{204 &}lt;a href="http://www.bcr.ro/irj/portal/?site=bcr">http://www.bcr.ro/irj/portal/?site=bcr ro .

²⁰⁸ http://www.brd.ro/special-tineri/produsele-pentru/studenti/creditul-studentplus/.

- there are limits generated by the innacuracy of the accounts as it is impossible to record all the details observed, the questions asked and the answers received during the performance;
- the results of the study must be looked upon also from the perspective of the service development stage that was tested: we studied the quality that can influence the buying decision and not the repeated purchase (for which it is necessary to consume the service).

3.3. THE EVALUATION OF TECHNICAL QUALITY

According to theory, the technical quality expresses the result of the performance (what the client stays with after the interaction with the supplier), excluding the way in which the interaction provider-client takes place. Taking into account the analysed service, we considered the following elements which do not depend on the employee's or the client's performance: the interest, the maximum borrowed sum, the maximum crediting period, the required collaterals and the way of granting the credit. We excluded such elements as: the value of the taxes and commissions or the number of documents required, which are considered less important in making the buying decision. Next, we established the assessment scale that is to be used. For the majority of elements we set a score from 1 to 5, 5 being granted to the most favourable value existing on the market, and 1 – to the least favourable value. For intermediary grades, the intervals were established mathematically. In the case of non-valorical elements, grade 5 was granted for the most favourable situation on the market and grade 1 for the least favourable situation. For a better relevance of the results we also used importance coefficients. (see Table 3.2)

3.4. THE EVALUATION OF FUNCTIONAL QUALITY

While technical quality expresses the result of the performance, the functional quality refers to the way in which the service is performed (the way in which the interaction with the supplier takes place). The functional quality is specific to services and clearly linked to the "truth moments". In order to identify the elements of the functional quality we took into account the 5 dimensions identified by A. Parasuraman, Valarie A. Zeithaml şi Leonard L. Berry: tangible elements, seriosity, responsiveness, safety and empathy. These were decomposed in components, taking into account traditional definitions, but also introducing new elements, in order to ensure the possibility of their manifestation in the "pre-shopping stage". In this case we also established an objective assessment scale. If in the case of technical quality, the assessment scale was established by reference to the market situation (the evaluation of the characteristics of a bank's service is made by reffering to the most favourable offer or the least favourable one on the market), in the case of functional quality the assessment scale was established by referring to the ideal situation.

3.6. CONCLUSIONS AND PROPOSED STRATEGIES

In the case of the service provided by BCR it is noticed that the score is maximum for technical quality, but minimum for functional quality. The strong points of the service are the borrowed sum and the long crediting period, but mainly not requesting collaterals and the possibility of transfering a part of the borrowed sum in the personal account.

In the case of the service provided by BANCA TRANSILVANIA, the total technical quality is medium, the weak point being the request of important collaterals and the strong point the transfer in the client's personal account (incresed flexibility for the client concerning the use of the credit).

For the service provided by BANCPOST, we notice the minimum score for functional quality. From this point of view, the service is obsolete. It is recommended either to abandon it or to update it. In the case of functional quality, most of the scores are medium, especially the lower degrees for staff presence at working points, availability to help, staff competence and information provided.

The service provided by UniCredit Tiriac Bank registers the biggest number of maximum grades. The functional quality is very close to perfection. Obviously, the client's expectations were exceeded. The weak points refer to

technical quality, through the considerable collaterals requested and the transfer of the whole sum in the account of the educational institution.

In the case of the service provided by BRD-Groupe Société Général, we can remark the interest for solving the clients' problems quickly, the pleasant environment for discussion, the sustained visual contact and the employee's interest to find the product that best suits the customer's needs.

4. FINAL REMARKS

Why do quality problems appear? The main cause is that the service provided does not live up to the client's expectations. There is a discrepancy between the client's perception and their expectations. This difference is produced also by other causes: the bank;s management does not know which the client's expectations are; the management knows what the client wants but it does not establish adequate quality specifications; the bank's employees do not observe the quality specifications imposed by the management; the advertising presents the services in a hyperbolic way.

Which is the situation on the banking services market? The practical study we made offers a comprehensive answer to this question. There are negative surprises (2 h waiting time and carelessness from employees in a bank with tradition; insufficiently informed staff in three banking institutions), but also positive ones (the ability and the care of the staff would make the client return only for "the sake" of interaction). It is intriguing that the negative events which impressed most (the so-called "critical incidents") have obvoius, easily identifiable solutions. By simply recording the clients' complaints and replacing the non-functional systems identified by them would lead to a substantially improved service.

The personal impression, after researching on the concepts referring to quality and making the practical study, is a contradictory one because there are two poles. On one hand we recognize the multiple difficulties that the problem of service quality rises, the degree of subjectivity that cannot be elliminated. Obviously, the quality in the field of services is a delicate theme, hard to define and to manage. However, the provider that obtained the highest performance did not do anything else but observe the requirements of the quality book, that is conform to standards. We consider this is a clue that until now the specialized literature has correctly identified the significance of quality for clients.

Starting from Edgar Schein's theory about the career anchors, this research paper pursues the identification of the career anchors of 25 managers from Mehedinţi County, working in pre-collegiate educational institutions and in firms from the domains of manufacture, commerce, construction. Rigorously following the phases of a scientific research and using the adequate methodology, our research is in measure to demonstrate that knowing the career anchors of each employee is very useful. Knowing the professional anchor is important not only from the perspective of the employee but also from the point of view of the company, in order to place the right person in the right position.

Keywords: career, anchor, manager

Cod JEL: M54

Introduction

The human factor represents the strategic element on which the optimal performances of the businesses around the world depend on. It is being estimated that the future will bring a rise in the human resources' flexibility, that there will be changes in the structure of the staff, in the significance of the professions and job functions. Preparation in a number of professions will grow further and new jobs and positions will appear. A new behavioral pattern and new values will be imposed so the human activity will have to rely more and more on competence, increased individual responsibility and increased efficiency. It happens more often that employees occupy a series of positions in different companies where they are needed. This fact makes it necessary for the employees to be preoccupied with their own career. The most important tasks that the manager has are to ensure that the best employees are kept in the company and to develop their potential. Therefore knowing the employees is very important.

A useful way to know the employees is to know their career anchor. This is the reason why our study is based on a research performed on the career anchors of 25 managers from the Mehedinți County. **Our objective** is to point out the agreement or disagreement between the career anchor and the job position occupied at the moment. It is important to observe in what extent the self-knowledge of an employee will help him in his career. We want our study to be useful for the human resources department in order to include the anchors test in the recruitment and selection process. This information gives the HR department the opportunity to establish better training programs and employ people on jobs that are right for them.

1. Schein's theory about career anchors

The professional career is perceived as: promotion, profession, a series of positions during one's life. A distinction has to be made between the **objective** career (includes staff development and implies promotions, specialization, motivation, human resources planning) and the **subjective** career (self-perception and the role that the job has in one's life).

Human resources literature speaks about two major theories: Holland's theory about career types and Schein's theory about career anchors. Holland's theory about career types identifies six different career patterns: conventional, artistic, realistic, social, entrepreneur and investigative. These are the six ideal career patterns. The way someone orientates for one or another depends on one's qualities although everybody has more than one quality. It is advisable that people try to find themselves in these patterns and plan their career accordingly. Our research has its base in Schein's theory about career anchors and this is why we will continue to pursue this approach.

Edgar Schein²⁰⁹ pleads that when one person knows themselves and has a clear occupational identity, they will have a clear perception of different talents, goals and values. Schein defined the career anchor of a person as a domain of personal concepts; one would never give up under any circumstances. He considered that career anchors develop and become clear at the beginning, as a result of education and experience. Being capable of identifying career anchors is indeed very important for an efficient administration of one's career. It's also important that the people within the company that are responsible of career management are aware of the fact that some anchors tend to prevail in their company.

-

²⁰⁹ Edgar Schein – researcher preoccupied with the professional career between 1979 and 1982, together with T.D. DeLong from Brigham Young University, Provo, Utah in order to establish the career anchors for students.

Schein identified 8 anchors: technical and functional competence; managerial competence, security, autonomy, creativity. Some add pure challenge and dedicating one's life to a cause or a life style.

In the same way anchors keep a boat from floating away, career anchors keep one focused on certain types of activities like the technical and functional competence, managerial competence, safety, autonomy and creativity. For those who developed a **technical/functional competence** the most important factor is the choice of a career is the actual content of the work. The possibility of a transfer to a domain that moves them away from their competence presents no interest to them. The person that develops a **managerial competence** focuses on reaching positions that imply higher responsibilities. The perspective that the occupied position offers is more important that the work content. What matters is the opportunity to develop analytical abilities and to gain useful experience. People with this anchor want to become managers. Other jobs are seen as ways to develop the needed competences in order to get a managerial position. **Safety** is an anchor that orientates people to occupy a secure position. People with this anchor need to maintain stability at work and they prefer jobs in firms or domains with low staff fluctuation. Those who have the **autonomy** anchor won't stay for a long in a domain or place that hasn't clear promotion plans. This type of person needs freedom and no constraints. Independence and freedom are more important than promoting. This type of people is able to decline a promotion if it means loosing one's independence. **Creativity** is an anchor that focuses people on activities where they can create something on their own feeling satisfied by the fact that they create something new.

The differences that arise from these theories show that people are different and that they shouldn't be treated in the same way. A manager has to take all those differences into consideration when they organize and guide the human resource.²¹⁰

In order to find out what anchor suits best we can use a questionnaire and a test that contains 40 statements.²¹¹ Each statement is evaluated by a score from 1 to 6 depending on the measure in which the statement is true to that person. Finally the answers are arranged as a matrix. Then three representative statements from the statements with the highest values are chosen. 4 points will be added to each of those three values. In the end they are summed up along the column. The final score is divided by 5 and arranged in descending order.

2. Study about the career anchors of managers in Mehedinţi County

Our study was realized in Mehedinţi County on 25 managers from pre-collegiate educational institutions and company managers from domains like manufacture, trade and constructions.

The following **steps** were followed in the process of scientific research:

- -the documentation is based on reference literature from the field of human resources.
- -Formulating a research objective and preparing a hypothesis.
- -Choosing pseudo-random samples.
- -Adapting the questioned people with the terms of career anchors and the testing procedure.
- -Statistical processing of the test and the questionnaire.
- -Verification of the initial hypothesis.
- -Drawing conclusions and formulating recommendations for the future.

Research methodology used was the free personal interview (Moscovici, 2007) based on the questionnaire. The chosen samples are pseudo-random. The results show the compatibility or incompatibility between the anchor of the subject and the position he holds at the moment as well as an analysis of the way one's values are tied to his career choices.

The results were interpreted from two perspectives: of the employee and of the company whose employees show certain anchors that were not known. Knowing one's career anchor, he can confront his opinion and decisions with what he values most depending on his self-perception.

The **hypothesis** of this research:

- -If we apply the anchors test on managers, the result will be the MG anchor.
- -If the managers have the MG anchor than they will be professionally satisfied.

3. The results of the research

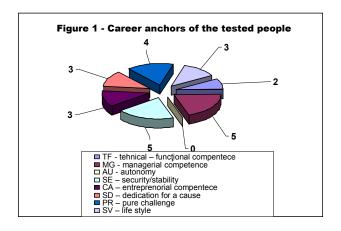

The qualitative interpretation of the results focuses mainly on the aspects about confirming or not the hypothesis up for discussion. Based on the quantitative interpretation of the anchors test and the interview based on the questionnaire, we have drawn all the information that we needed in order to reach our objectives and consequently the hypothesis that we formulated at first.²¹²

²¹⁰ Oargă, V. (2005), Foray in human resources management, Augusta Publishing, Timișoara, pg. 79-81.

²¹¹ Vlăsceanu, M. (2002), Career management. Learn how to build a career, comunicare.ro Publishing, București, pg.25-31.

²¹² Cioabă Ştefania-Raluca – Career anchors – a posibility of knowledge and self-knowledge, dissertation paper, session from February 2009, University of the West Timişoara, Faculty of Economics and Business Administration (coordinated by Valentina Oargă).

In this research the chosen sample was made of 25 managers. Through the statistical processing we observed that only 5 out of the 25 managers have the MG anchor – managerial competence. Figure 1 shows the number of anchors that came out after the test.

These results don't agree with Schein's theory where managers will surely have the MG anchor. The small number of managers that have the MG anchor doesn't confirm the hypothesis from the beginning. Regarding the professional abilities, no matter the department where the person works or the anchor that came out from testing, we can find the following aspects: entrepreneurial spirit, stress resistance, positive motivation, good communication, abilities in solving conflicts, etc. These abilities can be found in managers with the MG anchor as well as in others with different anchors.

There can be different explanations for this situation. We can assume that only 15 people are general managers and that the other 10 people have managerial positions in different departments. No matter what anchor came out after the test, the questioned managers say that, that anchor represents them. At the same time they say that they can do their work as managers even if they don't have the MG anchor.

Regarding the second hypothesis, we can see after processing the questionnaire that not only managers with the MG anchor are professionally satisfied. Out of the 25 managers, 21 are professionally satisfied and 4 say that they are not satisfied with their job. One of the 4 managers that are not satisfied with their job is a general manager. His anchor is SV – life style. People with this anchor consider that family is more important than the career. In this manager's case, he says that his dissatisfaction comes from the fact that he spends a lot of his time with work and that the time spent with his family is to short. Although not all managers have managerial competence, the large majority (21) is professionally satisfied and wouldn't want to change that job even if they don't have the corresponding anchor.

At the same time they claim that they have the qualities that a manager needs, an aspect proved by the revenue of the company they work for, or the unemployment rate or the success they reached within the school, for the managers of educational institutions. From the 4 managers that aren't professionally satisfied with their job, 2 have the career anchor PR – pure challenge. From Schein's theory we know that this type of people search for challenges that are more and more difficult. They look for jobs where they can face higher difficulties. These people define their life through competitive terms. Considering this aspects, those managers dissatisfaction correlated with a wish of change, Schein's theory is confirmed because every career anchor is a steady image of oneself even if there is no opportunity to prove this. The person who doesn't have the right anchor will always search for another job that suits his/her wishes.

4. Conclusion

Considering the small sample on which the research was performed in our country, this paper wants to be a small beginning in the study of this theme. Because of the small number of subjects in this sample, this paper is like a pilot study for the relationship between self-knowledge and career as well as the possibility that the career anchors represent a way o self-knowledge. The results we obtained are significant and represent a starting point for other larger researches in this domain that can draw finer lines in self-knowledge through the expansion of the tested sample. The small number of participant doesn't permit a generalization to all managers. Another situation that has to be considered is the fact that the questioned person's state of mind and desires at that moment influences the results. Certain needs can be very strong and they can affect the results of the research. This is the reason why it is better if the test is repeated after a certain amount of time has passed. Considering the results shown in the figures and tables, we can say that most managers from this research have a matching career anchor. The question that arises is if this identification is real because of the good self-knowledge or is this identification hazardous? There are multiple answers to this question if we consider that the questioned participants have managerial positions in different departments. Following the analysis of the tests we see that the directors of the educational institutions have the career anchor of SD – dedication for a cause, and the anchor of managerial competence. The people in

leading positions from the domain of education identify themselves with their anchor because they are successful in their job. Besides the anchor of SD and MG (in this order), we've seen the anchor of SE – security/safety. This anchor is due to the fact that teachers are titular in the institutions where they work appreciating the security of the job. According to the quantitative analysis we can identify the anchors of MG – managerial competence, PR – pure challenge and TF – technical competence in small and medium sized companies. Those managers consider that the anchor matches the job.

Through this research paper we followed the hypothesis that the career anchors are a way of self-knowledge. The obtained results confirm this hypothesis in most of the questioned subjects even is we consider the limitations that we mentioned before. The use of career anchors is recommended for human resources managers in order to fix the right person for the right job. Even if the results can't be generalized, they are a beginning of other researches in the domain of human resources and career management.

SOME REFLECTIONS AND COMPARISONS REGARDING THE ENTREPRENEURSHIP RESEARCH IN EUROPE

Oncioiu Florin Razvan

Constanta, str. Brizei, nr. 5A, bl. FB7A, ap. 1, e-mail: oncioiu_florin@yahoo.com University of Agronomic Sciences and Veterinary Medicine of Bucharest

Recent entrepreneurship research is characterized by the interest in divergent conditions for entrepreneurship, but also very different research traditions between countries.

Entrepreneurship research in Europe has a long tradition and can in many ways be regarded as the birthplace of theoretical entrepreneurship studies. However, in the late 20th century, entrepreneurship re-emerged on the political agenda across Europe, and during the 1980s and especially in the 1990s developed a foothold within European research. Entrepreneurship and small business research is to a great degree international, exhibiting the same positive development in Europe as in other parts of the world.

The aim of this paper is to describe entrepreneurship research in the various parts of Europe.

Keywords: entrepreneurship, small business, economy.

JEL: L26.

Introduction

Entrepreneurship has a long tradition within economics, but it is difficult to identify any uniformity regard the use of definitions. Practical, economists were the fist to attempt to endow the concept of entrepreneurship with greater scientific meaning.

There are ambiguity about the content of the concepts entrepreneurship. Different studies have used many various definitions. For example, Morris found 77 different definitions in a review of journal articles. Some common definitions for entrepreneurship are :

Act of innovation that involves endowing existing resources with new wealth-producing capacity (Drucker 1995);

Process by which individuals pursue and exploit opportunities irrespective of the resources they currently control (Stevenson 1985);

The creation of organizations, the process by which new organizations come into existence (Gartner 1988);

Way of thinking, reasoning, and acting that is opprtunity driven, holistic in approach, and leadership balanced (Timmons 1997);

About how, by whom, and with what consequences opprtunities to bring future goods and services into existence are discovered, created, and exploited (Venkataraman 1997).

The view of entrepreneurship as the emergence of new organizations has found expression in two international projects: The Entrepreneurship Research Consortium (ERC) and the Global Entrepreneurship Monitor (GEM). But, the rapid development of entrepreneur concept within the field has had some adverse effects. For example, concerns have been raised in respect of:

- 1. the problem of defining entrepreneurship and the uncertainty in the domain of entrepreneurship: some definitions are related to entrepreneurship as a societal phenomenon, while others are related to the need to define entrepreneurship as a scholarly domain. Davidsson argues that we need to distinguish between "entrepreneurship as a societal phenomenon" and "entrepreneurship as a scholarly domain". Following the reasoning of Davidsson the definition of entrepreneurship as a societal phenomenon is inadequate for entrepreneurship as a scholarly domain because we can indentify a number of fundamental approaches to defining entrepreneurship: entrepreneurship as a function of the market; entrepreneurship as an individul, and entrepreneurship as a process.
- 2. entrepreneurship research gradually changed from being a topic within economic science, becoming a part of behavioral science, before finally moving into the area of management science.

However, today the efforts to attain coherence by unified entrepreneurship research are open to questions like: What are the contribution of entrepreneurship reasearch? How to remove the difficulties in defining core concepts? What makes entrepreneurship reasearch unique?

The entrepreneurship research in Europe

Entrepreneurship in Europe has several characteristics:

- 1. entrepreneurship research is characterized by its diversity;
- 2. in order to stimulate development in society the entrepreneurship research has received more attention;
- 3. there is an acceptance of a broader range of methodological approaches among European researchers;
- 4.the diversity of entrepreneurship research in Europe influences not only the methodological approaches used and the topics chosen but is also reflected in the research communities in the various countries.

There is a very great variation in research traditions between countries (Hisrich & Drnovsek, 2002) in terms of not only the size of the research community in each country but also the researchers' disciplinary backgrounds and epistemological concems. Due to the great heterogeneity and diversity of the continent, it seems difficult to give an adequate description of entrepreneurship research.

In Europe, Great Britain was one of the first countries to be hit by the economic structural changes at the end of the 1960s and early 1970s. The Northern part of England was a region especially affected by these structural changes, along with Wales, Scotland and other older industrial areas, resulting in business closures and a high rate of unemployment. It was this recession that prompted increased political interest in entrepreneurship and the small business sector. Due to their ability to create jobs, which large corporations were unable to provide, small firms were regarded as the answer to the employment problems resulting from structural changes. The growing political interest in small firms on the part of the UK government at this time led the British government to initiate a comprehensive inquiry into the role of small businesses in the economy. The final report, the Bolton report, was presented in 1971 and exerted significant influence on politicians, academics and the media. During the 1970s the political parties developed explicit small business policies and the media devoted more coverage to the small business sector, thus leading to an interest in small business research among academics in the UK.

The political agenda in terms of entrepreneurship and small business changed dramatically in the early 1980s when Margaret Thatcher came to power (1979). Thatcher had an ideological view of entrepreneurship and small businesses and initiated a large number of measures in order to change the mentality of the people in the UK - creating an entrepreneurial culture - including privatizations, deregulation, a new tax regime, and a large number of new instruments to stimulate new and small businesses. Entrepreneurship and competition were two central concepts in this policy, concepts which also influenced academia. The universities were expected to be increasingly self supporting, which led to increased competition between them. As a consequence, the research became more empirical and concentrated on areas that were likely to create revenue for the university in question - contract research offered one of few mechanisms for obtaining research funds in a situation where core research funding were extremely limited. At the same time, many education programs focusing on entrepreneurship and small business management were established at different universities, several of which emphasized training and education for small business managers. Thus, Thatcher had a very broad approach to entrepreneurship it was a question of changing the minds of people and she was very influential in this regard.

At the end of the 1980s the UK Economics and Social Science Research Council (ESRC), in collaboration with private sector businesses and some government bodies, initiated a comprehensive small business research program (the ESRC Small Business Initiative) an initiative which could be regarded as a real milestone and put small business research on the map. David Storey was appointed program coordinator. The ESRC Initiative focused on four areas: (1) the economic role of small firms within a national and international context, (2) local labor markets and small firms, (3) structural and organizational issues, and (4) determinants of the birth, survival and growth of small firms. A large number of projects were undertaken and three research centers were established (Kingston, Cambridge and Sussex universities). Storey decided to select several well known researchers who were not regarded as small business researchers, which afforded the program a diversity of interest, a multidisciplinary character, and ensured high quality research. The studies performed as part of the program were all very carefully designed with interesting analyses that have contributed a variety of new knowledge to the research in this field. In the 1990s the interest changed toward growth oriented established businesses.

The Nordic countries (Denmark, Finland, Norway and Sweden) have, despite their geographic proximity, quite different traditions of entrepreneurship and small business research and must therefore be treated separately.

During the recession in the Swedish economy in the 1970s, great hopes were pinned on small businesses, with the ensuing call for more knowledge about the sector. Research was, however, limited to a small number of researchers and the research began to specialize in studies of networks and local entrepreneurial cultures.

In the 1980s the state made considerable reform to stimulate the small business sector, and throughout the decade there was a vigorous increase in entrepreneurship and small business research. Researchers attempted, in as far as possible, to link knowledge to concepts and models within the area of business administration, which resulted in the limited influence of other disciplines. The growth of research was characterized by (1) the spread of research to many universities throughout the country - a geographic diffusion of the research, (2) a change as regards the object of study - from the traditional family business to new types of small firms, such as technology-based firms and fast-growing businesses, and (3) although the research was rooted in the discipline of business administration, at this time it began to mould an identity of its own - the researchers began to regard themselves as specialists in entrepreneurship and small business.

Among the Scandinavian countries only Finland shows a similar development to that of Sweden within the area of entrepreneurship and small business, and it is primarily since the mid 1980s that the research and education in this subject area have been greatly intensified.

Today almost every university in Finland has a full or associate professorship in entrepreneurship indicating that the number of chairs and researchers is relatively large in Finland, but also implies a fragmentation of the research despite the fact that a number of centers conducting more systematic research within the field have emerged.

Similar to the other Scandinavian countries, interest in the area of entrepreneurship and small business in Norway first appeared on the political agenda in the 1970s when the Norwegian government released a white paper on small business

Since the 1980s entrepreneurship and small business have been on the agenda in several universities, but the efforts within the field have been uncoordinated and unsystematic. However, during the 1990s, Bodo Graduate School of Business in Bodo in the northern part of the country and Trondheim University of Technology have turned out to be the leading exponents of entrepreneurship and small business research, and we can find a more systematic form of entrepreneurship and small business research at these two universities. Under the direction of Lars Kolvereid, the business school in Bodo was the first to offer graduate courses in entrepreneurship in 1986, a master program was introduced in 1995, and a PhD program started in the early 2000s.

A key feature of the industrial structure in Denmark is the lack of large corporations. As a consequence, it has proved difficult to distinguish entrepreneurship and small business research from management studies in general. This has also resulted in the fact that there are few research centers dedicated to entrepreneurship and small business research, the research community is fragmented and dominated by researchers with many years experience of entrepreneurship and small business research, for example, Mette Monsted and Poul Rind Christensen to name two of the best known within the field. Traditionally, governmental and regional institutions have also assumed responsibility for counseling and research, even if the importance of these institutions has gradually declined in line with the increasing importance of academic research.

At the same time a couple of other studies emerged which indicated intensified activity in the area of small business research in Denmark. Several quantitative studies were presented, which focused on the number of entrepreneurs and their socioeconomic importance.

The linkage between knowledge development in entrepreneurship and the development of industry and trade has continued. For example, much of entrepreneurship research has been financed by government ministries and the academic interest in entrepreneurship and small business has continued. At the Copenhagen Business School, research has been channeled to the Department of Management, Philosophy and Politics, where the interest has been broadened and today involves several different research themes.

In the German speaking countries there is a long tradition of entrepreneurship research dating back to the early Schumpeterian theory of economic development. However, it is not pure entrepreneurship that has been the main characteristic of the German speaking countries but the dominance of small firms, especially in craft, retail and service businesses. Over the years, a number of research institutes have been established aimed at developing management practice and knowledge, mainly connected to different sectors of industry. Thus, there is extensive research on the small business sector conducted outside the academic setting, but in many cases with some form of link with the universities. The relationship between the Universities and the Institutes can be characterized by a division of labor, with the Institutes focusing on continuous observations of the sector and applied research, mainly on aggregate levels of analysis, whereas the Universities concentrate more on basic research.

These extensive research efforts in the German speaking countries indicate that the research is on the threshold of a breakthrough and is growing rapidly, although some decisive factors should be taken into account.

Both Italy and Spain are countries that have many small businesses, not least in the form of family-run firms in the tourism and service sectors. In common with most industrialized countries, Italy experienced major changes in the industrial structure during the 1970s and at the start of the 1980s with the growing importance of small businesses for economic development and the high proportion of self-employment. The major fluctuations in the world economy in recent decades have had important consequences for Italian industry, as many sectors are strongly dependent on export. Despite this, Italy has been relatively successful, among other things due to the devaluation of the lira and the continuous undervaluing of the currency, which has made Italian products more competitive.

Thus, economists and researchers within industrial economics have dominated Italian small business research for a long time. In recent years we can, however, discern an increasing interest in the situation of small companies among researchers with a focus on micro-level analysis. One of the main characteristics of small business research in Italy is that the research is to a large extent individual and highly fragmented - it is hard to identify a homogeneous research community around small business research. In recent years, however, Italian small business research has increasingly acquired a stronger empirical foundation as well as a more international character.

In Spain there was an early interest and we are talking about the early 1970s in the personal characteristics of the entrepreneur and the attitudes toward entrepreneurship among students and managers, an interest which grew strongly during the 1980s. The research on the characteristics of the entrepreneur as an individual has however stagnated, and research is instead directed toward topics such as the" economic and financial structure of SMEs" and "SME strategies", but also research on family businesses and public policies for SMEs has been fairly prominent.

During the initial period (1980 to 1995), a feature of the research was a lack of empirical studies articles that informed about themes relating to small firms and entrepreneurship, but without a base in empirical studies. In the case of empirical studies, quantitative methodological approaches dominated.

One of the main issues facing the transition countries is the need to develop a private business sector. This development from public to private sector ownership has taken various forms including (1) a direct privatization of former state owned enterprises - in many cases managers of state-owned enterprises as well as former politicians (the nomenclature) have used their influence to privatize "their enterprise", (2) private firms tolerated during the socialist period, for example, craft enterprises in Poland, continued to exist during the transition period, and (3) the creation of completely new businesses, including self-employment and part-time businesses (in many cases in order to provide "self help" for former employees of state-owned enterprises Who were made redundant or have been forced to resign as well as many informal sector businesses).

However, it should be emphasized that each transition was different and that the countries are now at different stages in their development toward a market economy - entrepreneurship seems to have developed more quickly in countries where reforms proceeded smoothly and quickly.

As a consequence, the interest in small business research increased dramatically. For example, considerable research has been conducted in the Czech Republic, Hungary, Poland and Slovakia due to the growth of entrepreneurship in these countries as well as to their membership of the OECD (the Organization for Economic Cooperation and Development) and various EU funding programs that have given domestic researchers the opportunity to collaborate with researchers in western countries.

Conclusions

In conclusion, Finland today has a large infrastructure in the area of entrepreneurship and small business research, as evident from the fairly large number of chairs and researchers within the field, and the soaring number of dissertations, but also a fragmentation and lack of long-term systematic research within the field.

Also, the bulk of research within the German speaking countries has, due to the industrial structure and business culture, been focused on small businesses and to a lesser extent on entrepreneurship. However, for a long times there have been individual initiatives aimed at highlighting entrepreneurship research.

To sum up, entrepreneurship research in Spain can be said to be emerging. As much of the research is performed by doctoral students, it is seldom presented in international scientific journals. The research is also strongly fragmented among different universities with an interest in entrepreneurship and small businesses.

One main problem is that the quality of aggregated economic data does not follow market principles or Eurostat (the Statistical Office of the European Union) standards, thus research based on official data should be treated with caution. In addition, the informal economy is widespread in the transition countries, which means that a large proportion of actual economic activity is not measured by formal indicators.

The international research community has shown an interest in this transformation process and considerable research has been conducted both by native researchers and visiting researchers from Western countries, the results of which have been presented in many journals and at international conferences. In addition, a couple of specialized conferences have been established thus contributing to the diffusion of knowledge about the transition process.

THE IMPORTANCE OF TACIT KNOWLEDGE WITHIN THE ORGANIZATION

Orzea Ivona

The purpose of this article is to understand what is tacit knowledge supported by Polanyi's definition "we know more than we can tell". Tacit knowledge is a concept developed in connection with knowledge management field of research. Tacit knowledge represents personal knowledge obtained as a result of the direct interaction between individuals and their environment. It contains also intuitions, feelings, hunches, talent and many other forms of knowledge which are non-rational. Tacit knowledge represents an excellent reservoir of intangible resources from which the organizations can gain a major competitive advantage.

Keywords: tacit knowledge, explicit knowledge, competitive advantage

JEL code: D83: Search, Learning, and Information

Introduction

Throughout the history capital, raw material and labor have been considered the main source for creating and applying knowledge. The new trends in informational age, the development of knowledge management has changed that belief. Knowledge has become the key economic resource and the dominant source of competitive advantage. Knowledge has become the core element of every activity in our society. Workers who lack the adequate education and training, or skills struggle to survive in a society whose emphasize has became knowledge. The management has become aware of the importance of valuable human and knowledge resources, this is why they intensify their efforts in gathering, sorting and sharing knowledge. Creative people that are eager to apply their knowledge are the requisites for a company's success. In a 2000 survey (Bonner, 2000), scientist have realized that more than 90 percent of the knowledge in organizations is embedded in their employee's heads. This is the tacit knowledge, the invisible line item in corporate budgets (Smith, 2001).

Knowledge management is a formal, directed process of determining what information a company has that could benefit others in the company and then devising ways to making it easily available (Liss, 1999). Maybe the best characterization of knowledge management is that it reuses company's resources to help people seek out best practices in order to not reinvent the wheel and hence the increasing importance of the field in the recent years.

Over the years there have been many debates concerning the distinction between knowledge and information, the main elements knowledge management works with. "Knowledge is a fluid mix of framed experience, values, contextual information, and expert insight that provides a framework for evaluating and incorporating new experiences and information" (Davenport and Prusak, 1998). Knowledge is a human, personal asset. Information has little value until it is given meaning or used on the job, the raising levels of competences (Pascarella cited by Smith, 2001). Nowadays the challenge is to move beyond knowledge to wisdom, which the scientists consider to be very close related to tacit knowledge.

In 1966, Polanyi draws the attention on the fact that people have more kinds of knowledge. People possess different types of tacit and explicit knowledge and apply it in different, unique ways.

Tacit knowledge

Tacit knowledge is relatively hard to code and extract. Tacit knowledge is probably the most important part of knowledge management and it doesn't solely need to be discovered, captured but it has to be, also, disseminated so that more and more people can benefit from this shared knowledge.

Tacit knowledge can be defined as "work related practical knowledge learned informally on the job" (Wagner and Sternberg, 1985). But, unfortunately, this definition is not complete because it comprises only one part of what tacit knowledge really is, only the how-how. Tacit knowledge is not just about experiences learned on the job, it also comprises beliefs, values, attitudes, ideals, and elements that are related to the culture of the individual. For example, the artisans cannot explain how they know the exact sequence of actions they do in order to make the finite product. Over time they have learned such tacit skills and this cannot be described by a process chart or in words. These skills have been learned by apprentices by observation and imitation, after several years spent with the master.

Tacit knowledge may be best understood using Polanyi's (1966) words "we know more that we can tell". If people are asked to write down a process or a workflow this observation is quickly verified. If asked how to drive a car most people cannot fully explain how they accomplish this everyday task. Tacit knowledge is the one that cannot be found in manuals, books, databases and files. People use metaphors, analogies, demonstrations and stories to convey their tacit knowledge. Listeners can evaluate the content of the story and the actions and apply the knowledge that is best suited for their job.

Tacit knowledge is much easier to understand and to remember that explicit knowledge. Almost two thirds of the information received at work is transformed into tacit knowledge and this comes mostly from face to face conversations such as informal conversations, stories, mentoring, internships and apprenticeships. Creative conversations occur when people exchange ideas in a free and open environment.

Most of the tacit knowledge is acquired from experience, which is able to help to a better understanding of the present situations. For example, you buy a cookbook in order to learn to bake bread, the book gives you the recipes, the ingredients, the techniques and all the rest but unfortunately it does not give you the feeling of the dough properly kneaded. It only tells you to bake it for five minutes or until it becomes elastic. To know how the dough should look like when is properly kneaded you need the help of a chef. Experienced people are extremely valuable to a company because of the perspective that they have earned to view the situation, an ability that most of the newcomers never have.

Tacit knowledge's characteristics are examined in the next section as depicted by Johnson (2007):

- Personal knowledge. Tacit knowledge is part of an individual's understanding and it is tied to other personal understandings and it can also be shared with others, which hold similar tacit knowledge. This shared tacit knowledge is often conceptualized as being organizational knowledge (Nonaka and Takeuchi, 1995) but in essence it has personal roots.
- *Tacit qualities*. As it name suggests tacit knowledge is tacit. This characteristic is related to the fact that tacit knowledge constitutes knowledge that is unarticulated, implicit. Also, when talking about the tacit qualities of tacit knowledge we also have to take into consideration the subconscious nature of tacit knowledge.
- Path dependency. Tacit knowledge depends on personal experience. The accumulation of tacit knowledge requires time, but its usage depends on the propensity to utilize intuition.
- *Context dependency*. This characteristic is closely related to the path dependency, but context is more related to a place, a destination.
- *Embeddedness*. As previously discussed tacit knowledge has an embedded nature. Skills like playing the piano or riding a bike are only learned by practice. The tacit knowledge of an expert can be passed on through apprenticeship. For example, piano playing can be passed on from the expert to the apprentice via co-practice. This means that the apprentice uses both observation and mimetic behavior.

Tacit knowledge is personal, context-specific knowledge that is difficult to record, articulate; it is stored in the heads of the people. The tacit knowledge is mainly acquired through a process of trial and error encountered in practice, it can be felt and understood but it cannot be easily expressed. Explicit knowledge is that knowledge that can be easily codified and passed on in a systematic or formal language.

Contrary to tacit knowledge, explicit knowledge is technical data or information which can be described in formal language (manuals, expressions, patents and copyright). It is the "know-what". Explicit knowledge is carefully codified, stored in databases and accessed with reliability, fast. Explicit knowledge assets can be reused to solve many types of problems or connect with people who have valuable reusable knowledge.

Sharing, creating tacit knowledge

Some scientists believe that explicit knowledge cannot be converted into tacit knowledge. Opposing views say that tacit knowledge, skills can be converted to explicit knowledge through observation and verbal protocols. Nonaka (1991) created a spiral of knowledge, where four patterns are used for transforming knowledge in organizations:

- 1. Tacit to tacit: Socialization: Using this mode the individual acquires tacit knowledge from another person through observation, imitation, and practice. They do not use language as the main channel of distribution. Communities of practice, collective or organizational memory are all phenomena that have been studied as best practice of the circulation of tacit knowledge.
- 2. Tacit to explicit: Externalization: This mode is realized daily in an organization, due to institutionalization of tacit rules as internal regulations. Rumors that circulate tacitly can become hard fact. The emergence of organizational strategies is a phenomenon of the articulation of collective tacit knowledge into an explicit formulation embracing a plan, actions and tactics. (Baumard, 2001).
- 3. Explicit to explicit: Combination: Individuals exchange and combine their knowledge through mechanisms such as telephone conversations. The combination of existent information can be facilitated by the selection, adding, grading, and categorization of explicit knowledge (Nonaka, 1992).
- 4. Explicit to tacit: Internalization: To understand this mode the best method used is that of a practical example. Prisoners have the explicit knowledge of the surveillance tower. They recognize the possibility that they are being watched at any given moment, but they do not know exactly the moment when the guardian is looking or not. The prisoners "internalize" the knowledge and turn it into tacit knowledge; they know tacitly that they may be watched at any given time ant they accept the possibility (Baumard, 2001).

It is very easy to transform explicit knowledge into tacit knowledge when people cooperate, when they trust each other and share their knowledge willingly. Cooperation, trust, sharing occur when people who add to and use databases are recognized and awarded for sharing their knowledge. But in order to encourage employees to share their tacit and explicit knowledge organizations and more exactly the management has to develop fair, equitable

reward systems for those who share their knowledge. Employees must be rewarded and encouraged to share their tacit knowledge to write their personal stories, to document their insights and use photos to show how to solve a difficult problem or to improve the existing work processes.

In order to facilitate the sharing, codifying and collection of knowledge technology plays an important role. For this, it is important to have a strong information technology to design and implement the systematic storage and dissemination of information. The management has to take into consideration that information technology is only an enabler, but by itself will not extract anything out of people's head.

Knowledge sharing, capture and reuse

Knowledge capture and reuse is the process that ensures that the projects are able to make best use of available knowledge and in turn capture relevant learnings and examples for subsequent projects. It is concerned with identifying and using knowledge that could be reused, to make selling and delivery of the project more effective, and with identifying and making available that knowledge that should be captured for future engagements. Knowledge capture and reuse is a key enabler for effective project management. Knowledge reuse allows projects to take advantage of previous experience, to minimize the risk of repeating mistakes, and to leverage existing materials to allow deliverables to be produced more efficiently, all at a relatively low cost to the project.

Tacit knowledge is acquired through learning, knowledge fairs, learning communities, job rotation, stories, myths, and study missions. The people who have the experience teach the less experienced ones their tacit knowledge by "showing them the ropes" (Smith, 2001).

Nowadays maybe the most common way to capture and share knowledge is through *communities of practice*. A community of practice is a natural grouping of people who share and focus on a specific knowledge domain or topic, with the objective to create, expand and exchange knowledge, and to develop individual and organizational capabilities. The origin of these communities of practice is in the Greece "corporations" of metalworkers, masons and craftsmen. They gradually evolved into guilds that maintained standards to protect the interests of their members.

Members of these communities of practice develop group knowledge and generate assets by transferring knowledge and stimulating innovation. Members of communities of interest build knowledge for the company and for themselves through informal communication and contact. (Tobin cited by Smith, 2001).

Conclusion

An organization is what it knows. What it knows it gets from its learning (Bonner, 2000). The strength and importance of tacit knowledge is that it is often very difficult for competitors to imitate it and, therefore, to be transferred. Organizations that use and recognize the employees' wealth of tacit and explicit knowledge achieve a competitive advantage. More and more organizations become aware of the importance of the employee and more exactly of the importance of the tacit knowledge that the employee possesses. This is why the management of every company has to find the right motivational system to make its employees capture, reuse and share their knowledge, thus avoiding mistakes, losing time and profits and increasing the advantage in front of the competitors.

The aim of this paper is to raise the specialists' interest in the necessity of a redefinition of some concepts and the introduction of new concepts, so as to provide a sharp, coherent and interdisciplinary understanding of any organization as a natural system with complex self-regulation. On the basis of such a comprehension, the manager is able to conceive integrative descriptive and evaluative models, by means of which (s)he should study, through simulation on computer, the organizational mobility in order to maximize the efficiency.

Keywords: System, energy, intellectual energy, human information, human interpreter of information, spiritual self-regulation, technological simulation, managerial simulation, simulative model.

Cod JEL: J24, J21.

1. REDEFINITIONS OF SOME CONCEPTS NECESSARY FOR COMPREHENDING THE ORGANISATION AS A COMPLEX SELF-REGULATION NATURAL SYSTEM

The objective reality is extremely complex in comparison with what we know about it. Over the last 50 years, in order to decrease the knowledge efficiency, it outlined in the managerial field (but also in other fields) the management systemic school. The philosophy of this school starts from the most general concept, system, firstly defined in biology, psychology and cybernetics and then generalized in most of the sciences. With a few differences from an author to other, in Romania most of the essays use the system definition proposed by the biologist L. von Bertalanffy: the system represents "a lot of elements that interact and condition themselves"

The existing definitions are insufficient because they don't suggest the criteria on the basis of which we should divide, enough sharply, the objective/subjective reality in systems and subsystems or to define enough correctly these divisions. They don't help the managers to understand the organization as a complex self regulation natural system and use this property (characteristic) in order to achieve efficiency.

In consequences, I propose the following conceptual redefinitions that are more operational for the comprehension of the coherent structural -processual of the material and spiritual realities known till now:

- -The system is a philosophic category, which means a lot of elements with characteristic functions, whose interconnection, interaction and structure are conditioned by the prevailing forms of energy and by the final processes. The definition introduces as criteria, of subsystems and its elements delimitation and naming: the prevailing form of energy and the definitive process (function). The minimal functions of the elements of an integral system are: of source, that transform an external form of energy in a system specific energy and of receptor, that transform the system energy in other form of interaction necessary to its interconnection with the environment. Between the minimal elements, source and receptor (named such upon their own function) could be a lot of elements with other functions such as: of accumulation, of command, of protection, of transducer, of adaptor, of rectifier, of oscillator, of dissipater, *etc.* The exemplification of this definition on different objective and subjective entities, in order to suggest its maximum level of generality and its utility in knowledge and management, it doesn't concern this paper. It is noteworthy that in order to know a system it is necessary to identify: the prevailing form of energy, the definitive process, the component elements and the functions of each structural component, the main parameters that evaluate the inner and also from the system processing levels and rhythms;
- -The energy is a property of each concrete form of existing material (named bearer) to produce effectively or potentially intrinsic and/or extrinsic processing (transformations), in interaction conditions. Example: a pencil, the bearer, produces mechanic processing (transformations) when it is thrown (the parameters that describe the processes refer to the changing of the elements' relative position), chemical transformations when it is burned (the parameters that describe the process refer to the modification of the system's substances), but it is built specially for the transmission of the human information on a written support (function that can be named: informational converter):
- -The bio-energy is the specific form of energy that provides the structure, the interconnection and the bio-systems self-regulation and their elements. It can be understood as a complex and concomitant amount of natural energies (mechanic, chemic, electric, electromagnetic, etc.) that are in different reports from an individual to an individual, a

variety, a species, etc. It is obviously that the bio-system flora differs fundamentally from the bio-system fauna through the bio-mechanic component (insignificant to flora in comparison with fauna) and others.

-The process is a pre-established succession of transformations, that take place in a system as a result of the interactions and whose finality should be ante-evaluated. The managerial processes or functions take place in the managerial subsystems of an organization and have the finalities treated in the general theory of the management.

2. NEW CONCEPTS, NECESSARY FOR THE COMPREHENSIVITY OF THE HUMAN SOCIETY SELF-REGULATION COMPLEXITY AND OF THE ORGANISATION AS A BIOSYSTEM

If we accept the above definitions, then we should put more natural questions as: which is the bio-energy component that distinguishes the human society from any animal bio-system?, does this component obtain by natural means, as to other animals, or by a specific human process?, from managerial point of view does it present any importance for the increase of the national or organizational socio-economical efficiency?

In order to reply enough sharply and relative correctly to these questions I propose the introduction of new concepts:

-The intellectual energy is that component of bio-energy, measured in human information (mediated by the human language), which delimitates the human society from the animal regna. Taking into account the bearer, it could be individual or of group. Through this definition it is an explicative component of the spiritual energy treated in philosophy and psychology.

-The human information is any description mediated by the human language, related to a system and which allows the bearer (the human individual) to interact consciously with that system, through the human interpreter of the information and of the interfaces that (s)he has.

The unfound descriptions related to a system should be considered data.

- 1. The basis **components** of the information are: **the support** (specific to the language typology), the description **codification** (the known language) and **the content** (message, described sequence).
- 2. The principal qualities of the human information are: the value (the fidelity description), the complexity (how complete is described the system), the opportunity (the moment of its arrival to the receptor), the importance (integrates the other three qualities).

The basic parameter of evaluating the intellectual energy is competence. Competence means the system of information (knowledge) the skills in using them and minimal experience regarding the interaction with the system which is the object of the information. Example: The bearer (titular of a post holder) it is competent (can produce positive previously evaluating changes) to use a personal computer if he has the required information and skills to identify it, turn on and off, to use the system of operation; different software programs and the necessary peripherals to process the certain categories of human information.

-The human interpreter of information is the system of sciences, theories and appliance capacities, which are always operational, through which, the interactions with the internal and external environment change into reactions proper to each bearer. It is the main objective of human education. It is significantly differentiated between the executants and the leaders. Unfortunately, nowadays the higher education in Romania doesn't have as an objective to shape the human managerial interpreter of information, for all the existing specializations, but it focuses on the professional aspect, which is narrow, of high educated executant. The obvious consequence is the general lack of performance of the managerial and governing systems, which are made up mostly of higher education graduates.

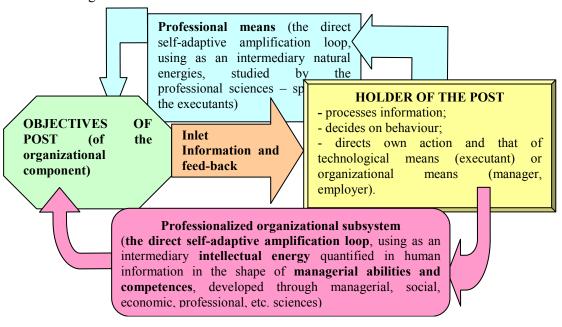

Fig. 2.1. The post holder as a self-adaptable energetic amplifier

Understanding the human personality, **holder of a post, as a self-adaptable energetic amplifier**, brings a new vision on the organizational interactions complexity. A proposed model in [4/49], adapted is revealed in Fig.2.1.

3. A FEW MANAGERIAL CONSEQUENCES OF ACCEPTING THE NEED OF REDEFINING AND INTRODUCING THE CONCEPTS PROPOSED

3.1. The necessity of introducing the "information" function as the foremost, primary function (or process) of the system of management, out of those mentioned by the general theory of management

The aims of this function (or process) lie in creating, with premeditation, by the manager: **the information-based culture, civilization and system**, within the organization. It is treated as an organizational function in [2/41..42]. Starting from the above ideas, **culture** can be understood as the **degree of information accumulated** (at the level of the particular posts, and also in the centralized pattern), concerning the object of activity, the relationships with the environment and the way of promoting the image of the organization. **Civilization** consists in the **capacity of the individual and that of the team to positively turn to account the transforming potential of their own culture**. In other words, culture represents the level of the intellectual energy, both individual and collective, while civilization is the transforming effect of the use made of that energy (or the measure of the interactions it generates) [4/13]. The components of the process of information do not fall under the scope of the present study.

3.2. Reconsidering the nonchalance in using the concepts and terminology in education

The great variety of the acceptations that exist in the literature currently produced in the field of education, to designate the fundamental or detailed concepts, **referring to the same material or spiritual entity, with the same goal: knowing** it, is conducive to a useless, discomforting intellectual stress. An example concerning the knowledge of automotive cars is presented in detail in [4/129...132]. A science, or one of its detail or experts areas, are nothing but systems of information referring to system, taken as an object of study [4/11...12], made up by means of concepts and terminology. The cases of ambiguity, confusion or conceptual contradictions contained in human educational information represent as many useless models acting on the students' / learners' personality. Those within the scope of the study of management theory can turn, through the indirect amplification loop (Fig. 2.1.), into functional distortions and damage or detriment that is all the more significant as the organization is larger (suffice it to analyze the way Romania has been governed over the last 20 years).

Ensuring the convergence of the educational moves attempted individually by the teaching staff, by adopting a unitary view of the concepts and terminology at the organizational level, must be one of the topmost priorities of educational managers especially in the higher education, because the nonchalant style can be transmitted along all the indirect amplification loops, towards the pre-academic education system, and, even more seriously, towards the governing system. The systemic approach could be one of the profitable manners of making diverging views and opinions came closer.

3.3. The necessity for delimiting the technological model-analyses from the managerial ones

Technological model-analyses are strictly specialized models (i.e. belonging to the field of engineering, economics, finances, etc.), which need a knowledge of a number of highly detailed, as well as mathematical sciences at an expert level, which is **unnecessary to general managers and employers**. They are significant for the managers of the organizational components.

At the level of any organization a managerial team cannot be set up, who are able to conceive and efficiently use organizational simulative models without basing them of the same general managerial theory. It is obvious that, at the level of the components, there will be different, albeit integrative, theories of expertise deepening, which is impossible currently, through the "playing at concepts".

The general managers (the top of the managerial career), who, as a general rule, **lack sufficient mathematical expertise**, take over, in a conscious manner – at the descriptive level, the performance and interconnection parameters established by technological means, and need a simplified, functional model, which should describe the reaction of all the component parts, when the parameters of one or several of them is modified. Such modeling, **a purely informational one**, would rather be designated by the name of managerial modeling, as it serves to achieve the study of the organizational behavior on making various decisions or / and on being perturbed by those who are in leading positions.

4. TECHNOLOGICAL MODELLING AND MANAGERIAL MODELLING

Any organization can be technologically modeled (i.e. starting from the artificial means interconnected and structured according to the posts) in the components in Fig. 4.1. All the subsystems of the organization are interknitted, making up a neuronal-type structure, where the interactions hold between any one of them. Understanding this structural and functional complexity is difficult if there is no systemic approach and suitable delimitation of the technological model from the managerial one. In keeping with the size of the organization, the subsystems can exist as distinct, relatively autonomous subsystems, or else in cumulative structures.

Technological optimization by means of simulation can be achieved via the methods of operational calculus, applied in a differentiated manner from one subsystem to the next (in [1] enough illustrations are presented). It precedes the managerial modeling, because it is now that the optimized (i.e. necessary) functional parameters of state are established. It does not fall under the scope of the present study.

The development of the environment of a company has a direct influence on its performance and its success. For this reason a company should not only analyze its internal performance, but also the external performance of the business environment and the sustainable development. In order to help the management of a company, this article presents a system of indicators for the performance measurement of the sustainable development. To cover all aspects which influence the sustainable development, there are analyzed six categories of indicators: the economic development, the development of the population, the education level, the protection of the environment, the innovation degree and the development of the infrastructure. For each of these elements there are presented several indicator systems and their development for Romania.

Key words: performance measurement, sustainable development, indicators, economic development

The article's JEL code: M20

1. Introduction

The success of a company is influenced not only by the internal management aspects, but also by the external elements of the environment. In order to have success, the manager of a company has to monitor and analyze in a permanent way both the internal factors and the external factors so that he observes in time the negative aspects and takes measures in order to eliminate these negative directions. Only those companies can survive and have a long term success, which have the ability to observe the negative developments in time and to react to them, by showing a great capability of adaptation to those negative changes (Pelau, 2009). Especially in time of financial and economical crisis, it is important to have this capability to adapt to the developments of the environment and probably only those companies, which have this capability, will survive the crisis.

The measurement of the performance of a company and its environment contributes to the adaptation capability of the company. The analyzed indicators allow the company to detect in time the negative developments and to take measures in order to reduce the effects of these changes. That is why, it is important to monitor and analyze permanently the efficiency and efficacy of the company and its environment.

This article concentrates on the performance measurement of the external factors of the company, more precisely on the performance of the sustainable development. The sustainable development of a region or a country offers a good framework for the development of the company. For this reason a company should monitor its performance. In this article there is presented a system of indicators which take in consideration the most important elements for the sustainable development. There are presented both the indicators for each of the components of sustainable development and the relation between them.

2. The performance measurement system for sustainable development

In order to increase the overall performance of the sustainable development of a region or a country, the management of it has to take in consideration six main elements as it can be seen in fig. 1. These elements are the economic development, the population and its education, the innovation degree, the infrastructure and the environment. The performance measurement of the sustainable development includes indicators for all six elements.

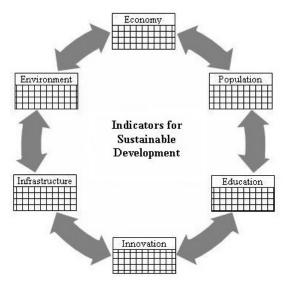

Fig. 1.: Categories of indicators for sustainable development

An efficient and efficacy performance measurement system should take care that each of the elements should be developed, but besides this there should be a balance between these factors. In fact between the six elements there are both positive direct relations and contradictory relations. There are factors which influence in a positive way the development of other factors, but there are also factors which are developed in the detriment of others. For instance the development of the population and its conditions of living improves the level of education, for people who have a minimum standard of living try to achieve a better position in the society. Moreover a higher level of education stimulates the innovations in a country. Besides this innovations and a high level of education create new technologies which contribute to the creation of a modern infrastructure. A modern, environment-friendly infrastructure helps to improve the conditions of the environment, by reducing the pollution in the country. Not less important is the clean, healthy environment which gives the population the possibility to develop itself and to be healthy. All these elements are sustained by good economical developments which invests in them in order to develop them, although the relation here has also to directions. So in a reverse direction, the development of innovations, research and even infrastructure, the economy of a country can be developed.

In spite of the positive, constructive relations between the elements, there are also opposed and contradictory connections. Especially, at a reduced or limited budget different conflicts may appear regarding the possibilities of investments. For instance there should not be a very high development of the economy in the detriment of the environment or we should not develop to much the infrastructure, but neglect the education.

3. Indicators used for the performance measurement of the domains of sustainable development

In this chapter, there are analyzed the importance of each element and its contribution to the sustainable development. There are also presented several indicators and indicators systems for all of the six factors and their development in Romania.

3.1. Indicators for economic development

The economic development is important for the sustainable development of a region or a country, because it is the element which finances the development of the other factors. Only by a good economical situation there can be invested in the other elements from the presented model. On the other hand the development of the other factors influences in a positive way the growth of the economy, for innovations or infrastructure create a valuable framework for the economy.

There is great number of indicators which evaluate the performance of the national or a regional economy. The National Institute of Statistics, Romania divides the indicators into three categories: investments, competitiveness and occupation of the population (Institutul National de Statistica, 2009). In the first category there are considered the gross domestic product (GDP), the growth of the gross domestic product, gross domestic product per population, inflation, economies of the population, national income, costs of the consumption. By analyzing the results it can be easily observed that there are differences in the economical developments of the regions in Romania. For instance the greatest developments are around Bucharest, with a GDP/person of about 28325,7 lei/inhabitant and in the western and central part of Romania with about 14960,4 lei/inhabitant and 13549,2 lei/inhabitant and only 9114,2 lei/ inhabitant in the north-eastern region (Institutul National de Statistica, 2009). The other two categories contain elements regarding the productivity of work, the occupation degree of the population and the unemployment. Besides this, there

are also other indicators which give an overview of the wealth of the economy such as the number of companies in certain field, the structure of the economy on different fields, whereby a country can specialize on its strength domains, people active in a certain field and many others. Because of the financial crisis, the actual trend of the indicators is a negative one. The government of the country should take measures which will assure the long term success of the economical development.

3.2 Indicators for the general development of the population

The population of a country or of a region is an important element for the sustainable development, because it sets the basis for all the other activities. Only with a healthy, wealthy and qualitative population there can be developed a growing, prosper economy, there can be a good education system which sustains the innovations and the infrastructure of a country or a region, and last but not least it sustains a clean environment. Actually the population can be seen as the blood which flows through the venous of the system. For this reason it is important to monitor the development and the situation of the population.

There are many aspects which characterize and analyze the situation and the development of the population. One of the most important aspects is the number of the population, for in case of negative developments several measures should be taken. Besides this, according to the National Institute of Statistics, Romania there should be analyzed the poverty and the social exclusion, the obsolescence of the population and the public health (Institutul National de Statistica, 2009). In order to measure these elements, there are used indicators such as poverty rate, distribution of income, the percentage of the population with lower income than the minimum accepted, access to work, school abandon and the percentage of the population with a education level below the minimum accepted. Besides this other elements can be also analyzed ad for instance consumer behavior, purchasing power and the culture and habits of the population. All these indicators alert the government of a country in case of negative development, which might influence in a negative way the other elements.

3.3. Indicators for the level of education

Education is an indispensable and fundamental social component, which has the goal to reach a sustainable development and involves a long term process that seeks to develop values like solidarity, equality, inclusion (integration) and cooperation among all citizens. The education system primarily aims to educate and to form the population and to prepare them as the future political, economical and social decision factors. Moreover they train specialized human resource so that they will be able to develop and implement strategies by which the population will become aware of the priorities of international development and sustainable human development through a better understanding of the causes and effects of global problems and solving them through a personal and informed involvement. Education plays also an important role in other fields as for instance the innovation, the infrastructure, environment and economy. Only be well educated people, a country or a region will be able to develop these elements.

By analyzing the statistic indicators between 2000 and 2007 one will notice an improvement of the situation in Romania (Institutul National de Statistica, 2009). The percentage of the population with a low education level has decreased over this period with about 5% (people who are 15 years or more and people between 25 and 64 years old) and the ratio of young people (18 to 24 years old) quitting the education system early has diminished over the same period of time with 4.3%, but it remains over the mean level of EU-27 of 15.2%. The competitive training is provided through lifelong learning, therefore by linking education and learning during lifetime to the labor market and by providing greater opportunity for future participation in the modern, flexible and inclusive labor market. Unfortunately the statistic indicator of permanent education in Romania shows that during the last 5 years the value remained constant, at 1.5%.

3.4. Indicators for the environment

The environment offers a benefical framework for the development of the popolation and their living standards. All human activities of degradation and pollution of the surrounding environment have negative effects on human health, biodiversity and ecosystems, and are also causing economic damage. Therefore it is essential that not only the enterprises that operate in pollutant industries, but also those in less pollutant industries to show their responsibility towards the protection of the surrounding environment. The population should be also trained to involve itself in the protection of the environment through activities of recycling, electricity or clean water savings an others

The sustainable development aims to improve the environmental factors. According to the National Institute of Statistics, Romania the main indicators of sustainable development with reference to the environment belong to some areas such as climate change and energy, nature and biodiversity, quality of life in urban area and of environment in general, natural resource usage and waste generation, transportation and recycling. For analysis and measurement are used indicators such as emissions of greenhouse gases, CO₂ emissions per capita and gross domestic energy consumption, waste generated by economic activities, changes in the state of the threatened and/or protected species, the percent of population with access to drinkable water, the connection of population to the purification stations of used water, the percentage of forests affected by defoliation, energy consumption by means of transport, etc. The government should take measures in order to reduce the negative impact on the environment

as much as possible especially through the use of biodegradable products, and in order to increase the usage of energy from renewable resources. It should also encourage the organic farming that delivers the population ecological products and the society emphasizes on the waste recycling as well.

3.5. Indicators for the degree of innovation

Innovations are very important for the development of the humanity and they can change the behavior and the living standards of the population. Innovations can be created only with the help of a well developed education system and they contribute in a significant way to the development of the economy, because they can contribute to the growth of the productivity of work, to new technologies and other. Besides this, innovations can lead to the development of new products which will make profits on the worldwide markets

In order to measure the innovation potential of a country or a region, it is important to monitor the number of innovations in a certain period, their degree of innovation, by considering the differences of the product or technology in comparison to the existing one, their potential on the markets and others. Not less important are the costs of the innovations. It is important to analyze how much the consumers are willing to pay for the innovation and if this price covers the costs of the innovation.

3.6. Indicators for the development of infrastructure

Infrastructure is another important aspect for the development of a country, because it has a great influence both on the economic and on the social field. Only with the existence of well developed infrastructure system with good transportation possibilities, access to utilities and communication and information possibilities the economy can grow. Besides this, it also influences the people and their living standards. Moreover, only by a good access to communication and information means, the inhabitants of a country can have access to education. Not less important is the transportation system, without which the children can not go to school.

The performance measurement system for the evaluation of the infrastructure depends on the categories which were presented above. For the transportation system there are indicators like the number and the length of the highways or national roads, the length of the railway system, number of airports or harbors. These indicators can be analyzed in their absolute value or related to the surface of the country or region or to the number of inhabitants. For the utilities it also evaluated the quantity and the quality of them. Besides this, it is also important to measure the percentage of the population, who has access to utilities. For the communication and information means it is also analyzed the number of people who have access in a traditional way to the public libraries and media and in a more modern way the access to the internet. All these elements show the development of a country.

4. Conclusions

In order to analyze if a system is well implemented, it is important to measure and monitor its performance. Depending on the results of the performance of the activities, the manager can take several measures in order to improve it and eliminate the dis-functionalities. In the sustainable development of a country or a region, it is also important to permanently monitor the performance of the elements of it. It is important that each of the factors should develop in a proper way, but without affecting in a negative way the other ones. As mentioned before, there should be a balance between the six elements: economic development, population, education, innovations, infrastructure and environment. These indicators are a very good prevention model and by analyzing them in time, a country can avoid the development in the wrong direction.

The actual financial and economical crisis will have a negative impact on Romania's economy but it must not affect its sustainable development. Although a negative trend will be difficult to be avoided, the government of the country must apply several measures in all these six directions in order to assure the long term success of it. Even in time of crisis these elements should not be neglected, because this could cause severe negative effects that might effect the future generations.

It is already a well known fact that public-private partnerships (PPPs) are considered to be a solution for world wide governments facing insufficient public budgets.

In the context of the current economic crisis, many voices promote public-private partnerships also as a solution for fighting the crisis, as PPPs help creating jobs, offer good value for money, do not have a negative impact on the public deficit, favour economic recovery.

On the other side, however, the current economic crisis affects projects which are aimed at making the public and the private sectors work together. Thus, the crisis determines a decrease of the number of private competitors and the number of financial institutions willing to get involved and finance such projects. This means lower competition and in the end higher total costs.

Keywords: public-private partnership (PPP), infrastructure investments, economic recovery, economic crisis, budgetary deficit.

JEL Classification: H44, L88

1. Introduction

Over the past decade we have witnessed a world wide growing interest for public-private partnerships (PPPs). PPPs popularity is due to the fact that governments are more and more eager to increase the quality and efficiency of public services, but in the same time they face insufficient budgetary resources to cover investment needs, coupled with public spending restrictions [1].

Public-private partnerships are not anymore a brand new concept in Romania. Several progresses have been made recently. Thus, a Central Unit for Public-Private Partnership was set up within the Ministry of Public Finance in 2005, and in 2006 and 2007 a new enabling legislation was introduced. However, there is a slow PPP deal activity to date if we look at the number of implemented projects. The reasons for the slow pace of activity include: the complexity of the PPP process in terms of preparation and awarding, not very strong, clear and long term political support, a very restrictive legislative framework (the Romanian legislation limits PPPs to service concessions and works concessions), little public sector expertise in relation to PPPs, etc.

When taking a close look into the current context for PPPs in Romania we cannot not consider the economic crisis and its' impact on the cooperation between the public and the private sectors. In this paper we focused very much on the infrastructure sector (especially the roads sector) and most of all on the PPPs opportunities which exist in this area. This particular interest is due to the fact that infrastructure development is a key determinant for economic progress and prosperity. In Romania, the infrastructure modernizing process is one of the drivers for foreign investments and also a tense item on the public agenda. Moreover, PPPs are considered to be a mechanism to fill the infrastructure "gap" which exists in many CEE countries [7] in general and in Romania in particular.

When talking about public-private partnerships in relation with the current economic crisis, two main types of attitudes emerge. On one side we have "the optimists" and on the other side we have "the pessimists".

Optimists see PPP projects as instruments for fighting the economic crisis and for economic recovery. Pessimists instead see the current economic crisis as an important obstacle in the PPPs' evolution in Romania. Therefore, the next two sections of this study are emphasizing the main arguments and counter-arguments related to PPPs as a solution for the current economic crisis. Furthermore, after presenting both arguments and counter-arguments, some objective conclusions are drawn.

2. Public-Private Partnerships, Solution for the Current Economic Crisis

PPPs may be important instruments for fighting the economic crisis and for economic recovery, and this is, as already mentioned, the optimists' approach. The arguments that support this approach are related to the *advantages* of PPPs: (1) PPPs may help redefining the State's direct role in the economy; (2) PPPs have positive impact on public finance; (3) PPPs may contribute to job creation; (4) there is a special fiscal treatment for PPPs (the "off balance sheet" treatment); and (5) PPPs may lead to a better absorption of EU funds.

Redefine de State's direct role in the economy

Public-private partnerships help the State to better focus on its' original functions: representing the people and managing those services that cannot be transferred to the private sector [8]. During recession periods this aspect is critical for a country's economic recovery pace. Moreover, PPPs are intended to be the recognition of the private sector's efficiency and know-how.

Multiple positive impacts on public finance

Public-private partnerships can have a significant impact on public finance by [8]: (a) generating new sources of income, new infrastructures and new services; (b) allowing new development for existing sources of revenue (public transportation, sanitation); (c) promoting industrial development and as a consequence, increasing fiscal income; and (d) better directing public budgets.

There are a lot of competing demands on the public purse which makes it difficult for governments to choose which project to finance or not. PPPs make this choice easier and help governments finance more projects than they would usually do by using traditional methods.

Public-private partnerships also contribute to reducing taxation, which is one of the primary measures governments should adopt during critical periods. Thus, the redirected resources stimulate demand and contribute to the country's wealth.

Job creation

Public-private partnerships are source of jobs on the medium and long-term and the key of the anti-crisis programs. For example, the 900 billion dollars plan for revigorating the American economy adopted in 2009 is aimed at saving 2,5 million jobs in the next two years through public-private partnership infrastructure projects: roads, bridges, schools, ecological technologies, etc. [9].

The Eurostat treatment for PPPs/the "off balance sheet" treatment

The fiscal treatment of public-private partnerships is one of the main drivers for such projects in the new European Union member states. Thus, accordingly to the EU state budget and public finance rules, PPPs can benefit of the "off balance sheet" treatment if: the construction risk and either the demand risk or availability risk is accepted by the private company.

In other words, the Eurostat treatment for PPPs establishes the minimum level of risk the private sector has to assume in order to degrevate the public budget of that project (the assets involved in a PPP project will not be registered in the government's balance sheet).

The private company assumes the construction risk if the public sector pays only when the results obtained match the agreed parameters.

The private partner assumes the demand risk if he is totally responsible for the demands' variability compared to the moment when the contract was signed.

The private company bears the availability risk if the public authority applies penalties when the concessionaire's performance is poor, meaning that he was not able to reach the stated quality standards.

In the context of the current economic crisis, it is in the state's interest to keep investment in public infrastructure off the balance sheet so that it does not add to the national budgetary deficit.

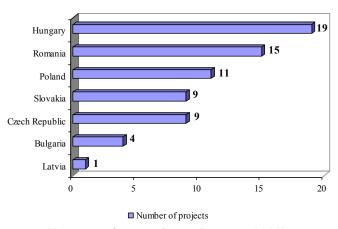

Absorption of EU funds

Public-private partnerships assure a better absorption of the EU grants. PPPs which blend public and private finance with EU funds are called hybrid PPP. Optimists think that EU money will protect PPPs from the negative effects of the financial crisis.

Grant financing has three principal impacts on public-private partnerships [2]: (a) an immediate impact on the project' financial viability by reducing costs (or increasing revenues); (b) an impact on local authorities budgets by reducing demand on funds and allowing budget transfer to other requirements; and (c) an impact on the private sector contractor's perception of the project viability.

Figure 1 shows a series of infrastructure development opportunities in Central and Eastern European countries that are expected to be developed on a PPP basis during 2007-2013. Romania ranks second in this top.

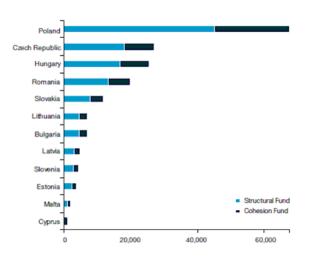

Figure 1 Major infrastructure development opportunities by country

(Source: PricewaterhouseCoopers, 2008)

However, the allocations of EU funds for CEE countries for 2007-2013, as shown in Figure 2, ranks Romania on the fourth position. This indicates two important aspects. First it highlights that there is a real interest for PPPs and that things are starting to move forward. Second, this situation is the consequence of the historic underinvestment in infrastructure in Romania, which caused an infrastructure "gap" by comparison with other CEE countries.

Figure 2 Allocations of EU funds in CEE countries in 2007-2013 (€m)

(Source: PricewaterhouseCoopers, 2008)

3. Public-Private Partnerships, Victim of the Current Economic Crisis

The current economic crisis may be an important obstacle in the PPPs' evolution in Romania, and this is the pessimists' approach. Most of them fear that big infrastructure projects, like Comarnic-Brasov highway or the Bucharest ring road will be affected by the current macroeconomic context (Table 1). The arguments that support this approach are: (1) tighter lending conditions; (2) decrease in the investor's confidence; (3) weaker external demand; and (4) difficulties in blending PPPs with EU grants.

Tighter lending conditions

Given the actual financial crisis it is likely that a single bank will not be capable to finance a one billion euros PPP infrastructure project, like Comarnic-Brasov. Such an investment will require the participation of at least ten banks. Also, more time will be needed in order to obtain the necessary loans and the negotiation conditions will be for sure tougher. At the moment banks do not have enough financial resources and as a consequence they will tend to be very selective when it comes to getting involved in a major infrastructure project [4].

Decrease in the investors' confidence

The tough lending conditions will force investors to be very careful with their money. Moreover, the banks restrictive attitude will force private partners to increase their equity contribution. This means investors will get involved in a PPP deal only if the project proves to be very feasible. In other words, the bankability and viability of projects will be very much affected. Bankability refers to the private sector's interest in participating in a public-private partnership, while viability measures the project's capacity to generate positive cash-flows.

Weaker external demand

The fragile economic situation will generate a decrease in the number of tenders interested in participating at PPPs bidding processes. This comes as a natural consequence if we think about the costs private partners have to bear in order to make a proposal: pre-feasibility and feasibility study expenses, consultancy, negotiation costs, etc. Less tenders mean less competitive price for PPPs and higher prices are translated into lower efficiency, which in the end means less value for money.

Difficulties in blending PPPs with EU grants

During 2007-2013 the European Union allocated for Romania 13.1 billion euros from the Structural Fund and also 6.6 billion euros were allocated from the Cohesion Fund. Although the absorption of EU grants is extremely appealing for PPPs as it offers the cheapest financing, there are several financial, legal and organisational incompatibilities that make it difficult to insert EU grants within public-private agreements. Thus there is a difference in the timing of payments: EU funds are available for a much shorter period of time (7 years) than public-private agreements, which are long-term contracts (20-25 years), based on constant availability payments. Pessimists consider that PPPs are not going to attract as much EU funds as predicted due to this inconveniences.

Table 1 Ongoing and upcoming infrastructure PPP projects (road sector)

Project	Status	Procurer	Project details	Project	Likely
				size (€m)	timetable
Comarnic- Brasov highway	Ongoing project	Romanian National Company of Motorways and National Roads (CNADNR)	Twelve tenders have been already submitted for the competitive dialogue procedure relating to the concession contract.	995	2008-2011
Sibiu- Pitesti highway	Upcoming project	CNADNR	The length of the concession highway will be around 120km. The feasibility study is under development.	1,260	2009-2012
Brasov- Ploiesti highway	Upcoming project	CNADNR	The length of the concession highway will be around 111km.	2,051	2009-2013
Focsani- Brasov highway	Upcoming project	CNADNR	No further details about the project have been announced yet.	n/a	n/a
Targu Mures-Iasi highway	Upcoming project	CNADNR	The length of the concession highway will be around 300km.	1,050	2009-2013
Bucharest ring road	Upcoming project	CNADNR	The length of the concession highway will be around 164km.	1,000	2009-2013

(Source: PricewaterhouseCoopers, 2008)

If for instance we take a look at the Comarnic-Brasov highway which today has a six years delay compared to its initial deadline (2003) we will notice that it would have been more advantageous for the Romanian state to close the negotiations in 2003, when the prices were lower compared to 2009. If instead we analyse Hungary's experience we can clearly see that although its M1-M15 motorway PPP contract was considered to be unsuccessful at that time (2003) (due to unrealistic traffic forecasts which led to several renegotiations of the contract and in the end to the re-nationalisation of the project), today is thought to be a major achievement, which attracts foreign investors and boosts economic development, compensating the high price paid from the public purse in order to build it.

4. Conclusions

Romania is starting to implement major infrastructure projects with a PPP component in an extremely delicate macroeconomic context, when financial institutions are becoming very selective because of their low financing capabilities. This gives us two main alternatives: either to continue, or temporary give up our infrastructure plans, until the economic situation will improve.

Optimists' opinion is to continue PPPs plans because PPPs bring along a series of advantages that can compensate the negative impact of the economic crisis and can help achieve economic recovery faster.

On the other side, pessimists suggest to postpone infrastructure PPPs as they tend to be more expensive today than they will be once the recession ends. However such a rationale does not take into consideration our past experience or the PPP lessons learned by other Central-Eastern European countries.

We may conclude that it is better to finance infrastructure PPP projects today than tomorrow. Although today it may be more expensive due to the "credit crunch" generated by the financial crisis, tomorrow it will not be cheaper because prices always tend to grow up and because the renegotiation process is very expensive too.

The paper contains a presentation and a summary analysis on the health services in Romania and the Netherlands. The research goal is to provide a more complete picture of how each country is providing these services, and how well they satisfy the public interest. The coordinates for the analysis were: how the health services are organized in each country, how they operate, how they ensure patient care, the way that they ensures the quality of services offered, and how they are succeeding to maintain the costs of work carried out.

Keywords: public health, services, quality, changes

JEL code for paper: I: Health, Education, and Welfare, II: Health, I18: Government Policy; Regulation; Public Health

1. Changes in Public Health Services from Romania

Romania in 1990 had an exclusively public health system, highly centralized, supported financially by the state and coordinated by the Ministry of Health and its health inspectors county. Services were offered to the population, officially without any costs, but the serious financing problems of the system for a long period of time resulted in lower quality services provided and the transfer of a part of the cost to the public.

Many hospitals and polyclinics were in damaged buildings, without proper technical equipment, medicines and materials, Romanian health system did not cover demand in the health units and the imported medicines, new and effective, were inaccessible to most people. Thus, part of the costs of treatment were transferred, directly or indirectly, to the recipient, including through informal payments to medical personnel, in this way limiting access to segments of the population to medical services.

Reduced quality of services and gaps in the system, due to low budget, required for decisions in order to improve public health care in Romania. Switching to a model-based health insurance has been evaluated by the decision persons, at the time, the optimal solution for many of the system problems. As a result, the principles of organizing, financing and providing the public services of public health have been amended since 1996 in terms of legislation, and in terms of actual and real transformation since 1999.²¹³

Health services are thus currently granted on the basis of contribution to health insurance fund. Insured benefit, based on this contribution, free of charge of a package of services defined as vital and which are legal regulated.

Primary health care is currently provided by the family doctor, whishing to emphasis the role of a primary service, as the first filter to solve problems. Access to assistance and outpatient hospital and access to free medicines and offset is made by your family doctor. Doctors no longer have the status of employees of state, but are healthcare providers who enter into a contract with Home Health Insurance, the new coordinator of the system. The average health staff is employed by these service providers (doctors and hospitals). Ministry of Health retains only the role of funding and coordination of national public health programmes. Also, the new model resulted in an access reduction of the population to health services by some people who can not qualify for medical assistance (outside the emergency minimum), having no health insurance.

After 1990, were made changes in the positive direction, in providing health care. Some of polyclinics and hospitals in the public sector today provides services improved and diversified compared to over 19 years now, and on the market now you can find new and effective medicines, including imports. There is also a private system of granting medical services, adjacent to the public system and a wide network of private pharmacies. Meanwhile, in the context population poverty, a large segment of it, although assured, can not afford the cost of treatment, accessing to hospitals performing services outside the locality of residence or the offices of the private system as an alternative to the public health system.²¹⁴

2. Synthesis analysis on the health system of Romania

A large proportion of the Romania population has at present a shortage of health education and family planning, including lack of awareness of the role of prevention and habits of consultation, in the case of a problem, elements that demonstrate the reduced role that the health programs have for health education and prevention among the population. As a result, in Romania there are the highest values (the European) for incidence of diseases of the circulatory, the TB and other infectious or parasitic diseases. Infant and maternal mortality are relevant indicators of the access problems of mothers and children newborns to health care, the reduced quality of services they receive and the degree of insufficient information on methods of preventing diseases and maintaining health. Despite the decreasing trend since 1990, infant mortality rate in Romania is three times higher than the average European Union countries and two times higher than in Eastern Europe. 215

Population appreciation regarding quality practices of family doctors reflects the current problems in medical equipment, in the state office building housing, the toilet and cleaning facilities. If some problems are related to poor financial resources, others, such as cleanliness or solicitude for the medical problems could be solved much easier. Negative public perception of the quality of services and physician-patient relationship may be a demotivator factor in the call of the doctor. Pending, for the benefit of consultation is another problem reported by the population, reflecting, in some areas, shortages of doctors and health units. On the other hand, legal regulations require periodic renewal of a recipe by a doctor, where long-term treatment is needed, leading to congestion of these people at the door the doctor, increasing waiting time. This system is putting the doctor in a situation of losing a part of the time filling out papers to the detriment of providing advice.

High rate of admission in hospitals shows that patients are admitted to the hospital without having a high outpatient care (70.3% of all admissions are an emergency admission), showing primary and secondary health care deficiencies, and reduced access by the sick persons of these services from the first symptoms of the disease.²¹⁶

Product market liberalization and reduced domestic production of medicines have exaggerated increased the prices of pharmaceutical products. Thus, the increased cost of drugs has diminished access to this type of consumption for poor families, even with regard to vital treatments, mandatory.

Current financial crisis caused the inability of the population to access the public services to which they were entitled, such as: basic medical tests offered by laboratories, compensated or free drugs in the case of children or serious illnesses. One of the serious problems of the Romanian health care system is insufficient public health preventive programs and their inefficiency.

Low standard of living in Romania and the conditions offered by the Romanian health system in recent decades have led gradually to a polarization in terms of access to health services, with long-term consequences on the population health and in contradiction with the principles of social equity stated by the law of health. While a segment of the population has access to advanced services provided by specialized assistance from academic centers, to private health care and cost effective medicines, another segment of the population has problems in accessing health and quality of medication and what is worse even in accessing primary care (including dental care).

The main weaknesses of the Romanian health care system identified are: poor funding of public health, poor information of population on health insurance, a low number of buildings for health services, equipment, medical personnel, use of old technical Medical Investigation in most hospitals in Romania, which do not meet a correct diagnosis or a completely treatment for a sick person, expensive medical services, the precarious situation of public health in rural areas, insufficient information or lack of it for population on the methods of preventing disease and maintenance of sanitary hygiene, lack of motivation for employees in the medical system, the existence of a relatively large number of unqualified staff in health facilities and lack of improvement of medical staff, in Romania there are the highest values of the incidence of circulatory diseases, TB and other infectious and parasitic diseases.

3. Overview of the health system in the Netherlands

Before moving to the presentation of the current Netherlands health system it has to be noted the fact that the Netherlands has registrated major problems in health care system, but has managed to improve it through good strategies and effective planning.

It should be noted and accepted before we move on to presenting the current Dutch health system, the fact that the Netherlands has registrated major problems in health care system, but has managed to improve it through good strategies and effective planning.

In the Netherlands, the government is not responsible for the management of daily health. Private health providers are responsible for the provision of services. Government is responsible for providing and ensuring access and quality of healthcare. The main characteristics of Dutch health care system are: complete coverage of all residents,

2

²¹⁵ www.iccv.ro.

²¹⁶ www.ipp.ro.

attention to primary care, providing primary care by specialists trained in family medicine, all other medical specialists are in place in hospitals (private or state), increasingly important role of nurses.²¹⁷

Who is insured? Since 1 January 2006 there is a new system of health insurance in the Netherlands. In the past there was a difference between the public and private healthcare services. But it was removed, and now everyone must purchase the basic package of health insurance.

Before 2006, people with incomes higher than € 30,000 per year and those in their care (about 35% of the population) were excluded from the coverage area supported by public funds of the disease and could get coverage from private insurance companies. This form of substitution of private health insurance has been regulated by the government to ensure access to appropriate health care for the elderly and poor people and compensation of insurance public health from the state budget. Over time, increasing dissatisfaction with this dual system of public and private coverage has led to reforms in 2006.

Basic package. Government created the basic package that offers the same features as the previous system. The health insurance companies are required by law to provide at least the basic package and they can not refuse anyone who wants to apply for it. Standard health insurance is financed by a mix of income derived from contributions paid from wages and insurance premiums. The contribution of salary is fixed at 6.5% for wages not exceeding € 30,000 in annual taxable income. Employers must reimburse employees for their contribution and the employee must pay tax on the refund. For those who do not have an employer and receive no unemployment benefits, the income is 4.4%. The contribution of self-employed person is assessed individually by Tax Department. With the basic package, beneficiaries are offered the following medical services: medical care, hospitalization, dental care (until 18 yearsold, to 18 years or older are only offered care services and false teeth), various medical devices, various drugs, antenatal care, patient transport (eg, ambulance), paramedical care. Insured people may decide to purchase additional insurance which are not included in the basic package. However, in this case, insurance companies may refuse the request and have the right to set a higher price.

The basic package price. Fees for the basic package of health insurance is set annually by insurance ealth companies and are normally around 95 € per month. Although the Ministry of Health establishes the first standard insurance, insurance companies clearly establish a tax on the additional insured will pay in the end, being inserted in the monthly rate and in claims. Through these extra charges insurance companies maintain competition between them. Taxes of insurance varies from one company to another, and therefore it is advisable to compare prices. Children under the age of 18 should not pay health insurance and they are insured for free through the basic package.²¹⁸

The assured pays an initial lump sum (determined by insurance companies) to the private health insurer. All people who have the same nsurance pay the same insurance premium. In 2006, an insured person was chosen for a refund of $255 \, \text{\ensuremath{\in}}$, if he did not have any medical care costs. If the policyholder has taken care expenses, but under $255 \, \text{\ensuremath{\in}}$, it will receive the difference back to the end of the year. Thise system "no claims, you get a bonus" was abolished in 2007 following a change of government and has been replaced by the exemption from income tax.

Those with low incomes are entitled to so-called "care allowance" up to a maximum of 330 € per year. Now each insured person over the age of 18 years have to pay the premium for health insurance of 150 € in a year. In 2006, the average annual premium was € 1050 (\$ 1513).

How is the system of granting medical insurance organized? Funds for health insurance: private insurers are regulated by private law. Are allowed to be grouped in companies that pursue profits. They must be registered by the Insurance Supervisory Health (CSAS) to check if the supplies are in accordance with the Act Health Insurance and can contribute to payments for the equalization fund in case of risk. Policyholder has the free to choose the insurers, and the insurer must accept every resident in their area of coverage (although most already operate at national level). A system of equalization in cases of risk is used to prevent direct or indirect risk selection policy by insurance companies. Doctors: they work directly or indirectly, in contracts negotiated with insurance private health companies. Doctors are paid for each patient on their practice list, and receive a premium for each consultation. Additional revenue can be negotiated for additional services, the practice nurses, for difficult locations, etc. Hospitals: Most hospitals are private non-profit organisations. Hospital budgets are developed using a formula that pays a fixed amount per bed, for the patientnumber, and the number of licensed professionals, and other factors. Additional funds are provided for capital investment, although hospitals are increasingly encouraged to obtain private capital through the private market.

At the level of health system, **the quality of health care** is ensured by law in performance training, service quality health care, patients' rights and the technologies used in medicine. National Health Inspectorate is responsible for monitoring the quality of all activities. The main methods used to ensure quality in institutions include accreditation and certification, mandatory and voluntary assessments based on performance indicators and national quality improvement method based Progress - "Breakthrough" (Sneller beter).²¹⁹

²¹⁷ http://www.tandarts.nl/ http://www.minvws.nl/.

²¹⁸ http://www.actiz.nl/home/home.do.

²¹⁹ http://www.civitas.org.uk.

How is effectiveness of care provided? The main approach for improving efficiency in the Dutch health system is based on regulation of competition between insurers combined with significant attention paid to performance and transparency in the results obtained by the use of performance indicators.

4. Brief analysis of the health system in the Netherlands

The main problems of public health in the Netherlands before the year 2006 were: a rigid two-tier system of private medical insurance for the rich and assurance standard for the rest of the population, which has highlighted inequalities of health services, a system of risk equalization to resolve problem of discrimination in private insurance, an inefficient bureaucracy that highlights increased costs, dependence on the employer; multiple types of insurance (health insurance, private health insurance for civil servants, etc.), ineffective or non-competitive incentives for insurers, too little pressure or the lack of it on providers to achieve better performance, and inaccurate initial effects thereof.

After the year 2006 were identified the following problems: limited accessibility for people with low incomes to the new health system; increase of the nominal first medical assurance from $320 \in$ in 2005 to $1038 \in$ in 2006, although this was offset by the decreased level of contributions from income; increase in the costs of healthcare sport for the consumers.

Top rated increased. However, charges on loans and the Health Insurance ensures that the system still serves the public interest and in terms of international standards of health costs are still relatively low, add the administrative costs of the identification for the individuals who have not made payments for the first binding. Currently is discussing the possibility to investigate such "bad payers"

CONCLUSIONS

In the end of the paper we want to point out some issues relating to the organization and functioning of health system in the Netherlands that could be takeing into consideration in reforming health services system in Romania and, where possible, to adapt a number of practices of the Netherlands health system.

Few coordinates to consider the change management of health services in Romania are briefly presented below.

- **A)** Efficiency in the program due to technical and political complexity: The first issue is a clear indication of the objectives of health services in Romania, modalities of action and a realistic timetable for their implementation. The initial reform plan for implementation was 4 years. A more realistic timetable would reflect a period of at least 15-20 years. Such a program built on a sensitive issue both from a political point of view such as health (financing) is hardly implemented by a cabinet appointed for a period of only 4 years.
- **B)** Elimination of free medical services: A second aspect is that the Dutch proposal for health insurance market is not a free one. A free market for health insurance would have side effects, which are considered by most companies as undesirable. In a market of health services free of charge, most people with low income and chronically ill people should have access to all medical care they need because of financial factor.
- C) Monitoring of the health services. It is important to note that the Dutch government has formulated a proposal for regulating competition. Instead of direct government control over volume, price and production capacity, the Government should create conditions necessary to prevent undesirable effects of free markets and to enable the market to satisfy the public interest as regards health care. Access to good quality care for the entire population is an important objective.
- **D)** Establishing the package of the mandatory health insurance. Therefore the government will focus on regulating the first health insurance mandatory for everyone, subsidized risk premium adjusted for insurers, anticartel measures, quality control and information disclosure. Therefore it is better for the Dutch health reforms to be considered "rules" instead of "deregulation".
- **E)** Prevention of "disadvanteges customers with limited access to additional services": Last issue aims prevent this trend and is a necessary condition to reap the benefits of competition rules inserted in the health insurance market. This disadvantage means that selection occurs when insurers prefer profitable costumers over the unprofitable ones.

Over the last years many countries have turned into real service economies. As a result the strategic importance of purchasing services has increased. This article aims to present the complexity of the process of buying services. In the first part of the article we emphasis the importance of buying services and we make a literature review about the purchasing of services. Furthermore the paper presents the findings from the interviews done in three romanian companies. At the end of the paper we present the conclusions about how it can be improved and monitorized the purchasing process of business services.

Keywords: Supply chain management, purchasing services, management control

JEL Classification: M19, L80

1. Literature review

Until recently, academic interest in purchasing was very manufacturing oriented with an emphasis on production buying. The purchasing of services has only gained limited attention from management and researchers (Fearon and Bales, 1995; Telgen and de Boer, 1995).

The role of the Purchasing Department in the purchasing process varies from company to company and from situation to situation. In general, the Purchasing Department's involvement is highest in purchasing of raw materials, special and standard production items and MRO supplies. The involvement of the Purchasing Department is smaller or absent in the purchase of non-product related (nontraditional) goods and services, such as:

- Capital equipment (vehicles, lathes, etc);
- Services, which are all those purchases that have a high content of personal input (health care plans, insurance, advertising, legal assistance, and telecommunications);
 - Resale items (e.g. the tires sold in a petroleum firm service station).

A number of previous studies (U.S. Bureau of the Census, 1991; Fearon and Bales, 1995) indicate that the role of the Purchasing Department is much smaller in the purchase of services than commonly believed. These areas, such as insurance, utilities, consultancy, travel and advertising, are likely to be purchased without the involvement of professional buying practice and skills. For example, the Center for Advanced Purchasing Studies (CAPS) in a study in 1993 (Fearon and Bales, 1993) found that in a surprisingly large percentage of firms, the Purchasing Department had no input to the purchase of nontraditional goods and services (e.g. in 39% of the firms, there was no involvement in the purchasing of utilities).

Similarly, in another study made in 1995, Center for Advanced Purchasing Studies (CAPS) found that from the total of \$ 140.3 billion purchased by the 116 organizations, only 41 percent was spent by the purchasing department, 59 percent was spent outside of the purchasing department. From these 59 percent: 41.55 percent was spent by some other nine departments (transportation, finance, administration, human relations, etc.) and for 17.45 percent the study couldn't identify the buyers. The research highlights the purchase dollars spend of the total 116 organizations for the largest ten goods and services. The purchasing department apparently had very little input in the purchase of the majority of services.

Business services have a number of characteristics which may contribute to the fact that they are purchased outside of the Purchasing Department:

- wide range of services which are often coupled with an even larger numbers of suppliers;
- relative high frequency of initial purchasing activities;
- high level of internal end-user involvement, especially in the initial steps of the purchasing process;

Also, purchasing of business services is not seen by managers as a necessity, compared to the purchasing of goods and raw materials for the primary process. As a consequence of this undervaluation, structural attention and management of purchasing of services is not considered as a means for improving effectiveness and reducing expenditures. Because of the lack of clear and direct insight in the size and contents of the purchasing volume of business services, managers are missing opportunities for adding value to their organizations.

In Michels' view (1996), a purchasing department can be involved in three different ways:

- purchasing can be directly involved in purchasing of services;
- purchasing can act as an internal consultant/advisor for service purchase buyers;
- purchasing can act as a cross functional team member dealing with purchasing expenditures.

While benefits of involving purchasing department in the purchasing process of services may be numerous there are also several major challenges of involving purchasing department in the service procurement (see table 1).

Major benefits of involving PD in buying services	Major challenges of involving PD in buying services
 cost savings service and quality improvement reducing service cycle time improved process efficiency greater compliance to pre-negotiating contracts controlled costs legal protection a better informed and prepared supplier 	 gaining the acceptance, confidence and cooperation of the using department capturing attention of top management developing a value preposition for key customers and management limited availability of NPR purchasing data and information rivalries among separate business units or managers emotional issues that users have in terms of being comfortable with doing things in certain ways

Table 1: Major benefits and challenges of involving PD in buying services

Source: C. Nowikow (1999); W. Atkinson (2000); A. Porter (1999)

2. Purchasing management of services in three romanian companies

In the attempt to develop a model for the purchasing process of business services we made three in-depths interviews in three romanian companies in order to see how are things in practice. With the interviews we wanted to find out the answers to the following questions:

If the business services are bought outside of the purchasing department?

How often does this happen?

Which of the business services are bought more frequently outside of the purchasing department?

Is top management interested in purchasing process of business services?

If the purchasing process of business services is controlled by top management?

Etc.

The interviewers were the purchasing managers from the following companies:

SC Adiss SA (Baia Mare);

SC Faimar SA (Baia Mare);

SA Amisa SA (Baia Mare).

From these three companies, the purchasing process of business services is best organized at SC Faimar SA. At this company there is a clear methodology for the purchasing process of business services. Also, general manager is interested in the purchasing of services and knows what is going on in the company: who is buying what? from which supplier? This fact is obvious in the way that the process of buying services is organized and controlled. In this company it has been established very clear what types of services are bought through the Purchasing Department and what types are bought outside.

SC Adiss SRL has just started the process of reorganization of purchasing services. A big step was made because the general manager and the manager of the purchasing department realized the great importance of the services purchases. In the process of reorganization of purchasing of services, they are trying to centralize all the purchases of business services inside the Purchasing Department.

At SC Amisa SA NPR purchasing is not considered a priority neither for general manager, nor for manager of the Purchasing Department. This can be observed in the way that purchasing process is organized. In this case, there are not clear define procedure for the purchasing process of services and it is not clear who is responsible for the purchasing of each type of business service.

General manager does not know the answer to the following questions:

How much money are spent for each type of business service?

Who buys each type of business service?

From which suppliers?

Etc

The lack of clear purchasing policies and procedures influences the organization of the entire purchasing process. Based on the results from the interviews we can draw some conclusions:

The Purchasing Department's involvement in buying business services is still limited and problematic because of the frictions between the specialists from the Purchasing Department and from the other departments in the organization;

The involvement of the Purchasing Department in the purchasing process of services can offer many advantages, including improved control over the purchasing of services;

The problem of involving or not the Purchasing Department in the purchasing process of business services is ignored sometimes by management.

As we have seen during the interviews, in two organizations the majority of business services are purchased without the involvement of the Purchasing Department. This is not necessarily bad but it requires management to control these purchases in order to make sure the organization's interest is well served. Two approaches can be used in performing the control phase of purchasing management: *problem prevention (pre-action control)* where possible, followed with a monitoring system that detects problems *(post-action control)* that slip through the prevention net. With regards to control of the purchasing performance the following methods are used in practice:

A. Pre-action control:

- 1. Budgeting In the purchasing area several budgets may be used e.g. per purchasing package and/or per department.
- 2. Limited buyer authority. The manager can control expenditures by requiring larger expenditures to be signed by a purchasing manager.

B. Post-action control:

- 1. Monitoring purchasing cost savings These refer to the extent to which the purchasing function is able to lower total costs of services purchased.
 - 2. Ratios and indices
- 3. Purchasing reports Information on how the purchasing function operates may be regularly reported to top-management.
- 4. Audit The purchasing audit is a review-procedure to ensure that proper procedures relative purchasing and management principles have being applied.

All of these methods do have significant shortcomings in practice (Weele, 1984); especially in so far as they are applied to the purchasing activities outside of the purchasing department. For controlling the purchasing performance most of these methods are inadequate.

For example, the budgets can indicate the maximum spending but they can't control the quality of purchasing: what are we buying?; at what price?; from which supplier?. Budgeting in purchasing in most cases only includes the direct or production materials and departmental expenses, whereas indirect materials and other items remain out of focus.

Most of the purchasing ratios and indices serve primarily as indicators or warning-signals, but it is not clear what to do with them.

A problem with purchasing reports is that these usually do not explain why certain problems occur.

The purchasing audits are little used in most of the companies because of the time and costs involved. If they are used the translation of their results into management control is still very difficult.

Also, for all of these approaches to be manageable we have to create within the organization appropriate structures and to provide appropriate training, supervisory guidance and motivation for personnel in order to be able to do it properly.

3. Conclusions

As we have seen earlier the current control methods have significant shortcomings and they are not working properly when they are applied to purchasing of business services. Therefore there is a clear need for new methods and approaches for managing purchasing of business services.

In developing tools for managing purchasing of services we also have to take into account the fact that for some activities it may be good or even desirable that they are performed outside of the Purchasing Department. Some of the typical daily operational activities (ordering, incoming items control, administration) can be performed successfully outside of the Purchasing Department. The Purchasing Department might still want to provide tools,

methods and training to help (teach) people to buy in a correct way, but there is no reason why they should be directly involved.

Activities regarding initial and tactical purchasing (setting up long term contracts, preparing and developing purchase order specifications, selection and contracting of suppliers in general and programs aimed at supply-base reduction in particular, etc) usually belong to the responsibility of the Purchasing Department. Some disadvantages may arise from performing these activities outside of the purchasing department:

lack of economies of scale;

no uniform attitude towards suppliers;

the impossibility of a tighter control on overall purchases performed in a company;

probably different commercial purchasing conditions for different business units (departments); etc.

Relating the findings from the interviews and literature review, we arrive at the following conclusions.

-If top management does not clearly communicate the different possibilities for professional (specialised) purchasing involvement, effective involvement from an internal purchasing department will remain problematic. The examples suggest that internal customers may refrain from involving the internal department, not so much because they believe the purchasing department has little value to offer but because they fear that involving the purchasing department will necessarily imply involvement from other internal customers. Another problem that becomes apparent from the interviews is that the lack of a clear structure for possible specialized purchasing involvement seriously harms top management's credibility regarding future policies on purchasing of services.

-The internal purchasing department may also have to more consciously rethink its approach towards the internal customers in terms of the value they could add. In many cases, for examples regarding the purchasing of ingredients for catering, the purchasing activities are closely complementary to the internal operations and/or require very specific (dissimilar) knowledge regarding the content. This suggests that the internal purchasing department would add most value by developing a dedicated co-operation relationship to this particular internal customer and/or facilitate the process of bringing in outside specialists. As mentioned before, given the wide variety of services, the internal demand for specialist involvement in each individual item or service will simply be too small and infrequent to justify such an internal specialist.

All in all, we conclude that top management – at least in theory – could improve its grip on purchasing of services by more clearly creating the conditions for a self-regulating 'economic system' within the firm which offers internal departments different possibilities for organizing their respective purchasing activities.

THE ASSESMENT CENTER, A NEW "FASHION" IN PERSONNEL SELECTION

Popa Luminita

Street Sfantul Apostol Andrei, no 105. Bl PB9, appart. 4, Oradea, Bihor University of Oradea, Economic Sciences Faculty, popalumi@gmail.com

The Assessment Center is a relatively new method for personnel selection that becomes more and more popular among the Human Resources Managers. It has proven to have efficiency both in personnel selection and training needs identification. This paper refers mainly to the assessment center in personnel selection, describing the entire process of creating and implementing an Assessment Center. The case study presented in this paper emphasizes the importance and the efficiency of this method in choosing the right candidates for the Key Account Manager position.

Keywords: human resources, assessment center, competencies, behavior, interview

JEL CODE: 015: Economic Development: Human Resources; Human Development; Income Distribution; Migration

Introduction

There are various methods used by the companies for personnel selection, in the process of attracting the best candidates for their job openings. The Assessment Center is one of the most efficient methods in this area. During the traditional personnel selection process, the person who is making the interviews can gather much information in regards to the candidate. Nevertheless, almost any candidate who has some experience in participating in a job interview can prepare his/her answers in advance and can simulate the optimal behavior expected during the interview. Especially for these cases, it is recommended to use the Assessment Center. More over, the Assessment Centers are used when there is more than one candidate that suits perfectly the job profile and the hiring company would like to offer a chance to each one of them. Also, there are cases when the manager is hesitating or let's say he/she is not decided between two or more candidates fitting the job profile. In any case, this method is recommended for the middle management positions, top management positions, specialized positions or positions that require a permanent communication with clients or business partners.

The Assessment Center is a method of selection which is utilizing a wide range of evaluation techniques and it usually has the following characteristics:

- The focus in on the behavior
- It uses exercises for representing and simulating the essential dimensions of the job, like role -plays for 2 persons or group exercises. It is assumed that a high performance during these simulations is predicting and anticipating a high performance on the new job.
- Besides the group exercises, there are interviews and tests completing the recruitment process.
- During the assessment center the performance is measured from many angles, in terms of necessary competencies for reaching the expected level of performance on a certain activity or at a certain level of the organization.
- The evaluations of the candidates or participants is done by putting them together, in order to permit the interaction between them and for making the experience more open and participative;
- A large number of evaluators or observers are used, in order to have a high objectivity level of the evaluation. It is recommended to use superior managers of the organization, to have the guarantee that they take "ownership" and are very responsible during the evaluation process. The evaluators must be chosen very carefully.

The Assessment Centers offer very good opportunities of finding how compatible are the candidates with the organizational culture. This is established by observing their behavior in different, but representative situations and also by the results on the various tests and interviews which are part of the procedure. Plus, the Assessment Centers offer to the candidates the possibility of making a clearer image in regards to the organization and its values, so finally they can decide themselves if they will integrate or not and if they will succeed or not.

An Assessment Center well organized can definitely reach a better predictability of the performance level and the future progress of the candidate, in comparison with the appreciations made by the regular methods, by the middle/top managers and even HR Managers interviews.

Broad and limited definition of the assessment center. Concept limitations.

Limited definition: the Assessment Centers mean simulation exercises.

Broad definition: the Assessment Centers mean simulation exercises, personality tests, skills' tests, interviews. Concept limitations:

- The Assessment Center is a standardized evaluation process of a set of behaviors.
- It utilizes a minimum of two simulation exercises of relevant job related situations
- It involves many observers who record and evaluate the behaviors

The basic principles of the Assessment Centers

- The Assessment Centers' use concerns the evaluation of measurable and observable behaviors
- The candidates are requested to demonstrate that they really know to do things as good as they claim
- The activities included in the Assessment Center must simulate and not reproduce relevant situations for a certain job

- It is necessary to inform all participants in regards to what is an Assessment Center
- It is necessary that the direct manager or a person who is not higher than two levels up the position to participate in the Assessment Center as assessor.

The first thing in organizing a successful Assessment Centers is to define the necessary behaviors for a certain job profile of a certain position within a company. The Assessment Center can be basically designed based on this first information.

The next step is to establish the date, the place and the duration of the assessment process. Generally, the Assessment Centers are organized at the end of the week, because most of the participants cannot take part in it during their working days in their present jobs. Every candidate must be informed before hand in regards to the event and to the entire process. In regards to the location, it is best to organize the Assessment Center in a neutral location – Business Centers or hotels' conference rooms, for example.

After all the assessment processes take place, the participants must be informed in regards to the results. This is done by meeting with the company consultants or by written reports.

The competencies of the Assessment Center

The competencies are sets of behaviors that are relevant for obtaining the performance on a certain job. In the Assessment Centers that has the personnel selection as main priority, the competencies are referring primarily to the necessary skills (the skills are the behaviors developed by learning and exercising). With 4-5 competencies the results are quite accurate. It is recommended to use a maximum of 10 competencies because the more they are the number of exercises involved is increasing, the time needed for the entire process is longer and the effort done by the assessors is higher. Frequently, the Assessment Centers are organized for 3-4 candidates, maximum 7. It is recommended for an assessor to evaluate maximum 2 candidates.

Some examples of competencies:

Planning and organization; leadership; results oriented; negotiation; adaptability; relationship skills; creativity; communication skills.

The meeting of the assessors after the Assessment Center

- The reunion of the assessors
- Discussing the observations and the evaluations given to each competency for each candidate
- The observations for each behavior must be listed as positive or negative
- The summation of the behaviors, how many positive, how many negative and the final grades given to each candidate
- Taking the final decision taking in consideration the grade received in the Assessment Center, the job requirements, the interview and the organizational culture

The Assessment Centers, similar to the psychological tests, need to be validated. The first studies have shown that the results in regards to this method are positive. Therefore, the method has been developed and utilized on a wide scale. An older study made in the USA by James Hock has shown that the probability of choosing a manager with subsequent good results is: 15% if selection is done by first impression; 35% if selection is completed with the evaluation of candidate's management skills by other methods than the assessment center; 75% if the selection is the result of the evaluations done by the superior managers of the job and the results of the assessment center. It has been noticed that the validity of the Assessment Centers is higher when there are more than one competency taken into consideration, when the assessors are psychologists, not managers and when there are used simultaneously evaluations by managers and evaluations done by professionals.

Advantages and disadvantages of the Assessment Center

Besides advantages, there are also disadvantages of the Assessment Centers. A company can loose a part of the candidates, as they can refuse participating in such a process, for personal reasons. But statistically this does not happen too often. Also, it can be very time consuming, as it has sessions of over 4 hours duration. More over, it is difficult to realize such an assessment and to draw all the conclusions can take few days. On one hand, this method might seem as lost time, but on the other hand for managers it saves time, because they have the possibility to know all the candidates in one day, without being necessary to see them in separate interviews.

In regards to the advantages, this method insures a higher objectivity, as in the recruitment and selection process there are more than two observers. Usually, along with the candidates, there are two to four assessors who take part in the process. The ideal case is to have at least one assessor for each candidate. Another advantage is that for the duration of the evaluation, the manager has the possibility to observe the behavior and the reactions of the candidate and he is able to compare these reactions in real time. The comparison is rigorous, as all the candidates participate in this process having the same conditions and they have to answer to the same requests. During the role plays is clearly emphasized the place each participant could take as a team member.

Case study

I will present now the Assessment Center for the Key Account Manager job, which was organized in August 2008 in Bucharest, having myself as a Coordinator. Following the preliminary interviews and the personality tests priori applied, resulted that 8 candidates are suitable and fitting the requirements of the job profile, whilst the necessary number of employees on this position was 4.

The details of the competencies and the exercises used for this Assessment Center are described hereby. After analyzing the responsibilities that are necessary for a candidate to perform very good on the Key Account Manager position, we identified the following competencies as being the ones supporting the performance in this specific activity: results orientation, negotiation, relationship skills, influencing skills.

The exercises used in this assessment center are as follows:

- 1. The plane crashed in the desert an exercise for observing the influencing skills, relationship skills and negotiation skills.
- 2. Negotiation for coins an exercise for observing the influencing skills, relationship skills, negotiation skills
- 3. Plasticize sharing. an exercise for observing the influencing and relationship skills.
- 4. Puzzle, while blindfolded and hands tied. an exercise for observing the results orientation, relationship and influencing skills.

Processing the information and drawing the conclusion, based on the Key Account Manager Assessment Center - Bucharest, August 2008

The processed information is referring to the behaviors that were noted by each assessor during the 4 exercises, for every candidate that was assigned to them at the beginning of the Assessment Center. Each behavior noted by the assessor was discussed by all the team of assessors, in order to be placed to the competency where it belongs to. The assessor which noted the behavior, when it was necessary had to give explanations to make the task easier for all other, in order to assign the behavior to the right competency. Although at the first sight it seems to be a very easy task, it is actually not easy at all. This is because for each candidate, there were noted approximately 20 behaviors for every exercise and each one of these exercises had to be discussed by the assessors' team while processing the information. In this stage, it was very useful to have all competencies divided by behaviors. Also, some of the assessors noted instead of clear, precise behaviors, vague observations or assumptions, general ideas. In this situation the assessor was asked to describe exactly the situation and the behavior of the candidate. This is one of the reasons why it is much indicated that the processing of the information to be done in a short while after the assessment center (as the information shall be still fresh in the memory of the assessor).

After the evaluators agreed on every behavior and classified it to the right competency, every behavior had to be divided into positive or negative. This went faster, as the discussion on behaviors was already done. Therefore, for each competency, for each candidate, the result was a number of positive behaviors and a number of negative behaviors. These numbers were introduced into an Excel table and the candidates were classified on every competency, following the behavior they had during the Assessment Center.

Another stage was to decide the importance, in percentages, of each selection method in taking the final decision. We considered the most important methods the professional knowledge test and the Assessment Center results, followed by the psychological tests results and at the end the interview. Another information would have been the salary required by each candidate but in our case all the candidates' requirements matched the salary range offered by the employer. Combining all these methods we finalised the clasification of the canidates for the Key Account Manager job.

Final results: Marius - 10.00; Marian - 9.60; Tudor - 9.20; Florin - 9.00; Crina - 7.80; Dorin - 7.40; Cristian - 6.80; Marcel - 4.60

Final order: Marius, Marian, Tudor, Florin, Crina, Dorin, Cristian, Marcel

Although before organizing the Assessment Center we had 8 candidates fitting the requirements of the job profile and it was really difficult to choose between them, after the Assessment Center, we forwarded to the employer 4 candidates for the final interview: Marius, Marian, Tudor and Florin. They were all hired after the final interview, which means that our team had a success rate of 100% in finding the right persons for the Key Account Manager position.

An important support mechanism for the realization of the knowledge-based economy is strong university-business environment co-operation. This allows for the rapid conversion of scientific knowledge into commercial innovations with strong social and economic benefits. Scientific and technological collaborations between industry and universities enrich the academic experiences of faculty and students and facilitate economic growth. This is why a very strong relationship between the academic research and the business environment should develop in each country. An exploratory research study was conducted to identify which are the most important aspects that determine the cooperation between academic environment and business environment regarding research activities in Romania.

Keywords: academic research, business environment, R&D

The article's JEL code: 123

1. Introduction

There are two main knowledge-creating sectors in an innovation system: universities and the business environment. By studying thoroughly the research activities they are involved in, we discover the complementary nature of their actions, and how they can support one another for the development of the society.

While universities play a more pregnant role in basic research, the business environment plays an important role in developing and delivering new products and new processes to the market. Therefore, the challenge for policymakers and industry managers is to discover ways in which a nation can use the science and technology capabilities of the two knowledge creating sectors to increase the science and technology capability for innovation. Through research activities, a university transforms knowledge into wealth, but is the major role of the business environment to transform knowledge, including scientific knowledge, into utility for society.

There is a vast literature regarding various aspects of the relationship between academic research and industrial research and innovation activities. The largest number of these studies is represented by small case-studies with focus at the university level (Cohen, et al., 1998). According to Cohen et al. (1998) few cross-sectional studies have been reported in the literature.

Some studies focus on the characteristics of universities as generators of knowledge flows of great interest for business environment's activities of innovation and R&D (Shane, 2002). Also, Kondo (2004) identifies **three ways** in which universities can contribute to industry innovation: knowledge transfer from universities to industry; joint creation of knowledge by university and industry researchers; and formation of a new company based on university knowledge.

There are authors questioning the ability of companies to utilise knowledge flows from universities. The issue of "relevance" of academic research for the business environment is largely debated. For example, Moody (2000) defines relevant research as that which "addresses a practical need", and goes on to state that relevance and utility can only be evaluated by practitioners. Hanseth & Monteiro (1996) assert that "the relevance of ISD research is intrinsically connected to influencing [i.e. improving] the practice of ISD", while Saunders (1998) also defines relevance in terms of usefulness to professionals: "When research is relevant, managers can use its results to successfully solve critical problems with which they are faced and to use information technology to reshape the environments in which their organizations operate."

Other authors have placed more emphasis on the **channels** through which the knowledge flows from universities to industry, as for instance:

- -Participation in conferences and presentations (Cohen, et al., 1998; Shane, 2002).
- -Personal networks of academic and industrial researchers (Hanseth & Monteiro, 1996)
- -Spin-offs of new firms from universities (Shane, 2002)
- -Flows of fresh graduates to industry (Varga, 2000).

Most studies have concentrated on the **one-directional effect from university R&D to industrial R&D** and the outputs of industrial R&D in most cases measured in terms of the *number of patents* and *neglected the possible mutual interaction*. However, if there is a mutual interaction between university and industry R&D, and if there are

knowledge externalities involved, then we can develop a dynamic explanation to the clustering of innovative activities based on positive feedback loops.

There are many important reasons for industrial firms and universities to work together. **Benefits to a firm** include access to highly trained students, facilities, and faculty as well as an enhanced image when collaborating with a prominent academic institution. **Benefits to universities** are related to funding issues - additional funds, particularly for research, exposing students and faculty to practical problems, creating employment opportunities for their graduates, and gaining access to applied technological areas. As a result of the complementary nature of industry-university relationships, some of these collaborative activities have been instrumental in helping firms advance knowledge and propel new technologies in many areas, e.g., in biotechnology, pharmaceuticals and manufacturing.

The **set of functions and outputs** of a modern university as a research centre include:

- 1. The creation of new basic knowledge though research;
- 2. The creation of human capital through teaching (i.e., knowledge transfer from faculty to students);
- 3. The transfer of existing know-how (technology) to businesses, governmental agencies, and other organisations;
- 4. The application of knowledge to the creation and commercialisation of new products and processes, or the improvement of existing ones (i.e., technological innovation);
- 5. Capital investments in the built form, and in equity in private businesses;
- 6. Leadership in addressing critical local problems;
- 7. Co-production (with other R&D organisations) of a regional knowledge infrastructure;
- 8. The creation of a certain kind of regional milieu favourable to innovation.

2. Knowledge Typologies

In identifying the role of universities and business environment in the creation of knowledge, it seems useful for our purpose to distinguish between the following **two knowledge concepts**: the **scientific knowledge** and the **technological knowledge**.

Scientific knowledge represents the form of basic scientific principles that can form a basis for the development of technological knowledge, while **technological knowledge** is the form of technical solutions or inventions that either materialise in new products or can be readily used in the production of goods and services. Usually, scientific knowledge functions as a background to or platform for technological knowledge in the innovation process.

According to Stokes (1997), research is categorized into **three types** (Figure 2.1.): *pure basic research* (exemplified by the work of Niels Bohr, early 20th century atomic physicist), *pure applied research* (exemplified by the work of Thomas Edison, inventor), and *use-inspired pure basic research* (Pasteur's quadrant). Louis Pasteur's method bridges the gap between "basic" and "applied" research. Pasteur-type research has been growing in importance because innovation has become more science-based. Thus, the importance of scientific knowledge created in the university sector and of university-industry partnership has grown.

As shown in the following figure, scientific research can be classified by whether it advances human knowledge by seeking a fundamental understanding of nature, or whether it is primarily motivated by the need to solve immediate problems.

Figure 2.1. Applied and Basic research ("Pasteur's Quadrant")

Quest for fundamental understanding?

Pure basic research basic research (Pasteur-type)

No Pure applied research (Edison-type)

No Yes

Considerations of use?

Source: Modified from diagram of Donald E. Stokes, Pasteur's Quadrant: Basic Science and Technological Innovation, Washington, D.C.: Brookings Institution Press, 1997.

In the process of exchanging knowledge between universities and the business environment there exist costs and fundamental difficulties. This explains why markets for exchange of knowledge are rare. The buyer's and the seller's transaction information is intrinsically asymmetric. Potential buyers may question the value of the knowledge, and sellers have a concern to show the value without revealing the specific knowledge.

3. Forms of University-Business Environment Partnerships

Firms and university research centres work together in a variety of ways. Successful innovation partly depends on the ability of companies to acquire scientific and technological knowledge from external sources and to integrate effectively this knowledge in their innovation activities. This is done by various types of partnerships between the universities and the business environment.

Three main ways to utilize the science and technology capability of the university sector for industrial innovation capture our attention, based on Kondo (2004):

A. jointly creating knowledge between university researchers and industry researchers

B. transferring university knowledge to the industry

C. establishing new companies based on university knowledge.

For each way there are some **forms of university-industry partnership**.

A. Joint knowledge creation can be done through: *joint research*, *contract research* (also has some aspects of joint knowledge creation since research themes are given from the industry at the beginning of research and some feedbacks are provided during the research), and *academic donation* (a weak form of joint knowledge creation as the business environment is slightly interested in the outcome of the scientific research). Lately, a new form of partnership has appeared: the *comprehensive collaboration agreement*, covering a wide range of collaboration areas such as: joint research, joint research grant applications, information exchanges, personnel exchanges, and joint human resource development. This agreement can be concluded in relations varying from one-to-one (one university - one company), to one-to-many (one university - many companies), or many-to-many (many universities - many companies).

Facility and equipment usage is another form of partnership. If the facilities are extremely expensive, this type of partnership is important. For small-and-medium-size companies, university facilities and equipment can be useful.

B. The dissemination of knowledge from university research centres to the business environment is done mainly through: journal papers and books, the Internet, and conference presentations. More targeted forms of knowledge transfer include consulting by professors and patent licensing. Also, students can be good media for knowledge transfer as they internships while they are still studying, jobs in the industry after graduation, and when a company sends its employees to study at a university.

C. Another way to create a research partnership between universities and the business environment is represented by the creation of start-ups that will commercialize university research results for industrial innovation. In some cases, university knowledge is transferred through technology licensing or via other forms. In other cases, university knowledge is transferred through the involvement of university researchers or students in the management of start-ups.

Specifically, university – business environment relationships usually encompass four major interrelated components: research support, cooperative research, knowledge transfer, and technology transfer.

Research support is the least interactive component, referring to financial and equipment contributions, which can consist of unrestricted gifts or endowment trust funds that the university uses to upgrade laboratories, provide fellowships to graduate students, or provide seed money for promising new projects.

Cooperative research relationships are more interactive than research support and include contract research with individual investigators, consulting by faculty, and certain group arrangements specifically for addressing immediate industry problems (NSF, 1982).

Knowledge transfer refers to a much broader array of highly interactive activities that include on-going formal and informal personal interactions, cooperative education, curriculum development, and personnel exchanges (Reams, 1986). Examples of knowledge transfer mechanisms are industry-university research consortia, trade associations, and the co-authoring of research papers by university and industrial firm members (NSF, 1982). Other forms are the recruitment of recent university graduates and employing student interns, and cooperative education programs which encourage information exchanges and on-the-job training experiences for undergraduate and graduate students.

Technology transfer occurs in many ways such as through technological consulting arrangements, the firm's use of centre sponsored extension services, and jointly owned or operated ventures. Joint ventures usually represent large-scale commitments by both the firm and university to transfer technologies and are often based on successful prior relationships between the firm and the university research centre.

4. Landscape of the RDI system in Romania &

the stimulation of university – business environment research partnerships

The system of governance for R&D and innovation in Romania currently accords primary responsibility for both to the Ministry for Education and Research (MER) and primary responsibility for industrial development to the Ministry for Economy and Commerce (MEC), with various other bodies such as the Inter-Ministerial Council for Science, Technology and Innovation responsible for ensuring the compatibility of policies in different areas. The R&D activity is undertaken by the Higher Education Institutions as well as by public - private Research Institutes.

The National Authority for Scientific Research (ANCS) within the Ministry of Education, Research and Youth is main responsible for the formulating, monitoring, implementation and assessment of R&D and Innovation policies. NASR implements the R&D strategy by coordinating the programs carried out through projects. The projects are realized by national organizations directly or by active participation at international programs.

The national programs are financed in most cases by public funds, but also by private ones (co-financing), depending on the type of program and organization. The international programs are financed by means of Romanian contributions from public funds to the programs of the international organizations or by applying the

international co-operation agreements settled at Governmental or institutional level. As now Romania is part of EU, a new type of program is financed by structural funds, in order to reach the community goal of increasing national competitiveness at the European development strategy level.

The National Research, Development and Innovation Plan for the period 2007-2013, hereinafter National Plan II (NP II), is the main instrument used by the National Agency for Scientific Research (ANCS) to implement the National RDI Strategy. Through its National Development Plan, Romania has introduced a series of national development priorities, the most important of which is its **strategy to boost competitiveness**. One major development objective in this strategy is reaching the threshold in research and development expenditure of 3% of GDP by the year 2015 in line with Treaty of Lisbon targets.

The Higher education sector includes 74 accredited universities, out of which 58 public universities and 18 private ones. According to the national education law, the teaching staff from universities has 25% of working time dedicated to the research activities. The research activity from universities is financed through the research projects selected based on the national competition. Apart from this, taking into consideration the quality of their research activity, the universities can receive supplementary budget from the Ministry of Education, Research and Youth.

5. Case study: IBM R&D Partnerships

Through the **Academic Initiative**, IBM provides faculty around the world with a broad range of resources and support to help educate students in the skills they need to compete in the fast-paced, ever-changing information technology (IT) workplace. The Academic Initiative is structured on the following levels: Country Project, Faculty Award, Shared University Research, Innovation Award, PhD Fellowship.

Through the programs designed to universities, IBM Romania participated in the update of the educational curricula, in the modernization, restructuring and in the creation of new courses of study and higher education programs. IBM's priority is represented by the involvement in the update of university curricula so as to create specialists with multi-disciplinary training in information technology, in software applications' development, networks, business models, collaborative innovation and social networking. This requirement of modern training is promoted through new scientific, engineering and service management (SSME) programs.

At the same time, IBM Romania established *centres of excellence and laboratories for education and research purposes* through partnerships with most prestigious Romanian universities (University "Politehnica" Bucharest, The Technical University of Cluj-Napoca, University "Politehnica" Timişoara).

In February 2009, IBM Romania and the Academy of Economic Studies (ASE) have concluded a partnership with educational and research purposes, aiming at:

- increasing the competencies of ASE's graduates in the field of software and informational technologies and of their use in economic applications, so as to train a highly qualifies work force, adapted to current needs;
- providing free training of teachers;
- providing recruitment support for employment of graduates skilled in IT industry;
- establishment of joint research activities IBM ASE;
- promoting innovation in higher education and academic research:
- consolidating the relationship between two important sectors, the IT and the economic sectors.

Another important component of IBM Romania's Academic Initiative is represented by the promotion of the open-source technologies among students. Annually trainings are offered by IT specialists to students on the following topics: Linux, Java & Eclipse.

IBM Romania organizes The Annual National Student Contest "Best Linux Application", through which students are encouraged to innovate by using Linux, or to improve the performances and the utility of an existing Linux application. Also, IBM is the main sponsor of the International Contest of ACM Programming at world level; the South-Eastern European section of this contest is organized in Bucharest, with a tradition of 11 years.

Conclusions

Partnerships in scientific research between universities and the business environment work in their mutual benefit, and in the benefit of society as a whole. In Romania, The National Research, Development and Innovation Plan for the period 2007-2013 aims at encouraging partnerships between universities and the business environment. In this respect, the most important role was played by PNCDI – Program 4 "Partnerships in Fields of Priority".

So far, institutions of higher education have concluded partnerships with private companies in granting scholarships in high level domains, internship protocols or research contracts. These partnerships have forwarded the development of research laboratories in State universities, improving the training conditions for students or PhD candidates. Most of these partnerships have rather small scale applicability, while partnerships with large implications on the society are now starting to be shaped, as shown by the case of IBM Romania.

The whole process of getting a job refers to a set of measures, from the identification of the opportunity to offer a new job to the consolidation of the relationship with the new employee starting the first day after accepting the job. Once the opportunity is defined, it is crucial to specify as clearly as possible the requirements of the respective job as well as to identify the necessary experience, skills and other attributes that a candidate must have so that (s)he may get the respective job. A set of behaviors is expected from each employee. There is no such thing as a "universal key" meant to open all doors to the management of human resources, but there is an efficient instrument by means of which the employee becomes aware of his responsibilities, skills and prerogatives. This instrument may be achieved by a correct analysis and projection of job openings and is called job description.

Keywords: skills, job description, interview, questionnaire, management

JEL Classification: M12, M51

1. Observations and facts

"Responsibility is the major factor in the development of human potential."

Mary Parker Follett

It is an undeniable truth that the more efficient the people within an organization, the more efficient the organization itself.

The whole process of getting a job refers to a set of measures, from the identification of the opportunity to offer a new job to the consolidation of the relationship with the new employee starting the first day after accepting the job. Once the opportunity is defined, it is crucial to specify as clearly as possible the requirements of the respective job as well as to identify the necessary experience, skills and other attributes that a candidate must have so that (s)he may get the respective job.

Some years ago, I got hired in a company as Human Resources Manager. The organization was in a delicate position because some days before my arrival 200 employees had left the company in a single day, as they had been lured by the competition with not so orthodox means of persuasion.

These employees were highly qualified in their rare jobs and they had received recognition of their expertise on the expenses and effort of the organization. The loss for the organization was high and coming back to normality involved higher costs and effort.

I will only offer one example: more than 100 employees were Railway Engine Mechanics and they were qualified for this job, who also held recognition from the Romanian Railway Authority (RRA), obtained on the expense of the company.

As a person who was directly involved in the recruiting and selection process I asked myself: "How can I hire 100 railway engine mechanics in a single day?"

There were almost no solutions to get me out of trouble, but I thought of professional development. The only solution was to send 100 new employees to a training course for the respective qualification, which was to be organized by a specialized institution in Bucharest during one year. The cost would have been huge, involving specialist lecturers, logistics of the institution that held monopoly over professional development for the job openings in the Romanian Railway System, as well as accommodation and meals for 100 trainees.

I looked for other solutions and finally succeeded, for the first time in post 1990 Romania, in organizing – as a private company – our own course training Railway Engine Mechanics, in Ploieşti, in close collaboration with the County Agency for Professional Development (CAPD). We had maximum efficiency:

- We recruited and selected trainees within the unemployed from Prahova County.
- Lecturers were selected within the specialists from the company.
- The company offered classrooms and the necessary logistics so that the practical training could be achieved (engines, carriages, own railway system etc.).
- In close collaboration with CAPD, we succeeded in offering courses during 6 months instead of one full year, following the same requirements of the training procedures.

The whole process was highly successful, but I could not ask myself:

- "What could have been done so that the unpleasant event did not take place?"

- "How could employees have been better motivated and made aware of their importance and how could the company have avoided this situation?"
- "How could loyalty have been obtained as well as devotion and faithfulness from those employees?"

We reached the conclusion that everything started the moment of hiring in an organization, when every person gets a status within the respective organization.

This is a very important phase in the way the respective candidate will finally adapt to the new working environment and consequently is important for his efficiency in the respective job.

A set of behaviors is expected from each employee, and they arise from the role he is about to have within the respective organization.

There is no such thing as a "universal key" meant to open all doors to the management of human resources, but there is an efficient instrument by means of which the employee becomes aware of his responsibilities, skills and prerogatives, as well as his position within the respective company. This instrument may be achieved by a correct analysis and projection of job openings and is called job description.

2. Analysis and projection of jobs at S.C. COMPANIA DE TRANSPORT FEROVIAR S.A. (Company for Railway Transport) Bucharest

S.C. COMPANIA DE TRANSPORT FEROVIAR S.A. (Company for Railway Transport) Bucharest is a privately-owned company that was made from the privatization of specific smaller companies having the following descriptions: Railway transport for merchandise on Romanian railway and industrial railway handling, Construction and repairs for freight cars and carriages, Repairs for electric engines, diesel and electric engines, diesel and hydraulic engines, Construction and repairs for railways.

2.1. SWOT analysis

Strengths:

- -it is a privately-owned company. The company does not face conservatorism, stereotypy and professional leveling; -it has a modern integrated management system: quality, environment, health and security; it has implemented the integrated management system according to SREN ISO 9001/2001, SREN ISO 14001and SREN ISO 18001 and has Certificate series SMC no. 059 and Certificate series SMM no. 025 from the Romanian Railway Authority (RRA) Bucharest;
- -diversification of products and services:
 - -construction and repairs for freight cars and carriages;
 - -construction and repairs for railways;
 - -freight railway transport;
 - -repairs for electric engines, diesel-electric engines and diesel-hydraulic engines.
- -the products and the services together with the competitive prices offer the company a favorable image, which make the company a market leader.
- -it holds the following logistics: engines, cars, carriages, railways etc., and is the only company in Romania having a complete organization of the logistics; the company does not hire third parties for specialist services translating into better prices for their products and profit for the company.

Weaknesses:

- -inheriting (by means of privatization) old technologies which further led to higher financial costs for improvement of the installations (the company is in a continuous process of renewing its technology and logistics);
- -reduction of cost by reduction of employees, the result being a loss in competence.

Opportunities:

- -accession to the European Union and extension of market taking into account that labor is much cheaper than in the EU and quality is high (for example: freight railway transport in Greece);
- -positive perception on their products and services on the market;
- -taking into account the development potential of the operating areas, the company may integrate vertically and become diversified.

Threats:

- -law insecurity;
- -intensification of competition;
- -the possibility of employee migration towards the competition which also recruited personnel coming from this company using unorthodox techniques;
- -corruption. If we take into account that railway transport is tempting from a financial point of view we may reach the conclusion that there are groups that are interested in showing their influence in this field.
- -external migration of highly qualified labor force. It is a known fact that accession to the EU and opening of borders made it easier for Romanian workers to find another job in the European Union.

2.2. Analysis and projection of jobs

The job openings that were analyzed are the following:

- Railway Engine Mechanic – a representative job if we take into account the specificity of the company;

- Chief of Quality Management;
- Executive Manager for CAHQ (Certification, Authorization, Homologation, Quality).

As the main methods and techniques for the current presentation, we used analysis of existing documents (job descriptions, rules of organization, Quality Manual, work instructions etc.), observation, interview and questionnaire. We have also read older job descriptions as well as the current job descriptions, organisation chart and we have gathered information on the general activity of the company and on the job openings that we wanted to analyze. By means of regular visits to the company, I made myself a more formal, official entrance to the jobs to be analyzed; by analyzing the existing documents I could better understand the nature of the job and of its requirements; by observation, I followed the way in which daily activity happened and I could get information on the requirements involved by the specific job opening.

Another method of analysis was the formal interview, which took place following a precise pre-established order. I made a list of 6 questions, designing thus a structured interview, with standard questions for all the three job openings to be analyzed (as well as for other jobs so that we could compare the results).

Individual specific questionnaire for the	ne job of

3. Conclusions and suggestions

As a result of the analysis of the job openings at S.C. COMPANIA DE TRANSPORT FEROVIAR S.A. (Company for Railway Transport) Bucharest, together with the specialist in the field of integrated management designated by the management of the company to take part in this analysis, we can say the following:

- The management of the company is preoccupied with designing the jobs so that they have all the prerogatives, skills and requirements included in the job descriptions; it is worth mentioning that the management is aware of the fact that job descriptions should be changed permanently and this has also been put into practice.
- The management has made available the organization chart of the company and all the job descriptions of the employees, in accordance with the laws in force today in the area of railway transport:
 - Law no. 55/2006 about railway safety:
- Order of the Transport Ministry no. 535/2007 about the norms to offer license for on the Romanian Railway system.

This means that jobs are thoroughly described and they are in accordance with the law requirements. For example, a railway engine mechanic cannot have the training, experience, length of service and physical skills that are lower than the standard as they are presented in the laws in force.

- The management of the company understands that analysis of the jobs is an important factor to discover the causes of underperformance and the fact that, by signing the job description, responsibility is also given to the employee. Only if he knows he has some responsibility, the employee may be sanctioned for underfulfillment of tasks. It is worth mentioning that, in the area of railway transport, underfulfillment of some tasks may result in high losses both for the company and for the third parties that are involved.
- The management of the company is constantly interested in analyzing staff competence, because any fall in the competence may have serious negative results. For example, an engine or a car that has not been properly repaired may lead to a disaster and consequently, this means loss for the company, both in image and in finance.
- The management of the company is aware of the fact that the working environment is a dynamic one and is constantly adapting to it.

Taking into account all these observations, in order to improve the resources and working methods as well as to improve the quality of professional life, and to have greater efficiency, I suggest:

- Making an annual objective from job analysis this should be carried out by means of the methods presented in this study: analysis of existing documents, observation of the activity, interviews, specific questionnaires.
- Setting up a job for a job analyst who, together with external auditors, should take part in the analysis process and interpret all the data using the techniques mentioned above, design and redesign jobs in accordance with real necessities, workplace dynamics and society dynamics.
- New projects require new jobs or adaptation of existing jobs to the new reality. For this, I suggest the following projection methods:
- "job rotation", that should involve the rise of variety and diversity of tasks by periodically changing work rhythm, adapting it to reality;
- "job enlargement", by enhancing prerogatives together with rising compensation for this will eventually lead to employee satisfaction and high performance for the company.
- Adopting flexible functioning forms in the form of project teams. For example, for the construction of a certain type of car, a project team should be made of a designer, an engineer, a quality inspector, and the execution staff. The team will be autonomous, thus leading to the acceptance of a larger area of responsibilities. The employees will set their own targets and accept the objectives taking into account the system of rewards and benefits.

This approach may be profitable both for the company and for the employees, satisfying their needs.

- Training and retraining some personnel (usually for jobs that risk not being occupied) in order to avoid the situation we described in the beginning of the paper. This should be set as a management objective: training and retraining employees in the necessary jobs by means of professional development programs.

In the end, I would like to add that a professional job analysis, which is carried out completely, allows a deeper understanding of the content of the job and its requirements, creating a real basis for making decisions about the staff, which in their turn, put into operations the strategy and policy of a company.

SPECIFIC FRAMEWORKS OF ORGANIZATION IN THE MEDICAL SECTOR AND SELECTION PROCEDURES ASSOCIATED WITH THE MEDICAL FIELD

Popescu Cătălin

Petroleum-Gas University from Ploiesti, Faculty of Economic Sciences, B.dul Bucuresti nr.39, Ploiesti, 100680, catalin nicolae@yahoo.com, 0244573171 ext.221

Jana Nistorica-David

Petroleum-Gas University from Ploiesti, Faculty of Economic Sciences, Jeni.nd@gmail.com, 0727347361

The design of the organization framework is done according to the activity objective, the types of services and the technical standards. Present paper present different types of organization frameworks: simple (the head doctor is also the manager; technical structure and auxiliary personnel; the operations group); technical bureaucracy (works best in case of calamities); professional bureaucracy; mutual arrangement; matrix framework. The research is carried out in order to identify a proper framework for the medical field. Also in the paper is treated a vital problem for medical field in Romania: personnel selection process.

The selection process is made out of two parts: the first step is that of recruitment; which has the objective of finding suitable candidates and the second step is that of selecting the best performing candidates. The process starts with a letter of intent, followed by an interview (which contains a multitude of questions and psychological tests). If all the requirements are optimally met, then, a professional team can be built.

Keywords: organization framework, medical sector, selection procedures

JEL Classification: I 1, M 12

1. Specific organization frameworks

The framework of organization is based on the objective of the activity, the types of services and technological standards – medical technology and instruments, pharmaceuticals. In the case of introducing new technology, changes can appear in the framework, functional levels, number of positions. There are a lot of organization frameworks. Below there are some examples starting from figure 1.

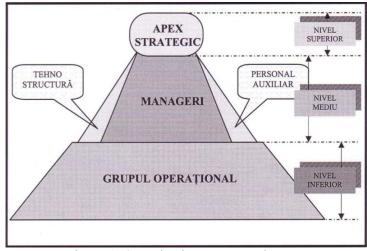

Figure 1. Organization Framework

Framework types:

- 1. Simple represented by private practices:
- the main doctor is also the manager;
- the technical structure and adjacent personnel;
- operations group: minimum number of people.
- 2. Technical bureaucracy complex, integrated framework, with well trained, experienced personnel:
- decisions are made by the strategic apex;
- management and control styles are autocratic.

This type of framework is not adequate to the medical system but it can work in case of major emergencies or catastrophes.

3. Professional bureaucracy – is made out of complex, integrated framework, numerous in personnel; in which the strategic apex is formed out of field experts and the decisions are imposed in a decentralized manner.

This type of framework is best represented in medical corporations.

- 4. Mutual arrangement diversified, non-standard framework. Some features:
- managers of the different levels in the organization have decisional independence;
- control is done independently;
- activity coordination through mutual arrangement, the interaction between managers and specialist. This type of framework works well in the case of medical research.

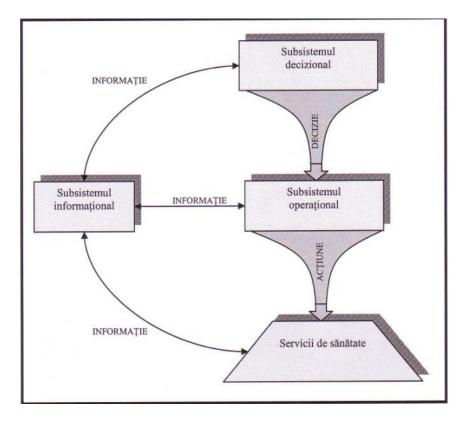

Figure 2. Health system – functional framework.

5. Matrix framework – the general manager has a very important role in activity organizing, following the proposed objective.

In the present Romanian Social Health Insurance System has a complex structure that wants to deliver the best medical services. Although in the last years, the structure have been changes we could say that the system presented in the figure 3 require much more improvements in order to increase the quality for the medical services.

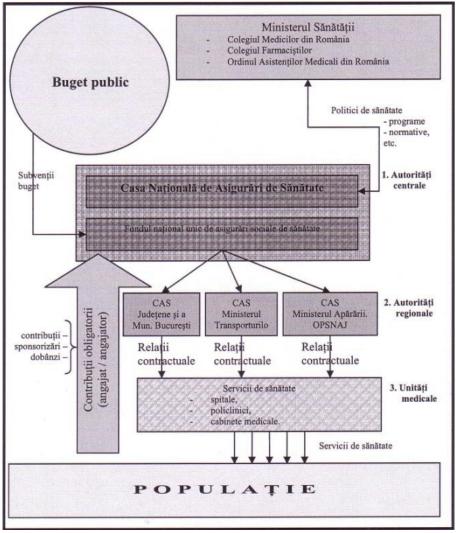

Figure 3. Romanian Social Health Insurance System

2. Selection procedures

The objective of recruitment is to find the appropriate candidates for certain positions and to draw them to the organization, while the job of selection is to choose the best of them and convince them to stay in the organization. The main reason of the selection process is to make an acceptable offer to the most appropriate candidate for the position in question.

The most used method in selection is interviewing, after which the psychological test. The first step in this process is a "letter of intent" in which the candidate explains his or hers interest in the vacant position. This procedure enables easier access to the interview, because the candidates knowingly leave out anything that would be of disadvantage to them. This is the reason why many organizations have decided to create their own applications, requiring the candidates to express themselves in a standardized way. These applications require routine information or open questions.

The interview

It is the most often used selection procedure.

To be of value, the interview refers to similar conclusions about the candidates from different interviewers – an interview is considered valid when a candidate is appropriate for a certain position. Here is a guide of good interview manners:

be prepared for the interview - for this is necessary to gather information as much is possible, develop details for the job, create the candidate profile, design the application form, do a plan for the interview process;

show to the candidate that s(he)is welcomed – for this is necessary to present to every candidate the procedure for the interview, then starting the interview by using simple and incentive questions;

encourage the candidate to speak – for this is necessary to have open questions, support questions. Listen carefully every response of the candidate. Also stop to interesting points of discussions in order to find out more about candidate skills;

control and monitor the interview - for this you need to focus the questions in the direction that you need to reach your goals; look to the watch time to time in order to respect the duration of the interview;

offer to the candidate any useful information - respond to some questions asked by the candidate concern the job position and inform the candidate about the next step of the selection process;

prepare to finish the interview and the meeting - try to finalize the interview with gather final information concern the candidate; after the meeting is important to make some notes about the candidate and also give a mark to the candidate; also fulfill the administrative procedure required for the final decision.

In a selection interview, questions play a vital role, being the main way of obtaining information from a candidate.

Questions can be open or closed. The principal differences between these two types are:

Closed question ask for a specific answer or a yes/no answer. For example: "What studies do you have to be qualified for this position?" (Specific answer); "Do you have any experience?" (Yes/no).

Open question asks of a person to answer about a subject in his or her way: "What interests you in this position?" Open questions are asked to verify the information that the candidate offered in the letter of intent.

There are situations where candidate assumes control of the interview, dominates the discussion, following his or hers interests.

The interviewers can diplomatically keep control through certain methods:

appropriate preparations – key questions

in case that the candidate gives a false, yet plausible answer, an interview can come back to those questions with which he's not satisfied with the answer.

Another aspect of the selection process is giving the candidate routine information about the working conditions, but only near the end.

The allowed time is better spent for evaluating the candidate which, alongside the information contained in the letter of intent, can give a close to reality portrait of the candidate.

Also in evaluating candidates, psychological test can be used. These are standard test for each position, which objectively shows certain human traits by evaluating the candidates' behavior.

There are four categories of tests:

- intelligence tests;
- aptitude test;
- knowledge test;
- personality test.

Intelligence tests – "Intelligence is not, evidently, the single factor that influences professional results, but is frequently more important" ("The truth about managing people...and nothing but the truth" – Stephen P. Robbins). This IQ is very important because it will be correlated with results obtained in new professional activities: "If you want to hire the best possible workers, every other requirement being the same, choose the smartest you can find" (Stephen P. Robbins).

Aptitude tests – these tests control the innate abilities (mechanical, numerical, manual dexterity).

Knowledge tests – these test the level of obtained knowledge.

Personality tests – the purpose of these tests is to identify character traits and the dimensions of a person (introvert, extrovert, isolated, sociable).

The next step specific to the selection process done at the headquarters of the organization, is applying a predefined grading system following criteria specific to a certain position. Making the decision is the next step and after this, informing the candidates about the result.

In the medical field, in the selection processes are much more important the aptitude tests and knowledge tests, because in the case of nurses they are complied with a practical probation and also they have to fill out a test with medical questions. In the case of medical doctors there is first of all a national tryout called: Rezidenţiat. After this period of three years, each medical doctor needs to pass a new exam in order to become a specialist in his domain. Further, medical doctor need some special training and years of practice for the next step in the career: primary medical doctor.

The problems of our days concern medical domain is that there are less potential candidates to obtain jobs in medical field, main causes being:

- -less interest from youth to be enrolled in certain forms of medical education;
- -many people with experience in medical domain (medical doctors and nurses) are choose to work abroad for better payment;
 - -the lack of public medical post high-schools;
 - -the shortages in the medical infrastructure existing in almost of hospitals.

3. Conclusions related to the processes of recruitment and selection.

For these processes (of recruitment and selection) in order to assure a good future performance, these points must be followed:

- identifying the present level of performance of an individual at the workplace;
- the offering of a basis to reward properly employees for their contribution in fulfill the organizations objectives;
- identifying the strong and weak points of an employee;

- to find out each time ways of improving activity;
- create/ design employee motivation;
- identifying the needs for training;

When all these objectives are followed and met, we can safely say we have a professional team in the hospitals or in medical dispensaries.

TBE'S MODEL FOR LEADING A CLIENT ORIENTED ORGANIZATOAN

Rosca Remus Dorel

Univeritatea din Oradea Facultatea de Științe Economice Oradea, str. Sovata, Bl. C4, ap. 2, nr. 56 rrosca@uoradea.ro 0740/246610

As a profesor, manager and consumer, I have come about to notice the lack of focus on the clients of numerous organizations on the Romanian market. Due to increasing competition and the fenomenon of globalization, the growth of difficulties on the market because of the curent crisis, the orientation towards the clients in order to satisfy his demands, is a necesity. The development of a business based on the principle of focusing on its clients implies a considerable group effort, TBE presented in this paper being a very useful tool for that purpose.

Keywords: Focus on clients' needs/Client demands, needs oriented business, a balanced reporting schedule, performance indicators, important factors of success, strategic objectives, clients.

The need to improve client satisfaction policies in Romania's organizations

I took the opportunity to design a model graphic for leading an organization that wants to improve its global performance through a better client oriented policy, taking into consideration the following:

- client satisfaction represents the basis for a long term successful business in todays competitive environment, which forces organizations to promote a client satisfaction oriented business, focusing on his needs and demands;
- the existence of numerous organizations on the Romanian market whose performances and competitivity would be highly improved if they would promote client satisfaction policies as a basic principle of their business. In my opinion, the proof of this remark is represented by Romania's commercial balance deficit

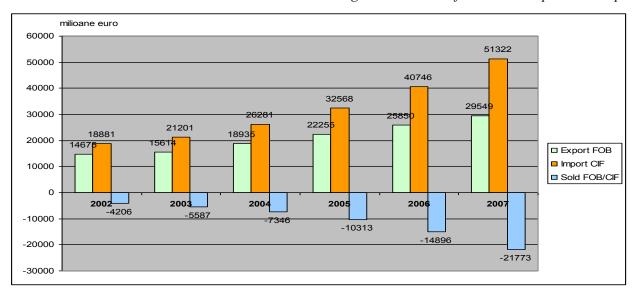

Fig. 1 – Evolution of Romanian imports and exports²²⁰

During the studied period, the value of imports was constantly greater than the value of exports, the exports being only 66,42% of the total value of imports. Unfortunately, the growth of internal consumption depends on imports, due to the internal productions' incapacity to respond to this opportunity. The comercial balance is a relevant indicator concerning an economy's competitivity (and the economic organizations that are part of it) on the international market. The severe deficit of the commercial balance reflects a dramatic lack of competition on internal supplies (or their inexistence on certain product markets). At the center of this lack of competition also lies the lack of a client oriented policy of the Romanian firms.

TBE model - Instrument for leading a client oriented organization

Next I will analyze the critical success factors, objectives and performance indicators specific to the TBE model in order to guide a client oriented organization. The goals concerning the performance indicators and improvement plans are set by every organization taking into account specific realities of their internal and external environment.

Although scarcely approached in specialty literature, the social aspect of efficiency is much more obvious in commerce than in other fields, due to the direct public relationships of the commercial staff. As it is considered by other authors, we assume that social efficiency of commerce can be contemplated as the consumer's efficiency, which can be understood as the quality of its serving. That is why, especially within retail commerce, all final results must also be interpreted in terms of their clients' interests, which implies a system of specific indicators. Throughout this scientific paper, we have tried to show the customers' satisfaction level as an expression of social efficiency of services.

Keywords: consumers` satisfaction, social efficiency, quality of services, reliable services.

Code JEL: M11, M12, L81

In our opinion, social efficiency, especially within the framework of commercial services, depends on multiple factors, such as: aspects that aim at the modernization degree of the service providing commercial unit – essential requirement (especially within the trade of nonalimentary products) of creating a modern, civilised commerce, which directly and decisively determines the quality of the service, the assortment variety – which must fully comply to their consumer's needs, their accessibility degree - not just to company - related information, but also to the unit itself, the professionalism of the members of staff involved in providing services and many other factors. The quality of the service will be finally granted by the quality of each influencing factor, separately.

Improving the efficiency of services in compliance with consumer's demands, must take into consideration the service quality improvement and reliable service providing. It is obvious that, non-quality inevitably leads to losing current and potential customers. Providing reliable services by systematic pursuit and control of the process of carrying out services, can contribute to the accomplishment of improving the level of social efficiency of services, being at the same time, an important source of competitive benefits for companies who adopt this strategy. The implementation of an adequate quality for full customer satisfaction becomes essential for the survival and development of any service providing company, which performs its activity in a competitive environment.

Since social efficiency can not be expressed using quantitative indicators, most examples that exist nowadays in specialty literature, refer to measuring service quality, consumer's degree of satisfaction, namely the service level perceived (as the difference between the level of the provided service and the one desired by the consumer).

In the actual context, where the competition is harsh, and the market is controlled by demand rather than the offer, the client demands to be recognised, understood and served impeccably, otherwise he will give up the services of that service providing company, reorienting towards competition.

Although all managers within a company are preoccupied with and involved in ensuring quality, lately, the role of top managers has become more obvious in ensuring quality, client satisfaction. Once with the processual approach of organizations, the idea the no one must give up his/her own identity was launched, on the contrary, that they must develop it, but they must admit the fact that the provided service is a collective result. This resulted in the role of managers of creating an alliance of different compartments and a strong relationship between individual abilities. This can be achievable if a new mentality is born, where, although everyone's autonomy and individuality are respected, individual abilities are mutually extended and are supporting the innovation downstream and upstream their own jobs.

It is known that, among all policies expressed during this decade, in order to ensure quality, the most appreciated was the one that lays in the foreground the client's satisfaction. In order to increase the quality and social efficiency of services, the managers of service providing companies must set as a main objective the permanent evaluation of client satisfaction and the awareness of the consumer's response to services provided by the enterprise.

It is obvious that, from the consumers' perspective, the decisive factor of satisfaction after service consumption is represented by its faultless performance. A service providing company, which offers an incomplete service, which does not keep its tempting promises, initially made in order to attract clients, makes mistakes that could have been avoided and which will persuade clients to loose their trust in their service offer (thus, diminishing their chances of gaining the reputation for high quality).

For service enterprises, the achievement of an impeccable performance and of a reliable service, leads to emphasizing the attachment of clients towards the company, due to the increase of their satisfaction degree, the

improvement of the service providing company's image and, at the same time, the amplification of their employees' degree of satisfaction and motivation²²¹.

Taking into consideration the fact that, the confidence in a particular service represents the prevailing standard used by the clients in assessing service quality, a strategy of social services can't trigger the desired effects if the service received by the consumer is not perceived as a trustworthy one.

The permanent preoccupation for creating a perfect service – a characteristic of excellence in service providing process – represents a difficult action, but not impossible to achieve by the service providing companies.

An efficient way of ensuring social efficiency of services implies the simultaneous satisfaction of the following conditions²²²:

- the complete awareness of consumers' expectations;
- providing the quality expected by consumers, by elaborating and respecting standards related to the quality of services:
- the efficient managing of resources involved in the process of service providing, among which, human resources are vital.
- the efficient communication with clients in order to ensure their loyalty and to develop a favourable image of the service providing company within the competitive environment.

Knowing the consumers' expectations

The process of creating reliable services places the beneficiary of these services in the middle of all enterprise decisions, aiming at orienting the activity depending on the needs and expectations that they are manifesting. All these information, together with the triggers which must be released in the consumer's behaviour, in order to ensure maximum satisfaction – an optimum level of social efficiency, respectively – can be established via marketing research. The constant and continuous elaboration of market studies and the intensive guidance upon the results of these studies, together with an efficient communication between the members of staff, that are connecting with clients, and management, will determine that the real expectations of service consumers to be correctly perceived by the management of the service providing enterprise.

Providing the expected quality by the consumers

Having correct representations upon the level of consumers' demands – upon the importance of service characteristics, in order to ensure the assessment of the its quality by clients, respectively – and upon the desired level of quality, the management of the enterprise has the ability of transposing the real expectations of the consumers in concrete quality specifications of services.

Defining clear objectives in the field of service quality – the decisive attitude of management towards improving the quality of the provided services, respectively – the adequate use of instruments, in order to ensure the standardization of the provided services, the elaboration of regulations as clear as possible, referring to the physical aspects of the service, but also to the immaterial ones, and the providing of the service in order to meet the level of expectations of the company's management (in compliance with the established quality standards), all these will contribute to respecting the company's commitment regarding the service providing with respect to expected conditions by the consumers.

Efficient management of resources

Among the resources that contribute to the service accomplishment, the human ones have an essential role. As the provider represents the enterprise of services before the consumer, being impossible to separate it from the provided service, it is obvious that, providing a quality service implies the involvement of the staff in the service providing process, and their adequate professional training. The service provider must possess the ability and also the desire of carrying out the service expected by the consumers, and this performance can be achieved by those service providing companies who pay careful attention to human resources management. The efficient management of human resources implies the elaboration of an adequate policy regarding the selection and employment of personnel, continuous professional vocational training of employees, an attractive system of motivation of human resources, team-work encouragement, ensuring a favourable framework of internal and external communication, and last but not least, the creation and development of a strong organizational culture. By recruiting, training and maintaining the staff of the enterprise in job positions which will ensure the exploitation to the highest degree of their working competences and ability, and, at the same time, their adequate motivation – which will provide them a professional and financial satisfaction – the management of the service providing company will benefit from a quality personnel, which will carry out exactly the expected service by the consumers.

In this context, we consider that the motivation of the staff represents a vital element for ensuring the providing of services to the highest quality degree: therefore, the members of the working staff must be recruited in order to fit the job description as more as possible; the working conditions must stimulate the excellent professional activity of the employees; personal achievement must be facilitated; supporting the members of the staff in their actions which

²²¹ Bruhn, M., Orientatin Towards Clients – the foundation of a successful business, Economic Publishing House, Bucharest, 2001, p.159.

²²² Ioncică M., Service Economy, Uranus Publishing House, Bucharest, 2000, p.237.

will contribute to quality improvement becomes essential; the progress of the service providing personnel in terms of professional career must be defined.

The triggered conclusion becomes obvious: an adequate personnel policy – the efficient management of human resources, respectively – represents the key of complying with the promises made by the company regarding the quality of rendered services.

Regarding the role of *material resources*, we must mention that, in order to achieve performing services, it is necessary:

- to provide quality equipments and their efficient management within the process of service accomplishment;
- to use new techniques and high technologies in order to have the equipments improved and the services automated, but only if they are accepted and agreed upon by the consumers (thus, contributing to the increase of clients' satisfaction). For this purpose, we must specify that, in certain fields of services, the interaction provider consumer becomes decisive, and, in consequence, the implementation of new technologies is not efficient. Or, in some cases, the technical solutions proposed by the service providing company can be rejected by their consumers or even by their own employees.

Efficient communication with clients

It is obvious that, in order to meet the consumers' desires and expectations, the main condition is to communicate with them. Via an adequate, constant communication, many problems can be solved or avoided, thus, increasing the level of consumers' satisfaction.

An efficient communication with clients is meant to:

- *inform, educate, facilitate comprehension* by clients of *services* provided by the company – where and when they can purchase these services, at what price, whom they can contact in case they need it and, especially, about the benefits arising from their purchasing (thus, contributing to creating a favourable image of the service providing company among consumers);

- *persuade* the client segment set as target, that the best solution for satisfying their needs is that specific offer of the respective company, and not the one provided by the competition;

- *mention* to their actual and future consumers the entire offer provided, thus, persuading them to buy; as the consumers` expectations are also influenced by the advertised promises made by the company, we must specify that, they shouldn't overrate the quality degree of the company's offer, on the contrary, they must render its real profile;

- *keeps permanent contact* with actual clients, by providing them with useful data and information in order for them to benefit to the highest extent, from the offered and services, in compliance with the buying needs and behaviour of every single client;

- ensure the loyalty and win the client's trust, establish long-term preferential relationships, by providing services at a superior level of expectations of the made promises, thus, satisfying the consumers.

We think that, an efficient communication with consumers, by developing an adequate inter-relationship system, leads to the fulfilment of consumers' expectations, but also of the long-term interests of the company. By respecting these requirements, the service providing company manages to remove those 5 recognized insufficiencies as reasons for consumers' dissatisfactions and which can influence in a negative manner, their perceptions upon the quality of the provided service (the discrepancy between clients' real expectations and their expectations as they were perceived by the enterprise's management, the discrepancy between the clients' expectations perceived by the management and their implementation in quality specifications of services, the discrepancy between the quality norms and the effective quality of services provided to clients and the company's communication to clients upon the provided services, the difference between clients' expectations upon services and the actual perception regarding the provided services²²³).

The triggered conclusion becomes obvious: the increase of service efficiency in relation to the consumers' demands implies, on behalf of the service providing company, the acknowledgement of potential reasons which might cause the occurrence of potential problems and the adoption of managerial decisions which will determine their avoidance.

The complexity degree of the reliable service represents a real challenge – but not an impossible one – for service providing companies who aim at reaching the faultless objective and implies the service providing process without errors, in due time, and also being aware and understanding the subjective standards of the consumers and entirely conforming to them.

What Romanian managers must do nowadays, and unfortunately very few manage do it, is to start looking at their own employees as the company's most important "assets", to pay careful attention to relationship and loyalty-oriented programmes, interactive marketing and client data bases, customer relationship management.

-

We reckon that, at present time, the most important strategic assets of commercial companies are represented by their clients (in specialty literature, the acronym MCSA is used for the concept of Managing Customers as Strategic Assets), from at least the following reasons:

- actual customers represent an extremely important resource in future sales increase, a stable and predictable resource to a certain extent;
- customers can be efficiently managed, as we already possess a data base referring to their buying and consumption behaviour, which makes them vulnerable to advertising actions;
- however, customers are subject to depreciation, because companies with new products permanently occur on the market, sometimes more performing, not to mention the demographic changes which influence the customer data bases (age growing, regional or local demographic changes, affecting the volume of sales);
- the clients' portfolio represents an asset which can be exploited when selling or merging companies.

In our opinion, nowadays, the greatest challenge for companies who perform their activity in the field of commerce and provide sales support services, consists in conforming to the laws of the market – the increase of efficiency, respectively, simultaneous with maintaining or even improving the quality degree.

STRATEGIC MANAGEMENT – CASE STUDY: THE WATER SUPPLY SYSTEM IN GREAT BRITAIN

Sabie (Abăluță) Oana

Bucharet, Academy of Economic Studies Faculty of Management Calea Serban Voda, nr. 22-24, sector 4, Bucuresti E-mail: oana maty@yahoo.com Phone: 021 3354653

A range of alternatives are available to water companies in the UK (United Kingdom) for reducing future water supply deficits, each having different implications in terms of environmental impacts (both positive and negative), level of service provided to customers and associated costs. This paper presents the results of two choice experiment valuation studies in the south east of England, in which water supply problems are considered. Further to the specifics of the individual scenarios, these studies lead to more general observations relevant to the future evaluation of water supply options.²²⁴

Keywords: water supply, public services, focus group, analysis

JEL code for paper: Z Other Special Topics

During a study visit at the University of Newcastle upon Tyne in northern England I have participated in a series of meetings which aimed to identify consumer preferences on the options / alternatives for the water supply by combining multiple methodologies.

Currently companies supplying water in the UK have a number of alternatives for preventing possible shortages of water resources in certain areas and seasons. Each alternative presents certain advantages and limitations that affect the environmental impacts, costs associated and the level of service provided.

The paper summarizes the results of two surveys on consumer choices regarding the availability of paying additional costs for the service delivered. In terms of specifications possible scenarios, this leads to general observations relevant for future evaluations of options for supplying water, as follows: to maintain and ensure the present level of service delivery is an opposition to pay for any improvement in safety for the supplies and service, in contrast, recipients of service are willing to pay more to prevent negative impacts on the environment.

To investigate the content and validity of these principles was that a survey company and representative sample consisted of distributing questionnaires to several focus groups.

Survey results were the foundation of research in order to improve them.

1. Establish methods of research

The most commonly used assessment is contingent achievement involving a hypothetical transaction to maximize a specific policy in the investigation. Processes contingent valuation focuses on assessing a specific scenario that promote a possible change in service quality and the environment. Given these issues is mandatory for researchers to accurately and fully inform beneficiaries of the service specification on the possible scenarios in order to identify the exact preferences of the latter.

It recommends implementation of an evaluation by sequential use of alternative methodology consisting in identifying attributes and service levels provided to them. The best known approach is the use of profiles to describe the goods or services analyzed. Profiles represent levels of particular attributes that characterize the consumer receiving service.

2. Options assessment of water

Complex assessment methods are becoming more frequently used to identify consumer preferences on the options of water. For example, contingent evaluation has been used widely in water supply industry to measure the reliability of service. Moreover, evaluation contingent and other alternative methods have undergone changes in their contents, thus being able to estimate / detect the availability of consumers to pay the costs of water supply in terms of conservation and environmental protection.

Results of studies suggest that recipients are willing to pay a small amount, but not unimportant to improve the reliability of water supply and to reduce negative environmental impacts.

Water companies in south east England have developed management plans for resources which compare forecasted demand with the current level of demand for water, under several scenarios.

These plans formed the foundation for the development and implementation of water resources in south eastern England under the Environment Agency. The case studies presented below highlight some problems arising during the implementation strategy, the problems that are solved in a better collaboration between service providers and beneficiaries. Techniques and methods of economic evaluation can provide information about consumer preferences and this helps in improving the management of water resources.

_

²²⁴ This paper is a parte of IDEI 1780 project financed by NURC

3. Case study number 1 - Risks relating to the transfer of water resources

One of the basic principles established by the strategy of water resources refers to the need to transfer water from areas with surplus to areas facing shortage during the dry season. In this variant had to resort before opting for any other alternative (water reservoirs).

In the area of Sussex in south east England local water companies forecast that will face major shortages of water supply in dry years.

At the same time have been identified in other areas of additional water resources. To eliminate the risk of significantly reducing the water resources, and hence the emergence of temporary incapacity provision of water services to the proposed transfer of water from surplus areas to areas facing a shortage of water.

This option was considered in the context of the strategy of water to the region becoming favorite strategic option for services respecting environmental standards.

After some experiments have identified a potential risk regarding to the transfer of unwanted species in the basin for collecting water from the Sussex area. Of all the species identified, two of them were classified as dangerous, which is why they were included in the analysis and risk assessment of adoption of these decisions.

Crassulla helmsii plant is an aquatic parasite (intruder) and Ergasilus sieboldi is a bacterium / parasite a specific fish.

These endangered species of aquatic life of rivers and Rothera Wallers Haven, and the land on which they were drained (Pevensey Levels and Romney marshes). These contaminated areas are not currently Crassulla helmsii, although fish from the river is infested with the parasite Rothera Ergasilus.

Crassulla develops into a rapidly and destroy aquatic flora. Once he has made presence felt this plant is difficult exterminated, especially during the winter that it is not frozen.

The presence of bacteria in fish does not affect in any recreational activities on water courses and areas supplied from these rivers.

At the time of adoption of the measure to transfer the water could not make a more precise estimate of operating costs. All these deficiencies have led to use the method with several variants / scenarios, which method is more flexible than the assessment quotas.

Following the use of appropriate methodology to successfully identify the best scenario. Final solution was to transfer the necessary water resources, leaving them the possibility of beneficiaries to choose between several different prices.

4. Case Study number 2

One of the possible ways to resolve the imbalance of water in western Sussex area consisted of "Hardham Artificial Reharge Supply. Considered that when demand for water exceeds the deficient supply of the necessary quantity of discharge water during the events of rye in the conservation of the environment.

In the winter months is an artificial regeneration of water resources that have been discharged from the aquifer during the summer, through capture of a nearby river. Water shall, except chloriding, fully treated before going back in the aquifer.

After some mathematical calculations and analysis of cost-benefit has reached the following results:

- Beneficiaries of the service are willing to pay an additional cost of more than 10 pounds per year to prevent the multiplication of plant parasite;
- The beneficiaries are willing to fund in addition to approximately 18 pounds per year bacterial parasite destruction in fish.

In conclusion, this paper presents results of two experiments conducted as a case study in south east England area facing problems with water in the region. Beyond the specific scenarios presented, these case studies led to several general observations relevant for future assessment of the options of water. For example, at the current level of reliability to provide the service consumers are not willing to pay additional costs for new investments, but consumers are willing to pay higher fees for providing this service in order to prevent negative impacts on the environment, and to a more generally, the beneficiaries are willing to pay for the operations of water supply which would lead to the conservation and improvement of the environment, although this depends on the type of improvements taken into account.

More to explore the meaning and validity of these principles to appeal to an experiment that targeted consumer options, options that were studied using the analysis of the resulting distribution of questionnaires to six focus groups. The results provide qualitative support for preliminary observations, suggesting that beneficiaries are satisfied with current levels of provision of quality service and have a preference for environmental protection and not for improving the service (quality of investments). Taking into account the environment and improving environmental factors, it was found that participants in these focus groups could see the importance of the strategic management on environmental protection.

This paper categorizes and presents some of the most important business opportunities in Maramureş County, a county that is quite isolated from the rest of the region and from the Pan-European Corridors but nevertheless has good development potential in tourism, agriculture and industry. Any territory should be able to identify itself by its perennial values. It is necessary to identify the brands that are representative for Maramureş County and to advertise them.

Keywords: Maramureş, entrepreneurship, industry, agriculture, tourism, brand

M: Business Administration and Business Economics; Marketing; Accounting

1. Introduction

In Maramureş County underground resources can be found in limited quantities, a situation which makes the existence of well-developed trade flows with other regions necessary in order to support economic activity. The poorest are the energy resources (coal, oil, natural gas), that are intensely exploited nowadays by the national economy and are far from satisfying needs. Other resources, however, are well represented:

- complex and gold-silver ores (in the Oaş-Gutâi-Ţibleş-Rodna area) equaled, at a the national level, only by the resources of the South-West Region;
- bauxite (in Pădurea Craiului Mountains and Bihorului Mountains), the region emerges at a national level;
- salt (in Maramures Depression), in considerable quantities;
- building materials, such as common limestone, marble, (in Viştea), kaolin (in Pârva and Aghireş), refractory clays (at Şuncuiuş), etc.

The share of land planted with cereals is very high (58.41%), even if the conditions of soil and climate are not favorable. In our opinion it is necessary to extend the land planted with sugar beet, oleaginous plants, tobacco, medicinal plants and other plants with high yield (vegetables and legumes, especially peas). Obviously, to support a strong livestock sector, fodder crops should reach at least 35% of the cultivated area.

Fiber plants are, in this context, a priority for the region, from at least two reasons:

- the region presents excellent climate and relief conditions for the cultivation of flax and hemp;
- increasing the cultivated areas is a sine qua non condition for the development of the textile industry, being the only option for a certain branch of the clothing industry that will refocus towards production under own brand name, making use of indigenous raw materials.

Another advantage is in the fruit industry. Also, Maramureş is among the first counties in terms of forest area, thus the opportunity for forestry. Forests are an important asset for the region, both in terms of raw materials and for the secondary activities of wood processing. However, there is a risk of deforestation as a result of irrational wood exploitation.

The development potential of Maramureş County is expressed through:

- possibilities for development of traditional craftsmanship (in metal, wood, wool);
- rich ethnographical content, that can help promote tourism;
- the existence of several universities in Baia Mare, providing superior qualification of the workforce (the university center Clui is nearby):
- Maramureş County is well known internationally for rural tourism, for original peasant folk art and culture and for unique monuments (Săpânța, Moisei, Şurdeşti).

Unfortunately, Maramureş is unfavorably positioned relative to the internal market, as it occupies a quite isolated position, far from the capital and from the pan-European corridors.

But there also are many opportunities that can stimulate entrepreneurs to start a business in the county because of the fact that demand is not satisfied for a whole range of products.

Any territory should be able to identify itself by its perennial values. It is necessary to identify the brands that are representative for Maramureş County and to advertise them by local, national and international media. Thus, one can consider the following aspects as regional brand candidates:

- Maramureş the civilization of wood.
- A certain black rock, typical for Maramureş andesite.

- Maramures tourism and history.
- Eco-Maramures proposed as a brand according to policy on ecology.

As a conclusion, the goals set should converge towards developing a common language for describing Maramureş County (according to its brands) and improving its image – improvement that would have a positive impact on the economy.

2. Opportunities-Presenting Fields from an Entrepreneurial Point of View

According to Maramureş County Development Plan 2007-2013, the following economic fields have priority:

- information technology and connected activities;
- machinery and equipment industry;
- agriculture;
- hotels and restaurants:
- furniture production;
- research.

Also, Maramureş County opted for a poli-centric model of development, emphasizing economic growth based on functional territory specialization. As a consequence, territorial planning units (TPU) – that correspond to areas where there are consistent characteristics and functionality throughout the area – have been identified in the county, The TPUs comprise several administrative units (communes and cities) without necessarily taking into account county boundaries.

2.1. Industry

According to natural resources availability and development potential, the following industrial branches have priority in Maramures County:

- machinery and equipment industry;
- clothing industry;
- furniture industry;
- food industry;
- wood industry;
- research.

Areas with the greatest investment, turnover and staff are manufacturing, wholesale and retail trade, repairing of motor vehicles and personal and household goods.

The following strategic goals were identified in Maramureş County:

- providing the infrastructure needed for the investor's activities;
- supporting small and medium enterprises as a local development engine, improvement of horizontal collaboration, establishment of clusters, creation and development of original products;
- supporting the establishment and development of business incubators;
- promoting research and innovation activities in the technology field and creating technology development centers (techno-parks);
- promoting imports that carry technological value, with the ultimate result of accumulating technological know-
- eliminating the raw material exports and supporting exports that carry technological value;
- eliminating the lohn cases and enhancing creativity and innovation for own creations.

2.2. Agriculture

Agriculture plays an important role in the county's economy, in the following aspects:

- agriculture uses about 65% of the county's land and about 50% of the population are employed in agriculture, with a tendency of the population to move from the urban back to the rural;
- it provides over 40% of the cereals and almost 100% of the potatoes, fruits, meat, dairy and other food products used by the population.

Maramureş County's territory has natural assets that are favorable for development of agriculture (as a complex economic function). The following are the prevalent branches of agriculture in Maramureş:

- animal husbandry and animal production;
- cereal and technical plants production;
- fruit farming.

Corresponding to the three main branches of agriculture characteristic to the county, there are three developing industry branches – the ones dealing with the animal products (milk, meat, leather), with the technical plants (oleaginous and fiber plants) and with fruit.

Directly assuming and applying in the county's agriculture the regulations existing in developed countries or recommended by international organizations, without taking into account tradition, local specificity, professional qualifications, material base and, most of all, the mentality of the farmers or land owners has lead to obstacles that

have to be overcome for the sake of stability and durability in agriculture. Agriculture in Maramureş Country is, actually, quite far from meeting the three capital demands:

- ecologic not to be polluted or polluting;
- economic to provide a decent living standard for farmers/rural population;
- social to produce, in sufficient quantities, with quality level meeting the required standards and at prices accessible to the population, food products that are vital to the consumer masses; the social effect also has to reflect in employing the workforce.

Thus, we differentiate the following county strategic goals:

- development of the agriculture and forestry sector, so that they become competitive, dynamic and adapted to the economic environment;
- correlation of the production with the demand and with the industrys processing ability;
- diversifying of income generating activities in the rural environment;
- safeguarding the quality of the rural environment, supporting the activities that provide balance between human life and natural resource preservation;
- raising the life standards in the rural environment for attracting the workforce and for providing social development on a long term;
- providing a competitive environment, based on private initiative;
- implementing development models based on communitarian association that aim towards supporting local economic activity.

2.3. Tourism

To support tourism development in Maramureş County, a measure plan was devised, with the following strategic priorities, organized according to the fields that it covers:

- in the field of touristic infrastructure:

- establishing tourist information centers;
- rehabilitating the roads to areas of touristic interest;
- recuperating and marking of touristic trails in the mountain areas;
- organizing themed touristic circuits;
- developing recreation, leisure areas and sport grounds;
- rehabilitating historic centers, museums and archeological sites:

- in the field of sustainable development:

- creating public-private partnerships for investing in the touristic field;
- securing close collaboration between administration, local communities and professional
- -communities that are involved in tourism;
- making the most of the natural reservations by including them in the touristic circuits;

- in the field of touristic marketing:

- producing of promotional materials;
- creating and maintaining of a unique, original image (touristic logo);
- participating in national and international fairs and exhibitions;
- organizing of festivals and fairs;

- in the field of human resources:

- increasing the quality of services by organizing courses for the personnel employed in tourism.

3. Favorable Moments

3.1. European Financing Opportunities and Local Opportunities

Pre-accession funding (PHARE, ISPA, SAPARD) was available in the pre-accession period. Structural and cohesion funds have been available since 1 January 2007 (the date of Romania's accession to the EU). These financing sources bring considerable opportunities.

During the 2007-2013 programming period Romania will benefit from an amount of 19 667 million Euro from the Structural and Cohesion Funds of the EU. From these, 3 726 million Euro will be allocated to the Regional Operational Program (ROP).

The financing sources for ROP are: the European Regional Development fund (ERDF) (3 726.02 million Euro), national public funds (657.56 million Euro) and private funds (184.76 million Euro).

The eight regions will benefit, through POR, from an amount 4 436.83 million Euro, representing the contribution of the European Regional Development Fund and the national contribution (public and private). Also, the regions will benefit from Technical Assistance funding, amounting to 131.51 million Euro for the implementation of the whole program. These amounts have been distributed to the eight regions based on their development degree, as we can see in Table 1:

Table 1. Funding distribution for the eight developing regions

Region	Funding distribution for the 2007-2013 period		
Kegion	(Mil. Euro)	%	
North-East	724.09	16.32	
South-East	587.88	13.25	
South	631.36	14.23	
South-West	621.60	14.01	
West	458.77	10.34	
North-West	536.41	12.09	
Center	483.62	10.90	
București-Ilfov	393.10	8.86	
Total	4 436.83	100.00	

Source: Regional Operational Program 2007-2013, Government of Romania, Ministry of Development, Public Works and Housing, Bucureşti, June 2007

The highest amount will be absorbed by the North-East Region and the Bucureşti-Ilfov Region will absorb the lowest amount. The North-West Region, the one that Maramureş County is part of, is on the fifth place.

Together with the European financing sources there are other opportunities, like, for instance, the business incubators.

In Maramureş County, during 1997, The Development Centre for Small and Medium Sized Enterprises Maramureş proceeded to establish such a Business Incubator in Baia Mare and completed the implementation in 1999, with the aid of PHARE/FIDEL financing.

3.2. Business Ideas for 2009

Having the world economy crisis as a background, talks about business opportunities are quite reserved. However, opportunities are linked to the fields that can obtain stable financing, either from European funds or from the state budget.

Due to the specificities of Maramureş County one of the development possibilities could be the high touristic (balneary, cultural, sightseeing, hunting) potential – Vişeu area, Iza area, Cosău-Mara area, Tg. Lăpuş, Sighet-Tisa, Cavnic-Baia Sprie, Izvoarele, etc. because of the following aspects:

- interest from tourists and tour operator networks;
- increasing domestic and international interest in agro-tourism;
- interest for cluster development;
- agro-tourism offers a viable development alternative for rural zones to subsistence agriculture and declining industries (mining);
- the existence of certain European (EAGGF European Agricultural Guidance and Guarantee Fund) and government financing sources.

For this reason, in Maramureş County there are quite good possibilities of business development in tourism (rural tourism included) – tourism has grown in time and will continue to grow. Many lodging facilities for tourists have been built in the most beautiful areas of the county, in places where traditions are kept. For example in Ocna Şugatag many hotels, motels and villas have been built to meet the ever-growing demand. So any business idea that is linked to tourism, in Maramureş County, is an opportunity for any entrepreneur.

There also are business opportunities linked to the winter sports field – providing services to the people taking a vacation in the mountains, in the cold season: lodging, food, sports counseling and support, leisure activities.

Another development possibility could be given by the existence of certain craftsmen that are willing to pass on their craftsmanship knowledge to the young generation (in Moisei, Bârsana, Valea Izei, Ocna Şugatag, etc.) through:

- opportunities of participating in fairs and international exhibitions;
- demand for traditional products on external markets or from tourists.

In the end, we suggest the following business opportunities: waste recycling, furniture factories on a small scale, housekeeping services, child and patient care, event organizing, catering, fish farming (especially in touristic areas), quarries (especially now that certain building materials are necessary for strengthening the infrastructure).

This article is a study carried out within the company CATALI SHOES of Piteşti concerning the production capacity and the situation of the costs of this organization. S.C. CATALI SHOES S.R.L. is a dynamic company which continuously developed its production capacity during the 15 years of activity and which proves to be highly professional in managing costs and profit margin.

Key words: production, costs, analysis, S.C. CATALI SHOES S.R.L

Jel Code: M20

1. Introduction

In the specialty literature cost is defined as a sacrifice made with the purpose of holding a product or a service. This sacrifice is measured using the amount of money spent, the transferred property, the offered services etc. In the management accountancy cost is defined as follows²²⁵:

- the amount of money spent for producing or buying a good, for carrying out a work or for delivering a service; a resource sacrifice;
- a synthetic indicator by means of which we characterize the quality and efficiency of the economic activity.

Florica Badea defines cost as :"all the expenses made for carrying out the production process (personnel and materialized work expenses) represent the production cost of an industrial production unit; this economic category is obtained after carrying out a certain production volume and emphasizes the fixed assets use efficiency degree"226. Managers and organizations need information related to costs for the main management activities such as 227:

- Planning- in order to know to what level we need to reasonably set the future expenses;
- Control- so as to identify costs that cause expense exceeding so that we can pay attention to them;
- Elaborating decisions- so as to decide what price we should ask, for instance, for providing certain services, by knowing which are the costs engendered by them;
- Administrative responsibility- so as to be able to justify the expense purpose so that the financial statements be able to offer a real and correct image of the organization to those persons from outside and from within the company who are interested in its functioning.

2. OVERALL PRESENTATION OF THE COMPANY CATALI SHOES

CATALI SHOES PITEŞTI is a limited liability company which has been set up according to law 31/1990 republished, with the prior modifications and completions.

S.C CATALI SHOES S.R.L. was set up in 1994. According to the company articles of association, the main object of activity consists of: production and purchase in order to industrialize or semi-industrialize finished products resulting from manufacturing lether shoes; services – shoe repairs; wholesale and retail trade through its own stores, through stores belonging to other companies, in fairs or in other especially designed places.

The secondary activity (building works) consists in building a dwelling building Ground floor + 6 floors. This project is situated in a residential area of Piteşti – Găvana district, on a piece of land having an area of 2.676 sq. m. in Ion Minulescu street. The area is considered to be one with real estate development potential. The location has all the necessary utilities being integrated in the city utilities and energy network.

In the begining S.C. CATALI SHOES S.R.L. had a small number of employees who worked in rented premises; the production process related to the cutting and pulling activities used to be made by hand so the production level was quite low – approximately 50 pairs/day.

During the last 5 years the company had an explosive development and the production got ten times bigger in this period.

S.C. CATALI SHOES S.R.L. Piteşti has an organizational chart which correspond to the company needs as we can see below in table 1.

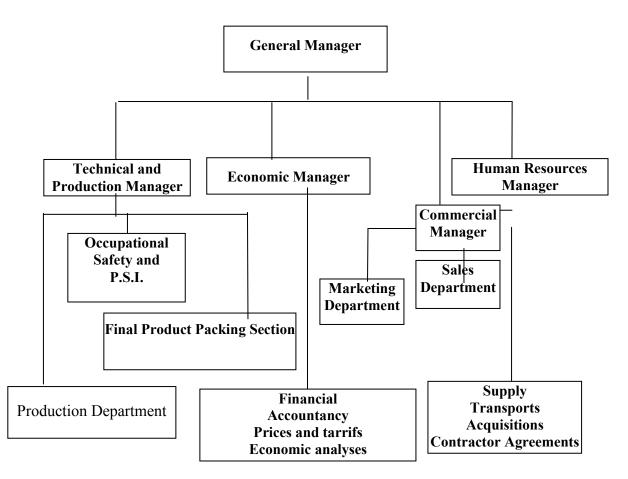

Image 1. Organizational chart of S.C. CATALI SHOES S.R.L

Source: S.C. CATALI SHOES S.R.L.-Human Resources Department

The company has a total number of 110 employees distributed as in table 1.

Table 1: Personnel Structure.

Personnel category	Number	Share
Total	110	100%
Out of which:		
Management / TESA Personnel	15	13,6%
Productive stuff - Total		
Out of which:		
- directly productive	95	100%
- indirectly productive	-	-

Sourse: S.C. CATALI SHOES S.R.L.-Human Resources Department

CATALI SHOES is among the most significant Romanian companies that produce shoes and in continuous course of development and modernization.

The products manufactured by the company are sold both on the internal market (300 clients) and to the export - Portugal, Sweden, Spain, Hungary, Croatia.

The materials necessary for production come from Romania or are imported – Italy and Turkey. The company has its own distribution system through which we sell 60-70% of the manufactured products.

From a functional point of view, the entire activity of S.C. CATALI SHOES S.R.L. is managed by the General Manager (unique associate).

The unit has specific premises for production, storing and internal services in its own building which was first used in 2002, having a production capacity of 12.000 pairs/month.

The production process was retechnologized in 2001, 2002, 2003 through the acquisition of new imported technological equipment (Italy and Checz Republic).

3. PRODUCTION CAPACITIES AND TECHNOLOGICAL ENDOWMENT

The production capacity in physical units is of 15.000 pairs/month.

At present, the production activity and the annexed activities are carried out in its own buildings which dispose of all the necessary utilities for the correct functioning of the activity.

The company is endowed with fixed assets necessary to the production activity in the specific field, represented by:

- technological equipment and machines;
- special plants;
- transport means;
- other household inventory means.

The production process is carried out in a mechanized form and the three main activities: cutting, sewing, pulling-soling-finishing are situated in distinct workshops. The three workshops are endowed with modern equipment purchased within the last 2 years from import – Italy and Czecz Reppublic (Molina-Bianchi, Durkopp-Adler, Minerva) their total number raising to 70.

The company also has its own transport park which includes four ware transport vehicles and also a mechanical workshop where we do the cutting knives as well as the current and capital repairs of the equipment.

The production activity is organized on workshops and is coordinated by employees having specialty diplomas. The economic-administrative activity is divided into departments: acquisitions, sale, transports, financial-accunting, personnel, administrative and is also coordinated by employees that have specialty diplomas.

The manufacturing technologies used for the main activity which is shoe production are classical, they present the advantage that they are relatively simple but they depend on human operators and on the quality of the operations performed by them. The fluency of the operations carried out by the company ensures the fact that the used technologies are in accordance with the specific fabrication requirements and the position on the market specifies the fact that the products are of quality.

The technological flow supposes:

- 1. Preparing the production: participating in fairs, exhibitions and specific manifestations, prospecting the market; own creation modelling, model selection.
- 2. The fabrication process:
- The cutting operation an operation carried out by means of specialized equipment (cutting devices) we produce the shoe faces;
- Pulling and soling mixed, manual operation carried out with specialized equipment (presses and rotating machines) an operation through which we apply and fix the product sole;
- Finishing shoe finishing operation through external uniformization operations, wax and polish application, final finishing;
- Final checking, storing.

4. COST ANALYSIS

The analysis made based on the average price calculation to men shoes revealed the following structure:

Table 2: Cost Structure at S.C CATALI SHOES S.R.L.

	%
Raw material	68.40
Consumables	3.90
Energy	1.00
Direct and indirect labour	13.60
Equipment amortization	1.60
Transport and third party services	5.00
Other direct and indirect expenses	6.50
The share of direct expenses in the total production cost	84.50
The share of the indirect expenses in the total production cost	15.50
Average profit cost	18.00

The production price is set based on the price calculations and production reports, the final sale price being adjustable from profit shares for placing within the market margins, according to the specific market manifestations.

The market prices are set based on the market conditions as they represent a significant element as compared to the specific product consumers.

As we can notice from the structure, the production cost is dominated by the expenses related to raw materials and consumables, with a share of over 72%.

Taking into account the fact that the company has an equilibrated policy concerning stocks (the company only purchase raw materials in direct correlation with the orders for finished products and with the production program), it comes out that it is easy to hold control over the production cost structure as compared to the production program.

The second element with a share of **13.60%** is labour expense, the direct labour obtaining a pourcentage of 80% in the structure from the total labour (including expenses with meal tickets granted to the employees).

Comparing the production cost to the value of the finished products in a normal production month, determined based on the average sale price indicated an average profit margin of 18% (a value comparable to the result of the gross margin determined in the financial analysis for 2008).

The policy of the analyzed company, of adaptation to the market events and price level engenders a significant support of the sale policies and reveals the existence of a performant management which is very aware of the economic environment. The stock policy adopted by the bussiness managers is coherent; also we can notice the correlation of the production program and implicitly of the purchase program with the orders which offers a direct control of the production costs and implicitly flexibility as compared to the market conditions.

5. Conclusions

After the study carried out at CATALI SHOES the following things came out:

- S.C CATALI SHOES S.R.L. was set up in 1994, having as the main object of activity: production and purchase in order to industrialize or semi-industrialize finished products resulting from manufacturing lether shoes; services shoe repairs; wholesale and retail trade through its own stores, through stores belonging to other companies, in fairs or in other especially designed places.
- Raw materials necessary for the production are purchased from Romania or are imported from Italy and Turkey.
- The products are sold both on the internal market (300 clients) and for export Portugal, Sweden, Spain, Hungary, Croatia.
- The company is endowed with fixed assets necessary to the production activity in the specific field such as: technological plants and equipment; special devices; transport means; other household inventory means.
- The production process is carried out in a mechanized form and the three main activities: cutting, sewing, pulling-soling-finishing are situated in distinct workshops. The three workshops are endowed with modern equipment purchased within the last 2 years from import Italy and Czecz Reppublic (Molina-Bianchi, Durkopp-Adler, Minerva) their total number raising to 70.
- The production cost is dominated by the expenses related to raw materials and consumables, with a share of over 72%.
- The company has an well-balanced policy concerning stocks (the company does not purchase raw materials but in direct correlation with the finished products orders and with the production program); as a result it is easy to hold control over the production costs structure as compared to the production program.

THE EFFECTIVENESS OF IMPLEMENTATION MECHANISMS FOR WASTE MANAGEMENT STRATEGIC OBJECTIVES IN ITALY

Stoian Marian

Academia de Studii Economice din Bucureşti Facultatea de Management, Catedra de Administrație și Management Public Calea Șerban Vodă, Nr. 22-24, Sector 4, București stoimaryca@yahoo.fr 021.335.46.53

The working paper present from a pragmatic perspective, the main levers by which the Italian authorities were able to successfully implement of modern waste management systems as a result of the necessity to compliance with respective communitarian acquis.

In the beginning essential details are given of the legislative framework that has established the major waste management principles and strategic objectives. Then are considered the mechanisms by which they were implemented forecasted targets, putting a special emphasis on specifying concrete results reached in order to demonstrate the solutions and instruments effectiveness which the central, regional and local authorities have resorted to ensure achievement of objectives and standards on waste management.

Keywords: waste management, economic instruments, implementation strategy, effectiveness

JEL Classification: H23, H31, Q53, Q58

Italian waste management legislation

Waste management is covered in Italian law by Legislative Decree no. 22 of 5 February 1997. Through this legislation three major European Directives have been transposed into national legislative framework: the European Directive 75/442/EEC on waste and waste management, the European Directive 91/689/EC on hazardous waste and the European Directive 94/62/EC on packaging and packaging waste.

Adoption of the decree allowed the implementation of integrated waste management in accordance with the principles and objectives contained in the European Strategy on Waste, which has involved a general reforming of the Italian waste management system. Clean technologies were promoted for waste treatment and disposal and specific voluntary agreements between local authorities and waste operators in order to provide viable opportunities for recycling and a modern infrastructure necessary for urban waste recovery and disposal was created.

Regulations established by Legislative Decree no. 22/1997 have configured the urban waste management system based on prevention of their generation and energy recovery from waste treatment, vision shared by the national and local waste management plans too. At the same time the decree established measures to encourage the construction of waste incinerators for significant reduction of municipal waste quantities disposed of by landfilling; the incinerators were equipped with advanced systems for energy recovery has priority for funding.

To stimulate the waste prevention and recovery of household waste, Legislative Decree no. 152/2006, which repealed the Decree of 1997, governs a series of tax incentives that encourage voluntary agreements as instruments of particular importance for waste management hierarchy of waste treatment and disposal solutions.

Legislative Decree no. 152 of 3 April 2006, entered into force on 29 April 2006, repealed the previous Decree of 1997, including all the principles, objectives and previous estimates on waste management and introducing a number of significant changes on the vision of mechanisms and methods by which the new European waste management standards can meet.

From 1 January 2007 the decree canceled waste management tax based on the area housing and initiated a new tax calculated according to the polluter pays principle. The new way for tax calculation is based on the PAYT and takes into account first, the amount of waste generated by a household and, on the other hand, the quality of waste management services provided by the municipality. PAYT²²⁸ or "pay-as-you-throw" is a collection system for urban solid waste in which households are charged according to the amount of waste that we produce. The method allows encouraging recycling and decreasing waste recoverable quantities generated. The fee is levied depending on the number of bags or containers emptied by the operator who collect the waste.

According to the decree, the budget for sanitation activities and urban waste collection should be covered progressively to 100% of tax revenue collected from waste producers for delivered services. Thus municipalities were encouraged to develop mechanisms and methods throughout more strictly revenue and expenditure for urban waste management were accounted.

_

Decree 152 of 2006 also sets interim evolution targets for urban waste selective collection systems at local level. By the end of 2006 the implementation rate of selective collection had to be 35%, to reach 45% by the end of 2008, with a maximum of 65% until 31 December 2012.

Waste management implementation strategy in Italy

For the implementation of strategic waste management objectives and under the provisions of paragraph 1 of Article 5 of European Directive 31/99/EC on waste disposal, Italy has developed a National Strategy which aims to reduce the amount of biodegradable waste disposed of by landfill. The strategy states witch are the subcategories and types of waste that falls within the biodegradable category, setting specific goals and targets for reducing them, in accordance with Decree 36 of 2003 on waste disposal. The document describes some tools and measures that must be adopted to meet with summary presentation of the results obtained in 2002 in this area.

Taking into account the regulations of the decree on waste disposal, the strategy presents like a necessary requirement the regional authorities obligation to formulate a coherent strategy for reducing biodegradable waste quantities disposal.

National strategy for reducing biodegradable waste landfilled set²²⁹ that up on 27 March 2008 to reach a quantity of biodegradable waste generated less than 173 kg/capita/year. Threshold for 2011 was 115 kg/capita/year, and until 27 March 2018 should not exceed 81 kg/capita/year biodegradable waste generated. In the strategy are presented several instruments and measures that will help attain the objectives, for example:

- using economic instruments to discourage landfill as a form of final waste disposal;
- source selective collection for organic waste from urban waste composition, for waste wood and textiles;
- bio-mechanical treatment of waste;
- waste incineration in special facilities with energy recovery;
- establishment of landfill banning for certain categories of waste.

In Article 5 of the decree has provided a special requirement that within one year after the entry into force all the regions of Italy to develop and approve programs for the reduction of biodegradable waste disposed of by landfill. These programs had related with regional plans for waste management, previously established under Article 22 of Legislative Decree 22 of 1997.

Effectiveness of strategic objectives implementation mechanisms

Following the occurrence of Decree no. 22 of 1997 the Italian authorities have resorted to using a large variety of instruments to implement the waste management objectives. Under the "polluter pays" principle there are a number of economic instruments like environmental taxes or contributions that waste producers are required to pay to finance the management of waste resulted from its activities. These are established for producers of packaging, batteries, used oils etc.

During the 90's were established in Italy consortia with specific tasks for the management of certain categories of special waste. Consortium for Polyethylene Products Recycling was organized under Article 48 of Decree no. 22 of 1997. Article 47 of the same decree was a basis for organization and operation of Consortium for Used Oils Management. Article 9 of Law no. 475 of 9 November 1988 was established Consortium for Batteries Recycling. All these organizations operate as non-profit associations, being established on public-private partnership model with the mission to ensure the waste collection, recovery, recycling and disposal in a maximum security environment and human health conditions.

By Legislative Decree no. 152 of 3 April 2006 were systematically encouraged and promoted voluntary agreements, which have taken a great scale in recent years by the positive effects recorded at national and regional level and throughout the number and role of actors involved: the Ministry of Environment and Spatial Planning, local authorities, specialized operators etc.

Since 1996 the Italian authorities have introduced the regional tax on waste landfilling, with the specific purpose²³⁰ to fight and possibly reduce traditional waste disposal systems and to encourage the prevention, recovery and recycling. Beneficiaries are the landfills facilities administrators or waste incinerators operators witch are not equipped with recover energy performing systems.

Law no. 549 of 28 December 1995 for waste landfill fee regulation establishes a tax rate calculated according to household waste weight. For each of the three waste categories set out by law we have minimum and maximum limits (see Table no. 1). In 1996, the first year after the tax was introduced, the fee charged to the minimum threshold, it is valid if the regional authority has not previously utilized the tax on waste disposal.

229 According to data available on the official site of the Italian Ministry for Environment and Marine Territory, www.minambiente.it. 230 Laraia, R.; Paina, A.; Zatti, A, The application of the landfill tax in Italy, Superior Institute for Environmental Protection and Research, 2005.

Table no. 1. Tax limits for waste disposal in Italy, by main waste categories

Waste category	Minimum limit	Maximum limit
Industrial waste produced by minig, construction and extractive industry	1,03 €/tone	10,33 €/tone
Another industrial waste	5,16 €/tone	10,33 €/tone
Another waste categories (biodegradable waste, special waste etc.)	10,33 €/tone	25,82 €/tone
Incinerated waste without energy recovery; waste resulted after recycling, recovery and composting process; sludge and wastewater	20% of tax level	

Source: Superior Institute for Environmental Protection and Research, www.apat.gov.it.

Under the law, the revenue collected from charging can be used by local authorities for funding of environmental projects such as those aimed at waste prevention, encourage materials recycling and energy recovery from waste treatment, rehabilitation and upgrading of waste landfills sites or for funding regional agencies for environmental protection and establishment and maintenance of new protected areas and natural reserves.

Law no. 549 of 1995 provides that the regional authorities are free to determine the mechanism coordinates for waste disposal tax implementing. At regional level administrations can establish the tax level and the destination of the funds collected and may also determine which categories of waste are subject for taxation. There were cases in which some regions of Italy are covered by legislation important increases of the tax amount if it doesn't meet targets relating to selective collection implementation rates, established by Decree no. 22 of 1997.

Law no. 475 of 9 November 1988 was introduced nationally compulsory for green purchasing payments for certain goods; i.e. for a battery of 55 amperes-hour fee was € 0.83. Italian authorities sought to encourage waste collection and recycling by companies involving in a collection / recovery system for waste generated after the end of life goods witch they produced.

Consortia played the main role in this system because they were the direct beneficiaries of taxes levied. In 2005 the Consortium for Batteries Recycling spent € 24.6 million for waste recycling. The amount was recovered in the proportion of 56% from green tax collected for the purchase batteries and up to 44% from funds collected from waste batteries valuation.

Between 1992 and 2002 during the early perception of green taxes, has been increased by up to 38% of the batteries collected quantities. Thus, for example in 2003²³¹ were collected 183,422 tones of waste batteries of which have recovered 8,600 tones of polypropylene and have neutralized 30 million liters of sulfuric acid. The system has proven to be extremely efficient in economic terms. Annually over 15 million waste batteries and accumulators are collected, recovered and recycled in Italy.

Introduced for the first time by Decree no. 141 of 1998 and then governed by Legislative Decree no. 36 of 13 January 2003, landfill banning for certain categories of waste has to encourage use of alternative and clean methods for waste treatment and disposal.

It prohibited the landfill of waste liquids, the explosive and/or combustible waste, corrosive substances, waste from medical activities, waste generated in the production of pesticides, substances resulting from research activities, whose effect on the environment and human health can not be estimated etc. After 16 July 2003 the ban came into force for used tires, and from 1 January 2007 has been prohibited landfill of waste with caloric value greater than 13,000 kJ/kg.

Failure to apply the landfill banning regional authorities applies administrative sanctions under Article 51 of Decree no. 22 of 1997 and Article 16 of Decree no. 36 of 2003. Whole system monitoring was the responsibility of Regional Agencies for Environmental Protection, which has reduced the amount of biodegradable waste landfill by complementary measures adopted and some projects managed.

Selective collection of urban waste came into force in 1997, with the emergence of the Legislative Decree no. 22 of 5 February 1997. Until 2006 when legislative framework for selective collection implementation was modified by Legislative Decree no. 152 of 3 April 2006 have been positive developments for selective collection rate at regional and national level (see Table no. 2).

²³¹ Waste Report 2004 - Vol. 1. Municipal Waste, Superior Institute for Environmental Protection and Research, 2004.

Table no. 2. Selective collection rates evolution for urban waste in Italian regions

Region	2002	2003	2004	2005
North	28,6	30,6	33,5	35,5
Centre	12,8	14,6	17,1	18,3
South	4,7	6,3	7,7	8,1
Italy	17,4	19,2	21,5	22,7

Source: Superior Institute for Environmental Protection and Research, www.apat.gov.it.

Decree of 2006 was regulated the waste paper and cardboard, glass, plastic, metal, household waste, waste from parks and gardens, waste electrical and electronic equipment, waste wood, textiles and batteries used. By implementing the selective collection has followed to reduce quantities of annual waste generated quantities and encourage recoverable materials recycling, interim targets²³² for the implementation rate of selective collection being established: 35% until 31 December 2006, 45% until 31 December 2008 and 65% by the 31 December 2012. Currently in Italy over 600 municipalities runs projects aimed at implementation of selective collection systems for household waste.

National Consortium of Packaging Waste Management has implemented since 1998 a coherent system for monitoring the package recycling activities with the purpose to achieve the goals set by European Directive 62/94/EC on packaging and packaging waste management. The system is organized and operates through the activities carried out by six specific organizations representing six categories of waste materials: aluminum, glass, paper, plastic, steel and wood, the main materials used in Italy in the manufacturing of packaging.

Packaging producers are members in consortia, but the system is part of most companies involved in the life cycle of each material categories. Thus the National Consortium of Packaging Waste Management coordinates the work of six consortiums made across Italy: Consortium for Recycling Steel, Aluminum Packaging Consortium, Consortium for the Cellulose based package Recycling, Consortium for Recovery and Recycling of Wood packaging, Consortium for the Plastic Recovery and Glass Packaging Consortium.

Collection and recycling of packaging waste are subject to different agreements between the Consortium and the Italian Association of Municipalities. The purpose of these agreements is to encourage the implementation of selective collection of waste materials recovered at the local level. Agreement was first signed in 1998, but the 2004 deadline was extended due to the need of achieving the objectives set by the new European Directive 12/2004/EC on packaging and packaging waste. Recycling of packaging waste has positive developments, proving the effectiveness of the system created in Italy. In 2005 they were collected about 6.7 million tones of packaging, i.e. 58.6% of total packaging waste market.

Since 1997 in Italy began a broad campaign to promote and encourage all administrative levels for recycled products purchases. Legislative Decree no. 22 of 5 February 1997 introduced a series of measures to promote the use of goods and products made from recycled materials. Their attempts in this way a good recycled products market development and thus reduce the quantities of waste material generated annually. Ministerial Decree no. 203 of 8 May 2003 amended and supplemented prior to the reconfiguration of the active involvement of producers and the public sector. Is settled and the necessary measures to ensure that regional level to guarantee a minimum rate of use of products from recycled materials by 30%.

Through the active involvement of all decision-makers and a integrated thinking on waste management systems Italy has make a significant contribution to achieving the objectives established throughout a coherent series of mechanisms and economic instruments that have demonstrated its major effectiveness for short, medium and long term.

AN EFFICIENT COMMUNICATION WITH "PROCESS COMMUNICATION MANAGEMENT"

Todăriță Elida-Tomița

Universitatea Româno-Germană din Sibiu Facultatea de Științe Economice Calea Dumbrăvii, Nr. 28-32 E-mail: elida todarita@yahoo.com Telefon: 0742282094

An organisation is not defined only by its products or services but also by the ability of communication of its employees and its managerial team. The manager's ascent itself on the hierarchical steps of his profession, a fact confirming the success is determined by his ability to communicate efficiently. The managerial communication is a factor of competitiveness and a strategical advantage of an organisation. We are going to present one of the most efficient models of the management of communication, that is Process Communication Management. It defines the manager's style of communication who has a strong impact not only on the efficiency of the act of communication but also on the climate of communication and on the other it displays the people's privileged ways to perceive the world (building a model based on six types of personality) irrespective of the activity it performs or the environment where it finds itself.

Keywords: managerial communication, types of personality, manager.

JEL Code: M12

On a personal scale, the communication allows a correct defining and understanding of the messages the acquiring of the cooperation of those around, the detension of a tensed state. On a managerial scale, the communication is a device with the help oh which the manager sends and gets information and decisions, accepts or rejects some solutions, plans, organises, trains, controls, prepares and implants the change.

The communication is a complex process that imprints all the activities that are displayed in the interior of an organisation but in the ecterior background too where it opperates²³³; it also influences the processes of gathering, re-making, stocking and transmitting of the necessary information to take and apply the management decisions. The analytical step is structured on a theoretical base followed by graphical exemples.

The explanation of misunderstanding disagreement or even conflicts is to be found in the communication, in the barriers people rise more or less deliberately in the communication road²³⁴.

One of the most efficient models of communication management is Process Communication Management (PCM). Through PCM, we'll get better acquainted and we'll better understanding eachother, we'll better understand the others and we'll be able to keep up the communication in the contents plan, avoiding the side slipping in the plan of the connection.

In order, to understand each other, it is necessary to know and respect the other's needs, aspirations, interests and expectations. At the same time, it is desirable to be conscious of our own needs, aspirations, interests and expectations. Inside a communication, there is a content (What) and there is also a process (How). Most times, the process is more important than the content. PCM is the American Psychologist Taibi Kahler's creation and it has been used by NASA in order to selsct astronauts. It was about how to estimate the team's compatibility and to forsee their behaviour when shut off in a spaceship far away in the immensity of the space. PCM has been examined for 13 years and it was tested by half a million of people on five continents in education, business, politics, sales, religion, family and personal relationships.

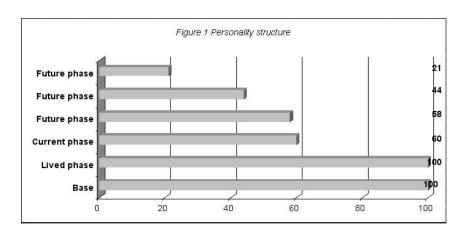

The model PCM has been successfully used in business sales, education, politics, medicine, family and personelrelationships; it has also been used as a method of knowledge, self-knowledge and personal development. At the same time, PCM fits efficiently to the activity done by the managers in the instituations where they act, becoming an active part of the whole process of communication.

The personality structure. PCM sets out from the people's privileged ways to perceive the world, building a model based on six types of personality: Bombastic (grandiloquent), Workaholic (that will be named Pensive), Assiduous (Tenacious), Dreamer, Rebel and Promotor. Each type of personality has its strong parts and privileged means of communication, its own psychological needs and its typical behaviours in conditions of stress. Knowing all this, we may have an extra chance to manage in a positive way the communication, maintaining it in the plan of the content and cultivated an adequate relationship. Each type of personality has strong parts and some less strong. The six elements of our personality compose the personality structure²³⁵ (Figure 1).

²³⁴ Niculae Tudorel, Gherghiță Ion, Gherghiță Diana, Comunicarea organizațională și managementul situațiilor de criză, Editura Ministerului Administrației și Internelor, București, 2006, p. 42.

²³⁵ Taibi Kahler, The Mastery of Management: How to Solve the Mystery of Mismanagement, Edition 4, Published by Kahler Communications Inc, 1988, pp. 18-23

Thees, if we take into consideration only the base and the phase we have thirty possible types of personality combinations. The six types of personality can occupy the upper levels of the personality house in 720 different manners. If we also take into consideration the available energy on each level, we get to an infinity of human types: each person is unique. The project of the personality house is already done, we have had it since we were two years old. We have already built the base and the first level (the phase). Until we are six, we build the other four levels; at this age, we have already had our personality house entirely built. During uor life we are furnishing gradually our personality house. Obviously, it is much easier to carry the "furniture" to the lower levels and much more difficult to the upper ones because the comfort is little. In other words, it is more difficult by for to use the types of personality from the upper levels. If we feel good, if our psychological needs are satisfied, then we can "take the elevator" to climb to the right level in the "personality type". If the situation asks for it, we climb to that part of our personality that best suits to the situation in which we are and we can stay there more or less, depending on how much that part of our personality is developped. Then, it is adequately to get down to the level where we live (the present phase) and load up sur psychological batteries (to satisfy our specific psychological needs).

If our psychological needs are not satisfied, we can get into stress. In this case, we cannot anymore climb towards the phose of personality asked by the situation, on the contrary we get down to the lower levels and we function automatically, led by a stress driver or by a failure script, specific to our type of personality.

These are extremly usefull things to know because, in this way we can learn how to anticipate our getting into stress and take some precautions measurea: the way we eat when we are hungry, in the same way we up sur psychological batteries when the led lights.

We are different. We all have dufferent modalities to perceive the world. Paul Wave pointed out the fact that there are people who perceive the world through their emotions, people who perceive it through the filter of their "thinking" and people "see" the world through "action". Setting out from here, Taibi Kahler noticed that those who first think, can do it relying on objective facts and information (the type Pensive or Workaholic – as he named it) or taking into account principles, ideas or opinions that is preformed modalities to watch and interpret the world (the Assiduous). Further on, he devided those who have the action (behaviour) as their main purpose, in three categories: those who first act (then think or feel - Promotor), those who do not act and they are retreating (Dreamer) and those who are reacting (Rebel).

We can enjoy ourselves for the fact that we are different in order to communicate, understand and enrich, to develop and to be satisfied or we can be "upset" because the others look different or they do not understand us and sometimes scold us. It is our choice, the decision is ours.

The channels of communication. Each of us has one or several favourite channels of communication. On the whole, there are five channels of communication: Stopper-Reassuring, Informative-Interrogative, Nutritive, Directive, Emotional-Ludic. These channels refer to both the used words, but, especially to the non-verbal part of communication (gestures, mimic, tone of voice). Let's remember that only 7% of the message is conveyed through the word, because 38% is included in the tone of voice and the rest of 55% is conveyed through body language. Channel one is an emergency channel. The other four channels correspond to the positive transactions (*Table 1*²³⁶). In chart two, there are given exemples of the use of the communication channels, illustrating both the acceptance and non-acceptance from the part of the other person. The Stopper-Reassuring Channel (1) is a channel for emergency situations when the other person is overwhelmed by emotions and we are addressing to our senses. The Directive Channel is a communication channel through which clear definite respectful and calm orders are transmitted. When we use it we are connecting ourselves to the Normative (General) Parent. Kahler called this State of the Ego Manager, considering it a part of personality.

Table 1. The correspondance of the communication channels from PCM with positive transactions

__

²³⁶ Idem, p. 210.

Nt. Crt.	Communication channel PCM	Positive transaction
1	Stopper-Reassuring	-
2	Directive	Normative Parent-Adult
3	Informative/Interrogative	Adult-Adult
4	Nutritive	Child-Nutritive Parent
5	Emotional-Ludic	Free Child-Free Child

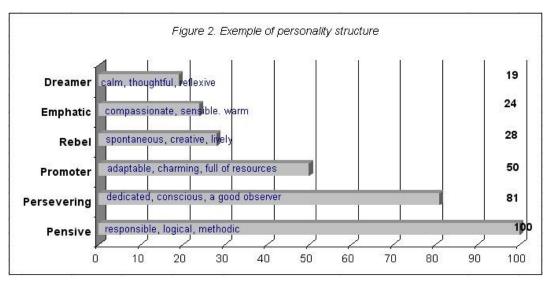

The Informative-Interrogative Channel (3) is a communication channel through which am exchange of information is performed. The tone is neutral, the discourse is logical and the person appeals to his/her reflexive part. The emotion is not present. When we use it, we are connecting ourselves to the Adult Taibi Kahler called this State of the Ego, Ordinator – as a part of personality. The Nourishing Channel (4) is defined by the care, appreciation or compassion we have towards each other. When we use it we are connecting to the Careful Parent. Hahler called this State of the Ego, Protector, as a part of personality. The Emotional-Ludic Channel is the channel of expressing emotions when we are connecting to the child. Kahler renamed this State of the Ego Emotor, as a part of personality.

The Psychological Needs. The Psychological needs are wishes that must be satisfied if we want to have a good state of mind and our behaviour stay positive. The satisfying of our psychological needs represents an important and basical condition of motivation. Taibi Kahler has found some psychological needs ($Table\ 2$)²³⁷. We all possess these but we answer them in a different way. In other words, their priority is different from person to person.

Table 2. The psychological needs

The type of personality	Psychological needs		
Emphatic	Acknowledgement as person and sense		
Emphatic	satisfaction		
Pensive	The appreciation for the quality of the work		
rensive	and time structuration		
Persevering	The appreciation for the quality of the work		
reisevering	and for opinions		
Dreaming	Solitude		
Rebel	Ludic contacts		
Promotor	Excitation		

Even more, Kahler associated one or two specific psychological needs to each type of personnality. When the psychological needs are not satisfied, we have the necessary energy to manage the communication and to access, that part of personality fit to the moment. If we don't have our psychological needs satisfied, then it is very likely not to have the disponibility to manage the communication using the suitable channel. To exemplify, let's take into consideration a person with the personality structure ($Figure\ 2$)²³⁸. The communication channel the person is using in a natural manner is the Informative-Interrogative Channel.

²³⁷ Ibidem, p. 256.

_

²³⁸ Taibi Kahler, The Mastery of Management: How to Solve the Mystery of Mismanagement, Edition 4, Published by Kahler Communications Inc, 1988, pp. 24-26

Simplifying in order to understand, the psychological needs in the first place are: the appreciation for the quality of the work done, the appreciation for the personal opinions and time-structuring $(Table\ 3)^{239}$.

Table 3. Exemples of using the communication channels

Nr. Crt.	Communication channel	Offer	Offer acceptance	Offer non acceptance
1	Retainer- Reassuring	Cool-down, Look at me, Listen to me, Breathe		
2	Directive	Please, buy me a packet of cigarettes	Of course, I'll bring it on hour when I come back	Buy it yourself!
3	Informative Interogative	What time is it?	Aquarter to one.	Buy a watch!
4	Alimental	You are a very pleasant	Thank you, it's very nice of you!	YesDid you read the repport I gave to you yesterday?
5	Emotional-Ludic	Have you seen the photos from the ball?	Oh, yes, cool! Excellent!	I don't have time for such a stupid thing!

If this needs are not satisfied, the person doesn't have either the posibility or the necessary energy to "take the left" and to access, for instance his/her creative, spontaneous and lively parts characteristic of the Rebel type but he/she rather remains blocked in automatic and unconscious behaviours of the stress reaction, for instance the reproach, the criticism, rather observing what is wrong than what is good, manipulation, avoidance. These behaviours specific for the type of personnality and they are structured on three levels of stress: level one activates as the Driver, level two the Masques and level three which is a serious one – Despair. What is important is the fact that when the person in front of us seems to be stressed, which could lead to conflict and misunderstanding, bringing down the communication from the content plan into the relationship one, we can manage the communication, addressing to the specific psychological needs. Thus we have an additional chance to maintain a good relationship and keep the communication in the plan of the matter.

The satisfying of the psychological needs on negative ways. When we are not able to satisfy our psychological needs in a positive way, it is very possible to try to do this on negative ways. We are doing this because it is better to draw the attention in a negative way rather than being isolated.

The stress and the communication. Every moment of our life we are looking for satisfying our psychological needs. If we don't succeed in doing this in a positive way, then we enter stress and we try to satisfy them in a negative way. If satisfying the psychological needs means motivation, we can say that distress represents the dissatisfaction of the vital needs.

The knowledge of stress can help us to feel satisfied dispite of stress. In PCM, the stress is structured in three levels, from one to three, depending on its severity. In the first stage of stress, it is easy to change the behaviour. It is about very simple things to speak on the phone with a friend, to change your temporary activity, to have a drink with one of your colleagues²⁴⁰. In the second stage, the signals point to the fact that it's time to stop and be concerned with your own person. For instance, a manager realizes that he is on the point of overcontrolling, so to arrise serious problems to his team or he accumulates errors, that is he prepares big problems on long term. The third stage is rarer and easier repetable for it generally corresponds to a deep state of crises. The first degree stress is on alarm signal. In this situation a driver begins to function, an automatic mechanism which controls our behaviour. The moment the first signs of stress appear, we are warned that it is necessary to do something in order to satisfy our psychological needs. If we don't do this, we down to the second degree stress which is more serious. If, later on, our psychological needs are still unsatisfied, then we move downwards the third degree stress. This stress is very serious. If we live a longer period of time in this stress, we may be injured by serious illnesses. We must also know that the other's stress invites us to stress. To maintain the dialogue we need two persons, to break it only one.

There is no communication in stress. To take again the communication there is only one solution: getting out of stress. When we notice the first signs of stress at the person we are talking with, it is absolutely necessary to satisfy his/her psychological needs in order to take again the communication. At the same time, we can learn how to

²³⁹ Idem. p. 267.

²⁴⁰ Bob Selden, Who do you need to Influence the Most? – Four Simple Skills, When and How to Apply Them, in Management communication, Volum I, Published by Business management ideas for your success, 2006, pp. 1-4

manage our own stress. Getting to know ourselves better we can thus get to recognise the first signs of stress that we can manage, removing them through satisfying our own psychological needs.

We can say that the whole process of communication is a real art. In only one sentence we can say that the art of communication lies in using the proper communication channel to motivate the one in front of us by satisfying the psychological needs it answers. There is communication when there is offer and the acceptance of it. However important the contents might be, if the form is not acceptable for the interlocutor, there are a few chance for the message to be received. The tracts of personality must not be inhibited nor even shaped depending on the individual interests, on the group or the organisation. They must be used the way they are. It is the essential condition of a manager by his hierarchical position and especially by his tracts as leader that he must know, understand and use in a positive sense each personnality he has. The lack of communication or an inadequate management of this process can lead to the falsification of several components of the management of the company or, on the other hand the lack of certain abilities and of the organisation culture regarding these components invalidates constantly the process of communication.

One of the most significant changes in the practice of marketing during the last decade in the shift in emphasis from a transaction orientation to the customer relationship management (CRM). Customer relationship management consists of the processes a company uses to track and organize its contacts with its current and prospective customers. CRM software is used to support these processes; information about customers and customers interactions can be entered, stored and accessed by employees in different company departments.

Keywords: software, marketing, business, management, customer, relationship.

Cod Jel: M00: General

1. The history of Customer Relationship Management (CRM)

The approach by the client has always been a base principle of the marketing. Kotler says that the marketing people and the clients must work together in order to find out how the clients can be satisfied better.

The acronym of CRM entered recently in the marketing specialist's language. The '90 marked the transition from the transactional marketing to relational marketing. The relational marketing presupposes the collaboration between all the organization departments and the marketing department in order to satisfy the client. So the orientation based on a very big number of transaction in a short time have been replace with long time relationships, based on trust and satisfaction. Recently, CRM is seen more like a business strategy.

The IT revolution which embraced all the human research areas could not avoid the sales universe.

Customer Relationship Management (CRM) is one of those magnificent concepts that swept the business world in the 1990's with the promise of forever changing the way businesses small and large interacted with their customer bases. It offered long term changes and benefits to business that chose to use it. The reasons for this are because it allowed companies to interact with their costumers on a whole new level.

The **1980**'s saw the emergence of database marketing, which was simply a catch phrase to define the practice of setting up customer service groups to speak individually to all of a company's customers.

In the **1990**'s companies began to improve on Customer Relationship Management by making it more of a two-way street. Instead of simply gathering data for their own use, they began giving back to their customers not only in terms of the obvious goal of improved customer service, but in incentives, gifts and other perks for customer loyalty.

This was the beginning of the now familiar frequent flyer programs, bonus points on credit cards and a host of other resources that are based on CRM tracking of customer activity and spending patterns. CRM was now being used as a way to increase sales passively as well as through active improvement of customer service.

In the years between **2000 and 2004**, CRM was a constant topic of corporate discussion. The economy was shaky and CRM was seen either as a solution by those who understood it, or a panacea, by those who didn't.

Instead of feeding information into a static database for future reference, CRM became a way to continuously update understanding of customer needs and behavior. Branching of information, sub-folders, and custom tailored features enabled companies to break down information into smaller subsets so that they could evaluate not only concrete statistics, but information on the motivation and reactions of customers.

The Internet provided a huge boon to the development of these huge databases by enabling offsite information storage. When before companies had difficulty supporting the enormous amounts of information, the Internet provided new possibilities and CRM took off as providers began moving toward Internet solutions.

Today, CRM is still utilized most frequently by companies that rely heavily on two distinct features: customer service or technology. The three sectors of business that rely most heavily on CRM, and use it to great advantage, are financial services, a variety of high tech corporations and the telecommunications industry.

2. The means of Customer Relationship Management (CRM)

The concept was defined as a software product, a data collect method, a sales strategy or a data analyze. CRM totalize this definition and many others depending on each user necessity.

The well known company SECOR from Great Britain praise to have the most complete definition of CRM. In their opinion, CRM means to establish, to implement, to maintain and to optimize of a long time relationship between the client and the company.

Another definition: CRM (customer relationship management) is an information industry term for methodologies, software, and usually Internet capabilities that help an enterprise manage customer relationships in an organized way.

Paul Greenberg, in his book, "CRM at the Speed of Light: Essential Customer Strategies for the 21st Century", says that CRM is a philosophy and a business strategy, supported by a system and a technology, designed to improve human interactions in a business environment.

When the struggle to define CRM back in the prehistoric 1990s, it was characterized most frequently with technological and functional terms. The mantra, It isn \Box t a technology, it \Box s a system, actually came into vogue because of a reaction to the strong technological wind stirred by CRM and what was at the time the dot.com boom, primarily because of vendor marketing. After all, Siebel \Box s big enterprise CRM application suites were hot stuff, and they would make the future relationship between business and its paying customers something to behold.

The industry standard definition was developed in 2000 by the META Group in "The Customer Relationship Management Ecosystem". Unfortunately, what the META Group defined as the components of CRM technology and functionality became all-encompassing CRM to the rest of the known world. All the literature that emerged at this time META Group \Box s definition very broadly, which had the effect of distorting CRM \Box s actual value, though there was nothing inherently wrong with the definition. In fact, this particular definition stuck and to this day is the foundation for traditional CRM.

In January 2003 in an Aberdeen Group interview, Ad Nederlof, CEO of Genesys Telecommunications Laboratories, said, "CRM is a term that can refer to a range of things from the management of the relationship with customers all the way to the software and hardware that allow one to manage (his or her) relationship with a customer. It has become a catchall term.

Frederick Newell, in his book "Why CRM Doesn't \Box t Work", says, "The very phrase explained in (books about CRM) – CRM, or Costumer Relationship Management – implies that companies can manage the customer relationship by targeting specific customers for specific product offerings. How audacious, how imprudent, how wrong!" Newell propose CRM – customers' relationship management – that empower customers to determine their own fate. You can \Box t make a customer do what he doesn't \Box t want to do.

3. Learning from CRM □s Leaders

John F. Tanner worked eight years at Rockwell International and Xerox Corporation in sales and marketing. Since 1988, he has taught sales and marketing at Baylor University \Box s Hankamer School of Business, where he also served as department chair and associate dean. He has published more than 50 research articles in top journals such as the "Journal of Marketing", "Journal of Business Research", etc. His research won many awards, including Mu Kappa Tau \Box s top sale study in 2000.

From his research about CRM: "Tree words that mean many things too many people when linked together, Customers Relationship Management has become something as an enigma. There is little doubt; it would seem, about what a customer is, though the term CRM is applied to things done to non-customers as well. The key that makes CRM different from other forms of strategy or marketing is that it is about relationship management. There are a number of dreams to which CRM software can contribute dreams such as seamless customer interaction across multiple channels, one-to-one marketing, 360-degree knowledge of the customers, and so forth. The reality is that CRM often devolves into an endless stream of campaigns that may take advantage of better customer data, but do not really build or contribute to a relationship."

Marc R. Benioff is founder, chairman, and CEO of salesforce.com. A 25-year veteran of the software industry, Benioff has pioneered "the end of software", demonstrating how on-demand applications can replace traditional software to deliver immediate benefit at reduced risk.

Marc R. Benioff bout CRM: "American cycling great Tour de France champion Lance Armstrong called his 1999 best selling autobiography 'It's not about the bike'. As Armstrong makes clear, in competitive cycling – indeed, in life – success depends on the brains, foresight, and heart one brings to an endeavor. The equipment is secondary.

As many enterprises are discovering today, the same applies to Customer Relationship Management. It is not about the software. It is about the people. Specifically, it is about sales, service, helpdesk, and marketing people sharing information about customers. Armed with more complete, timely information, these people, can make better decisions and, ultimately, keep customers coming back to buy more products".

Don Peppers and Martha Rogers was recognized for the past decade as world-renowned experts on customer-based business strategies, and individually named to Accenture's global list of "Top 100 business intellectuals".

Don Peppers and Martha Rogers about CRM: "At the root of the problems with the term 'customer relationship management' is the fact that the software vendors have used the term so much that many business practitioners equate 'CRM' with 'CRM software'. Technology is a very important, enabling firs step, but we have seen a variety of firms spend vast amounts on the installation and integration of technology without moving the needle on their bottom line at all as a result. Very large companies spent millions of dollars on CRM technology and did not know how that technology was going to contribute to the value of their customer base.

We should think of CRM as the hundred managerial decisions each of us makes in business every day, and making those management decisions from the perspective of increasing the value of the customer base, and using the best tool we have – relationship – to do just that".

4. CRM in Romania

The CRM applications brought in 2006 almost 4 million dollars in Romania. The autochthon market is increasing. At least that is what the questioned organization sustained. The inquest made by Market watch journal show that the Romanian CRM market increases with 50-80% a year. There are various reasons for this increasing strong trend from increasing competitively level all the way to economic development, from UE integration all the way to the IMM sector development and the increase of competition.

As it was expected, the "locomotive" of Romanian CRM market is the telecommunication sector and the financial-banking sector, but also the retail zone and the services deliver firms. How the clients sustained the autochthon market, there is other sectors interest by these solutions.

A study realized by a consulting company, release that the CRM market maintains to 5,8% from the ERP (Enterprise Resource Planning) market from Romania.

By an ordinary client perspective, have been identified a few problems of CRM users: after the product in paid, it became hard contact them; the absence of professionalism shown by consulting firm employees, the terms not respected by sealers.

The purchase of software and hardware is not enough for an organization for the CRM implementation. The hard work is just beginning, because the users need knowledge in the field and a client orientation. CRM is helpful just if the client orientation is already made by the employees.

CRM is a concept before being a software application. A company must concept a CRM strategy before a software application is implemented. The companies reach later to a sophisticate level necessary to imagine a CRN strategy, so neither the CRM need don't show up to every company. Also the companies must have a well defined structure in marketing departments. The small companies can manage with contact management software (a sort of junior CRM); for a true CRM, the company well defined departments of marketing, sells and services.

CRM strategy can vary in size, complexity, and scope. Some companies consider a CRM strategy only to focus on the management of a team of salespeople. However, other CRM strategies can cover customer interaction across the entire organization. Many commercial CRM software package provide features that serve the sales, marketing, event management, project management and finance industries.

CHANGES AND TRENDS IN MANAGERIAL ROMANIAN PRACTICE

Tohătan Anamaria

anatohatan@yahoo.com Universitatea de Vest "Vasile Goldiş" Arad

The world in its entirety is in a continuous change and transformation. Their effects are to be sensed on all levels: economic, social, political, etc. All these changes have an effect on the managerial theory and practice also.

Romanian management has been and still is subject to some changes, most of the time radical ones.

The transition to the economic system of the United Europe imposes high exigencies towards the piloting an enterprise in a competent and proficient way.

Keywords professionalizing, competitivity, know-how, axiological

COD JEL M

The world in its entirety is in a continuous change and transformation. Their effects are to be sensed on all levels: economic, social, political, etc. All these changes have an effect on the managerial theory and practice also.

Romanian management has been and still is subject to some changes, most of the time radical ones.

By change in organisation's management, we understand a change in the process of the management, change that adds new elements of management, and/ proper relationships between the already existing elements and the new ones, or, eliminating the old obsolete or downgraded elements together with the relationships that such elements had created.

Two categories of phenomena that determine and make the change necessary have been identified

- Objective phenomena, which require that through change in the management of organisations, any dysfunction is being eliminated
- -Subjective phenomena, caused by certain deficiencies in the organisation, which make necessary that through change in management, as materialised in actions of improvement, any possible flaw is eliminated.

The economic system of United Europe

In Pierre Maillet and Phillipe Rollet's opinion, "the economic integration is an original formula of organising foreign relationships the main objective of which is – improving the efficiency and the dynamics of the economies of the member countries."

Jan Tinbergen defines integration as being ''the growth of the most desired world-wide economic structure, through abolishing the artificial obstacles out of the way of optimal functioning and through deliberate introduction of all necessary elements for coordonation and unification.''

The mechanism of the economic integration include:

- -creating a common economic space
- -Free circulation of the production factors when there is a common market, using the existing with maximum economic and social efficiency.
 - -Coming up with a common policy in the fields of economy, money and society.

As far the advantages of economic integration are concerned, these are many and may be due to:

- -a higher efficiency of production through specialisation on the principles of comparative advantages
- -a higher level of production, due to a better exploitation of scale economies obtained through continuing growing of the market size.
- -to an internationally improved market position that leads to better exchange relationships -to changes that affect the quantity and the quality of production factors, as a result technological process and the growth of the capital inflow.
 - -to changes in the economic efficiency due to enhanced competition in the very heart of the integrated area.

Rollet Ph . and Huart .F. believe that "integrated countries are involved in a virtuous circle of improved competitivity of economic growth and productivity."

By opening the frontiers, and by practising the economic integration, the competition process is subjected to an inevitable strenghtening, making the organisation pass to a higher effort of adjusting and modernising, and eventually of restructuring, in order to increase competitivity. For the whole economy, the transition to the economic system of U.E. means accepting the new dimensions of the concepts of performance and competitivity. This transition also comes with higher exigencies towards the problem of managing organisations in an efficient manner.

Running a profitable business with certain odds of success in the future, is, in fact, the main purpose of every organisation. This purpose cannot be achieved unless each and every person involved in the institution is totally

committed. The manager is the ''dynamo'' that causes the business to prosper. What makes a ''good manager'' and the difference between a good one and a bad one means precisely the success or the failure of a company.

Factors that determine changes in management

The transitional period for the U.E. economic system, puts a lot of pressure on the Romanian management, which has to renew its attitudes, behaviours and has to establish new co-ordinates in order to successfully deal with the new demands, such as:

1. Mutations between people, determined by:

The evolution of demographic factors, such as the number of population, the structure of population,, the average hope of life, the busy and active population, natality, mortality.

The population growing up-in terms of a higher level of training of the working population and in terms of changing the retirement policy in the working area. This way the managers will be able to use a better trained working force, and this is of course something to be happy about as this will substantially contribute to the improvement of the management system to making better decisions and applying them consequently. On the other hand, this aspect can become a major problem because of the increasing wages that have to be paid to qualified professionals. This category of people may also become more demanding about getting jobs according to their high skills, the number of those who will perform routine work decreasing.

The population able to work constantly aging. The risk here is that of having many institutions that use an ageing personnel

Migration of the labour force towards the European Union markets. Massive exodus of the labour force is felt especially in the organisations, which have to deal with lack of personnel, who show little interest towards work.

Changing the social-cultural factors, that is, the whole of the elements such as the social structure of the population, their culture and mentality, the school system, health education, science, etc.

2. Mutations in the economy consisting of:

restructuring the national economy

development of the elements making up the economic space in which economic unity, the volume and the structure of the supply of goods activate the level of cash income, the volume of goods demands the movement of the competitive prices are at stake.

the new economy makes information accessible

the speed and high capacity of information processing by computers constitute a substantial support to increasing the rationality of the management processes.

the intense pace of designing and implementing the scientific and technical progress and technology as expressed through the rapid growth of the number of patents and technologies, the accelerated growth of the package of programs for computers. Consequently, the possibilities for improvement, mainly technical, of the organisations, are substantial, the managers being provided with a white range of innovation strategies

the rapid rate of wearness of moral knowledge and of know-how, is also impediment, but, at time, a factor of increased competitiveness

development of the external economic activities and of regional and worldwide integration in the context of world globalisation. All these will lead to the diminishing of the perfectionists practices on an international plan. The management of the organisations has to deal with a fierce competition from certain multinational companies

3. Mutations in the law field, related to:

legislative changes: frequent changes in common law create chaos in management.

the action performed by certified organs to initiate and adopt laws concerning the organisations' activities.

all the legal rules that is directly or indirectly concerned with the market activity of the organisation: laws, decrees, governmental decisions, and orders of ministers.

These can favour or on the contrary can impede the smooth operation business organisations.

The globalisations expresses the growth of the economic interdependencies between countries, as shown in the flux of products and services, financial capital and information beyond the countries' borders. In the global markets, the financial capital can be obtained on a national market and used to buy raw material from another market.

Changes in management practice:

Changes in the political and economic environment determine changes in the management of the organisations. The most representative changes on management level are the growth of the dynamics of the management, the

increased professionalism of the management function, amplifying the action put on the human resources management.

1. Managerial dynamism growth

This is, first of all, determined by the increasingly dynamic of the environment existing and performing, by the spectacular growth of change frequency.

Placing the accent on certain purposes that the management actions should have, leads, logically, to a finality that is to make sure that directly or indirectly the main objectives of the organisation are achieved. The rationality of these actions is first of all appreciated as related to the way in which they respond to the demands requested by the general objectives of the organisation.

In terms of praxeology, the finality of the management actions has certain aspects, which are of utmost importance for the components of these actions:

- a. nomologic concerning the close interdependence between the organisations' activities-they will allow its objectives to be fulfilled
- b. psychological-concerning the large range of personal-individual aspirations of the members of the organisation, which is not necessarily the same with those of the firm's objectives.
- c. sociological concerning the relationship between the members' personal aspirations and those of the organisation's-the essential problem being that of putting them in harmony.
 - d. axiological concerning priority of the objectives, of the management actions.

2.Professionalising of the business manager

Professionalising the work of those in charge of the organisation has become nowadays of utmost importance in the fan of the main resorts of economic and social development, which rapidly grows both nationally and internationally. This idea is furthermore strengthened and practically illustrated through the existence of numerous schools, institutions, instruction centres for leaders in management, world-wide spread nowadays mainly in the developed countries which can more easily provide this people with the necessary elements for "graduating" and with the basics for successfully practising the job.

The professionalising of the business managers, namely their evolution is conditioned not only by applying fair social criteria, but also by the existence of the training system of those programmed to be in charge and of those already in charge. In this aspect, the main issues of the training program are:

- a) of content:
- -providing a multilateral training
- -providing the necessary pragmatism
- -continuous updating of knowledge
- -providing the leaders with necessary abilities and modelling the behaviours and necessary attitudes b) of organisation:
- -performing in a compact period of time
- -performing with intermittence with several cycles
- -assuring the periodical recycling of members

The essential actual and future condition of the management is suggestively defined by what P.Drucker relates to as" the new postulates of the management", namely: the management constitutes the main factor of the activity's improved efficiency.

3. Amplification of the concerns regarding management of human resources.

Most managers currently have to deal with problems concerning human relationships and not with those which can be solved by using the techniques of the operational resource. That's why there is a discrepancy between the influence of the quantitative approach and that of the behaviour approach which has proved to be stronger.

Although until 1960's, few managers had strong educational basis necessary for understanding or using sophisticated quantitative techniques, nevertheless through a sustained, post-graduate intruction, this handicap was rapidly overcome.

We can say that, at present, a theoretical and practical coherent system was elaborated. This consists of concepts, principles, methods and techniques very well articulated which constitute the "pillars" of the structural base of a metascience of thought and managing practice, just in the way in which mathematics is considered to be the metalanguage of science-the language that expresses all superior general truths.

Conclusions

Knowing the concerns of the business management is extremely important in order to understand the fundamental principles of the process of management and implicitly what is that makes the activity efficient. These changes will have consequences on the management practice. Those who will find themselves unable to "put up with" this new challenge-the globalisation will be excluded from the business world, and this requires taking up a new style of management.

The transition to the EU economic system imposes high exigencies as far as the problem of running a business successfully and in a competent way is concerned.

A performance management can be implemented in the Romanian economy only by using specialists trained in the organisation management, specialists that have a new vision of the manager's role in increasing the economic efficiency. Such countries require that managers have new abilities in order to be able to deal with the new environmental challenges.

The management of organisations is subjected to numerous challenges, with processes of evolution which can be favourable or unfavourable and which permanently impose changes.

In this sense, the management of organisation has to mainly concentrate on:

- identifying the changes which had to be made in organisations, preliminary to successive stages that must be achieved, and to factors that influence these changes.
- knowing and applying the management mechanisms through which these changes can be and kept under control.

The contemporary management compel to fulfilling the more complex managerial functions, to adopting new concepts and practices in management. It is important that the rhythm in which these will be understood and applied should be parallel with the speed in which the values and factors that condition the changes in management is produced.

The human resource planning is the process by which the organizations anticipate and forecast the future requirements of staff and develops the programs to ensure the number and categories of employees at the right place and time. In order to fulfill its mission, the human resource planning must begin with identifying and recognizing the philosophy and missions of the organization, continuing the examination of the environment, assessing the strength and the weakness points, forecasting the organizing ability, establishing the objectives and the strategies, implementation and reviewing the plans. Based on the analysis of the information from the internal and external environment is done forecasting the demand and supply of personnel, information underlying at the base of preparing the human resources plans where is necessary: of recruitment, of disposal, retirement, development and training, of career development.

Keywords: strategy, development, objectives, plans of human resources

JEL Classification: M 12 Business Administration. Personnel Management.

Introduction

Planning the human resources achieves the link between the general objectives of the firm and the strategy of human resources. It is estimated the staff needs for the future (number of employees and qualities) and, depending on the available staff, are established plans trough which can be covered this need.

Trough the research, studying works of the specialists in the field and realizing case studies at Romanian commercial societies, SC TRANSGAL SA Galati, SC INTERTRANS SA Galati, SC FAN SA Galati, SC BONAROMA SRL Galati, SC ANCATERRA Bucharest, we proposed to determine the content of the forecast management of the human resources necessary, its integrations in the organization management, the most effective methods for forecasting the demand and of a future supply of labor depending on the size, specific and complexity of the activities, by the organization strategies and by different concrete situations in which the firm will be.

1. The purpose and necessity of planning the human resources.

The purpose of the human resources planning is to ensure the organization with the necessary staff, on types of adequate classification and the right time. The human resource Planning s is having in view the staff movements towards the organization and from the organization towards outside.

Some of the considerations which require the human resource planning are:

-provision with staff of specialty and the managerial personnel necessary in the case: of developing, expansion, modernization, changing of technology, changing of the range of products etc;

-preventing the employment of staff over the needs of the organization;

-preventing the situations of un-occupying of some key options and of disrupting the organization activities;

-preventing overlaps, sub-loading and overloading the employees with tasks;

-providing the promotion opportunities for the own personnel and reducing the dependence of external recruitment of staff;

-ensuring the maintenance of a flexible organization of the personnel and preventing the offered risks by the firm's external environment which is constantly changing.

As inseparable part of the planning process of an enterprise, human resources planning can be considered the analysis process and identification of the personnel necessary on professions, qualifications, age, and sex. To do this are required more activities such as: identifying the professions and occupations which aren't covered with personnel, the pyramid analysis of the staff, analyzing the staff fluctuations on departments, comparing the requests with the availability of human resources of the organization241.

Human resource planning starts with identifying and recognizing the philosophy and mission of the organization and continues with the examination of the external environment, assessing the strong and weak points, forecasting the ability to organize, establishing the objectives and strategies, implementing and reviewing plans. Planning the personnel objectives includes a set of activities that facilitates obtaining the necessary labor of sustaining the production effort, of an organization. It is based on an intense activity of analysis and forecast of the supply and

241 Cornescu, V,. Bonciu, C., 1999, "The management of human resources", Ed. Three, Bucharest, p 15.

demand of work at the level of personnel category, of one service or of the organization as a whole 242. Planning the necessary of human resources involves identifying the exact number of the effective of persons on each compartment within an organization and uses it for a period to another. This effective is actually provided in terms of both humans of the necessity of human resources of each compartment, and of the global objectives of the organizations.

Human resource planning is based on accurate information, being adequate tot the organization specific and having as purpose providing the fulfilling of general objectives.

2. The planning process of the human resources

Before to engage ourselves in the planning process is necessary that in advance, to have access to the following basic information:

- a. The knowledge of the objectives and strategies of the organization for the period covered by the plan, as well as of the objectives of each structural links. These objectives and strategies in general are viewing: extending or restricting the production of goods and existent services, diversifying the production, possible reorganizing of the major functions within the organization, introducing the modifications in the procedures and methods of production, increasing the profitability.
- b. The knowledge of the profile positions of employment. The job profile includes a description of the sequence of the involved activities of each post (actual or future) as well as the qualification required to holders
- c. *The knowledge of the labor characteristics* used in present in the organization. The personnel files must, in this case, to contain: general information concerning the effectives: name, age, sex, occupied post in present, nationality, languages spoken and written, full academic formation and formation (training) gained during the work, experience: the jobs previous occupied and the type of enterprise or experience acquired, assessing the performance and potential, projects of career of the individuals and their progress on payroll plan As a whole, these processes include three main steps243:
- 1. The analysis of the effective characteristics existing and forecasting the effective movements (internal job offer, present and future).
- 2. The requisitions of the organization concerning the necessary perspectives for fulfilling the current tasks and of those that will be created (demand of wok in the interior of the organization).
- 3. The calculation of the positive and negative deviations between the internal supply and demand of organization to meet the future needs of effectives.

The internal offer of work – includes:

- a. establishing the profile of characteristics actual effective, on categories of staff (workers, technicians, administrative staff, officials, etc) for each of the structural links. These features relates to: age, sex, level of schooling, experience, academic studies, actual and potential competence, aspirations;
- b. trying to provide the number of individuals who will remain in the studied category during the upcoming months of the year or years to develop that plan.

The internal demand of work – includes:

- establishing an inventory of the currently held posts in present, in a given category, taking into account the qualifications required;
- calculation of the possible opening in this category: openings created as a result of increased volume of goods and services provided or trough a diversification of products and services, created trough a reorganization of the administrative structures or by introducing new technologies (automation of accounting activities oar those administrative);
- calculation of the number of posttest that can be dissolved after introducing new technologies, of an administrative of a tasks restructuring at the offices/workshops or a task modification or of hours of work etc;
- purchasing the data collected during previous stages in order to know the number of posts at the end of the period and of required qualification. Also it will be established the proportion of these jobs which will be effectively covered taking into account the financial resources.

Reconciling the supply and demand of work – supposes:

- a. comparison the forecasts of the supply with those of the demand, establishing the deficits that must be covered and the surpluses that must be corrected;
- b. scheduling some actions of recruitment, selection and training of the effectives employed or of reduction of the existent effectives;
 - c. provisioning a periodic review and of global assessment of the program

The plan of human resources, according to Aurel Manolescu concept244 is composed from: the recruitment plan, plan of preparation and perfection; plan of promotion.

²⁴² Nicolescu O., Lefter V., 2004, "The managers and human resources management", Ed. Economic, p.134.

²⁴³ Mathis, R. L., Nica, P., C., Rusu, C., 1997, "Management of the human resources", Economic Ed., Bucharest, p. 145.

²⁴⁴ Manolescu, A., 2001, "Management of the human resources", Economic ed., Bucharest, p. 123.

At developing the human resources plan it will take into account the main actors of influence and will be revealed the way in which they are putting conditions and acts on the plan. Among the most important factors of influence, may be mentioned: the technical progress, the level of resources, labor market, governmental regulations, the general economic situation, the policy of the internal and external partners; these factors work in close interdependence. Only taking into account these factors and the interdependences between them, it can develop a realistic plan and effective, oriented towards achieving the organizational objectives.

The planning process of the human resources must begin with the activity of collection of information, both from internal and external environment of the organization. The data from the interior of the organization are concerning the previsions strategic and tactical organizational, the growth prospects, technological change, product change, assortments, manufacturing lines, establishing of new activities, restrictions of some activities, concentration, aggregation, etc. Also the information on the number, structure and quality of labor existent in the organization, as well as the rates and causes of it fluctuations, are of great importance in planning the staff.

The information from the external environment of the organization refers to the internal policies in the scientific domain, education, cultural, etc., the factors from the economy and their trends, the technological situation at national and international level, the legal regulations, situation in which the evolution of the national and regional labor, the demographic trend and social, the situation and evolutions of the competitions and others. After collecting and analyzing the internal and external information of the organization, the specialists in planning the human resources will forecast the future demand of labor of it. The forecast of the personal demand will have in view the estimated necessary of an year, two or three, sometimes and on a period of five years. For the short period, of a year, the forecast will be more detailed, concerning each post and positions. After determining the future demand, the specialists in human resources will forecast the future supply of labor, having two major components: internal supply of staff, having as base the existent promotion of the personnel and the possibility of retraining; the external supply from the work force market, trough the offices of labor distribution, by transfer to other firms, from schools, universities, other forms of education etc.

Developing of each forecast in the domain of human resources is based on technological, financial, on those concerning the market, human potential and material of organization. The analysis and assessment of the results constitutes a mechanism of self-planning of human resources, serving at identifying the optimal strategies of action.

3. Forecast of human resources

Forecast of human resources is influenced by the activity domain at which refers, by the sphere of coverage and by the chosen horizon. Elaborating the forecast of human resources must ensure the compliance to some requirements: such as accurate knowledge of reality, the existence of data passed on periods of sufficient length, eliminating from the calculation the calculation of data with accidental character concomitant use of several methods of forecasting. In this context appears the question: "Can a manager to know the future in the human resources domain?"

The answer is yes, but no absolute, in the sense that the actual speed of progress of the phenomena economic and social is extremely big, and the technical scientific as well. In this sense, any manager of human resources must continuously inform concerning these changes (especially on the supply and demand of labor and at competition) for not to be taken by surprise and making decisions inappropriate of lack of information.

The objectives of the firm are the point of leaving of any forecast of the human resources, whereas on the basis of this are effectuated the inventory of available resources, and establishing the necessary is performed by professionals, training, performances, with the help of capable people from the inside and outside of the organization.

Regarding the human resources planning, the objectives if these are following:

identifying the issues concerning the personnel effectives, before to appear in the form of a short term crisis, medium or long;

identifying the uncertainties to which it is possible to cope with which reflects on the qualitative and quantitative necessary of human resources;

maintaining of a flexible organization of personnel to cope with the changes that occurs in the enterprises activity;

analyzing the existent situation in firm concerning the posts of work and human resources;

developing the forecasts in relation to the necessary of human resources of the organizations;

adopting on short term, medium or long of the necessary of human resources in relation to the number of existing human resources and with the strategic objectives of the firm.

3.1. Used methods for determining the necessary of human resources

In the literature of specialty and in the practice of economic units are presented different methods for determining the necessary of staff, like this:

Methods of regression, which establishes certain relationships between the effectives of workers (under qualitative and quantitative aspects) and some indicators of the enterprises as: sales volumes, production volume,

the value added, etc. Starting from these relations, it is projected the necessary of staff for each future periods, taking into account the planned indicators of the firm.

The analysis of trends as a method that estimates the predictable needs taking into account the evolutions and trends recorded in the company concerning the employees effectives, staff personnel, etc. Are obtained global estimates of the necessary of staff, compared with the data from the previous periods;

Estimating the staff necessary by each hierarchical chief. This method assumes that in each section of work, the production link and conception, the hierarchical chiefs respective to asses the staff needs for the future periods, taking into account the specific developed activities.

Delphi method. In the enterprises where the specific of their activity makes difficult to quantify of some estimations for the volume of the future activities, it may be forecast the necessary of staff using the Delphi technique. In this purpose is constituted a group of 10 - 20 of specialists – experts who know very well the specific of the developed activities. They express their opinion concerning the development in the future of the enterprise, filling some questionnaires, during on several interactive sessions, coordinated by an expert specialist in the field of prevision.

Estimating the necessary of personnel based on the work productivity. The variable productivity of work is the basis for forecasting the necessary of staff. The norms concerning the work productivity must be set according to the external criteria (probable progresses of the competition) and not by internal criteria (which are taking into account the existent relations between workers or between the workers and hierarchical bosses) because an organization can't support much time expenditures of work bigger of the competition.

3.2 Forecasting of the work offer

After forecasting the demand of work force, is necessary to establish the personnel offer, first the internal offer and then the external.

Internal supply

The internal supply is composed of all existing employees, at a time, in organization and which, are expected that will remain an in the future for which is made the forecasting. The internal supply of work force changes permanently because are making retires, having held deaths, dismissals, resignations, employments. The specialists in the human resources must have a good information system well put in place to meet all the time the situation of the internal supply of staff and to forecast the next offer. For the small organization it can be used **the file system of staff**, which shows the number of persons who carries a particular job within the organization. These records must be updated regularly to have a real situation. At the big organization, the manual system of the files of personnel isn't sufficient, having to create and operate a informatics system if the human resources.

To asses the current supply of work force and identifying the candidates for promotion or to transition to other positions within the organization, can be used the inventory **form of the qualifications**. For each employee there is also a form on which are passed the personal data: name and surname, place of employment, activity, experience, education, training courses, foreign languages, favorite post, favorite place, and hobbies. The informatics system of the human resources can respond to the inventory requirements of the personnel and of permanently actualization if the new data are entered into the computer as soon as they are known.

For **forecasting the intense supply** of work force it can be used various methods, including **the Markov analysis** based on the **probability matrix of transition**.

On long term are recommended the forecasts based on logic methods effectuated by the managers that are taking into account by the: employees categories, qualifications on categories, the system flexibility (how easy can be transferred the employees from a job to another), the syndicate position, promoting possibilities, fluctuation of the force work and from its causes.

The forecast of the internal supply of work force can be use in efficient way the information linked to the fluctuation of the staff if it's realized a analysis of departures from the organization, on categories of employees and on seniority categories at work.

The external supply of work force

The organization can't resolve the demand of work force only with the internal supply; she has relations of permanent inter-conditioning with the external market of its. The labor market is a concept which designates an area, geographical and on skills, from which a organization recruits its staff. The market can be situated in a small geographical area and close to the company which has demand of labor, for example, food chemistry engineers for a company of Galati are found in this town where a faculty works with this profile; persons with another qualifications, auto mechanics, mechanic or unqualified, also are found in the area. For other qualifications: university professors, top-level managers, researchers, engineers, etc, the labor market can be of national or international level. Moreover, for companies in the country, from Sibiu, Brasov, Timisoara, Baia Mare etc., which looks for engineers chemistry food, the respective market isn't situated in geographical area near to them.

Conclusions

The planning activity of human resources is particularly important for ensuring with the necessary of work force for the future periods from the organization evolution, being organically linked to the requirements and strategic objectives of the organization. In this process are intervenes several factors, of endogenous or exogenous factor of the organization of which evolution isn't always easy to predict, which requires more rigorous approach, based on experience and the managers intuition and of specialists in human resources and in planning, but and using scientific methods, specific to the management or adapted from mathematics, statistics, economics, etc. Developing the process presumes organizing a informational system which to be cable to provide the necessary information, in the required quantity and structure, at the right time. After were forecasted the demand and the internal supply of labor and was analyzed the external offer from the labor work, specialists, in human resources must establish programs to solve the coverage problem, at the appropriate moment, with employees, quantitative, structural and qualitative of the future needs. Due to the dynamicity of the environment evolution of the organization it he contemporary society, the planning problem of human resources remains always topical

LEVELS OF ETHICS THAT CHARACTERIZE THE MANAGERIAL REASONING

Tutulea Anca

Universitatea "Lucian Blaga" din Sibiu Facultatea de Științe Economice Adresa de contact: Sibiu, Bld. Mihai Viteazu, Nr. 19, Bl. V9, Ap. 103, Cod 550350 E-mail: anca.tutulea@ulbsibiu.ro Telefon: 0744356382

Ethics in business has become a subject of increasingly important and topical due to the rapid change of technologies, internationalization of business, the impact of various economic, political and labor factors on public and private sector. Managers and employees should be aware, well informed about ethical issues that may arise in the process of adapting the organization to changes in business environment.

The ethics of business and its staff depend to a large extent on the qualities and leadership ability of its managers. Every manager has a special moral responsibility: it must show a high professionalism, to lead people so that they could achieve the business objectives, to be a model of conduct for its employees, moreover, the manager should contribute to the institutionalization of ethics within the organization through culture, media, rules, customs, practices, etc.

Keywords: ethics, manager, moral, imoral.

JEL Classification: M20, M21.

"A person who values more privileges than her own principles will soon lose both."

(Dwight D. Eisenhower)

1. The Manager – the decision factor of ethical behavior within organizations

Ethics seeks a rationalization of human actions that is based on the general ethical reasoning; it defines basic concepts (good-bad, right-wrong, values, beliefs, ethics, conflict of ethics, etc.) and it comes up with theories that can be developed into tools of decision making, of solving different types of moral conflicts and ethical dilemmas that may occur within organizations.

For a better understanding of the role of ethics in business it is very important the attitude of the superior in the company which shows a particular respect to ethics through their own actions as managers and through the policies within the company, through the decisions and delegated tasks, through wage policies adopted in the company, through the way of application of disciplinary sanctions, etc.

Thus, we can say that ethics is "image generator" both for the manager towards his employees and for the company towards the environment in which company operates.

Believing in the ethical principles is not an option. Regardless of the position held within a company and of the individual personality, the ethical principles should underpin all of its shares. For example, in positions of leadership, the ethics of the manager both in the internal or external relations is reflected automatically in the image of the company where he is employed. The manager represents a model of behavior both for the team he coordinates and whose team members are his subordinates and for his other colleagues.

Ethical principles²⁴⁶ should serve for each manager the basis for creating a personal system of ethics:

- central positioning of the "golden standard", implies the fact that the manager has the obligation not to show any unproper behaviour (a way he would not like to be treated himself) towards subordinates, management team, suppliers and customers;
- the manifestation of principiality in the life situation of duties, responsibilities, the right to benefit from the use of resources and establishing deadlines for completion and distribution of forces and means, rights and powers;
- adopting urgent measures to eliminate mistakes in one's own activity;
- participation in expanding and developing the application of ethics in business;
- supervising that in any action ethics should not violate rules or other ethical rules;
- ethical principles of respect of other firms, regions or countries;
- taking into account culture and traditions in the process of securing ethics in the company;
- implementation of involvement methods in management;
- the implementation of personal ethical beliefs when they are in accordance with the requirements of universal ethics and managerial ethics;
- avoid any signs of psychological aggression on subordinates;
- using constant influence through models and psycho-social means to achieve the ethical requirements imposed on the company;
- removing potential contradictions and conflicts likely to attack the quality and performance measures applied:

²⁴⁵ Petrescu, I., Managementul performanței, Editura LUX LIBRIS, Brașov, 2002, p.291.

²⁴⁶ Petrescu, I., Managementul performanței, Editura LUX LIBRIS, Brașov, 2002, p.309.

- improving confidence in the ability of the company, of the management team and staff to meet the demands arising from ethical concepts and moral foundations of performance management;
- respect for freedom of thought and action of employees;
- the development of the ethical way thinking and action of the subordinates.

Ethics Management operates with the following terms²⁴⁷: company, groups of interest, internal problems and personal problems.

The company is the general category towards which ethics management must define its behavior.

Groups of Interest define the correct paths in the initial steps to solve social problems of special Groups of Interest and how they are affected by managerial decisions.

Internal problems generate management attitudes that need to define the nature of relations between the company and employees, including managers.

Personal problems are those related to the relations of a person towards another person within the organization. Ultimately, the manager must take into account of issues²⁴⁸ with ethical values:

- interest of the general public;
- objectives for whom he works;
- understanding of all participants involved in the business and of the changes taking place in the organizations they

Managers have two main priorities²⁴⁹, which sometimes can be contradictory:

- the public;
- their own organization.

In general, what is considered moral for a manager, at the same time it may be considered immoral by the other actors involved in conducting business, thus ethical dilemmas may result.

2. The main levels of ethics that characterize managerial reasoning

The reality today confirms increasingly more clear and more often that managers of corporations are subject to considerable pressure to compromise on their personal ethics in order to achieve company goals. A research²⁵⁰ of over 238 managers from various industries, showed that almost 65% of the total agree with the following statement: "Managers now feel pressure to compromise personal standards to achieve organizational objectives." The results of the research suggest that managers live in a real pressure or perceive it, a preassure of making a compromise among moral standards, personal or organization to meet prospects. The research also suggests that this pressure is perceived more by middle managers and those on lower levels than the top managers.

Regarding this analysis of the behavior of managers in terms of ethics or unethics in business, Gheorghe Militaru suggests a guide for managers in the decision-making process, a simplified model of extremely valuable ethical behavior. This model highlights three types of ethical behavior of reference²⁵¹:

- 1. Maximum personal benefits (selfishness). A manager with a selfish behavior would evaluate alternatives in terms of having personal gains such as salaries, prestige, power or anything else that has value for him. If the organization or the company gains certain benefits, these are simply at random. Therefore, to maximize personal wealth is a priority for the management.
- 2. Maximum social benefits (altruism). A selfless decision to select the version that will provide maximum welfare benefit. In practice, taking decisions on a selfless basis is difficult because it is hard to establish personal benefits that they generate unselfish behavior.
- 3. The obligation of a formal principle. It is placed between the two extremes previously submitted. Selfishness is an act valid only if the benefits of individual counts. Altruism is good only if the benefits of the company count. In reality, the criteria which will establish a standard of ethics for managers is the consequences. In contrast, adherence to ethical principles is formally based on the idea of verticality of the manager because the correctness/fairness or incorrectness/unfairness of an act/action depends on principles rather than on consequences. Continuing the idea presented above, we can say that the main levels of ethical or moral that characterizes

managerial reasoning, are the following:

1. The immoral manager is characterized by selfishness that cares only for his own profits and for the benefits of the company. He has a negative position/attitude towards what is moral and his objectives are set out towards profitability and performance achieved at any cost, the legal violation and exploitation of opportunities strictly for the benefit of the company.

2. The moral manager can be characterized in opposition to the immoral manager. The moral manager is acting within an ethical standard, showing the sense of honor, righteousness, sense of duty and accepted values and

²⁵¹ Militaru, Gh., Comportament organizațional, Editura Economică, București, 2005, p.154.

practices. Profitability is situated within legal and ethical standards and he considers law as a basic minimal ethical behavior. He calls for action beyond what the law requires and solves ethical dilemmas and he highlights selfinterest

3. The amoral manager is acting from a legal point of view, taking decisions beyond the area of application and of the management activities, beyond the moral order of a specific code. His motivations are well-meant but selfish. The objectives of his plan are based only on profitability, the others being considered that they lack importance. The expression justifying his behaviour is: "the law is the ethical guide, and managers are responsible only to legal mandates and require these mandates".

Some of the guiding principles of common sense that can help managers to consider the ethical implications of managerial decisions and behaviors are the following:

- 1. obeying the law, as far as it regards content and spirit;
- 2. to tell the truth. Telling the truth is important in winning the confidence of the business partners:
- 3. to show respect for people, a fact that has deep roots in the study of ethics;
- 4. use and comply with the 'Golden Rule', which means treating individuals fairly and honestly, as managers would be treated if the business would belong to an individual.
- 5. most important than anything is not to cause anyone damage, or hurt. This principle is considered by some American researchers to be the baseline of any ethical consideration, and also an easy guideline to apply in
- 6. active involvement without paternalism. It refers more to learning about the customers' needs, than deciding what it is best for them;
- 7. always act when you have responsibilities.

In the paper, 'Ethics of the effective leader or leadership based on principles', Stephen Covey presents the results of a study and a detailed research of 500 managers conducting their business based principles. Characteristics of such managers²⁵² are:

- 1. They always learn, read, prepare, learn with your eyes and ears; they are curious, always developing their skills,
- 2. The purpose of their life is to serve others; they consider that their life is a mission, not a career.
- 3. They glow with positive energy, they have cheerful, pleasant, happy appearance' they are optimistic, enthusiastic, confident (not sullen, peevish, paranoid).
- 4. They believe in other people, they do not exaggerate towards negative behaviors, critics and human weaknesses, they are not vengeful; they do not label others taking into account prejudices and stereotypes.
- 5. They lead balanced lives, perceive their own value which consists of courage, integrity and lack of need to brag; they are simple, direct, open, not manipulative.
- 6. They believe that life is an adventure; relishing her life, without prejudices, their safety lies in their initiative, resourcefulness, willingness, courage, force, native wit.
- 7. They are synergetic (synergy is the condition in which the whole is the sum of the parts); they believe in the power and capabilities of others, they do not feel threatened by those who are better; they know to make a distinction between man and matter.
- 8. They constantly practice for self-renewalness; they regularly participate in a program physical exercises to strengthen their physical and mental health, they practice their minds through reading, writing, visualization and problem solving; they are patient, they listen to others with genuine empathy, unconditional love; they are responsible for their own lives, decisions and reactions; from the spiritual point of view they are interested in prayers, studying the Scripture, they practice meditation and fasting.

True leadership principles have profound moral bases. Practitioners of this type of management are recommended to forbid the so-called "seven sins" 253 that anyone could fall onto, namely:

- 1. Wealth without work. Nowadays, there professions built on the idea to make a fortune without work, to earn money without paying taxes, to benefit from government programs for free, without any financial liability bear etc. (types of network marketing, pyramid organizations).
- 2. Pleasure without awareness. Many people seem to want pleasure without consciousness or sense of responsibility.
- 3. Knowledge without character. Development of pure intellectual development in the absence of the same nature "is silly as high as if you give a sports car of high power in the hands of a stoned teenager". Action must be taken (in the education system) so that there should a balance between the development of intellect and character.
- 4. Business without morality. Adam Smith is the one who in the work "The richness of nations" explained how important is moral to our success, that it is important how to behave towards each other, the spirit of goodwill, of service, of help. If you ignore the moral foundation and allow economic systems to function without it and without constant education, there is the a risk of the appearance of amoral or even immoral companies and business.

²⁵³ Stephen, R., Etica liderului eficient sau conducerea bazată pe principii, Editura ALLFA, București, 2006, pp.83-90.

- 5. Science without humanity. Although we see very well prepared people, rapidly climbings on the scale of the scientific success, we notice that this step ladder lacks human kindness and it cannot rely on the wall which should support it (a normal, natural scientific accumulation of knowledge and teaching competence).
- 6. Religion without sacrifice. It takes sacrifice to help others in distress, killing our pride and prejudices.
- 7. Politics without principles. It is dramatic is that within many large economic organizations which support their existence on questionable statements, there people robbed in the broad daylight with witnesses, or somebody steal their self-respect, money, position and nobody is judged for this. And yet there is consolation that the best companies and organizations are run by natural laws and principles. That is why we advocate for such an ethics board and its corresponding attached.

3. Measures adopted to ensure the level of ethics

To prevent the occurrence of unehical practices, organizations adopt specific objectives²⁵⁴ such as:

- understanding the typology of ethical concerns;

recognition of the pressure exerted on managers and formulation of measures to implement the - - ethical concerns;

- understanding how decisions can be encouraged and targeted according to ethical criteria;
- counteracting ethics violations or abuses in the employment practices;
- familiarizing the management team and the employees with the steps that should be taken in the decision making process to achieve knowledge and application of ethical standards.

In order to preserve competitiveness and confidence in the activities, organizations distinguish themselves by intense concern for moral action. In this respect, the ways²⁵⁵ in which ethical behavior can be encouraged are the following:

- publishing its own code of ethics, according to recognized social standards and values;
- training managers on issues of ethics in business;
- developing programs to resolve ethical conflicts;
- institutionalization of committees to oversee ethical behavior;
- granting proper rewards and sanctions.

To improve ethical behavior²⁵⁶ several ways have been proposed among which we mention:

- 1. Top management involvement. Managers determine organizational culture as patterns of behavior for employees, through what they say but especially through what they do.
- 2. The selection of employees. Managers, in the selection process, shall hire persons whose characteristics show morality.
- 3. *Ethic codes*. The document which includes a set of values which the organization supports and defends, as well as general rules of behavior that the employees are expected observed.
- 4. Ethical behavior training. Using the training programs to strengthen ethical values of the organization specified in ethic codes.
- 5. Independent audit of ethical behavior. Evaluates the morality of the employees' behavior, aiming at finding inaccuracies.
- 6. Formal protection mechanisms. The establishment of formal mechanisms of protection (ethical issues counsels or committees, ethical issues officers, communication systems of ethical incidents), to protect employees who face ethical issues so that they act in the spirit of moral correctness.

An organization can not be ethical if its members do not have an ethical behavior, an organization that promotes moral principles through the institutionalization of a set of rules of conduct will not tolerate within itself individuals who violate these moral rules or values. Practice shows that compliance with moral principles within the company extends in its relationship with the external environment, ie it contributes to promoting values, to creating and maintaining a good image of the company in the community in the short and long term.

SOME ACTUAL CONSIDERATIONS ABOUT CRISIS MANAGEMENT

Udrescu Margareta

Ovidius University From Constanta, Economical Sciences Faculty, University Road, No. 1, Udrescu Marga@Yahoo.Com, +40 721 983139

Ilie Constantin

Ovidius University from Constanta, Mechanical, Industrial and Maritime Faculty, Mamaia Ave., no. 124, ilie.ctin@yhoo.com, +40 721 205325

Considering the current worldwide financial and economical conditions and especially in the spectrum of an epidemic of H1NI virus the authors feel the need to remained the importance of crisis management. Defining what a crisis is and thinking a couple of its types and also the crisis management and the importance of the crisis communications the authors also want to signal the present needs for a more accurate consideration of the crisis management and its usage and also bending the decisions in order to minimize the psychological effects of the crisis and maximizing the positive effects of the decisions.

Keywords: crisis, crisis management, crisis communications

O20

1. What is a crisis?

In order to defined and comprehend a crisis and its effect we should defined the hierarchical level were the crisis acts:

- In general?
- For an organization?
- For government or bureaucracy?
- For a private company?
- In healthcare?
- In drug safety?

Crisis can be defined as:

"A significant business disruption that stimulates extensive news media coverage. The resulting public scrutiny will affect the organization's normal operations and also could have a political, legal, financial and governmental impact on its business." (Institute of Crisis Management)

Few organizations understand and qualify specific threats in order to evaluate risks accurately. The consequences can be extreme. Not only are some threats overlooked, but also resources and budgets are misapplied to threats that do not exist or have a minimal impact.

Specific threats to organization:

- Operational viability;
- Reputation;
- Credibility:
- Financial stability;
- Legal action.

The basic causes of a business crisis are four in number:

- 1. "acts of God" (storms, earthquakes, volcanic action, etc);
- 2. mechanical problems (ruptured pipes, metal fatigue, etc.;
- 3. human errors (the wrong valve was opened, miscommunication about what to do, etc.);
- 4. management decisions/indecision (the problem is not serious, nobody will find out).

1.1. Sudden crisis

A sudden crisis is defined as:

A disruption in the company's business which occurs without warning and is likely to generate news coverage and may adversely impact:

- 1. Our employees, investors, customers, suppliers or other publics
- 2. Our offices, franchises or other business assets
- 3. Our revenues, net income, stock price, etc.
- 4. Our reputation--and ultimately the good will listed as an asset on our balance sheet

A sudden crisis may be:

- a. A business-related accident resulting in significant property damage that will disrupt normal business operations
- b. The death or serious illness or injury of management, employees, contractors, visitors, etc. as the result of a business-related accident
- c. The sudden death or incapacitation of a key executive

- d. Discharge of hazardous chemicals or other materials into the environment
- e. Accidents that cause the disruption of telephone or utility service
- f. Significant reduction in utilities or vital services needed to conduct business
- g. Any natural disaster that disrupts operations, endangers employees
- h. Unexpected job action or labor disruption
- i. Workplace violence involving employees/family members or customers (Institute of Crisis Management) *Sudden Level 1*

Can be handled by on-duty personnel responsible for responding to and managing this kind of situation.

Example: A careless employee leaves oily rags in the storeroom of an office building. Spontaneous combustion occurs. Luckily the fire is discovered and extinguished quickly by one of the building maintenance men.

Sudden Level 2

Can be handled by the personnel who respond, with support from other employees on duty or who may have to be called in from their homes.

Example: The fire is out but heat and smoke damaged office furniture in the storeroom. The owners are irate and threaten to sue.

Sudden Level 3

Requires additional resources and people beyond the regular personnel. These managers and employees may be from other facilities or the corporate office, and may be supplemented by outside vendors or consultants

Example: The fire was not discovered in time and spreads outside the storeroom The fire department is called and puts out the blaze but it has severely damaged three offices. Two TV news stations cover the story and report that the fire was thought to have been caused by a careless employee.

Sudden Level 4

The situation is out of control and will impact an extended area and numerous people indefinitely. Business will have to be curtailed or discontinued and employees diverted from their normal duties until it is resolved. Other employees may have to be furloughed, vendors ordered not to make deliveries, etc.

Note: Local emergency response agencies will be actively involved. State and federal agencies also may be called in.

Example: The fire spreads throughout the office building. High winds send cinders into nearby neighborhoods causing additional fires and forcing the evacuation of residents in the area. The fire department calls in all available equipment from the city and surrounding areas to control the numerous fires.

Local TV stations feed the story to their networks and it is carried on the evening news programs, with the suspected cause of the fire mentioned in the reports.

1.2. Smoldering Crisis

A smoldering crisis is defined as: Any serious business problem that is not generally known within or without the company, which may generate negative news coverage if or when it goes "public" and could result in more than a predetermined amount in fines, penalties, legal damage awards, unbudgeted expenses and other costs. Examples of the types of smoldering business crises that would prompt a call to the Crisis Management Team would include:

- a. Sting operation by a news organization or government agency;
- b. OSHA (Occupational Safety and Health Administration) or EPA (Environmental Protection Agency) violations which could result in fines or legal action;
- c. Customer allegations of overcharging or other improper conduct;
- d. Investigation by a federal, state or local government agency;
- e. Action by a disgruntled employee such as serious threats or whistle blowing;
- f. Indications of significant legal/judicial/regulatory action against the business;
- g. Discovery of serious internal problems that will have to be disclosed to employees, investors, customers, vendors and/or government officials.

2. Crisis management

Crisis management is a relatively new field of management. Typically, proactive crisis management activities include forecasting potential crises and planning how to deal with them, for example, how to recover if your computer system completely fails. Hopefully, organizations have time and resources to complete a crisis management plan before they experience a crisis. Crisis management in the face of a current, real crisis includes identifying the real nature of a current crisis, intervening to minimize damage and recovering from the crisis. Crisis management often includes strong focus on public relations to recover any damage to public image and assure stakeholders that recovery is underway.

The first goal of crisis management is prevention. A model for the crisis management is shown in figure 1. The general purposes of crisis management are:

- Prevention;
- Survival;
- Successful outcomes.

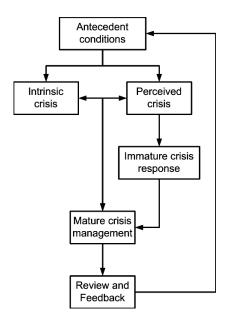

Figure 1. Example of crisis management model.

The model's elements from figure 1 can be briefly explained as follows:

- Perceived crisis: as seen by all individuals from particular viewpoints;
- Intrinsic crisis: total situation as seen by neutral observer with all the facts;
- Immature crisis response: instant and irrational (denial/shock/panic);
- Mature crisis management: grasp of intrinsic crisis;
- Review and feedback: assessing success and failure and feeding learning into future planning.

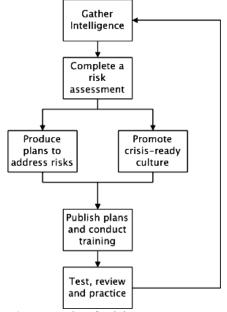

Figure 2. Example of crisis management model.

In order to define, to construct and to implement the decision as results of crisis management activities the first step is the management risk intelligence (figure 2) and consists in whether the management representative observe and determines the incipient signs of crisis.

Elements of this risk intelligence as:

- continuous scanning (networks/media/public opinion, etc)
- superficial focus
- collaboration
- positive relationships

are at the most important for the results of the crisis management implementation and must avoid effects such as: uncertainty/ambiguity and try to impose effect such: urgency of response and strategic effects of decisions.

The success can be measured results:

- Has organizational capacity been restored?
- Have losses been minimized?
- Have lessons been learned?

3. Crisis Management vs. Crisis Communications

The difference between crisis management and crisis communications and the new term of business continuity needs to be clarified. Where do you draw the line between management and communications in a crisis? If you and your management are smart, you won't. As a matter of fact, you'll do everything you can to coordinate the management, operational and communications response to any crisis that goes "public."

To start with, Trigger Points must be clearly defined and well understood by all of the members of the response team. All too often someone says, "We have a crisis out here." What are the factors that make it a crisis as opposed to a serious internal problem?

Operational response:

- implement emergency response procedures;
- protect employees and business operations;
- assess the situation;
- brief headquarters.

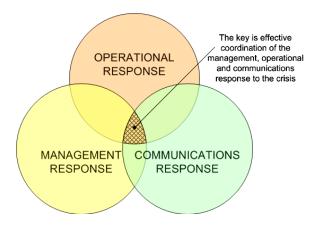

Figure 3. Elements of an effective crisis response

Management response:

- mobilize crisis teams;
- confirm crisis severity;
- advise senior executives;
- adjust and implement crisis response plans;
- prepare for external communications.

Communications response

- employees at all locations;
- families of employees;
- supporter and adversaries;
- government officials;
- the news media.

The key is in having an integrated, coordinated approach by all three groups. The process starts with defining the organizations vulnerabilities to business disruptions and developing realistic workarounds and contingency plans. That's the basis of the business continuity approach that has emerged as companies, non-profit organizations and government agencies worldwide prepare for any type of business disruption including a pandemic.

The year 1989 marked a turning point in Romania's evolution since it led to the passage, or to put it better, the coming back, after more than four decades from the strictly planned, administrative-bureaucratic centralized economy to the strongly decentralized market economy in which the orientation and leading of activities is done through economic/financial factors, compatible with the economic democracy and the market mechanisms. Within the frame of the new economic-social realities installed after 1989, managers' capacity to adapt to these new realities and efficiently operate in a dynamic economic environment, conditioned Romania's chances to take the path of development, and acquire dynamism, modernity and competitiveness. Following the establishment of the market economy, managers' activity and profiles undertook serious changes since the new context obliged them to cope with a more dynamic environment.

When it comes to differences between state-owned companies and multinational companies, opinions are divided. They go from perceptions of the type 'people work like slaves on plantations in multinational companies' all the way to convictions of the type '"P" from "Public" sector comes from playing hard rather than working hard'. Each idea has its own partisans and there are employees who prefer to remain all their life on one side of the barricade due to these ideas. Generally speaking, there are no big differences between state-owned companies and multinationals. Both types of organization focus on hierarchy, unlimited information flow, discipline and the observance of rules and procedures.

In spite of all this, there are differences in work styles that can be seen with the naked eye and which mainly relate to organization. One of the main differences between public sector employees and private sector employees is their work schedule. Employees of state-owned institutions generally enjoy fixed working hours which begin at 8 a.m. and finish by 4 p.m. It is very seldom necessary for them to spend extra hours at work. There are also things that one can do back home. For instance, if you have a report that you have to draw up, you can work on it over the week end, but this situation occurs extremely rarely. One does not have to spend extra hours working on a frequent basis and this aspect is confirmed by many of the employees of a state-owned institution.

The situation is different with multinationals where, if needed, employees get to spend extra hours working for several days in a row in the case of rush jobs. One tax consultant working in a consultancy multinational company, present on the local market, explains: "Most of the times employees themselves are the ones that censor flexibility. As long as your projects are finished in due time, there is no problem and you are even allow to solve your personal problems. In case of projects which admit of no delay, however, there is no room for concessions; nay, employees have to work the needed number of hours in order to deliver the project on due time. There are obviously relaxed periods with few projects and in these cases the working hours finish by 6 p.m., but there are also days when employees leave the office by 9 p.m. or even 11 p.m". In the private sector, a senior economist with over three years of work experience can earn between 600 and 1500 euros a month, while a tax consultant with the same level of experience earns 1500 euros a month. On the other hand, consultants, experts, inspectors and auditors working in a City Hall, for instance, had by the end of last year basic wages that could reach 2000 lei (470 euros approximately), to which all sorts of bonuses and allowances are added.

There are many people who have worked both in the private sector and in a public institution and most of them believe that private sector employees work much harder than public sector employees. Within the public sector, everything moves terribly slowly and one can rarely meet with the concept of management inside state-owned institutions. Although there have been attempts to change this by means of international projects, results were anything but visible. A big problem with the state environment is that there are way too many irresponsible managers who not only put up with the lack of performance but also encourage it. Thus, apart from the fact that everything that is related to internal communication is a "sweet utopia", the relationship with the boss is most of the times formal. Projects are discussed with bosses and they are asked to express their opinion when difficulties arise. Differences of opinion may occur with respect to the interpretation of certain paragraphs from the applicable legislation, but most of the times a consensus is reached quite fast.

On the other hand, multinationals can also confront themselves with internal tension, but this is mainly related to the tight deadlines which have to be observed. Both sides face bureaucracy; yet, in the case of state-owned companies one feels as a defendant, as being held responsible for something or begging for mercy, while in a multinational company bureaucracy is somehow impersonal and easier to bear with, according to several individuals. State bureaucracy rather has its roots in politics. The whole system is politicized and I think this aspect creates the chaos everybody complains about. Bureaucracy is based on political interests since its establishment follows the rules conceived by Ministry officials. I believe everything could be more efficient if performance criteria were taken into consideration to the detriment of political orientation. As to the organizational culture, while private companies focus on a profitability-type of objective, which is usually set up by the shareholders, state-owned companies have generally no objectives. They just fulfil duties following indications in an approved recipe. Even if on the administration level there is a document which approaches these objectives, it is most probably written using a set language and with a low understanding of the strategic concepts and objectives. In the case of public administration and state-owned companies, objectives are not translated into inferior level objectives if these exist. In other words, no one in the system knows how his/her work shall lead to the fulfilment of the general objective or even which this objective is. Employees are only asked to observe some kind of regulation that is written somewhere. In the best case scenario, such recipes for functioning bring losses to the company. Generally, however, they are recipes for failure.

On the other hand, multinational private organizations have a delegation of authority and decision mechanism which, however stiff and imperfect it may often be, is still a lot more than nothing. Their problem is that they focus too much on results with no clear connection to the organization's mission and goals and this may result in hypercompetitiveness on the employees' side. Hyper-competitiveness is modern business world's evil. It is therefore associated with the lack of ethics, cooperation and quality in customer management.

Consequently, state-owned organizations are of the perfectionist-conventional type, process and rule oriented, with no external objectives and no extrinsic motivation whatsoever. Multinational organizations, on the other hand, are competitive-power dependant, meaning that employees are motivated to exceed their colleagues, use force to yield results and allow to be controlled by their superiors. Finally, the public sector employee is no different from the private sector employee. The key is in the way each of them is controlled. State-owned sector employees are not different from private-owned sector employees, except for status and salary. It is true that many of them adopt the "laisser-faire" attitude, meaning that they leave things follow their natural course. The public sector enjoys its highly capable employees just as multinationals have to deal with their "dry lands/woods". Wages and stability is what lures young people into the public sector. If we relate to the human resources policies, we can say that the state-owned institutions' system is way behind the private one. We are dealing with two completely different worlds with no common points between them. As far as differences in recruitment are concerned, in the private sector 80% of it is done based on competence, while in the public sector the ratio is almost reversed in favour of nepotism and political preferences.

Working in a state-owned institution imply:

- fixed working hours;
- formal relationship with the boss;
- a greater job stability;
- the existence of political interests.

Working in a multinational company imply:

- flexible work schedule, but with the perspective of working extra hours;
- more open relationship with the boss;
- possibility to get promoted according to performance;
- more stress because of tight deadlines.

The correlative approach in the management of companies and public institutions, seen in terms of managerial instruments, entails the following conclusions:

- the range of management systems, methods and techniques, that can be used in both types of organization, is extremely wide and, in the same time, varied. Any of the management functions, from projection to control, can be fulfilled with high efficiency results by resorting to specific managerial instruments;
- from the viewpoint of their contribution *to economic, social and educational managerial performance*, one can notice significant differences arising from the constructive and functional specificities of the two categories of organization, companies and public institutions, and even differences within each category arising from the type of organization (small, medium and large sized companies, companies with majority or integral state-owned capital as well as different decentralized and deconcentrated public institutions, etc.):
- at the "management systems" level, we must point out the fact that each such complex managerial instrument has to be approached differently according to its degree of use in the managerial practice. In this way:
- **profit centre-based management** can only be used within organizations whose essential objective is profit maximization (companies, public corporations, national companies);

- the management by objectives is recommended for any type of organization as long as some specificity elements are taken into consideration: the way objectives are set up and expressed (being approached rather quantitatively by companies and rather qualitatively by public institutions), the way the other management components lay their foundations by means of objectives, the way results are evaluated and the personnel that contributes to their yielding gets motivated;
- **project management** is recommended for all types of organization considering the ever growing number of complex, strategic and highly innovative problems. Unfortunately, due to the lower degree of decision autonomy that characterizes the deconcentrated public institutions, project management is seldom applied in their field, as opposed to the decentralized institutions (city halls, prefects' offices);
- exception management is mainly used in companies in spite of recommendations to use it in production organizations;
- the cost-hour-production system is only recommended to companies in the machining industry and under no circumstances to public institutions;
- **product-based management** is also exclusively recommended for companies with a wide well-defined production array.
- with respect to the management methods and techniques, other common or differentiation aspects are signalled, thus:
- **diagnosis** is used following the same methodological line, yet the analysis approach is different. In this way, a company needs a managerial viability analysis together with a financial-economic viability analysis. On the other hand, in the case of public institutions, the latter aspect focuses on the analysis of the way public money is spent, as a form of income valuation;
- management charts are also significantly different for the two types of organization, either due to the different information needs of their managers for which they are drawn, or to the different ways of expressing results yielded in the field that they manage;
- organizational instruments (regulations, flowcharts, job descriptions) cannot stand as authentic managerial instruments since their content does not underline the process, decision, information and structural-organizational aspects needed for the achievement of the different types of objectives. For instance, Regulations for the Organization and Functioning of the county public finance general directorates (the so-called "products" or "laboratories" of the National Agency for Fiscal Administration) comprise a separate chapter dedicated to some structural regulations for the set up and functioning of departments which promote from the very beginning stiff, inefficient organizational structures. As far as job descriptions from the deconcentrated public institutions are concerned, they focus on tasks instead of individual objectives, and their updating is far from being operated on a regular basis. Moreover, it is impossible to pragmatically assess the individual performance concept, which is frequently used in employee evaluation, based on the actual job description model which is heavy and inefficient;
- methodologies for the design/re-design and operative maintenance of management together with its components are identical in content for the two categories of organization, but they are almost never put into practice. While companies make attempts to achieve substantial managerial modernization, public institutions lack this aspect completely, and they all throw the blame on the obligation to observe certain standard provisions.

Reference model of the forecast of human resources (SPRU), originally designed for integrated organizations are faced today with new problems, from the appearance of network - organizations and organizational networks. Although these organizational forms are not new, their development is a major comeback and a way of adapting the enterprises to the new organizational contexts. The paper examines the implications of structural characteristics of this type of organization on the model and the practices of the forecast system of human resources. Following the axiomas of the contingent structural theory of organizations, work assumes analysis of the possibilities of an extension of the sphere and the model theory of SPRU new organizational forms.

Keywords: organization, organizational-network, adaptation, forecast of human resources

Jel classification:L0, L2

I. The reference model

Foreseeable development approaches in human resources is a phenomenon that has started about forty years ago. However there wasn't and there isn't a worldwide terminology accepted by everyone and dedicated to its concrete utilisation (Gilbert, Parlier, 1999).

Planning staff, the concept from which has started, was named in turn 'preventive', management, 'anticipated' management, forecast management (system) of staffs, forecast management (system) of employment, management (system) of places of work and skills.

Emergence of forecasts in personnel management was held in 1960, following the progress of research and development of operational data, the first attempts were made in the American army, in the large western companies and administration practice (Benayoun, 1969). Management forecast models have been developed by several research groups and proposed to enterprises, but they are formed on a purely numerical basis, limited to what is calculable and refers only to long term. Intergration attempts of some elements of a quality appeared in the U.S., but the achievements were not that good.

The human relations era (1970-1975) reveals a transformation of the concept in France (Jardillier, 1972), which becomes "a management forecast of careers", pointing that the objective is the forecast distributions of individuals in accordance with the company requirements and aspirations of individuals. This guidance was applied in the management of staff, specifically in managing their careers, where it was taken and the new denomination.

The renewal of the foreseeable management recorded a revive at the end of the 1970s, in response to imbalances recorded in terms of jobs and worsening of unemployment, combined with deficits of human resources in other sectors. The up to now increase has been replaced by stagnation and human resources management has been faced with crisis prevention, following the massive staff reductions in heavy industry. Large industrial companies were the first to put into practice a management forecast job, which gradually becomes in some countries (France), "a national problem".

After 1990, the company must become more flexible and has to respond close to environmental challenges. It tries to develop, to better respond to these challenges, the potential of their employees in two ways:

- on internally, through polyvalent developing, increasing functional mobility and preventing the exclusion;
- on externally, by support the worker in the accumulation of recognized competences, which can be exploited on the labor market.

Thus it appears, the latest version of the concept, respectively "preventive and foreseen management of employment and skills".

Reference model of SPRU's, done by Mallet (1992), considers that its ensemble of activities it is of a specialized human resources structure. It presumes that activities of this foreseeing system are accurate sequences, chaining of operations to be performed successively in order to reach an effective result. SPRU activities result from the integration of a perspective in the foreseeable activities of presentation and distribution of personnel (Terence, 1993). Forecast lies in introducing a long-term projections (10-20 years, with annual distance) of the personnel structure in terms of age and structure of posts. It is described by a procedure consists of five sequential phases:

- an accomplishment of an inventory by knowing the current human resources (actual, positions etc.);

- forecast the evolution of such resources, accompanied by a probability of achievement, to meet requirements, the use the simulation and optimization (Vermont-Gaud, 1987);
- estimation of differences between what is wanted and the reality at some point;
- identification of risks in order to control the selection in best conditions (description, classification, job evaluation, recruitment, initiation and the testing perioad), assessment and participation;
- designing human resources policies that regulate the differences and optimize the solutions.

The objective of forecast is double and refers, primarily, to the identity the couple man-job at the individual level and then to the actual balance staff-requirements to the group level. Individual management concerns looking for a perfect compatibility between recruited person and tasks to be done, which is found in the job description of the organization. Collective management covers three functions:

- management forecast of staffs, whose goal is to anticipate the evolution of the structure of staff;
- management forecast a job of professors or qualifications based on organization skills required on medium and short term;
- management forecast of careers, attached to renewal of key competencies in the organization.

SPRU purpose lies in the reasoning and the tools used. Its activities describe an instrumental structure, a set of techniques for identifying requirements and staff resources, skills needed, namely:

- a structure of posts that correspond to a grouping and a ranking of the various tasks performed;
- a policy of promotion or career that will match to the desired developments done by individuals, through the posts and taking into account their qualifications;
- a forecast for the next years;
- a policy and a forecast of employment;
- information, discipline and sanctions, physical protection of personnel and social activities.

SPRUs model of reference is organizing the human resources function through various sequential activities derived from key variable, which is the job. Because causes precede effects, optimum causes have to be induced to obtain optimal effects at a certain time. This perspective has renewed human resources management system, adding to its administrative character a corresponding role of the organizational effectiveness.

The renewal of the reference way through organic paradigm did not alter the intrinsic logic of its reasoning. This opened the SPRU towards strategy, that has to adapt the organization to the environmental developments. Thus the system appears as a structure for adjusting the human resource to the developments of the strategy and environment. SPRU practices appear also contingent with different organizational strategies, determined in relation with the environmental configurations.

Keeping the ambition of universality (Igalens, 1996), SPRU evolves towards more universal contingent models, whose validity is limited to specific structural characteristics, and positions as a subordinate function to achieve the strategy. The organic SPRU articulates two contingent factors:

- the first development of the contingent theory is interested in adapting the system to the strategic plans of the organization (extraorganizational perspective). Starting from the definition of strategy, we arrive to the definition of optimal SPRU. Recently appared models are different by variables that they take into consideration. Some theoretical models are studying the foreseeable specific strategies to adapt to different degrees of stability and evolution of the external environment (Mathis, 1982, Stone & Fiorito, 1986), other to appropriate strategies for the growth and development activity (Alpander, 1989; Wils, Guerin, 1991), economic performance (Galbraith, 1993; Jerkins, 1994) or perfection of the organization (Igalens, 1994).
- the second development of this theory aims to achieve the strategy (intraorganizational perspective). Its reasoning is based on the postulate that the organizational strategy can't be achieved unless the employees behaviour don't differ from that which the organization expects. SPRU models try to eliminate the possibility of apparution of such divergent behaviours by providing by the organization adequate stimulus. It skips collective influences on individual behavior, considering that the first is a sum of the other, neglecting the psychological results and choose methodological individualism. A first theoretical set use the SPRH sociopolitical conception, concepting the SPRU elaboratio after a didactic and pedagogical approach (Lawrence, Mills, 1984; Fornbrun, Tichy, Devanna, 1984) or by satisfying the expectations of employees and the organization (Walton, 1984; Peretti, 1986, Igalens, 1997) or even through a cultural approach (Armstrong, 1992; Schuler, 1993). The second theoretical set adds to the sociopolitical dimensions an economic concept (Savall, Zardet, Iseor, 1995). More than divergent, the two theoretical stes demonstrate their complementarity in the construction of a SPRU linked to the organization a strategy, to its environment and guarantees the existance of human resources adjusted to strategic options.

II. The specific of new organizational forms

Development of competitional system has led to the emergence of organizational networks and a network organizations which pose problems for the forecast system of human resources. This model was designed for an organization with a compact structure, with an a well-defined place inside, rational and rationalized.

Organizational network is based on the interdependence and the reunification of independent organizations from juridic conception, the best known case is of a sustainable cooperative relations established in a car company and

its equipment provider. These relationships are characterized by relations of cooperation in a joint project (design and production of a car), each partner contributing with a part without which the ultimate goal can't be achieved. The leader of such organizations seek the combination of actors (partners) and not factors of production to optimize the profit.

Network organizations shall agree and work independently within a channel of value added harmonizing their plans and assuring to each other a degree of guarantee for the future (Frery, 1994; Desreumaux, 1996).

Network organizations are organizations running horizontally, such as transversal team set and configured for various missions, in whitch incorporation and the departure of the experts is based on the requirements and key competencies. Changing that appears here is developing within the organization and is characterized by the creation of multifunctional teams for a project that manages its parallel phases (Weiss, 1994). Other researchers define network-organization as a structural form by reducing the number of hierarchical levels, in which the decision is founded on expertise and less on hierarchical position, which increases flexibility by developing antreprenorial structures (such as SMEs), where is improved participation and self-discipline (Desreumeaux, 1996). In both cases, the organization manages processes in uncertain and unstable environments, where the reactivity must be intense manifested. Simon (1993) highlights another aspect of the network organization, namely it represents a structure able to learn, integrating in real-time restrictions and environmental opportunities. Taking the example of the automobile sector and the evolution of large companies, Moidson and Weil (1992) identify two points of this type of stucture, also known as the structure through project, respectively its secventiality and closing. Regardless the perspective from which it is analyzed, extraorganizational - by articulating legal independent organizations - or intraorganizational - with a multi-organizational activity, network - organizations cause changes in the forecast system of human resources.

III. SPRU classic model and new organizational structures

As mentioned above, the reference model of SPRU is a sequential and normative model, instrumental and tehnicist, which is based on a formal organizational structure in which jobs are defined, are managed staffs, qualifications, careers, pay and training etc. Network organizations and organizational networks no longer meet the basic principles of bureaucratic organization: a rational definition and specialized of work, a chain conceived as a process of adjusting and coordinating activities. The parameters of coordination and design of network organization - don't result of a standardization procedures or results (Mintzberg, 1995), but from a standardization of skills, itslef obtained by standardizing qualifications (professional bureaucracy) or jobs (adhocraty).

Structural analysis of network organizations provide a first conclusion regarding contingent practices SPRU. The degree of complexity of business organization, and levels of standardization and its forecast of tasks, is a factor in relation to practices and coordination of SPRU default. It determines the degree of autonomy of each employee in the work situation, because the assumption of a complex activity is difficult to control by an organization (such as assessment of the effectiveness and efficiency of employees' work of a project), while a "simple" organization may be exhaustive described by a definition of the job. Abandoning the notion post, known as a set of required tasks, whose execution is prescribed by the enterprise, apply for a structure based on the SPRU other variables associated to collective competence.

Implications for SPRU are centered around the concept of training. SPRU aims to prospect and develop skills, knowledge, and starting from here, the individual experiences. In classical organization the goal aims to develop adapting skills of the organization to its environment or even of the capacities for innovation, namely structuring / modeling of the environment to its structures.

From this point of view, the cross-project groups, multidisciplinary, don't have the vocation to achieve the tasks of study or production. Their roles is to ensure overall coherence of the project and coordination between project collaborators of various functions of the organization. These groups seek to optimal allocation and use of resources, accelerating the circulation of information and mobilizing the actors on the priority axes. Continuing the example of incorporating a car, Moidson and Weil presents this complex activity, which needs to articulate the different tasks of different competences, involving different players, teams, or the establishments partners. The competencies of the players are determined for the suport and the effectiveness of the project, developing through the experiences generated by it.

The organization-network is based on the interdependence between individual and collective efficiency, links and determinants of close cooperation. Thus, from an individual management competence, SPRU moves to a collective management skills of the organization-network. Its position is to develop and perpetuate the skills, knowledges and organizational experiences, sharing some elements to different actors individual and collective (Weick, 1995).

The complexity of tasks, activities, a media-network organizations require a multidisciplinary design, to gather teams and projects around a shared purpose, with different competent professionals. So change the meaning and purpose of training, which have a cross character, including professions, trades, establishments or teams.

A new method of inducing an organizational management skills and project team transcede the usual spilts between functional and optional services, the opposition between individual and collective development and simultaneously stimulates the expertise of each employee in the profession (Midler, 1995).

It is also necessary to identify the occupations and critical skills to the achievement of the project. From a technical point of view also, this function of the SPRU regards the developing a management system based on the available skills, both individual and collective (jobs). Thus, various competences look determinant for project success, namely:

- ability of the actors to connect and maintain relational networks with other actors and applications, through their critical competences in the project, essential for realizing the project, which is an prior item to the group project;
- relational and pedagogical skills of players who completed their technical expertise, work on the project effectiveness and of collective structure;
- autonomy, competence and self-organization of labor and management time determines the efficiency in project management. Management competencies of the project claim the construction of some methods and indicators for assessing its specific advancement.

Supporting the integrity and the unique vision of the organization, its structure, avoiding the risks of disruption in the pilot islands, controlling coherence and relevance of various projects and ensure their integrity and organizational missions. The organization-network is structured thourgh projects and structures that appear and disappear, it recomposes, which leads to risk of disappearance of a whole unit. SPRU has the mission to develop and communicate a book

project in progress to all employees.

In the external phase of change structures, the organization requires management of human resources to accompany the evolution from a functional structure to the dot-matrix, contributing to the emergence of new function - head of project, which should ensure the animation and regulation, the composition of the group by identifying critical skills.

Staff evolve to new hierarchical roles, to heads of the project assuming a role of animation and development of agents skills.

In the network-organizations the conception of human resources management is different depending on projects and professional (employees) who are or are not involved in the projects. The employees involved in the project belong to groups of occupations (jobs) of which are strategic for the organization, covering mission and its basic activity. SPRU becomes more individualized and, in part, delocalized at the level of group - project. Members of the group are breaking the special functional behavior, which influences its behavior or of his former colleagues to come-back.

Problems appear also to the actions of assessment, remuneration and career as project team members work evolves in different projects with different heads on different periods.

Conclusion

The development of new organizational forms is characterized, primarily, by the appearance of new structures. It put such issues in terms of validity and transferability of the reference model of SPRU to new organizational forms. Appealing to contingent structural theory, the paper reminds the structural characteristics of network-organizations and organizational networks to identify the research required by SPRU in such situations. Their organizational structures put in evidence the complexity of their activity, which requires a flexible organization in time and space. The aim of this paper is to fix some coordinates necessary to the construction of a specific SPRU to these evolutionary organizations. On one side are shown horizontal coordination mechanisms inherent in project groups, on the other hand the changes that these new organizational forms need to find an answer in the management of human resources and SPRU.

Education, training and vocational training play a vital role in Europe economic and social strategy. Training has become a national priority in all European countries, being a component of the concept of "life long learning" set in the Amsterdam Convention and again by the European Commission. Currently it is required the implantation on the educational ideology perimeter of some models taken from the field of scientific management and their adaptation to nowadays specific educational market. It is necessary to find a balance between social skills and develop attitudes, on the one hand and knowledge of general and specific occupational areas, on the other hand. Taking to account the utility on the labor market, it should be reconsidered those capacities which belongs to the general preparation and ability, communication skills and working manual of mental capacity to work collectively educate sustained work ability, the ability of independent learning.

Keywords: lifelong learning, learning society, the curriculum

JEL classification: A23

The concept of lifelong learning

Modern educational policies have as main purpose building and developing the learning society concept, characterized by the transition from education, where school is in center, to the one based on lifelong learning, by developing professional software conversion and continues training. This educational guidance is based on adult education reviving need as a result of confrontation with the major problem of unemployment and significant changes in the economic and social system due to the dynamism imposed by technological revolution.

The "life long learning" term has its roots in the concept of "life long education" used in the 1920s in connection with northern education system (Hasan, 1996). After 1970, there were used other terms, namely "recurrent education", "popular education", "continuing education", "adult education", "post-initial education and training". "The most quoted document referring to the life long learning term is "Learning To Be" (Faure et al, 1972).

During the 1980s the incidence of bibliographic references to the terms lifelong education and lifelong learning declined, while those to the term "adult education" continued to remain at a constant level. He does not fully explain this phenomenon. It may be that the focus in many countries throughout the 1980s combating the severe social and economic effects of recession and widespread unemployment by raising the literacy, skills base and quantifications of the adult population explains why a more specific term, such as "adult education" proved more useful for policy makers. Using a more specific term might also have helped them to distinguish between the needs of younger resource older and learns to relation in the labor market in a time of economic constraint and limited state budgets for education and training. During the 1990s, at international policy level, and individual in many countries at national level, lifelong learning became an umbrella term subsumed which part or all of what might earlier have been referred to as "lifelong education, recurrent education, popular education", "adult education" or simply "post-initial education and training".

The OECD report (1996) includes all aspects of education and training from pre-school through to adult education and includes learners of all ages within the concept of lifelong learning.

Lifelong learning was response to the 1990s, or even defense against a changing, frightening and unknown technological, economic, social and political environment-it became a concept as slippery and multifaceted as the environment in which it exists.

Others view the economic, technological, demographic, cultural and social trends prevailing in the 1990s as an intensification of a process that was present in earlier decades, but which grew in importance over the last quarter of the 20th century. Where agreement is hat is the speed of technological, particularly ICT, developments during the 1990s led to significant changes in employment trends, career patterns and skill demands (OECD, 1996). This, together with a widespread concern about the economic effects of increasingly aging societies (OECD, 1998), encouraged national governments and the international organizations to which they belonged, to consider policy instruments which might be used to meet these new demands.

Content of teaching is extremely important for the initial formation of the adult; it must be analyzed not only through the prism of what is taught but how, why and with what results. Educational ideologies evolution is significantly influenced not only by concepts of the curriculum but also by its actual configuration.

A development of the progressive current in the nineteenth and twentieth century is considered to be reconstruction, appropriate educational ideology of a democratic society with unlimited opportunities for

experimentation and development. Under this ideology, the curriculum should be structured according to the requirements of social life with significant influences over the individual quality of life.

Currently it is required the implantation on the educational ideology perimeter of certain models taken from the field of management. It is necessary to find a balance between social skills and attitudes development, on the one hand and knowledge of various general and specific occupational areas, on the other hand. Taking to account the perspective of the labor market, should be reconsidered those capacities which are the general preparation and ability, communication skills and mental and manual working, of collectively working capacity, educated sustained work ability, the ability of independent learning.

Lifelong learning at national, european and international level

The European process determined by the changes of recent years in the economic, social, cultural, political and academic world gives a very important role through the necessity of building and strengthening intellectual, cultural, scientific and technological dimensions of the new Europe. Only a Europe of knowledge is able to provide its citizens with the skills necessary to face the challenges of the current millennium.

The debate of continuing training of adults and the relationship between this and a sustainable development as a mean of eradicating poverty is a major concern and high current level. Thus, in Budapest in the period 3-5 December 2008 it was held the Pan European conference, that joined the following conferences prior to the sixth International Conference of Adult Education CONFITEA - VI which will be held in May 2009 in Brazil and its propose to discuss issues related to policies, structures, funding, quality, lifelong learning skills of duties as citizens and as a means of eradicating poverty.

Lifelong learning is an essential strategy in educational policy domain for civic attitudes development, social cohesion and personal fulfillment.

Education, training and vocational training play a vital role in Europe economic and social strategy. *Training* has become a national priority in all European countries, being a component of the concept of "life long learning" issued in the Amsterdam Convention and again by the European Commission in a statement that has the following *key points*:

- continuous and universal access to learning through the accumulation of basic knowledge, especially knowledge of science, foreign languages, entrepreneurship, technological culture, social knowledge to face the challenges of knowledge-based society;
- an increased amount of investment in human resource;
- the application of innovation through the use of methods of teaching-learning specific continuing education;
- assessment of learning;
- ensuring an easy access to quality information and advice on learning opportunities for every age;
- organization of education throughout life as close to home.

Continue training provides important opportunities on the individual to maintain and develop skills and abilities; it is an individual strategic objective.

In Romania, the professional training of adults according to Government Ordinance no.129/2000 has as objectives: to facilitate social integration of adult on the labor market, improving training in the basic occupation and occupations related, to acquiring advanced knowledge, modern methods and processes necessary for tasks of service, professional development skills already acquired and acquiring new skills. Adult training includes the initial and continuing training organized by other forms than the specific national education system.

The relationship of cooperation between education institutions and businesses, universities, business community, local community is called by the Government Ordinance No 115/2000 of *social partnership in education and initial training*, and activities relate to the development of knowledge, human resources development, development of voluntary and optional components of the national curriculum, the establishment of professional qualifications, diversifying and increasing sources of revenue of establishments of education, etc.

Training adults is differently organized than the original one and takes account of the needs of employers, of the basic skills of adults, the requirements imposed by the employment and adults' opportunity to build a career.

The procedure for training adults are courses organized by employers within their units or by specialist trainers, training courses and practical training in units throughout the country and abroad and other forms of training provided by law. To authorize providers of training at national level was created a body which coordinates this activity, namely the National Adult Training.

A component of the Bologna Process concerns to the higher education organization on the cycles of learning and is closely related to the need to increase the quality of education and the creation of closer links between higher education and research, between higher education and economic environment.

Common bases of European higher education are based in accordance with the Bologna Process, on two main cycles which divide higher education on different levels, known as Bachelor and Master in order to develop a rigorous framework, common to the qualifications of national and internationally level.

According to art. 9 of Law 288/2004 on the organization of university studies in Romania, university masters "provides in depth studies for a license or in an area near capacity building and scientific research as a basis for compulsory preparatory doctoral studies".

Education Law No. 84/1995 on art.134 states that the Ministry of Education grant specialist assistance, on a contractual basis, those who organize various training programs in adult education system and the permanent conversion training.

For Romania to participate in the Program for Integrated Lifelong Learning (LLP), officially launched at European level in May 2007, was created in 2005, the National Agency for Community Programs in Education and Vocational Training (ANPCDEFP - www.anpcdefp.ro), and for 2008 have been allocated from the budget over 21 million for the development of "Lifelong Learning". Since 1 January 2007, The SOCRATES II and LEONARDO DA VINCI II continues in a manner integrated with the new *Community Lifelong Learning, LLP - Lifelong Learning Program* 2007-2013, which will be held between 1 January 2007-31 December 2013.

Central Priority of the Lifelong Learning Program is to strengthen the contribution of education and training in achieving the Lisbon objective, of transforming the European Union into the most competitive knowledge based economy, with sustainable economic development, more and better jobs, and increased social cohesion. Each component of the program give priority to actions that support national strategies development for lifelong learning in the participating countries and consolidate cooperation between the various components of the system of national education and training, is strengthening the content of lifelong learning and supporting the acquisition of competent key.

Legislation it was created and that regulate the activity of training and adult education in various fields: Law no. 375/2002 for adults training, which provides the overall framework for the creation of training providers, Government Ordinance no 67/2007 on Romania's participation in community programs "Lifelong Learning", "Erasmus Mundus" and "Youth in action" during the period 2007-2013, OMECT no. 5.056/2008 regarding the provisions relating to the legal establishment and organization of university masters programs.

Dynamics of adults participating in the initial and continuing training

According to 2009 EUROSTAT edition, in 2006 the Romanian pupils and students was 3.8 million, meaning 4% of all European pupils and students, and students represented 21.8% of the total school population, compared with 20% of European average. Share of population aged 25 to 64 years included in the training is about 3% to almost 10% European average (Europe 27).

Number of higher education institutions increased from 48 to 286 students in 1991 to 104 to 775 of faculty in 2007 and the rate of students per 10,000 inhabitants from 81 in 1990-1991 to 364 students per 10,000 inhabitants in 2007

Between 1990 and 2007 the number of students increased by approx. 4 times and the highest growth recorded per students to university courses with low frequency (about 6 times) followed by students in university courses in education day (about 4 times) and open distance learning (about 3 times).

If in the 1990/1991 academic year, the technical specialties represented 62.5% of graduate school, in 2006/2007 they were only 21.7%, the medical-pharmaceutical were halved, while economic specializations and share tripled, and the legal increased about 5 times.

Postgraduate education has been an increase in the total school population from 1% in 2002/2003 to 3.2% in 2006/2007.

Population by level of school education Table No 1. (% Total school population)

Education level	2002/2003	2003/2004	2004/2005	2005/2006	2006/2007
Higher Education	14,1	15,1	16,5	18,6	20,7
Postgraduate education	1,00	1,40	2,00	2,60	3,20

Source: Source: Romanian Statistical Yearbook, 08-Education p.353

In 2007-2008, according to the Report on the status of national education in 2008, higher education had the most spectacular growth, 6.4% more compared to the previous year. Thus, today more than half of the population age range is appropriate for this level of education. If the academic year 2000/2001 the rate of coverage in higher education was 27.7%, in 2007/2008 amounted to 53.6%. The rate of coverage of female population in higher education is higher by about 5 percentage points than that of men throughout the period 2000/2001-2007/2008.

The rate of occupancy of the active population at the University has increased during 2001-2007 from 81.7% to 86.6%.

A very significant indicator to highlight the effectiveness of external learning system and its adaptation to the needs of the labor market is the *insertion of graduates of various levels of education who have found a job one year after completing their studies*. Unfortunately, there are no investigation systems at national level for different levels of

education competence. Last investigation on the transition from school to work (in the investigation AMIGO) conducted regularly at system in Romania, took place in 2000 and is planned for current year.

Public expenditure on education as a share of GDP, highlights the financial support made by system for education sustaining and the importance given to education as a system and different levels of education and is issued as follows:

Public expenditure on education as% of GDP Table no. 2

2000	2001	2002	2003	2004	2005	2006	2007	2008
3,4	3,6	3,6	3,5	3,3	3,5	4,3	5,5	cca.6,0

Source: Ministry of Education and Research, General Directorate for Budget, Finance, Investment and Heritage

Romania continued trend of increased funds allocated to education as the Czech Republic and Bulgaria too, significantly closer to the average of the EU member countries. In 2007 Romania has allocated to education more than 17% of total public expenditure, being one of the privileged public services, including higher education having returned 3.9% (MECT, 2008, INS, 2008).

If we refer only to expenditure on higher education in total spending for education, we can find maintaining their weight around 22% during 2002-2007.

Total expenditure for continuing training as an expression of the total percentage of total expenditure on education should be calculated by considering the public and private contributions too. Unfortunately no information necessary to establish the correct value of this indicator is available. Joint Interim Report 2008 draws attention to the effectiveness and sustainability of funding education and training remain the most critical EU member. In Romania, the average expenditure per employee continues to be well below the European average.

According Progress Towards the Lisbon Objectives in Education and Training Report, Commission of the European Communities (2008) there are large differences with regard to participation in adult education and training between the EU Member States: the Scandinavian countries and the UK recorded the highest rate of participation over 20%, while in Bulgaria, Greece, Romania these rates are around 2%, over four times lower in comparison with the EU average.

In 2007 the rate of participation of adults (25-64 years) on education and training is at 1.3%, when the European states that the objective value is at least 12.5%.

In Romania, there are many *university departments of continuing education or lifelong learning and developing centers of excellence* in the programs of the National Council for Financing Higher Education (CNFIS) financed by the World Bank. Center for Continuous Training mission in the universities is to monitor and manage training programs conducted at their level. These training activities are defined as training activities in the sphere of vocational training programs which involve the conversion / reconversion / professional training courses, postgraduate courses for specialization, postgraduate refresher courses, workshops, summer schools.

Some departments integrated to the PRIME-NETWORK European association (Interuniversity Professional Networking for Educational Management).

The following extract from a report in 1994 by the Commission of the European Community is typical of policy documents of this period: "All measures must therefore necessarily be based on the concept of developing, generalizing and systematizing lifelong learning and continuing training. This means that education and training systems must be reworked in order to take account of the need-which is already growing this year set to grow even more in the future-for the permanent recomposition and redevelopment of knowledge and know-how".

MANAGING RENEWABLE ENERGY IN THE EUROPEAN UNION

Zamfir Andreea

Academy of Economic Studies Bucharest Faculty of Management 6th Piata Romana RO 010374 Bucharest Romania zamfir andreea ileana@yahoo.com +4021.319.19.00/250

This study investigates the instruments used by governments in order to support renewable energy sources in the European Union. The findings of this study reveal that policy goals could be achieved by using a large variety of instruments. The study was carried out by combining a wide variety of sources, such as strategies, reports and regulations. The methodology and the results reported in this research could be used for designing new, harmonized policy instruments to support renewable energy sources in the European Union.

Key Words: renewable energy, environmental protection, policy instruments, supporting schemes

JEL Classification: M11, Q42

1. Introduction

This study investigates how the governments could better promote the use of renewable energy sources. The manner in which renewable energies are supported is a highly debated issue these days because of renewable energies' role within the energy scenario. The main conclusion of this study is that policy goals could be achieved by using a large variety of instruments.

The research was conducted using a wide variety of sources, such as strategies, regulations, road map, as well as articles and reports. The research question was answered by analyzing published sources, evaluating and interpreting evidence. Answering the research question was difficult because some policy instruments used in several countries in order to support renewable energy generation are still too young to be evaluated.

2. Background

There are at least four reasons for valuing renewable energies: first, society relies mainly on fossil fuels, which are limited and non-renewable; second, fossil fuels will be exhausted in a foreseeable future; third, the use of fossil fuels has generated environmental effects that negatively affect social well-being beyond acceptable limits; fourth, renewable energy sources could satisfy the needs of modern society in terms of consumption and environmental impact.

Renewable energies promise some strategic improvements in the security of supply, reduce the long-term price volatility to which the European Union is subjected as a price-taker for fossil fuels and could offer an enhanced competitive edge for the European Union energy technology industry. In addition, renewable energies reduce air pollution and greenhouse gas emissions. They also facilitate improvement in the economic and social prospects of rural and isolated regions in industrialized countries and help meet basic energy needs in developing countries (Commission of the European Communities, 2006). Sustainable development is possible only when it is based on the real type of economic progress in harmony with the limitations in nature, especially the amount of natural sources and the regeneration and neutralization capabilities of the biosphere combined with human-made emissions (Pozeb & Krope, 2007). Therefore, the main research and development priorities are the development of renewable electricity, cost reduction and research on environment issues, as well as the need to adapt the electricity networks to new technological, economic, environmental and political realities (Kjaer, 2006).

The development and implementation of green electricity policies have evolved differently in European Union's member states. The current revenues expected for renewable electricity are largely dependent on the variety of national support systems. The revenues will be determined by market conditions, whereby competition between technologies determines the prices. In this context, member states' support systems for renewable electricity production may be extremely important.

3. Policy Instruments Used for Promoting Renewable Energy Sources in the European Union

European Union is applying a range of policy instruments to encourage electricity from renewable energy sources and to bring nature closer to an environment friendly consumption (Gan et al., 2007; Pozeb & Krope, 2007). According to Gan et al. (2007), a general tendency in European Union is that policies shift emphasis from research and development stimulation towards dissemination and market application of renewable energy technologies. The instruments used to promote renewable energy sources are usually grouped in more categories, the most widespread formula being direct and indirect instruments (Table 1).

Table 1 Policy instruments used for promoting renewable energy sources

No.	Policy instruments				
		•	1.1.1. Subsidies and loans		
			1.1.2. Tax exemptions or advantage		
			1.1.3. Feed-in tariffs		
			1.1.4. Green certificates		
		1.1. Financial measures	1.1.5. Bidding		
	Direct instruments		1.1.6. Funding research and development		
1.			1.1.7. Interconnection regulations		
			1.1.8. Independent power producer framework		
			1.1.9. Biofuels mandate		
		1.2. Non-financial	1.2.1. Negotiated agreements between producer		
			and government		
		measures	1.2.2. Quota obligation on production		
			1.2.3. Quota obligation on consumption		
		2.1. Information campaigns			
	Indirect instruments	2.2. Education and training			
2.		2.3. Labelling			
		2.4. Technology standards and certification			
		2.5. Grid connection standards			

Direct instruments could be financial measures or regulations, while indirect measures are represented by actions taken in other sectors that could influence the use of renewable energies, such as: education, information, standards. Taxes, subventions, environmental product marking, and green certificates are only some examples of such environmental instruments. The decision on what kind of instruments should be used is a very important one, as the instrument to be used will influence the outcome and the public expenses. How the decision is taken depends on the criteria used for the evaluation of the policy instruments. Usually, several criteria are used, and the final decision depends on how much weight is given to each criterion.

Electricity generation from renewable energy sources is promoted within the European Union by using different groups of support systems: feed-in tariffs, quota often combined with tradable green certificates, tender, and tax incentives or investment grants (Ragwitz et al., 2004; Pfaffenberger et al., 2006; Ragwitz et al., 2006; Swedish Energy Agency, 2008; Valle Costa et al., 2008).

It is to mention that policy instruments used to support renewable energies do not make any difference among various types of renewable energy sources. There are countries in the European Union where only one instrument is used to support wind onshore, biomass, biogas, small hydro and solar energy (Ragwitz et al., 2006; Howley et al., 2008; Swedish Energy Agency, 2008; Federal Ministry for the Environment, Nature Conservation and Nuclear Safety – BMU, 2008; Valle Costa et al., 2008). For instance, Austria, Denmark, Estonia, Portugal, Spain, Hungary and Lithuania use feed-in tariff as the only instrument to support all five renewable energy sources. For these renewable energy sources different instruments are used in different countries and all instruments could support each one of the renewable energy sources. Each country could choose any instrument or mix of instruments to promote renewable energy sources, taking into consideration the local conditions of renewable energy sources, the costs and the target for market penetration.

The use of renewable energy sources is stimulated in most countries by more than one instrument. This statement is based on surveying the support schemes applied by the different European Union countries to stimulate renewable energy development. National support is essential in order to ensure the development of renewable energy sources. A wide range of policy instruments are mixed support schemes, which vary among member states. Generally, a mix of instruments is essential and a key to success.

The dominant instruments for promoting the generation of electricity by renewable energy sources have been feed-in tariffs and quota with green certificates. These two instruments were also found as having high effectiveness (Dijk, van et al., 2003).

Feed-in tariffs are used by a majority of European Union's member states for promoting electricity generation from renewable energy sources. For instance, in Germany, Spain and Denmark they have been successful in supporting the expansion of wind, biogas and solar power production (Ragwitz et al., 2004; Ragwitz et al., 2006; Swedish Energy Agency, 2008). According to Ragwitz et al. (2006), this system allows independent electricity generators to sell green electricity at a fixed tariff for a determined period of time. The main advantages of feed-in tariffs system are the long-term certainty about receiving support, which may significantly reduce investment risks, and the

possibility of early market diffusion of less mature technologies, which may reduce costs for society in the long term. However, the system of feed-in tariffs was frequently criticised for not stimulating competition among electricity generators to a sufficient degree to bring down the costs of renewable energy technology investments (Ragwitz et al., 2004).

Green certificates or electricity certificate systems or quota obligations are used in several countries within the European Union (such as Sweden, Romania, Belgium etc.) and are based on the principle of imposing minimum shares of renewable electricity on consumers, suppliers or producers (Ragwitz et al., 2004; Ragwitz et al., 2006; Swedish Energy Agency, 2008). Compared to feed-in tariffs, quota systems are strongly market-oriented policy systems (Ragwitz et al., 2006), based on the interaction between the supply and demand of certificates. The producers receive additional revenue from certificates, in addition to that from the sale of electricity. This support system encourages expansion of the most efficient types of renewable electricity generation (Swedish Energy Agency, 2008), but there is a risk of supporting only lower-cost technologies, as forecasting the price of green certificates over a long period of time is difficult. A particular case in the European Union is Latvia which uses a quota system without certificates that includes elements of quota system and tenders. The Latvian system is based on quotas established yearly, determining the amount of installed capacity from renewable electricity that may be produced within the country.

The tender scheme, that has been used in the United Kingdom and Ireland and is still used only in France, is a quantity-driven mechanism (Ragwitz et al., 2006), meaning that the state calls for offers from companies wanting to supply renewable electricity on a contract basis at a particular price. The company submitting the most competitive tender receives the contract, and the consumers who purchase the electricity have to pay a fee element covering the additional costs arising in connection with production of the renewable electricity (Swedish Energy Agency, 2008). The main advantage of the tender system is related to the awareness of renewable energy investment opportunities (Ragwitz et al., 2004). Nevertheless, the market uncertainty and the risk of not covering the cost of electricity production through tenders lead to a much lower penetration of renewable energy sources than expected.

Tax incentives form a group of policy measures that include tax relief, exemptions from energy tax, grants and investment support (Ragwitz et al., 2006; Swedish Energy Agency, 2008). Frequently, these mechanisms are used in order to complement other types of policy measures for promoting renewable energy sources. For that reason it is difficult to evaluate the results of the tax incentives as instruments for promoting renewable energy sources.

4. Conclusions

The study reveals that policy goals in the renewable energy field could be achieved by using a large variety of instruments. This conclusion is based on the premises that (1) the local conditions of renewable energy sources, the costs and the target for market penetration influence one country's option for one instrument or a mix of instruments; (2) various instruments are used in different countries and all instruments could support each one of the renewable energy sources; (3) countries with more experience in this field use a variety of supporting schemes; (4) the market penetration of renewable energies is influenced by many factors; and (5) policy instruments complement each other in achieving the energy policy objectives.

The findings of this study could justify the effort invested in designing new policy instruments. This could be helpful in order to better address the problems encountered in supporting the use of renewable energies.

SERVICE QUALITY IN THE AUTOMOTIVE INDUSTRY

Zima Liliana Adela

Ph.D.The North University of Baia Mare Faculty of Sciences, Victoriei Street No. 76, 430122 Baia Mare Email address: lili zima@yahoo.com; tel: 0741289893

Abstract: Every company and every team must be concern today about the quality of services because is a perfect correlation between the level of the "First Time Service Quality" and "Customer Loyalty". We must answer many questions regarding our customers: Who receives directly the products of services that you produce? How does your customer use that you produce? What would happen if you did not do your job right? How do your errors affect them? How do you find out if you are not meeting the needs or requirements of your customers? How far beyond your immediate customer can you trace the effect of what you do?

Keywords: service quality, customers expectations, customer loyalty, service satisfaction survey.

JEL code: M: Business, Administration and Business Economics; Accounting

1. INTRODUCTION

The need for a customer to have to bring his/her vehicle in for service, whether it be routine maintenance or to get a problem fixed, is in itself a burden. But the need to bring in back more than once for the same reason is a **major** dissatisfy.

Consider for a moment the time it takes a customer to travel to the retailer, the wait to be attended by service reception, the loss of one's transportation, the time and alternate transportation required to pick the vehicle up, and once again the wait at service reception to have the vehicle returned to the owner. This is anything but a pleasant experience and with today's level of "First Time Service Quality", the customer is faced with having to return and do it all again 44% of the time.

This article outlines a simple process whereby a retailer can identify, track, analyze, and resolve the reasons why a vehicle was not fixed at the first attempt. The result is drastically improved customer satisfaction and increased profits through the elimination of waste. The a perfect correlation between the level of "First Time Service Quality" and "Customer Loyalty".

In today's highly competitive automotive environment, there is no alternative but no meet and exceed customer expectations. You are asked to take the challenge and utilize this tool to effectively increase your level of "First Time Service Quality". For example, General Motors International Operations has set a goal to increase "First Time Service Quality" from the current level of 56% to 70% by the year 2009.

This article is aimed at helping you reduce the biggest single cause of customer dissatisfaction in your Service Department; Customer Comebacks. I shall refer to this topic, the process, and the performance measure as "First Time Service Quality".

All comebacks happen for a reason. Sometimes, this reason has to do with factors totally within your control at the dealership. Sometimes, it has to do with technical problems related to the product itself.

But whatever the reasons, your job at the dealership is to (1) find out what they are, and then (2) quickly take steps to control them, to the degree that you can.

It must be find a systematic approach for achieving both of these goals efficiently and effectively, at virtual no added costs to your current operation.

But as with so many aspects of service Department operations; if you, the Service Manager, do not take an active and continuing role in First Time Service Quality, the Comebacks will continue to be a problem – a problem none of us can really afford in today's highly competitive automotive market place.

2. GENERAL ASPECTS ABOUT THE PROCESS FOR IMPROVING FIRST TIME SERVICE QUALITY AND MINIMIZING THE IMPACT OF COMEBACKS

2.1. The definition and the type of comebacks

Definition: A comeback is any instance in which a customer must bring his or her vehicle back to the dealership to have work done that should have been done correctly the first time.

It does not matter why the work was not done - or done properly - the first time. The customer will not care what the technical reasons for the Comeback might be - an operations problem, competence problem, or product problem. All the customer knows is that he or she has had to return to the dealership a second time for the "same" problem ... and that's a "Comeback".

Comebacks are the single greatest cause of customer dissatisfaction and of poor Service Satisfaction Survey (SSS) scores. Comebacks erode consumer confidence, undermine customer loyalty and repurchase intention, and eat away at Service Department profits.

First Time Service Quality has a major impact on customer referrals to your business – very positive if is high, very negative if it is low.

Since most new-car purchase decisions are heavily influenced by the buyer's service experience, a poor First Time Service Quality record in the Service Department can have a devastating effect on the sales showroom floor.

So every Comeback has the potential for creating a tremendous "rippling" effect on your dealership's bottom line, which can in time add up to tens of thousands of dollars in lost revenues. Refer to the Figure Nr. 1.

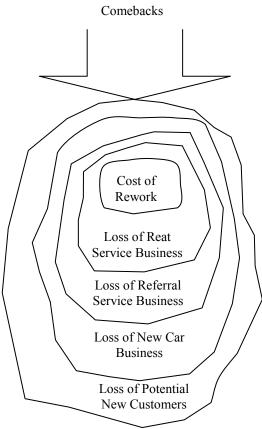

Fig. No.1. Comebacks

There are two kinds of Comebacks that affect First Time Service Quality – *AVOIDABLE* Comebacks and *UNAVOIDABLE* Comebacks. Avoidable Comebacks are those caused by conditions or actions in your workshop that are directly within your power to control or change, for example:

Service Advisor who do not accurately or completely fill in the Job repair Order so that the Technician knows exactly what the customer complained about or the actual condition(s) the customer described.

Service advisor who are unable to recognize a "Comeback Potential" situation when it arises, and who (therefore) do not respond appropriately to it.

Technicians who are inadequately trained or without the skill to do the repairs they are asked to do.

Technicians who do not have the tools or equipment to properly diagnose a vehicle's problem(s) and/or to repair them.

An understaffed Service Department that can not handle all the repair orders coming in on a given day (thus making customers "come back" another day for service).

A Parts Department that is not carrying an adequate inventory or that refuses to use expedited ordering procedures when the need arises to prevent a Comeback due to "parts" unavailability.

The lack of quality assurance procedures – including road testing and (where appropriate) visual inspection – applied to every repair after completion to ensure that problems cited on the Repair Order have been corrected.

Service department employees who do not adequately understand the crucial relationship between First Time Service Quality, customer satisfaction, SSS scores and the dealership's bottom line, and who (therefore) are not adequately motivated to achieve and improve First Time service Quality (or lessen the negative impact of Comebacks when they do occur).

In the vast majority of these cases – where a comeback is due to some failure in the Service Department – this failure can be easy to detect and easy to correct. That's why we say that these Comebacks are "avoidable".

As a practical matter, however, some levels of Comebacks are inevitable. Nobody's perfect, and even the best Service Advisors and service Technicians sometimes make mistakes. But there are also other reasons in addition for what we call "unavoidable" Comebacks, for example:

Sometimes, customers complain of problems that are of an intermittent nature, which are often impossible to accurately or completely diagnose on the customer's first repair visit.

Sometimes, a motor car develops a condition for which GM/Opel/Vauxhall has not yet developed a service fix; or, a Technician might (with the best intentions) try to "fix" something that's considered normal and operating the way it should.

Sometimes, a Technician will choose to employ a less-than-maximum repair procedure – to save the customer time, money, or inconvenience – only to find later that the symptoms re-occur and that a "bigger fix" than has to be carried out.

Sometimes, because of a mistake in a parts catalogue or service manual, a Technician will inadvertently install the wrong part, which ultimately does not solve the problem and (inevitably) results is a Comeback.

2.2. Improvement process

The test of a good Service Department is how well it responds to Comebacks when they do occur, (even after everyone has done everything possible to prevent them) and how well the department addresses the great potential for customer dissatisfaction inherent in every Comeback situation (regardless whether the Comeback is considered to be "avoidable" or "unavoidable").

It is possible to create a comeback-prevention and comeback-response process in your Service Department that virtually eliminates customer dissatisfaction caused by deficiencies in First Time Service Quality.

The first thing must do to reduce customers dissatisfaction due to service Comebacks is to eliminate avoidable Comebacks.

To do this, you have got to know as accurately as possible precisely where your Comebacks are coming from. This means you need to systematically track your Comebacks. Then, you have to make the changes necessary to remove those sources

The second step you can take to reduce customer dissatisfaction due to service Comebacks is to respond appropriately, sensitively, and caringly to the customer's feelings and transportation needs when an "unavoidable" Comeback does occur.

You need to know where these Comebacks are coming from, who or what is responsible, and the steps you can take to turn things around. We will talk about your Comeback Tracking Procedure in this Section – discussing (first) corporate date sources and how they may be used, and (second) you own, in-house records and their value in pinpointing specific troubles spots.

A. Analysis Causes of Comebacks – Corporate Data Sources Service Satisfaction Survey (SSS) – Total Europe

You must do a report which shows (among other things) the percentage of customer vehicles that were fixed right at the first attempt, by country, and for Europe overall. There is also data that indicates the reason why the problem neither was nor fixed right at the first attempt from the customer's perspective, for example, "Problem not identified/not corrected, Parts not available", or "Other".

Service Satisfaction Survey (SSS) – Retailer Results

The Retailer Results Report provides data on responses to the same questions as the Total Europe Report but focuses on your own dealership's performance. The Retailer's performance for the past 3 months and the last 12 months can be compared to the 12 month national average.

B. Analysing the Causes of Comebacks-in-House Data Sources The key to Service

You might have a vague or general idea about where your Comebacks are coming from – both from the reports available from GM Europe and from your own experience day-to-day – but the only way to known for sure is to count them. That's why it is a good idea for every dealership to establish and maintains a Comeback Tracking Procedure that becomes part of the ongoing daily routine within the service Department.

Another reason why it is useful to track Comebacks continuously is that they are not consistent. Both personnel changes as well as product changes can affect Comebacks. The weather can affect Comebacks. Because it influences customers expectations and perceptions, even GM/Opel/Vauxhall advertising can affect Comebacks.

So Comebacks are, to some degree a "moving target". But a good Comeback Tracking Procedure will help you stay on top of these changes and allow you to spot trends before they get out of hand and cause serious damage to customer satisfaction.

Until avoidable Comebacks are eliminated, they will probably remain the single most significant influence on your service customers' attitudes.

An effective Comeback Tracking Procedure can be set up any number of ways. If your Dealer Management System Provider is able to utilize your existing system to flag a potential Comeback upon reception on the customer and motor car, this one suggested method. But whatever method you use, your objective should be to keep a complete and detailed record of all Comebacks in your work-shop, on a continuing **daily** basis, the tracks Comebacks by date, by Service Advisor, by Technician, and by type or category of repair.

2.3. Comeback Tracking

A. Simple Comeback Tracking Procedure

This procedure requires the use of the following two forms:

Comeback Tracking Comet Sheet: This form can be reproduced in quantity from a master copy provided with this Manual. You will need one of these sheets for every Comeback detected and tracked.

Monthly Comeback Analysis Worksheet: This form can also be reproduced in quantity from a master copy provided with this Manual. You will need one of these forms per month, or 12 per year.

The Service Manager/Service Director, who is responsible for the Customer Comeback Investigation Phase is notified at this time. He or she should also be provided with details of the vehicle repair history.

B. Customer Comeback Investigation Phase

-The Service Advisor is normally the first person in the dealership to become aware of the Comeback situation and he or she will initiate the Comeback Tracking Comet Sheet at the time the Job Repair Order is written. The Comeback Tracking Comet Sheet is then passed to the Service Manager/Service Director along with the vehicle repair history for review.

-The Service Manager/Service Director reviews the Comeback Tracking Comet Sheet, passing it back to the Service Advisor, or to other responsible person within the Service Department for an effective follow-up to begin.

-The Service Advisor (or other individual) is asked to thoroughly investigate the cause(s) of the Comeback, and to write down his/her findings on the Comeback Tracking Comet Sheet in the space marked "Comeback Cause". This will involve a comprehensive review of the vehicle's entire service and repair history, customer complaint/comments, Technician's notes on Repair Orders, an interview of the Technician and anyone else involved in the repair process, and a determination of parts availability.

-After tracing the root cause of the Comeback he/she is also asked to write down in the space provided his/her best thoughts about what steps, actions, or operational changes could have prevented the Comeback.

-The Service Manager/Service Director asks the Parts Manager to add his/her comments and Comeback prevention suggestions to the Comeback Tracking Comet Sheet for Parts Department related Comebacks.

-Once the work has been completed and the vehicle returned to the customer, the Service Advisor will contact the customer by telephone to ensure the problem or concern has been rectified entirely to the customer's satisfaction.

-On completion, the Comeback Tracking Comet Sheet is returned to the Service Manager/Service Director for final review to ensure that the root cause of the Comeback has been identified and clearly understood. The Service Manager/Service Director will have also particular attention to actions taken to recover customer confidence and trust in the dealership, and to ensure that adequate follow-up has been conducted.

C. Monthly Comeback Analysis Worksheet

The Monthly Comeback Analysis Worksheet is used to record the number of Comebacks an daily basis and to summarize the findings of the investigation by technical category and area of responsibility.

-At the beginning of each month, write down the day and date of each working day coming up that month under the Date column. Also record the names of each Technician and Service Advisor under "Name" in their respective columns.

-Each day, record the number of Comebacks that require investigation in the "number" column adjacent to that day's date.

-Upon completion of the investigation, determine the "Repair Category" i.e. Technician, Service Advisor, Parts Department.

-Record a tally mark adjacent to the appropriate "Repair Category", "Technician", and "Service Advisor" under the respective "Number" column. For Parts Department related Comebacks record the "Repair Order Number" and "Part Name".

3. Conclusions and recommendations

The aim of this improvement process is to identify the customer comeback, the cause of this and eliminating them.

After you tracked your Comebacks for a while, you'll begin to see specifically where the majority of "avoidable" Comebacks are coming from in your after sales departments.

Avoidable Comebacks generally arise because of problems in one of four basic areas of operations: Training of Employees; Tooling and Equipment; Job Systems; Procedures and Manpower Loading; Parts Operations.

The following check list is provided for your reference:

- Staff Training

Sales Staff

- Explain operational features

Service Staff

- Effective customer communication
- Familiarity with Customer Comeback Tracking/Prevention

Service Advisor

- Accurate and complete Job Repair Order documentation

- Review all Service bulletins

Service Technicians

- Certification in their respective specialty areas
- Proper procedures for diagnosing, servicing, and repairing vehicles
- Review all Service Bulletins
- Knowledge in the use of TIS
- Effective utilization of technical assistance
- Tools and Equipment
- Specialized diagnostic, testing, and calibration equipment
- Tools, supplies, work materials and workshop equipment
- Well-maintained library of Service Manuals
- Logically catalogued set of Service Bulletins
- Ready access to TIS
- Job Systems, Procedures and Manpower Loading
- Utilization of an effective Quality Assurance Procedure
- No vehicle should be returned to a customer until the "fix" has been verified
- An appointment system for efficient handling of Comebacks
- A dispatch system that utilizes the proper Technicians
- Adequate availability of Service Advisor on hand
- Enough service Technicians to handle scheduled workload
- Parts Availability
- A policy that allows parts stocking and expediting that minimizes parts-related repair delays
- Stock parts comeback-tracking indicates a need
- A cohesive and co-operative working relationship between the Parts and Service Departments
- Comeback Control Meetings
- Review each Comeback
- Determine and implement process improvements
- Address Service Advisor, Technician, equipment and facility needs
- Develop new customer satisfaction initiative
- Review SSS performance

MARKETING

THE LIFE CYCLE OF SHOPPING CENTERS AND POSSIBLE REVITALIZATION STRATEGIES

Abrudan Ioana Nicoleta

This paper addresses the concept of shopping centers life cycle. The concept is considered a possible explanation for the death of certain types of shopping centers and birth of others. Of course that there are also other theories that explains this evolution, such as the wheel of retailing concept postulated by Malcolm McNair (1958); the dialectic process discussed by Maronick and Walker (1974);, the retail accordion, or the general-specific-general process of Hollander (1966); the adaptive behavior and natural selection concepts, which are in fact very similar; Christallers location theory (Christaller: 1980); or the Thiessen Polygone (Thiessen: 1911). The article discusses the adaptation of the life cycle concept as used for products and stores. It tries to provide a framework for delineating the stages of shopping center life using certain relevant attributes. The last part of the article provides some suggestions for the revitalization of the centers found in the decline stage of their life cycle.

Keywords: life cycle, commercial center, strategy

JEL code of the paper: M31

Introduction

Since their birth, at the beginning of the 20th century, shopping centers have grown a great deal both in number and diversity of formats and the evolution process is not even nearly over. At present, there are an impressive number of projects of new shopping centers all over the world, on each continent (see table 1). The experience of developed countries, where the concept of shopping center has a significant age, may be also transferred to emerging markets, such as Romania. Therefore it is important to identify the stages of their life cycle, characteristics and appropriate strategies for each one, so that the profitable period of shopping centers can be extended as much as possible.

The concept of shopping centers life cycle, similar to that of store formats (George, 1997: 133; Ferring, 2001: 44) initially applied to goods and services. It studies and identifies the changes their characteristics suffer during the existence of a shopping center. The concept asserts the fact that shopping centers, just like store formats, goods or services, go through four different life stages, different one from the other: innovation (launch), growth (accelerated development), maturity and decline (adaptation from Berman & Evans, 2001: 148, Dunne et. al., 2002: 122, Lowry, 1997: 78). This concept is very useful since it "provides a plausible and useful explanation for the emergence and decline of the different shopping center formats" (Lowry, 1997: 78).

Table 1 Shopping Centers worldwide and in Romania (companies own site)

				Year of
Name of the Center	City, State	Surface m ²	Shop nb.	opening
Mall of Arabia	Dubai, United Arab Emirates	2.000.000	1000	2008
South China Mall	Dongguan, China	900.000		2005
Berjaya Times Square	Kuala Lumpur, Malaysia	700.000	1000	2003
Golden Resources	Peking, China	680.000	1000	2004
Colosseum	Bucharest, Romania	600.000		2010
Siam Paragon	Bangkok, Thailand	500.000		2005
Beijing Mall	Peking, China	440.000		2005
Grandview Mall	Guangzhou, China	420.000		2005
Cevahir S.M.	Istanbul, Turkey	412.000	328	2005
Mall of America	Minneapolis, USA	390.000	520	1992
West Edmonton Mall	Edmonton, Canada	350.000	600	1981–2004
Aricanduva Mall	Sao Paulo, Brazil	342.000		1991
Bluewater	Kent, UK	312.000		
Arkadia	Warsaw, Poland	287.000	242	2004
Shopping City Süd	Vösendorf, (Vienna) Austria	270.000	330	1976
King of Prussia Mall	Philadelphia, USA	250.000	400	
Ala Moana Center	Honolulu, USA	245.000	240	1986
Donauzentrum	Vienna, Austria	225.000	210	1975
Mall of the Emirates	Dubai, United Arab Emirates	225.000	465	2005
Iulius Mall			250	2007

Craiova Mall	Craiova, Romania	122.000		2009
Polus Center	Cluj-Napoca, Romania	120.000	150	2007
Militari S.C.	Bucharest, Romania	114.000		
Akropolis	Vilnius, Lithuania	108.000		2002
Sihlcity	Zürich, Switzerland	100.000	89	2007
Plaza Romania	Bucharest, Romania	100.000	150	2004
Băneasa S.C.	Bucharest, Romania	85.000		
Lotus Market	Oradea, Romania	30.000	120	2006

The concept of Shopping Center Life Cycle

As costs involved in planning, building and managing a shopping center are very high, it is important to identify the stages of shopping centers life cycle for both developers or owners and retailers in the strategic planning of their activity. The stages of the life cycle are differentiated (Lowry, 1997: 78, see table 2) by the following attributes: market factors, shopping center developer strategies and retailer-tenant strategies. *Market factors* include the number of competing shopping centers of that type and of other types, amount of shopping traffic generated by each type of center, growth rate of each type of center, and vacancy rate for the type of center. *Strategies of shopping center developers* include the control they exert, their advertising and promotional activities, renovation of their facilities, efforts to attract new retailers, rental rates, and length of lease. *Strategies of retailer-tenants* are based on advertising and sales promotion activities, store size and layout and selection of store managers.

Table 2 Shopping center life cycle

ATTRIBUTE		STAGE OF THE LIFE CYCLE				
	Important considerations	Launch/ Innovation	Growth/ Accelerated development	Maturity	Decline	
	Number of competing centers	Very few	Rapid growth	Many of the same type of center	Many same and newer types	
Market factors		Increases rapidly	Steadily increases	Stable amount	Steadily decreases	
		Very rapid	Rapid	Moderate to slow	Slow or negative	
	Vacancy rate Control exerted by developers	Low Extensive	Very low Moderate	Moderate Extensive	High Moderate	
	Advertising and promotional activities	Extensive	Moderate	Extensive	Moderate	
Shopping center developer	Renovation of facilities	None	Minor modi- fications	Maintenance of existing facilities	Neglect or extensive reformatting	
strategies	Efforts to attract new retail tenants	Extensive	Moderate	Moderate	Extensive	
	Rental rates	High	High	Competitive	Low	
	Length of lease	Long	Long	Moderate	Short	
	Advertising and promotional activities	Extensive, to create awareness	Moderate, to draw greater interest	Extensive, to compete on price	Moderate, to remind of sale price	
Retailer- tenant	Special sales and price discounts	Few	Moderate	Extensive	Extensive	
strategies	Merchandise offerings	Preplanned variety and assortment	Variety and assortment to the market	Stable variety and assortment	Reduced variety and assortment	
	Store size and layout	Prototype model	Adjusted to meet market demand	Stable size	Scaled down	
	Type of store	Entrepreneurial	Aggressive	Professional	Caretaker	

Source: adapted from Lowry, J.R, The Life Cycle of Shopping Centers, Business Horizons, January-February 1997, pp. 79

Factors more or less controllable by shopping center management determine the move from one stage of the life cycle to the next one and may also be exploited in the favor of shopping center profitability. These factors can be classified into two large categories, following the ease of influence from shopping center management, and more exactly, their location in center's marketing environment:

-exterior factors (less controllable by the shopping center management);

-situated in the micro-environment: changes related to shopping center—shareholders—and—stakeholders (owners, investors, builders, financial organisms,—professionalism of suppliers, local community, public authorities, various—organizations, mass-media); intensification of competition; consumers—preferences; For example, thoroughfare improvements can affect even a young—shopping—center's—accessibility—and—visibility (Carn et al., 1995: 31).

-situated in the macro-environment: changes in the demographic structure of the target market, changes affecting local culture, economic situation of the shoppers and of the whole country, changes in the legislation, technology, etc.

-interior factors (directly controllable by the shopping center management) — assortment of merchandise and services provided to shoppers, more specifically tenant mix, communication and promotion activities, location of a center, physical evidences, affected by shoppers traffic, age of the center, technology, shopping center personnel, shopping center operations, extra services, facilities and amenities.

Launch (Innovation) Stage

During this stage of a new type of shopping center there are only a few centers of that type, and, since the shopping center is fairly new, the component stores will register a rapid increase in store traffic, which will, in turn, induce a rapid growth of their sales volume. In order to provide the best possible mix of retailers for the profile of that shopping center's target customers, together with the lowest possible degree of vacancy rate, the developer maintains close control over its operations. In order to assist the increase of its tenants' sales volumes by attracting shoppers, the developer undertakes extensive promotional activities, especially advertising. Shopping center's management tries to lease space for long periods of time and at high rental rates, given the attractiveness and freshness of a new center. During this stage, profits are small, despite growing sales and high occupancy rate, because of development costs that need to be recovered.

Regarding tenants' activities, they will engage in significant advertising activities in order to generate awareness of their presence in the shopping center among customers and to attract them. Stores' advertising stresses more their novelty and attractiveness and less price promotions they develop. Initial merchandise selection and layout are predetermined, their adjustment being made only after a period of time. Merchandise selection and store design are customized to meet customers from that particular market's preferences. In order to accomplish this, the management must be enterprising, actively oriented towards shoppers.

Growth (Accelerated Development) Stage

During this stage, since other shopping center developers have noticed the monetary (financial) and also non-monetary (behavioral or attitudinal) success of that new type of shopping center, the number of competitors of the same type increases rapidly. At the same type, shopper traffic grows just as fast, because consumers have already found out about center's offer, and this generates an accelerated rate of sales volume growth. Other retailers are also attracted by the success of the existing stores, this contributing to the increase in shopping center's occupancy rate (if this hasn't already been of 100%). Having already an occupancy rate close to (or even) 100%, it is no longer needed that the management tries to attract new tenants, and may charge high rental rates, since the shopping center is in its early years and to secure leases for longer than the usual 5 to 7 years with its actual tenants. Owing to a high traffic of shoppers, promotional spending is reduced, while maintenance and renovation expenditures are augmented, because years passed have put their sign on the attractiveness of shopping center's facilities and its image must be adjusting to modern trends and to the image projected by center's tenants. In this phase, both market share and profitability tend to reach their highest levels.

Retailers continue to develop promotional activities in order to increase the attractiveness of their offer, and the focus shifts from advertising to sales promotion activities, while overall promotional spending may be reduced as shoppers traffic is already a high one and continuously growing. Stores operating experience allows stores managers to adjust merchandise assortment to consumers' needs and desires and to remodel their stores, or even to reduce their rented space. Although they have already established a particular niche in its market, store managers must remain aggressive in their efforts to meet competition and build a solid base of loyal customers.

A possible example may be the Leipzig Central Station, which was transformed in 1997 into a large shopping center with 140 stores covering 30,000 m². In 30 minutes this center is reachable by all of the 620.000 inhabitants of the city, and also by the approximately 75.000 daily commuters (Zentes, Swoboda, 1998: 81-85).

Maturity stage

It is characterized by the existence of a large number of centers of the same nature that often overlap their market areas. Intense competition among shopping centers prevent sales volumes from increasing, growth rate being medium to small, although each of the centers already has a base of loyal customers. Some of the retailers decide to move to other fresher and trendier centers at the moment that their lease contracts expire, this imposing on center's management the pressure to involve in finding new tenants. In certain cases it is needed, in order not to increase vacancy rate even more, to adjust the level of rental rates and the length of lease agreements. Among the most important measures that must be undertaken by shopping center developers or managers are modifications of existing facilities and facelift alterations of the spaces. If these measures are accomplished, the center may remain in this phase for a long period of time. At the same time, promotional activity must be resumed with an even greater intensity. During this stage, market share is stabilized, and profits begin their decline, at the same time with the decrease in the level of rental rates.

The tenants situated in a mature shopping center have already understood their consumers' preferences and, as a consequence, even from the previous stage they have already adjusted merchandise assortment, layout and dimension of their stores to market demand. Thus, in this period these store physical facilities and offer are already stabilized. In order to counteract their competitors' efforts of attracting their customers, managers must employ a variety of strategies and tactics. An important strategy concerns promotion. They must increase promotional actions, especially those of sales promotions; advertising is mainly used to support price-oriented promotional activities.

Decline Stage

As a result of increased competition from other similar centers and from other types of shopping centers, the shopping center enters the decline stage. In this situation, its management has two alternatives. The first one would be to convert that center into another type, undertaking elaborate renovations. The second option would be to sell it and invest its resources in something more profitable. A shopping center with a timeworn and careless look is the most vulnerable to new, modern competitors that offer modern, pleasant facilities, beautiful stores, with an attractive assortment of merchandise. In case shopping center developers decide to follow the first alternative, and wish to exit this unfavorable decline situation and possibly to initiate a new life cycle, they must initiate complex renovation and reorganization or reconversion programs (this strategy can be followed by those that invest into a decline center), followed by marketing actions that inform target shoppers about them.

Among the turnaround strategies a center may choose from are included the following (adapted from Lowry, 1997: 84-85, Feldman, 2004: 38, ICSC, Shopping Center Management, 1999: 221-223):

- 1) Redevelopment is an extensive strategy that may include renovation, expansion or reconfiguration of the center. Usually it is accomplished in order to meet the changes in the market environment, more specifically to better face up challenges and take advantage of the market opportunities.
- *expansion* involves creating large spaces for anchor tenants, by the department stores, hypermarkets, supermarkets or anchor tenants that provide entertainment services (the most popular ones are multiplexes and casinos), etc, or mini theme parks. In certain situations there might be added new spaces for smaller retailers as well.
- reconfiguration may comprise in certain cases an expansion component, too, but it aims in attracting retailers of smaller dimensions than anchor stores to avoid financial problems that might be caused by an eventual bankruptcy of these; innovative retailers of goods or services, whose offer cannot be found somewhere else; or those that match the new profile of the shopping center that it is intended to impregnate on the shopping center. It also aims at modifying parking lot configuration, the image of a center or of its use or in remodeling the space for new tenants, especially entertainment companies (bars, restaurants, coffee shops, multiplex theatres, casinos, game rooms, children playrooms, etc), because this type of companies are renowned to attract many consumers and improve the profitability of a center (Kang & Kim, 1999: 47).
- renovation is accomplished in order to freshen up a center's image and involves redoing entrances, public spaces, parking spaces, roofs, floors, toilets, sitting spaces, improving visibility of anchor stores, building various amenities (for instance baby changing rooms), etc. The decision to renovate a mall depends on the depreciation of net rental incomes, the level and rate of change of renovation costs, discount rates and changing market conditions (Wong & Norman, 1994: 46).
- 2) Termination of lease contracts with poor performing retailers, utilizing the amounts they pay for early cancellation of lease contracts for attracting new tenants.
- 3) Changing the destination of a shopping center into medical center, campus, convention center, etc. As suggested by Pilzer (1993: 76-77), an unsuccessful shopping center could be converted into a TEC center. The main tenants in such a center would be large organizations that need meeting rooms to train and confer with their current employees; recruiting organizations and offices of major employers; service firms related to employment activities (medical examination firms, drug-testing firms, reference-checking firms, skill-testing firms, training companies,

etc); life-long educational institutions that could provide information and skills to those that want to improve their knowledge or change careers.

4) Selling the center.

Also, if a center focuses its marketing efforts towards a certain marketing segment and succeeds in attracting retailers in this direction, it may be drawn to its maturity stage or even to accelerated growth stage (Lowry, 1997: 85). In case management planning is successful, shopper traffic may be augmented. In the opposite case, if the renovation is unsuccessful, or if no center renovation actions are undertaken, reduced shoppers traffic and sales volume will cause the loss of many of the tenants and the acceleration of center's decline. The efforts to attract new tenants, materialized in promotional actions (advertising and price reductions), the decrease of lease terms, and others are in many cases useless because of low shoppers' traffic. In this stage promotional expenditure as a means of attracting visitors are minor, promotional efficiency being very low since the atmosphere of the shopping center is inadequate.

In certain cases the decrease in shoppers traffic ad in sales volume are caused by demographic changes among target market – aging of that center's trade area population, changes in the level of incomes, in the structure of households, etc. Under such circumstances, the structure of a shopping center must be modified, so that the offer is adjusted to the new characteristics of the target market.

The strategies of the retailers in a shopping center that is in the decline stage of its life regarding promotion include many sales promotion activities and certain advertising actions that are meant to remind consumers of their presence within the shopping center. Advertisements are focused on price reductions in order to attract price sensitive consumers. Because they are aware of the fact that investments in stores renovation in a center that is in decline does not bring extra sales, stores managers avoid such expenses, trying instead to diminish merchandise assortment and to rearrange stores to reduce rented space.

In countries with mature markets from the shopping centers point of view it may be noticed that many shopping centers projects are, in fact, expansions or reconfigurations of the existing ones (Cushman & Wakefield, 2008: 2; James, 1982: 11). This is because there are a large number of centers that have adequately served their target markets, and it is considered not to be economically viable to build new ones, redevelopment being the best solution for all actors in the micro-marketing environment of those shopping centers. For investors, advantages of such a strategy include lower costs, circumvention of bureaucracy involved in building a new construction, avoidance of possible refuses to grant construction authorizations for new locations, rapidity in finalization of construction. For local communities renovations and expansions have positive aspects as well, including creation and/ or retention of existing jobs, retention or augmentation in the level of local taxes gathered by the local authorities, removal of the danger of degradation of decline shopping centers neighborhood areas, spurring the rehabilitation of surrounding areas (James, 1982: 11).

Shopping centers markets stages of life cycle

The study the life cycle of shopping centers in countries that have a long history of shopping center activity reveals their dynamics and heterogeneity. Because of this, identifying the stage of life cycle a shopping center is situated in is a difficult task. Developers must continuously pay attention to any modifications intervened in the environment and take appropriate measures to take advantage of the opportunities and counteract threats. Shopping center's age, competition, changes in shoppers' behavior and market changes, etc. are factors that affect vitality and determine the stage of its life. At present, shopping centers life cycle is an accelerated one, new formats passing much more rapidly through each life cycle stage.

The concept of life cycle may be also applied to shopping centers markets. Thus, from the age point of view and especially that of number of shopping centers found in each country, shopping centers markets may be divided into emergent, developing and mature. United States and Canada markets are mature markets. In Europe, the situation is the following:

- -Mature markets: Scandinavian Countries (where the first modern closed shopping center was built), Great Britain, France, Holland, Germany.
 - -Developing markets: Spain, Portugal, Italy.
 - -Emerging markets: countries from Easter Europe, Russia, Turkey, Greece.

Communication in the European Union combines the information with the new communication techniques, thus having a profit that is selling an image. However communication is a complex phenomenon which can not be reduced to persuasion. Communication Policy of the European Union is initiated by the European Commission, for which the distinction between information and communication appears to be clear: "Communication is addressed to the heart, while the information is addressed to the mind". The Commission also is responsible for the transmission of information to journalists, taking part in their achievement. But the public relations activity of the Commission can not be limited, as we shall see, to the relationship with the media.

Mots-clés: communication lucrative, politique d'information, médias, politique d'image

Cod JEL: M31

La communication, que de nos jours l'on rencontre partout (rubriques spécialisées des journaux, organigrammes des entreprises, écoles de publicité, circuits intégrés des puces électroniques, etc.), est devenue «un secteur industriel en pleine expansion»²⁵⁷ comprenant l'industrie publicitaire et l'industrie des nouvelles technologies d'information et de communication.

Dans l'unification européenne, ce concept a joué et joue encore un rôle essentiel car l'on considère que l'espace communautaire se construit physiquement par les voies et les réseaux de communication, que la prospérité des pays membres est assurée par les nouvelles technologies de communication, que les Européens peuvent surmonter leurs préjugés culturels à l'aide du contact et de l'échange d'information, que l'écoulement des marchandises et l'idée symbolique d'une conscience européenne reposent sur la communication persuasive.

C'est ainsi que la Communauté Européenne apparaît comme une «société de communication», comme la matérialisation du rêve d'une Europe unie et prospère, possible – semble-t-il – uniquement grâce à ce «secteur industriel» que les institutions européennes encouragent. Cependant, faire de la communication une marchandise culturelle en l'abandonnant aux seuls mains des industriels risque de réduire la Communauté Européenne à un marché dépourvu d'âme et de passion et d'empêcher même l'unification européenne, car, à la différence de la «société de communication» réclamée par les non professionnels, qui offrent une image des plus séduisantes, celle que dressent les industriels de la communication révèle des profils des plus alarmants résultant de la pratique différente de la communication dans l'industrie publicitaire et l'industrie des nouvelles techniques d'information et de communication. Dans le premier cas, l'essence de la communication est, selon l'expression de J. Baudrillard²⁵⁸, «faire vouloir», la «société de communication» repositionnant en fait la «société de consommation», tandis que dans le second cas la communication se définit comme un simple échange d'informations, la «société de communication» annonçant ainsi l'avènement de la «société de communication technologique». Celui-ci entraîne des conséquences telles: la mort de la communication interpersonnelle due à la communication médiatisée, le rapprochement des distances, mais l'éloignement des personnes (le téléphone, le minitel), l'ouverture sur le monde associée par contre à l'isolement de notre famille (la télévision, l'ordinateur), l'accès à plus d'informations ce qui s'avère être en réalité une «désinformation par surinformation», la participation à des événements déroulés à grande distance et le renouement du dialogue qui engendrent finalement le manque d'une véritable interaction²⁵⁹. La convergence entre communication technologique et communication publicitaire est très bien mise en évidence par les médias, dont l'influence symbolique est profonde surtout parce qu'ils informent la société sur elle-même.

La globalisation et l'utilisation systématique des nouvelles techniques d'information et de communication ont imposé le regroupement des différentes techniques de la communication persuasive en un même modèle, à savoir, la *communication lucrative*²⁶⁰, qui peut emprunter deux voies:

²⁵⁷ Dacheux, É., Les stratégies de communication persuasive dans l'Union Européenne, Éditions l'Harmattan, Paris, 1992, p. 77.

²⁵⁸ Baudrillard, J., «L'ère de la facticité» in Technologie et Symbolique de la communication, P.U.G., Grenoble, 1990.

²⁵⁹ Dacheux, É., op. cit., p. 94-95.

²⁶⁰ C'est une communication qui à travers une gamme toujours plus diversifiée de techniques poursuit toujours le même objectif final: maintenir ou augmenter les profits de la firme.

- une voie «psychologique», ouvertement commerciale, qui vise à déclencher l'acte d'achat et qui recourt à des techniques telles: la création de noms de marque, la packaging, le merchandising;
- une voie «sociologique», qui cache son caractère lucratif derrière une patine culturelle et qui a pour but de renforcer les valeurs sociales favorables à l'organisation et de neutraliser celles qui lui sont hostiles.

De cette façon, l'organisation sort de l'espace privé et fait entendre sa voix dans l'espace public par une présence accrue dans les médias (communication publicitaire, parrainage d'émission, sponsoring sportif), mais aussi par des actions plus «feutrées» auprès des instances politiques (lobbying) ou journalistiques (relations publiques; celles-ci assurent la transmission des informations entre l'organisation et les médias à travers les dossiers, communiqués ou conférences de presse, instaurant ainsi un climat de confiance). Il faut préciser que toute communication lucrative qui tent à créer un milieu externe favorable n'est pas nécessairement «tapageuse». Une communication plus discrète, pas du tout perçue par le grand public, s'est avérée efficace, à savoir le lobbying et les relations publiques, car ces deux techniques ne s'adressent pas au public.

Dans l'Union Européenne, c'est la Commission qui a initié la politique de communication, mettant en place un organe spécialisé, la «Direction générale audiovisuel, information, communication, culture» (DG X) qui adopte une double stratégie à partir de la distinction entre information et communication:

- une communication «persuasive», entièrement calquée sur la communication lucrative, destinée à «vendre» la Communauté aux citoyens européens;
- une communication «informative», plus originale, pour expliquer le fonctionnement du Grand Marché²⁶¹.

Des spécialistes dans le domaine des médias européens ²⁶² ont essayé à analyser les relations entre la Commission Européenne et les médias afin de relever si elles reposent sur une véritable «politique» de l'information, si «derrière les mots de la rhétorique institutionnelle peut se déceler une véritable action publique, dotée d'une cohérence politique et d'une certaine profondeur historique²⁶³». En examinant comment se sont établis, dès 1960, sous la forme du «système Olivi», de nombreux et étroits rapports entre la Commission Européenne et les journalistes présents à Bruxelles, voués à rendre l'actualité, on est arrivé à la conclusion que ces liens ont été le résultat d'une activité administrative «discrète mais intelligente», constituant la «matrice» d'une politique de l'information. Ce terme ne doit pas être entendu dans son sens conjoncturel (la gestion quotidienne des conflits d'intérêt entre l'institution et les médias) mais plus radicalement comme création des conditions assurant à la Commission la coparticipation à la réalisation de l'information la concernant²⁶⁴.

Quant à la gestion des relations publiques et de la politique d'information des institutions européennes des années '50, les sources sont assez pauvres. Par contre, le peu de témoignages disponibles mettent en évidence les grandes difficultés auxquelles se sont confrontées les institutions dans la promotion de leurs premières activités et dans l'intention de focaliser l'attention des médias des pays membres²⁶⁵. L'idée qui en ressort c'est qu'à l'époque les responsables chargés de la politique d'information européenne ne disposaient d'autre moyen de toucher ces médias que d'aller eux-mêmes porter l'information dans les capitales. On peut se rendre compte que cette politique rudimentaire se fondait sur un modèle centrifuge dans lequel la diffusion de l'information dépendait exclusivement de l'effort et de la capacité des instituitons. Après des débats très intéressants sur ce sujet, à la fin des années 1950, la sollution trouvée pour remédier le manque d'intérêt des médias européens relatif au processus en cours a été la création d'une agence de presse européenne «officielle» capable de rédiger des documents à diffuser dans les médias²⁶⁶. Pourtant on a rapidement renoncé à cette idée au profit d'un autre modèle, qualifié de centripète, qui consistait à attirer les les journalistes des agences de presse internationales à Luxembourg et à Bruxelles dans le but de transmettre l'actualité communautaire. Un premier pas sur la voie de la mise en place de cette stratégie a été la

262 Bastin, G., Institut d'Études Politiques de Grenoble; http://hal.archives-ouvertes.fr/docs/00/33/24/14/PDF/Politique de l information ENA 2007 .pdf.

²⁶¹ Cf. Dacheux, É., op. cit., p. 184-185.

^{263 «}On sait par exemple que c'est seulement à la suite des remaniements institutionnels ayant suivi la démission de la Commission Santer en mars 1999 que le service du Porte-Parole, auparavant directement rattaché à la Présidence de la Commission, fut intégré à une Direction générale de la communication en charge de la stratégie de communication».

²⁶⁴ Les éléments présentés dans cet article ont été recueillis avant 1999. C'est pourquoi certaines évolutions propres à la période la plus récente peuvent ne pas être prises amenées en discussion.

²⁶⁵ A noter, dans ce sens, le témoignage de Paul Collowald, un ancien correspondant du «Monde» à Strasbourg, devenu fonctionnaire du service d'information de la ECA en 1957 et chargé de la promotion du premier baccalauréat européen. Entre 1958 et 1959 celui-ci dirige le service commun d'information des Communautés Européennes, entre 1959 et 1967 devient porte-parole de Robert Marjolin (Vice-Président de la Commission Européenne) puis, entre 1967 et 1972, porte-parole adjoint de la Commission, entre 1973 et 1984, Directeur à la DG X et enfin Directeur général de l'information et des relations publiques du Parlement Européen (1984-1988); http://hal.archives-ouvertes.fr/docs/00/33/24/14/PDF/Politique_de_l_information_ENA_2007_.pdf.

²⁶⁶ Dans les archives conservées à Florence [CEAB 12/632], le document 3903/54f, prenant acte de l'importance des agences de presse pour la diffusion d'informations sur la CECA et de la difficulté de les persuader de venir à Luxembourg, avance que «d'autres solutions doivent être examinées, par exemple celle qui permettrait de rédiger nous-mêmes des textes d'information et de les diffuser parmi les agences de presse par la voie des bureaux établis dans les capitales». Il s'agit particulièrement d'une newsletter mensuelle; ibidem.

politique d'abonnements des Communautés aux dépêches de ces agences²⁶⁷, continuée bientôt dans les années '60 par d'autres moyens aléatoires.

Les documents historiques disponibles mentionnent la mise en place à Bruxelles, au début des années '60, d'une véritable organisation des rapports entre la Commission et les journalistes y présents²⁶⁸, à savoir les «rendez-vous de midi» qui donnaient l'occasion au groupe à fonction de service du porte-parole actuel de rencontrer chaque jour à midi les journalistes accrédités à Bruxelles et de leur transmettre des informations sur l'activité de la Commission²⁶⁹. Une fois le «rendez-vous de midi» institutionnalisé, le détour des médias internationaux a été assuré et les relations entre la Commission et les journalistes ont été régulées à la fois par une forme de contrat implicite défendant les journalistes accrédités sur le travail du marché dans ce secteur et le maintien d'une multitude d'information disponible pour ces journalistes en échange de leur stabilisation professionnelle à Bruxelles mais aussi d'un traitement plutôt favorable de l'actualité européenne. Ces conférences sont gérées en commun avec les journalistes qui ont un droit de regard sur l'accréditation par l'intermédiaire d'un comité consultatif dont la tâche est l'examen des nouvelles demandes de journalistes. Le plus souvent cela n'est pad du ressort de ce comité vu le renouvellement de postes régulier, mais au moment où la demande semble problématique, la Commission se remet au pouvoir du comité. Remplaçant en quelque sort un organisme de régulation professionnelle, ce comité a de plus mis en place des règles facilitant l'accès progressif au statut de journaliste accrédité à la suite d'un stage permettant d'estimer le sérieux de la demande. D'un autre côté, l'association représentative des journalistes accrédités à Bruxelles, l'Association de la Presse Internationale (API), a beaucoup travaillé à la mise en place d'un régime de protection des journalistes accrédités de la concurrence extérieure (régimes spécifiques d'attribution des propos en salle de presse pour maintenir l'avantage de la présence en face-à-face par rapport au suivi de la conférence de presse sur le canal EbS par exemple, interdiction faite à un journaliste professionnel de passage à Bruxelles d'entrer dans la salle de presse jusqu'en 1996, maintien de délais avant la diffusion des notes de presse sur Internet, etc.)²⁷⁰. Les journalistes doivent aussi détenir le monopole de la réception de l'information exclusivement émise par le porte-parole, parfois même avec leur contribution, car la participation aux «rendez-vous de midi» leur permet de disposer non seulement d'un ensemble de documents facilitant la rédaction des papiers et des dépêches mais aussi l'environnement matériel de travail nécessaire pour le faire (bar et espaces de discussion, salle de travail, matériel de reprographie, fax, téléphones, etc.).

Depuis 1960, le nombre de documents transmis à la presse à l'occasion des «rendez-vous de midi» tout comme celui de journalistes accrédités par la Commission est de plus en plus grand. Ces journalistes étaient «poussés par une dynamique historique qui conférait à la place de Bruxelles une importance grandissante aux yeux des rédactions de médias internationaux» mais également «attirés et fixés professionnellement sur place par le développement d'un véritable *monde de l'information*» leur garantissant l'accès à une abondance de documents et d'informations dont la valeur sur le marché ne cessait d'augmenter à mesure que se développait le besoin d'information européenne et aussi tout un ensemble de positions professionnelles et de sources de revenus permettant de durer dans ce monde»²⁷¹.

Pour que le «système Olivi» fonctionne, les journalistes devaient s'installer, rester et travailler à Bruxelles, ce qui a été possible grâce au développement d'organes de presse locaux ²⁷² et celui des activités communicationnelles de la Commission.

À partir de 1970, la réglementation liée au Marché Commun a favorisé l'apparition d'un marché pour la production de *newsletters* destinées à des secteurs d'activité déterminés. Depuis 1980, avec la perspective de l'Objectif 1992, ce marché a été encore élargi mais également investi par des spécialistes des relations publiques qui «ont cependant toujours recours aux journalistes européens comme cadres ou comme sous-traitants lorsqu'ils ne disposent pas de la main d'oeuvre nécessaire pour répondre à une demande spécifique d'un client (ce qui est fréquent) ou qu'ils recherchent un style d'écriture *punchy*, une qualité souvent attribuée aux journalistes»²⁷³. Par conséquent, les journalistes et les anciens journalistes sont nombreux dans ce secteur d'activité, tout comme dans les *think tanks* ou dans l'organisation de conférences à Bruxelles.

À la fin des années 1980, le «système Olivi» entre en crise, cela pouvant s'expliquer, dans l'opinion des spécialistes, par deux éléments: d'un côté, l'incapacité pour la Commission de garder la position centrale longtemps occupée dans la mobilisation professionnelle des journalistes présents à Bruxelles, de l'autre côté, le

1 1033 271 I

²⁶⁷ L'inexistence du dispositif de l'information qui permettra aux institutions européennes à partir des années '60 d'intéresser à leur activité un nombre toujours croissant de professionnels de l'information impliquait la nécessité de convaincre les agences mondiales de dépêcher un correspondant sur place. L'abonnement était un argument dans ce sens.

²⁶⁸ C'est Bino Olivi, porte-parole de la Commission entre 1962 et 1977, qui en fut le principal artisan.

²⁶⁹ Ces conférences de presse sont plus communément dénommées briefings aujourd'hui.

²⁷⁰ Cf. Bastin, G., «Les journalistes accrédités auprès des institutions européennes à Bruxelles. Quelques signes du changement d'un monde de travail», article paru dans Les métiers de l'Europe politique. Acteurs et professionnalisations de l'Union européenne (D. Georgakakis dir.), Presses Universitaires de Strasbourg, 2003.

²⁷¹ Ibidem.272 Ibidem.

²⁷³ http://hal.archives-ouvertes.fr/docs/00/33/24/14/PDF/Politique_de_l_information_ENA_2007_.pdf.

développement de formes de résistance professionnelle à ce modèle de coproduction de l'information au sein même des journalistes accrédités²⁷⁴.

À part son devoir d'informer les médias, il faut que la Commission, par sa DG X, informe aussi les citoyens de ses activités. De plus, la DG X est chargée de relaver l'opinion publique dans les États membres auprès de la Commission (par les Eurobaromètres), de coordonner les représentations de la Commission dans les États membres, de centraliser tous les contacts avec les médias et d'essayer à assurer une cohérence des questions concernant l'information et la communication au sein de la Commission. Cette dernière tâche implique des contacts très réguliers avec les autres directions générales et services. Une attention particulière est également portée sur l'information en direction des pays tiers²⁷⁵.

Souvent ces objectifs ne sont pas atteints pour plusieurs raisons: l'emploi d'un vocabulaire très technique, la quantité écrasante d'informations, le manque de coordination entre les politiques informatives des institutions communautaires, le recours trop fréquent à l'«eurojargon», etc.

L'intérêt de la Commission concernant les relations avec le grand public se traduit par une importante politique directe. Dans cette direction, la Commission organise et encourage financièrement la visite des institutions européennes, action qui vise tous les citoyens européens mais qui s'adresse principalement aux partenaires sociaux et aux étudiants.

Dans la diffusion de l'information communautaire, la Commission privilégie l'information écrite sur laquelle se fondent trois types de documents: publications d'information générale et de vulgarisation (qui visent le grand public et particulièrement les jeunes et les partenaires sociaux), publications à caractère documentaire (qui s'adressent essentiellement aux grands industriels et aux PME), publications officielles (qui diffusent l'ensemble de l'information juridique).

Par contre, la Commission emploie également d'autres moyens informatifs tels l'unité audiovisuelle de la Direction information de la DG X, les conférenciers répartis dans les différentes Directions générales, les nouvelles technologies d'information et de communication.

Son activité de relations publiques s'associé à une politique symbolique qui essaie de faire émerger une identité commune (l'Union européenne a un drapeau, un hymne, une monnaie), sans chercher à développer une communication originale fondée sur la participation des citoyens et imitant le «modèle marchand» de la communication destiné à provoquer une adhésion passive à une image mythique²⁷⁶. Dans cette politique d'image, la Commission ne recourt pas, quand même, à la communication publicitaire, mais au sponsoring et aux événements (foires expositions internationales, compétitions sportives, etc.). Ce choix de plus en plus fréquent de telles techniques persuasives s'explique essentiellement par l'échec de la politique informative, échec qui oblige à confier l'information européenne aux médias et à délaisser le «produit» Europe au profit de «l'image» Europe, afin de développer une communication audiovisuelle. Cela correspond à la fois à une «stratégie d'image» et à la stratégie économique énoncée par la Communauté.

Pourtant, il semble que la télévision ne soit pas adéquate pour diffuser l'information communautaire. L'appropriation du concept «image» (de marque) par la Commission s'avère, à cause de la rigidité du terme, une communication persuasive contraire à l'esprit ouvert d'une société pluriculturelle. Tenter donc de créer une «culture européenne» par une technique (la création «d'image de marque») qui, dans l'opinion d' É. Dacheux, n'est efficace que si elle renforce la culture nationale, constitue une erreur grave.

Au fur et à mesure, la Commission s'est vu obligée à repenser et à renforcer sa stratégie de communication, surtout pendant les dernières années. Quelques aspects ont été décisifs dans ce sens: l'insuccès de la constitution européenne, le constat de la mauvaise connaissance des citoyens relative à l'Union européenne et leur désir de mieux la comprendre, la prochaine ratification du traité modificatif et les craintes d'une forte abstention aux élections européennes de 2009.

Par conséquent, la Commission a lancé en octobre 2005 le «Plan D comme Démocratie, Dialogue et Débat»²⁷⁷. A la suite du rejet par la France et les Pays-Bas du Traité constitutionnel, l'objectif était de promouvoir le dialogue et la réflexion sur l'avenir de l'Europe dans chaque État membre. Entre 2005 et 2007, le Plan D a permis de cofinancer six projets transfrontaliers novateurs de consultation des citoyens, coordonnés par des organisations de la société civile, ainsi que des projets locaux axés sur les femmes et les jeunes.

La Commission Européenne a publié, le 3 octobre 2007, une texte intitulé Communiquer sur l'Europe en partenariat²⁷⁸, dont la principale proposition est la signature d'un accord interinstitutionnel entre le Parlement Européen, le Conseil et la Commission. L'accord doit faciliter la coopération entre institutions et entités communautaires, ainsi qu'avec les États membres. Il vise à obtenir une convergence de vues autour des grandes

²⁷⁴ Bastin, G., «Les journalistes accrédités auprès des institutions européennes à Bruxelles. Quelques signes du changement d'un monde de

²⁷⁵ http://www.touteleurope.fr/fr/actions/construction-europeenne/information-et-communication-sur-l-europe.html.

²⁷⁶ Dacheux É., op. cit., p. 189.

²⁷⁸ http://ec.europa.eu/dgs/communication/pdf/political_declaration_081022.pdf.

priorités de l'UE dans le domaine de la communication et souligne la nécessité d'une meilleure coordination des méthodes utilisées par les institutions européennes pour communiquer. Un groupe interinstitutionnel de l'information (GII) serait chargé de mettre en application le partenariat en coordonnant la communication sur les questions européennes.

Afin d'élargir le dialogue instauré par le plan D, on a initié "Debate Europe" en vue des élections européennes de 2009. En janvier 2008, le nouveau site "Debate Europe" a été mis en ligne. Plusieurs questions y sont proposées pour lancer le débat. Par exemple: Pensez-vous que l'Europe va dans la bonne direction? Où doivent s'arrêter les frontières de l'Europe? La Commission a publié également en 2008 une stratégie dédiée à l'audiovisuel qui vise une couverture plus large des affaires européennes sur les chaînes audiovisuelles existantes et le soutien à la création de réseaux européens d'organismes de radio et de télévision²⁷⁹.

En guise de conclusion, nous pouvons affirmer que les activités de communication et de relations publiques de la Commission favorisent la création des échanges, des débats et la compréhension entre les institutions européennes, le grand public, la société civile organisée et des publics spécialisés au niveau européen, national, régional et local. De plus, le dialogue avec les citoyens et le renforcement de la transparence devraient se retrouver dans toute question. Consacrer du temps et une part adéquate des ressources disponibles à de telles fins, ce serait, donc, un investissement profitable.

THE USE OF READING NONVERBAL MESSAGES FROM CUSTOMERS

Barin Ioana

University of Bacau Faculty of Economic Sciences ioana barin@yahoo.com

About 50 percent of communication is nonverbal. Nonverbal messages sent by customers are conveyed by body language. The five channels of body language communication are body angle, face, arms, hands and legs. No single channel can be used to determine the feelings or attitudes of customers. Salespeople need to analyze the body language pattern composed of all five channels to determine when a customer is nervous, bored or suspicious. In addition to asking questions and listening, salespeople can learn a lot from their customers' nonverbal behaviors. This article is about how salespeople can use the three forms of nonverbal communication – body language, space, and appearance – to convey messages to their customers. In business and social situations, buyers often use nonverbal cues to try to be polite. As a result salespeople often have difficulty knowing what a customer is really thinking. Salespeople can use nonverbal communication to convey information to customers. Salespeople need to know the appropriate distances between themselves and their customers for different types of communications and relationships. Salespeople should learn to use their physical appearance and dress to create a favorable impression on customers.

Keywords: body language, physical contact, appearance.

The article's JEL code: M310

Intoduction

The moment salespeople meet prospective customers, the customers are being judged by how they look and what they do. The process takes about seven seconds, but the impression lasts. Making or breaking a sale often depends on the nonverbal signals that are exchanged during this initial contact. Attire, body positions, expressions, facial movements, and eye contact are all factors to be understood and managed by the successful salesperson. Masterful negotiation results from being able to correctly read between the lines of what people are saying. One of the most powerful ways to do this is to acquire an understanding of body language. Effective negotiators recognize when they need to slow down or speed up the negotiation process. They know how to relieve anxiety and calm difficult situations. Rather than relying solely on verbal cues, however, the primary way they gauge what is happening is by watching for nonverbal behavior that signals someone's unconscious, and therefore unmonitored, motivation.

1. Reading nonverbal messages from customers

In addition to asking questions and listening, salespeople can learn a lot from their customers' nonverbal behaviors. In this article I discuss how salespeople can collect information by observing their customers' body language.

1.1. Body angle

Back-and-forth motions indicate a positive outlook, whereas side-to-side movements suggest insecurity and doubt. Body movements directed toward a person indicate a positive regard; in contrast, leaning back or away suggests boredom, apprehension, or possibly anger. Changes in position may indicate that a customer wants to end the interview, strongly agrees or disagrees with what has been said, or wants to place an order.

1.2. Face

The face has many small muscles capable of communicating innumerable messages. Customers can use these muscles to indicate interest, expectation, concern, disapproval, or approval. The eyes are the most important area of the face. The pupils of interested or excited people tend to enlarge. Thus by looking at a customer's eyes, salespeople can often determine when their presentations have made an impression. The average blink rate for a relaxed person is 10 to 20 blinks per minute (bmp). During normal conversation, it increases to about 25 bmp. Bmp over 50, and particularly over 70 bmp, indicates high stress levels.

Eye position can indicate a customer's thought process. Eyes focused straight ahead mean a customer is passively receiving information but devoting little effort to analyzing the meaning and not really concentrating on the presentation. Intense eye contact for more than three seconds generally indicates customer displeasure. Staring indicates coldness, anger, or dislike. Customers look away from the salesperson while they actively consider information in the sales presentation. When the customer's eyes are positioned to the left or right, the salesperson has succeeded in getting the customer involved in the presentation. A gaze to the right suggests the customer is considering the logic and facts in the presentation, and gazing to the left suggests more intense concentration based on an emotional consideration. Eyes cast down offer the strongest signal of concentration. However, when customers cast their eyes down, they may be thinking, *How can I get my boss to buy this product?* or How *can I get out of this conversation?* When customers look away for an extended period, they probably want to end the meeting.

Significant cultural differences dictate the appropriate level of eye contact between individuals. In the United States salespeople look directly into their customers' eyes when speaking or listening to them. Direct eye contact is a sign of interest in what the customer is saying. In other cultures looking someone in the eye may be a sign of disrespect. In Japan looking directly at a subordinate indicates that the subordinate has done something wrong. When a

subordinate looks directly into the eyes of his or her supervisor, the subordinate is displaying hostility. In Muslim countries, eye contact is not supposed to occur between men and women. In Korea eye contact is considered rude. Brazilians look at people directly even more than Americans do. Americans tend to find this direct eye contact, when held over a long period of time, to be disconcerting. Skin color and skin tautness are other facial cues. A customer whose face reddens is signaling that something is wrong. That blush can indicate either anger or embarrassment. Tension and anger show in a tightness around the cheeks, jaw-line, or neck.

1.3. Arms

A key factor in interpreting arm movements is intensity. Customers will use more arm movement when they are conveying an opinion. Broader and more vigorous movement indicates the customer is more emphatic about the point being communicated verbally. Always remember cultural differences. For example, it's rude to cross your arms in Turkey.

1.4. Hands

Hand gestures are very expressive. For example, open and relaxed hands are a positive signal, especially with palms facing up. Self-touching gestures typically indicate tension. Involuntary gestures, such as tightening of a fist, are good indicators of true feelings. The meanings of hand gestures differ from one culture to another. For example, the thumbs-up gesture is considered offensive in the Middle East, rude in Australia, and a sign of OK in France. In Japan the OK sign made by holding the thumb and forefinger in a circle symbolizes money, but in France it indicates that something is worthless.

1.5. Legs

When customers have uncrossed legs in an open position, they send a message of cooperation, confidence, and friendly interest. Legs crossed away from a salesperson suggest that the sales call is not going well. Crossing your feet and showing the bottoms of your shoe soles are insulting in Japan.

1.6. Body language patterns

The patterns of signals that generally indicate the customer is reacting positively or negatively to a salesperson's presentation. However, no single gesture or position defines a specific emotion or attitude. To interpret a customer's feelings, salespeople need to consider the pattern of the signals via a number of channels. For example, many men are comfortable in informal conversations with their arms crossed. It doesn't necessarily mean they're against you or what you're saying.

In business and social situations, buyers often use nonverbal cues to try to be polite. As a result salespeople often have difficulty knowing what a customer is really thinking. For example, smiling is the most common way to conceal a strong emotion. Salespeople need to know whether a customer's smile is real or just a polite mask. The muscles around the eyes reveal whether a smile is real or polite. When a customer is truly impressed, the muscles around the eyes contract, the skin above the eyes comes down a little, and the eyelids are slightly closed. Some other signals that customers may be hiding their true feelings are as follows:

- Contradictions and verbal mistakes. People often forget what they said previously. They may leak their true feelings through a slip of the tongue or a lapse in memory;
- Differences in two parts of a conversation. In the first part of a conversation, a customer may display some nervousness when asked about the performance of a competitor's product and give a flawless response outlining the product's benefits. Later in the conversation, the evaluation of the competitor's product may be much more convoluted;
- Contradictions between verbal and nonverbal messages. For example, facial expression may not match the enthusiasm indicated by verbal comments. Also, a decrease in nonverbal signals may indicate that the customer is making a cautious response;
- Nonverbal signals such as voice tone going up at the end of a sentence, hesitation in the voice, small shrugs, increased self-touching, and stiffer body posture suggest that the customer has concerns. When customers disguise their true feelings, they are often trying to be polite, not deceptive. To uncover the customer's true feelings and build a relationship, the salesperson needs to encourage the customer to be frank by emphasizing that she or he will benefit from an open exchange of information. Here are some comments a salesperson can make to encourage forthright discussion: *Perhaps there is some reason you cannot share the information with me; Are you worried about how I might react to what you are telling me?; I have a sense that there is really more to the story than what you are telling me. Let's put the cards on the table so we can put this issue to rest.*

2. Sending messages with nonverbal communication

The preceding part described how salespeople can develop a better understanding of their customers by observing their body language. Salespeople can also use their own body language, spacing, and appearance to send messages to their customers.

2.1. Using body language

During a 30-minute sales call around 800 nonverbal signals are exchanged. Astute salespeople use these signals to communicate more effectively with customers. For example, salespeople should strive to use positive signals. Cooperative cues indicate to customers that the salesperson sincerely wants to help them satisfy their needs. On the

other hand, salespeople should avoid using negative cues. These cues will intimidate customers and make them uncomfortable. The most effective gestures are natural ones, not those you are forcing yourself to perform. A buyer can spot nongenuine non-verbals.

2.1.1.Facial Muscles

Nonverbal communication is difficult to manage. Facial reactions are often involuntary, especially during stressful situations. Lips tense, foreheads wrinkle, and eyes glare without salespeople realizing they are disclosing their feelings to a customer. Salespeople will be able to control their facial reactions only with practice.

As with muscles anywhere else in the body, the coordination of facial muscles requires exercise. Actors realize this need and attend facial exercise classes to learn to control their reactions. Salespeople are also performers to some extent and need to learn how to use their faces to communicate emotions. Nothing creates rapport like a smile. One recent study of tradeshow attendees found that 80 percent were more likely to have a positive perception of a company or product if the seller was smiling. The smile should appear natural and comfortable, not a smirk or an exaggerated, clownlike grin.

2.1.2. Eye Contact

Appropriate eye contact varies from situation to situation. People should use direct eye contact when talking in front of a group to indicate sincerity, credibility, and trustworthiness. Glancing from face to face rapidly or staring at a wall has the opposite effect. However, staring can overpower customers and make them uncomfortable.

2.1.3. Hand Movements and Hand Shaking

Hand movements can have a dramatic impact. For example, by exposing the palm of the hand, a salesperson indicates openness and receptivity. Slicing hand movements and pointing a finger are very strong signals and should be used to reinforce only the most important points. In most cases pointing a finger should be avoided. This gesture will remind customers of a parent scolding a child. When salespeople make presentations to a group, they often use too few hand gestures. Gestures should be used to drive home a point. But if a salesperson uses too many gestures, acting like an orchestra conductor, people will begin to watch the hands and miss the words.

In terms of shaking hands, salespeople should not automatically extend their hand to a prospect, particularly if the prospect is seated. Shaking hands should be the prospect's choice. If the prospect offers a hand, the salesperson should respond with a firm but not overpowering handshake while maintaining good eye contact. Chances are that you have experienced both a limpid handshake - a hand with little or no grip - and a bone-crunching grip. Either impression is often lasting and negative.

Women should shake hands in the same manner men do. They should avoid offering their hand for a social handshake (palm facing down and level with the ground, with fingers drooping and pointing to the ground). Likewise, a man should not force a social handshake from a woman in a business setting.

The salesperson selling in an international context needs to carefully consider cultural norms regarding the appropriateness of handshaking, bowing, and other forms of greeting. For example, the Chinese prefer no more than a slight bow in their greeting, whereas an Arab businessperson may not only shake hands vigorously but also keep holding your hand for several seconds. A hug in Mexico communicates a trusting relationship, but in Germany such a gesture would be offensive because it suggests an inappropriate level of intimacy. Germans tend to pump the hand only once during a handshake. Some African cultures snap their fingers after shaking hands, but other Africans would see this act as tasteless. And some Eastern cultures also use the left hand for hygienic purposes, so offering a left hand to them would insult them.

2.1.4. Posture and Body Movements

Shuffling one's feet and slumping give an impression of a lack of both self-confidence and self-discipline. On the other hand, an overly erect posture, such as that of a military cadet, suggests rigidity. Salespeople should let comfort be their guide when searching for the right posture.

2.2. The role of space and physical contact

The physical space between a customer and a salesperson can affect the customer's reaction to a sales presentation. The intimate zone is reserved primarily for a person's closest relationships; the personal zone for close friends and those who share special interests; the social zone for business transactions and other impersonal relationships; and the public zone for speeches, teachers in classrooms, and passersby. The exact sizes of the intimate and personal zones depend on age, gender, culture, and race. For example, the social zone for Latinos is much closer than that for North Americans. Latinos tend to conduct business transactions so close together that North Americans feel uncomfortable. Customers may react negatively when they believe that salespeople are invading their intimate or personal space. To show the negative reaction, customers may assume a defensive posture by moving back or folding their arms. Although approaching too close can generate a negative reaction, standing too far away can create an image of aloofness, conceit, or unsociability.

In general, salespeople should begin customer interactions at the social zone and not move closer until an initial rapport has been established. If the buyer indicates that a friendlier relationship has developed, the salesperson should move closer.

In terms of touching, buyers fall into two touching groups: contact and noncontact. Contact people usually see noncontact people as cold and unfriendly. On the other hand, noncontact people view contact people as overly friendly and obtrusive. Although some customers may accept a hand on their backs or a touch on their shoulders, salespeople should generally limit touching to a handshake. Touching clearly enters a customer's intimate space and may be considered rude and threatening - an invasion.

2.3. Appearance

Physical appearance, specifically dress style, is an aspect of nonverbal communication that affects the customer's evaluation of the salesperson. Two priorities in dressing for business are (1) getting customers to notice the salespeople in a positive way and (2) getting customers to trust the salespeople. If salespeople overdress, their clothing may distract from their sales presentation. Proper attire and grooming, however, can give salespeople additional poise and confidence. During a given day a salesperson may have to visit his or her company's and customers' offices, each of which may have a different dress code. And sometimes the buyer will have dress codes that even salespeople who visit them must follow.

Conclusion

Using nonverbal communication as a business tool means becoming conscious of what was previously a mostly unconscious process. Instead of just having a feeling about someone, the salesperson can learn which body signals led him/her to that insight - and then decide whether their conclusion was valid. Instead of just hoping that are making a good impression, the salesperson can learn the nonverbal signals of confidence and credibility.

The ability to perceive and use nonverbal cues to one's advantage gives the business person the power to be successful. Nonverbal communication includes any part of the body used by a person to send a message to another person. A person's dress, attitude and movements are all contributions to personal business transactions. These cues can help a business owner get the message across or be able to correctly interpret a message received from a customer. Often the nonverbal messages express true feelings more accurately than the actual words.

REGULATION AND MARKETING TO CHILDREN

Barin Ioana

University of Bacau Faculty of Economic Sciences ioana barin@yahoo.com

Prihoanca Diana

University of Bacau Faculty of Economic Sciences dianaprihoanca@yahoo.com

Marketing to children is a major concern to regulators and consumers groups. The regulation of marketing activities aimed at children focuses primarily on product safety, advertising and promotions, and privacy protection. Product safety issues focus on appropriate product design and materials. The article is about the privacy protection and advertising and other promotional activities targeting children as consumers. The regulation of these activities rests heavily on theories of children's consumer behavior, particularly their information – processing skills. In addition to concerns about children's comprehension of advertisements, there is concern about the effect of the content of commercials on children. There are a variety of state, federal and voluntary guidelines and rules governing marketing to children. Despite these rules, many feel that some marketers continue to take advantage of children and that the overall marketing system, particularly advertising, is socializing children to value things rather than intangibles such as relationships and integrity.

Keywords: children, product safety, advertising, privacy protection.

The article's JEL code: M310

Introduction

There are a variety of state, federal, and voluntary guidelines and rules governing marketing to children. Despite these rules, many feel that some marketers continue to take advantage of children and that the overall marketing system, particularly advertising, is socializing children to value things (products) rather than intangibles such as relationships and integrity. One basis for the concern over marketing to children is based on Piaget's stages of cognitive development which indicate that children lack the ability to fully process and understand information, including marketing messages, until around 12 years of age. This and related theories are the basis for most regulation of advertising aimed at children and, according to critics, for some marketing programs that deliberately exploit children. It is difficult to articulate how young children interpret advertising. An ability to understand persuasive intent develops over time, primarily as a result of cognitive growth and development, and is independent of the quantity of media messages to which children are exposed. A mature comprehension of persuasive intent goes beyond a child's ability to acknowledge that an ad is trying to persuade. Four key elements must be understood: the source of the message has other interests and perspectives than the receiver; the source intends to persuade; persuasive messages are biased; and biased messages demand different interpretive strategies than unbiased messages.

1. Concerns about the Ability of Children to Comprehend Commercial Messages

Advertisers should always take into account the level of knowledge, sophistication, and maturity of the audience to which their message is primarily directed. Younger children have a limited capacity for evaluating the credibility of information they receive. They also may lack the ability to understand the nature of the personal information they disclose on the Internet. Advertisers, therefore, have a special responsibility to protect children from their own susceptibilities.

Realizing that children are imaginative and that make-believe play constitutes an important part of the growing-up process, advertisers should exercise care not to exploit unfairly the imaginative quality of children. Unreasonable expectations of product quality or performance should not be stimulated either directly or indirectly by advertising. The article's current focus is limited to children's abilities to *comprehend* advertising messages. There are two main components to this concern: (1) Do children understand the selling intent of commercials? and (2) Can children understand specific aspects of commercials, such as comparisons?

Do Children Understand the Selling Intent of Commercials? Research suggests that younger children have at least some difficulty understanding the selling intent of commercials. Currently, the advertising industry strives to separate children's commercials from the programs by prohibiting overlapping characters and by using separators such as "We will return after these messages."

This problem is growing in intensity, as children's products are often the "stars" of animated children's films and television programs. Increasingly, product lines and television programs (and movies) are being designed jointly with the primary objective being sales of the toy line. Parents have expressed concerns ranging from the effects that toy-based programming has on their children's behaviors and emotional development to the fear that such programming may replace other more creative and child-oriented programs. These proposals have produced an ongoing debate about who controls the television set. One argument is that it is the parent's responsibility to monitor and regulate their children's viewing behaviors. If a sufficient number of parents find such programs inappropriate and refuse to let their children watch them, advertisers will quit sponsoring them and they will no longer be available.

Another argument is that today's time-pressured parents do not have time to screen all the shows their children watch. Furthermore, tremendous peer pressure can develop for children to watch a particular show or own the products associated with it. Denying a child the right to watch such a show then causes arguments and resentments. Therefore, society should set appropriate standards within which broadcasters should operate. Which, if either, of these views matches your own?

Can Children Understand the Words and Phrases in Commercials?

The second aspect of comprehension involves specific words or types of commercials that children might misunderstand. For example, research indicates that disclaimers such as "Part of a nutritious breakfast," "Each sold separately," and "Batteries not included," are ineffective with preschool children. Young children have a difficult time understanding these phrases.

For example, one toy ad contained this disclaimer: "TV Teddy comes with one tape. Other tapes sold separately." However, it appeared near the bottom of the screen in lettering that measured only 3.5 percent of the screen height against a multicolor background. It was not repeated by an announcer and appeared for less than three seconds. A child would have to read at 200 words per minute to read the message! Unfortunately, this treatment of the disclaimer is more the rule than the exception.

There are special rules for comparison advertising and prohibits price minimizations such as "only" and "just." It also suggests specific phrasing for certain situations, such as "your mom or dad must say it's OK before you call" rather than "ask your parents' permission."

2. Concerns about the Effects of the Content of Commercial Messages on Children

Even if children accurately comprehend television ads, there are concerns about the effects the content of these messages has on children. These concerns stem in part from the substantial amount of time children spend viewing television. The large amount of time children devote to watching television, including commercials, gives rise to two major areas of concern: the impact of commercial messages on children's values and the impact of commercial messages on children's health and safety. Recognizing that advertising may play an important role in educating the child, advertisers should communicate information in a truthful and accurate manner and in language understandable to young children with full recognition that the child may learn practices from advertising which can affect his or her health and well-being.

Advertisers are urged to capitalize on the potential of advertising to influence behavior by developing advertising that, wherever possible, addresses itself to positive and beneficial social behavior, such as friendship, kindness, honesty, justice, generosity and respect for others.

Care should be taken to incorporate minority and other groups in advertisements in order to present positive and pro-social roles and role models wherever possible. Social stereotyping and appeals to prejudice should be avoided. Although many influences affect a child's personal and social development, it remains the prime responsibility of the parents to provide guidance for children. Advertisers should contribute to this parent-child relationship in a constructive manner.

Products and content which are inappropriate for children should not be advertised or promoted directly to children. Representation of food products should be made so as to encourage sound use of the product with a view toward healthy development of the child and development of good nutritional practices. Advertisements representing mealtime should clearly and adequately depict the role of the product within the framework of a balanced diet. Snack foods should be clearly represented as such, and not as substitutes for meals.

Children should not be urged to ask parents or others to buy products. Advertisements should not suggest that a parent or adult who purchases a product or service for a child is better, more intelligent, or more generous than one who does not. Advertising directed toward children should not create a sense of urgency or exclusivity, for example, by using words like "now" and "only."

Benefits attributed to the product or service should be inherent in its use. Advertisements should not convey the impression that possession of a product will result in more acceptance of a child by his or her peers. Conversely, it should not be implied that lack of a product will cause a child to be less accepted by his or her peers. Advertisements should not imply that purchase and use of a product will confer upon the user the prestige, skills, or other special qualities of characters appearing in advertising.

Advertisements should not portray adults or children in unsafe situations, or in acts harmful to themselves or others. For example, when athletic activities (such as bicycle riding or skateboarding) are shown, proper precautions and safety equipment should be depicted.

3. Health and Safety

In many instances, children and teenagers are exposed to advertising directed at adults. Even ads clearly not targeting children can have potentially harmful consequences:

A television commercial for Calgonite automatic dishwasher detergent showed a woman inside an automatic dishwasher. The commercial was withdrawn voluntarily after it was received a complaint that a three-year-old child had climbed into a dishwasher shortly after viewing the commercial. The problem caused by the Calgonite

commercial illustrates the difficulty marketers face. This commercial was not aimed at children nor shown during a children's program. The fact that children watch prime-time television extensively places an additional responsibility on marketers.

Ensuring that advertisements portray only safe uses of products is sometimes difficult, but it is not a controversial area. Advertising of health-related products, particularly snack foods and cereals, is much more controversial. The bulk of the controversy focuses on the heavy advertising emphasis placed on sugared and high-fat products. Advertising sugared products such as presweetened breakfast cereals does increase their consumption. However, this same advertising may also increase the consumption of related products, such as milk. What is not known, and probably cannot be determined, are the eating patterns that would exist in the absence of such advertising.

4. Values

Advertising is frequently criticized as fostering overly materialistic, self-focused, and short-term values in children: We cannot afford to raise a generation of children that measures its own value by the insignia on their clothes—not by the compassion in their hearts or the knowledge in their minds.

One reason is the magnitude of advertising focused on kids. One estimate is that marketers spend \$15 billion per year advertising to children. In addition, estimates of the number of TV ads that children are exposed to ranges from 18,000 to 40,000 per year. Obviously, these numbers are conservative in terms of total ad exposure since they exclude other popular media such as the Internet. Many are concerned that this consistent pressure to buy and own things is producing negative values in children.

Numerous cosmetics companies are now targeting children as young as 8 with products and advertising. Most position the products in terms of fun rather than sensuality. For example, Disney's products are packaged in boxes with pictures of Tinkerbell, Winnie the Pooh, and similar characters. According to an industry expert, girls 8 to 12 are now wearing platform heels and "low-rise jeans, tight miniskirts and midriff-baring T-shirts."

There is also an increase in concern about looking thin and eating disorders in children as young as 6. Many find this apparent shortening of childhood and the related body image problems inappropriate. They assign a large part of the blame to the marketing of products such as cosmetics and personalities such as Britney Spears.

5. Controversial Marketing Activities Aimed at Children

There are a number of marketing activities targeted at children in addition to television advertising that are controversial and for which various regulatory proposals are being considered. For example, violent entertainment products (movies, videos, and music) labeled for those 17 and older were, until recently, routinely marketed to kids. Highly publicized acts of violence by teenagers produced threats of regulation and improved self-regulation by the industries. However, it remains a problem.

5.1. Mobile Marketing and Children

Sometimes referred to as the "Third Screen," cell phones are an increasingly integral part of our lives. And marketers see younger children as the next big growth market.

Various types of promotional efforts are being used including:

- *Ringtones* Customized ringtones are quite the craze. Movies have gotten into the mix in a big way and allow downloads of ringtones such as Samantha's "nose wiggle" ring tone for the movie *Bewitched*. An example targeting an even younger audience is the Pokemon ringtone.
- *Mobile games* General mobile games are a major market. Increasingly, mobile games are being customized to a brand or event. *Batman Begins* was promoted with a mobile game custom designed around the movie.
- *Text-in contests* Text message codes are being used by numerous companies for contests and other promotions. Text in a specific code provided in an ad or on the package and you can enter to win various prizes. The ability for marketers to infiltrate yet another media domain with promotions and materials that are seen as further blurring the line between advertising and entertainment has many parents and consumer advocate groups worried.

5.2. Commercialization of Schools

There has been ongoing concern and controversy around the commercialization of elementary and high schools. Schools are often motivated by money as budgets continue to be tight. The issue of commercialization covers a broad sphere of activities. Consumers Union has the following classification system:

- *In-school ads* Ads in such places as school buses, scoreboards, bulletin boards, as well as coupons and free samples. Other aspects might include schools selling naming rights to companies and distributing ads in student newspapers
- Ads in classroom Ads in classroom magazines and television programs. This also includes ads in magazines distributed in school libraries.
- Corporate-sponsored educational materials and programs Also called sponsored educational materials or teaching provided SEMs. **SEMs** are materials by corporations, usually free. for They come in various forms including posters, activity sheets. multimedia teaching aids.

- Corporate-sponsored contests and incentive programs - When companies gain access through various contests and incentives including prizes such as travel, free pizza, and so on.

Another area of great concern includes direct sales, usually by food products companies. Carbonated beverages are increasingly under pressure as a result of health concerns related to obesity and juvenile diabetes.

5.3. Internet Marketing and Children

Children are major users of the Internet. Not surprisingly, marketers use the Internet to communicate with kids. Two major concerns have emerged: invading children's privacy and exploitation of children through manipulative sales techniques.

Concern regarding manipulative Internet practices often revolves around the creation of sites that blur the line between entertainment and advertising. This goes back to concerns touched on earlier in terms of difficulties that children have in discerning selling intent and their ability to distinguish commercial from noncommercial content. An emerging concern is "adver-games." These customized games which are placed on a company's Web site prominently feature or integrate the company's brands and products as part of the game itself.

An early set of guidelines set the following principles for development of online commercial services:

- Personal information should not be collected from children, nor should personal profiles of children be sold to third parties.
- Advertising and promotions targeted at children should be clearly labeled and separated from content.
- Children's content areas should not be directly linked to advertising sites.
- There should be no direct interaction between children and product spokespersons.
- There should be no online microtargeting of children (commercial or promotions developed for individual children), and no direct-response marketing.

6. Children's Online Privacy Issues

Online privacy relates to the collection and use of information from Web sites. Collecting information from children is a sensitive issue, as well it should be, given all we know about their information processing deficits relative to adults

Care should be taken not to exploit a child's imagination. Fantasy, including animation, is appropriate for younger as well as older children. However, it should not create unattainable performance expectations nor exploit the younger child's difficulty in distinguishing between the real and the fanciful. The performance and use of a product should be demonstrated in a way that can be duplicated by the child for whom the product is intended. All price representations should be clearly and concisely set forth. Price minimizations such as "only" or "just" should not be used. Program personalities, live or animated, should not be used to sell products, premiums, or services in or adjacent to programs primarily directed to children in which the same personality or character appears.

Children have difficulty distinguishing product from premium. If product advertising contains a premium message, care should be taken that the child's attention is focused primarily on the product. The premium message should be clearly secondary.

The act requires that commercial Web sites that collect personal information from children under 13 obtain prior parental consent before they collect that information. The act only applies to Web sites, or portions thereof, directed to children or to Web sites that knowingly collect personal information from children under 13. The act does not apply to nonprofits.

Children's commercial Web sites have modified their data collection practices and limited the amount of data being collected. More children's commercial Web sites that collect personally identifiable data are posting privacy policy notices informing parents of what they are collecting and how it will be used. A majority of sites do not have a "clear and prominent" link to privacy policies. Children's sites that have a link for feedback, such as e-mail, often overlook this as a data collection point. In attempting to restrict children under 13 from entering personal identifying information, some sites use methods that could encourage age falsification.

Conclusion

Marketing messages are powerful communications that can have a positive or negative influence on children's behavior, attitudes, health and well-being. Children today are exposed to more marketing that any previous generation, having expanded beyond traditional TV ads into newer media. Food and beverage products developed for, and advertised to, young people are dominated by those that are calorie dense and nutrient poor. Young children have been shown to lack the cognitive abilities to objectively evaluate advertising. An increased interest among stakeholders in addressing the regulation of children's advertising suggests there is an opportunity to move forward with this approach. Several organizations have made public statements about the need for improved regulation of children's advertising. There are legitimate concerns about the effectiveness of a legislated ad ban given the quantity of cross-border media available to children via TV and the Internet. The susceptibility of young children to marketing messages is well established. There is strong evidence that children under eight years of age

generally lack the cognitive abilities to objectively evaluate marketing messages. Younger children, four years and under, cannot consistently tell the difference between television commercials and programming. Marketing to children is seen as critical to establishing and maintaining a life-long relationship with customers and children are increasingly becoming a powerful economic group in their own right.

Today, marketing is essential to any educational institution of higher education, so much as it is imperative that the needs of potential candidates to be identified and satisfied in a manner which will generate long-term effects (post-graduation), may particularly with regard to continuing education and voluntary classification in communities Alumni.

Because the marketing education undertaken to end in attracting and maintaining a higher number of students, institutions of higher education need to know and to understand better how the criteria of choice, expectations and sources of information used by prospective candidates.

That is why, the general objective of this study is investigating and analyzing the items listed above (criteria of choice, sources of information, expectations, etc.) and charting directions of strategic and tactical support for higher education in marketing education.

Keywords: educational marketing, institution of higher education, marketing research.

JEL Classification: M

1. Introduction

For Romanian universities, strategic marketing is a novelty. Private universities use couple marketing instruments to attract high school graduates but these are simple and non adapted forms of classical marketing. ²⁸⁰

We appreciate that the concept of marketing may help the institutions of higher education to understand the wide context of changes within which they are operating, thus supplying an important feedback system to identify the various and ever changing needs in order to establish the quality services satisfying those who are building the target-segments: potential students, actual students, companies, parents, society etc.

Recruitment of college students is an increasingly policy issue for many institutions of higher education. While an important part of university budgets as financial burden have shifted from government to institutions and students, it increased the importance of being able to recruit and enrol prospective students, especially high-ability students. That's why, faculties must carry out surveys among high school pupils in order to obtain information about student choice decision making to assist institution in optimizing their recruitment and enrolment efforts.

2. Decision making process of educational choices

The student's choice literature details that the faculty-choice process involves three broad stages. The first stage is the formation of faculty aspirations, which typically takes place from early childhood through high school. The second stage involves the identification, selection of, and application to a set of faculties known as "choice set". This stage typically takes place in a pupil's junior or senior year in high school. The final phase is admission to an institution of higher education (or a number of institutions) and eventual matriculation to one or many of them. ²⁸¹ Potential students are often viewed as "autonomous choosers" who make decisions about whether to apply for university, and which university to attend. Some surveys are signalling that some students have no choice ²⁸². Student choice decision-making is not rational or linear, but a complex process, influenced by numerous factors including tuition fee and other costs, information, access, academic achievement, admission method, job opportunities, life and school experience. ²⁸³

The educational marketplace is highly reputational. The choice process involves an outcome of the filtering of information through layers of preconceptions influenced by personal priorities, family background, culture and subjective judgement. Evaluating options, even for students with access to quality information, is challenging

because of the product intangibility, the complexity of the process and the implications on student's life. Reducing the complexity of decision-making requires that managers of higher education institutions understand which information is truly important to the potential student. Consumer behaviour is influenced by three categories of factors: cultural (culture, subculture, social class), social (reference groups, family, social status), and personal (age, life cycle, occupation, life style, personality, self concept)²⁸⁴.

People make choices every day, but most of them are low-involvement decisions. The decisions about educational choices are high-involvement decisions because²⁸⁵:

- The pupil's decision will reflect upon his or her self-image and could have long- term consequences.
- The cost to carry out a decision involves major personal or economic sacrifices.
- The personal and social risk of making a "wrong" decision is perceived as high.
- There is a considerable reference-group pressure to make a particular choice or to act in a particular way, and the target consumer is strongly motivated to meet the expectations of these reference groups.

The decision about which faculty to attend is a process that starts long before the enrolment decision is made and may have consequences long time afterward because it may affect career, friendships, residence and life satisfaction. This is the reason why faculty managers must understand each aspect of educational consumer behaviour. They should understand how pupils gather information about educational options, the reasons for choosing an educational program, and even the reasons to abandon faculty.

There are conflicting findings as to which factors are most influential and variation on numbers of such factors. However, 'quality' factors such as Academic reputation and Quality of faculty are consistently identified as fundamentally important.²⁸⁶

Other factors that applicants typically consider are:

- Location of the university and closeness to home area.²⁸⁷
- Job opportunities following completion of study: placements, employability, reputation and careers guidance.
- Influence of others. Extensively researched factors include the influence of family, friends, socioeconomic status, etc. ²⁸⁸

Next figure shows the steps followed by a potential student in educational choice decision-making process.

3. Survey carried out among 12th grade pupils

The aim of this survey is to determine: the information sources used by potential students, the most important criteria used by pupils when they choose a faculty, the reasons to choose a particular educational program, the influence of other persons, the potential students' choice regarding the admission methods.

3.1. Methodology

The research was carried out through survey method, using the interview technique (Malholtra, 2006). The questionnaire was the instrument of data gathering. The pupils were asked to deliver information about: their intention to attend a faculty, the institution of higher education chosen, the city in which they want to study, the reasons for choosing a particular educational program, the information sources used, the persons that may influence their decision and the preferred admission method.

To determine the importance of various influence factors in decision making process, it has been used a four point scale ranging from (1) "Not important at all" to (4) "Very important". The scale has an even number of steps to "force" the pupils to adopt a positive or negative attitude towards the analysed factors.

The questionnaire assessed the perceived importance along the following factors: "tuition fee", "institution's reputation", "closeness to the home area", "campus facilities", "student centeredness", "information offered by faculty", "family tradition", "job opportunities", "fields of study", "courses attended in high school", and "admission method".

The research was carried out among 12th grade pupils from 16 counties.

3.2. Need arousal

The results of the study show that 96% of the pupils intend to apply to a faculty. Among those who want to continue their studies, 47% said that the reason is the need to have higher education and 20% want to develop their skills in a particular field. Yet, 5.5% of pupils want to attend courses of an institution of higher education just to obtain a diploma. The arguments invoked by the pupils who didn't intend to matriculate to a faculty were lack of need to continue studies (66.7%) and the intention to leave the country (33.3%).

3.3. Information gathering

12th grade pupils prefer to use as information sources in the process of data gathering about education choices faculty internet website and brochures. The less utilised information source is family. Just 3.9% have visited faculty facilities and 2.6% have assisted to presentations held by university professors.

Regarding educational fairs, most of the students (89%) don't know any fair. In the case of the students which heard about educational fairs 80% of them have visited at list one fair. After visiting an educational fair most of pupils said that they are satisfied (25%) or very satisfied (33%), but there are also some which are unsatisfied.

Table 1: Information sources utilised by 12th grade pupils

Information source	Percent
Internet websites	61.0%
Brochures	19.5%
High school colleagues	7.8%
Presentation held by high schools' professors	3.9%
Visit the faculty facilities	3.9%
Presentation held by faculties' professors	2.6%
Family	1.3%
Total	100.0%

3.4. Faculty evaluation criteria

The most important factors when pupils select their faculty are "Job opportunities" and "Disciplines studied in High School", 94.8% of students said that those factors are important or very important. On the second place there is "Institution's reputation" 89.7% considering this factor important or very important. Another very important criterion in process of selection is "Information offered by faculty" 89.6% of pupils indicated this factor as being important or very important.

Table 2: The importance of factors which influence decision to attend a faculty

Tuble 2. The importance				•
Factors which influence	Not	Unimportant	Important	Very
decision to attend a faculty	important at			important
·	all			_
Admission fee	16.9	31.5	41.6	16.9
Tuition fee	1.3	20.8	55.8	22.1
Institution's reputation	1.3	7.8	48.1	41.6
Institution size	20.8	37.7	33.8	7.8
Location of the university	14.3	24.7	41.6	19.5
Campus facilities	6.5	11.7	54.5	27.3
Information offered by faculty	-	10.4	54.5	35.1
Family tradition	48.1	36.4	11.7	-
Job opportunities	-	5.2	35.1	59.7
Disciplines studied in High	-	5.2	35.1	59.7
School				
Admission method	1.3	10.4	62.3	26.0
Foreign lines of studies	1.3	19.5	49.4	29.9

The less important factor is "Family tradition", just 11.7% seeing this criterion as at list important. Same time criteria like "Institution size", "Admission fee" and "Closeness to home town" are seen as being not so important. Most of the pupils (83.1%) wish to study in traditional way. Among these, 32.4% will choose traditional learning because increased volume of information and 22.1% will choose this form of education to enjoy "student life". The rest of them will choose distance learning to be able to work in same time.

Most of students prefer state universities (62%). The reasons for this choice are lesser costs (38%), the prestige of the state universities (19%), and a better student selection (3%).

In case of the pupils who prefer private universities 72% think that there is no difference between the diplomas offered by state and private universities, 21% want to attend a private institution because is seen as being easier and 7% of those pupils have greater confidence in private faculties.

The most wanted faculty is Faculty of Economics and Business Administration from Cluj-Napoca (22.1%). The main reason for this option is the possibility to find easier a job. On the second place is Faculty of Computer Science from Cluj-Napoca (12%). The reason in this case was also the possibility to find easier a job. On the third place is Faculty of Political Sciences and Public Administration and the main motive is the possibility to study in foreign languages.

The most wanted admittance form is exam based admittance chosen by 49% of interviewed persons. In same time 38% of pupils prefer file based admittance and 13% wish a mix form of admittance based on exam and file. The preferences is influenced by sex, females chose exam based form while males chose file based form.

Most of pupils want to study in Romanian language (57%) but there are 30% of pupils who want to study in English language.

4. Conclusions

The most utilised information sources regarding educational programs are faculties' internet websites, universities brochures and high school colleagues.

The most important criteria in faculty-choice process are: "Job opportunities" and "Disciplines studied in High School", showing rather rational than emotional motivation. Because the next most important factors are "faculty's reputation", "information offered by faculty" and "admission method", institutions of higher education must focus on recruitment process in order to attract enough students. The ignorance of those aspects may result in loosing potential students to other faculties from same or different cities. Family tradition has almost no influence in choosing a particular faculty. There is little association between mentioned factors and "sex".

The most important reason, for pupils who want to study economics or business administration, is to continue studies from high school. The other reasons are the fields studied in faculty, the wish to work as an economist, the reputation of faculty the opportunities offered by the Bachelor of Science degree and the interest in economics.

The most preferred admittance method is exam based form. Managers of the institution of higher education must give high attention to admittance method because this criterion is seen as important and very important by most of the pupils. But, in the same time, faculty must take into consideration her mission and it must to keep their strategy to achieve a high university performance.

Competitiveness of the travel and tourism industry - one of the common concepts employed to approach and describe the sustainable development of the industry, as well as, that of the tourist destinations, is generally defined taking into consideration a set of reference elements related to the major functional dimensions such as the business environment, infrastructure, laws and regulations, and resources available in the tourist destinations.

The paper assesses in an exploratory manner how important are and what is the contribution of the natural resources to the overall competitiveness of the travel and tourism industry and to its specific performances based on the specific data referring to the Central and Eastern European countries.

Key words: natural resources, tourism competitiveness, CEE countries

JEL classification: L83, M31

Introduction

In the last decades, environmental worries used to focus on the effect of running out of natural resources like oil and industrial metals on the economy growth. Lately, these issues became more diversified and impacted significantly the tourism industry. According to Esty and Winston (2006), top ten environmental issues are climate change, energy, water, biodiversity and land use, chemicals, toxins, and heavy metals, air pollution, waste management, ozone layer depletion, oceans and fisheries, deforestation.

There is an inherited and fixed trade-off: ecology versus economy. On one hand, there are benefits of environmental standards and, on the other hand, there are higher prices to be paid and a reduced industrial competitiveness (Porter and Van der Linde, 2008).

Due to the impressive growth, in the last decades, in the number of the international tourist arrivals, from only 25 (in 1950) to 903 million (in 2007), tourism has become one of the largest and fastest growing economic sectors. (WTTC 2008). In this context, the competitiveness of tourism destinations and, generally, the overall competitiveness of the travel and tourism industry, became vital for their survival and growth in the international market. Hence, sustainable tourism and preservation of natural resources are essential for tourism destination competitiveness and development.

The competitiveness of a tourism destination is a complex and relative concept, a part of this complexity being suggested by the definition given to the tourist destination seen as places or some form of actual or perceived boundary, such as physical boundaries of an island, political boundaries, or even market-created boundaries (Kotler, Bowen, and Markens, 2006). As a consequence, measurement of the tourism destinations competitiveness is also a complex due to the methodology employed and to the reference considered in the process of measurement (that can be a destination itself or an organization operating at the level of that destination). One of the tools that can be used to analyze and measure the competitiveness of a tourist destination can be the Porter's five forces model, which takes into consideration the factor conditions (skilled labor, infrastructure, natural, cultural and historical resources), demand conditions, related industries, corporate strategy, structure and rivalry in the sector (Claver-Cortes, Molina-Azorin, and Pereira-Moliner, 2007, 2009).

Characteristics of a competitive tourist destination are of a very different nature and form a significantly diversified set of features. Among these are mentioned the ability to increase tourism expenditures, to increasingly attract visitors, to provide tourists with satisfying and memorable experiences in a profitable manner, to contribute to the enhancement of the well-being of destination residents and preservation of the natural resources for the future generations (Richie and Crouch, 2003). Seen from a macroeconomic perspective, tourism destination competitiveness has a support the three pillars of natural resources, climate and culture (Lumsdon, 1997). Ejarque (2005) proposes the following set of elements to be considered in analyzing the tourism destinations: the geographical location, environmental and physical conditions, demographical situation, existing tourist attractions, image perceived and image associated with the tourist destination, tourism resources (natural, cultural, activities, infrastructure and services).

Natural resources and climate have been identified a one of the significant factors, together with the cultural heritage, sport, recreation and education facilities, shopping and commercial facilities, infrastructure, and the cost of living (Tang and Rochananond, 1990) in determining the attractiveness of a country as a tourist destination and,

by extension, the competitiveness of the travel and tourism industry. There is a set of natural elements accepted by specialists: forests, soils, water and fisheries, minerals, energy. (Lovins, Lovins, and Hawken, 2007; Hart, 2007).

Methodological Notes

The main objectives to be reached through the present research approach referred to the assessment of the correlations between the natural resources and overall competitiveness and performances of the travel and tourism industry and economy and between the determinant factors and the overall competitiveness of the natural resources in the case of the selected CEE countries.

In order to assess the impact of the natural resources over the travel and tourism competitiveness it was employed a set of data included in The Travel & Tourism Competitiveness Report 2009 (called further TTC Report 2009) issued by the World Economic Forum in Geneva, Switzerland. Ten countries of the Central and Eastern Europe (CEE) have been selected from a list of 22 based on the affiliation to the region and their status as members of the European Union: Bulgaria, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovakia, and Slovenia.

Variables of the research approach have been the following:

-overall travel and tourism competitiveness, as it is expressed by the indexes determined, according to the specific methodologies, for all the 133 investigated countries;

-performances of the travel and tourism industry and economy: GDP and travel and tourism industry and economy, employment in travel and tourism industry and economy, international tourist arrivals and international tourism receipts;

-factors describing the natural resources competitiveness: number of the World Heritage sites, protected areas, quality of the natural environment and total known species.

Pearson correlation coefficient has been the statistical tool employed to conduct the measurements and produce the aimed results.

Major Findings

An overall assessment of the travel and tourism competitiveness in the CEE allow drawing a conclusion according to which there is not a significant difference between these countries regarding their competitiveness: although Czech Republic (with an overall score of 4.86) and Estonia (4.83) appear distanced, in the upper part of the hierarchy, from the remaining countries, the all ten CEE countries form a relatively uniform assembly in terms of their travel and tourism competitiveness (the average score at the level of the group being of 4.41).

For all ten CEE countries, regulatory framework appears as a supportive dimension of their competitiveness. Business environment and infrastructure appears as a dimension exerting an unfavorable impact over the competitiveness of the CEE countries (with the exception of Slovenia) while human, cultural and natural resources play a similar unfavorable role, Poland being the single CEE country for which these resources represent a strength of the travel and tourism industry's competitiveness.

Impact of the natural resources on the competitiveness of the travel and tourism industry in the CEE countries has been assessed considering the scores expressing the competitiveness of the natural resources and the performances in terms of the gross domestic product and employment (for the industry and for the economy), international tourist arrivals and receipts at the level of the ten CEE countries.

Table 1. Natural resources and the travel and tourism industry, economy and performances in the selected CEE countries (2008)

Notes: TTC – Travel and Tourism Competitiveness Index; 13NR – Natural Resources; GDPi – GDP and travel and tourism industry (US\$ millions); EMPi – employment and travel and tourism industry (thousand jobs); GDPe – GDP and travel and tourism economy (US\$ millions); EMPe – employment and travel and tourism economy (thousand jobs); ITA – international tourist arrivals (thousands); ITR – international tourism receipts (US\$ millions); countries ranked in the descending order of the TTC index.

Extremely surprisingly, natural resources (defined and assessed through the number of UNESCO natural World Heritage sites, quality of the natural environment, total known species of animals in the country and the percentage of nationally protected areas in the total surface of the country) appear to be very poorly related to the competitiveness of the CEE countries as travel and tourism destinations (r=0.18). This may suggest that although these countries have several natural attractions their contribution to the overall competitiveness of the travel and tourism industry and activities at their level is rather less significant. Also, CEE countries seem to unfortunately not have the knowledge and/or found the capacities for an effective employment of the natural resources as a critical driver of their competitiveness.
